- Drug screen

C. Rejection Criteria to Disqualify Candidates for Assignment

The decision by Consultant to disqualify a candidate for assignment shall be based upon consideration of all relevant information, favorable and unfavorable, as to whether the assignment would be clearly consistent with the necessity to maintain an environment conducive to a safe work place.

To assist in making appropriate determinations, this matrix identifies several types of adverse information. These are not all-inclusive, but contain many of the factors, which may raise legitimate questions to a person's eligibility for assignment.

1. Criminal Charges

a. Criminal Charges Pending

"Pending" is defined as awaiting formal review by the court to determine the disposition of the arrest. All pending charges will be evaluated on a case by case basis; however pending charges which may meet Progress Energy's criteria for disqualification if convicted will normally preclude an acceptable recommendation.

Charges which result in a disposition of adjudication withheld, nolle pross, pre-trial intervention, prayer for judgment continued or are otherwise unadjudicated shall be evaluated on a case by case basis. This evaluation shall focus on the status of the charge, and the behavior or incident which resulted in the charge being made, and the effect on an applicant's trustworthiness and reliability.

b. Felony Convictions

CRITERIA FOR REJECTION	ACTIONS TO BE CONSIDERED
Any felony conviction with in the last five years	Not eligible for assignment for five years from the date of conviction.
Persons on active probation/parole or a work furlough program for a felony conviction or participating in court diversion program for charges which would meet rejection criteria. (Ex. Pre-trial intervention and deferred prosecution).	Not eligible for assignment until completion of probation or parole or court diversion program. Eligibility must also comply with criteria above. (As if convicted)
Failure to fulfill a court order (i.e. failure to appear) for any felony conviction.	Not eligible for assignment until disposition of court order is completed.

c. Misdemeanor Convictions

Multiple misdemeanor convictions demonstrate a pattern of continued disregard for the laws of the land. Such disregard without adequate evidence of rehabilitation raises doubt as to the person's reliability and trustworthiness.

CRITERIA FOR REJECTION	ACTIONS TO BE CONSIDERED
Any misdemeanor conviction within the last five years involving illegal drugs (includes individuals currently serving a court-ordered diversion program)	Not eligible for assignment for five years from date of last conviction.
Any misdemeanor conviction within the last year involving violence or theft.	Not eligible for assignment for one year from the date of conviction.
Two or more misdemeanor convictions (excluding infractions [i.e. speeding and non-moving violations]) within the last five years. For example, convictions in 11/2005, and 11/2006 not eligible until 11/2010	Not eligible for assignment for five years from the date of earliest conviction.
Persons on active probation/parole or a work furlough program for a misdemeanor conviction or participating in court diversion program for charges which would meet rejection criteria. (Ex. Pre-trial intervention and deferred prosecution).	Not eligible for assignment until completion of probation or parole or court diversion program. Eligibility must also comply with criteria above. (As if convicted)
Failure to fulfill a court order (i.e. failure to appear) for any misdemeanor conviction	Assignment may not be recommended based on the severity of the court order.

2. Other

CRITERIA FOR REJECTION	ACTIONS TO BE CONSIDERED
One drug test failure	Not eligible for assignment for 5 years.
Evidence or admission of use, possession or sale of illegal substances	Not eligible for assignment for 5 years from the most recent occurrence.
The refusal to participate in drug testing	Not eligible for assignment.
Attempted to subvert the testing process, or has shown in anyway to have altered a specimen provided for testing	Not eligible for assignment for 5 years.
Theft of company property from past employer	Not eligible for assignment for 3 years from the most recent occurrence.
Any other information that would adversely reflect upon the reliability and trustworthiness of the person as it relates to their assignment to Progress Energy	Not eligible for assignment – eligible to reapply determined on a case by case basis.

D. Drug Screen

All candidates who will require a BI will also be required to have a Pre-assignment Drug Screen. Consultant must have all drug screens completed prior to the start of Work or in the case of emergencies, may be permitted to start Work while the screens are being conducted. (All drug screens must be completed within 10 working days of starting work.)

A certified Health and Human Services Laboratory must perform all drug testing. Only workers whose test result is determined to be negative are eligible to work on Owner controlled property. In addition, individuals that refuse to participate in drug testing, attempt to subvert the testing process, or are shown in any way to have altered a specimen provided for drug testing are not eligible to work under this Contract.

Owner will reimburse Consultant a reasonable and customary amount for performing pre-assignment drug screens unless Work is performed on a firm fixed price basis. Owner shall not be obligated to reimburse Consultant for any Drug Screen expense for individuals who fail to meet the minimum acceptable qualifications.

The drug screening for the substances below and the testing levels generally follow the Department of Transportation Guidelines. Laboratories that use lower cut off levels for drugs or Metabolite than those listed below are acceptable by Owner.

1. Drug Testing Cut Off Concentrations for Screening and Confirmation Levels

Type of Drug or Metabolite	Initial Test	Confirmation Test
Marijuana Metabolites	50	15
Cocaine Metabolites (Benzoylecgonine)	300	150
Phencyclidine (PCP)	25	25
Amphetamines	1000	
Amphetamine		500
Methamphetamine		500 (specimen must also contain amphetamine at a concentration of greater than or equal to 200 ng/ml.)
Opiate metabolites	2000	
Codeine		2000
Morphine		2000
6-monacetylmorphine (6-MAM)		10 (Test for 6-MAM in the specimen. Conduct this test only when specimen contains morphine at a concentration greater than or equal to 2000 ng/ml.)

2. Specimen Collection

The specimen must be collected by trained and qualified collectors and collected under conditions that protect the integrity of the specimen. Laboratory patient service centers and Doctor's Urgent Care are suggested for collection purposes.

SECTION 31. WORKPLACE VIOLENCE PREVENTION

Owner strives to provide a workplace for a worker that is free from physical attack, threats of violence and menacing or harassing behaviors.

Owner will not tolerate any unwanted or hostile physical contact, including physical attack, threat of violence, harassment, or damage of property by or against any worker including Owner employees.

Any worker who experiences, witnesses, or has knowledge of acts, conduct, behavior, or communication (threat) that may constitute or may lead to a workplace violence event should immediately report the incident to any of the following:

- Consultant Supervisor or Owner supervisor or manager, AND
- Corporate Security 1-888-275-4357 or

- The Ethics Line at 1-866-8Ethics (1-866-838-4427)

SECTION 32. LIMITATION OF LIABILITY

Consultant's liability of Owner's damages will in the aggregate, not exceed $2,000,000. This provision takes precedence over any conflicting provision of this Contract. This limitation of liability will apply whether Consultant's liability arises under breach of contract or warranty; tort, including negligence; strict liability; or any other causes of action, and shall include Consultant's officers, affiliated corporations, employees and subcontractors.

In no event shall CH2M HILL, its affiliated corporations, officers, employees, or any of its subcontractors be liable for any punitive, economic or consequential damages, including but not limited to loss of revenue or profits, suffered or incurred by the Client or any of its agents, including other contractors engaged at the project site, as a result of this Agreement or CH2M HILL's performance or non-performance of services pursuant to this Agreement. Limitations of liability provided in this paragraph apply whether the liability is claimed to arise in contract, tort (including negligence), strict liability, or otherwise. This limitation of liability does not apply to Sections 13, 19 or 22 of this contract.

The parties execute this Contract by their signature or the signature of their authorized agents.

Raleigh, NC 27602

Subject: Progress Energy Greenhouse Gas (GHG) Inventory Assistance
Request No. CPS-0001LB; Contract #349635 – Change Notification

Dear Kristin,

Per your request, CH2M HILL is pleased to present Progress Energy Services Company, LLC (Progress Energy) with a change notification to request additional funding to complete a revised approach to the original scope of work under the above referenced Progress Energy Request and contract number.

Progress Energy originally contracted with CH2M HILL in November 2007 to support development of an entity-wide greenhouse gas (GHG) inventory (Contract No. 349635). The Scope of Work provided in the original contract included development of a detailed analysis of direct and indirect GHG emissions for all of the six major GHGs (CO_2, CH_4, N_2O, PFCs, HFCs, and SF_6). The following tasks were specified:

Task 1 **Develop GHG Inventory Management Plan (IMP).** The GHG Inventory Plan will define the scope of work, roles and responsibilities, project timeline, resource needs for data collection and deliverables. It will also capture key decisions that will be required early in the project, such as operational boundaries; identification of sources that will be included and excluded in the inventory; years to be included for data collection; and the inventory protocol.

Task 2 **Collect Data.** Identified field resources will develop a comprehensive list of GHG emissions sources and will collect operational data required to support the emissions calculations.

Task 3 **Calculate GHG Emissions.** GHG emissions will be calculated and documented on an Excel spreadsheet for each year selected in the GHG Inventory Plan. Benefits from completed or ongoing emissions reductions projects will also be calculated. Once the inventory has been generated, potential de minimis sources will be identified and a baseline will be established. For each source, the spreadsheet will indicate the quality of the calculation or estimation methodology used and an explanation of why this approach was chosen.

Task 4 **Establish Ongoing Implementation Strategy.** The GHG Inventory Core Team will develop the ongoing strategy for collecting, calculating and documenting the annual GHG emissions inventory and carbon offsets. The recommended strategy will be documented for internal management review.

Specific deliverables to be completed under the four tasks were:

1. Conduct an Objectives Workshop/Kickoff Meeting (includes draft and final agenda and presentations)
2. Conduct an Inventory Development Planning Meeting (data gathering planning)
3. Conduct technical approach meetings (two)
4. Develop data collection plan and tool (includes draft and final tool)
5. Provide data gathering technical support
6. Conduct a data gap review (includes summary and review meeting)
7. Develop IMP (includes draft and final Plan)
8. Complete entity-wide GHG emissions inventory (includes draft and final quantification tool)
9. Assist with development of on-going strategy development

As of June 1, 2008, the current budget of $78,900 has been expended with the completion of deliverables 1, 2, 3, 4, and 5 and the partial completion of deliverables 7 and 8. Due to the large amounts of data reviewed and processed for not only the generating facilities, but also the non-generating facilities and the level of technical support rendered deliverables 6 and 9 have not been initiated under the current budget.

To facilitate the completion of the project, additional funding is needed. This change notice serves to document a revised approach to completing the original scope of work (under either of two options provided by Progress Energy) and the additional funding required. We propose the following actions as outlined in the attached revised scope of work. The budget for these two options is also included.

If you have any questions, please feel free to contact me at 314.335.3015 or Jamiyo Mack at 703.376.5180.

Sincerely,
CH2M HILL

Enclosures

Revised Scope of Work

Option 1 - Limited Consultant Support Approach

Under this option, Progress Energy will bear the responsibility of performing the emissions calculations for the development of the corporate-wide inventory (deliverable 8) using the emissions quantification tool/template created by CH2M HILL.

Specifically, Progress Energy will provide CH2M HILL with several sets of spreadsheets (i.e. a model generating plant, a model set of non-generating facilities, and distribution and transmission sources) populated with source and operational data representative of that collected to-date from these entities. CH2M HILL will finalize the draft GHG emissions calculation template based upon the data provided in these spreadsheets. Progress Energy personnel will complete the development of the facility-based GHG emissions inventories by populating the template with the actual data collected from the generating plants, facilities, and other sources in the data collection forms developed under deliverable 5. Progress Energy personnel will also generate the corporate-wide roll-up of emissions. CH2M HILL will be available for periodic consultation and technical support on emission estimation methodology and the data aggregation approach as well as provide a QA/QC review of the populated emissions quantification spreadsheet.

For deliverable 6, Progress Energy will lead the effort to identify and address data gaps as needed to complete the corporate-wide inventory and finalize the IMP (deliverable 7). CH2M HILL will provide technical support and QA/QC review for the development of the final IMP.

For deliverable 9, Progress Energy will develop an ongoing strategy for annual inventory development. CH2M HILL will be consulted during the development of the strategy for the purpose of review and comment. CH2M HILL expects to spend no more than 10 hours of time on this task.

Assumptions:

- Deliverables will be submitted electronically

Deliverables:

- Final emissions quantification tool/template in Microsoft Excel

Option 2 - Full Consultant Services Approach

Under this option, CH2M HILL will finalize the draft GHG emissions calculation tool/template for developing the corporate-wide inventory (deliverable 8). Progress Energy will provide CH2M HILL with several sets of spreadsheets (i.e. a model generating plant, a model set of non-generating facilities, and distribution and transmission sources) populated with source and operational data representative of that collected to-date from these entities in order to complete the template.

Upon completion of the tool, CH2M HILL will review the emissions quantification tool with Progress Energy personnel for agreement on methodology. Progress Energy will provide CH2M HILL with the completed data collection sheets from the generating plants, non-generating facilities, and distribution and transmission sources. CH2M HILL will complete the facility-based emissions inventory by populating the calculation tool/template with the actual data from the generating plants, facilities, and other sources. CH2M HILL will generate the

entity-wide roll-up of emissions. CH2M HILL will complete a QA/QC review of the populated emissions quantification spreadsheet.

For deliverable 6, CH2M HILL will complete a data gaps analysis of the data and information received. Progress Energy will lead the effort to address the data gaps, if possible, and provide feedback to CH2M HILL. CH2M HILL will provide technical support during the period in which Progress Energy personnel are addressing the data gaps. After data gaps have been addressed, CH2M HILL will finalize the draft IMP developed under deliverable 7 based upon the information received from Progress Energy personnel.

Under deliverable 9, Progress Energy will develop an ongoing strategy for annual inventory development. CH2M HILL will provide technical support during the development of the strategy for the purpose of review and comment. CH2M HILL has estimated to spend no more than 10 hours of time on this activity.

[redacted]

Deliverables:

- Final emissions quantification tool/template in Microsoft Excel
- Data gaps analysis summary in Microsoft Excel
- Final IMP in Microsoft Word
- Final corporate-wide GHG emissions inventory in Microsoft Excel

Schedule

CH2M HILL expects to proceed with the revised scope of work immediately upon being notified of the accepted option by Progress Energy. Option 1 would be completed four weeks after the notice to proceed. Option 2 is anticipated to conclude by August 31, 2008 if final facility-level data is submitted no later than June 30, 2008.

PEF's Response to Staff's Fourth Request for Production of Documents (Nos. 5 - 6)

BEFORE THE PUBLIC SERVICE COMMISSION

In re: Environmental Cost Recovery Clause	Docket No. 080007-EI
	Dated: September 23, 2008

PROGRESS ENERGY FLORIDA'S RESPONSE TO STAFF'S FOURTH REQUEST FOR PRODUCTION OF DOCUMENTS (NOS. 5-6)

PROGRESS ENERGY FLORIDA, INC. ("PEF"), pursuant to Rule 28-106.206, Florida Administrative Code, Rule 1.350, Florida Rules of Civil Procedure, and the Order Establishing Procedure in this matter, hereby responds to Staff's Fourth Request for Production of Documents (Nos. 5-6):

RESPONSES

5. **Please refer to the testimony and exhibits of Lori Cross dated August 4, 2008. Please provide a schedule that shows the capital structure, components, and cost rates relied upon for calculating the revenue requirement rate of return. Please include in this schedule the derivation of debt and equity components used in the Return on Average Net Investment, lines 7 (a) and (b), on Form 42-8E. Please cite all sources and include the rationale for using the particular capital structure and cost rates.**

Response: See Attachment 5-1.

6. **Please refer to the testimony and exhibits of Lori Cross dated August 4, 2008. Please provide a reconciliation, explanation, and possible corrected pages for 1, 2, 7, and 9 of forms 42-8E. Please cite all sources and include the rationale for using the particular capital structure and cost rates. (Pages 1 & 2 have an unexplained "Other" amount for Line 7c and pages 7 & 9 contain an unexplained difference for the amount on Lines 7a/7b on May 2008 and May-December 2008, respectively).**

Response: A reconciliation was performed in May 2008 to ensure that the depreciation rates that were being utilized on the ECRC schedules agreed to the plant accounting system. All of the ECRC asset depreciation rates agreed to the plant system except for the two exceptions noted below for Page 1 and Page 7.

Page 1: The Pipeline Integrity Management (PIM) program (42-8E page1), had two assets (Alderman Road Fence and Pipeline Leak Detection) that were in-service and both being depreciated using a 3.07% rate. This rate agreed to the plant system for the Alderman Road Fence. However, the Pipeline Leak Detection portion of the program had been classified in the plant system as Boiler Plant Equipment which has a depreciation rate of 4.10% based on the 2005 Rate Case Settlement Agreement (Order

No. PSC-05-0945-S-EI). Therefore, in May the assets for PIM were separated on the Capital Program Detail (Exhibit LC-2, pg. 2) and the depreciation was adjusted for January 2006 through April 2008. This adjustment calculation appears on Attachment 6-1 and the adjustment is included in Line 8e of Project 3.1b of the Capital Program Detail. Because the Net Investment would have been affected by the depreciation adjustments in the prior periods, the return on debt and equity was also adjusted. These adjustment calculations also appear on Attachment 6-1 and the adjustments are included in Line 7c of Project 3.1b of the Capital Program Detail. Attachment 6-2 through 6-4 include the adjusted schedules for the Pipeline Leak Detection project and Attachment 6-5 through 6-7 show the Alderman Road Fence project using the same 3.07% rate but separated for purposes of the analysis.

Page 2: This amount, as documented in footnote (G) represents the portion of the return on investment from the Turner Tank 8 Above Ground Storage double bottoming project that PEF impaired and determined appropriate to refund to the customer. Refer to the following schedules in Attachments (6-17 through 6-24):

- Refund Analysis – provides the allocation of costs to the impaired portion of the asset
- Impairment Detail Summary – provides a summary of the costs provided by the business service group
- True Up Filings – 42-8A pg2 schedules for the following years
    - 2003
    - 2004
    - 2005
- True Up Filings – Cap Program Detail schedules for the following years
    - 2006
    - 2007
- Estimated / Actual Filing – Cap Program Detail schedule
    - 2008

Page 7: Also, each of the sites that are part of the CAIR/CAMR – Peaking program (CAIR CT's, 42-8E page 7), were classified in the plant system as Prime Movers which have various depreciation rates based on the plant sites per the 2005 Rate Case Settlement Agreement. However, the ECRC schedules were being depreciated using the rates for the Misc. Power Plant Equipment group so the depreciation was adjusted for these assets from their in-service dates in November 2007/January 2008 through April 2008. This adjustment calculation appears on Attachment 6-8 and the adjustments are included in Line 8a of Projects 7.2a through 7.2h of the Capital Program Detail (Exhibit LC-2, pg. 2) with the current month actual depreciation expense. Because the Net Investment would have been affected by the depreciation adjustments in the prior periods, the return on debt and equity was also adjusted. These adjustment calculations appear on Attachment 6-8 and the adjustments are included in Lines 7a and 7b of Projects 7.2a through 7.2h of the Capital Program Detail with the current month return. Attachments 6-9 through 6-16 include adjusted 2007 and 2008 schedules for the CAIR CTs projects from the Capital Program Detail.

Page 9: This page summarizes the capital expenditures for the CAIR Crystal River project that earns AFUDC. Projects earning AFUDC do not recover return on capital from the ratepayers until the assets have been placed in service. For CAIR Crystal River, the only assets included as in-service in 2008 are the Vehicle Barrier System/Access Road and Low NOx Burner CR4 which appear on the Capital Program Detail as Projects 7.4a and 7.4b. Therefore, the only return that appears on 42-8E Page 9 is the return for these two assets which is calculated on the Capital Program Detail.

SERVED this 23rd day of September, 2008.

Proposed breakout of CWIP into Recoverable O&M Exp and Refund to Customer

CWIP Balance Impaired - (O&M)		367,843
Refund to Customer - (cr. Return on Investment)	<b>	190,414

<a> - The commercial paper rate was obtained off of Form 42-3A of the actuals filing for 2003-2007 and from Form 42-3E on the 2008 estimated filing.
<b> - Amount of return previously earned through the clause that is due back to the customer. The amount has been increased $629 from $189,785 to $190,414 due to an error in the calculation. This change will be corrected within the 2008 True-up Filing.

PEF's response to Staff's First Set of Interrogatories (Nos. 1 - 4)

HEARING EXHIBIT - 00000760

BEFORE THE PUBLIC SERVICE COMMISSION

In re: Environmental Cost Recovery Clause	Docket No. 080007-EI
	Dated: July 28, 2008

PROGRESS ENERGY FLORIDA'S RESPONSES TO STAFF'S FIRST SET OF INTERROGATORIES (NOS. 1-4)

PROGRESS ENERGY FLORIDA, INC. ("PEF"), pursuant to Rule 28-106.206, Florida Administrative Code, Rule 1.340, Florida Rules of Civil Procedure, and the Order Establishing Procedure in this matter, hereby responds to Staff's First Set of Interrogatories (Nos. 1-4):

RESPONSES

1. **Regarding the Pipeline Integrity Management Program (PIM) discussed on page 3 of the Direct Testimony of Patricia Q. West, please provide clarifications for the following:**

   a. **Lines 10 - 12 on page 3 of the testimony indicate that the PIM O&M project expenditures were $338,637 or 43.0% lower than projected. On page 6 of the 2007 Final True-up calculation in EXH WG-1, the end of period total of the O&M cost for the PIM (Project 3a) was $449,790. Please reconcile these numbers.**

   Answer:

   Actual 2007 O&M expenditures for the Pipeline Integrity Management Program (PIM) were $449,790. The variance between this total and the projection per the Estimated/Actual Filing was $338,637. Refer to PIM project 3a in Line 1 on Form 42-4A.

   b. **On page 9 of the 2007 Final True-up calculation of EXH WQ-1, PEF presented the capital investment calculation of PIM (Project 3b). Please explain or describe the difference between this PIM (Project 3b) and the PIM Project 3b described above in 1a.**

Answer:

PEF believes this question is referring to Exhibit WG-1, Page 9 of 21 and PIM Project 3a described above in 1a. Project 3a, as described in 1a, consists of the PIM O&M projects and is presented on Exhibit WG-1, Page 6 of 21. Project 3b, is presented on Exhibit WG-1, Page 9 of 21, and consists of the PIM Capital projects.

c. **Lines 14 - 20 on page 3 of the testimony explain the reasons for the delay of the PIM project. Please provide the commencing date, the original planned completion date and the current planned completion date.**

Answer:

Lines 14 – 20 refer to two projects: the Main Line Valve Guardrails project and the Main Line Valve Telemetry project.

The Telemetry project was delayed due to the need for design and installation modifications as well as the unavailability of contractors when work was scheduled. This project commenced in December 2006 and the original planned completion date was December 2007. The revised planned completion date is August 2008.

The Guardrails project was delayed to avoid conflicts with the Telemetry project and to await FDOT completion of work along a portion of the highway. This project commenced in April 2007 and the original planned completion date was December 2007. The revised planned completion date was February 2008 for the portion delayed for the Telemetry project and 2010 for the portion delayed due to FDOT work.

2. **EXH PQW-1, PEF's Clean Air Compliance Plan "D", includes "fuel switching at Crystal River Units 1 and 2 to burn low sulfur coal" as one of the measures to reduce SO2 emissions. It also includes "installation of powdered activated carbon (PAC) injection on Crystal River Unit 2" as one of the measures to reduce mercury emissions. Please explain or describe why PEF only plans to install the PAC injection on Crystal River Unit 1 rather than on both Unit 1 and 2.**

Answer:

The original Integrated Clean Air Compliance Plan (March 31, 2006) includes a review of the Clean Air Mercury Rule as it was understood at that time as well as PEF's plan to comply with the rule. As discussed in the Plan, the synergistic effects of the SCRs and scrubbers to be installed on Units 4 and 5, along with the allowances that were expected to be issued for the Crystal River coal units, only necessitated installation of a PAC injection system on Unit 2 to meet the compliance requirements of the first phase of CAMR. On page 77 (Quantitative Analysis of Alternative Compliance Plans) the Plan addresses the use of allowances and PAC injection as part of the compliance strategy: "For mercury, the allowance balance is only slightly above zero at the end of 2025. In Plan D, PAC injection systems are installed on Crystal River Unit 2 in 2017. PEF has the ability to add controls to Crystal River Unit 1 or advance the controls on Unit 2, if necessary."

These same conclusions were reached in the June 1, 2007 and April 2, 2008 Plan updates. The Integrated Clean Air Compliance Plan continues to be assessed with the evolution of federal and state rules; none of these developments has resulted in a determination to alter this aspect of the original plan. As noted in Ms. Patricia West's testimony of April 2, 2008, a recent federal appeals court decision vacated the federal CAMR regulations. This development does not immediately impact PEF's implementation of Plan D because the plan does not contemplate installation of mercury-specific controls (PAC injection) until 2017.

3. **Refer to Form 42-8A, p.13 of the Final True-up filing calculations and PEF Response to Audit Request Number: ECRC-12. Please explain or describe:**

   a. **What is the reduction amount for PEF's assertion "Line 7a and 7b included reductions to the return for this issue. (Last sentence of the response to this request)"?**

Answer: Line 7a included a reduction of $978 and Line 7b included a reduction of $179.

   b. **How are the numbers shown in line 1d (-3,767 in July, -3,040 in August, 426 in October and -1,702 in December) used in the calculation of line 9?**

Answer:

The amounts shown in line 1d are added directly to Line 9 and therefore the calculation described in Footnote E is incorrect. In future filings, any credits for return will be included in Line 7c and any credits for depreciation and property tax will be included in Line 8e.

4. **Refer to Form 42-8A, p.5 of the Final True-up filing calculations. Please explain or describe how line 1c NOx Emission Allowance was derived and how it relates to line 6b and line 7.**

Answer:

Line 1c represents the inventory of NOx Emission Allowances. It is calculated based on the cost of NOx Emissions Allowances acquired that are charged to the inventory account designated for these allowances. During each accounting close, the expenditures for the current month are added to the ending inventory balance from the prior period and the new inventory balance is verified to the general ledger account balance. The inventory of NOx allowances will be expensed beginning in 2009 as they are used for compliance purposes.

Line 1c has no impact on Lines 6b or 7. These lines account for SO2 Auction Proceeds amortization and SO2 allowance expense.

DATED this 28th day of July, 2008.

PEF's response to Staff's Second Set of Interrogatories (Nos. 5 - 7)

HEARING EXHIBIT - 00000766

BEFORE THE FLORIDA PUBLIC SERVICE COMMISSION

In re: Environmental cost recovery clause.	DOCKET NO. 080007-EI
	DATED: AUGUST 25, 2008

PROGRESS ENERGY FLORIDA'S RESPONSES TO STAFF'S SECOND SET OF INTERROGATORIES (NOS. 5-7)

PROGRESS ENERGY FLORIDA, INC. ("PEF"), pursuant to Rule 28-106.206, Florida Administrative Code, Rule 1.340, Florida Rules of Civil Procedure, and the Order Establishing Procedure in this matter, hereby responds to Staff's Second Set of Interrogatories (Nos. 5-7):

RESPONSES

5. **Regarding the proposed Low Level Radioactive Waste Storage Project, please describe or explain:**

   a. **The time line of the project, using the completion of the following activities as the milestones: purchasing five storage containers, engineering analysis, additional engineering, licensing and training activities, and construction of a separate on-site storage facility;**

Answer: Two on-site storage containers (OSSC) to be purchased December 2010 and three more to be purchased December 2012; Engineering analysis for the approval to store OSSC's on the south side of CR3's security zone (referred to as the "berm") to be completed prior to April 2010; Additional engineering and environmental analysis will be required if the storage facility needs to be located off the berm due to the potential flood plan concerns. This study will be completed by June 2010; Training and licensing activities will be completed by December 2010; Construction of a separate on-site storage facility, if needed, is projected to be completed June 2011.

   b. **PEF's statement: "Any new costs that are incurred under this project will be offset by the savings that result from terminating shipments to Barnwell County";**

Answer: The Barnwell, South Carolina Low-Level Radioactive Waste Disposal Facility will no longer be available to PEF to dispose of Class B and Class C low level waste. Beginning June 30, 2008 Crystal River 3, no longer has a licensed disposal facility available to dispose of its Class B and Class C LLW. In accordance with NRC guidelines,

HEARING EXHIBIT - 00000767

the only NRC-authorized method for disposal is by transfer to a licensed low-level radioactive waste disposal facility. Until new disposal options become available, PEF will need to construct on-site storage for its Class B and Class C LLW. This interim storage will result in incremental increases in capital and O&M costs associated with the construction of facilities and the management and handling of the LLW on-site, which would not be required if the LLW could be disposed of.

Crystal River 3 will continue to accrue the costs for disposal of LLW when the LLW is first generated. This accrual process is repeated each year for all waste that has been generated during that year but has not been disposed of. Accruals are based on the projected costs to dispose of the waste at the time the accrual is assessed. Accrual of disposal costs on the LLW that Crystal River 3 must store on-site is appropriate because Crystal River 3 remains responsible for disposing of that LLW at some future date. Crystal River 3 is currently accruing disposal costs based on the existing Barnwell disposal fees. Based on the LLW disposal historical cost structure, PEF expects that the ultimate actual disposal cost will be at least as much as the accruals, as it does not appear likely at this time a future disposal facility would charge a lower fee than what was being charged to dispose LLW at Barnwell County.

c. How much, if any, PEF has spent each year for off-site LLW storage including disposal fees for the last 10 years;

Answer: PEF's Crystal has not stored LLW off-site, however disposal costs are as follows:

1999

Shipment # 99-091, 12/1/99, 8-120 Resin HIC, Approximate Cost: $85,000.00
Total 1999: $85,000.00

2000 Shipment # 00-023, 6/13/08, 8-120 Filter HIC, Cost: Approximately $52,000.00
Total 2000: $52,000.00

2001 Shipment #01-027, 6/1/01, 8-120 Filter HIC, Cost: $41,479.54
Total 2001: $41,479.54

2002

Shipment 02-014, 3/21/02, 8-120 Filter HIC, Cost: $54,459.74
Shipment 02-022, 5/9/02, 8-120 Resin HIC, Cost: $111,741.84
Shipment 02-026, 5/30/02, 8-120 Resin HIC, Cost: $114,905.24
Total 2002: $281,106.82

2003 Shipment 03-046, 8/26/03, 8-120 Filter HIC, Cost: $42,402.80
Shipment 03-093, 12/11/03, 8-120 Resin HIC, Cost: $128,743.00
Total 2003: $171,145.80

2004 No Shipments to Barnwell or processed through Studsvik Processing Facility

2005 Shipment 05-034, 7/29/05, 8-120 Resin HIC, Cost: $38,914.00
Shipment 05-035, 8/5/05, 8-120 Resin HIC, Cost: $156,379.00
Shipment 05-036, 8/11/05, 8-120 Resin HIC, Cost: $161,823.00
Shipment 05-040, 8/31/05, 8-120 Resin HIC, Cost: $141,104.00
Shipment 05-045, 9/22/05, 8-120 Filter HIC, Cost: $150,195.00
Total 2005: $648,415.00

2006 No Shipments to Barnwell or processed through Studsvik Processing Facility

2007 Shipment 07-019, 4/18/07, 8-120 Resin HIC, Cost: $151,846.00
Shipment 07-021, 4/25/07, 8-120 Resin HIC, Cost: $150,856.00
Shipment 07-023, 5/9/07, 8-120 Resin HIC, Cost: $150,856.00
Shipment 07-026, 5/16/07, 8-120 Resin HIC, Cost: $150,842.00
Total 2007: $604,400.00

2008 Shipment 08-020, 3/18/08, 8-120 Filter HIC, Cost: $177,926.00
Shipment 08-025, 4/2/08, 8-120 Resin HIC, Approximate Cost: $167,000.00
Shipment 08-028, 4/16/08, 8-120 Resin HIC, Approximate Cost: $167,000.00.
Shipment 08-030, 4/30/08, 8-120 Resin HIC, Approximate Cost: $167,000.00.
Shipment 08-031, 5/7/08, 8-120 Resin, Approximate Cost: $167,000.00
Total 2008: $845,926.00

d. How much of the expenditure described in interrogatory No. 5c was recovered through the base rate each year;

Answer: Approximately $600,000 of disposal costs were recovered through base rates each year. No costs described in No. 5c were recovered through the Environmental Cost Recovery Clause during these years.

e. What is the Useful life (years) of the storage containers that will be purchased initially;

Answer: The useful life is expected to be for the life of the plant. With the approval of the license extension, Crystal River -3 has an expected life through 2037.

f. What is the Useful life (years) of the separate on-site storage facility that PEF may construct commencing in late 2009.

