Re: Resolution of Petition to Establish Non Discriminatory Rates, Terms, and Conditions for Resale Involving Local Exchange Companies and Alternative Local Exchange Companies pursuant to Section 364.161, Florida Statutes - Docket No. 950984-TP

Dear Ms. Bayo:

Enclosed for filing in the above-styled docket is the original, non-confidential portion of Sprint-United/Centel's cost studies. The confidential portion of the cost studies was filed on this date with the Division of Records and Reporting under a separate confidential cover.

Please acknowledge receipt and filing of the above by stamping the duplicate copy of this letter and returning the same to this writer.

Thank you for your assistance in this matter.

Yours truly,

John P. Fons

EXECUTIVE SUMMARY

Switching Cost Information System (SCIS) Overview

The Switching Cost Information System (SCIS) is a Bellcore developed system of models which Sprint utilizes for switching investment and cost development. SCIS is the predominently used model in the telecommunications industry within the United States in determining switch related investment/cost. In July, 1992 Arthur Anderson & Co. completed an independent review of SCIS and found the output is generally reasonable and consistent with principles of cost causation.

The Switching Cost Information System consists of three interactive models: SCIS-MO, SCIS-IN, and CCSCIS. SCIS-MO is the Model Office Module and calculates a standard set of basic investment building blocks for offices and remotes. Sprint uses SCIS to calculate investment for Nortel's and AT&T's (Lucent) switch technologies. The investments can be calculated for a single switch or aggregated to reflect multiple switches and geographic areas. CCSCIS models the Common Channel Signaling investment associated with switching investment. SCIS-IN utilizes switch vendor tables[1], results of SCIS-MO and CCSCIS studies and feature specific inputs and calculations to determine investment associated with network features and services.

Various cost methodologies can be modeled through SCIS including Average, Marginal-Capacity and Marginal-Long Formula. The terminology Average, Marginal-Capacity and Marginal-Long Formula is Bellcore's labeling and should not be confused with the meaning which those terms might have in economic circles.

Marginal cost, as produced in SCIS, would be representative of LRIC costs as it reflects the additional cost created (or avoided) by the decision to provide (or not provide) an additional block of output. In order to most appropriately reflect TSLRIC, Sprint utilizes the Average Model Office investment in SCIS. The Marginal runs would reflect a theoretical capacity utilization which would result in a cost which is lower than that actually realized. The Average model office investment more accurately reflects the actual costs incurred by the incumbent LEC to provide a network element to an alternative LEC. This methodology is consistent with the language in Order No. PSC-96-0811-FOF-TP at page 13 which states: "These (cost) estimates shall be based on the providers current or prospective network facilities, as opposed to some theoretically optimal network configuration."

[1] Switch vendor tables contain input data provided by the vendor for its switch types. This data is used in the algorithms for calculating investments. Examples of vendor tables are: Capacity Table, SS7 Capacity Table, Assumption Table, Real Time Table, etc.

TSLRIC vs LRIC

Long Run Incremental Cost (LRIC) is the additional cost created (or avoided) by the decision to provide (or not to provide) an additional block of output. If the service is already being provided, LRIC includes only the variable costs of providing the additional block of output.

Total Service Long Run Incremental Cost (TSLRIC) is a variation of LRIC. TSLRIC represents the additional cost created by providing an entire service. Specifically, TSLRIC includes all fixed and volume sensitive costs created by offering the entire service, or avoided by not offering the entire service. In other words, the TSLRIC of a specific service is equal to the difference between (1) the total cost of the company providing all services, and (2) the total cost of the company providing all services except the specific service.

The TSLRIC of a group of services is equal to the TSLRIC of each individual service within the group plus those fixed and volume sensitive costs created by offering the entire service but not affected by any of the individual services within the group.

TSLRIC (or LRIC) should include only current or forward looking technologies. Typically, these studies make some basic assumptions as to the infrastructure to be used. For example, existing central office locations will be used, although the technology may differ from that which currently exists. Existing infrastructure, such as conduit, will also be used.

A so-called "scorched earth" approach is another variation which assumes there is no existing infrastructure, i.e. anything is possible. For example, a central office location may be anywhere the analyst believes is more efficient. Existing outside plant configurations may be replaced by some "leap-frog" technology.

For purposes of network element unbundling, TSLRIC is the appropriate costing standard. In this instance, we are concerned with the cost of providing network elements associated with telecommunication services, versus not providing those network elements.

TSLRIC Investment of Unbundled Network Elements

Typically, both LRIC and TSLRIC studies determine the incremental investment associated with a specific service, and then apply an appropriate annual charge factor.

For switching and transport, while specific equipment will vary in practice, the following investment items are typically included in the TSLRIC incremental investment. The items marked with an asterisk might not be included in a LRIC study where the existing service already exists. However, there is no absolute rule. Each service and the purpose for which the study is being done must be analyzed to identify specifically what cost elements should or should not be included.

Unbundled Switching:

- Line Termination
  - ◊ Line Card
  - ◊ Main Distribution Frame
  - ◊ Protection
- Central Processing Units *
- Memory
- Line-side traffic sensitive investment
- Trunk-side traffic sensitive investment
- Network matrix
- Remote switches
- Host-remote umbilicals
- Land, building, and power for central offices and remotes *
- Software essential for basic exchange and interexchange switching functions *
- Generic upgrades

Unbundled Transport:

- Fiber cable
- Fiber repeaters
- Fiber tip cable
- Fiber patch panels
- Fiber optic terminals
- DSX3 cross connects
- M1/3 multiplexers
- DSX1 cross connects
- Conduit *
- Poles *
- Rights-of-way *

TSLRIC Incremental Annual Charge Factor:

The following expense items are typically included in an incremental study.

- Maintenance
- Depreciation
- Customer services
- Income taxes
- Property taxes
- Return on investment, including equity

Specifically excluded from an incremental study are corporate overheads and administrative expenses which are not directly attributable to individual services.

COST METHODOLOGY AND ASSUMPTIONS

COST METHODOLOGY AND ASSUMPTIONS

UNBUNDLED SWITCH PORTS - USAGE

Costs of Local Switching - Capacity Based

Methodology explanation

For purposes of calculating the cost of unbundled line-side switching, individual call set-up and MOU costs are not required. Instead, the cost of the capacity utilized by the ALEC is appropriate.

The Switching Cost Information System (SCIS) model, licensed from Bellcore, identifies several components of switching, including cost per line CCS, cost per trunk CCS, and cost per processor millisecond.

The process for converting SCIS results into costs per capacity involves five basic processes.

1. Determine the number of LCMs and DS-30A links required by the ALEC. This will be specific to each LCM.

2. Determine the busy hour CCS capacity per LCM based upon the number of DS-30A links required. Each DS-30A link has a busy hour capacity of 1,080 CCS (36 CCS * 30 channels). Each LCM has from two to six DS-30A links. Therefore the minimum CCS capacity with two links is 2,160 CCS, with each additional link per LCM providing an additional 1,080 CCS capacity.

3. Calculate the busy hour investment - SCIS Model Office output gives busy hour investment per processor millisecond, line CCS, and trunk CCS. These are the basic components for all calling.

4. Calculate the annual cost - Multiplying the busy hour investment by the annual charge factor provides the level of revenue required to sustain that investment annually.

5. Convert from annual to monthly cost by dividing by twelve.

COST METHODOLOGY AND ASSUMPTIONS

UNBUNDLED SWITCH PORTS - USAGE

Costs of Trunk Switching - Capacity Based

Methodology explanation

To determine the cost of usage on interoffice calls between an ALEC and Sprint, the following capacity based approach is appropriate.

The Switching Cost Information System (SCIS) model, licensed from Bellcore, identifies two separate components of a call. First is the call set-up function which establishes a connection for the call, including incomplete calls. Call set-up does not include any usage. Second is the usage function which consists of the actual on-line time, including non-conversation time.

The process for converting SCIS results into costs per capacity involves four basic processes.

1.All costs will be determined at the DS1 capacity level. Each DS1 has a busy hour capacity of 864 CCS (36 CCS • 24 channels).

2. Calculate the busy hour investment - SCIS Model Office output gives busy hour investment per millisecond, line CCS, trunk CCS, and tandem trunk CCS. These are the basic components for all calling.

3. Calculate the annual cost - Multiplying the busy hour investment by the annual charge factor provides the level of revenue required to sustain that investment annually.

4. Convert from annual to monthly cost by dividing by twelve.

UNBUNDLED SWITCHING

A. UNBUNDLED SWITCHING DEFINITION

Unbundled switching is the capability derived from the central office switch hardware and software required to permit customers to transmit or receive information over the Company's public switched network.

A Company-provided unbundled switching provides network functionalities, such as the end office switching of exchange service, exchange access traffic, a telephone number, announcements, translations and supervision. In addition, Company-provided switching also provides access to operator services and E911, but not the services themselves.

Tariffed, unbundled switching will include the following capabilities.

1. Termination

Consists of non-traffic sensitive investment, including the line card, a portion of the main distributing frame, and protection. The largest component is the line card. The following are typical line cards utilized by DMS technology. Each line card has an individual cost, which can be readily identified and reflected in cost studies and tariffed rates.

Type A - Used for basic residence and business service
Type B - Used for public telephone and ground start PBX

To determine the investment associated with a two wire voice grade analog l line card, a "composite" line card cost must be determined based on a weighted average of the investments associated with the Type A and Type B line cards.