Answer: The useful life will be for the "life" of the plant.

g. **What will be the O&M costs for the on-site storage facility?**

Answer: When the facility is operating there will be routine operating costs incurred to operate and maintain the facility. Such costs will include but not limited to resources to survey and monitor the facility, escort LLW to the facility, and transportation/hauling equipment rental and repairs. Minor repairs and periodic painting and other maintenance may also be required. Total O&M costs are expected to be between $20,000 - $40,000/year.

6. **Regarding the proposed Greenhouse gas Inventory and reporting project, please describe or explain, in detail, the scope of PEF's Greenhouse Gas (GHG) Reduction Program;**

Answer: Progress Energy Florida is currently developing an entity-wide greenhouse gas inventory; a reduction program has not been initiated. The greenhouse inventory will align with The Climate Registry General Reporting protocol and other nationally-recognized protocols, establish a baseline for the company, and be of a quality and format for successful independent verification and external reporting.

A detailed analysis of greenhouse gas emissions is being conducted for all six major greenhouse gases (CO_2, CH_4, N_2O, PFCs, HFCs, and SF6) and will include direct and indirect emissions from each of the following owned or controlled functional areas of the organization:

- Stationary sources (e.g., boilers, turbines, internal combustion engines)
- Electricity transmission and distribution (e.g., transmission and distribution losses from purchased or wheeled electricity)
- Fugitive sources (e.g., air conditioning, fire suppression equipment, SF6)
- Mobile sources (e.g., road, air, rail)
- Process sources (e.g., sorbent use for flue gas desulfurization systems)
- Facilities (e.g., office buildings)

Source of Scope 3 emissions (as defined in the WBCSD/WRI GHG protocol and The Climate Registry protocol – such as employee commuting and transportation of waste materials) will be identified, but not quantified in this scope of work.

Development of the greenhouse gas inventory includes the following distinct tasks:

Task 1. Develop Greenhouse Gas Inventory Plan. The Greenhouse Gas Inventory Plan will define the scope of work, roles and responsibilities, project timeline, resource needs for data collection and deliverables. It will also capture key decisions that will be required early in the project, such as operational boundaries; identification of sources that will be included and excluded in the inventory; and emissions calculation methodologies.

Task 2. Collect Data. Identified field resources will develop comprehensive list of greenhouse gas emissions sources and will collect operational data required to support the emissions calculations.

Task 3. Calculate Greenhouse Gas Emissions. Greenhouse gas emissions will be calculated and documented on an Excel spreadsheet as determined in the Greenhouse Gas Inventory Plan. Once the inventory has been generated, potential de minimis sources will be identified and a baseline will be established. For each source, the spreadsheet will indicate the quality of the calculation or estimation methodology used and an explanation of why this approach was chosen. Emissions will be entered into The Climate Registry reporting software, CRIS.

Task 4. Establish Ongoing Implementation Strategy. The Greenhouse Gas Inventory Core Team will develop the ongoing strategy for collecting, calculating and documenting the annual greenhouse emissions inventory. The recommended strategy will be documented for internal management review.

Progress Energy is a founding reporter to the Climate Registry, which will require reporting of annual emissions by June 30 of each year and third-party verification by December 15 of each year. The first reporting to the Registry will occur by June 30, 2009 for 2008 emissions.

7. **Regarding the proposed Crystal River Thermal Discharge Compliance Project,**

a. **Please explain the differences between the three kinds of cooling towers: Modular Cooling Tower; 12 Cell Circular Cooling Tower; and Helper Cooling Tower.**

Answer: The discharge canal is equipped with two groupings of once-through cooling towers. The first group, Helper Cooling Towers (HCTs), is a permanent arrangement of four linear forced draft cooling towers termed 'Helper Towers.' These towers are designated HCT-1, HCT-2, HCT-3, and HCT-4. This set of towers was designed by Hamon Cooling Towers and entered service in 1991. Each HCT consists of nine cells. Each cell is rated at 19,000 gpm, resulting in each HCT operating at ~ 171,000 gpm, for a total capacity of ~ 684,000 gpm. The HCTs are served by a set of four seawater lift pumps. The discharge of the lift pumps is to a common header which can be valved to direct flow from the pumps to the various towers. The combined capacity of the thirty-six (36) cells, which make up the four Hamon towers, is currently ~52% of the total (summer) flow in the canal. The total discharge canal flow during the summer is ~ 1,318,680 gpm.

The Modular Cooling Towers (MCTs), the second group, are mechanical forced draft cooling towers. The four groupings of modular towers were installed and first operated

in the summer of 2006. The MCTs are comprised of a total of sixty-seven (67) smaller units. The MCTs are temporary units that were leased from Aggreko for five years, were installed by Aggreko, and are owned and maintained by Aggreko. The Aggreko lease started in 2006 and runs through the summer of 2010. Flow through the modular cooling towers is estimated at 180,000 gpm or ~14% of total flow in the discharge canal. The Commission approved recovery of prudently incurred costs for the MCTs in Docket No. 060162-EI.

The proposed 12 Cell Circular Cooling Tower is a set of 12 cooling cells (similar to the HCTs) arranged in a circular pattern. The circular arrangement makes the cooling tower more efficient than those arranged in a line configuration. The flow through the proposed cooling tower will be approximately 240,000 gpm. Specifics of this cooling tower's design have not been completed.

b. Please provide the total Revenue Requirements for the proposed permanent cooling solution over 15 years.

Answer: Please see Attachment 7-1 for the estimated revenue requirements. These estimates are preliminary estimates based on studies that are still in progress. The final thermal discharge compliance solution has not yet been determined and no contracts have been issued for the construction of the new equipment. As such, the final revenue requirements may vary significantly. Also, the preliminary estimates in Attachment 7-1 are based on an estimated cost allocation between drivers (CR3 Uprate vs. CR1&2 Environmental) using the respective heat mitigation for each as an allocation basis.

c. Please state the annual costs PEF currently incurs for leasing the Modular Cooling Towers.

Answer: The annual lease payment is $3,336,752 based on $834,188 per month for the months of June, July, August and September. Additional costs consist of approximately $1.6 million for installation and approximately $0.9 million for removal. The total 5 year cost is expected to be approximately $19.3 million.

d. Please provide a side by side comparison of the Revenue Requirements for Crystal River Unit 1 & Unit 2 (CR1 & CR2) with and without the permanent cooling water solution. Please also describe or explain all the assumptions used.

Answer: PEF interprets this interrogatory to be asking for the relevant changes in revenue requirements associated with Crystal River Units 1 & 2 with and without the permanent POD solution. For these purposes a scenario without the permanent solution will be considered the base case and changes associated with having a permanent solution will be considered. The relevant cost changes are primarily associated with changes due to additional capital investment and changes in fuel costs. Please see the response to

question 7b above for preliminary capital cost estimates over the first 15 years of operation. With regard to estimating the fuel savings, this is heavily dependent on environmental conditions and fuel prices. Assuming a replacement fuel cost of between $90 and $130 per MWh and using PEF's experience from 2003-2007 to calculate an average annual avoided 110,760 MWh's per year, PEF estimates the average annual savings due to avoided derates would be between $10 and $15 million per year. By comparison, the preliminary estimated annual revenue requirements for the first 15 years range from approximately $6.2 to $10.6 million per year, as shown on Attachment 7-1.

e. **Please provide the Useful life (years) of the proposed permanent cooling solution facility.**

Answer: The useful life (years) of the proposed permanent cooling solution facility is 30 years.

f. **Please provide the useful life remaining (years from 2009 to the retirement) of CR1 and CR2.**

Answer: At this time, PEF does not have a planned retirement date for Crystal River Units 1 & 2.

DATED this 26th day of August, 2008.

Note

(1) Depreciation rate comes from Order No. PSC-05-0945-S-EI on Docket 050078 page 159 of Attachment A.

(2) O&M assumption based on current O&M costs of the current Helper Cooling Towers which have a heat rejection capacity of 4.57 B BTUs/Hr. The O&M maintenance budget is approximately 500,000 dollars per year. The new equipment solution heat rejection capacity is 2.29 B BTUs/Hr. The expected O&M maintenance cost is estimated to be 250,000 dollars per year (half of the Helper Cooling Towers O&M maintenance budget) for the new equipment. The electrical auxiliary power requirements are being evaluated. These are preliminary estimates and will be refined during the design phase of the project.

PEF's response to Staff's Third Set of Interrogatories (No. 8)

HEARING EXHIBIT - 00000779

BEFORE THE FLORIDA PUBLIC SERVICE COMMISSION

In re: Environmental cost recovery clause.	DOCKET NO. 080007-EI
	DATED: September 23, 2008

PROGRESS ENERGY FLORIDA'S RESPONSES TO STAFF'S THIRD SET OF INTERROGATORIES (NO. 8)

PROGRESS ENERGY FLORIDA, INC. ("PEF"), pursuant to Rule 28-106.206, Florida Administrative Code, Rule 1.340, Florida Rules of Civil Procedure, and the Order Establishing Procedure in this matter, hereby responds to Staff's Third Set of Interrogatories (No. 8):

RESPONSES

8. **Regarding the $368,303 higher O&M cost due to the provider's failure to deliver the correct secondary containment technology described on pages 3-4 of witness P. West's testimony dated 08/04/2008, has Progress pursued any compensation from the vendor regarding the loss incurred?**

Answer: Yes. PEF has pursued compensation from the vendor for over four years. As summarized in PEF's response to Staff's Production of Document Request No. 6, "schedules relating to page 2," costs were initially incurred in 2003 and 2004, which corresponded to the scheduled time for the secondary containment upgrade at the Turner location. Once installed, the containment system never passed the acceptance testing. After contacting the vendor for corrective actions, and not receiving satisfactory remediation, PEF suspended the fieldwork. PEF subsequently hired outside counsel to communicate with the vendor in attempt to obtain recourse, either by warranty-type work or receipt of monetary refund. Additionally, during this time, PEF learned that the vendor was experiencing financial difficulty. In early 2006, the project was reopened as the vendor came under a different management team and a new attempt to "settle" the problem of the containment system was initiated. PEF's outside legal counsel provided a draft settlement agreement, but it was never executed by the vendor. However, the vendor did provide PEF with replacement putty and coatings products and a cash payment which was applied towards installation. At this time, PEF made the decision to replace the bottom and complete the project prior to the FAC imposed deadline of December 31, 2009 as it was not economically feasible to continue pursuing the vendor as the vendor could not provide satisfactory remediation and did not have the financial solvency to equitably settle the situation.

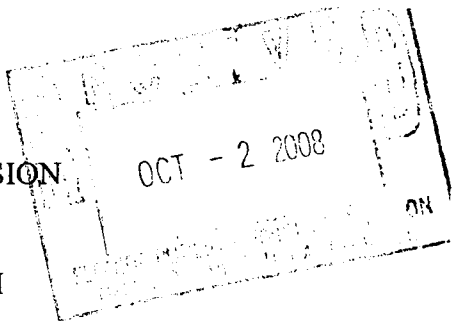
PEF's response to Staff's Fourth Set of Interrogatories (Nos. 9 - 18)

HEARING EXHIBIT - 00000782



BEFORE THE FLORIDA PUBLIC SERVICE COMMISSION

In re: Environmental cost recovery clause.	DOCKET NO. 080007-EI
	DATED: October 2, 2008

PROGRESS ENERGY FLORIDA'S RESPONSES TO STAFF'S FOURTH SET OF INTERROGATORIES (NOS. 9-18)

PROGRESS ENERGY FLORIDA, INC. ("PEF"), pursuant to Rule 28-106.206, Florida Administrative Code, Rule 1.340, Florida Rules of Civil Procedure, and the Order Establishing Procedure in this matter, hereby responds to Staff's Fourth Set of Interrogatories (Nos. 9-18):

RESPONSES

9. **For Project 4.1-Above Ground Tank Secondary Containment-Peaking, on page 10 of 21 of Exhibit WG-1, the company provided the actual depreciation expense for the month of April 2007 in the amount of $22,824. The Capital Program Detail, Exhibit WG-2, on pages 1 through 6 of 13 provides a breakdown of the $22,824 depreciation expense by plant site as follows: $424 for Project 4.1b-Bartow CTs, $20,520 for Project 4.1c-Intercession City CTs, $520 for Project 4.1d-Avon Park CTs, $565 for Project 4.1e-Bayboro CTs, and $794 for Project 4.1h-University of Florida. Project 4.1c-Intercession City CTs' depreciation expense for April is more than the monthly calculated amount. Provide a detailed explanation of what occurred at this site and the components used in the calculation. Also, if this is a correction, please provide the appropriate breakdown for each affected month and year.**

Answer: In March 2007, the Above Ground Secondary Containment asset at Intercession City was placed in-service retroactively as of November 2006 in the plant accounting system. The depreciation expense that was not recorded from November 2006 through February 2007 ($15,960) was added to the April depreciation expense ($4,560) in the April 2007 column, line 8a. The depreciation was corrected in March in line 3 but not in line 8a due to oversight. Please see Attachments 1 and 2 for the schedules which were used for purposes of calculating the adjustment for 2006 and 2007.

10. **For Project 4.3-Above Ground Tank Secondary Containment-Intermediate, on page 12 of 21 of Exhibit WG-1 the company's monthly depreciation expense for September through December 2007 is more than twice the monthly calculated amount based upon the plant investment and Commission approved depreciation rate. Provide a detailed explanation of how the company calculated the monthly depreciation expense.**

Answer: The formula for the depreciation expense was utilizing the rate from project 4.1h instead of the rate for project 4.3 resulting in an overstatement of depreciation and property tax expense. This issue was recognized in July 2008 and therefore the depreciation expense was reduced and corrected in the July 2008 column for September 2007 through June 2008 (-$7,721) in Exhibit LC-1, line 8e, along with the correction to the property tax expense (-$1,661) for the same formula issue. See Attachment 3 for a summary of the adjustment calculation and Attachments 4 and 5 for the schedules which were used for purposes of calculating the adjustment.

11. **For Project 10.1-Underground Storage Tanks-Base, page 19 of 21 of Exhibit WG-1, shows that July 2007 was the first month the plant was placed in service, but the calculated monthly depreciation expense is more than the subsequent months. Please provide a detailed explanation of how the expense was calculated.**

Answer: In July 2007, the Underground Storage Tanks – Base project was placed in-service retroactively as of June 2007 in the plant accounting system. Depreciation expense utilizes the half-month convention for the first month an asset is in-service. Therefore, half of the monthly depreciation expense ($230) for June was added to the depreciation expense for July ($460) in the July column, line 8a. See Project 10a on Attachment 6 for the schedule used for purposes of calculating the adjustment.

12. **For Project 10.2-Underground Storage Tanks-Intermediate, page 20 of 21 of Exhibit WG-1 shows that June 2007 is the first month plant was placed in service, but the calculated monthly depreciation expense is more than five times the amount for any of the subsequent months. Please provide a detailed explanation of what occurred in the calculation of the depreciation expense.**

Answer: In June 2007, the Underground Storage Tanks – Intermediate project was placed in-service retroactively as of January 2007 in the plant accounting system.

Depreciation expense utilizes the half-month convention for the first month an asset is in-service. The depreciation expense for January through May ($909) was added to the depreciation expense for June ($202) in the June column, line 8a. See Project 10b on Attachment 7 for the schedule used for purposes of calculating the adjustment.

13. **For Project 11-Modular Cooling Towers-Base, on page 21 of 21 of Exhibit WG-1, the company shows for July 2007 an abnormal depreciation expense occurred in the amount of $19,698. Please provide a detailed explanation of how the depreciation expense was calculated. Also, if this is a depreciation true-up amount, please provide the months effected and the correct expense.**

Answer: In July 2007, additional assets for the Modular Cooling Towers – Base project totaling $147,916 were placed in-service retroactively as of March 2007 in the plant accounting system. Depreciation expense utilizes the half-month convention for the first month an asset is in-service. The depreciation expense for the new assets for March through June ($8,629) was added to the depreciation expense for July ($11,069) in the July column, line 8a. See Attachment 8 for the schedule used for purposes of calculating the adjustment.

14. **For Project 11-Modular Cooling Towers-Base, on page 21 of 21 of Exhibit WG-1, line 1(d) Other(A), the company explained in "Note (A) that a credit was applied reflecting expenses recovered through base rates for the breakers that were replaced to compensate for the increased load." It is not apparent to staff to what account(s) the credits were applied for the months of July, August, October, and December 2007. If the credits should not be included in any of the plant totals, please explain why.**

Answer: These credits were for return on equity and debt, depreciation, and property taxes recovered in base rates for the original breakers that were replaced by the breakers placed in-service in March 2007 as ECRC assets. Therefore, they were applied directly to Line 9 because they are not capital expenditure credits that would affect line 2. In the future, any adjustments for return will be included in line 7c and any adjustments for depreciation and property tax will be included in line 8e.

15. **For Project 3.1, on page 9 of 22, line 8(a), the company shows a change in the depreciation expense for the period of January through April and May through**

December, in the amount of $6,843 and $9,109. Also, reflected on line 8(e)-Other(g), the company provided a depreciation true-up in the amount of $63,462.

a. **Provide a detailed explanation of why the company used different depreciation rates and resulting expenses as stated above for the period of January through April and May through December.**
b. **Provide a month to month breakdown of the $63,462 depreciation true-up as shown on line 8(e) Other (g).**

Answer: Please see response to No. 6 of Staff's Fourth Request for Production Documents as related to Page 1.

16. **The overall summary for Project 4.1-Above Ground Tank Secondary Containment-Peaking, the depreciation expense on line 3- Less: Accumulated Depreciation, for the month of March 2008 includes an additional $6,840 in depreciation expense. Staff review of the company's Capital Program Detail, Exhibit LC-2 attributes this excess depreciation expense to Project 4.1(c)-Intercession City CTs. Explain in detail why the excess depreciation expense in the amount of $6,840 was included in the March total, although the monthly depreciation expense for Intercession City CTs is only $4,694.**

Answer: The additional $6,840 in depreciation expense was included in March 2008 due to oversight as it was actually an adjustment included for March 2007 that was not deleted from the cell. The issue was corrected in line 3 in July 2008.

17. **For Project 4.3, on line 8e-Other(G), the company shows $9,382 as a depreciation true-up amount which is also stated in the Note section.**

a. **Please provide the appropriate depreciation rate and depreciation expense by the applicable months which determined the depreciation true-up in the amount of $9,382.**
b. **Please explain in detail why the company did not include the depreciation expense true-up as part of line 3-Less: Accumulated Depreciation.**

Answer: Please see response to Interrogatory No. 10 above. The amount included in line 3 was $7,721 per the information in that response.

18. For the project sites listed below as part of Project 7.2, the Capital Program Detail Support shows a negative $10,086 in depreciation expenses occurring during May 2008. The overall summary for Project 7.2 project plant sites shows a negative depreciation expense in the amount of $9,110. Provide a detailed explanation to include why this difference occurred, the months affected, and the methodology used to calculate the May 2008 depreciation expense.

Project Number	Description	Depreciation Expense
7.2a	CAIR CTs-Avon Park	($ 184)
7.2b	CAIR CTS-Bartow	($ 440)
7.2c	CAIR CTs-Bayboro	($ 69)
7.2d	CAIR CTs-DeBary	($ 419)
7.2e	CAIR CTs-Higgins	($2,395)
7.2f	CAIR CTs-Intercession City	($3,909)
7.2g	CAIR CTs-Turner	($ 946)
7.2h	CAIR CTs-Suwannee	($1,724)
	Total	($10,086)

Answer: In the chart above, Project 7.2c and 7.2d depreciation expense was actually filed as $69 and $419 (not -$69 and -$419) which would change the total in the chart to $9,110. Please see response to No. 6 of Staff's Fourth Request for Production Documents as related to Page 7 for an explanation of this issue.

DATED this 1st day of October, 2008.

HEARING EXHIBIT - 00000797

BEFORE THE FLORIDA PUBLIC SERVICE COMMISSION

In re: Environmental cost recovery clause.	DOCKET NO. 080007-EI
	DATED: October 13, 2008

PROGRESS ENERGY FLORIDA'S RESPONSES TO STAFF'S FIFTH SET OF INTERROGATORIES (NOS. 19-25)

PROGRESS ENERGY FLORIDA, INC. ("PEF"), pursuant to Rule 28-106.206, Florida Administrative Code, Rule 1.340, Florida Rules of Civil Procedure, and the Order Establishing Procedure in this matter, hereby responds to Staff's Fifth Set of Interrogatories (Nos. 19-25):

RESPONSES

19. **In the schedule of Project 4.1c shown on page 3 of 13 of Exhibit WG-2 filed on April 2, 2008, the total system recoverable expenses (Line 9) are $298,468. However, in the schedule of Project 4.1c shown in Attachment C to PEF's response to staff's second request for PODs (No. 2), the total system recoverable expenses (Line 9) for the same project are $285,336. Please reconcile these two numbers and provide an amended schedule for Project 4.1c.**

Answer: In the last two sentences in the first paragraph of PEF's response to staff's second request for PODs (No. 2), PEF stated that the corrected schedules (i.e. Attachment C) were only used for the purpose of calculating the correct return through the month (i.e. March 2007) the correction was made and not as the basis for any part of the schedule (i.e. Exhibit WG-2) after that month. This revised schedule (Attachment C) was created in March 2007 only for the purposes of calculating the adjustment to return that was necessary for January and February 2007 that were not recorded correctly. This adjustment was added to the March 2007 return in Line 7b. Therefore, the comparison between the total system recoverable expenses of $298,468 and $285,336 is not a meaningful comparison because the amount per Exhibit WG-2 was also based on the actual activity that occurred from April through December 2007, which was not included as part of Attachment C per the reasons cited above. Based on the reasons cited in this response, an amended schedule will not be provided.

20. **In the schedule of Project 4.1e shown on page 4 of 13 of Exhibit WG-2 filed on April 2, 2008, the figure on Line 2 PIS for December showed a discrepancy compared to**

the rest of the months of the year. If the same formula applied, the December amount should be $352,593 rather than $349,609 as filed. If this calculation is correct, please provide an amended schedule for Project 4.1e. If this calculation is not correct, please explain.

Answer: In December 2007, a project cost reconciliation was performed and PEF determined that $2,984 was incorrectly recorded to the project twice during 2007. Because the amount was not a true credit to the project per the project accounting system in December 2007, it was not included in line 1a and 1b. Instead, the amount was subtracted directly from Line 2 to correct the Plant In Service balance going forward. Based on the reasons cited in this response, an amended schedule will not be provided.

21. **In PEF's response to staff's second request for PODs (No. 2) dated July 31, 2008, it stated that "Project 4.1d and Project 4.1h also include immaterial return on equity true-ups totaling a decrease of $90 and return on debt true-ups totaling a decrease of $17 due to other minor calculation errors." Please provide amended schedules for 4.1d and 4.1h.**

Answer: The 2006 return on equity and debt were not filed correctly for Projects 4.1d (Avon Park) and 4.1h (University of Florida) in Exhibit WG-2 from Docket 070007-EI due to use of an incorrect in-service date. Attachments 1 and 2 show the schedules that were used for purposes of calculating the adjustments needed to correct the return for 2006 and these adjustments were added to the return on equity and debt in January 2007 in line 7a and 7b. Project 4.1d had adjustments of ($4) and ($1) and Project 4.1h had adjustments of ($86) and ($16) to return on equity and debt respectively. An amended schedule will not be provided due to the reasons included in this response.

22. **Based on the responses to the above Interrogatories Nos. 19, 20 and 21, please provide an amended schedule for project 4.1 of the Actual True-up Jan. 2007 through Dec. 2007.**

Answer: See responses for Nos. 19, 20, and 21. Amended schedules are not applicable.

23. **In the schedule Deferred Gain on Sales of Emissions Allowances (Project 5), on page 13 of 21, of Exhibit WG-1 filed on April 2, 2008, please explain or describe the following and provide an amended schedule for Project 5:**

a. **Why is the amount shown in January for Line 1a a discrepancy compared to the amounts listed in the same line for the other months of the year when using the same calculation formula.**

b. **Why is the amount shown in May for Line 1b in discrepancy compared to the amounts listed in the same line for the other months of the year when using the same calculation formula.**

Answer: In January 2007, there was a purchase of SO2 allowances for $10,400,000 so this amount increased the SO2 Emission Allowance Inventory in line 1a in January. In May 2007, the EPA purchased SO2 allowances from PEF for $1,098,566 which increased the Auctioned SO2 Allowance liability in line 1b in May. Due to the reasons included in this response, an amended schedule will not be provided.

24. **In the schedule Deferred Gain on Sales of Emissions Allowances (Project 5), on page 13 of 22, of Exhibit LC-1 filed on August 4, 2008, please explain or describe the following and provide an amended schedule for Project 5:**

a. **Why is the amount shown in January for Line 1a a discrepancy compared to the amounts listed in the same line for the other months of the year when using the same calculation formula.**

b. **Why is the amount shown in May for Line 1b a discrepancy compared to the amounts listed in the same line for the other months of the year when using the same calculation formula.**

Answer: In January 2008, there was a purchase of SO2 allowances for $23,027,500 so this amount increased the SO2 Emission Allowance Inventory in line 1a in January. In May 2008, the EPA purchased SO2 allowances from PEF for $906,201 which increased the Auctioned SO2 Allowance liability in line 1b in May. Due to the reasons included in this response, an amended schedule will not be provided.

25. **In the schedule Deferred Gain on Sales of Emissions Allowances (Project 5), on page 9 of 32, of Exhibit LC-3 filed on August 29, 2008, please explain or describe the following and provide an amended schedule for Project 5:**

a. **Why is the amount shown in May for Line 1b a discrepancy compared to the amounts listed in the same line for the other months of the year when using the same calculation formula.**

b. Why is the amount shown in April for Line 1c a discrepancy compared to the amounts listed in the same line for the other months of the year when using the same calculation formula.

Answer: 25(a) – The calculation is correct and no amended schedule will be provided. Line 1b represents the proceeds received for the allowances withheld by the EPA for auction. The auction proceeds are amortized during their vintage year. PEF receives the auction proceeds and then amortizes them over the year via two accounts: Auctioned SO2 Allowance (Line 1b) and SO2 Amortization Expense (Line 6b). The discrepancy seen in May on Line 1b represents the receipt of the 2009 proceeds, less the amortization for the first five months of the year. The 2009 proceeds based on the formula provided by the EPA were projected to be $560,489. The amortization expense of these proceeds for the first five months of the year was calculated to be $233,537 ($560,489/12*5). There is an additional $11,795 in amortization expense related to the amortization of advance purchased allowances. By taking the April ending balance of ($2,016,074) less the amortization expense of ($245, 332) [$233,537+$11,795] plus the annual proceeds received for the current year auction of $560,489 the May balance of ($2,331,231) is achieved.

25(b) – The calculation is correct and no amended schedule will be provided. Line 1c represents the NOx Emission Inventory Balance. The following is the formula to calculate the inventory balance: Beg Balance + Purchases – Expenses = Ending Balance. The schedule in question only provides stand alone lines for three of the four variables: Beginning Balance, Expense and Ending Balance. Prior to April 2009, there were no purchases allowing for a direct calculation [Line 1c – Line 6c] resulting in the next month balance on Line 1c being straightforward. In April 2009, however, there was a purchase of $7,160,625 which is included within Line 1c resulting in an indirect calculation of the formula demonstrated above. By isolating this purchase, the calculation of the balance is as follows:
(Line 1c-March) $53,614,523 + (Purchase) $7,160,625 – (Line6c-April) $3,892,117= (Line 1c-April) $56,883,031.

DATED this 13th day of October, 2008.

PEF's response to Staff's Sixth Set of Interrogatories (No. 26)

HEARING EXHIBIT - 00000806

BEFORE THE FLORIDA PUBLIC SERVICE COMMISSION

In re: Environmental cost recovery clause.	DOCKET NO. 080007-EI
	DATED: October 20, 2008

PROGRESS ENERGY FLORIDA'S RESPONSE TO STAFF'S SIXTH SET OF INTERROGATORIES (NO. 26)

PROGRESS ENERGY FLORIDA, INC. ("PEF"), pursuant to Rule 28-106.206, Florida Administrative Code, Rule 1.340, Florida Rules of Civil Procedure, and the Order Establishing Procedure in this matter, hereby responds to Staff's Sixth Set of Interrogatories (No. 26):

RESPONSE

26. **Please refer to the testimony of Lori Cross filed August 29, 2009, exhibit LC-3, page 3 of 32, line 3, which shows total costs allocated to energy as $74,695,222. Please show how this total is calculated (activities 5, 7.4, and 12 under line 1 do not appear to add up to the total shown on line 3).**

Answer: The calculation of the total costs allocated to energy on Form 42-2P line 3 is as follows:

Project No.	Project Description	End of Period Total
Line 1 - 5	SO2 and NOx Emissions	$71,976,198
Line 1 - 7.4	CAIR/CAMR Crystal River AFUDC	2,662,344
Line 1 - 12	Greenhouse Gas Inventory & Reporting	56,680
	Energy per Line 1: TOTAL	**$74,695,222**
Line 3	Recoverable Costs Allocated to Energy	$74,695,222
	Difference	**$ -**

DATED this 20th day of October, 2008.

HOPPING GREEN & SAMS, P.A.

Notice of Service of Discovery Response

Dear Ms. Cole:

Please take notice that Progress Energy Florida, Inc. has today served its Response to Staff's Sixth Set of Interrogatories (No. 26).

By copy of this letter, the response has been furnished to all parties of record.

If you have any questions regarding this notice, please give me a call at 425-2359.

Very truly yours,

Gary V. Perko

Gulf's Response to Staff's First Request for Production of Documents (No. 1)

1. Referring to the testimony of Rhonda Martin dated April 2, 2008, please provide a schedule that shows the capital structure, components, and cost rates relied upon for calculating the revenue requirement rate of return. Please include in this schedule the derivation of debt and equity components used in the Return on Average Net Investment, lines 7 (a) and (b), on Schedule 8A attached to the testimony. Please cite all sources and include the rationale for using the particular capital structure and cost rates.

ANSWER:

In accordance with FPSC Order No. PSC-94-0044-FOF-EI, the rate of return used to develop the revenue requirements of ECRC investment is based on the capital structure and cost rates approved in Gulf's last rate case, Docket No. 010949-EI, FPSC Order No. PSC-02-0787-FOF-EI, dated June 10, 2002.

Gulf Power Company
Environmental Cost Recovery Clause
Calculation of Revenue Requirement Rate of Return

Gulf's Response to Staff's Second Request for Production of Documents (Nos. 2 - 5)

2. Regarding the proposed Plant Smith SPCC Compliance Project, please provide the following:

   a. The original and the revised versions of Title 40 CFR Part 112.8(c), the SPCC regulation as commonly referred;

   b. Any and all workpapers that were used to derive the estimated 2009 Capital expenditures: $20,000 ± 20%;

   c. Any and all workpapers that were used to derive the estimated 2009 O&M expenses: $5,000 ± 20%.

ANSWER:

2(a) - The SPCC regulation that was in place prior to the July 2002 revision and subsequent amendments is included as Attachment A. The current SPCC regulation is provided in Attachment B. The revised SPCC regulation defines bulk storage containers as "any container used to store oil. These containers are used for purposes including, but not limited to, the storage of oil prior to use, while being used, or prior to further distribution in commerce. Oil-filled electrical, operating, or manufacturing equipment is not a bulk storage container." According to the General Applicability section, 112.1(5), the revised SPCC regulation does not apply to "any container with a storage capacity of less than 55 gallons of oil."

2(b) - The Plant Smith SPCC capital cost estimate was based on a June 2008 proposal from Alabama Metal Fabricators, Inc. (AMF) to construct a concrete secondary containment area for a padmount transformer. The AMF quote is included as Attachment C.

2(c) - The O&M cost estimate was based on working knowledge from similar aboveground storage tank containment projects.

3. Regarding the proposed Plant Crist Water Conservation Project, please provide the following:

   a. A copy of the previously approved "Plant Crist Water Conservation and Consumptive Use Efficiency Program";

   b. A copy of all documents in FPL's possession related to Gulf Power Company's negotiations with Emerald Coast Utilities Authority for utilizing reclaimed water from the utility's new wastewater treatment plant;

   c. Any and all workpapers that Gulf Power used to derive the estimated 2009 Capital expenditures: $17,000,000 ± 20%;

   d. The detailed scope of the project.

ANSWER:

3(a) - A copy of the Plant Crist Consumptive Use permit and correspondence regarding measures Plant Crist has taken to conserve water are included in Attachment D. During 2006 Plant Crist installed automatic level controls on the fire water tanks to reduce groundwater usage. The FPSC granted ECRC approval for recovery of the Plant Crist level controls in Order No. PSC-05-1251-FOF-EI.

3(b) and 3(c) - Per discussion with Staff counsel, Gulf will provide the contract and documentation responsive to this request after negotiations have been completed.

3(d) - See Attachment E.

4. Regarding the proposed Impaired Waters Rule (IWR) Project, please provide the following:

   a. A copy of the FDEP proposed listing of waters in watersheds surrounding Gulf's generating facilities for nutrients and mercury;

   b. Any and all workpapers that Gulf Power used to derive the estimated 2009 O&M expenditures: $100,000 ± 30%;

   c. The detailed scope of the project.

ANSWER:

4(a) - The requested documents are provided as Attachments F, G, H and I.

The map entitled "Map of Hg Impaired Waterbodies" depicts areas in the state of Florida where water quality standards for mercury (Hg) have not been attained. These areas are illustrated in red on the map. This includes the Pensacola Bay system and Escambia River near Plant Crist in Pensacola, FL. The St. Andrews Bay system, which is near Plant Smith in Southport, FL, is also listed for impairment for mercury. Plant Scholz is located in Sneads, FL along the Apalachicola River. The Apalachicola Bay and surrounding Gulf waters are also illustrated as being impaired. There are many contributing factors to the listing of mercury (i.e. global pool of mercury from sources outside of the US as well as natural sources) and a modeling effort will mostly will be required to determine what effect, if any, Gulf's generating facilities may have on these water bodies.

Nutrient listings are also provided in Attachments G through I. These documents illustrate the nutrient as well as other listed impairments in the Apalachicola River (Attachment G), St. Andrews Bay system (Attachment H), and Pensacola Bay system (Attachment I). It should be noted that chlorophyll is a listed impairment that results from nutrients. In addition, in some cases dissolved oxygen listings can be a result of algal populations and other environmental factors. Therefore these parameters, which can be a result of nutrients, may also need to be evaluated.

4. Regarding the proposed Impaired Waters Rule (IWR) Project, please provide the following:

   a. A copy of the FDEP proposed listing of waters in watersheds surrounding Gulf's generating facilities for nutrients and mercury;

   b. Any and all workpapers that Gulf Power used to derive the estimated 2009 O&M expenditures: $100,000 ± 30%;

   c. The detailed scope of the project.

ANSWER:

4(b) - The estimated O&M expenses were derived from a verbal cost estimate from HydroQual, Inc. The verbal estimate from HydroQual was $100,000 per facility. In discussions with HydroQual, Gulf determined the possible need for both hydrodynamic and water quality modeling. Hydrodynamic modeling involves running a model that predicts the effects of wave action, currents and water flow into the system and how these factors affect concentrations of parameters such as nutrients, etc. The water quality modeling portion of the project involves how inputs into the water body as well as existing concentrations are affected by dispersion and diffusion of the various parameters.

If it is deemed necessary to expand the modeling effort to determine if Gulf Power needs to make any reductions in loadings, additional modeling such as air modeling or other studies (surface water or sediment sampling) may be required. This level of study may be required to evaluate the impact of Gulf's permitted industrial wastewater discharges.

4(c) - The IWR project scope has been discussed in response to item 4(b). In summary, water quality in the water bodies around Gulf's generating facilities may need to be modeled to evaluate Gulf's permitted industrial wastewater discharges. As previously discussed, additional sampling or modeling may be required to fully evaluate these sites.

5. Regarding the proposed Annual Climate Registry Fees, please provide any and all workpapers that Gulf Power used to derive the estimated 2009 O&M Expenditures: $8,000 ± 30%.

Answer:

See Attachment J.

The estimated cost for Gulf's initial climate registry fee and historical data reporting is $7,500. The initial registration fee will be based on Gulf's revenue. The initial registration fee for organizations with revenues between $500 million to $ 2 billion is $6,000. The historical data reporting fee is 25 % of the registration fee which would be $1,500 for Gulf.

SOURCE: 38 FR 34165, Dec. 11, 1973, unless otherwise noted.

EDITORIAL NOTE: Nomenclature changes to part 112 appear at 65 FR 40798, June 30, 2000.

§ 112.1 General applicability.

(a) This part establishes procedures, methods and equipment and other requirements for equipment to prevent the discharge of oil from non-transportation-related onshore and offshore facilities into or upon the navigable waters of the United States or adjoining shorelines.

(b) Except as provided in paragraph (d) of this section, this part applies to owners or operators of non-transportation-related onshore and offshore facilities engaged in drilling, producing, gathering, storing, processing, refining, transferring, distributing or consuming oil and oil products, and which, due to their location, could reasonably be expected to discharge oil in harmful quantities, as defined in part 110 of this chapter, into or upon the navigable waters of the United States or adjoining shorelines.

(c) As provided in section 313 (86 Stat. 875) departments, agencies, and instrumentalities of the Federal government are subject to these regulations to the same extent as any person, except for the provisions of § 112.6.

(d) This part does not apply to:

(1) Facilities, equipment or operations which are not subject to the jurisdiction of the Environmental Protection Agency, as follows:

(i) Onshore and offshore facilities, which, due to their location, could not reasonably be expected to discharge oil into or upon the navigable waters of the United States or adjoining shorelines. This determination shall be based solely upon a consideration of the geographical, locational aspects of the facility (such as proximity to navigable waters or adjoining shorelines, land contour, drainage, etc.) and shall exclude consideration of manmade features such as dikes, equipment or other structures which may serve to restrain, hinder, contain, or otherwise prevent a discharge of oil from reaching navigable waters of the United States or adjoining shorelines; and

(ii) Equipment or operations of vessels or transportation-related onshore and offshore facilities which are subject to authority and control of the Department of Transportation, as defined in the Memorandum of Understanding between the Secretary of Transportation and the Administrator of the Environmental Protection Agency, dated November 24, 1971, 36 FR 24000.

(2) Those facilities which, although otherwise subject to the jurisdiction of the Environmental Protection Agency, meet both of the following requirements:

(i) The underground buried storage capacity of the facility is 42,000 gallons or less of oil, and

(ii) The storage capacity, which is not buried, of the facility is 1,320 gallons or less of oil, provided no single container has a capacity in excess of 660 gallons.

(e) This part provides for the preparation and implementation of Spill Prevention Control and Countermeasure Plans prepared in accordance with § 112.7, designed to complement existing laws, regulations, rules, standards, policies and procedures pertaining to safety standards, fire prevention and pollution prevention rules, so as to form a comprehensive balanced Federal/State spill prevention program to minimize the potential for oil discharges. Compliance with this part does not in any way relieve the owner or operator of an onshore or an offshore facility from compliance with other Federal, State or local laws.

[38 FR 34165, Dec. 11, 1973, as amended at 41 FR 12657, Mar. 26, 1976]

§ 112.2 Definitions.

For the purposes of this part:

HEARING EXHIBIT - 00000822

Adverse weather means the weather conditions that make it difficult for response equipment and personnel to cleanup or remove spilled oil, and that will be considered when identifying response systems and equipment in a response plan for the applicable operating environment. Factors to consider include significant wave height as specified in Appendix E to this part, as appropriate, ice conditions, temperatures, weather-related visibility, and currents within the area in which the systems or equipment are intended to function.

Animal fat means a non-petroleum oil, fat, or grease of animal, fish, or marine mammal origin.

Complex means a facility possessing a combination of transportation-related and non-transportation-related components that is subject to the jurisdiction of more than one Federal agency under section 311(j) of the Clean Water Act.

Contract or other approved means: (1) A written contractual agreement with an oil spill removal organization(s) that identifies and ensures the availability of the necessary personnel and equipment within appropriate response times; and/or

(2) A written certification by the owner or operator that the necessary personnel and equipment resources, owned or operated by the facility owner or operator, are available to respond to a discharge within appropriate response times; and/or

(3) Active membership in a local or regional oil spill removal organization(s) that has identified and ensures adequate access through such membership to necessary personnel and equipment to respond to a discharge within appropriate response times in the specified geographic areas; and/or

(4) Other specific arrangements approved by the Regional Administrator upon request of the owner or operator.

Discharge includes but is not limited to, any spilling, leaking, pumping, pouring, emitting, emptying or dumping. For purposes of this part, the term *discharge* shall not include any discharge of oil which is authorized by a permit issued pursuant to section 13 of the River and Harbor Act of 1899 (30 Stat. 1121, 33 U.S.C. 407), or sections 402 or 405 of the FWPCA Amendments of 1972 (86 Stat. 816 *et seq.*, 33 U.S.C. 1251 *et seq.*).

Fish and wildlife and sensitive environments means areas that may be identified by either their legal designation or by evaluations of Area Committees (for planning) or members of the Federal On-Scene Coordinator's spill response structure (during responses). These areas may include wetlands, National and State parks, critical habitats for endangered/threatened species, wilderness and natural resource areas, marine sanctuaries and estuarine reserves, conservation areas, preserves, wildlife areas, wildlife refuges, wild and scenic rivers, recreational areas, national forests, Federal and State lands that are research national areas, heritage program areas, land trust areas, and historical and archeological sites and parks. These areas may also include unique habitats such as: aquaculture sites and agricultural surface water intakes, bird nesting areas, critical biological resource areas, designated migratory routes, and designated seasonal habitats.

Injury means a measurable adverse change, either long- or short-term, in the chemical or physical quality or the viability of a natural resource resulting either directly or indirectly from exposure to a discharge of oil, or exposure to a product of reactions resulting from a discharge of oil.

Maximum extent practicable means the limitations used to determine oil spill planning resources and response times for on-water recovery, shoreline protection, and cleanup for worst case discharges from onshore non- transportation-related facilities in adverse weather. It considers the planned capability to respond to a worst case discharge in adverse weather, as contained in a response plan that meets the requirements in § 112.20 or in a specific plan approved by the Regional Administrator.

The term *navigable waters* of the United States means *navigable waters* as defined in section 502(7) of the FWPCA, and includes:

(1) All navigable waters of the United States, as defined in judicial decisions prior to passage of the 1972 Amendments to the FWPCA (Pub. L. 92–500), and tributaries of such waters;

HEARING EXHIBIT - 00000823

(2) Interstate waters;

(3) Intrastate lakes, rivers, and streams which are utilized by interstate travelers for recreational or other purposes; and

(4) Intrastate lakes, rivers, and streams from which fish or shellfish are taken and sold in interstate commerce.

Navigable waters do not include prior converted cropland. Notwithstanding the determination of an area's status as prior converted cropland by any other federal agency, for the purposes of the Clean Water Act, the final authority regarding Clean Water Act jurisdiction remains with EPA.

Non-petroleum oil means oil of any kind that is not petroleum-based, including but not limited to: Fats, oils, and greases of animal, fish, or marine mammal origin; and vegetable oils, including oils from seeds, nuts, fruits, and kernels.

Offshore facility means any facility of any kind located in, on, or under any of the navigable waters of the United States, which is not a transportation-related facility.

Oil means oil of any kind or in any form, including, but not limited to petroleum, fuel oil, sludge, oil refuse and oil mixed with wastes other than dredged spoil.

Oil Spill Removal Organization means an entity that provides oil spill response resources, and includes any for-profit or not-for-profit contractor, cooperative, or in-house response resources that have been established in a geographic area to provide required response resources.

Onshore facility means any facility of any kind located in, on, or under any land within the United States, other than submerged lands, which is not a transportation-related facility.

Owner or operator means any person owning or operating an onshore facility or an offshore facility, and in the case of any abandoned offshore facility, the person who owned or operated such facility immediately prior to such abandonment.

Person includes an individual, firm, corporation, association, and a partnership.

Petroleum oil means petroleum in any form, including but not limited to crude oil, fuel oil, mineral oil, sludge, oil refuse, and refined products.

Regional Administrator, means the Regional Administrator of the Environmental Protection Agency, or his designee, in and for the Region in which the facility is located.

Spill event means a discharge of oil into or upon the navigable waters of the United States or adjoining shorelines in harmful quantities, as defined at 40 CFR part 110.

Transportation-related and *non-transportation-related* as applied to an onshore or offshore facility, are defined in the Memorandum of Understanding between the Secretary of Transportation and the Administrator of the Environmental Protection Agency, dated November 24, 1971, 36 FR 24080.

United States means the States, the District of Columbia, the Commonwealth of Puerto Rico, the Canal Zone, Guam, American Samoa, the Virgin Islands, and the Trust Territory of the Pacific Islands.

Vegetable oil means a non-petroleum oil or fat of vegetable origin, including but not limited to oils and fats derived from plant seeds, nuts, fruits, and kernels.

Vessel means every description of watercraft or other artificial contrivance used, or capable of being used as a means of transportation on water, other than a public vessel.

Worst case discharge for an onshore non-transportation-related facility means the largest foreseeable discharge in adverse weather conditions as determined using the worksheets in Appendix D to this part.

[38 FR 34165, Dec. 11, 1973, as amended at 58 FR 45039, Aug. 25, 1993; 59 FR 34097, July 1, 1994; 65 FR 40798, June 30, 2000]

§ 112.3 Requirements for preparation and implementation of Spill Prevention Control and Countermeasure Plans.

(a) Owners or operators of onshore and offshore facilities in operation on or before the effective date of this part that have discharged or, due to their location, could reasonably be expected to discharge oil in harmful quantities, as defined in 40 CFR part 110, into or upon the navigable waters of the United States or adjoining shorelines,

HEARING EXHIBIT - 00000824

shall prepare a Spill Prevention Control and Countermeasure Plan (hereinafter "SPCC Plan"), in writing and in accordance with §112.7. Except as provided for in paragraph (f) of this section, such SPCC Plan shall be prepared within six months after the effective date of this part and shall be fully implemented as soon as possible, but not later than one year after the effective date of this part.

(b) Owners or operators of onshore and offshore facilities that become operational after the effective date of this part, and that have discharged or could reasonably be expected to discharge oil in harmful quantities, as defined in 40 CFR part 110, into or upon the navigable waters of the United States or adjoining shorelines, shall prepare an SPCC Plan in accordance with §112.7. Except as provided for in paragraph (f) of this section, such SPCC Plan shall be prepared within six months after the date such facility begins operations and shall be fully implemented as soon as possible, but not later than one year after such facility begins operations.

(c) Owners or operators of onshore and offshore mobile or portable facilities, such as onshore drilling or workover rigs, barge mounted offshore drilling or workover rigs, and portable fueling facilities shall prepare and implement an SPCC Plan as required by paragraphs (a), (b) and (d) of this section. The owners or operators of such facility need not prepare a new SPCC Plan each time the facility is moved to a new site. The SPCC Plan may be a general plan, prepared in accordance with §112.7, using good engineering practice. When the mobile or portable facility is moved, it must be located and installed using the spill prevention practices outlined in the SPCC Plan for the facility. No mobile or portable facility subject to this regulation shall operate unless the SPCC Plan has been implemented. The SPCC Plan shall only apply while the facility is in a fixed (non-transportation) operating mode.

(d) No SPCC Plan shall be effective to satisfy the requirements of this part unless it has been reviewed by a Registered Professional Engineer and certified to by such Professional Engineer. By means of this certification the engineer, having examined the facility and being familiar with the provisions of this part, shall attest that the SPCC Plan has been prepared in accordance with good engineering practices. Such certification shall in no way relieve the owner or operator of an onshore or offshore facility of his duty to prepare and fully implement such Plan in accordance with §112.7, as required by paragraphs (a), (b) and (c) of this section.

(e) Owners or operators of a facility for which an SPCC Plan is required pursuant to paragraph (a), (b) or (c) of this section shall maintain a complete copy of the Plan at such facility if the facility is normally attended at least 8 hours per day, or at the nearest field office if the facility is not so attended, and shall make such Plan available to the Regional Administrator for on-site review during normal working hours.

(f) *Extensions of time.* (1) The Regional Administrator may authorize an extension of time for the preparation and full implementation of an SPCC Plan beyond the time permitted for the preparation and implementation of an SPCC Plan pursuant to paragraph (a), (b) or (c) of this section where he finds that the owner or operator of a facility subject to paragraphs (a), (b) or (c) of this section cannot fully comply with the requirements of this part as a result of either nonavailability of qualified personnel, or delays in construction or equipment delivery beyond the control and without the fault of such owner or operator or their respective agents or employees.

(2) Any owner or operator seeking an extension of time pursuant to paragraph (f)(1) of this section may submit a letter of request to the Regional Administrator. Such letter shall include:

(i) A complete copy of the SPCC Plan, if completed;

(ii) A full explanation of the cause for any such delay and the specific aspects of the SPCC Plan affected by the delay;

(iii) A full discussion of actions being taken or contemplated to minimize or mitigate such delay;

(iv) A proposed time schedule for the implementation of any corrective actions being taken or contemplated, including interim dates for completion of

HEARING EXHIBIT - 00000825

tests or studies, installation and operation of any necessary equipment or other preventive measures.

In addition, such owner or operator may present additional oral or written statements in support of his letter of request.

(3) The submission of a letter of request for extension of time pursuant to paragraph (f)(2) of this section shall in no way relieve the owner or operator from his obligation to comply with the requirements of § 112.3 (a), (b) or (c). Where an extension of time is authorized by the Regional Administrator for particular equipment or other specific aspects of the SPCC Plan, such extension shall in no way affect the owner's or operator's obligation to comply with the requirements of § 112.3 (a), (b) or (c) with respect to other equipment or other specific aspects of the SPCC Plan for which an extension of time has not been expressly authorized.

[38 FR 34165, Dec. 11, 1973, as amended at 41 FR 12657, Mar. 26, 1976]

§ 112.4 Amendment of SPCC Plans by Regional Administrator.

(a) Notwithstanding compliance with § 112.3, whenever a facility subject to § 112.3 (a), (b) or (c) has: Discharged more than 1,000 U.S. gallons of oil into or upon the navigable waters of the United States or adjoining shorelines in a single spill event, or discharged oil in harmful quantities, as defined in 40 CFR part 110, into or upon the navigable waters of the United States or adjoining shorelines in two spill events, reportable under section 311(b)(5) of the FWPCA, occurring within any twelve month period, the owner or operator of such facility shall submit to the Regional Administrator, within 60 days from the time such facility becomes subject to this section, the following:

(1) Name of the facility;

(2) Name(s) of the owner or operator of the facility;

(3) Location of the facility;

(4) Date and year of initial facility operation;

(5) Maximum storage or handling capacity of the facility and normal daily throughput;

(6) Description of the facility, including maps, flow diagrams, and topographical maps;

(7) A complete copy of the SPCC Plan with any amendments;

(8) The cause(s) of such spill, including a failure analysis of system or subsystem in which the failure occurred;

(9) The corrective actions and/or countermeasures taken, including an adequate description of equipment repairs and/or replacements;

(10) Additional preventive measures taken or contemplated to minimize the possibility of recurrence;

(11) Such other information as the Regional Administrator may reasonably require pertinent to the Plan or spill event.

(b) Section 112.4 shall not apply until the expiration of the time permitted for the preparation and implementation of an SPCC Plan pursuant to § 112.3 (a), (b), (c) and (f).

(c) A complete copy of all information provided to the Regional Administrator pursuant to paragraph (a) of this section shall be sent at the same time to the State agency in charge of water pollution control activities in and for the State in which the facility is located. Upon receipt of such information such State agency may conduct a review and make recommendations to the Regional Administrator as to further procedures, methods, equipment and other requirements for equipment necessary to prevent and to contain discharges of oil from such facility.

(d) After review of the SPCC Plan for a facility subject to paragraph (a) of this section, together with all other information submitted by the owner or operator of such facility, and by the State agency under paragraph (c) of this section, the Regional Administrator may require the owner or operator of such facility to amend the SPCC Plan if he finds that the Plan does not meet the requirements of this part or that the amendment of the Plan is necessary to prevent and to contain discharges of oil from such facility.

(e) When the Regional Administrator proposes to require an amendment to the SPCC Plan, he shall notify the facility operator by certified mail addressed to, or by personal delivery to,

HEARING EXHIBIT - 00000826

the facility owner or operator, that he proposes to require an amendment to the Plan, and shall specify the terms of such amendment. If the facility owner or operator is a corporation, a copy of such notice shall also be mailed to the registered agent, if any, of such corporation in the State where such facility is located. Within 30 days from receipt of such notice, the facility owner or operator may submit written information, views, and arguments on the amendment. After considering all relevant material presented, the Regional Administrator shall notify the facility owner or operator of any amendment required or shall rescind the notice. The amendment required by the Regional Administrator shall become part of the Plan 30 days after such notice, unless the Regional Administrator, for good cause, shall specify another effective date. The owner or operator of the facility shall implement the amendment of the Plan as soon as possible, but not later than six months after the amendment becomes part of the Plan, unless the Regional Administrator specifies another date.

(f) An owner or operator may appeal a decision made by the Regional Administrator requiring an amendment to an SPCC Plan. The appeal shall be made to the Administrator of the United States Environmental Protection Agency and must be made in writing within 30 days of receipt of the notice from the Regional Administrator requiring the amendment. A complete copy of the appeal must be sent to the Regional Administrator at the time the appeal is made. The appeal shall contain a clear and concise statement of the issues and points of fact in the case. It may also contain additional information from the owner or operator, or from any other person. The Administrator or his designee may request additional information from the owner or operator, or from any other person. The Administrator or his designee shall render a decision within 60 days of receiving the appeal and shall notify the owner or operator of his decision.

[38 FR 34165, Dec. 11, 1973, as amended at 41 FR 12658, Mar. 26, 1976]

§ 112.5 Amendment of Spill Prevention Control and Countermeasure Plans by owners or operators.

(a) Owners or operators of facilities subject to § 112.3 (a), (b) or (c) shall amend the SPCC Plan for such facility in accordance with § 112.7 whenever there is a change in facility design, construction, operation or maintenance which materially affects the facility's potential for the discharge of oil into or upon the navigable waters of the United States or adjoining shore lines. Such amendments shall be fully implemented as soon as possible, but not later than six months after such change occurs.

(b) Notwithstanding compliance with paragraph (a) of this section, owners and operators of facilities subject to § 112.3 (a), (b) or (c) shall complete a review and evaluation of the SPCC Plan at least once every three years from the date such facility becomes subject to this part. As a result of this review and evaluation, the owner or operator shall amend the SPCC Plan within six months of the review to include more effective prevention and control technology if: (1) Such technology will significantly reduce the likelihood of a spill event from the facility, and (2) if such technology has been field-proven at the time of the review.

(c) No amendment to an SPCC Plan shall be effective to satisfy the requirements of this section unless it has been certified by a Professional Engineer in accordance with § 112.3(d).

§ 112.7 Guidelines for the preparation and implementation of a Spill Prevention Control and Countermeasure Plan.

The SPCC Plan shall be a carefully thought-out plan, prepared in accordance with good engineering practices, and which has the full approval of management at a level with authority to commit the necessary resources. If the plan calls for additional facilities or procedures, methods, or equipment not yet fully operational, these items should be discussed in separate paragraphs, and the details of installation and operational start-up should be explained separately. The complete SPCC Plan shall follow the sequence outlined below, and include a discussion of the

HEARING EXHIBIT - 00000827

facility's conformance with the appropriate guidelines listed:

(a) A facility which has experienced one or more spill events within twelve months prior to the effective date of this part should include a written description of each such spill, corrective action taken and plans for preventing recurrence.

(b) Where experience indicates a reasonable potential for equipment failure (such as tank overflow, rupture, or leakage), the plan should include a prediction of the direction, rate of flow, and total quantity of oil which could be discharged from the facility as a result of each major type of failure.

(c) Appropriate containment and/or diversionary structures or equipment to prevent discharged oil from reaching a navigable water course should be provided. One of the following preventive systems or its equivalent should be used as a minimum:

(1) Onshore facilities:

(i) Dikes, berms or retaining walls sufficiently impervious to contain spilled oil;

(ii) Curbing;

(iii) Culverting, gutters or other drainage systems;

(iv) Weirs, booms or other barriers;

(v) Spill diversion ponds;

(vi) Retention ponds;

(vii) Sorbent materials.

(2) Offshore facilities:

(i) Curbing, drip pans;

(ii) Sumps and collection systems.

(d) When it is determined that the installation of structures or equipment listed in §112.7(c) to prevent discharged oil from reaching the navigable waters is not practicable from any onshore or offshore facility, the owner or operator should clearly demonstrate such impracticability and provide the following:

(1) A strong oil spill contingency plan following the provision of 40 CFR part 109.

(2) A written commitment of manpower, equipment and materials required to expeditiously control and remove any harmful quantity of oil discharged.

(e) In addition to the minimal prevention standards listed under §112.7(c), sections of the Plan should include a complete discussion of conformance with the following applicable guidelines, other effective spill prevention and containment procedures (or, if more stringent, with State rules, regulations and guidelines):

(1) *Facility drainage (onshore); (excluding production facilities).* (i) Drainage from diked storage areas should be restrained by valves or other positive means to prevent a spill or other excessive leakage of oil into the drainage system or inplant effluent treatment system, except where plan systems are designed to handle such leakage. Diked areas may be emptied by pumps or ejectors; however, these should be manually activated and the condition of the accumulation should be examined before starting to be sure no oil will be discharged into the water.

(ii) Flapper-type drain valves should not be used to drain diked areas. Valves used for the drainage of diked areas should, as far as practical, be of manual, open-and-closed design. When plant drainage drains directly into water courses and not into wastewater treatment plants, retained storm water should be inspected as provided in paragraphs (e)(2)(iii) (B), (C) and (D) of this section before drainage.

(iii) Plant drainage systems from undiked areas should, if possible, flow into ponds, lagoons or catchment basins, designed to retain oil or return it to the facility. Catchment basins should not be located in areas subject to periodic flooding.

(iv) If plant drainage is not engineered as above, the final discharge of all in-plant ditches should be equipped with a diversion system that could, in the event of an uncontrolled spill, return the oil to the plant.

(v) Where drainage waters are treated in more than one treatment unit, natural hydraulic flow should be used. If pump transfer is needed, two "lift" pumps should be provided, and at least one of the pumps should be permanently installed when such treatment is continuous. In any event, whatever techniques are used facility drainage systems should be adequately engineered to prevent oil from reaching navigable waters in the event of equipment failure or human error at the facility.

HEARING EXHIBIT - 00000828

(2) *Bulk storage tanks (onshore); (excluding production facilities).* (i) No tank should be used for the storage of oil unless its material and construction are compatible with the material stored and conditions of storage such as pressure and temperature, etc.

(ii) All bulk storage tank installations should be constructed so that a secondary means of containment is provided for the entire contents of the largest single tank plus sufficient freeboard to allow for precipitation. Diked areas should be sufficiently impervious to contain spilled oil. Dikes, containment curbs, and pits are commonly employed for this purpose, but they may not always be appropriate. An alternative system could consist of a complete drainage trench enclosure arranged so that a spill could terminate and be safely confined in an in-plant catchment basin or holding pond.

(iii) Drainage of rainwater from the diked area into a storm drain or an effluent discharge that empties into an open water course, lake, or pond, and bypassing the in-plant treatment system may be acceptable if:

(A) The bypass valve is normally sealed closed.

(B) Inspection of the run-off rain water ensures compliance with applicable water quality standards and will not cause a harmful discharge as defined in 40 CFR part 110.

(C) The bypass valve is opened, and resealed following drainage under responsible supervision.

(D) Adequate records are kept of such events.

(iv) Buried metallic storage tanks represent a potential for undetected spills. A new buried installation should be protected from corrosion by coatings, cathodic protection or other effective methods compatible with local soil conditions. Such buried tanks should at least be subjected to regular pressure testing.

(v) Partially buried metallic tanks for the storage of oil should be avoided, unless the buried section of the shell is adequately coated, since partial burial in damp earth can cause rapid corrosion of metallic surfaces, especially at the earth/air interface.

(vi) Aboveground tanks should be subject to periodic integrity testing, taking into account tank design (floating roof, etc.) and using such techniques as hydrostatic testing, visual inspection or a system of non-destructive shell thickness testing. Comparison records should be kept where appropriate, and tank supports and foundations should be included in these inspections. In addition, the outside of the tank should frequently be observed by operating personnel for signs of deterioration, leaks which might cause a spill, or accumulation of oil inside diked areas.

(vii) To control leakage through defective internal heating coils, the following factors should be considered and applied, as appropriate.

(A) The steam return or exhaust lines from internal heating coils which discharge into an open water course should be monitored for contamination, or passed through a settling tank, skimmer, or other separation or retention system.

(B) The feasibility of installing an external heating system should also be considered.

(viii) New and old tank installations should, as far as practical, be fail-safe engineered or updated into a fail-safe engineered installation to avoid spills. Consideration should be given to providing one or more of the following devices:

(A) High liquid level alarms with an audible or visual signal at a constantly manned operation or surveillance station; in smaller plants an audible air vent may suffice.

(B) Considering size and complexity of the facility, high liquid level pump cutoff devices set to stop flow at a predetermined tank content level.

(C) Direct audible or code signal communication between the tank gauger and the pumping station.