2. Translations

Includes central office hardware and software required to perform conventional translations where required.

3. Usage

Unbundled switching will include the processor usage in the switch associated with calls which are originated from and terminated to the unbundled port.

4. Telephone Number

Includes the capability to provide directory assistance, E911, and DBAS/LIDB, not the services themselves.

5. Software

Includes the cost of central office software required to provide basic switching functionality.

Note that unbundling switching from the loop may create additional costs such that the sum of the unbundled costs is greater than the bundled costs.

B. UNBUNDLED SWITCHING COST

Traditional costing employs a theoretical long run optimal utilization factor. For purposes of network unbundling, unless spare capacity is driven by specific services, an average utilization factor should be employed since it more accurately reflects the actual costs incurred by the incumbent LEC to provide a network component. A theoretical utilization would provide a lower cost than could be realized by any efficient LEC which would uneconomically discourage facilities-based competition.

Costs of unbundled switching should include a land, building, and power factor for switching equipment, but not corporate overhead. Unbundled skittering should also include the cost of basic swishing software.

The recurring cost of the various unbundled switching components is as follows:

1. Termination

The cost of line termination can be found in the SCIS-MO output as "Minimum Investment per Line". This cost includes an A line card, main distribution frame, protection, and "Excess CCS Capacity" (the portion of traffic sensitive investment not recovered by actual usage). As an example, assume a "Minimum Cost per Line" of $96.26069. Multiplying by an annual charge factor of .25 and dividing by twelve months yields a monthly cost of $2.01. Note that ISDN termination can be found in SCIS-IN as Feature 144 (BRI) and Feature 191 (PRI).

If a line card other than Type A is required, this figure can be manually adjusted using information found in the Investment Table of the Switching Cost Information System (SCIS) model licensed from Bellcore. The cost of

the A line card must be replaced by the cost of the other line card. For example, if a C line card is required, the "Minimum Investment Per Line" of $2.01 is adjusted by removing the cost of the A line card, $1.44, and replacing it with the cost of the C line card, $1.82, for a net cost of $2.39 ($2.01 - $1.44 + $1.82).

As stated previously, the cost of the two wire analog voice grade unbundled port represents a composite of the two analog lien cards, the Type A and Type B. Based on typical Sprint-United offices, the composite includes 97% Type A and 3% Type B cards. The MDF and protection costs should be added to the line card costs to obtain the termination cost.

The Basic Rate ISDN (BRI) and Primary Rate ISDN (PRI) port costs were developed using the SCIS IN features 144 and 191 respectively (included in backup) which determine the switch investment associated with BRI and PRI.

Costs for the 2-wire and 4-wore DID trunk ports were developed by determining the investments required to provide the ports. Those investments were run through the Levilizer Model (spreadsheet model developed by Sprint) which applies the appropriate depreciation, cost of money and tax factors to convert the investment to a monthly recurring cost. Diagrams have been provided of these ports which describes what investments are associated with these ports. The monthly recurring cost includes the cost of terminating these types of loops directly into the switch. There has also been an additional cost developed which includes the cost of the circuit equipment required on the Central Office end of the circuit. If the ALEC chose to provide that equipment, then the optional cost would not apply.

A diagram has also been provided to explain the costing methodology used for the 4-wire analog voice grade port. Sprint does not have the capability of terminating 4-wire analog voice grade circuits directly into the switch. To terminate analog voice grade circuits which have been transported via a 4-wire loop (i.e. B1 over T1), the loop must be terminated into a channel bank and then the channels are brought into the switch on individual 2-wire line cards. Therefore, the cost shown for 4-wire analog voice grade circuit ports is the cost of 24 2-wire analog voice grade ports. There is some additional cost associated with the circuit equipment required on the central office end of the circuit to demultiplex the circuit back down to the individual 24 channels before terminating into line cards. If the ALEC chose to provide this circuit equipment, then this additional cost would not apply.

2. *Translations*

No incremental investment for conventional routing.

3. Usage

The capacity cost of unbundled switching capacity (exchange service and exchange access traffic) should be determined by considering the capacity to be utilized by the ALEC. When an ALEC leases a line card from Sprint, they are acquiring the capability of a full 36 CCS during the busy hour. While this is theoretically correct, in reality relatively few lines, perhaps data lines, actually utilize this amount of switching capacity. Assuming 36 CCS per line card results in an extremely high per line per month cost in the range of $16.00.

Sprint's current proposal for determining capacity cost for usage is for each competitor to have dedicated access to the first point of concentration in the switch. In the DMS-100 switch, this point is the Line Concentrating Module (LCM). Sprint will provision LCMs and DS-30A links specifically for use by the ALEC, based on the competitor's own anticipated traffic volumes. The number of DS-30A links required will be a direct function of the ALEC's own traffic. After this point of concentration, the ALEC's traffic will be merged with all other switched traffic.

For line side usage, the MOU usage is determined as follows. Each DS-30A link is capable of carrying 1,080 CCS during the office busy hour (30 Channels • 36 CCS per channel). This capacity is multiplied times the appropriate processor investment and the annual charge factors are applied. The actual calculations are included on the pages titled COSTS OF LOCAL SWITCHING USAGE and COSTS OF TRUNK SWITCHING USAGE.

Under this proposal, each competitor will pay only for the costs it actually imposes on the network. In addition, this will avoid any potential that the competitor could adversely affect Sprint's network, or *vice versa.*

4. Telephone Number

a) DBAS/LIDB listing - No incremental investment. The cost of the actual query is recovered through the tariffed query charge.

b) E911 dialing capability - No incremental investment.

c) Directory Assistance access - No incremental investment. The ALEC should be charged for each occurrence according to a separate tariff rate element.

5. Software

The basic software packages required to provide basic switching capability as estimated by Sprint and Nortel subject matter experts are provided on the page entitled "CENTRAL OFFICE SWITCHING SOFTWARE". Also shown is the list price and the total cost after Sprint's discount. To determine a cost per line per month, this amount was levelized over ten years assuming an average of 25,000 lines per office growing at 4% per year.

Unbundled switching will not recover the costs of AMA recording.

C. Usage Patterns Per Line

A local usage study from July 1996 was used to provide the usage patterns per line required in determining the usage portion of unbundled switching cost. A summary of the results of that usage study have been provided on the page entitled "Local Usage Summary". In addition, the detail results from the study have been provided in the back-up.

The usage has not been added into the unbundled port but rather has been kept separate so that it can be priced as a separate rate element in addition to the unbundled port.

COMMON CHANNEL SIGNALING COST INFORMATION SYSTEM - COST DEVELOPMENT

The following pages are the outputs for the Common Channel Signaling Cost Information System (CCSCIS). This is a Bellcore model and is provided by the Corporate office.

COMMON CHANNEL SIGNALING COST INFORMATION SYSTEM - version 3.9
AGGREGATE

Study Id: FLTSA
Description: FL CB Avg

Mon Jul 15, 1996 15:24:41

AGGREGATION MODEL

About Study
User Name : Randy G. Farrar
Study Description: FL CB Avg
Study Identifier : FLTSA

Study Date : 12/06/1993
Valid For : 3/88 - PRES

Assumptions
Aggregate Unit Investments for: Trunk Signaling

Aggregate [Average] Unit Investments

Is the Service in the Study Area provided using -
A Regional STP? : No
Local STPs? : Yes

For Data Base Queries Routed Through the Local and Regional STPs,
GTTs are Performed in [Not Applicable]

Are Local STPs Linked Directly to SPOIs? : Yes

SS7 Investment

- Switching offices which serve as Service Switching Points (SSPs) to provide link access to the SS7 network require an additional resource investment output - "Investment per SS7 Octet".

- The "Investment per SS7 Octet" is developed as a levelized cost which reflects the SS7 investments and demand for signaling octets over the economic life of the SS7 equipment.

- Three calculation options are available based upon Economic Options and Parameters:

    1. Capacity Investment of the next link set.

    2. Non-exhaust marginal cost equals zero.

    3. Long Formula calculated when link sets are added over economic life.

- Input data for "Investment per SS7 Octet" analysis may be provided as:

    - Link Only

    - Service Only

    - Link and Service

ANNUAL CHARGE AND LAND & BUILDING FACTORS

THIRTY DAY STUDY

SCIS EXPLANATION OF TERMS

SWITCHING COST INFORMATION SYSTEM (SCIS)

Explanation of Terms

Cost Per Millisecond/Getting Started Investment

As relates to SCIS, the cost to provide common components that are required by the system before any subscribers may be served. Getting Started investment also includes Breakage. Breakage is the cost attributable to the inevitable underutilization of equipment. Many central office equipment components are purchased in large modules, i.e., frames, modules, units, shelves, etc., which may exceed a particular equipment requirement.

Line Termination Investment

a) **Minimum Cost Per Line**
Total of Working Plain Old Telephone Service (POTS) Line Cost and Excess Hundred Call Second (CCS) Capacity Cost.

b) **Working POTS Line Cost**
The Working POTS Line Termination Cost is the cost associated with the physical appearance of a line on the switch. The primary cost components for analog lines are the Distribution and Protection frame costs and the Line Card. The primary cost component for SLC-96 lines is the DS-1 termination.

c) **Excess CCS Capacity Cost**
Excess CCS Capacity Cost is that portion of the traffic-sensitive cost components not recovered by actual usage. It occurs when the input Originating + Terminating (O+T) CCS per Line, which is the actual usage, is less than the adjusted capacity breakpoint CCS per line. This unused CCS is identified as Excess Capacity. It recovers the cost of the unused Line Concentrating Module (LCM) at a Remote Line Concentrating Module (RLCM) and Remote Switching Center (RSC).

The cost for ISDN lines is composed of the above components, along with the Getting Started Cost per Basic Rate Interface (BRI), which includes BRI-specific breakage and spares.

Cost Per Line CCS (Originating or Terminating)

The usage cost for the office. It represents the actual use of traffic-sensitive cost components in the office being studied.

Note: The Cost per Line CCS reflects a weighted average of all analog and digital POTS lines in the office. This includes any analog line terminated on Line Concentrating Modules Enhanced Network (LCMEs) entered as ISDN data.

Digitone Increment per Digitone Call

Digital lines require Digitone (DT) receivers, housed in Maintenance Trunk Modules, to process Digitone dialing. The Digitone Increment per Digitone Call represents the incremental costs for Digitone service on digital lines.

Cost per Trunk CCS

The Cost per Trunk CCS Originating/Incoming (O/I) category reflects the cost associated with local trunk usage (analog, digital, and DS0 clear channel capability [DS0 CCC] digital) for interoffice calls. A weighted average is determined from the analog, digital, and DSO CCC digital trunk mix of the offices being studied. The Cost per Trunk CCS is calculated for end offices (DMS100) and end office/tandem combined switches (DMS100/200).

Cost Per Umbilical CCS

The equipment at each end of the host and the remote. Host includes T1 terminating card Line Group Controller (LGC) or Line Trunk Controller (LTC), a portion of the LGC and a portion of the Double Shelf Network Equipment (DSNE) or Enhanced Network (ENET). The remote includes the T1 termination card. This does not include the span line connecting the host to the remote. That is covered in the transport model.

ISDN DEFINITIONS

ISDN BASIC RATE INTERFACE (BRI)

The Basic Rate Interface (BRI) T-interface feature allows a 4-wire BRI that provides the basic ISDN 2B+D access. The wiring for the T-interface must be protected; i.e., inside a building or grounded conduit and has a maximum range of approximately 1,000 meters. A U-interface provides a 2-wire BRI for basic ISDN 2B+D access using echo-canceled hybrid technology for nonloaded loops. If bridge taps exist, the range is reduced.

ISDN PRIMARY RATE INTERFACE (PRI)

The Primary Rate Interface (PRI) supports up to 23 bearer channels carrying circuit switched voice or data. The bearer channels are controlled by the D channel, which carries the packetized signaling information. This configuration is known as the 23B+D interface, the CCITT standard for primary rate ISDN. The interface is implemented on a 1.544 mb/s digital connection.

EXECUTIVE SUMMARY

EXECUTIVE SUMMARY

An approximation of the total service long run incremental costs (TSLRIC) of unbundled loops were developed using the Benchmark Cost Model 2 (BCM2). The model was run for Sprint-United/Centel service territories within the state of Florida and Florida specific factors were used. All switching costs were zeroed out in the model so that the answer would reflect only the loop cost.

Because there are no forecasts for unbundled loop requirements of ALECs, it was appropriate to take as large a sample as possible in order to achieve a loop cost that is reflective of the average loop within Florida. BCM2 allowed for such a study. In addition, as we move forward to eventually determining unbundled loop costs based on density and distance, the BCM2 will allow us to convert these existing studies to the distance/density sensitive studies more readily.

BCM2 includes most of the direct costs involved in the provision of unbundled loops. However, some direct costs, such as Billing and Collections (B&C) and marketing/ customer service are not included in the model. These costs would need to be included to develop a Total Element Long Run Incremental Cost (TELRIC) as stated in FCC Docket 96-98.

Four unbundled loops were requested in this study. They are the 2-wire and 4-wire analog voice grade loops, a 2-wire ISDN digital grade loop, and a 4-wire DS-1 digital grade loop. The 2-wire analog voice grade loop cost is the $23.45 per loop cost which is the direct output of the BCM2 study. The 2-wire digital BRI loop cost is also the $23.45 per loop cost developed by the BCM2. However, the BRI loop may also incur an additional nonrecurring charge (NRC) to deload cable pairs and/or remove bridge tap if required. These NRC costs would be applied on an individual case basis as needed.

The 4-wire analog voice grade loop cost is obtained by multiplying the output from the BCM2 model by 2 ($23.45 X 2 = $46.90). This is necessary because a 4-wire analog voice grade loop would be provisioned using two copper pairs. The 4-wire digital DS-1 loop cost is obtained by multiplying the output from the BCM2 model by 3 ($23.45 X 3 = $70.35). Three copper pairs would be required for the 4-wire digital DS-1 loop - one transmit pair, one receive pair and one "order" wire. An additional monthly recurring cost might also apply to the 4-wire digital DS-1 loop if repeaters are required due to the loop length. That additional monthly recurring cost is $19.25 and represents the average DS-1 loop length.

SUMMARY - UNBUNDLED LOOP COSTS

SUMMARY UNBUNDLED LOOP COSTS

LOOP TYPE	MONTHLY RECURRING COSTS
2-Wire Analog	$23.45
4-Wire Analog (1)	$46.90
ISDN - BRI (2)	$23.45
DS-1 Digital (3)	$70.35
Repeater (4)	$19.25

FOOTNOTES:

(1) The 4-wire analog loop requires two cable pairs. Therefore, the cost of the 4-wire analog loop is twice the cost of the 2-wire analog loop (one cable pair).

(2) An additional nonrecurring (NRC) charge may apply if the loop requested for BRI requires deloading and/or removal of bridge tap. The NRC would apply on an individual case basis.

(3) The DS-1 digital loop requires three cable pairs - a transmit, receive and an "order" wire.

(4) The repeater cost will apply to DS-1 loops which are long enough to require repeaters. The calculation of the $19.25 is as follows:

Average Loop Length (BCM2) - 19,407 feet	
Average investment for one Mini-line repeater	$168.76
Number of repeaters for average loop length	5
Total repeater investment	$843.80
Annual charge factor - circuit equipment	0.2738
Annual Cost	$231.03
Monthly Cost	$ 19.25

Note: Costs were developed using BCM2 and Florida specific factors.

BCM2 STUDY RESULTS

The following five pages are the results developed from the BCM2 loop cost model. This model was run for Sprint's Florida operating territory only and includes Florida specific factors. All switching costs in the model were zeroed out so that the resulting cost represents only loop.

Benchmark Cost Model 2
Methodology

Introduction

The purpose of the model is to estimate a benchmark cost of providing basic local telephone service for both business and residence customers in small geographic areas for the entire U.S. and its territories. Small geographic areas are used because the cost of providing basic telephone service varies greatly even within the geographic unit of the wire center. Thus, the use of small geographic areas allow the model to identify specific areas which are high cost to serve because of the physical characteristics of the area.

The BCM2 assumes all plant is placed at a single point in time. All facilities are created as if the entire country is a new service area. Therefore, the BCM2 reflects the costs a telephone engineer faces installing new service to existing population centers.

BCM2 is a geographically-based high level engineering model of a hypothetical local network. The basic geographic units used by the model are Census Block Groups (CBGs), as designated by the U.S. Bureau of the Census. There are over 226,000 covering the entire U.S.[1] The basic data provided by the Census Bureau are the geographic boundaries of the CBG, the geographic center (centroid) of the CBG, and the number of households in the CBG. In addition to the Census data, terrain information from the U.S. Geologic Survey (U.S.G.S.) is developed by CBG. This information includes data which impacts the cost of placing telephone plant into service. The terrain data includes water table depth, depth to bedrock, hardness of the bedrock, surface soil texture, and the slope of the terrain. Another data item developed by CBG is an estimate of the number of business lines. This number is developed based on a third party data base of employees by CBG. These preceding items contain all the CBG characteristics necessary for input to BCM2.

The BCM2 starts with the existing central office locations throughout the country. The source of the central office locations is Bellcore's Local Exchange Routing Guide (LERG). This data is input into a geographic information system where each CBG is associated with the closest central office. Once all CBGs are associated with central office locations, this information plus the relative physical locations and CBG information are input to the BCM2. This basic input information allows the BCM2 to design a local exchange network utilizing a tree and branch topology.

[1] BCM2 is capable of using any small geographic unit, such as a census block or the "grid". Utilized by the Cost Proxy Model (CPM) developed by Pacific Telesis and INDETEC.

BCM2 methodology is presented below in the following sections:

- Assumptions for Loop Technology
- Assumptions for Feeder Plant Architecture
- Assumptions for Distribution Plant Architecture
- Assumptions for Switch Technology
- Assumptions for Density
- Algorithms to Develop Basic Local Service Costs
- User Adjustable Inputs

Prior to addressing BCM2 methodology a brief description of the major model changes from the original BCM is provided in the following section.

Major Changes From BCM to BCM2

Based upon public comments and analyses of the BCM, a number of enhancements have been incorporated into BCM2. These enhancements are designed to more accurately reflect actual engineering practices in the development of a local exchange network. BCM2 includes all costs of basic local telephone service, whereas the BCM only included the major cost drivers that differentiated high cost and low cost areas. The major changes from BCM to BCM2 follow.