(D) A fast response system for determining the liquid level of each bulk storage tank such as digital computers, telepulse, or direct vision gauges or their equivalent.

(E) Liquid level sensing devices should be regularly tested to insure proper operation.

(ix) Plant effluents which are discharged into navigable waters should

HEARING EXHIBIT - 00000829

have disposal facilities observed frequently enough to detect possible system upsets that could cause an oil spill event.

(x) Visible oil leaks which result in a loss of oil from tank seams, gaskets, rivets and bolts sufficiently large to cause the accumulation of oil in diked areas should be promptly corrected.

(xi) Mobile or portable oil storage tanks (onshore) should be positioned or located so as to prevent spilled oil from reaching navigable waters. A secondary means of containment, such as dikes or catchment basins, should be furnished for the largest single compartment or tank. These facilities should be located where they will not be subject to periodic flooding or washout.

(3) *Facility transfer operations, pumping, and in-plant process (onshore); (excluding production facilities).* (i) Buried piping installations should have a protective wrapping and coating and should be cathodically protected if soil conditions warrant. If a section of buried line is exposed for any reason, it should be carefully examined for deterioration. If corrosion damage is found, additional examination and corrective action should be taken as indicated by the magnitude of the damage. An alternative would be the more frequent use of exposed pipe corridors or galleries.

(ii) When a pipeline is not in service, or in standby service for an extended time the terminal connection at the transfer point should be capped or blank-flanged, and marked as to origin.

(iii) Pipe supports should be properly designed to minimize abrasion and corrosion and allow for expansion and contraction.

(iv) All aboveground valves and pipelines should be subjected to regular examinations by operating personnel at which time the general condition of items, such as flange joints, expansion joints, valve glands and bodies, catch pans, pipeline supports, locking of valves, and metal surfaces should be assessed. In addition, periodic pressure testing may be warranted for piping in areas where facility drainage is such that a failure might lead to a spill event.

(v) Vehicular traffic granted entry into the facility should be warned verbally or by appropriate signs to be sure that the vehicle, because of its size, will not endanger above ground piping.

(4) *Facility tank car and tank truck loading/unloading rack (onshore).* (i) Tank car and tank truck loading/unloading procedures should meet the minimum requirements and regulation established by the Department of Transportation.

(ii) Where rack area drainage does not flow into a catchment basin or treatment facility designed to handle spills, a quick drainage system should be used for tank truck loading and unloading areas. The containment system should be designed to hold at least maximum capacity of any single compartment of a tank car or tank truck loaded or unloaded in the plant.

(iii) An interlocked warning light or physical barrier system, or warning signs, should be provided in loading/unloading areas to prevent vehicular departure before complete disconnect of flexible or fixed transfer lines.

(iv) Prior to filling and departure of any tank car or tank truck, the lowermost drain and all outlets of such vehicles should be closely examined for leakage, and if necessary, tightened, adjusted, or replaced to prevent liquid leakage while in transit.

(5) *Oil production facilities (onshore)*— (i) *Definition.* An onshore production facility may include all wells, flowlines, separation equipment, storage facilities, gathering lines, and auxiliary non-transportation-related equipment and facilities in a single geographical oil or gas field operated by a single operator.

(ii) *Oil production facility (onshore) drainage.* (A) At tank batteries and central treating stations where an accidental discharge of oil would have a reasonable possibility of reaching navigable waters, the dikes or equivalent required under § 112.7(c)(1) should have drains closed and sealed at all times except when rainwater is being drained. Prior to drainage, the diked area should be inspected as provided in paragraphs (e)(2)(iii) (B), (C), and (D) of this section. Accumulated oil on the rainwater should be picked up and returned to storage or disposed of in accordance with approved methods.

HEARING EXHIBIT - 00000830

(B) Field drainage ditches, road ditches, and oil traps, sumps or skimmers, if such exist, should be inspected at regularly scheduled intervals for accumulation of oil that may have escaped from small leaks. Any such accumulations should be removed.

(iii) *Oil production facility (onshore) bulk storage tanks.* (A) No tank should be used for the storage of oil unless its material and construction are compatible with the material stored and the conditions of storage.

(B) All tank battery and central treating plant installations should be provided with a secondary means of containment for the entire contents of the largest single tank if feasible, or alternate systems such as those outlined in §112.7(c)(1). Drainage from undiked areas should be safely confined in a catchment basin or holding pond.

(C) All tanks containing oil should be visually examined by a competent person for condition and need for maintenance on a scheduled periodic basis. Such examination should include the foundation and supports of tanks that are above the surface of the ground.

(D) New and old tank battery installations should, as far as practical, be fail-safe engineered or updated into a fail-safe engineered installation to prevent spills. Consideration should be given to one or more of the following:

(*1*) Adequate tank capacity to assure that a tank will not overfill should a pumper/gauger be delayed in making his regular rounds.

(*2*) Overflow equalizing lines between tanks so that a full tank can overflow to an adjacent tank.

(*3*) Adequate vacuum protection to prevent tank collapse during a pipeline run.

(*4*) High level sensors to generate and transmit an alarm signal to the computer where facilities are a part of a computer production control system.

(iv) *Facility transfer operations, oil production facility (onshore).* (A) All above ground valves and pipelines should be examined periodically on a scheduled basis for general condition of items such as flange joints, valve glands and bodies, drip pans, pipeline supports, pumping well polish rod stuffing boxes, bleeder and gauge valves.

(B) Salt water (oil field brine) disposal facilities should be examined often, particularly following a sudden change in atmospheric temperature to detect possible system upsets that could cause an oil discharge.

(C) Production facilities should have a program of flowline maintenance to prevent spills from this source. The program should include periodic examinations, corrosion protection, flowline replacement, and adequate records, as appropriate, for the individual facility.

(6) *Oil drilling and workover facilities (onshore).* (i) Mobile drilling or workover equipment should be positioned or located so as to prevent spilled oil from reaching navigable waters.

(ii) Depending on the location, catchment basins or diversion structures may be necessary to intercept and contain spills of fuel, crude oil, or oily drilling fluids.

(iii) Before drilling below any casing string or during workover operations, a blowout prevention (BOP) assembly and well control system should be installed that is capable of controlling any well head pressure that is expected to be encountered while that BOP assembly is on the well. Casing and BOP installations should be in accordance with State regulatory agency requirements.

(7) *Oil drilling, production, or workover facilities (offshore).* (i) Definition: "An oil drilling, production or workover facility (offshore)" may include all drilling or workover equipment, wells, flowlines, gathering lines, platforms, and auxiliary nontransportation-related equipment and facilities in a single geographical oil or gas field operated by a single operator.

(ii) Oil drainage collection equipment should be used to prevent and control small oil spillage around pumps, glands, valves, flanges, expansion joints, hoses, drain lines, separators, treaters, tanks, and allied equipment. Drains on the facility should be controlled and directed toward a central collection sump or equivalent collection system sufficient to prevent discharges of oil into the navigable waters of the United States. Where drains and sumps are not practicable oil contained

HEARING EXHIBIT - 00000831

in collection equipment should be removed as often as necessary to prevent overflow.

(iii) For facilities employing a sump system, sump and drains should be adequately sized and a spare pump or equivalent method should be available to remove liquid from the sump and assure that oil does not escape. A regular scheduled preventive maintenance inspection and testing program should be employed to assure reliable operation of the liquid removal system and pump start-up device. Redundant automatic sump pumps and control devices may be required on some installations.

(iv) In areas where separators and treaters are equipped with dump valves whose predominant mode of failure is in the closed position and pollution risk is high, the facility should be specially equipped to prevent the escape of oil. This could be accomplished by extending the flare line to a diked area if the separator is near shore, equipping it with a high liquid level sensor that will automatically shut-in wells producing to the separator, parallel redundant dump valves, or other feasible alternatives to prevent oil discharges.

(v) Atmospheric storage or surge tanks should be equipped with high liquid level sensing devices or other acceptable alternatives to prevent oil discharges.

(vi) Pressure tanks should be equipped with high and low pressure sensing devices to activate an alarm and/or control the flow or other acceptable alternatives to prevent oil discharges.

(vii) Tanks should be equipped with suitable corrosion protection.

(viii) A written procedure for inspecting and testing pollution prevention equipment and systems should be prepared and maintained at the facility. Such procedures should be included as part of the SPCC Plan.

(ix) Testing and inspection of the pollution prevention equipment and systems at the facility should be conducted by the owner or operator on a scheduled periodic basis commensurate with the complexity, conditions and circumstances of the facility or other appropriate regulations.

(x) Surface and subsurface well shut-in valves and devices in use at the facility should be sufficiently described to determine method of activation or control, e.g., pressure differential, change in fluid or flow conditions, combination of pressure and flow, manual or remote control mechanisms. Detailed records for each well, while not necessarily part of the plan should be kept by the owner or operator.

(xi) Before drilling below any casing string, and during workover operations a blowout preventer (BOP) assembly and well control system should be installed that is capable of controlling any well-head pressure that is expected to be encountered while that BOP assembly is on the well. Casing and BOP installations should be in accordance with State regulatory agency requirements.

(xii) Extraordinary well control measures should be provided should emergency conditions, including fire, loss of control and other abnormal conditions, occur. The degree of control system redundancy should vary with hazard exposure and probable consequences of failure. It is recommended that surface shut-in systems have redundant or "fail close" valving. Subsurface safety valves may not be needed in producing wells that will not flow but should be installed as required by applicable State regulations.

(xiii) In order that there will be no misunderstanding of joint and separate duties and obligations to perform work in a safe and pollution free manner, written instructions should be prepared by the owner or operator for contractors and subcontractors to follow whenever contract activities include servicing a well or systems appurtenant to a well or pressure vessel. Such instructions and procedures should be maintained at the offshore production facility. Under certain circumstances and conditions such contractor activities may require the presence at the facility of an authorized representative of the owner or operator who would intervene when necessary to prevent a spill event.

(xiv) All manifolds (headers) should be equipped with check valves on individual flowlines.

(xv) If the shut-in well pressure is greater than the working pressure of the flowline and manifold valves up to

HEARING EXHIBIT - 00000832

and including the header valves associated with that individual flowline, the flowline should be equipped with a high pressure sensing device and shut-in valve at the wellhead unless provided with a pressure relief system to prevent over pressuring.

(xvi) All pipelines appurtenant to the facility should be protected from corrosion. Methods used, such as protective coatings or cathodic protection, should be discussed.

(xvii) Sub-marine pipelines appurtenant to the facility should be adequately protected against environmental stresses and other activities such as fishing operations.

(xviii) Sub-marine pipelines appurtenant to the facility should be in good operating condition at all times and inspected on a scheduled periodic basis for failures. Such inspections should be documented and maintained at the facility.

(8) *Inspections and records.* Inspections required by this part should be in accordance with written procedures developed for the facility by the owner or operator. These written procedures and a record of the inspections, signed by the appropriate supervisor or inspector, should be made part of the SPCC Plan and maintained for a period of three years.

(9) *Security (excluding oil production facilities).* (i) All plants handling, processing, and storing oil should be fully fenced, and entrance gates should be locked and/or guarded when the plant is not in production or is unattended.

(ii) The master flow and drain valves and any other valves that will permit direct outward flow of the tank's content to the surface should be securely locked in the closed position when in non-operating or non-standby status.

(iii) The starter control on all oil pumps should be locked in the "off" position or located at a site accessible only to authorized personnel when the pumps are in a non-operating or non-standby status.

(iv) The loading/unloading connections of oil pipelines should be securely capped or blank-flanged when not in service or standby service for an extended time. This security practice should also apply to pipelines that are emptied of liquid content either by draining or by inert gas pressure.

(v) Facility lighting should be commensurate with the type and location of the facility. Consideration should be given to: (A) Discovery of spills occurring during hours of darkness, both by operating personnel, if present, and by non-operating personnel (the general public, local police, etc.) and (B) prevention of spills occurring through acts of vandalism.

(10) *Personnel, training and spill prevention procedures.* (i) Owners or operators are responsible for properly instructing their personnel in the operation and maintenance of equipment to prevent the discharges of oil and applicable pollution control laws, rules and regulations.

(ii) Each applicable facility should have a designated person who is accountable for oil spill prevention and who reports to line management.

(iii) Owners or operators should schedule and conduct spill prevention briefings for their operating personnel at intervals frequent enough to assure adequate understanding of the SPCC Plan for that facility. Such briefings should highlight and describe known spill events or failures, malfunctioning components, and recently developed precautionary measures.

§ 112.20 Facility response plans.

(a) The owner or operator of any non-transportation-related onshore facility that, because of its location, could reasonably be expected to cause substantial harm to the environment by discharging oil into or on the navigable waters or adjoining shorelines shall prepare and submit a facility response plan to the Regional Administrator, according to the following provisions:

(1) For the owner or operator of a facility in operation on or before February 18, 1993 who is required to prepare and submit a response plan under 33 U.S.C. 1321(j)(5), the Oil Pollution Act of 1990 (Pub. L. 101–380, 33 U.S.C. 2701 *et seq.*) requires the submission of a response plan that satisfies the requirements of 33 U.S.C. 1321(j)(5) no later than February 18, 1993.

(i) The owner or operator of an existing facility that was in operation on or before February 18, 1993 who submitted

Subpart A—Applicability, Definitions, and General Requirements for All Facilities and All Types of Oils

SOURCE: 67 FR 47140, July 17, 2002, unless otherwise noted.

§ 112.1 General applicability.

(a)(1) This part establishes procedures, methods, equipment, and other requirements to prevent the discharge of oil from non-transportation-related onshore and offshore facilities into or upon the navigable waters of the United States or adjoining shorelines, or into or upon the waters of the contiguous zone, or in connection with activities under the Outer Continental Shelf Lands Act or the Deepwater Port Act of 1974, or that may affect natural resources belonging to, appertaining to, or under the exclusive management authority of the United States (including resources under the Magnuson Fishery Conservation and Management Act).

(2) As used in this part, words in the singular also include the plural and words in the masculine gender also include the feminine and vice versa, as the case may require.

(b) Except as provided in paragraph (d) of this section, this part applies to any owner or operator of a non-transportation-related onshore or offshore facility engaged in drilling, producing, gathering, storing, processing, refining, transferring, distributing, using, or consuming oil and oil products, which due to its location, could reasonably be expected to discharge oil in quantities that may be harmful, as described in part 110 of this chapter, into or upon the navigable waters of the United States or adjoining shorelines, or into or upon the waters of the contiguous zone, or in connection with activities under the Outer Continental Shelf Lands Act or the Deepwater Port Act of 1974, or that may affect natural resources belonging to, appertaining to, or under the exclusive management authority of the United States (including resources under the Magnuson Fishery Conservation and Management Act) that has oil in:

(1) Any aboveground container;

(2) Any completely buried tank as defined in § 112.2;

(3) Any container that is used for standby storage, for seasonal storage, or for temporary storage, or not otherwise "permanently closed" as defined in § 112.2;

(4) Any "bunkered tank" or "partially buried tank" as defined in § 112.2, or any container in a vault, each of which is considered an aboveground storage container for purposes of this part.

(c) As provided in section 313 of the Clean Water Act (CWA), departments, agencies, and instrumentalities of the Federal government are subject to this part to the same extent as any person.

(d) Except as provided in paragraph (f) of this section, this part does not apply to:

(1) The owner or operator of any facility, equipment, or operation that is not subject to the jurisdiction of the Environmental Protection Agency (EPA) under section 311(j)(1)(C) of the CWA, as follows:

(i) Any onshore or offshore facility, that due to its location, could not reasonably be expected to have a discharge as described in paragraph (b) of this section. This determination must be based solely upon consideration of

HEARING EXHIBIT - 00000835

the geographical and location aspects of the facility (such as proximity to navigable waters or adjoining shorelines, land contour, drainage, etc.) and must exclude consideration of manmade features such as dikes, equipment or other structures, which may serve to restrain, hinder, contain, or otherwise prevent a discharge as described in paragraph (b) of this section.

(ii) Any equipment, or operation of a vessel or transportation-related onshore or offshore facility which is subject to the authority and control of the U.S. Department of Transportation, as defined in the Memorandum of Understanding between the Secretary of Transportation and the Administrator of EPA, dated November 24, 1971 (Appendix A of this part).

(iii) Any equipment, or operation of a vessel or onshore or offshore facility which is subject to the authority and control of the U.S. Department of Transportation or the U.S. Department of the Interior, as defined in the Memorandum of Understanding between the Secretary of Transportation, the Secretary of the Interior, and the Administrator of EPA, dated November 8, 1993 (Appendix B of this part).

(2) Any facility which, although otherwise subject to the jurisdiction of EPA, meets both of the following requirements:

(i) The completely buried storage capacity of the facility is 42,000 gallons or less of oil. For purposes of this exemption, the completely buried storage capacity of a facility excludes the capacity of a completely buried tank, as defined in §112.2, and connected underground piping, underground ancillary equipment, and containment systems, that is currently subject to all of the technical requirements of part 280 of this chapter or all of the technical requirements of a State program approved under part 281 of this chapter. The completely buried storage capacity of a facility also excludes the capacity of a container that is "permanently closed," as defined in §112.2.

(ii) The aggregate aboveground storage capacity of the facility is 1,320 gallons or less of oil. For the purposes of this exemption, only containers with a capacity of 55 gallons or greater are counted. The aggregate aboveground storage capacity of a facility excludes the capacity of a container that is "permanently closed," and the capacity of a "motive power container" as defined in §112.2.

(3) Any offshore oil drilling, production, or workover facility that is subject to the notices and regulations of the Minerals Management Service, as specified in the Memorandum of Understanding between the Secretary of Transportation, the Secretary of the Interior, and the Administrator of EPA, dated November 8, 1993 (Appendix B of this part).

(4) Any completely buried storage tank, as defined in §112.2, and connected underground piping, underground ancillary equipment, and containment systems, at any facility, that is subject to all of the technical requirements of part 280 of this chapter or a State program approved under part 281 of this chapter, except that such a tank must be marked on the facility diagram as provided in §112.7(a)(3), if the facility is otherwise subject to this part.

(5) Any container with a storage capacity of less than 55 gallons of oil.

(6) Any facility or part thereof used exclusively for wastewater treatment and not used to satisfy any requirement of this part. The production, recovery, or recycling of oil is not wastewater treatment for purposes of this paragraph.

(7) Any "motive power container," as defined in §112.2. The transfer of fuel or other oil into a motive power container at an otherwise regulated facility is not eligible for this exemption.

(e) This part establishes requirements for the preparation and implementation of Spill Prevention, Control, and Countermeasure (SPCC) Plans. SPCC Plans are designed to complement existing laws, regulations, rules, standards, policies, and procedures pertaining to safety standards, fire prevention, and pollution prevention rules. The purpose of an SPCC Plan is to form a comprehensive Federal/State spill prevention program that minimizes the potential for discharges. The SPCC Plan must address all relevant spill prevention, control, and countermeasures necessary at the specific facility. Compliance with this

HEARING EXHIBIT - 00000836

part does not in any way relieve the owner or operator of an onshore or an offshore facility from compliance with other Federal, State, or local laws.

(f) Notwithstanding paragraph (d) of this section, the Regional Administrator may require that the owner or operator of any facility subject to the jurisdiction of EPA under section 311(j) of the CWA prepare and implement an SPCC Plan, or any applicable part, to carry out the purposes of the CWA.

(1) Following a preliminary determination, the Regional Administrator must provide a written notice to the owner or operator stating the reasons why he must prepare an SPCC Plan, or applicable part. The Regional Administrator must send such notice to the owner or operator by certified mail or by personal delivery. If the owner or operator is a corporation, the Regional Administrator must also mail a copy of such notice to the registered agent, if any and if known, of the corporation in the State where the facility is located.

(2) Within 30 days of receipt of such written notice, the owner or operator may provide information and data and may consult with the Agency about the need to prepare an SPCC Plan, or applicable part.

(3) Within 30 days following the time under paragraph (b)(2) of this section within which the owner or operator may provide information and data and consult with the Agency about the need to prepare an SPCC Plan, or applicable part, the Regional Administrator must make a final determination regarding whether the owner or operator is required to prepare and implement an SPCC Plan, or applicable part. The Regional Administrator must send the final determination to the owner or operator by certified mail or by personal delivery. If the owner or operator is a corporation, the Regional Administrator must also mail a copy of the final determination to the registered agent, if any and if known, of the corporation in the State where the facility is located.

(4) If the Regional Administrator makes a final determination that an SPCC Plan, or applicable part, is necessary, the owner or operator must prepare the Plan, or applicable part, within six months of that final determination and implement the Plan, or applicable part, as soon as possible, but not later than one year after the Regional Administrator has made a final determination.

(5) The owner or operator may appeal a final determination made by the Regional Administrator requiring preparation and implementation of an SPCC Plan, or applicable part, under this paragraph. The owner or operator must make the appeal to the Administrator of EPA within 30 days of receipt of the final determination under paragraph (b)(3) of this section from the Regional Administrator requiring preparation and/or implementation of an SPCC Plan, or applicable part. The owner or operator must send a complete copy of the appeal to the Regional Administrator at the time he makes the appeal to the Administrator. The appeal must contain a clear and concise statement of the issues and points of fact in the case. In the appeal, the owner or operator may also provide additional information. The additional information may be from any person. The Administrator may request additional information from the owner or operator. The Administrator must render a decision within 60 days of receiving the appeal or additional information submitted by the owner or operator and must serve the owner or operator with the decision made in the appeal in the manner described in paragraph (f)(1) of this section.

[67 FR 47140, July 17, 2002, as amended at 71 FR 77290, Dec. 26, 2006]

§ 112.2 Definitions.

For the purposes of this part:

Adverse weather means weather conditions that make it difficult for response equipment and personnel to clean up or remove spilled oil, and that must be considered when identifying response systems and equipment in a response plan for the applicable operating environment. Factors to consider include significant wave height as specified in Appendix E to this part (as appropriate), ice conditions, temperatures, weather-related visibility, and currents within the area in which the systems or equipment is intended to function.

HEARING EXHIBIT - 00000837

Alteration means any work on a container involving cutting, burning, welding, or heating operations that changes the physical dimensions or configuration of the container.

Animal fat means a non-petroleum oil, fat, or grease of animal, fish, or marine mammal origin.

Breakout tank means a container used to relieve surges in an oil pipeline system or to receive and store oil transported by a pipeline for reinjection and continued transportation by pipeline.

Bulk storage container means any container used to store oil. These containers are used for purposes including, but not limited to, the storage of oil prior to use, while being used, or prior to further distribution in commerce. Oil-filled electrical, operating, or manufacturing equipment is not a bulk storage container.

Bunkered tank means a container constructed or placed in the ground by cutting the earth and re-covering the container in a manner that breaks the surrounding natural grade, or that lies above grade, and is covered with earth, sand, gravel, asphalt, or other material. A bunkered tank is considered an aboveground storage container for purposes of this part.

Completely buried tank means any container completely below grade and covered with earth, sand, gravel, asphalt, or other material. Containers in vaults, bunkered tanks, or partially buried tanks are considered aboveground storage containers for purposes of this part.

Complex means a facility possessing a combination of transportation-related and non-transportation-related components that is subject to the jurisdiction of more than one Federal agency under section 311(j) of the CWA.

Contiguous zone means the zone established by the United States under Article 24 of the Convention of the Territorial Sea and Contiguous Zone, that is contiguous to the territorial sea and that extends nine miles seaward from the outer limit of the territorial area.

Contract or other approved means means:

(1) A written contractual agreement with an oil spill removal organization that identifies and ensures the availability of the necessary personnel and equipment within appropriate response times; and/or

(2) A written certification by the owner or operator that the necessary personnel and equipment resources, owned or operated by the facility owner or operator, are available to respond to a discharge within appropriate response times; and/or

(3) Active membership in a local or regional oil spill removal organization that has identified and ensures adequate access through such membership to necessary personnel and equipment to respond to a discharge within appropriate response times in the specified geographic area; and/or

(4) Any other specific arrangement approved by the Regional Administrator upon request of the owner or operator.

Discharge includes, but is not limited to, any spilling, leaking, pumping, pouring, emitting, emptying, or dumping of oil, but excludes discharges in compliance with a permit under section 402 of the CWA; discharges resulting from circumstances identified, reviewed, and made a part of the public record with respect to a permit issued or modified under section 402 of the CWA, and subject to a condition in such permit; or continuous or anticipated intermittent discharges from a point source, identified in a permit or permit application under section 402 of the CWA, that are caused by events occurring within the scope of relevant operating or treatment systems. For purposes of this part, the term discharge shall not include any discharge of oil that is authorized by a permit issued under section 13 of the River and Harbor Act of 1899 (33 U.S.C. 407).

Facility means any mobile or fixed, onshore or offshore building, structure, installation, equipment, pipe, or pipeline (other than a vessel or a public vessel) used in oil well drilling operations, oil production, oil refining, oil storage, oil gathering, oil processing, oil transfer, oil distribution, and waste treatment, or in which oil is used, as described in Appendix A to this part. The boundaries of a facility depend on several site-specific factors, including, but not limited to, the ownership or operation of buildings, structures, and

HEARING EXHIBIT - 00000838

equipment on the same site and the types of activity at the site.

Farm means a facility on a tract of land devoted to the production of crops or raising of animals, including fish, which produced and sold, or normally would have produced and sold, $1,000 or more of agricultural products during a year.

Fish and wildlife and sensitive environments means areas that may be identified by their legal designation or by evaluations of Area Committees (for planning) or members of the Federal On-Scene Coordinator's spill response structure (during responses). These areas may include wetlands, National and State parks, critical habitats for endangered or threatened species, wilderness and natural resource areas, marine sanctuaries and estuarine reserves, conservation areas, preserves, wildlife areas, wildlife refuges, wild and scenic rivers, recreational areas, national forests, Federal and State lands that are research national areas, heritage program areas, land trust areas, and historical and archaeological sites and parks. These areas may also include unique habitats such as aquaculture sites and agricultural surface water intakes, bird nesting areas, critical biological resource areas, designated migratory routes, and designated seasonal habitats.

Injury means a measurable adverse change, either long- or short-term, in the chemical or physical quality or the viability of a natural resource resulting either directly or indirectly from exposure to a discharge, or exposure to a product of reactions resulting from a discharge.

Maximum extent practicable means within the limitations used to determine oil spill planning resources and response times for on-water recovery, shoreline protection, and cleanup for worst case discharges from onshore non-transportation-related facilities in adverse weather. It includes the planned capability to respond to a worst case discharge in adverse weather, as contained in a response plan that meets the requirements in §112.20 or in a specific plan approved by the Regional Administrator.

Mobile refueler means a bulk storage container onboard a vehicle or towed, that is designed or used solely to store and transport fuel for transfer into or from an aircraft, motor vehicle, locomotive, vessel, ground service equipment, or other oil storage container.

Motive power container means any onboard bulk storage container used primarily to power the movement of a motor vehicle, or ancillary onboard oil-filled operational equipment. An onboard bulk storage container which is used to store or transfer oil for further distribution is not a motive power container. The definition of motive power container does not include oil drilling or workover equipment, including rigs.

Navigable waters means the waters of the United States, including the territorial seas.

(1) The term includes:

(i) All waters that are currently used, were used in the past, or may be susceptible to use in interstate or foreign commerce, including all waters subject to the ebb and flow of the tide;

(ii) All interstate waters, including interstate wetlands;

(iii) All other waters such as intrastate lakes, rivers, streams (including intermittent streams), mudflats, sandflats, wetlands, sloughs, prairie potholes, wet meadows, playa lakes, or natural ponds, the use, degradation, or destruction of which could affect interstate or foreign commerce including any such waters:

(A) That are or could be used by interstate or foreign travelers for recreational or other purposes; or

(B) From which fish or shellfish are or could be taken and sold in interstate or foreign commerce; or,

(C) That are or could be used for industrial purposes by industries in interstate commerce;

(iv) All impoundments of waters otherwise defined as waters of the United States under this section;

(v) Tributaries of waters identified in paragraphs (1)(i) through (iv) of this definition;

(vi) The territorial sea; and

(vii) Wetlands adjacent to waters (other than waters that are themselves wetlands) identified in paragraph (1) of this definition.

(2) Waste treatment systems, including treatment ponds or lagoons designed to meet the requirements of the

HEARING EXHIBIT - 00000839

CWA (other than cooling ponds which also meet the criteria of this definition) are not waters of the United States. Navigable waters do not include prior converted cropland. Notwithstanding the determination of an area's status as prior converted cropland by any other Federal agency, for the purposes of the CWA, the final authority regarding CWA jurisdiction remains with EPA.

Non-petroleum oil means oil of any kind that is not petroleum-based, including but not limited to: Fats, oils, and greases of animal, fish, or marine mammal origin; and vegetable oils, including oils from seeds, nuts, fruits, and kernels.

Offshore facility means any facility of any kind (other than a vessel or public vessel) located in, on, or under any of the navigable waters of the United States, and any facility of any kind that is subject to the jurisdiction of the United States and is located in, on, or under any other waters.

Oil means oil of any kind or in any form, including, but not limited to: fats, oils, or greases of animal, fish, or marine mammal origin; vegetable oils, including oils from seeds, nuts, fruits, or kernels; and, other oils and greases, including petroleum, fuel oil, sludge, synthetic oils, mineral oils, oil refuse, or oil mixed with wastes other than dredged spoil.

Oil-filled operational equipment means equipment that includes an oil storage container (or multiple containers) in which the oil is present solely to support the function of the apparatus or the device. Oil-filled operational equipment is not considered a bulk storage container, and does not include oil-filled manufacturing equipment (flow-through process). Examples of oil-filled operational equipment include, but are not limited to, hydraulic systems, lubricating systems (*e.g.*, those for pumps, compressors and other rotating equipment, including pumpjack lubrication systems), gear boxes, machining coolant systems, heat transfer systems, transformers, circuit breakers, electrical switches, and other systems containing oil solely to enable the operation of the device.

Oil Spill Removal Organization means an entity that provides oil spill response resources, and includes any for-profit or not-for-profit contractor, cooperative, or in-house response resources that have been established in a geographic area to provide required response resources.

Onshore facility means any facility of any kind located in, on, or under any land within the United States, other than submerged lands.

Owner or operator means any person owning or operating an onshore facility or an offshore facility, and in the case of any abandoned offshore facility, the person who owned or operated or maintained the facility immediately prior to such abandonment.

Partially buried tank means a storage container that is partially inserted or constructed in the ground, but not entirely below grade, and not completely covered with earth, sand, gravel, asphalt, or other material. A partially buried tank is considered an aboveground storage container for purposes of this part.

Permanently closed means any container or facility for which:

(1) All liquid and sludge has been removed from each container and connecting line; and

(2) All connecting lines and piping have been disconnected from the container and blanked off, all valves (except for ventilation valves) have been closed and locked, and conspicuous signs have been posted on each container stating that it is a permanently closed container and noting the date of closure.

Person includes an individual, firm, corporation, association, or partnership.

Petroleum oil means petroleum in any form, including but not limited to crude oil, fuel oil, mineral oil, sludge, oil refuse, and refined products.

Production facility means all structures (including but not limited to wells, platforms, or storage facilities), piping (including but not limited to flowlines or gathering lines), or equipment (including but not limited to workover equipment, separation equipment, or auxiliary non-transportation-related equipment) used in the production, extraction, recovery, lifting, stabilization, separation or treating of oil, or associated storage or measurement,

HEARING EXHIBIT - 00000840

and located in a single geographical oil or gas field operated by a single operator.