Population Distribution

The BCM2 rural CBG input data are modified by a Geographic Information System module to reduce the square mile area of the CBG to an area that reflects the clustering of households. This is done utilizing a third party road network database to identify the areas within the CBGs which have the highest probability of containing households. A 500 foot buffer is created on each side of roads in CBGs with 20 households per square mile or less. A new area is calculated by the buffer area. If road buffers overlap, the area is not double-counted.

Business Line Information

The BCM2 includes business lines, private line loops, as well as residential lines by CBG. State specific counts for reported business lines and private line loops are allocated to CBGs based on a third party data base of employees by CBG. Additional residential demand beyond a single line per household is included based on the national ratio of all residential lines reported in the end of year 1994 as a ratio of 1990 households.[2] The

[2] BCM2 has a user variable input for the number of lines per household. The default value is 1.2.

inclusion of these lines allows the realization of all economies of scale associated with loop plant within the wire center.

Engineering Assumptions

Additionally, there are four major areas where the engineering assumptions changed from BCM to BCM2: switching plant, distribution plant, feeder plant, and the placing of a cap on wireline loop investment.

The BCM2 switching module changes includes five switch sizes to more closely reflect the switch application. The new switch module uses the Local Exchange Routing Guide information for remote switch locations to place remote switches in the locations where they are currently installed. Additionally, stand alone switch sizes of up to 10,000 lines, 10,000 to 60,000 lines, 60,000 to 100,000 lines and over 100,000 lines are used.

The BCM2 distribution plant engineering has been altered to reflect the distribution demands of each CBG. Varying the distribution plant engineering assumptions in urban areas aligns the BCM2 engineering designs more closely with actual engineering practices in these areas. This is done by basing the number of distribution plant cable legs on the number of housing lots in each CBG. The original BCM utilized a simplifying assumption of a constant four distribution cables per CBG.

Another distribution plant enhancement is that no copper distribution distances exceed those specified by the user. The maximum copper distribution distance is a user input with a 12,000 foot default. The limitation of copper technology serving distance has the effect of producing multiple distribution areas within rural CBGs, which in effect extends the feeder plant facilities into the CBG. This change also aligns BCM2 more closely with actual engineering practices. The original BCM assumed all plant within the CBG was copper distribution plant and that there would always be four distribution cables.

Two other areas of distribution plant engineering changes are driven by high concentrations of business lines in a CBG. The first change is that if a CBG line count exceeds 2,016, a variable percentage of lines will be terminated at the DS1 level to reflect costs of providing service to digital PBXs and providing wideband private line services. This is a user variable input. Additionally, if line demand for a single CBG exceeds the capacity of a maximum size copper cable, fiber will be deployed to the CBG regardless of the distance.

The third major area of engineering assumption change is that the costs for feeder plant digital loop carrier (DLC) systems reflect the fixed and variable nature of the costs. This ensures that the cost for DLC equipment properly reflects the effects of the equipment loading in each CBG. This is an important change since there can now be multiple remote terminals within a CBG for two reasons. First, the inclusion of business lines can cause the line demand to exceed that which can be provided by a single remote terminal. Second, the maximum copper distribution distance can cause the deployment of multiple remote terminals.

The final major area of change is the assumption that an alternative wireless loop technology is utilized for loops requiring investment levels in excess of the cost of an alternative wireless technology. Based upon ongoing trials, a value of $10,000 per loop is used in BCM2.

Other Enhancements

There are a number of other enhancements included in the BCM2. The BCM2 includes costs of the local loop not previously reflected in the original BCM[3], slope data is included in the BCM2 input data, and new variables that impact structure costs are available for future use. Another area of change provides separate annual cost factors for cost items that are plant related and a separate annual cost factor for line-related expenses. Three separate plant related factors are utilized for cable and wire facility investment, circuit equipment investment, and switch equipment investment.

Model Methods

Assumptions for Loop Technology

Feeder cable (cable placed so that it can be supplemented at a later date) is deployed as analog copper plant where the total loop distance is less than the user-specified maximum copper cable length.[4] If the loop distance exceeds the maximum loop distance value, fiber feeder plant is deployed. Fiber Feeder may extend into the CBG to maintain the maximum copper distribution cable distance.

Distribution plant may contain analog copper technology when terminating signals at a voice grade level, or may utilize fiber loop technology or digital

[3] BCM2 includes costs for the pedestal, drop wire, network interface device, in-line terminals, splicing and engineering.

[4] The user may specify maximum copper distances of 9,000 feet, 12,000 feet, 15,000 feet, or 18,000 feet.

carrier on copper, when terminations are made at the DS1 signal level for a percentage of business lines.

BCM2 uses two types of DLC equipment depending on the number of lines needed at each remote terminal location. For a remote terminal requiring line capacities greater than 240 lines, Lucent Technologies SLC Series 2000 equipment is used. For remote terminal requiring 240 lines or less capacity, Advanced Fiber Communications equipment is used. Both products are deployed in drop/add configurations, with SLC having a total capacity of 2,016 voice grade channels per four fibers and AFC having a total capacity of 672 voice grade channels per four fibers.

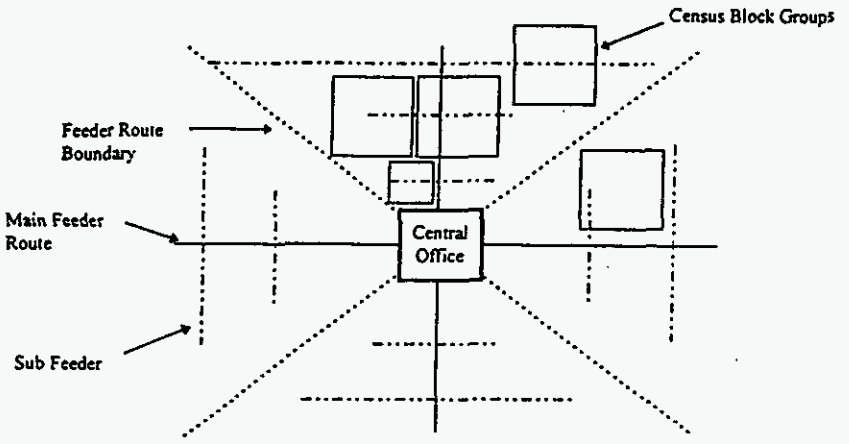
Assumptions for Feeder Plant Architecture

Feeder plant uses a tree and branch topology, with plant routes intersecting at right angles. Each feeder cable begins at the central office and generally ends at a terminal at the edge of a CBG. However, fiber feeder may extend into the CBG to ensure that the user specified maximum copper cable length is not exceeded.

Four main feeder routes leave each central office[5]: directly East (quadrant 1); directly North (quadrant 2); directly West (quadrant 3) and directly South (quadrant 4). The feeder route boundaries are at 45 degree angles to the main feeder routes.

[5] A central office may have less than four feeder routes if no CBGs are located within a feeder quadrant.

Feeder Plant Architecture



Both copper and fiber feeder cables share the structure and placement costs in the main feeder systems. As the main feeder routes move away from the central office and deploy cable capacity to the CBGs, the feeder cables taper in size to the capacity necessary for each individual segment.

Copper feeder cables range in size from 25 pair cable to 4,200 pair cable, while fiber feeder cable sizes range from 12 strand cable up to 144 strand cable. Feeder plant costs include the material cost of cable and electronics, as well as the capitalized cost of structure and placing the cable, electronics costs at the central office and remote terminals, as well as costs of in-line terminals, splicing and engineering.

Assumptions for Distribution Plant Architecture

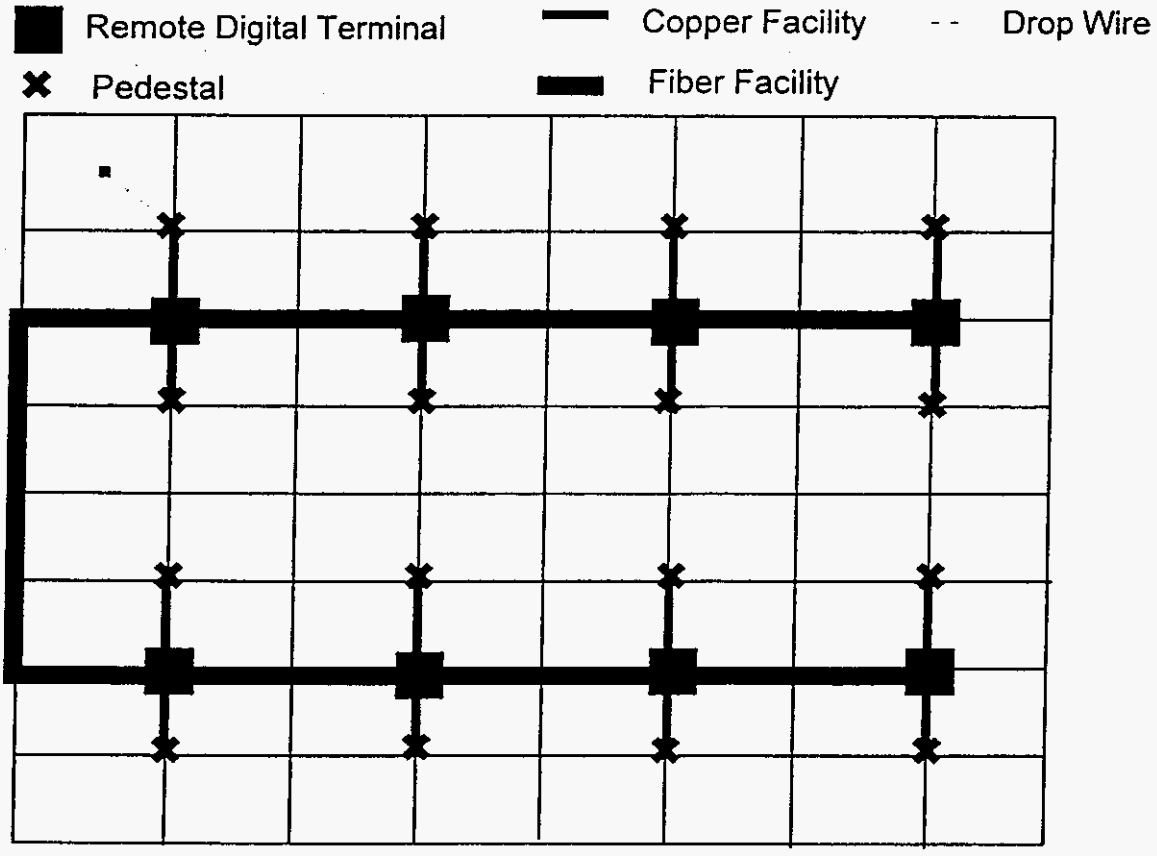
The BCM2 assumes that all households within a CBG are uniformly distributed. In rural areas, the CBG area input data has been reduced reflecting the removal of areas that do not have road access.