Regional Administrator means the Regional Administrator of the Environmental Protection Agency, in and for the Region in which the facility is located.

Repair means any work necessary to maintain or restore a container to a condition suitable for safe operation, other than that necessary for ordinary, day-to-day maintenance to maintain the functional integrity of the container and that does not weaken the container.

Spill Prevention, Control, and Countermeasure Plan; SPCC Plan, or Plan means the document required by §112.3 that details the equipment, workforce, procedures, and steps to prevent, control, and provide adequate countermeasures to a discharge.

Storage capacity of a container means the shell capacity of the container.

Transportation-related and non-transportation-related, as applied to an onshore or offshore facility, are defined in the Memorandum of Understanding between the Secretary of Transportation and the Administrator of the Environmental Protection Agency, dated November 24, 1971, (Appendix A of this part).

United States means the States, the District of Columbia, the Commonwealth of Puerto Rico, the Commonwealth of the Northern Mariana Islands, Guam, American Samoa, the U.S. Virgin Islands, and the Pacific Island Governments.

Vegetable oil means a non-petroleum oil or fat of vegetable origin, including but not limited to oils and fats derived from plant seeds, nuts, fruits, and kernels.

Vessel means every description of watercraft or other artificial contrivance used, or capable of being used, as a means of transportation on water, other than a public vessel.

Wetlands means those areas that are inundated or saturated by surface or groundwater at a frequency or duration sufficient to support, and that under normal circumstances do support, a prevalence of vegetation typically adapted for life in saturated soil conditions. Wetlands generally include playa lakes, swamps, marshes, bogs, and similar areas such as sloughs, prairie potholes, wet meadows, prairie river overflows, mudflats, and natural ponds.

Worst case discharge for an onshore non-transportation-related facility means the largest foreseeable discharge in adverse weather conditions as determined using the worksheets in Appendix D to this part.

[67 FR 47140, July 17, 2002, as amended at 71 FR 77290, Dec. 26, 2006]

§112.3 Requirement to prepare and implement a Spill Prevention, Control, and Countermeasure Plan.

The owner or operator of an onshore or offshore facility subject to this section must prepare a Spill Prevention, Control, and Countermeasure Plan (hereafter "SPCC Plan" or "Plan)," in writing, and in accordance with §112.7, and any other applicable section of this part.

(a)(1) If your onshore or offshore facility was in operation on or before August 16, 2002, you must maintain your Plan, but most amend it, if necessary to ensure compliance with this part, and implement the Plan no later than July 1, 2009. If your onshore or offshore facility becomes operational after August 16, 2002, through July 1, 2009, and could reasonably be expected to have a discharge as described in §112.1(b), you must prepare and implement a Plan on or before July 1, 2009.

(2) If your onshore facility is a farm as defined in §112.2, the compliance date described in paragraph (a)(1) of this section is delayed until the effective date of a rule establishing SPCC requirements specifically for farms or otherwise establishes dates by which farms must comply with the provisions of this part.

(b)(1) If you are the owner or operator of an onshore or offshore facility that becomes operational after July 1, 2009, and could reasonably be expected to have a discharge as described in §112.1(b), you must prepare and implement a Plan before you begin operations.

(2) If your onshore facility meets the definition of farm in §112.2, the compliance date described in paragraph (b)(1) of this section is delayed until the effective date of a rule establishing

HEARING EXHIBIT - 00000841

SPCC requirements specifically for farms or otherwise establishes dates by which farms must comply with the provisions of this part.

(c) If you are the owner or operator of an onshore or offshore mobile facility, such as an onshore drilling or workover rig, barge mounted offshore drilling or workover rig, or portable fueling facility, you must prepare, implement, and maintain a facility Plan as required by this section. You must maintain your Plan, but must amend and implement it, if necessary to ensure compliance with this part, on or before July 1, 2009. If your onshore or offshore mobile facility becomes operational after July 1, 2009, and could reasonably be expected to have a discharge as described in §112.1(b), you must prepare and implement a Plan before you begin operations. This provision does not require that you prepare a new Plan each time you move the facility to a new site. The Plan may be a general Plan. When you move the mobile or portable facility, you must locate and install it using the discharge prevention practices outlined in the Plan for the facility. The Plan is applicable only while the facility is in a fixed (non-transportation) operating mode.

(d) Except as provided in §112.6, a licensed Professional Engineer must review and certify a Plan for it to be effective to satisfy the requirements of this part.

(1) By means of this certification the Professional Engineer attests:

(i) That he is familiar with the requirements of this part ;

(ii) That he or his agent has visited and examined the facility;

(iii) That the Plan has been prepared in accordance with good engineering practice, including consideration of applicable industry standards, and with the requirements of this part;

(iv) That procedures for required inspections and testing have been established; and

(v) That the Plan is adequate for the facility.

(2) Such certification shall in no way relieve the owner or operator of a facility of his duty to prepare and fully implement such Plan in accordance with the requirements of this part.

(e) If you are the owner or operator of a facility for which a Plan is required under this section, you must:

(1) Maintain a complete copy of the Plan at the facility if the facility is normally attended at least four hours per day, or at the nearest field office if the facility is not so attended, and

(2) Have the Plan available to the Regional Administrator for on-site review during normal working hours.

(f) *Extension of time.* (1) The Regional Administrator may authorize an extension of time for the preparation and full implementation of a Plan, or any amendment thereto, beyond the time permitted for the preparation, implementation, or amendment of a Plan under this part, when he finds that the owner or operator of a facility subject to this section, cannot fully comply with the requirements as a result of either nonavailability of qualified personnel, or delays in construction or equipment delivery beyond the control and without the fault of such owner or operator or his agents or employees.

(2) If you are an owner or operator seeking an extension of time under paragraph (f)(1) of this section, you may submit a written extension request to the Regional Administrator. Your request must include:

(i) A full explanation of the cause for any such delay and the specific aspects of the Plan affected by the delay;

(ii) A full discussion of actions being taken or contemplated to minimize or mitigate such delay; and

(iii) A proposed time schedule for the implementation of any corrective actions being taken or contemplated, including interim dates for completion of tests or studies, installation and operation of any necessary equipment, or other preventive measures. In addition you may present additional oral or written statements in support of your extension request.

(3) The submission of a written extension request under paragraph (f)(2) of this section does not relieve you of your obligation to comply with the requirements of this part. The Regional Administrator may request a copy of your Plan to evaluate the extension request. When the Regional Administrator authorizes an extension of time

HEARING EXHIBIT - 00000842

for particular equipment or other specific aspects of the Plan, such extension does not affect your obligation to comply with the requirements related to other equipment or other specific aspects of the Plan for which the Regional Administrator has not expressly authorized an extension.

(g) *Qualified Facilities.* The owner or operator of a qualified facility as defined in this subparagraph may self-certify his or her facility's Plan, as provided in §112.6. A qualified facility is one that:

(1) Has an aggregate aboveground storage capacity of 10,000 gallons or less; and

(2) Has had no single discharge as described in §112.1(b) exceeding 1,000 U.S. gallons or no two discharges as described in §112.1(b) each exceeding 42 U.S. gallons within any twelve month period in the three years prior to the SPCC Plan self-certification date, or since becoming subject to this part if the facility has been in operation for less than three years (other than discharges as described in §112.1(b) that are the result of natural disasters, acts of war, or terrorism).

[67 FR 47140, July 17, 2002, as amended at 68 FR 1351, Jan. 9, 2003; 68 FR 18894, Apr. 17, 2003; 69 FR 48798, Aug. 11, 2004; 71 FR 8466, Feb. 17, 2006; 71 FR 77290, Dec. 26, 2006; 72 FR 27447, May 16, 2007]

§112.4 Amendment of Spill Prevention, Control, and Countermeasure Plan by Regional Administrator.

If you are the owner or operator of a facility subject to this part, you must:

(a) Notwithstanding compliance with §112.3, whenever your facility has discharged more than 1,000 U.S. gallons of oil in a single discharge as described in §112.1(b), or discharged more than 42 U.S. gallons of oil in each of two discharges as described in §112.1(b), occurring within any twelve month period, submit the following information to the Regional Administrator within 60 days from the time the facility becomes subject to this section:

(1) Name of the facility;

(2) Your name;

(3) Location of the facility;

(4) Maximum storage or handling capacity of the facility and normal daily throughput;

(5) Corrective action and countermeasures you have taken, including a description of equipment repairs and replacements;

(6) An adequate description of the facility, including maps, flow diagrams, and topographical maps, as necessary;

(7) The cause of such discharge as described in §112.1(b), including a failure analysis of the system or subsystem in which the failure occurred;

(8) Additional preventive measures you have taken or contemplated to minimize the possibility of recurrence; and

(9) Such other information as the Regional Administrator may reasonably require pertinent to the Plan or discharge.

(b) Take no action under this section until it applies to your facility. This section does not apply until the expiration of the time permitted for the initial preparation and implementation of the Plan under §112.3, but not including any amendments to the Plan.

(c) Send to the appropriate agency or agencies in charge of oil pollution control activities in the State in which the facility is located a complete copy of all information you provided to the Regional Administrator under paragraph (a) of this section. Upon receipt of the information such State agency or agencies may conduct a review and make recommendations to the Regional Administrator as to further procedures, methods, equipment, and other requirements necessary to prevent and to contain discharges from your facility.

(d) Amend your Plan, if after review by the Regional Administrator of the information you submit under paragraph (a) of this section, or submission of information to EPA by the State agency under paragraph (c) of this section, or after on-site review of your Plan, the Regional Administrator requires that you do so. The Regional Administrator may require you to amend your Plan if he finds that it does not meet the requirements of this part or that amendment is necessary to prevent and contain discharges from your facility.

(e) Act in accordance with this paragraph when the Regional Administrator proposes by certified mail or by personal delivery that you amend your

HEARING EXHIBIT - 00000843

SPCC Plan. If the owner or operator is a corporation, he must also notify by mail the registered agent of such corporation, if any and if known, in the State in which the facility is located. The Regional Administrator must specify the terms of such proposed amendment. Within 30 days from receipt of such notice, you may submit written information, views, and arguments on the proposed amendment. After considering all relevant material presented, the Regional Administrator must either notify you of any amendment required or rescind the notice. You must amend your Plan as required within 30 days after such notice, unless the Regional Administrator, for good cause, specifies another effective date. You must implement the amended Plan as soon as possible, but not later than six months after you amend your Plan, unless the Regional Administrator specifies another date.

(f) If you appeal a decision made by the Regional Administrator requiring an amendment to an SPCC Plan, send the appeal to the EPA Administrator in writing within 30 days of receipt of the notice from the Regional Administrator requiring the amendment under paragraph (e) of this section. You must send a complete copy of the appeal to the Regional Administrator at the time you make the appeal. The appeal must contain a clear and concise statement of the issues and points of fact in the case. It may also contain additional information from you, or from any other person. The EPA Administrator may request additional information from you, or from any other person. The EPA Administrator must render a decision within 60 days of receiving the appeal and must notify you of his decision.

§ 112.5 Amendment of Spill Prevention, Control, and Countermeasure Plan by owners or operators.

If you are the owner or operator of a facility subject to this part, you must:

(a) Amend the SPCC Plan for your facility in accordance with the general requirements in § 112.7, and with any specific section of this part applicable to your facility, when there is a change in the facility design, construction, operation, or maintenance that materially affects its potential for a discharge as described in § 112.1(b). Examples of changes that may require amendment of the Plan include, but are not limited to: commissioning or decommissioning containers; replacement, reconstruction, or movement of containers; reconstruction, replacement, or installation of piping systems; construction or demolition that might alter secondary containment structures; changes of product or service; or revision of standard operation or maintenance procedures at a facility. An amendment made under this section must be prepared within six months, and implemented as soon as possible, but not later than six months following preparation of the amendment.

(b) Notwithstanding compliance with paragraph (a) of this section, complete a review and evaluation of the SPCC Plan at least once every five years from the date your facility becomes subject to this part; or, if your facility was in operation on or before August 16, 2002, five years from the date your last review was required under this part. As a result of this review and evaluation, you must amend your SPCC Plan within six months of the review to include more effective prevention and control technology if the technology has been field-proven at the time of the review and will significantly reduce the likelihood of a discharge as described in § 112.1(b) from the facility. You must implement any amendment as soon as possible, but not later than six months following preparation of any amendment. You must document your completion of the review and evaluation, and must sign a statement as to whether you will amend the Plan, either at the beginning or end of the Plan or in a log or an appendix to the Plan. The following words will suffice, "I have completed review and evaluation of the SPCC Plan for (name of facility) on (date), and will (will not) amend the Plan as a result."

(c) Except as provided in § 112.6, have a Professional Engineer certify any technical amendments to your Plan in accordance with § 112.3(d).

[67 FR 47140, July 17, 2002, as amended at 71 FR 77291, Dec. 26, 2006]

HEARING EXHIBIT - 00000844

§ 112.6 Qualified Facility Plan Requirements.

(a) *Preparation and Self-certification of Plan.* If you are the owner or operator of a facility that meets the qualified facility qualification criteria in §112.3(g), you may choose to self-certify your Plan. You must certify in the Plan that:

(1) You are familiar with the requirements of this part;

(2) You have visited and examined the facility;

(3) The Plan has been prepared in accordance with accepted and sound industry practices and standards, and with the requirements of this part;

(4) Procedures for required inspections and testing have been established;

(5) The Plan is being fully implemented;

(6) The facility meets the qualification criteria set forth under §112.3(g);

(7) The Plan does not deviate from any requirement of this part as allowed by §§112.7(a)(2) and 112.7(d), except as provided in paragraph (c) of this section; and

(8) The Plan and individual(s) responsible for implementing the Plan have the full approval of management and the facility owner or operator has committed the necessary resources to fully implement the Plan.

(b) *Self-certification of Technical Amendments.* If you self-certify your Plan pursuant to paragraph (a) of this section, you must certify any technical amendments to your Plan in accordance with paragraph (a) of this section when there is a change in the facility design, construction, operation, or maintenance that affects its potential for a discharge as described in §112.1(b) except:

(1) If a Professional Engineer certified a portion of your Plan in accordance with paragraph (d) of this section, and the technical amendment affects this portion of the Plan, you must have the amended provisions of your Plan certified by a Professional Engineer in accordance with §112.6(d)(2).

(2) If the change is such that the facility no longer meets the qualifying criteria in §112.3(g) because it exceeds 10,000 gallons in aggregate aboveground storage capacity, you must prepare a Plan in accordance with the general Plan requirements in §112.7 and the applicable requirements in subparts B and C, including having the Plan certified by a Professional Engineer as required under §112.3(d).

(c) *Applicable Requirements.* Except as provided in this subparagraph, your self-certified SPCC Plan must comply with §112.7 and the applicable requirements in subparts B and C of this part:

(1) *Environmental Equivalence.* Your Plan may not include alternate methods which provide environmental equivalence pursuant to §112.7(a)(2), unless each alternate method has been reviewed and certified in writing by a Professional Engineer, as provided in paragraph (d) of this section.

(2) *Impracticability.* Your Plan may not include any determinations that secondary containment is impracticable and provisions in lieu of secondary containment pursuant to §112.7(d), unless each such determination and alternative provision has been reviewed and certified in writing by a Professional Engineer, as provided in paragraph (d) of this section.

(3) *Security (excluding oil production facilities).* You must either:

(i) Comply with the requirements under §112.7(g); or

(ii) Describe in your Plan how you secure and control access to the oil handling, processing and storage areas; secure master flow and drain valves; prevent unauthorized access to starter controls on oil pumps; secure out-of-service and loading/unloading connections of oil pipelines; address the appropriateness of security lighting to both prevent acts of vandalism and assist in the discovery of oil discharges.

(4) *Bulk Storage Container Inspections.* You must either:

(i) Comply with the requirements under §112.8(c)(6) or §112.12(c)(6), as applicable; or

(ii) Test/inspect each aboveground container for integrity on a regular schedule and whenever material repairs are made. You must determine, in accordance with industry standards, the appropriate qualifications for personnel performing tests and inspections, the frequency and type of testing and inspections which take into account container size, configuration,

HEARING EXHIBIT - 00000845

and design (such as containers that are: shop built, skid-mounted, elevated, equipped with a liner, double walled, or partially buried). Examples of these integrity tests include, but are not limited to: visual inspection, hydrostatic testing, radiographic testing, ultrasonic testing, acoustic emissions testing, or other systems of non-destructive testing. You must keep comparison records and you must also inspect the container's supports and foundations. In addition, you must frequently inspect the outside of the container for signs of deterioration, discharges, or accumulation of oil inside diked areas. Records of inspections and tests kept under usual and customary business practices satisfy the recordkeeping requirements of this paragraph.

(d) *Professional Engineer Certification of Portions of a Qualified Facility's Self-certified Plan.* As described in paragraph (c) of this section, the facility owner or operator may not self-certify alternative measures allowed under §112.7(a)(2) or (d), that are included in the facility's Plan. Such measures must be reviewed and certified, in writing, by a licensed Professional Engineer as follows:

(1) For each alternative measure allowed under §112.7(a)(2), the Plan must be accompanied by a written statement by a Professional Engineer that states the reason for nonconformance and describes the alternative method and how it provides equivalent environmental protection in accordance with §112.7(a)(2). For each determination of impracticability of secondary containment pursuant to §112.7(d), the Plan must clearly explain why secondary containment measures are not practicable at this facility and provide the alternative measures required in §112.7(d) in lieu of secondary containment.

(2) By certifying each measure allowed under §112.7(a)(2) and (d), the Professional Engineer attests:

(i) That he is familiar with the requirements of this part;

(ii) That he or his agent has visited and examined the facility; and

(iii) That the alternative method of environmental equivalence in accordance with §112.7(a)(2) or the determination of impracticability and alternative measures in accordance with §112.7(d) is consistent with good engineering practice, including consideration of applicable industry standards, and with the requirements of this part.

(3) The review and certification by the Professional Engineer under this paragraph is limited to the alternative method which achieves equivalent environmental protection pursuant to §112.7(a)(2) or to the impracticability determination and measures in lieu of secondary containment pursuant to §112.7(d).

[71 FR 77291, Dec. 26, 2006]

§112.7 General requirements for Spill Prevention, Control, and Countermeasure Plans.

If you are the owner or operator of a facility subject to this part you must prepare a Plan in accordance with good engineering practices. The Plan must have the full approval of management at a level of authority to commit the necessary resources to fully implement the Plan. You must prepare the Plan in writing. If you do not follow the sequence specified in this section for the Plan, you must prepare an equivalent Plan acceptable to the Regional Administrator that meets all of the applicable requirements listed in this part, and you must supplement it with a section cross-referencing the location of requirements listed in this part and the equivalent requirements in the other prevention plan. If the Plan calls for additional facilities or procedures, methods, or equipment not yet fully operational, you must discuss these items in separate paragraphs, and must explain separately the details of installation and operational start-up. As detailed elsewhere in this section, you must also:

(a)(1) Include a discussion of your facility's conformance with the requirements listed in this part.

(2) Comply with all applicable requirements listed in this part. Except as provided in §112.6, your Plan may deviate from the requirements in paragraphs (g), (h)(2) and (3), and (l) of this section and the requirements in subparts B and C of this part, except the secondary containment requirements in paragraphs (c) and (h)(1) of this section, and §§112.8(c)(2), 112.8(c)(11),

HEARING EXHIBIT - 00000846

112.9(c)(2), 112.10(c), 112.12(c)(2), and 112.12(c)(11), where applicable to a specific facility, if you provide equivalent environmental protection by some other means of spill prevention, control, or countermeasure. Where your Plan does not conform to the applicable requirements in paragraphs (g), (h)(2) and (3), and (i) of this section, or the requirements of subparts B and C of this part, except the secondary containment requirements in paragraph (c) and (h)(1) of this section, and §§ 112.8(c)(2), 112.8(c)(11), 112.9(c)(2), 112.10(c), 112.12(c)(2), and 112.12(c)(11), you must state the reasons for nonconformance in your Plan and describe in detail alternate methods and how you will achieve equivalent environmental protection. If the Regional Administrator determines that the measures described in your Plan do not provide equivalent environmental protection, he may require that you amend your Plan, following the procedures in § 112.4(d) and (e).

(3) Describe in your Plan the physical layout of the facility and include a facility diagram, which must mark the location and contents of each container. The facility diagram must include completely buried tanks that are otherwise exempted from the requirements of this part under § 112.1(d)(4). The facility diagram must also include all transfer stations and connecting pipes. You must also address in your Plan:

(i) The type of oil in each container and its storage capacity;

(ii) Discharge prevention measures including procedures for routine handling of products (loading, unloading, and facility transfers, etc.);

(iii) Discharge or drainage controls such as secondary containment around containers and other structures, equipment, and procedures for the control of a discharge;

(iv) Countermeasures for discharge discovery, response, and cleanup (both the facility's capability and those that might be required of a contractor);

(v) Methods of disposal of recovered materials in accordance with applicable legal requirements; and

(vi) Contact list and phone numbers for the facility response coordinator, National Response Center, cleanup contractors with whom you have an agreement for response, and all appropriate Federal, State, and local agencies who must be contacted in case of a discharge as described in § 112.1(b).

(4) Unless you have submitted a response plan under § 112.20, provide information and procedures in your Plan to enable a person reporting a discharge as described in § 112.1(b) to relate information on the exact address or location and phone number of the facility; the date and time of the discharge, the type of material discharged; estimates of the total quantity discharged; estimates of the quantity discharged as described in § 112.1(b); the source of the discharge; a description of all affected media; the cause of the discharge; any damages or injuries caused by the discharge; actions being used to stop, remove, and mitigate the effects of the discharge; whether an evacuation may be needed; and, the names of individuals and/or organizations who have also been contacted.

(5) Unless you have submitted a response plan under § 112.20, organize portions of the Plan describing procedures you will use when a discharge occurs in a way that will make them readily usable in an emergency, and include appropriate supporting material as appendices.

(b) Where experience indicates a reasonable potential for equipment failure (such as loading or unloading equipment, tank overflow, rupture, or leakage, or any other equipment known to be a source of a discharge), include in your Plan a prediction of the direction, rate of flow, and total quantity of oil which could be discharged from the facility as a result of each type of major equipment failure.

(c) Provide appropriate containment and/or diversionary structures or equipment to prevent a discharge as described in § 112.1(b), except as provided in paragraph (k) of this section for qualified oil-filled operational equipment. The entire containment system, including walls and floor, must be capable of containing oil and must be constructed so that any discharge from a primary containment system, such as a tank or pipe, will not escape the containment system before cleanup

HEARING EXHIBIT - 00000847

occurs. At a minimum, you must use one of the following prevention systems or its equivalent:

(1) For onshore facilities:

(i) Dikes, berms, or retaining walls sufficiently impervious to contain oil;

(ii) Curbing;

(iii) Culverting, gutters, or other drainage systems;

(iv) Weirs, booms, or other barriers;

(v) Spill diversion ponds;

(vi) Retention ponds; or

(vii) Sorbent materials.

(2) For offshore facilities:

(i) Curbing or drip pans; or

(ii) Sumps and collection systems.

(d) Provided your Plan is certified by a licensed Professional Engineer under §112.3(d), or, in the case of a qualified facility that meets the criteria in §112.3(g), the relevant sections of your Plan are certified by a licensed Professional Engineer under §112.6(d), if you determine that the installation of any of the structures or pieces of equipment listed in paragraphs (c) and (h)(1) of this section, and §§112.8(c)(2), 112.8(c)(11), 112.9(c)(2), 112.10(c), 112.12(c)(2), and 112.12(c)(11) to prevent a discharge as described in §112.1(b) from any onshore or offshore facility is not practicable, you must clearly explain in your Plan why such measures are not practicable; for bulk storage containers, conduct both periodic integrity testing of the containers and periodic integrity and leak testing of the valves and piping; and, unless you have submitted a response plan under §112.20, provide in your Plan the following:

(1) An oil spill contingency plan following the provisions of part 109 of this chapter.

(2) A written commitment of manpower, equipment, and materials required to expeditiously control and remove any quantity of oil discharged that may be harmful.

(e) *Inspections, tests, and records.* Conduct inspections and tests required by this part in accordance with written procedures that you or the certifying engineer develop for the facility. You must keep these written procedures and a record of the inspections and tests, signed by the appropriate supervisor or inspector, with the SPCC Plan for a period of three years. Records of inspections and tests kept under usual and customary business practices will suffice for purposes of this paragraph.

(f) *Personnel, training, and discharge prevention procedures.* (1) At a minimum, train your oil-handling personnel in the operation and maintenance of equipment to prevent discharges; discharge procedure protocols; applicable pollution control laws, rules, and regulations; general facility operations; and, the contents of the facility SPCC Plan.

(2) Designate a person at each applicable facility who is accountable for discharge prevention and who reports to facility management.

(3) Schedule and conduct discharge prevention briefings for your oil-handling personnel at least once a year to assure adequate understanding of the SPCC Plan for that facility. Such briefings must highlight and describe known discharges as described in §112.1(b) or failures, malfunctioning components, and any recently developed precautionary measures.

(g) *Security (excluding oil production facilities).* (1) Fully fence each facility handling, processing, or storing oil, and lock and/or guard entrance gates when the facility is not in production or is unattended.

(2) Ensure that the master flow and drain valves and any other valves permitting direct outward flow of the container's contents to the surface have adequate security measures so that they remain in the closed position when in non-operating or non-standby status.

(3) Lock the starter control on each oil pump in the "off" position and locate it at a site accessible only to authorized personnel when the pump is in a non-operating or non-standby status.

(4) Securely cap or blank-flange the loading/unloading connections of oil pipelines or facility piping when not in service or when in standby service for an extended time. This security practice also applies to piping that is emptied of liquid content either by draining or by inert gas pressure.

(5) Provide facility lighting commensurate with the type and location of the facility that will assist in the:

HEARING EXHIBIT - 00000848

(i) Discovery of discharges occurring during hours of darkness, both by operating personnel, if present, and by non-operating personnel (the general public, local police, etc.); and

(ii) Prevention of discharges occurring through acts of vandalism.

(h) *Facility tank car and tank truck loading/unloading rack (excluding offshore facilities).* (1) Where loading/unloading area drainage does not flow into a catchment basin or treatment facility designed to handle discharges, use a quick drainage system for tank car or tank truck loading and unloading areas. You must design any containment system to hold at least the maximum capacity of any single compartment of a tank car or tank truck loaded or unloaded at the facility.

(2) Provide an interlocked warning light or physical barrier system, warning signs, wheel chocks, or vehicle break interlock system in loading/unloading areas to prevent vehicles from departing before complete disconnection of flexible or fixed oil transfer lines.

(3) Prior to filling and departure of any tank car or tank truck, closely inspect for discharges the lowermost drain and all outlets of such vehicles, and if necessary, ensure that they are tightened, adjusted, or replaced to prevent liquid discharge while in transit.

(i) If a field-constructed aboveground container undergoes a repair, alteration, reconstruction, or a change in service that might affect the risk of a discharge or failure due to brittle fracture or other catastrophe, or has discharged oil or failed due to brittle fracture failure or other catastrophe, evaluate the container for risk of discharge or failure due to brittle fracture or other catastrophe, and as necessary, take appropriate action.

(j) In addition to the minimal prevention standards listed under this section, include in your Plan a complete discussion of conformance with the applicable requirements and other effective discharge prevention and containment procedures listed in this part or any applicable more stringent State rules, regulations, and guidelines.

(k) *Qualified Oil-filled Operational Equipment.* The owner or operator of a facility with oil-filled operational equipment that meets the qualification criteria in paragraph (k)(1) of this subsection may choose to implement for this qualified oil-filled operational equipment the alternate requirements as described in paragraph (k)(2) of this sub-section in lieu of general secondary containment required in paragraph (c) of this section.

(1) *Qualification Criteria—Reportable Discharge History:* The owner or operator of a facility that has had no single discharge as described in §112.1(b) from any oil-filled operational equipment exceeding 1,000 U.S. gallons or no two discharges as described in §112.1(b) from any oil-filled operational equipment each exceeding 42 U.S. gallons within any twelve month period in the three years prior to the SPCC Plan certification date, or since becoming subject to this part if the facility has been in operation for less than three years (other than oil discharges as described in §112.1(b) that are the result of natural disasters, acts of war or terrorism); and

(2) *Alternative Requirements to General Secondary Containment.* If secondary containment is not provided for qualified oil-filled operational equipment pursuant to paragraph (c) of this section, the owner or operator of a facility with qualified oil-filled operational equipment must:

(i) Establish and document the facility procedures for inspections or a monitoring program to detect equipment failure and/or a discharge; and

(ii) Unless you have submitted a response plan under §112.20, provide in your Plan the following:

(A) An oil spill contingency plan following the provisions of part 109 of this chapter.

(B) A written commitment of manpower, equipment, and materials required to expeditiously control and remove any quantity of oil discharged that may be harmful.

[67 FR 47140, July 17, 2002, as amended at 71 FR 77292, Dec. 26, 2006]

HEARING EXHIBIT - 00000849

Subpart B—Requirements for Petroleum Oils and Non-Petroleum Oils, Except Animal Fats and Oils and Greases, and Fish and Marine Mammal Oils; and Vegetable Oils (Including Oils from Seeds, Nuts, Fruits, and Kernels)

SOURCE: 67 FR 47146, July 17, 2002, unless otherwise noted.

§ 112.8 Spill Prevention, Control, and Countermeasure Plan requirements for onshore facilities (excluding production facilities).

If you are the owner or operator of an onshore facility (excluding a production facility), you must:

(a) Meet the general requirements for the Plan listed under §112.7, and the specific discharge prevention and containment procedures listed in this section.

(b) *Facility drainage.* (1) Restrain drainage from diked storage areas by valves to prevent a discharge into the drainage system or facility effluent treatment system, except where facility systems are designed to control such discharge. You may empty diked areas by pumps or ejectors; however, you must manually activate these pumps or ejectors and must inspect the condition of the accumulation before starting, to ensure no oil will be discharged.

(2) Use valves of manual, open-and-closed design, for the drainage of diked areas. You may not use flapper-type drain valves to drain diked areas. If your facility drainage drains directly into a watercourse and not into an on-site wastewater treatment plant, you must inspect and may drain uncontaminated retained stormwater, as provided in paragraphs (c)(3)(ii), (iii), and (iv) of this section.

(3) Design facility drainage systems from undiked areas with a potential for a discharge (such as where piping is located outside containment walls or where tank truck discharges may occur outside the loading area) to flow into ponds, lagoons, or catchment basins designed to retain oil or return it to the facility. You must not locate catchment basins in areas subject to periodic flooding.

(4) If facility drainage is not engineered as in paragraph (b)(3) of this section, equip the final discharge of all ditches inside the facility with a diversion system that would, in the event of an uncontrolled discharge, retain oil in the facility.

(5) Where drainage waters are treated in more than one treatment unit and such treatment is continuous, and pump transfer is needed, provide two "lift" pumps and permanently install at least one of the pumps. Whatever techniques you use, you must engineer facility drainage systems to prevent a discharge as described in §112.1(b) in case there is an equipment failure or human error at the facility.

(c) *Bulk storage containers.* (1) Not use a container for the storage of oil unless its material and construction are compatible with the material stored and conditions of storage such as pressure and temperature.

(2) Construct all bulk storage tank installations (except mobile refuelers) so that you provide a secondary means of containment for the entire capacity of the largest single container and sufficient freeboard to contain precipitation. You must ensure that diked areas are sufficiently impervious to contain discharged oil. Dikes, containment curbs, and pits are commonly employed for this purpose. You may also use an alternative system consisting of a drainage trench enclosure that must be arranged so that any discharge will terminate and be safely confined in a facility catchment basin or holding pond.

(3) Not allow drainage of uncontaminated rainwater from the diked area into a storm drain or discharge of an effluent into an open watercourse, lake, or pond, bypassing the facility treatment system unless you:

(i) Normally keep the bypass valve sealed closed.

(ii) Inspect the retained rainwater to ensure that its presence will not cause a discharge as described in §112.1(b).

(iii) Open the bypass valve and reseal it following drainage under responsible supervision; and

HEARING EXHIBIT - 00000850

(iv) Keep adequate records of such events, for example, any records required under permits issued in accordance with §§ 122.41(j)(2) and 122.41(m)(3) of this chapter.

(4) Protect any completely buried metallic storage tank installed on or after January 10, 1974 from corrosion by coatings or cathodic protection compatible with local soil conditions. You must regularly leak test such completely buried metallic storage tanks.

(5) Not use partially buried or bunkered metallic tanks for the storage of oil, unless you protect the buried section of the tank from corrosion. You must protect partially buried and bunkered tanks from corrosion by coatings or cathodic protection compatible with local soil conditions.

(6) Test each aboveground container for integrity on a regular schedule, and whenever you make material repairs. The frequency of and type of testing must take into account container size and design (such as floating roof, skid-mounted, elevated, or partially buried). You must combine visual inspection with another testing technique such as hydrostatic testing, radiographic testing, ultrasonic testing, acoustic emissions testing, or another system of non-destructive shell testing. You must keep comparison records and you must also inspect the container's supports and foundations. In addition, you must frequently inspect the outside of the container for signs of deterioration, discharges, or accumulation of oil inside diked areas. Records of inspections and tests kept under usual and customary business practices will suffice for purposes of this paragraph.

(7) Control leakage through defective internal heating coils by monitoring the steam return and exhaust lines for contamination from internal heating coils that discharge into an open watercourse, or pass the steam return or exhaust lines through a settling tank, skimmer, or other separation or retention system.

(8) Engineer or update each container installation in accordance with good engineering practice to avoid discharges. You must provide at least one of the following devices:

(i) High liquid level alarms with an audible or visual signal at a constantly attended operation or surveillance station. In smaller facilities an audible air vent may suffice.

(ii) High liquid level pump cutoff devices set to stop flow at a predetermined container content level.

(iii) Direct audible or code signal communication between the container gauger and the pumping station.

(iv) A fast response system for determining the liquid level of each bulk storage container such as digital computers, telepulse, or direct vision gauges. If you use this alternative, a person must be present to monitor gauges and the overall filling of bulk storage containers.

(v) You must regularly test liquid level sensing devices to ensure proper operation.

(9) Observe effluent treatment facilities frequently enough to detect possible system upsets that could cause a discharge as described in § 112.1(b).

(10) Promptly correct visible discharges which result in a loss of oil from the container, including but not limited to seams, gaskets, piping, pumps, valves, rivets, and bolts. You must promptly remove any accumulations of oil in diked areas.

(11) Position or locate mobile or portable oil storage containers to prevent a discharge as described in § 112.1(b). Except for mobile refuelers, you must furnish a secondary means of containment, such as a dike or catchment basin, sufficient to contain the capacity of the largest single compartment or container with sufficient freeboard to contain precipitation.

(d) *Facility transfer operations, pumping, and facility process.* (1) Provide buried piping that is installed or replaced on or after August 16, 2002, with a protective wrapping and coating. You must also cathodically protect such buried piping installations or otherwise satisfy the corrosion protection standards for piping in part 280 of this chapter or a State program approved under part 281 of this chapter. If a section of buried line is exposed for any reason, you must carefully inspect it for deterioration. If you find corrosion damage,

HEARING EXHIBIT - 00000851

you must undertake additional examination and corrective action as indicated by the magnitude of the damage.

(2) Cap or blank-flange the terminal connection at the transfer point and mark it as to origin when piping is not in service or is in standby service for an extended time.

(3) Properly design pipe supports to minimize abrasion and corrosion and allow for expansion and contraction.

(4) Regularly inspect all aboveground valves, piping, and appurtenances. During the inspection you must assess the general condition of items, such as flange joints, expansion joints, valve glands and bodies, catch pans, pipeline supports, locking of valves, and metal surfaces. You must also conduct integrity and leak testing of buried piping at the time of installation, modification, construction, relocation, or replacement.

(5) Warn all vehicles entering the facility to be sure that no vehicle will endanger aboveground piping or other oil transfer operations.

[67 FR 47146, July 17, 2002, as amended at 71 FR 77293, Dec. 26, 2006]

§ 112.9 Spill Prevention, Control, and Countermeasure Plan requirements for onshore oil production facilities.

If you are the owner or operator of an onshore production facility, you must:

(a) Meet the general requirements for the Plan listed under § 112.7, and the specific discharge prevention and containment procedures listed under this section.

(b) *Oil production facility drainage.* (1) At tank batteries and separation and treating areas where there is a reasonable possibility of a discharge as described in § 112.1(b), close and seal at all times drains of dikes or drains of equivalent measures required under § 112.7(c)(1), except when draining uncontaminated rainwater. Prior to drainage, you must inspect the diked area and take action as provided in § 112.8(c)(3)(ii), (iii), and (iv). You must remove accumulated oil on the rainwater and return it to storage or dispose of it in accordance with legally approved methods.

(2) Inspect at regularly scheduled intervals field drainage systems (such as drainage ditches or road ditches), and oil traps, sumps, or skimmers, for an accumulation of oil that may have resulted from any small discharge. You must promptly remove any accumulations of oil.

(c) *Oil production facility bulk storage containers.* (1) Not use a container for the storage of oil unless its material and construction are compatible with the material stored and the conditions of storage.

(2) Provide all tank battery, separation, and treating facility installations with a secondary means of containment for the entire capacity of the largest single container and sufficient freeboard to contain precipitation. You must safely confine drainage from undiked areas in a catchment basin or holding pond.

(3) Periodically and upon a regular schedule visually inspect each container of oil for deterioration and maintenance needs, including the foundation and support of each container that is on or above the surface of the ground.

(4) Engineer or update new and old tank battery installations in accordance with good engineering practice to prevent discharges. You must provide at least one of the following:

(i) Container capacity adequate to assure that a container will not overfill if a pumper/gauger is delayed in making regularly scheduled rounds.

(ii) Overflow equalizing lines between containers so that a full container can overflow to an adjacent container.

(iii) Vacuum protection adequate to prevent container collapse during a pipeline run or other transfer of oil from the container.

(iv) High level sensors to generate and transmit an alarm signal to the computer where the facility is subject to a computer production control system.

(d) *Facility transfer operations, oil production facility.* (1) Periodically and upon a regular schedule inspect all aboveground valves and piping associated with transfer operations for the general condition of flange joints, valve glands and bodies, drip pans, pipe supports, pumping well polish rod stuffing boxes, bleeder and gauge valves, and other such items.

HEARING EXHIBIT - 00000852

(2) Inspect saltwater (oil field brine) disposal facilities often, particularly following a sudden change in atmospheric temperature, to detect possible system upsets capable of causing a discharge.

(3) Have a program of flowline maintenance to prevent discharges from each flowline.

§ 112.10 Spill Prevention, Control, and Countermeasure Plan requirements for onshore oil drilling and workover facilities.

If you are the owner or operator of an onshore oil drilling and workover facility, you must:

(a) Meet the general requirements listed under § 112.7, and also meet the specific discharge prevention and containment procedures listed under this section.

(b) Position or locate mobile drilling or workover equipment so as to prevent a discharge as described in § 112.1(b).

(c) Provide catchment basins or diversion structures to intercept and contain discharges of fuel, crude oil, or oily drilling fluids.

(d) Install a blowout prevention (BOP) assembly and well control system before drilling below any casing string or during workover operations. The BOP assembly and well control system must be capable of controlling any well-head pressure that may be encountered while that BOP assembly and well control system are on the well.

§ 112.11 Spill Prevention, Control, and Countermeasure Plan requirements for offshore oil drilling, production, or workover facilities.

If you are the owner or operator of an offshore oil drilling, production, or workover facility, you must:

(a) Meet the general requirements listed under § 112.7, and also meet the specific discharge prevention and containment procedures listed under this section.

(b) Use oil drainage collection equipment to prevent and control small oil discharges around pumps, glands, valves, flanges, expansion joints, hoses, drain lines, separators, treaters, tanks, and associated equipment. You must control and direct facility drains toward a central collection sump to prevent the facility from having a discharge as described in § 112.1(b). Where drains and sumps are not practicable, you must remove oil contained in collection equipment as often as necessary to prevent overflow.

(c) For facilities employing a sump system, provide adequately sized sump and drains and make available a spare pump to remove liquid from the sump and assure that oil does not escape. You must employ a regularly scheduled preventive maintenance inspection and testing program to assure reliable operation of the liquid removal system and pump start-up device. Redundant automatic sump pumps and control devices may be required on some installations.

(d) At facilities with areas where separators and treaters are equipped with dump valves which predominantly fail in the closed position and where pollution risk is high, specially equip the facility to prevent the discharge of oil. You must prevent the discharge of oil by:

(1) Extending the flare line to a diked area if the separator is near shore;

(2) Equipping the separator with a high liquid level sensor that will automatically shut in wells producing to the separator; or

(3) Installing parallel redundant dump valves.

(e) Equip atmospheric storage or surge containers with high liquid level sensing devices that activate an alarm or control the flow, or otherwise prevent discharges.

(f) Equip pressure containers with high and low pressure sensing devices that activate an alarm or control the flow.

(g) Equip containers with suitable corrosion protection.

(h) Prepare and maintain at the facility a written procedure within the Plan for inspecting and testing pollution prevention equipment and systems.

(i) Conduct testing and inspection of the pollution prevention equipment and systems at the facility on a scheduled periodic basis, commensurate with the complexity, conditions, and circumstances of the facility and any other appropriate regulations. You

HEARING EXHIBIT - 00000853

must use simulated discharges for testing and inspecting human and equipment pollution control and countermeasure systems.

(j) Describe in detailed records surface and subsurface well shut-in valves and devices in use at the facility for each well sufficiently to determine their method of activation or control, such as pressure differential, change in fluid or flow conditions, combination of pressure and flow, manual or remote control mechanisms.

(k) Install a BOP assembly and well control system during workover operations and before drilling below any casing string. The BOP assembly and well control system must be capable of controlling any well-head pressure that may be encountered while the BOP assembly and well control system are on the well.

(l) Equip all manifolds (headers) with check valves on individual flowlines.

(m) Equip the flowline with a high pressure sensing device and shut-in valve at the wellhead if the shut-in well pressure is greater than the working pressure of the flowline and manifold valves up to and including the header valves. Alternatively you may provide a pressure relief system for flowlines.

(n) Protect all piping appurtenant to the facility from corrosion, such as with protective coatings or cathodic protection.

(o) Adequately protect sub-marine piping appurtenant to the facility against environmental stresses and other activities such as fishing operations.

(p) Maintain sub-marine piping appurtenant to the facility in good operating condition at all times. You must periodically and according to a schedule inspect or test such piping for failures. You must document and keep a record of such inspections or tests at the facility.

Subpart C—Requirements for Animal Fats and Oils and Greases, and Fish and Marine Mammal Oils; and for Vegetable Oils, including Oils from Seeds, Nuts, Fruits, and Kernels.

SOURCE: 67 FR 57149, July 17, 2002, unless otherwise noted.

§ 112.12 Spill Prevention, Control, and Countermeasure Plan requirements.

If you are the owner or operator of an onshore facility (excluding a production facility), you must:

(a) Meet the general requirements for the Plan listed under § 112.7, and the specific discharge prevention and containment procedures listed in this section.

(b) *Facility drainage.* (1) Restrain drainage from diked storage areas by valves to prevent a discharge into the drainage system or facility effluent treatment system, except where facility systems are designed to control such discharge. You may empty diked areas by pumps or ejectors; however, you must manually activate these pumps or ejectors and must inspect the condition of the accumulation before starting, to ensure no oil will be discharged.

(2) Use valves of manual, open-and-closed design, for the drainage of diked areas. You may not use flapper-type drain valves to drain diked areas. If your facility drainage drains directly into a watercourse and not into an on-site wastewater treatment plant, you must inspect and may drain uncontaminated retained stormwater, subject to the requirements of paragraphs (c)(3)(ii), (iii), and (iv) of this section.

(3) Design facility drainage systems from undiked areas with a potential for a discharge (such as where piping is located outside containment walls or where tank truck discharges may occur outside the loading area) to flow into ponds, lagoons, or catchment basins designed to retain oil or return it to the facility. You must not locate catchment basins in areas subject to periodic flooding.

HEARING EXHIBIT - 00000854

(4) If facility drainage is not engineered as in paragraph (b)(3) of this section, equip the final discharge of all ditches inside the facility with a diversion system that would, in the event of an uncontrolled discharge, retain oil in the facility.

(5) Where drainage waters are treated in more than one treatment unit and such treatment is continuous, and pump transfer is needed, provide two "lift" pumps and permanently install at least one of the pumps. Whatever techniques you use, you must engineer facility drainage systems to prevent a discharge as described in §112.1(b) in case there is an equipment failure or human error at the facility.

(c) *Bulk storage containers.* (1) Not use a container for the storage of oil unless its material and construction are compatible with the material stored and conditions of storage such as pressure and temperature.

(2) Construct all bulk storage tank installations (except mobile refuelers) so that you provide a secondary means of containment for the entire capacity of the largest single container and sufficient freeboard to contain precipitation. You must ensure that diked areas are sufficiently impervious to contain discharged oil. Dikes, containment curbs, and pits are commonly employed for this purpose. You may also use an alternative system consisting of a drainage trench enclosure that must be arranged so that any discharge will terminate and be safely confined in a facility catchment basin or holding pond.

(3) Not allow drainage of uncontaminated rainwater from the diked area into a storm drain or discharge of an effluent into an open watercourse, lake, or pond, bypassing the facility treatment system unless you:

(i) Normally keep the bypass valve sealed closed.

(ii) Inspect the retained rainwater to ensure that its presence will not cause a discharge as described in §112.1(b).

(iii) Open the bypass valve and reseal it following drainage under responsible supervision; and

(iv) Keep adequate records of such events, for example, any records required under permits issued in accordance with §§122.41(j)(2) and 122.41(m)(3) of this chapter.

(4) Protect any completely buried metallic storage tank installed on or after January 10, 1974 from corrosion by coatings or cathodic protection compatible with local soil conditions. You must regularly leak test such completely buried metallic storage tanks.

(5) Not use partially buried or bunkered metallic tanks for the storage of oil, unless you protect the buried section of the tank from corrosion. You must protect partially buried and bunkered tanks from corrosion by coatings or cathodic protection compatible with local soil conditions.

(6) Test each aboveground container for integrity on a regular schedule, and whenever you make material repairs. The frequency of and type of testing must take into account container size and design (such as floating roof, skid-mounted, elevated, or partially buried). You must combine visual inspection with another testing technique such as hydrostatic testing, radiographic testing, ultrasonic testing, acoustic emissions testing, or another system of non-destructive shell testing. You must keep comparison records and you must also inspect the container's supports and foundations. In addition, you must frequently inspect the outside of the container for signs of deterioration, discharges, or accumulation of oil inside diked areas. Records of inspections and tests kept under usual and customary business practices will suffice for purposes of this paragraph.

(7) Control leakage through defective internal heating coils by monitoring the steam return and exhaust lines for contamination from internal heating coils that discharge into an open watercourse, or pass the steam return or exhaust lines through a settling tank, skimmer, or other separation or retention system.

(8) Engineer or update each container installation in accordance with good engineering practice to avoid discharges. You must provide at least one of the following devices:

(i) High liquid level alarms with an audible or visual signal at a constantly

HEARING EXHIBIT - 00000855

attended operation or surveillance station. In smaller facilities an audible air vent may suffice.

(ii) High liquid level pump cutoff devices set to stop flow at a predetermined container content level.

(iii) Direct audible or code signal communication between the container gauger and the pumping station.

(iv) A fast response system for determining the liquid level of each bulk storage container such as digital computers, telepulse, or direct vision gauges. If you use this alternative, a person must be present to monitor gauges and the overall filling of bulk storage containers.

(v) You must regularly test liquid level sensing devices to ensure proper operation.

(9) Observe effluent treatment facilities frequently enough to detect possible system upsets that could cause a discharge as described in §112.1(b).

(10) Promptly correct visible discharges which result in a loss of oil from the container, including but not limited to seams, gaskets, piping, pumps, valves, rivets, and bolts. You must promptly remove any accumulations of oil in diked areas.

(11) Position or locate mobile or portable oil storage containers to prevent a discharge as described in §112.1(b). Except for mobile refuelers, you must furnish a secondary means of containment, such as a dike or catchment basin, sufficient to contain the capacity of the largest single compartment or container with sufficient freeboard to contain precipitation.

(d) *Facility transfer operations, pumping, and facility process.* (1) Provide buried piping that is installed or replaced on or after August 16, 2002, with a protective wrapping and coating. You must also cathodically protect such buried piping installations or otherwise satisfy the corrosion protection standards for piping in part 280 of this chapter or a State program approved under part 281 of this chapter. If a section of buried line is exposed for any reason, you must carefully inspect it for deterioration. If you find corrosion damage, you must undertake additional examination and corrective action as indicated by the magnitude of the damage.

(2) Cap or blank-flange the terminal connection at the transfer point and mark it as to origin when piping is not in service or is in standby service for an extended time.

(3) Properly design pipe supports to minimize abrasion and corrosion and allow for expansion and contraction.

(4) Regularly inspect all aboveground valves, piping, and appurtenances. During the inspection you must assess the general condition of items, such as flange joints, expansion joints, valve glands and bodies, catch pans, pipeline supports, locking of valves, and metal surfaces. You must also conduct integrity and leak testing of buried piping at the time of installation, modification, construction, relocation, or replacement.

(5) Warn all vehicles entering the facility to be sure that no vehicle will endanger aboveground piping or other oil transfer operations.

[67 FR 57149, July 17, 2002, as amended at 71 FR 77293, Dec. 26, 2006]

§§ 112.13–112.15 [Reserved]

Subpart D—Response Requirements

§ 112.20 Facility response plans.

(a) The owner or operator of any non-transportation-related onshore facility that, because of its location, could reasonably be expected to cause substantial harm to the environment by discharging oil into or on the navigable waters or adjoining shorelines shall prepare and submit a facility response plan to the Regional Administrator, according to the following provisions:

(1) For the owner or operator of a facility in operation on or before February 18, 1993 who is required to prepare and submit a response plan under 33 U.S.C. 1321(j)(5), the Oil Pollution Act of 1990 (Pub. L. 101-380, 33 U.S.C. 2701 *et seq.*) requires the submission of a response plan that satisfies the requirements of 33 U.S.C. 1321(j)(5) no later than February 18, 1993.

(i) The owner or operator of an existing facility that was in operation on or before February 18, 1993 who submitted a response plan by February 18, 1993 shall revise the response plan to satisfy

RE: Concrete Containment Wall

Dear Ms. Largilliere,

Alabama Metal Fabricators, Inc. appreciates the opportunity to quote the above referenced project. We will supply the material and labor to form and pour the slab and containment wall. The slab will be 5" thick x 9'-6" x 13'-6", with the wall being 6" wide x 14" tall. Both will have #4 rebar for internal strength and will be poured with 4000 pounds of concrete.

The cost for this project will be $9,282.00 (Nine thousand two hundred eighty-two dollars). Please allow 2 to 3 weeks after receipt of order to complete. If you have any questions, please do not hesitate to contact me at 251-986-6257.

Sincerely,

David Weaver

NOTICE OF AGENCY ACTION
Individual Water Use Permit No. 19850074
Consumptive Use Permit Application No. I06475

Dear Permitee:

Your Individual Water Use Permit was approved by the Governing Board of the Northwest Florida Water Management District at a public hearing on January 27, 2005. The permit issued is subject to the terms and conditions set forth in the enclosed permit document. As you are legally responsible for compliance with the conditions of the permit please read the document thoroughly. Pay close attention to any condition(s) of the permit which require the one-time or periodic submittal of information to the District.

If the property where the withdrawal facility is located changes ownership, the permit must be transferred. A permit transfer request must be made on NWFWMD Form A2-F and approved by the Executive Director. If the permit is not transferred you may remain responsible for compliance with the conditions of the permit.

If you have any questions concerning the permit document or if the District can be of any other service, please let us know.

Sincerely,

Angela Chelette, Chief
Bureau of Ground Water
Division of Resource Regulation

HEARING EXHIBIT - 00000860

NORTHWEST FLORIDA WATER MANAGEMENT DISTRICT
INDIVIDUAL WATER USE PERMIT
(NWFWMD Form No. A2-E)

Permit granted to:

Gulf Power Company
Crist Electrical Generating Plant
One Energy Place

Pensacola, Florida 32520-0328
(Legal Name and Address)

Permit No.: 19850074 Modification/Renewal

Date Permit Granted: January 27, 2005

Permit Expires On: February 1, 2010

Source Classification: Sand-and-Gravel Aquifer
Governor's Bayou/
Escambia River

Use Classification: Public Supply
Power Generation

County: Escambia Area: C

Location: Section 25 1/4 Section

Application No.: 106475

Township 1 North Range 30 West

Terms and standard conditions of this Permit are as follows:

1. That all statements in the application and in supporting data are true and accurate and based upon the best information available, and that all conditions set forth herein will be complied with. If any of the statements in the application and in the supporting data are found to be untrue and inaccurate, or if the Permittee fails to comply with all of the conditions set forth herein, then this Permit shall be revoked as provided by Chapter 373.243, Florida Statutes.

2. This Permit is predicated upon the assertion by the Permittee that the use of water applied for and granted is and continues to be a reasonable and beneficial use as defined in Section 373.019(4), Florida Statutes, is and continues to be consistent with the public interest, and will not interfere with any legal use of water existing on the date this Permit is granted.

3. This Permit is conditioned on the Permittee having obtained or obtaining all other necessary permit(s) to construct, operate and certify withdrawal facilities and the operation of water system.

4. This Permit is issued to the Permittee contingent upon continued ownership, lease or other present control of property rights in underlying, overlying, or adjacent lands. This Permit may be assigned to a subsequent owner as provided by Chapter 40A-2.351, Florida Administrative Code, and the acceptance by the transferee of all terms and conditions of the Permit.

HEARING EXHIBIT - 00000861

5. This Permit authorizes the Permittee to make a combined average annual withdrawal of **257,500,000*** gallons of water per day, a maximum combined withdrawal of **305,400,000**** gallons during a single day, and a combined monthly withdrawal of **9,366,700,000***** gallons. Withdrawals for the individual facilities are authorized as shown in the table below in paragraph six. However, the total combined amount of water withdrawn by all facilities listed in paragraph six shall not exceed the amounts identified above.

6. Individual Withdrawal Facility Authorization

7. The use of the permitted water withdrawal is restricted to the use classification set forth by the Permit. Any change in the use of said water shall require a modification of this Permit.

HEARING EXHIBIT - 00000862

8. The District's staff, upon proper identification, will have permission to enter, inspect and observe permitted and related facilities in order to determine compliance with the approved plans, specifications and conditions of this Permit.

9. The District's staff, upon providing prior notice and proper identification, may request permission to collect water samples for analysis, measure static and/or pumping water levels and collect any other information deemed necessary to protect the water resources of the area.

10. The District reserves the right, at a future date, to require the Permittee to submit pumpage records for any or all withdrawal point(s) covered by this Permit.

11. Permittee shall mitigate any significant adverse impact caused by withdrawals permitted herein on the resource and legal water withdrawals and uses, and on adjacent land use, which existed at the time of permit application. The District reserves the right to curtail permitted withdrawal rates if the withdrawal causes significant adverse impact on the resource and legal uses of water, or adjacent land use, which existed at the time of permit application.

12. Permittee shall not cause significant saline water intrusion or increased chloride levels. The District reserves the right to curtail permitted withdrawal rates if withdrawals cause significant saline water intrusion or increased chloride levels.

13. The District, pursuant to Section 373.042, Florida Statutes, at a future date, may establish minimum and/or management water levels in the aquifer, aquifers, or surface water hydrologically associated with the permitted withdrawals; these water levels may require the Permittee to limit withdrawal from these water sources at times when water levels are below established levels.

14. Nothing in this Permit should be construed to limit the authority of the Northwest Florida Water Management District to declare water shortages and issue orders pursuant to Section 373.175, Florida Statutes, or to formulate and implement a plan during periods of water shortage pursuant to Section 373.246, Florida Statutes, or to declare Water Resource Caution Areas pursuant to Chapters 40A-2.801, and 62-40.41, Florida Administrative Code

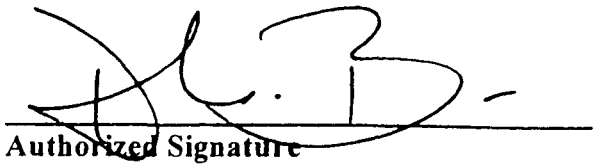
(a) In the event of a declared water shortage, water withdrawal reductions shall be made as ordered by the District.

(b) In the event of a declared water shortage or an area as a Water Resource Caution Area, the District may alter, modify or inactivate all or parts of this permit.

15. The Permittee shall properly plug and abandon any well determined unsuitable for its intended use, not properly operated and maintained, or removed from service. The well(s) shall be plugged and abandoned to District Standards in accordance with Section 40A-3.531, Florida Administrative Code.

HEARING EXHIBIT - 00000863

16. Any Specific Permit Condition(s) enumerated in Attachment A are herein made a part of this Permit.



Authorized Signature

Individual Water Use Permit No. 19850074
Individual Water Use Application No. I06475

1. The Permittee shall include the Individual Water Use Permit number and each well's Florida Unique Identification Number (e.g., AAA###) when submitting reports or otherwise corresponding with the District.

2. The Permittee shall maintain, in working order, in-line totaling flow meters on the well head of each production well.

3. The Permittee shall record the data required on Water Use Summary Reporting Form NWFWMD A2-I, and submit copies to the District by January 31 of each year. The withdrawals shall be reported separately by source (ground water and surface water). The ground and surface water withdrawals shall also be provided as a combined total. The Permittee, if preferred, may submit the report electronically by downloading the correct form from the District website, filling it out properly, and e-mailing it to compliance@nwfwmd.state.fl.us. The report for the year 2005 is due by January 31, 2006.

4. The Permittee, by January 31 of each year, shall report the following information:

   a. Water quality sample results from withdrawal well AAA6421 (CEPG #3) collected during the first two weeks of each month and analyzed for sodium, chloride, sulfate, bicarbonate, carbonate, calcium, magnesium, potassium, specific conductance, total dissolved solids and pH. Prior to sampling, the Permittee shall purge three to five well volumes from the well, and shall report with the test results, the purging duration, volume and rate used.

   b. Static water level data for each production well during the first two weeks of January, April, July, and October. The water level data shall be referenced to mean sea level.

   The Permittee, if preferred, may submit the reports electronically by e-mailing the data to compliance@nwfwmd.state.fl.us.

   The Permittee shall immediately initiate monthly collection, analysis, and reporting of ground-water quality samples and ground-water levels from all withdrawal wells identified in this permit, should drawdowns or water quality exceed a level of concern, as determined by the District. In this event, the Permittee shall, within 30 days, submit a written plan to the District identifying the specific actions it will implement to address the issue(s) of concern including monthly recording of the required data.

HEARING EXHIBIT - 00000865

5. The Permittee shall continue to return at least 95% of the surface water withdrawn from Governor's Bayou/Escambia River. The Permittee shall submit a statement to this effect by January 31 of each year. The first statement is due by January 31, 2006.

6. The Permittee shall implement measures to increase water conservation and efficiency at the facility. The Permittee, by January 31 of each year, shall submit to the District a report detailing the actions taken, and the progress during the previous year, in achieving the stated goal. The first submittal is due by January 31, 2006.

7. The Permittee shall mitigate interference to existing users that is attributable to the withdrawal amounts authorized herein, should it occur. The Permittee shall report the occurrence of any such interference to the District and shall identify the mitigation action undertaken to address the interference.

GULF POWER
A SOUTHERN COMPANY

January 28, 2008

Northwest Florida Water Management District
Division of Resource of Regulation
152 Water Management Drive
Havana, Florida 32333-9700

Dear Mr. Sir/Madam:
Individual Water Use Permit No. 19850074 Gulf Power Company Crist Electric Generating Plant

This letter is intended to present the District with the permit-required information. Attached are the copies of the quarterly static level readings from the wells, and the required analytical results for Well No. 3 and for Well No.5 that were sampled as part of our Groundwater Monitoring Plan. In addition the Water Use Summary Sheets are included.

Permit condition 5 indicates that the permittee shall implement measures to conserve water. The plant has installed level controllers and valves to keep the fire tanks full without overflowing. In 2004 the plant abandoned the CEGP # 2 that was previously used to wash the intake screens.

Permit condition 5 requires the plant to return at least 95% of the surface water withdrawn. The plant continues to operate in accordance with this requirement.

In addition to the description above, reductions in the groundwater withdrawals have been accomplished by the following:

1) Clear water reductions of an estimated 15,768,000 gal/yr by eliminating the cooling water to the no. 2 demineralizer booster pumps.
2) Clear water reduction of an estimated 175,200 gal/yr. by recycling pH sample lines from Units 6 & 7 back into the service water tanks.

Rainfall is collected from a stormwater pond at the landfill and a portion is transferred to the Cooing water basin for unit 6. The new cooling tower has improved drift eliminators that reduce the fog produced which equates to water losses.

If any questions arise concerning the information in these reports, please call me at (850) 444-6429.

Sincerely,

Joe Neese
Environmental Specialist

HEARING EXHIBIT - 00000868

Gulf Power Company
Plant Crist Unit 6 & 7
ECUA Reclaimed Water Project

INTRODUCTION

Gulf Power Company's Plant Crist is a coal-fired generating facility located in Pensacola, Florida. To reduce the amount of water drawn from the Governor's Bayou of the Escambia River, Gulf Power Company has partnered with Emerald Coast Utilities Authority (ECUA) to reuse reclaimed water. The reclaimed water will be used as makeup water for the scrubber system and for unit 6 and 7 cooling towers. To satisfy regulatory requirements, the reclaimed water has to be used in unit 7 circulating water system before it can be supplied to the scrubber system. When unit 7 circulating water is out of service the reclaimed water will be supplied directly to the scrubber system. Plant Crist will also return the used and un-used reclaimed water, up to a maximum of 6 million gallons per day (MGD), to ECUA as industrial wastewater for land application. As a result of the ECUA regulatory requirements, river water must be use to supply units 4, 5, 6, and 7 ash sluice systems. The river water will be pumped from the 4/5 intake structure to the existing ash sluice systems. In case of a 100 year flood a Canal drawn down system will be designed to pump water out of unit 6 intake canal to unit 4/5 discharge tunnel.