Distribution cable begins at the end of the feeder cable and continues to the customer premise. The distribution plant is designed to reach all households in the CBG through the placing of cables between subdivision lot lines.

BCM2 more precisely designs distribution plant for each CBG to ensure cables pass by each premise. The number of distribution cables may be as few as one for a small CBG to 20 or more cables in more densely populated CBGs.

In larger rural CBGs, it may be necessary to extend the fiber feeder into the CBG itself to maintain copper cable lengths less than the user specified maximum. An example of fiber extending into the CBG is displayed below.

Example of Distribution Plant With Fiber



Investments for distribution plant include the material cost of the cable and its cost of structure, as well as the network interface device, the drop wire, the pedestal, in-line terminals, digital terminals, splicing and engineering. Distribution cable sizes range from 12 pair cable to 3600 pair cable.

Since business lines are now included by CBG, the BCM2 distribution architecture uses fiber distribution cable in very dense CBGs that require

larger cable capacity than a maximum size copper distribution cable. Additionally, BCM2 terminates a percentage of the lines in these dense CBGs at a digital DS-1 signal level, since a percentage of businesses have digital PBXs or wideband services that utilize such capacity.

Assumptions for Switch Technology

The BCM2 uses five different size generic digital switches for calculating switch investments. Using Bellcore's LERG information, a switch is designated as a remote switch or a stand-alone switch. Stand alone switches are split by line size grouping: up to 10,000 lines; 10,000 lines to 60,000 lines, 60,000 lines to 100,000, and over 100,000 lines. Each size switch has a unique fixed or start up cost and a unique per line cost. The start up cost includes central processor frames, billing and data recording equipment and frames, miscellaneous power equipment and back-up power, the main distribution frame, frames for testing, and basic software.

Assumptions for Density

CBG densities are calculated in a three step process. First, the business lines are divided by a user input density adjustment. The default value for the density adjustment is 10 business lines occupying the physical space of one household line. In the second step, the adjusted business lines are summed with the CBG households. Finally, this sum is divided by the square miles of the CBG. This insures that the proper density characteristics are assigned to the CBG.

The BCM2 uses six different density groups to determine characteristics of the plant being used. The six density groups are as follows:

- 0 < and <= 5
- 5 < and <= 200
- 200 < and < 650
- 650 < and <= 850
- 850 < and <= 2,550
- > 2,550

The density groups determine the mixture of aerial and below ground plant, feeder fill factors, distribution fill factors, and the mix of activities in placing plant and the cost per foot to place plant. These are all user adjustable inputs.

Terrain Assumptions

U.S.G.S. data for four terrain characteristics that impact the structure and placing cost of telephone plant are included as inputs to BCM2 by CBG. These terrain variables include depth to water table, depth to bedrock, hardness of bedrock, and the surface soil texture. Combinations of these characteristics determine one of four placement cost levels. The normal placement cost for a density group occurs when neither the water table depth nor the depth to bedrock is within the placement depth for the cable and the surface soil texture does not interfere with plowing activities. The next higher level of placing cost occurs when either the surface soil texture does interfere with normal plowing activities or soft bedrock is within the cable placement depth. The third level of placing difficulty occurs when hard bedrock is within the placement depth of copper cable or fiber cable. The last level of placement cost difficulty occurs when the water table is present within the placing depth of copper or fiber cable.

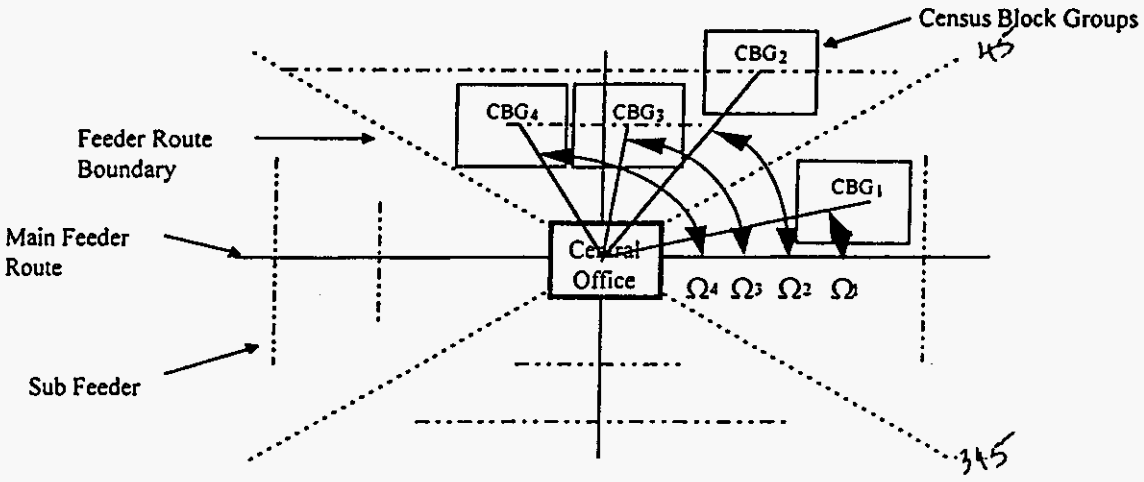
Algorithms to Develop Basic Local Service Costs

Feeder Plant Distance

Typically, each LEC central office has four main feeder routes, radiating out from the central office (BCM2 uses an East, a North, a West, and a South main feeder routes). Branching off from the main feeders are sub-feeders, typically at right angles to the main feeder, giving rise to the familiar tree and branch topology of feeder routes. Subscribers or homes are somewhat randomly spread within the route serving areas. The routes become less densely populated as the distance from the central office increases.

The geographic centers (centroids) of the CBGs may fall in any of the four feeder route serving areas. In order to determine on which of the four main feeder routes (or quadrants) a CBG is served, an angle Ω is calculated. The angle Ω represents the counter-clockwise rotational angle between a line connecting the CBG with the closest central office and a line headed directly east from the central office. This is displayed in the figure below.

Determination of Feeder Quadrant



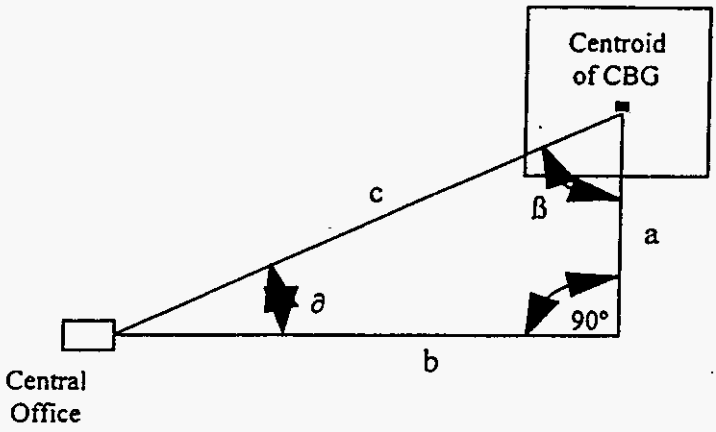
The relationship between the angle Ω and the feeder route is found in the table below:

East Feeder Route (Quadrant 1)	315°	<=	45°
North Feeder Route (Quadrant 2)	45°	<=	135°
West Feeder Route (Quadrant 3)	135°	<=	225°
South Feeder Route (Quadrant 4)	225°	=	315°

To estimate feeder plant costs for a given CBG, the length of the feeder cable from the closest central office to the CBG is approximated. For purposes of simplification, it is assumed that each CBG is square in shape, with the households within the CBG distributed uniformly. As discussed, in CBGs with less than 20 households per square mile, CBG area is reduced to eliminate non-populated areas. Additionally, it is assumed that sub-feeder cable generally ends at the edge of the CBG, unless the CBG boundary overlaps the main feeder route, in which case no sub-feeder plant is used. Thus, calculating the feeder distance becomes a two-step process.