SCOPE DEFINITION

ECUA Return and Supply

The reclaimed water will be sent to two new pipelines that shall be installed at the property boundary of Plant Crist near Clear Creek. ECUA will design a 30" and 20" pipelines from their water facility to Plant Crist property boundary. Southern Company Mechanical group will design and route a 30" and 16" pipeline from the boundary to a new enclosed pit – which will be the final designation for the pipes – located near the 4/5 intake structure. The 30" pipeline will be the "Service Pipe" from ECUA to Plant Crist and the 16" pipeline will be the "Return Pipe" from Plant Crist to ECUA. The Service Pipe will be designed to supply water to the following systems or locations: unit 6 and 7 cooling tower, scrubber makeup water tank, and the 4/5 intake tunnel. The 16" return line will tie into a vertical pump discharge header. Two (2) 4200 gallon per minute (GPM) vertical pumps will be installed. These vertical pumps will be placed over a new enclosed pit to pump the blowdown water from unit 6 and 7 cooling tower back to ECUA. The 30" supply line will be reduced to two (2) 16" pipes near the 4/5 stack. The first 16" supply line will be routed to the 4/5 intake tunnel at coordinate N: 579523.6 E: 1111300.41 Z: 73.00 The second 16" supply line will be routed to the enclosed pit. Also, the existing 30" blowdown pipe will be modified to send the blowdown water to the enclosed pit. The water in the new closed pit will be pumped back to ECUA through the 16" return line and tie into the 20"return pipeline at the property boundary. In order not to exceed the maximum 6 MGD return water to ECUA, two (2) additional 4000 GPM pumps will be installed at the enclosed pit to pump water to the 4/5 intake tunnel.

HEARING EXHIBIT - 00000869

Ash Sluice System

The existing units 4, 5, 6 and 7 ash sluice systems shall be modified to take water from Escambia River. Three (3) new 4800 GPM vertical pumps will be installed between the 4/5 intake structure screens and the new ECUA 4/5 intake tunnel feed to delivery water to the existing ash sluice systems. Two (2) pumps shall be sized to supply the maximum required flow to the ash sluice systems, with one (1) pump being an available back-up. A new pipeline will be routed from the new ash sluice header supply pumps to the existing units 4, 5, 6 and 7 existing ash sluice pumps located in various locations of the plant. This pipeline shall be composed of both carbon steel and HDPE piping. The existing units 4, 5, 6 and 7 ash sluice feed systems shall be isolated from the new supply system.

There shall also be two (2) new refractory cooling jockey pumps installed at the 4/5 intake structure. These pumps shall be used to supply river water to Refractory Cooling in the event none of the Ash Sluice Header Supply Pumps are not in service. One pump shall serve as a back-up. When one of the Ash Sluice Header Supply Pumps are in service, the Refractory Cooling Jockey Pumps shall be out of service. These pumps shall be tied into the same piping system used for the new ash sluice system.

As a result of the new Refractory Cooling Jockey Pumps, the existing Refractory Cooling Pumps PPCH 610A and B located in the vicinity of the Unit 6 Ash Sluice Pumps shall be removed from service. The new pumps shall supply sufficient flow and pressure to supply to Refractory Cooling.

Canal Drawdown System

In the event of a 100 year flood, a Canal drawdown system will be designed to pump water from the unit 6 intake canal to unit 4/5 discharge tunnel. Three pumps (3) will be installed in the sub-basement of unit 6, between columns HX 25-1/3 and I 24-1/3. When intake canal 6 water level exceeds sea level elevation of 97', two of the Canal Drawdown pumps will be used for operation. The third pump is used as a spare.

The 20" suction pipe for the new Canal Drawdown Pumps will tie into unit 6 condenser inlet pipe, which is located east of the pumps. There will be a manual valve on the suction pipe that will be opened in the event of a flood. This will allow water from the condenser inlet to flow into the suction pipe of the Canal Drawdown Pumps. It is important to note, the valve for the unit 6 circulating pumps, must be in the open position to allow water from the canal to flow into the condenser inlet pipe.

The discharge pipes of the Canal Drawdown Pumps will tie into a common header above the pumps. This 20" discharge pipe will then be routed from the sub-basement of unit 6 to the basement floor of unit 5 near Column 17-I. The Canal Drawdown Pumps discharge pipe will then tie into unit 4/5 cooling water pipe, near column Fc18, which discharges water into unit 4/5 discharge tunnel.

HEARING EXHIBIT - 00000870

MECHANICAL

Mechanical Project Scope of Work:

1. Provide field constructability walk down to determine existing space available for equipment layout, pipe routing and supports.
2. Prepare equipment specification and piping bill of materials for purchase.
3. Prepare equipment layout and pipe routing drawings (Isometrics, pipe support plans, plans and details).
4. Review and approve vendor drawings.
5. Provide construction support during installation.

Mechanical Work Included:

Provide for the following:

1. Prepare the specification, bid evaluation and recommendation, as well as, the requisition necessary to purchase all valves, piping, and pumps.
2. Review and approve vendor drawings.
3. Prepare all necessary design drawings including equipment layout and pipe routing for bid packages.
4. Provide piping layout locations and loads to Civil Discipline for use in designing the pumping pit foundation and piping supports.
5. Transmit to Document Control all final drawings including field changes for:
   - Routing of pipes from Plant Crist property boundary line to the new pumping pit with new control valve, isolation valve, and flow meter.
   - Routing of piping from 4/5 intake structure ash sluice pumps make up pump to the units 4, 5, 6 and 7 existing ash sluice pumps with new control valves and isolation valves.
   - Routing of piping from Refractory Cooling Jockey Pumps to the new ash sluice supply piping.
   - Routing of pipes from canal draw down pumps near unit 6 condenser inlets to 4 & 5 intake tunnel with manual valve, isolation valve and flow meter.

Mechanical Assumptions:

1. The Plant shall approve the proposed equipment location and pipe routing prior to start the design.
2. Design and procure the diversion tees and valves for all designed locations on the flow diagram.

HEARING EXHIBIT - 00000871

ELECTRICAL

Electrical Project Scope of Work:

1. Provide field constructability walk down to determine existing available space for electrical equipment building, any demolition requirements and raceway routing feasibility.
2. Provide field constructability walk down to determine power source availability.
3. Prepare single line diagrams and conceptual estimate.
4. Prepare cable sizing calculation for all electrical loads.
5. Prepare cable pulling calculations for worst case pulling conditions.
6. Design and layout PEEC equipment for new electrical building and surrounding area.
7. Design and layout equipment, raceway and grounding in the ECUA pump area, the Ash Sluice pump area and the Canal Drawdown pump area in the sub-basement of Unit 6 Turbine Building for motors, valves and instrumentation.
8. Provide grounding, lightning protection, lighting, heat tracing and fiber optic design as required.
9. Prepare design drawings including elementary and wiring diagrams.
10. Input data into the (PDMS) to develop cable pull & termination cards, bill of material, raceway and cable schedules.
11. Prepare & issue equipment specifications and bid evaluations.
12. Prepare and issue requisitions.
13. Review and approve other discipline's drawings.
14. Review and approve vendor drawings.
15. Provide field support during Construction.
16. As-built & Red-line Drawings
17. Transmit to Document Control final electrical drawings including field changes.

Power Supply Design Philosophy

- Power for the new ECUA Electrical building will be derived from the Scrubber new 4.16kV switchgears located in the JBR building.

- Two new 4.16kV motor control centers will be located in the ECUA Electrical building to power the (2) ECUA Return pump-motors, (3) Ash Sluice pump-motors and (2) 4160-480V power transformers.

- The transformers will power two new 480V motor control centers located in the ECUA Electrical building. The 480V MCC's will power the (2) ECUA Surplus & the (2) Refractory Cooling jockey pump-motors, distribution systems for motor operated valves and misc loads associated with the new ECUA electrical building.

Refer to drawing **D39070** for Master Single line Diagram.

- The (3) Canal Drawdown pump-motors will be fed from existing 600V motor control center 6F located in the Unit 6, elevation 132'.

Electrical Work Included:

ECUA Electrical Building

1. Existing Demineralizer building superstructure will be demolished, and a new electrical equipment building will be placed, with care taken not to damage any grounding or piping which is to remain for later connections. Civil discipline will address any action to be taken to modify the foundation for the new PEEC building.

2. A 16 ft x 50 ft pre-fabricated building will be procured with all electrical equipment such as the 4160V & the 480V MCC's, distribution panel boards and dry-type transformers, etc. and all cable tray, all indoor & outdoor lighting fixtures, receptacles, HVAC and equipment already installed and set in place before shipment. Equipment shall be installed, if practical, and shop tested prior to shipping. The building finished floor EL. will be 97'+/-. Refer to drawings **D39170** & **D39173** for building equipment contents and physical arrangement.

3. Define (for Civil) any stairs, platforms, oil containment, and Tee poles around electrical building needed for access and maintenance of HVAC equipment and power transformers. The base EL. of the transformers will be 97' +/-.

4. The existing ground cables stubbed out of the existing foundation corners are to be tested for continuity and readings prior to use with the new system. A ground loop shall be designed around the power transformers with ground rods driven to an 80' depth or refusal.

5. The building will be protected by addition of 8 – 18" air terminals along the ridge of the building roof. The air terminals will be connected to a 4/0 down-lead which will be carried to the existing ground cables at the four corners of the building support. The down-lead will also be connected to the support column (if present) with a Cadweld connection.

6. The (2) 4.16kV circuits providing power to the ECUA bldg from the JBR bldg will be routed in cable 2-12" tray runs approximately 1,100'. Fiber optic cables for control, security & LAN will be routed in the same redundant trays. These trays will be field-routed and supported.

Demineralizer Bldg and Chemical & Results Distribution

The Demineralizer bldg is currently fed from a 70A breaker of the existing 600V motor control center located in the Coal Handling house. Chemical & Results 120/208V distribution and outdoor lighting for the oil storage area are currently fed from a 120/208V distribution panel which is fed from the 600V motor control center via a 600-208/120V step-down transformer located in the Demineralizer Bldg.

It was decided that after demolition of the Demineralizer bldg:

1. The 70A breaker of the existing 600V motor control center located in the Coal Handling house will be utilized to feed the Chemical & Results 120/208V distribution via a new 45kVA transformer to be located @ the C&R pit area. Additional equipment, raceway and grounding design is required at this area. This work will be completed prior to demolition effort.

2. The outdoor lighting for the oil storage area will be fed from the new ECUA electrical building. Prior to completion of the ECUA electrical bldg, lighting will be fed temporary from the construction power.

ECUA Supply and Return

1. Design a raceway system and power, control & low level signal cabling from the ECUA electrical building to the ECUA pumps pit and within the pit area, including equipment, grounding, lighting and supports. Tee pole supports are required by Civil for overhead raceway.

2. The ECUA Return & Surplus pumps will be controlled via a HOA control station and the DCS located in the ECUA electrical bldg.

3. The motor operated valves within the pumps pit area will be powered from a new local 120/208V distribution system. The MOVs will be controlled from the DCS in the ECUA electrical bldg.

4. MOVs at the 6&7 Cooling Tower Makeup will be powered & controlled from the new Gypsum electrical building.

5. MOV at ECUA Scrubber line will be powered & controlled from the new JBR electrical building.

Ash Sluice System

1. Design a raceway system and power, control & low level signal cabling from the ECUA electrical building to the Ash Sluice pumps pit and the surrounding 4/5 intake canal area, including equipment, grounding and supports. Tee pole supports are required by Civil for overhead raceway.

2. Design an underground raceway system under the roadway access to the screen area and direct buried conduit as required.

3. The Ash Sluice HDR Supply & Refractory Cooling pumps will be controlled via a HOA control station and the DCS located in the ECUA electrical bldg.

4. The motor operated valves within the pumps pit area will be powered from a new local 120/208V distribution system. The MOVs will be controlled from the DCS in the ECUA electrical bldg.

HEARING EXHIBIT - 00000874

5. The air operated valves at Units 4/5, 6 & 7 Ash Sluice Pumps in the sub-basement controlled from the DCS in the ECUA electrical bldg.

Canal Drawdown

1. Design a raceway system and power & low level signal cabling from the Canal Drawdown pump location in Unit 6 sub-basement to the Unit 6 relay room and MCC 6F location on EL.132 platform and within the pump area, including equipment, grounding and supports.

2. The Canal Drawdown pumps will be controlled automatically via the DCS in the Unit 6 relay room.

3. The canal level transmitter will be wired to the DCS in the Unit 6 relay room.

Miscellaneous

1. There are valves, flow devices and various instruments and heat tracing which are located in remote areas, requiring power, control and low level signal cables to be routed from plant sources/destinations agreed upon with plant representatives.

Electrical Assumptions:

1. Plant approves the demolition of the existing Demineralizer building and the erection of the proposed ECUA Electrical building.
2. Plant approves the use of spare buckets/breakers of the 600V motor control center 6F to power the (3) Canal Drawdown pump motors.
3. B&V approves the 4.16kV feeds to the ECUA electrical bldg from the new 4.16kV Scrubber switchgears in the JBR bldg.
4. B&V approves the feeds to new MOVs from the JBR and Gypsum buildings and utilization of raceways in the duct bank running to the Gypsum building.
5. Sole source for the ECUA (PEEC) Electrical Building.
6. Accuracy of Motor HP ratings from Mechanical discipline.
7. Accuracy of PI&D & piping drawings from Mechanical discipline.
8. One out of two ECUA Return Pump will be running
9. All two (2) ECUA Surplus Pumps will be running
10. One out of two Refractory Cooling Pump will be running
11. All three (3) Ash Sluice Header Supply Pumps will be running
12. Two out of three Canal Drawdown Pumps will be running

HEARING EXHIBIT - 00000875

CIVIL

Civil Project Scope of Work:

Scope includes the following items.

1. Provide field constructability walk down to determine existing space available for equipment layout, pipe routing and supports.
2. Provide design for the ECUA Supply and Return pumping pit.
3. Provide design for Ash Sluice Pumping structure
4. Provide design for pipe supports.
5. Provide design for a manhole near cooling tower # 6.
6. Provide foundation design for the new Electrical switchgear building.
7. Provide all necessary design drawings.

Civil Work Included:

ECUA Supply and Return

1. Design pipe support bridge spanning canal and roads north of cooling tower #6
2. Design valve pit on north east side of cooling tower #6.
3. Verify and modify existing precipitator #7 framing steel at top of steel el 116'-9" as required. Framing at north end for supporting 30" and 16" diameter pipes.
4. Design Pipe Bridge and set of t-poles north of precipitator #6 along existing coal wall for continuation of 30' and 16" diameter pipes.
5. Design cross over and t-poles from end of existing coal wall to edge of pipe trench going east towards existing duct support steel framing.
6. Verify and modify existing duct support steel for supporting continuation of pipe running south into existing unit #4 & #5 intake tunnel
7. Provide design and drawings for new ECUA pump pit west of fire water tank.

Ash Sluice System

1. Provide design & drawings for new Ash Sluice Pump structure pit.
2. Provide new concrete trench for routing of 20' diameter pipe under existing road south of new ash sluice pump pit.
3. Verify existing abandoned duct steel framing north of units #1 & #2 for routing of 20" diameter pipe.
4. Provide supports and verify existing structures from unit #3 thru unit #7 for routing of 12",14",18" and 20" diameter pipes
5. Provide structural drawings indicating new support and members that need to be reinforced.

Canal Drawdown

1. Provide supports for a 20" diameter pipe between unit # 5 & # 6 from top of concrete el. 60'-0" to top of concrete el. 75'-0"
2. Verify existing steel at support locations for new loads.
3. Provide structural steel drawings at reinforced locations.

HEARING EXHIBIT - 00000876

Electrical Building

1. Verify and modify existing demineralization building foundation for new electrical building
2. Provide design for stairs and platforms around electrical building for access and maintenance.
3. Provide design for platforms and containment around new transformers
4. Provide design for steel support of electrical building skid
5. Provide design for t-poles around and near electrical building
6. Provide t-poles around pump pits
7. Provide construction support during installation
8. Transmit final drawings to Document Control.

Civil Assumptions:

1. Lead discipline information will be available at time of design.
2. Certified vendor information will be available at time of design.
3. Foundations will use same piles as scrubber projects on site.
4. Design drawings will be based on latest grid coordinate system..

INSTRUMENTATION & CONTROL

Instrument & Control Project Scope of Work:

Provide control logic and control graphics for pump protection and system performance monitoring; control of the ECUA return, ash sluice and canal draw down pumps. Provide control logic to monitor flow for the canal draw down and ECUA return and supply system. Provide control logic to monitor all associated motor control operated valves.

1. Work with other discipline to review and revise P&ID.
2. Prepare all necessary control logic drawings.

Instrument & Control Work Included:

1. Prepare requisition and purchase all control equipment needed for all water systems.
2. Provide Ovation control sheets, instrument list, instrument location drawings, primary connection drawings and installation details. Updating of the FGD DCS point data base to include this new equipment.
3. Produce AS-Build drawings for these drawings.
4. Transmit to Document Control final design drawings including field changes.

Instrument & Control Assumptions:

1. ECG, project personnel and plant personnel will develop the operational requirements for each of the three subsystems for the FGD water systems.
2. The control of this equipment will be through the common FGD node of the Ovation distributed control system.
3. Remote DCS nodes will be located in electrical buildings. These nodes will be defined later.

Revised June 2008

Verified List

OGC Case Number	Planning Unit	WBID	Waterbody Segment Name	Waterbody Type	Waterbody Class[1]	Parameters Included on the 1998 303(d) List	Parameters Assessed Using the Impaired Waters Rule (IWR)	Concentrations Causing Impairment[2]	Priority for TMDL Development[3]	Projected Year for TMDL Development[3]	Comments (# Exceedances/# Samples) PP=Planning Period VP=Verified Period[4]
	Choctawhatchee Bay	692	BOGGY BAYOU	ESTUARY	3M		Bactena	Exceeds DOH threshholds	Medium	2009	Beach advisones > 21 days/yr for 2002 and 2003.
	Choctawhatchee Bay	754	POQUITO BAYOU	ESTUARY	3M		Bactena	Exceeds DOH threshholds	Medium	2009	Beach advisones > 21 days/yr for 2003.
	Choctawhatchee Bay	778AC	GULF ISLAND NATIONAL SEASHORE	COASTAL	3M		Bacteria	Exceeds DOH threshholds	Medium	2009	Beach advisones > 21 days/yr for 2003.
	Choctawhatchee Bay	722B	ROCKY BAYOU STATE PARK	COASTAL	3M		Bactena	Exceeds DOH threshholds	Medium	2009	Beach advisones > 21 days/yr for 2002 and 2003.
	Choctawhatchee Bay	778A	CHOCTAWHATCHEE BAY	ESTUARY	2		Fecal Coliform (Shellfish Harvesting)	Exceeds SEAS threshholds	Medium	2009	PP = 35 / 1090; VP = 27 / 474. This WBID was listed because there was a downgrade in the shellfish harvesting classification (from approved to conditionally approved) for some portion of this Class II waterbody.
	Choctawhatchee Bay	778B	CHOCTAWHATCHEE BAY	ESTUARY	2	Coliforms	Fecal Coliform (Shellfish Harvesting)	Exceeds SEAS threshholds	Medium	2009	PP = 9 / 4032; VP = 4 / 453. This WBID was listed because there was a downgrade in the shellfish harvesting classification (from approved to conditionally approved) for some portion of this Class II waterbody.
	Choctawhatchee Bay	778C	CHOCTAWHATCHEE BAY	ESTUARY	2	Coliforms	Fecal Coliform (Shellfish Harvesting)	Exceeds SEAS threshholds	Medium	2009	PP = 518 / 4533; VP = 153 / 1751. This WBID was listed because there was a downgrade in the shellfish harvesting classification (from approved to conditionally approved) for some portion of this Class II waterbody.
	Choctawhatchee Bay	778CA	CHOCTAW BEACH COUNTY PARK	ESTUARY	2		Bacteria	Exceeds DOH threshholds	Medium	2009	Beach advisones > 21 days/yr prior to June 30, 2004.
	Choctawhatchee Bay	843B	GARNIERS PARK	COASTAL	3M		Bacteria	Exceeds DOH threshholds	Medium	2009	Beach advisones > 21 days/yr for 2002 and 2003.
	Choctawhatchee River	49, 49A-F	CHOCTAWHATCHEE RIVER	STREAM	3F	Mercury (Based on Fish Consumption Advisory) in WBIDs 49, 49F	Mercury (in Fish Tissue)	Exceeds DOH threshhold (> 0.5 mg/kg)	Low	2011	Data verified to be within the last 7.5 years. In 2004, 26 Largemouth Bass had an average mercury concentration of 0.69 mg/kg
	Choctawhatchee River	49F	CHOCTAWHATCHEE RIVER	STREAM	3F	Coliforms	Total Coliform	>2400 colonies/100 mL	Medium	2009	PP = 13 / 36; VP = 10 / 33
	Choctawhatchee River	49F	CHOCTAWHATCHEE RIVER	STREAM	3F	Coliforms	Fecal Coliform	>400 colonies/100 mL	Medium	2009	PP = 17 / 49; VP = 15/65
	St. Andrews Bay	986	PEACH CREEK	STREAM	3F		Historic Chlorophyll	Median TP=0.007 mg/l	Medium	2009	PP = Potentially Impaired; VP = Impaired. Historcal chla = 2 ug/l for 1992-1996. For 2001 and 2002, annual means > 50% above historcal background for 2 consecutive years, with values of 5.5 ug/L and 5.3 ug/L, respectively. TP is the limiting nutrient based on a mean TN/TP ratio of 62, using 212 values.
	St. Andrews Bay	1009	WESTERN LAKE OUTLET	ESTUARY	3M		Historic Chlorophyll	Median TP=0.007 mg/l	Medium	2009	PP = Potentially Impaired; VP = Impaired Historical chla = 2 ug/l for 1993-1997. For 2000 and 2001, annual means > 50% above historcal background for 2 consecutive years, with values of 6.3 ug/L and 3.1 ug/L, respectively. TP is the limiting nutrient based on a mean TN/TP ratio of 32, using 320 values.

HEARING EXHIBIT - 00000886

Choctawhatchee - St Andrews Group 3 Basins
Verified List

OGC Case Number	Planning Unit	WBID	Waterbody Segment Name	Waterbody Type	Waterbody Class[1]	Parameters Included on the 1998 303(d) List	Parameters Assessed Using the Impaired Waters Rule (IWR)	Concentrations Causing Impairment[2]	Priority for TMDL Development[3]	Projected Year for TMDL Development[3]	Comments (# Exceedances/# Samples) PP=Planning Period VP=Verified Period[4]

[1] Florida's waterbody classifications are defined as: 1 - Potable water supplies, 2 - Shellfish propagation or harvesting, 3F - Recreation, propagation, and maintenance of a healthy, well-balanced population of fish and wildlife in fresh water, 3M - Recreation, propagation, and maintenance of a healthy, well-balanced population of fish and wildlife in marine waters, 4 - Agricultural water supplies, 5 - Navigation, utility, and industrial use.

[2] "ln H+" means the natural logarithm of total hardness expressed as mg/L of CaCO3. For metals criteria involving equations with hardness, the hardness shall be set as 25 mg/L if actual hardness is < 25mg/L and set at 400 mg/L if actual hardness is > 400 mg/L. The concentration causing impairment for nutrient listings is the median.

[3] Priority and schedule for this WBID reflects the priority established for the WBID in the 1998 303(d) list. Where a parameter was 1998 303(d) listed, the priority shown for it in the 1998 303(d) list was retained if it was originally high or changed to medium if it was originally low. In the case of mercury, the priority remains low. Where a parameter was only identified as impaired under the IWR, priorities of high, medium, or low were used.

[4] PP - Planning Period (January 1, 1992 through December 31, 2001); VP - Verified Period (January 1, 1997 through June 30, 2004)

Choctawhatchee Basin / St. Andrews Basin Verified List based on IWR Run 17.

Confirmed coastal fish advisory for King Mackerel and the Bull Shark. 87 King Mackerel averaged 0.67 mg/Kg in 2002. This includes the following WBIDs: 502, 548A, 548AB, 548B, 548BB, 548C, 548CB, 548CC, 548D, 548E, 548F, 548FB, 548G, 548H, 738, 738AB, 8002, 8002A, 8003, 8003D, 8003E, 8004, 8004B, 8004C, 8005, 8006, 8006A, 8007, 8007A, 833, 846, 846CB, 848DA, 915, 915A, 915B, 915C, 915D, 915E, 915F, 987.

[1] Florida's waterbody classifications are defined as: 1 - Potable water supplies, 2 - Shellfish propagation or harvesting, 3F - Recreation, propagation, and maintenance of a healthy, well-balanced population of fish and wildlife in fresh water, 3M - Recreation, propagation, and maintenance of a healthy, well-balanced population of fish and wildlife in marine waters, 4 - Agricultural water supplies, 5 - Navigation, utility, and industrial use.

[2] The nutrient concentrations represent the 75th percentiles of data from the Verified Period. The target nutrient concentration used in the subsequent TMDL will be determined during the TMDL process.

[3] Priorities and schedule for TMDL development are only provided for waters in Category 5. Priorities set under the EPA Consent Decree were retained. Medium priority is used for newly listed waters identified unde

Statement of Intent Form

_____ will participate in The Climate Registry.

We will:

- Inventory and report entity-wide direct and indirect greenhouse gas (GHG) emissions, according to the guidance provided by The Climate Registry (the Registry).
- Verify our emissions through a Registry approved verifier.
- Report our total emissions through the Registry's online reporting software.

Gulf's Response to Staff's Third Request for Production of Documents (No. 6)

6. Referring to the testimony of Susan Ritenour dated April 4, 2008, please provide a schedule that shows the capital structure, components, and cost rates relied upon for calculating the revenue requirement rate of return. Please include in this schedule the derivation of debt and equity components used in the Return on Average Net Investment, lines 7 (a) and (b), on Schedule 8E attached to the testimony. Please cite all sources and include the rationale for using the particular capital structure and cost rates.

ANSWER:

In accordance with FPSC Order No. PSC-94-0044-FOF-EI, the rate of return used to develop the revenue requirements of ECRC investment is based on the capital structure and cost rates approved in Gulf's last rate case, Docket No. 010949-EI, FPSC Order No. PSC-02-0787-FOF-EI, dated June 10, 2002.

Gulf's response to Staff's First Set of Interrogatories (Nos. 1 -3)

1. Please refer to Gulf's petition filed August 28, 2009, page 7, regarding SPCC's 2009 projections for capital expenditures of $25,000, and refer to Exhibit SDR-3, page 3 of 87, line 1.20 - SPCC Compliance. Please reconcile the amount shown in the petition with the total shown in Exhibit SDR-3 ($128,006).

ANSWER:

The $25,000 as stated in Gulf's petition and shown on Exhibit SDR-3, page 23 of 87 (Line 1a of Schedule 4P, Page 20), represents total expenditures and placed-in-service for the SPCC Compliance Program in 2009. The $128,006 on Exhibit SDR-3, page 3 of 87, line 1.20 – SPCC Compliance represents total 2009 revenue requirements for the entire SPCC Compliance program.

This program includes two projects: PE 1272 – Crist Switchyard Stormwater (a previously approved project) and PE 1401 – Plant Smith SPCC Compliance (a new project). For 2009, PE 1272 has no projected expenditures. The 2009 revenue requirements for PE's 1272 and 1401 are $125,105 and $2,901 respectively.

2. Please refer to Gulf's petition filed August 28, 2009, page 7, regarding SPCC's 2009 projections for O&M expenditures of $5,000, and refer to Exhibit SDR-3, page 2 of 87. Please state where the O&M expenditures are shown in Exhibit SDR-3.

ANSWER:

The $5,000 in O&M expenses for the SPCC Program is included in Exhibit SDR-3, page 2 of 87, Line Item 1.11 – General Solid and Hazardous Waste.

3. Please refer to Gulf's petition filed August 28, 2009, page 7, regarding Plant Crist Water Conservation Project 2009 projections for capital expenditures of 17.4 million, and refer to Exhibit SDR-3, page 3 of 87, line 1.24 - Crist Water Conservation. Please reconcile the amount shown in the petition with the total shown in Exhibit SDR-3 ($35,571).

ANSWER:

The $17.4 million [(1)], as stated in the Gulf's petition, represents the total projected expenditures for the Plant Crist Water Conservation Project. For 2009, total expenditures and placed-in-service amounts for the project are projected to be $1.3 million as shown on Exhibit SDR-3, page 27 of 87 (Line 1a of Schedule 4P, Page 24). The $35,571 on Exhibit SDR-3, page 3 of 87, line 1.24 – Crist Water Conservation represents the demand portion of the total revenue requirements of $38,538 for the entire program.

This program is made up of two projects, PE 1227 and PE 1298. PE 1227 is a previously approved Plant Crist Water Conservation project that consisted of installing level controls on the fire water tanks during 2006. PE 1298 is a new Plant Crist Water Conservation project to utilize reclaimed water from a local wastewater treatment plant. For 2009, PE 1227 has no projected expenditures. The 2009 revenue requirements for PE's 1227 and 1298 are $12,745 and $25,793 respectively.

(1) The $17.4 million included in the petition inadvertently omitted AFUDC of approximately $0.5 million. This amount has been corrected in Section F (Company Specific Issues) in Gulf's position on Issue 3 in our Prehearing Statement.

30

TECO's Response to Staff's Second Request for Production of Documents (No. 2)

HEARING EXHIBIT - 00000910

2. Please provide workpapers (break down into line items) to support the Company's estimate of $15,000 - $150,000 O&M expenses for 2009.

A. The high-level estimate range was developed through telephone conversations with members of other Florida utilities. It includes, minimally, the fees to join the Climate Registry pursuant to the website, www.theclimateregistry.org as well as anticipated costs for establishing an infrastructure for data collection, reporting and third party verification of greenhouse gas emissions as required by House Bill 7135 ("HB 7135").

Attached is a preliminary, non-binding quote that Tampa Electric received to establish a Compliance Management System to track GHG. Once the Florida Department of Environmental Protection has finished reviewing HB 7135 and has established a rule and official start date Tampa Electric will have a better understanding of the compliance requirements and will be able to provide more definitive program details and costs. Although this quote includes other aspects of air emissions monitoring beyond GHG, at such time Tampa Electric files with the Commission a GHG program, the company will only request cost recovery for those expenditures specifically related to GHG and will take the steps to bid out the necessary work needed to comply with the rule and HB 7135.

Mr. Byron T. Burrows, P.E., BCEE
Manager, Air Programs
Tampa Electric Company
P.O. Box 111
Tampa, FL 33601-0111

Re: Request for Proposal
Tampa Electric Company
Bayside Power Station
Compliance Management System and Enviance System Configuration
Title V Air Permitting, Air Emissions Inventory, and Greenhouse Gas Management

Dear Mr. Burrows:

Malcolm Pirnie appreciates the opportunity to provide the Tampa Electric Company (TEC) with this proposal to further develop their Enviance® compliance management system with respect to Title V Air Permitting, Air Emission Inventory, and Greenhouse Gas (GHG) Management at its Bayside Power Station.

This proposal is being written at the request of TEC following our February 21, 2008 meeting at TEC's training facility in Tampa in which Malcolm Pirnie provided an overview demonstration of the Enviance® system that included Title V permitting and reporting at TEC's Big Bend, Bayside, Polk, and Phillips Power Stations. Our demonstration also included GHG and TRI applications which TEC could utilize in their recordkeeping and reporting at these facilities.
The scope for this proposal was further defined during our conference call held on March 28, 2008.