First, an airline distance is calculated using the latitude and longitude of the closest central office and the latitude and longitude of the centroid of the CBG. Next, the airline distance is converted to an equivalent feeder plant route length. This conversion becomes a simple mathematical model.

Feeder Distance Calculation



Airline distance between the central office and CBG centroid = Line c

Angle between Main Feeder Route (Line b) and Line c = α

Main Feeder Route Distance to CBG = Line b = c* cos α

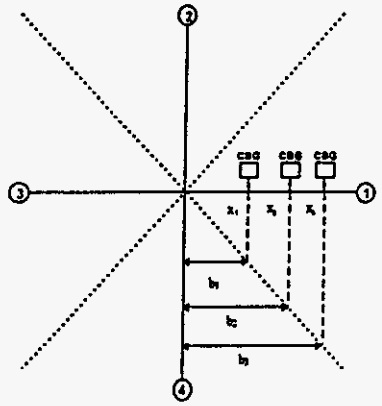
Sub-feeder route distance is calculated in a similar manner, however, the sub-feeder does not extend into the CBG.

The preceding distance calculations may be increased if the minimum or maximum slope measurements for a CBG reach the trigger values. If the slope is greater than the trigger value, then the feeder and sub-feeder distance are increased by a user specified factor.

Shared Feeder Plant Distance

CBGs that are served along a common feeder route share feeder facilities. The BCM2 calculates the distances for the shared feeder segments by calculating the Line b distance described above for each CBG in a quadrant. Once the Line b distances are calculated, the model sorts the CBG data first by central office, then by quadrant, and finally by Line b distance. An example of three CBGs in main feeder quadrant 1 is shown below.

SHARED FEEDER DISTANCE CALCULATION



In this example, there are three feeder segments in quadrant 1, main feeder segment X_1, main feeder segment X_2, and main feeder segment X_3. The formula for calculating the feeder segment distance is:

For n (the number of CBGs within a quadrant) > 1,

Main feeder segment $X_n = b_n - b_{n-1}$

The total feeder distance for a CBG is the sum of main feeder distance and sub-feeder distance.

Cable Capacity and Material Investments for Shared Feeder Plant

The required capacity of a segment of copper feeder plant is determined by the sum of the lines of all CBGs utilizing that particular segment and copper technology. Next, the sum of these lines is divided by the fill factor for the density group associated with the segment. This calculation yields the copper cable capacity required for the segment. The BCM2 then "looks up" the.cable capacity in a table to determine the actual cable size available (and its associated cost per foot) to meet the segment capacity. If the required capacity is greater than the size of the largest available cable, the BCM2 determines the number of maximum size cables and the next size cable to meet the capacity needs of the segment. The copper feeder cable sizes available in the model are 25, 50, 100, 200, 400, 600, 900, 1200, 1800, 2400, 3000, 3600, and 4200 pair.

The required capacity for a segment of fiber feeder plant is determined in a similar manner, however, SLC technology and AFC technology cannot share fiber strands because of differing transmission parameters. For SLC systems, four fibers can carry up to 2,016 voice grade paths. If the segment capacity exceeds this limit, four additional fibers are required for each increment of 2,016 voice grade paths. For AFC systems, four fibers can carry up to 672 voice grade paths. Like SLC, each additional increment of 672 voice grade paths capacity requires an additional four fibers. The voice grade paths are determined by technology by summing the lines by CBG utilizing the particular technology and dividing the sum by the fill factor associated with the density group of the feeder segment.

The total capacity for a fiber feeder segment is the sum of the required SLC fiber strands and required AFC fiber strands. The BCM2 determines the number of maximum size fiber cables and the size of the additional fiber cable to meet the capacity needs of the segment. The fiber feeder cable sizes available in the model are 12, 18, 24, 36, 48, 60, 72, 96, and 144 strands.

Once each feeder segment's cable size and cost per foot is determined, a total material cost is calculated for the segment. This calculation is the material cost per foot multiplied by the number of feet of the feeder segment. Each CBG that utilizes the segment facilities shares the material cost on an equal cost per unit (per line).

Distribution Plant Distances

The design of the plant within a CBG is dependent upon the number of square miles within the CBG, as well as the number of households served within the CBG. First, the CBG is checked to determine if the width of the CBG is greater than twice the maximum copper serving distance (specified by the user). If the width is greater, then the appropriate number of feeder-type legs will be extended into the CBG to sub-divide the area into multiple distribution areas.

The vertical distribution distance per feeder-type leg within the CBG is calculated as width of the CBG divided by the number of feeder-type legs, less two base lot side lengths. The horizontal serving distances for copper facilities within the CBG are calculated as the maximum copper serving distance less one-half the width of the CBG and one base lot side length. However, if the horizontal distances are so large as to require the use of remote terminals on the horizontal legs then the horizontal copper facility distance is calculated as one half the number of base lots between remote terminals multiplied by the base lot side length. Fiber is deployed into the horizontal plant legs when remote terminals are used. In this case, the horizontal plant length is calculated as the width of the CBG, less the distance between remote terminals, less a base side lot length.

Cable Capacity and Material Investments for Distribution Plant

Copper cable and fiber cable capacities for distribution plant are determined in a similar manner as feeder plant. However, distribution plant only provides capacity to serve lines within the CBG. Thus, for distribution plant each of the horizontal plant legs serves an equal portion of the CBG line capacity as do the vertical legs. As with feeder plant the cable sizes (and their cost per foot) deployed by the model are determined by utilizing a "look up" table of the number of lines served by each cable leg (done separately for horizontal and vertical cables) divided by the fill factor for the CBG's specific density group.). The copper distribution cable sizes available in the model are 12, 25, 50,100, 200, 400, 600, 900, 1200, 1800, 2400, 3000, and 3600 pair. The fiber distribution cable sizes available in the model are 12, 18, 24, 36, 48, 60, 72, 96, and 144 strands.

The total distribution cable material investment is calculated as follows for both copper cable and fiber cable:

Distribution Cable Investment = Number of Horizontal Distribution Legs * Horizontal Distribution Distance * Horizontal Cable Cost Per Foot + Number of Vertical Distribution Legs * Vertical Distribution Distance * Vertical Cable Cost Per Foot

Structure and Placement Costs

Structure and the cost of placing plant include the costs of poles, conduit, innerduct, etc., and the capitalized costs of installing cable and wire facilities plant. The BCM2 uses a cost per foot for structure that varies by plant type, terrain, and density group. It represents the cost of structure and placing the smallest size cables. Each density group and terrain difficulty reflects a different mix of placing activities and structures. The basic structure calculations are done outside the BCM2. Following is an example of the calculations for below ground plant for the three different levels of terrain difficulty associated with the 650 to 850 Households per Sq. Mi. density group.

		650-850 Normal	
Activity	$/FT	% of Activity

			14.51

The tables above display the development of a weighted cost per foot for below ground structure. The first column shows the activity. The second column displays the cost per foot of the activity in that row. The cost per foot data used as the default values in the BCM2 are based on a national average of available

contractor prices for that activity. The third column displays the percent of the activity in the specific density group and terrain difficulty. The final column represents the multiplication of the cost per foot and the percent occurrence of the activity. The final weighted average above is the sum of specific activity prices times the percent occurrence.

The Cost Factor Table in the BCM2 includes a weighted average structure cost per foot for below ground plant and aerial plant. This table includes separate entries for distribution plant, copper feeder plant, and fiber feeder plant by density group by terrain difficulty. Structure costs are adjusted for cable size in the structure cost calculations. As copper cable sizes increase, there are additional handling costs because each cable reel holds less cable. The BCM2 structure costs recognizes these additional handling costs separately for three copper cable size groupings: 600 - 900 pair, 1200 pair, and 1800 pair and above. Additional handling costs for fiber cables are less pronounced and only occur with fiber cables of 72 fiber strands or more. The final element of the structure and placement cost is the cost to pull the largest size cables through conduit. The structure cost calculation follows:

Structure Cost = Density Group Terrain Specific Cost Per Foot * Cable Length * Cable Size Factor + Number of Maximum Size Cables * Cost Per Foot to Pull Underground Cable Through Conduit

Switch Equipment Investments

Switching investments are calculated based on current central office locations as reported in the LERG. Investments are calculated using generic digital switch investments for five sizes of switch. The BCM2 categorizes the switch at each location either as a remote (if designated as a remote switch in the LERG) or by the number of CBG lines, both residence and business associated with the switch location. The total switching plus interoffice investment per line is calculated as follows:

Location Specific Fixed Costs Per Line =

((Fixed Cost for Specific Remote/Line Size) * (NTS % of Switch + (1 - NTS % of Switch) * (% Local DEM)) / Lines at Location

Total Switch and Inter-Office Investment Per Line =

Land & Building Factor * Switch Equip Discount * Switch Engineering Factor * Switch InterOffice Investment Ratio * (Fixed Switch Cost Per Line + Switch Size Specific Per Line Cost)

Circuit Equipment Investments

The BCM2 uses SLC and AFC digital loop carrier equipment investments split between the fixed costs of the remote terminal and digital loop carrier costs that vary by line. The fixed remote terminal costs include the optical line interface units, software, cabinet, power, and the access resource manager common card kit. The per line component includes the line card and shelves at the remote terminal, as well as all the components of the central office terminal.

The circuit equipment investments by CBG are developed through the use of a "look up" table which provides the appropriate fixed terminal cost for the number of lines using the terminal, as well as the cost per line for the individual terminal size. When these investments are found in the table, the discount factor is applied, as well as the engineering and installation factor.

Annual Cost Factors

Throughout the BCM2 process, all cost calculations are derived in terms of investment. In order to determine a monthly cost for basic local service by CBG, the BCM2 uses both investment related expense factors and line related expense factors.

The investment related factors are developed separately for three plant categories: cable and wire facilities, switching equipment, and circuit equipment. For each of these three investment categories, 1995 ARMIS data is used to derive the historical ratio of certain investment related expenses to the gross investment for the plant category. The expense categories include:

Return on Investment at 11.25 %
FIT, State, and Local Taxes
Plant Specific Expenses
Plant Non-Specific Expenses
Depreciation/Amortization

Using national 1995 ARMIS data the historical booked expenses were developed. Thus, the factors reflect the historical maintenance expense to investment relationship as well as regulatory-approved depreciation lives. These factors are user adjustable. The BCM2 default values for the three plant category annual cost factors are:

Cable & Wire	.23276
Circuit Equipment	.24241
Switching Equipment	.25703

The expenses that vary based on the number of lines includes customer operations - marketing, customer operations - services, corporate operations, and other depreciation/amortization. This cost per line is also developed from 1995 ARMIS. This annual cost per line is $133.39. The BCM2 uses an allocation factor to associate non-plant related expenses to local service. Both the annual cost per line and the allocation factor are user adjustable. The BCM2 default value for the allocation factor is .75.

User Adjustable Inputs

Nearly all the variables included in the BCM2 are user adjustable. U S WEST and Sprint have set default values for the inputs at levels that they feel represent forward-looking practices for the deployment of basic local telephone service. Attachment A is a map of the User Inputs and Tables. This map indicates where specific input tables are located on the Input Tables worksheet.

Below are listed the BCM2's user inputs. Following the user input list are user adjustable tables used in the calculations of investments.

USER INPUTS TO MODEL

Variable	Value	Description
NormalUGDepth	24	Normal Placement Depth in inches for Buried/Underground Copper Cable
NormalFiberDepth	36	Normal Placement Depth in inches for Buried/Underground Fiber
CriticalWaterDepth	3	Depth in feet at which water impacts placement costs
WaterFactor	30	% Cost increase for presence of water within critical depth
ResLinesMultiplier	1.21	Residence Lines per household multiplier
MaxFiberSize	144	Maximum Fiber Cable Size
MaxFeederSize	4200	Maximum Copper Feeder Cable Size
Max DistSize	3600	Maximum Copper Distribution Cable Size
CprMaxDistr	12000	Maximum length of copper cable in the CBG distribution area
NewTerrainTrigger	5	Value that triggers new terrain variable multiplier
NewTerrainFactor	1	Cost multiplier when new terrain variable exceeds trigger point
MinSlopeTrigger	12	Point at which minimum slope effects placement distance

MinSlopeFactor	1.1	Change in distance due to increased average slope
MaxSlopeTrigger	30	Point where presence of very high slope causes yet more cable distance
MaxSlopeFactor	1.05	Change in distance due to a maximum only slope presence
CombSlopeFactor	1.2	Secondary change in distance due to substantial slope presence
EngrInstall	35	Engineering and installation loading factor for electronics
ElectronicFill	0.85	Fill Factors for Electronics
HiCapFill	0.95	Fill Factors for High Capacity Optic Multiplexers
SpecAccRatio	0.13	Ratio of Special Access Lines to Business and Special Access
DensAdjUnits	10	Average Number of Business lines per location
OpticsCost	162000	Average cost for each DS-3 for CO and field DS3 to DS1 multiplexers
CopperT1	1133	Average Cost per DS-1 on copper (both terminals & repeater)
InterofficeSwRatio	1.03	Multiplier to add interoffice trunking cost
	20	Digital Switching Discount % (Enter whole %)
	20	Fiber Cable Discount % (Enter whole %)
	20	Copper Cable Discount % (Enter whole %)
	10	AFC Electronics Discount % (Enter whole %)
	20	SLC Electronics Discount % (Enter whole %)
DropCostPerFoot	0.1	Drop Cost per FT
PedestalCost	48.22	Cost of Pedestal
NidCost	30	Cost per NID
Input Variables for switching and overheads[1]		
SwitchEngrFactor	1.07	Loading Factor for Switch Engineering
SwitchFillFactor	0.8	Switch Fill Factor
SwLandBldgFactor	1.043	Sw Land & Building Factor
NonTrfSen	70.00%	% Non Traffic Sensitive (Enter as decimal)
TrfSen	73.93%	% of Traffic Sensitive that is local (Enter as decimal)
OSPEngrFactor	1.05	Loading Factor for Outside Plant Engineering
FiberSpliceRatio	0.045	Loading Factor for splicing of fiber cable (Enter as decimal)
FiberInLineRatio	0.07	Additive for in line pedestals, cross connects, etc. (fiber)
CopperSpliceRatio	0.07	Loading Factor for splicing of copper cable (Enter as decimal)
CopperInLineRatio	0.1	Additive for in line pedestals, cross connects, etc. (Copper)
CableWireFactor1	0.23276	Factor 1 for cable & Wire Facilities
ElectronicsFactor1	0.24241	Factor 1 for circuit Facilities
SwitchingFactor1	0.25703	Factor 1 for Switching facilities
OtherFactor1	133.391	Factor 1 for other loading per line served
OtherAllocRatio1	0.75	Allocation Factor 1 applied to non-plant related expenses

CableWireFactor2	0.23276	Factor 2 for cable & Wire Facilities
ElectronicsFactor2	0.24241	Factor 2 for circuit Facilities
SwitchingFactor2	0.25703	Factor 2 for Switching facilities
OtherFactor2	133.391	Factor 2 for other loading per line served
OtherAllocRatio2	0.45	Allocation Factor 2 applied to non-plant related expenses
CprSizeFctr1	1.2	Structure Cost multiplier for cables 401 to 900 pr versus < 400 pr
CprSizeFctr2	1.3	Structure Cost multiplier for cables 901 to 1500 pr versus < 400 pr
CprSizeFctr3	1.4	Structure Cost multiplier for cables 1501 to max size versus < 400 pr
FbrSizeFctr	1.2	Structure Cost Multiplier for fiber cables >60 fibers versus < 60 fibers
UGPullCost	0.77	Cost per ft to pull UG cables into conduit duct

Miscellaneous Calculations (Do not change any value!)		
AfcDiscount	0.9	AFC Pricing ratio after Discount
SlcDiscount	0.8	SLC Pricing ratio after Discount
FiberCostRatio	0.8	Fiber cable cost factor
CopperCostRatio	0.8	Copper Cable Cost factor
SwitchingCostRatio	0.8	Digital Switching cost ratio after discount
OptionalBenchMark		Optional Benchmark to replace 80
LoopInvCap	10000	Loop Investment Cap
Breakpoint	12000	Fiber/Copper breakpoint

Miscellaneous Notes

1. Switching costs are entered as a fixed cost per switch plus the per line additive. Both costs must be included to accurately reflect switching costs. The fixed cost will be converted to a per line cost and added to the per line additive to determine final switching cost per line. Costs are in the switch cost matrix above and to the right. The % Non traffic sensitive is applied to the fixed cost portion of the switch.

TABLES

Surface Type	
RockH	=Hard rock above plowing depth - requires dynamite or rock saw to place
RockS	=Soft rock above plowing depth - requires more costly trenching, backhoeing, etc.
Normal	=Straight plowing with minimal surface impact

STUDY INPUTS

The following pages are the user inputs which are required to run the BCM2 cost model. These inputs were developed by subject matter experts in Sprint's headquarters with input from Sprint-Florida subject matter experts.

USER INPUTS TO MODEL

Variable	Value	Description
NormalUGDepth	24	Normal Placement Depth in inches for Buried/Underground Copper Cable
NormalFiberDepth	36	Normal Placement Depth in inches for Buried/Underground Fiber
CriticalWaterDepth	3	Depth in feet at which water impacts placement costs
WaterFactor	30	% Cost increase for presence of water within critical depth
ResLinesMultiplier	1.21	Residence Lines per household multiplier
MaxFiberSize	144	Maximum Fiber Cable Size
MaxFeederSize	4200	Maximum Copper Feeder Cable Size
Max DistSize	3600	Maximum Copper Distribution Cable Size
CprMaxDistr	12000	Maximum length of copper cable in the CBG distribution area
NewTerrainTrigger	5	Value that triggers new terrain variable multiplier
NewTerrainFactor	1	Cost multiplier when new terrain variable exceeds trigger point
MinSlopeTrigger	12	Point at which minimum slope effects placement distance
MinSlopeFactor	1.1	Change in distance due to increased average slope
MaxSlopeTrigger	30	Point where presence of very high slope causes yet more cable distance
MaxSlopeFactor	1.05	Change in distance due to a maximum only slope presence
CombSlopeFactor	1.2	Secondary change in distance due to substantial slope presence
EngrInstall	35	Engineering and installation loading factor for electronics
ElectronicFill	0.85	Fill Factors for Electronics
HiCapFill	0.95	Fill Factors for High Capacity Optic Multiplexers
SpecAccRatio	0.13	Ratio of Special Access Lines to Business and Special Access
DensAdjUnits	10	Average Number of Business lines per location
OpticsCost	162000	Average cost for each DS-3 for CO and field DS3 to DS1 multiplexers
CopperT1	1133	Average Cost per DS-1 on copper (both terminals & repeater)
InterofficeSwRatio	1.03	Multiplier to add interoffice trunking cost
	20	Digital Switching Discount % (Enter whole %)
	20	Fiber Cable Discount % (Enter whole %)
	20	Copper Cable Discount % (Enter whole %)
	10	AFC Electronics Discount % (Enter whole %)
	20	SLC Electronics Discount % (Enter whole %)
DropCostPerFoot	0.1	Drop Cost per FT
PedestalCost	48.22	Cost of Pedestal
NidCost	30	Cost per NID
Input Variables for switching and overheads[1]		
SwitchEngrFactor	1.07	Loading Factor for Switch Engineering
SwitchFillFactor	0.8	Switch Fill Factor
SwLandBldgFactor	1.043	Sw Land & Buliding Factor
NonTrfSen	70.00%	% Non Traffic Sensitive (Enter as decimal)
TrfSen	73.93%	% of Traffic Sensitive that is local (Enter as decimal)
OSPEngrFactor	1.05	Loading Factor for Outside Plant Engineering
FiberSpliceRatio	0.045	Loading Factor for splicing of fiber cable (Enter as decimal)
FiberInLineRatio	0.07	Additive for in line pedestals, cross connects, etc. (fiber)
CopperSpliceRatio	0.07	Loading Factor for splicing of copper cable (Enter as decimal)
CopperInLineRatio	0.1	Additive for in line pedestals, cross connects, etc. (Copper)
CableWireFactor1	0.2595	Factor 1 for cable & Wire Facilities
ElectronicsFactor1	0.2738	Factor 1 for circuit Facilities
SwitchingFactor1	0	Factor 1 for Switching facilities
OtherFactor1	0	Factor 1 for other loading per line served
OtherAllocRatio1	1	Allocation Factor 1 applied to non-plant related expenses
CableWireFactor2	0	Factor 2 for cable & Wire Facilities
ElectronicsFactor2	0	Factor 2 for circuit Facilities
SwitchingFactor2	0	Factor 2 for Switching facilities
OtherFactor2	0	Factor 2 for other loading per line served
OtherAllocRatio2	0.45	Allocation Factor 2 applied to non-plant related expenses
CprSizeFctr1	1.2	Structure Cost multiplier for cables 401 to 900 pr versus < 400 pr
CprSizeFctr2	1.3	Structure Cost multiplier for cables 901 to 1500 pr versus < 400 pr
CprSizeFctr3	1.4	Structure Cost multiplier for cables 1501 to max size versus < 400 pr
FbrSizeFctr	1.2	Structure Cost Multiplier for fiber cables >60 fibers versus < 60 fibers
UGPullCost	0.77	Cost per ft to pull UG cables into conduit duct

Miscellaneous Calculations (Do not change any value!)

AfcDiscount	0.9	AFC Pricing ratio after Discount
SlcDiscount	0.8	SLC Pricing ratio after Discount
FiberCostRatio	0.8	Fiber cable cost factor
CopperCostRatio	0.8	Copper Cable Cost factor
SwitchingCostRatio	0.8	Digital Switching cost ratio after discount
OptionalBenchMark		Optional BenchMark to replace 80
LoopInvCap	10000	Loop Investment Cap
Breakpoint	12000	Fiber/Copper breakpoint

Miscellaneous Notes

1. Switching costs are entered as a fixed cost per switch plus the per line additive.

Both costs must be included to accurately reflect switching costs. The fixed cost will be converted to a per line cost and added to the per line additive to determine final switching cost per line. Costs are in the switch cost matrix above and to the right. The % Non traffic sensitive is applied to the fixed cost portion of the switch.

TABLES

Surface Type	
RockH	=Hard rock above plowing depth - requires dynamite or rock saw to place
RockS	=Soft rock above plowing depth - requires more costly trenching, backhoeing, etc.
Normal	=Straight plowing with minimal surface impact

USER INPUTS TO MODEL

Variable	Value	Description
NormalUGDepth	24	Normal Placement Depth in inches for Buried/Underground Copper Cable
NormalFiberDepth	36	Normal Placement Depth in inches for Buried/Underground Fiber
CriticalWaterDepth	3	Depth in feet at which water impacts placement costs
WaterFactor	30	% Cost increase for presence of water within critical depth
ResLinesMultiplier	1.21	Residence Lines per household multiplier
MaxFiberSize	144	Maximum Fiber Cable Size
MaxFeederSize	4200	Maximum Copper Feeder Cable Size
Max DistSize	3600	Maximum Copper Distribution Cable Size
CprMaxDistr	12000	Maximum length of copper cable in the CBG distribution area
NewTerrainTrigger	5	Value that triggers new terrain variable multiplier
NewTerrainFactor	1	Cost multiplier when new terrain variable exceeds trigger point
MinSlopeTrigger	12	Point at which minimum slope effects placement distance
MinSlopeFactor	1.1	Change in distance due to increased average slope
MaxSlopeTrigger	30	Point where presence of very high slope causes yet more cable distance
MaxSlopeFactor	1.05	Change in distance due to a maximum only slope presence
CombSlopeFactor	1.2	Secondary change in distance due to substantial slope presence
EngrInstall	35	Engineering and installation loading factor for electronics
ElectronicFill	0.85	Fill Factors for Electronics
HiCapFill	0.95	Fill Factors for High Capacity Optic Multiplexers
SpecAccRatio	0.13	Ratio of Special Access Lines to Business and Special Access
DensAdjUnits	10	Average Number of Business lines per location
OpticsCost	162000	Average cost for each DS-3 for CO and field DS3 to DS1 multiplexers
CopperT1	1133	Average Cost per DS-1 on copper (both terminals & repeater)
InterofficeSwRatio	1.03	Multiplier to add interoffice trunking cost
	20	Digital Switching Discount % (Enter whole %)
	20	Fiber Cable Discount % (Enter whole %)
	20	Copper Cable Discount % (Enter whole %)
	10	AFC Electronics Discount % (Enter whole %)
	20	SLC Electronics Discount % (Enter whole %)
DropCostPerFoot	0.1	Drop Cost per FT
PedestalCost	48.22	Cost of Pedestal
NidCost	30	Cost per NID
Input Variables for switching and overheads[1]		
SwitchEngrFactor	1.07	Loading Factor for Switch Engineering
SwitchFillFactor	0.8	Switch Fill Factor
SwLandBldgFactor	1.043	Sw Land & Buliding Factor
NonTrfSen	70.00%	% Non Traffic Sensitive (Enter as decimal)
TrfSen	73.93%	% of Traffic Sensitive that is local (Enter as decimal)
OSPEngrFactor	1.05	Loading Factor for Outside Plant Engineering
FiberSpliceRatio	0.045	Loading Factor for splicing of fiber cable (Enter as decimal)
FiberInLineRatio	0.07	Additive for in line pedestals, cross connects, etc. (fiber)
CopperSpliceRatio	0.07	Loading Factor for splicing of copper cable (Enter as decimal)
CopperInLineRatio	0.1	Additive for in line pedestals, cross connects, etc. (Copper)
CableWireFactor1	0.2595	Factor 1 for cable & Wire Facilities
ElectronicsFactor1	0.2738	Factor 1 for circuit Facilities
SwitchingFactor1	0	Factor 1 for Switching facilities
OtherFactor1	0	Factor 1 for other loading per line served
OtherAllocRatio1	1	Allocation Factor 1 applied to non-plant related expenses
CableWireFactor2	0	Factor 2 for cable & Wire Facilities
ElectronicsFactor2	0	Factor 2 for circuit Facilities
SwitchingFactor2	0	Factor 2 for Switching facilities
OtherFactor2	0	Factor 2 for other loading per line served
OtherAllocRatio2	0.45	Allocation Factor 2 applied to non-plant related expenses
CprSizeFctr1	1.2	Structure Cost multiplier for cables 401 to 900 pr versus < 400 pr
CprSizeFctr2	1.3	Structure Cost multiplier for cables 901 to 1500 pr versus < 400 pr
CprSizeFctr3	1.4	Structure Cost multiplier for cables 1501 to max size versus < 400 pr
FbrSizeFctr	1.2	Structure Cost Multiplier for fiber cables >60 fibers versus < 60 fibers
UGPullCost	0.77	Cost per ft to pull UG cables into conduit duct

Miscellaneous Calculations (Do not change any value!)

AfcDiscount	0.9	AFC Pricing ratio after Discount
SlcDiscount	0.8	SLC Pricing ratio after Discount
FiberCostRatio	0.8	Fiber cable cost factor
CopperCostRatio	0.8	Copper Cable Cost factor
SwitchingCostRatio	0.8	Digital Switching cost ratio after discount
OptionalBenchMark		Optional BenchMark to replace 80
LoopInvCap	10000	Loop Investment Cap
Breakpoint	12000	Fiber/Copper breakpoint

Miscellaneous Notes

1. Switching costs are entered as a fixed cost per switch plus the per line additive.

84

Both costs must be included to accurately reflect switching costs. The fixed cost will be converted to a per line cost and added to the per line additive to determine final switching cost per line. Costs are in the switch cost matrix above and to the right. The % Non traffic sensitive is applied to the fixed cost portion of the switch.