Based on these discussions, Malcolm Pirnie understood that TEC's ultimate goals for the expansion of the Enviance® system with respect to air program compliance include:

- Track milestones, deadlines, requirements, and compliance items associated with environmental regulations at its powers stations.
- Provide task notifications and calendaring to support the successful completion of compliance items at its power stations.
- Perform data compilations and calculations associated with the preparation of Annual Operating Reports (AORs).
- The automation of weekly emissions reports generated from CEMS data for internal review.
- Verification of compliance for Annual Compliance Certification Reports.
- Data tracking and creation of deviation reports.
- Data integration into the Enviance® system to allow this system to function as a data repository so that information can be pulled out and reported in tables or graphs (for trending analysis) for both internal use and externally as required for reporting purposes.
- GHG management and tracking with respect to but not limited to the following: development of baseline emissions, future emissions tracking, measurement of performance, and association of costs with GHG management and tracking efforts.
- To provide a system that is easily manageable by internal TEC personnel.

As we discussed in our March 28, 2008 conference call, TEC would like to initially configure the Enviance® system for Title V Permitting and Air Emissions Inventory at its Bayside Power Station. The configuration of the Bayside Power Station for air compliance will provide TEC with a complete air permitting "template" that can be used as a guide by TEC personnel to build out and configure the system for the other power stations. For expansion of the Title V and emission inventory configuration to the other three sites, Malcolm Pirnie can provide training to allow for TEC personnel to perform these configurations.

At TEC's request, this proposal is written in three sections, with a section addressing each of the following: Title V Permitting, Air Emissions Inventory, and GHG Management.

Scope of Work

Title V Permitting

The Bayside Power Station is an electric power plant consisting of combined cycle gas turbine units. The facility also generates emissions at its F.J. Gannon Station Fuel Yard from activities including the transfer and storage of coal via railcar, truck, and barge.

A full Title V Environmental Compliance solution, which provides a centralized relational database with task and event notification, tracking, and reporting will be created for the Bayside Power Station. Each and every requirement from the Title V permit will be configured in the system. Malcolm Pirnie will convert the requirements of the Title V permit into active objects within the system, including tasks, data inputs, calculations, emissions limits tracking, log books, permit deviations documentation, and compliance tracking.

The scope of this proposal is based on the Bayside Power Station Title V Permit numeric and non-numeric requirements as outlined in the excel spreadsheet named *Bayside Title V Limits & Compliance Summary* provided to Malcolm Pirnie via email on March 3, 2008 and the Title V permit dated January 1, 2005.
Malcolm Pirnie understands that this spreadsheet may not be completely up to date with respect to current permitting conditions. Malcolm Pirnie will review the Title V permit in full and identify additional requirements (and associated tasks) that are not in the current spreadsheet. These identified requirements will be included in the configuration scope. Based on our cursory review of the Compliance Summaries and Title V Air permits we estimate there are approximately 50 numeric and 50 non-numeric requirements for the Bayside facility.

Project Planning, Data Collection, and Solution Design

Malcolm Pirnie proposes to conduct a one-day project kickoff and data collection workshop at TEC's office in Tampa, Florida. The purpose of the data collection workshop is to define and document the specific details and decisions related to the layout and configuration of the environmental compliance solution. Based on the information gathered prior to and during the workshop and follow-up communications, Malcolm Pirnie will prepare for TEC's review and comment a data collection worksheet (DCW). The DCW will allow the project team to jointly review and approve the conceptual solution prior to the configuration of requirements in the Enviance® system.

After review of the DCW and incorporation of project team comments, TEC and Malcolm Pirnie will sign off on the DCW prior to initiation of the Configuration phase. Changes to the DCW may be necessary

during the course of the project as additional information becomes available. The project team will review any potential changes to determine their impact on the overall solution as well as on the project scope, schedule, and budget. Changes approved by the project team will be documented and incorporated into the DCW.

Configuration

Once TEC signs off on the DCW, Malcolm Pirnie will begin the configuration of the Title V Air Permitting solution. During configuration, TEC will have access to the system to review the progress of the configuration. Malcolm Pirnie will conduct internal solution testing during configuration to evaluate the results against the DCW. At the completion of the Configuration phase, Malcolm Pirnie will perform solution testing of the entire solution and evaluate it against success criteria contained in the DCW as well as project scope for completeness. TEC will have the opportunity to evaluate the system configuration. If deficiencies are found with respect to the fulfillment of the DCW, then Malcolm Pirnie will work with TEC to address them. Once the configuration is deemed complete, the project will move into the deployment phase.

Deployment and Training

Malcolm Pirnie will provide up to 8 TEC end user personnel with one day of on-site training. The objective of the training will be to train key TEC staff on the use of the Title V Permitting solution. At the conclusion of the training and sign off of this phase, TEC will have on-going use of a live Title V Permitting solution. Malcolm Pirnie will provide ongoing adoption support to assist TEC with usage of the system after the training period.

Schedule

Malcolm Pirnie expects delivery of the complete Title V Permitting system within one to two months from notice to proceed. This is dependent on the availability of integral TEC personnel and accuracy of the data needed to configure the solution. Malcolm Pirnie is prepared to begin work immediately upon authorization to proceed.

Cost

Malcolm Pirnie will deliver the Title V Permitting solution for a total lump sum fee of $30,000 which includes all expenses. The table below provides a breakdown of these costs:

Task Description	Cost
Title V Permit Review	$3,000
Kickoff Meeting & Data Collection Workshop	$4,500
Data Collection Worksheet	$4,500
System Configuration	$14,500
Training	$3,500
TOTAL	$30,000

Air Emissions Inventory

This section of the proposal covers the Enviance® system configuration to facilitate the required air emissions calculations and associated reporting for the Bayside Power Station. The system will be configured to perform emission inventory calculations and generate the associated required annual emission report. Configuration of the emission inventory calculations will include all required raw data inputs (i.e., emission factors, fuel usage, material throughput, etc.), calculation definition (i.e., monthly calculations, rolling 12-month average calculations and annual summaries) and output parameters. This information will be identified based on previously generated spreadsheets, used by TEC, that are currently used for this purpose.

The tasks described previously for the Title V Permitting effort will be employed for this effort, with the exception of the permit review. Malcolm Pirnie will deliver, in approximately one month from notice to proceed, the Air Emissions Inventory solution for a total lump sum fee of $23,500 which includes all expenses. The table below provides a breakdown of these costs:

Task Description	Cost
Kickoff Meeting & Data Collection Workshop	$4,500
Data Collection Worksheet	$4,500
System Configuration	$11,000
Training	$3,500
TOTAL	$23,500

Greenhouse Gas Management

TEC is extremely interested in developing a GHG management system. TEC is a member of the Chicago Climate Exchange and are eager to develop a cost-effective, streamlined GHG management system that will incorporate the essential tools to initially allow for the establishment of baseline emissions, followed by emission and performance tracking, and reporting. Malcolm Pirnie will configure the Enviance® system to meet TEC's regulatory need to establish a current GHG "footprint" that can be supported by a credible emissions inventory that is complete and accurate and can withstand rigorous third-party auditing and verification. Ultimately, TEC's Enviance® system can be configured to meet various GHG protocols for reporting emissions across a wide range of programs such as:

- Voluntary GHG reduction programs
- GHG registries
- National and regional industry initiatives
- GHG trading programs
- Sector-specific protocols developed by a number of industry associations

The direct (Scope 1) and indirect (Scopes 2 and 3) emissions must be determined. Other important considerations in developing the inventory of emissions are the company's options for reducing GHG emissions and how the company can shape its carbon footprint to maximize its cost savings opportunities and minimize its risks. The development of an emissions inventory will support development of GHG management strategies will allow TEC to identify the following:

MALCOLM PIRNIE

- Their GHG emissions profile
- Where reductions might be possible
- Whether they may need to buy carbon credits

For the purposes of this proposal, the Bayside Power Station will be the first facility included in the emission inventory. Malcolm Pirnie understands that TEC is very motivated to complete a corporate wide GHG inventory and the development of the GHG inventory for the Bayside facility will be an important step in providing a streamlined process that can be used for the other facilities, service centers, and for other potential sources of indirect emissions. The GHG solution will be able to leverage integration and data collection from existing programs (i.e., Title V implementation) to generate the GHG emissions inventory. Our scope for the development of a GHG management Enviance® system configuration is listed below.

Kickoff Meeting and Data Collection

Malcolm Pirnie proposes to conduct a one-day project kickoff and data collection workshop at TEC's office in Tampa, Florida. The purpose of the data collection workshop is to outline all GHG sources and to define and document the specific details and decisions related to the layout and configuration of the environmental compliance solution. Enviance® has a GHG template complete with typical Scope 1, 2, and 3 sources and conversion factors based on the World Resources Institute (WRI) standard. This template can be used by TEC as a starting point in determining the Baseline emissions for their direct and indirect sources at the Bayside Power Station. During the workshop, Malcolm Pirnie will work with TEC personnel to determine the:

- Sources of GHG sources
- Available data that tracks GHG emissions (e.g. fuel source and usage)
- Data gaps and how they can be filled

The Baseline emissions are the calculated amount of GHG emissions for the designated baseline year. TEC will be able to compare future GHG emissions to this Baseline to show reductions and/or as a basis for carbon trading. The Inventory and Baseline will include direct and indirect GHG emissions from the Bayside Power Plant facility.

Based on the information gathered prior to and during the workshop and follow-up communications, the emissions inventory will be developed and provided to TEC for their review, comment, and approval. Malcolm Pirnie will incorporate the emissions inventory into a DCW and submit to TEC for review and comment. The DCW will allow the project team to jointly review and approve the conceptual solution prior to the configuration of requirements in the Enviance® system.

Solution Design and Configuration

Once the Emissions Inventory solution design has been approved by TEC, Malcolm Pirnie will calculate the annual emissions of GHGs for each source to create the Baseline. All GHG emissions will be converted into CO_2 equivalents for reporting purposes.

The State of Florida has joined The Climate Registry. The Climate Registry is a multi-state and tribe collaboration aimed at developing and managing a common greenhouse gas emissions reporting system with high integrity that is capable of supporting various GHG reporting and reduction policies for its member states and tribes and reporting entities. The Climate Registry has not developed its own set of protocols yet. It will follow the California Climate Action Registry General Reporting Protocol until its

own protocol is developed.

Deployment, Reporting, and Training

The solution configuration will be designed to produce a defensible Baseline in accordance with the General Reporting Protocols to be reported to The Climate Registry. Malcolm Pirnie will provide up to 4 TEC end user personnel with one day of on-site training. The objective of the training will be to train key TECO staff on the use of the GHG solution.

Following successful determination of Baseline Emissions, Malcolm Pirnie will work with TEC in developing emissions tracking, performance measurement, and reporting solutions. Additionally, Malcolm Pirnie understands that TEC would like to use the Enviance® system as a means to associate costs with GHG efforts. The scoping of these solutions can better be determined following the development of TEC's Baseline emissions for the Bayside facility and Malcolm Pirnie can provide scope tasks and pricing at that time.

Following the training session, Malcolm Pirnie will provide ongoing adoption support to assist TEC with ongoing usage of the system.

Schedule

Malcolm Pirnie expects delivery of the complete GHG Management system within one to two months from notice to proceed. This is dependent on the availability of integral TEC personnel and accuracy of the data needed to configure the solution. Malcolm Pirnie is prepared to begin work immediately upon authorization to proceed.

Cost

Malcolm Pirnie will deliver the Title V Permitting solution for a total lump sum fee of $20,000 which includes all expenses. The table below provides a breakdown of these costs:

Task Description	Cost
Kickoff Meeting & Data Collection	$4,000
Development of Baseline Emissions	$4,000
Solution Design and Configuration	$6,500
Deployment and Reporting	$2,500
Training	$3,000
TOTAL	$20,000

At TEC's request Malcolm Pirnie has provided the scoping and fees for the Title V Permitting, Air Emissions Inventory, and GHG Management broken out as individual projects. We would like to provide TEC with the option of performing the three projects simultaneously, which would provide for an economy of scale by reducing travel expenses and coordination meetings. Should TEC decide to perform the projects concurrently, we would be able to provide a cost savings of $5,000 off of the summation of project costs resulting in a total fee of $68,500.

MALCOLM PIRNIE

Team and Experience

David Cibik, Senior Project Engineer in the Tampa office will be the project manager, responsible for the day-to-day progress of the project. The configuration of the TEC's Enviance® system will be performed by Tampa-based staff with support from our Buffalo office. Malcolm Pirnie will coordinate and facilitate all necessary communications with Enviance®. Due to our extensive experience with architecture and configuration of the Enviance® system, we will execute the project independent of direct involvement with Enviance® staff.

If you have any questions regarding this proposal, please contact me at (813) 242-7210. We appreciate this opportunity to provide TEC with these environmental services.

Very truly yours,

MALCOLM PIRNIE, INC.

David Cibik, P.E., R.E.M.
Senior Project Engineer

TAMPA ELECTRIC COMPANY'S

ANSWERS TO FOURTH REQUEST FOR

PRODUCTION OF DOCUMENTS (NO. 4)

OF THE

FLORIDA PUBLIC SERVICE COMMISSION STAFF

Tampa Electric files this its Answers to Production of Documents (No. 4) propounded and served on September 12, 2008, by the Florida Public Service Commission Staff.

HEARING EXHIBIT - 00000920

4. Please provide a schedule that shows the capital structure, components, and cost rates relied upon for calculating the revenue requirement rate of return. Please include in this schedule the derivation of debt and equity components used in the Return on Average Net Investment, lines 7 (a) and (b), on Form 42-4P attached to the testimony of Howard Bryant, filed August 29, 2008. Please cite all sources and include the rationale for using the particular capital structure and cost rates.

A. The following schedule shows the derivation of the debt and equity components for lines 7(a) and (b) on Form 42-4P.

Last FPSC Capital Structure and Cost Rates
Based on 11.75% ROE

	Amount ($)	Ratio (%)	Cost Rate (%)	Weighted Cost (%)
Long Term Debt	558,899	30.08	7.81	2.35
Short Term Debt	56,194	3.02	5.37	0.16
Preferred Stock	45,539	2.45	6.49	0.16
Customer Deposits	43,512	2.34	7.86	0.18
Common Equity [1]	801,028	43.12	11.75	5.07
Deferred ITC - Weighted Cost	59,035	3.18	10.01	0.32
Accumulated Deferred Income Taxes & Zero Cost ITCs	293,667	15.81	0.00	0.00
Total	**1,857,874**	**100.00**		**8.2392**

[1] Effective January 1, 1995 per FPSC Order No. PSC-95-0580-FOF-EI, Docket No. 950379-EI.

HEARING EXHIBIT - 00000921

ITC split between Debt and Equity:

	Amount ($)	Ratio (%)
Long Term Debt	558,899	39.77
Equity - Preferred	45,539	3.24
Equity - Common	801,028	56.99
Total	**1,405,466**	**100.00**

Deferred ITC - Weighted Cost:

Debt	=.32% * 39.77%	0.13%
Equity	=.32% * 60.23%	0.19%
	Weighted Cost	**0.32%**

Total Equity Cost Rate:

Preferred Stock	0.16%
Common Equity	5.07%
Deferred ITC - Weighted Cost	0.19%
Total	5.42%
Tax Multiplier	1.628002
Total Equity Component	**8.8238%**

Total Debt Cost Rate:

Long Term Debt	2.35%
Short Term Debt	0.16%
Customer Deposits	0.18%
Deferred ITC - Weighted Cost	0.13%
Total Debt Component	**2.82%**

TAMPA ELECTRIC COMPANY
DOCKET NO. 080007-EI
INDEX TO STAFF'S FIRST SET OF INTERROGATORIES (NOS. 1-2)

Number	Witness	Subject	Bates Stamped Page
1	Bryant	In its response to No. 1 of PSC staff's Audit Request 11 FAC, Tampa Electric Company (the Company) stated "At the time Tampa Electric began the utilization of the FGD System on Big Bend Units 1 & 2, it was determined that 25% of the incremental payroll was used for specific Scrubber operations. Therefore, the Company began allocating 25% of the incremental payroll to the Big Bend FGD Units 1&2 project which is recovered through the ECRC."	1
2	Bryant	In its response to No. 3 of PSC staff's Audit Request 11 FAC, the Company stated "the Big Bend Unit 2 neural network system, projects L6377 and L7477, was retired due to loss of functionality. A evaluation is under way to determine future actions."	3

Howard T. Bryant
Manager, Rates

Tampa Electric Company
702 N. Franklin Street
Tampa, Florida 33602

1. In its response to No. 1 of PSC staff's Audit Request 11 FAC, Tampa Electric Company (the Company) stated "At the time Tampa Electric began the utilization of the FGD System on Big Bend Units 1 & 2, it was determined that 25% of the incremental payroll was used for specific Scrubber operations. Therefore, the Company began allocating 25% of the incremental payroll to the Big Bend FGD Units 1&2 project which is recovered through the ECRC."

   a. Please explain whether the Commission or the Company made the decision.

   b. If the decision was made by the Commission, please provide the Order Number.

   c. Please state which year the payroll allocation started.

A. On May 15, 1998, Tampa Electric petitioned the Florida Public Service Commission for approval of its FGD system on Big Bend Units 1 and 2 for cost recovery through the ECRC. On September 2, 1998, the Commission conducted a hearing on the matter and in Docket No. 980693-EI, Order No. PSC-99-0075-FOF-EI, issued January 11, 1999, ECRC approval was granted.

The FGD system began commercial operation in December 1999. In anticipation of its operation, Tampa Electric determined the FGD system's ECRC projected expenditures as part of the normal process to identify all 2000 projected costs for ECRC recovery. Consistent with the testimony of Tampa Electric witness Don Pless filed in Docket No. 980693-EI, the company's 2000 ECRC projection filing submitted in Docket No. 990007-EI on October 1, 1999 contained O&M costs for four new, incremental operating employees necessary to operate the FGD system. The capital and O&M costs for the FGD system, including the four new positions, were approved in Order No. PSC-99-2513-FOF-EI, issued December 22, 1999.

Recognizing the four new employees would eventually change positions, leave for other employment or retire, the difficulty of tracking four specific individual employees for future cost allocation to the FGD system was evaluated. The FGD system required 16 total employees to maintain its

HEARING EXHIBIT - 00000926

operation. Therefore, the company determined that the four incremental employees represented 25 percent of the total work force necessary to operate the FGD system. Subsequently, Tampa Electric has utilized this method of accounting for the incremental ECRC payroll cost associated with the Big Bend Units 1 and 2 FGD system and the Commission has audited and approved those costs for ECRC recovery to date.

HEARING EXHIBIT - 00000927

2. In its response to No. 3 of PSC staff's Audit Request 11 FAC, the Company stated "the Big Bend Unit 2 neural network system, projects L6377 and L7477, was retired due to loss of functionality. A evaluation is under way to determine future actions." Please describe or explain:

   a. Details of the projects L6377 and L7477;

   b. How the Scrubber Unit 2 maintains its normal performance without the neural network on line;

   c. What is the Company's plan to replace or repair the neural network;

   d. When does the Company expect the problem will be solved;

   e. Regarding the neural network of the Unit 1 Scrubber, has the Company conducted any re-training/ updating of the neural network to improve its function since it was placed on-line;

   f. Has the Company considered using modern artificial intelligence technologies, such as the fuzzy neural network or evolutionary neural network, to replace the retired and/or existing neural network(s) to improve the performance and efficiency of the Scrubber(s)?

A. a. Tampa Electric entered into a Consent Decree ("CD") with the United States Environmental Protection Agency in February 2000. Two initial requirements of the CD focused on NO_x emissions reductions. First, the company was required to implement technologies that would provide early NO_x reductions through commercially available combustion optimization methods, and second, the company was required to explore and demonstrate innovative NO_x control technologies that would be generating unit specific. Big Bend Neural Network Combustion Optimization, project L7477, was initiated in December 2000 as part of early CD efforts to reduce NO_x emissions on Big Bend Unit 2. The neural network system was purchased from Pegasus with the intent of improving combustion and reducing the amount of NO_x produced in the combustion process. While Tampa Electric was engaged with Pegasus to install and tune the operations of the neural network, Pegasus developed a method to optimize sootblowing operations.

HEARING EXHIBIT - 00000928

The optimization was designed to further reduce NO_x emissions as well as maintenance and operating costs while improving boiler efficiency. Therefore, Big Bend Neural Network Sootblowing Optimization, project L6377, was initiated in May 2002 as part of the innovative NO_x abatement CD requirement.

Testing of these technologies was completed in early 2006. Shortly thereafter, Pegasus was purchased by Neuco, another neural network supplier, and Neuco made a decision to not support the Pegasus technology. Subsequent to the non-support decision by Neuco, Tampa Electric elected to continue the operation and tuning of the neural network system and the sootblowing technology; however, it became apparent that without manufacturer support the equipment could not be maintained at its optimal performance level. Therefore, the company discontinued its use mid 2006 and contracted with another manufacturer for neural network systems.

b. Big Bend Unit 2 scrubber operations are not effected by the neural network system. The intent of the neural network is to lower NO_x production while the scrubber mitigates SO_x production.

c. In 2007, Tampa Electric installed a neural network system on Big Bend Unit 4 and initiated plans to install a system on Big Bend Unit 3 in 2008. This is a critical step in that the neural network is performing well on Unit 4, but Unit 3 is a different type of boiler. Therefore, once the neural network has been installed on Unit 3 and the test results for that unit and its boiler configuration become available, Tampa Electric will determine the cost-effectiveness of installing neural network systems on Big Bend Units 1 and 2 which are the same boiler types as Unit 3.

d. As previously stated, it was not in the company's best interest to continue trying to operate the Pegasus systems without ongoing support from the manufacturer. The plan to pursue proven technology was initiated with success on Big Bend Unit 4. If the proven technology is successful with the boiler configuration on Big Bend Unit 3, Tampa Electric will continue to pursue neural network combustion optimization on Big Bend Units 1 and 2 with installations occurring in 2009 and 2010.

HEARING EXHIBIT - 00000929

e. The only operating neural network for combustion optimization is on Big Bend Unit 4. Tampa Electric's plan is to continue the sequential installation of neural network systems on the remaining three units as long as the systems prove to be useful and prudent based on each previous unit's performance. With regard to retraining the neural network system, the technology continuously updates and "retrains" the model to optimize combustion under changing boiler conditions.

f. Tampa Electric continues to pursue modern neural network systems for combustion optimization on all the Big Bend coal units. Additionally, the company monitors the technology as it applies to applications such as sootblowing optimization, scrubber operations and selective catalytic reduction operations. Tampa Electric currently has no plans to install any of these technologies except for combustion optimization, and only as long as it is cost-effective and prudent to do so.

TECO's response to Staff's Second Set of Interrogatories (No. 3)

HEARING EXHIBIT - 00000931

3. Please describe, in detail, the scope of Tampa Electric Company's Greenhouse Gas ("GHG") Reduction Program.

A. The intent of Tampa Electric's GHG Reduction Program is solely to initiate voluntary data collection and reporting of GHG emissions as required by House Bill 7135 ("HB 7135"). At this time, no scope of work exists, as it is only an estimate of costs to join the Climate Registry, establish GHG inventory procedures and to establish repeatable results for third party verification.

The Florida Department of Environmental Protection is still reviewing HB 7135 in an effort to establish a rule and official start date. At that time Tampa Electric will have a better understanding of the compliance objectives and requirements.

TAMPA ELECTRIC COMPANY'S

ANSWERS TO THIRD SET OF INTERROGATORIES (NOS. 4-7)

OF THE

FLORIDA PUBLIC SERVICE COMMISSION

Tampa Electric files its Answers to Interrogatories (Nos. 4-7) propounded and served on September 17, 2008, by the Florida Public Service Commission.

HEARING EXHIBIT - 00000934

TAMPA ELECTRIC COMPANY
DOCKET NO. 080007-EI
INDEX TO STAFF'S THIRD SET OF INTERROGATORIES (NOS. 4-7)

Number	Witness	Subject	Bates Stamped Page
4	Howard Bryant	Refer to the August 29, 2008 filing form 42-4P, p. 13 of 26, Big Bend No_x Emissions Reduction. Please explain why line 2, Plant-in-Service/Depreciation Base and Line 3, Accumulated Depreciation are added together. Please provide the correct depreciation calculations for line 8.a.	1
5	Howard Bryant	Refer to the August 29, 2008 filing form 42-4P, p. 24 of 26, Big Bend FGD system reliability. The projected numbers for line 2, Plant-in-Service/Depreciation Base, appear to be the same numbers that were used in the August 4, 2008, filing. Please verify that the numbers are correct.	2
6	Howard Bryant	Refer to the August 29, 2008 filing form 42-4P, p. 11 of 26, Big Bend Units 1 and 2 FGD, Notes (A) and (D). A depreciation rate of 2.3% is shown for account no. 312.45. Account 312.45 appears to be the account number for units 3 and 4. Please explain. If the correct rate is not being used, provide the correct depreciation calculation.	4
7	Howard Bryant	Refer to the August 29, 2008 filing form 42-4P, p. 21 of 26, Big Bend Unit 2 SCR, Notes (A) and (D). A depreciation rate of 2.4% is shown for account no. 312.44. Account 312.44 appears to be the account number for unit 4. Please explain. If the correct rate is not being used, provide the correct depreciation calculation.	23

Tampa, FL 33602

4. Refer to the August 29, 2008 filing form 42-4P, p. 13 of 26, Big Bend No_x Emissions Reduction. Please explain why line 2, Plant-in-Service/Depreciation Base and Line 3, Accumulated Depreciation are added together. Please provide the correct depreciation calculations for line 8.a.

A. On form 42-4P, page 13 of 26, the formula in line 5 calculates Net Investment by adding Plant-in-Service, line 2, and Accumulated Depreciation, line 3. The balance in accumulated depreciation is reflected as a negative balance but due to the August 2007 retirement of plant equipment, the accumulated depreciation balance reflects a positive balance.

When retiring units, the original cost of a retired asset is credited to the plant account and debited to accumulated depreciation. The cost of retiring the asset is also debited to accumulated depreciation.

HEARING EXHIBIT - 00000936

5. Refer to the August 29, 2008 filing form 42-4P, p. 24 of 26, Big Bend FGD system reliability. The projected numbers for line 2, Plant-in-Service/Depreciation Base, appear to be the same numbers that were used in the August 4, 2008, filing. Please verify that the numbers are correct.

A. On form 42-4P, page 24 of 26, the projected numbers for line 2, Plant-in-Service/Depreciation Base, contained an inadvertent formula error. Attached is the revised form. The overall impact to the 2009 Projection filing due to the correction associated with this interrogatory is attached to the response to Interrogatory 6.

6. Refer to the August 29, 2008 filing form 42-4P, p. 11 of 26, Big Bend Units 1 and 2 FGD, Notes (A) and (D). A depreciation rate of 2.3% is shown for account no. 312.45. Account 312.45 appears to be the account number for units 3 and 4. Please explain. If the correct rate is not being used, provide the correct depreciation calculation.

A. Due to an inadvertent error, the correct depreciation rate was not used to calculate the depreciation expense for a portion of the Big Bend Units 1 and 2 FGD project placed in-service in January 2007. The correct depreciation rate is 2.9% for account number 312.46e.

Tampa Electric corrected the applicable forms in the 2007 True-up, 2008 Actual/Estimated True-up files and the 2009 Projection filings. These forms are attached as well as the forms that reflect the overall impacts from the revisions associated with Interrogatory Nos. 5 and 7.

Environmental Cost Recovery Clause (ECRC)
Calculation of the Final True-Up Amount for the Period
January 2007 to December 2007
(in Dollars)

Form 42 - 1A
REVISED

Line		Period Amount
1.	End of Period Actual True-Up for the Period January 2007 to December 2007 (Form 42-2A, Lines 5 + 6 + 10)	$22,088,568
2	Estimated/Actual True-Up Amount Approved for the Period January 2007 to December 2007 (Order No. PSC-07-0922 FOF-EI)	9,624,173
3	Final True-Up to be Refunded/(Recovered) in the Projection Period January 2009 to December 2009 (Lines 1 - 2)	$12,464,395

HEARING EXHIBIT - 00000940

Tampa Electric Company
Environmental Cost Recovery Clause (ECRC)
Total Jurisdictional Amount to Be Recovered

For the Projected Period
January 2009 to December 2009

Line	Energy ($)	Demand ($)	Total ($)
1. Total Jurisdictional Revenue Requirements for the projected period			
a. Projected O&M Activities (Form 42-2P, Lines 7, 8 & 9)	$5,259,690	$334,116	$5,593,806
b. Projected Capital Projects (Form 42-3P, Lines 7, 8 & 9)	44,360,731	152,790	44,513,521
c. Total Jurisdictional Revenue Requirements for the projected period (Lines 1a + 1b)	49,620,421	486,906	50,107,327
2. True-up for Estimated Over/(Under) Recovery for the current period January 2008 to December 2008 (Form 42-2E, Line 5 + 6 + 10)	(7,788,845)	35,621	(7,753,224)
3. Final True-up for the period January 2007 to December 2007 (Form 42-1A, Line 3)	12,596,764	(132,369)	12,464,395
4. Total Jurisdictional Amount to Be Recovered/(Refunded) in the projection period January 2009 to December 2009 (Line 1 - Line 2- Line 3)	44,812,502	583,654	45,396,156
5. Total Projected Jurisdictional Amount Adjusted for Taxes (Line 4 x Revenue Tax Multiplier)	$44,844,767	$584,074	$45,428,841

Notes: Allocation to energy and demand in each period is in proportion to the respective period split of costs indicated on Lines 7 and 8 of Forms 42-5 and 42-7 of the actuals and estimates.

INTERROGATORIES
INTERROGATORY NO. 6
PAGE 19 OF 19
FILED: OCTOBER 7, 2008

7. Refer to the August 29, 2008 filing form 42-4P, p. 21 of 26, Big Bend Unit 2 SCR, Notes (A) and (D). A depreciation rate of 2.4% is shown for account no. 312.44. Account 312.44 appears to be the account number for unit 4. Please explain. If the correct rate is not being used, provide the correct depreciation calculation.

A. Due to an inadvertent error, the correct depreciation rate was not used to calculate the depreciation expense for Big Bend Unit 2 SCR. A depreciation rate of 3.1% for account number 312.42 is the correct rate to be applied to the depreciation base when calculating depreciation expense.

Upon further review, Tampa Electric discovered an error with the depreciation rates used for Big Bend Unit 3 SCR for 2008 and 2009. The correct depreciation rates are 1.2% and 2.6% for account numbers 311.43 and 312.43, respectively.

The following affected revised forms are attached to this response:

2008 Actual/Estimated True-up
Form 42-4P, page 21 of 26

2009 Projection
Form 42-4P, page 21 of 26
Form 42-4P, page 22 of 26

The overall impacts to the 2008 Actual/Estimated True-up and 2009 Projection filings due to the corrections associated with this interrogatory are attached to the response to Interrogatory 6.

	c Total Jurisdictional Rev. Req. for the projected period (Lines 1a + 1b)	29,156,959	59,507,212	2,413,172	91,077,343
2	True-up for Estimated Over/(Under) Recovery for the current period January 2008 - December 2008 (FORM 42-1E, Line 4, filed on August 4, 2008)	(2,994,900)	(2,572,131)	(161,546)	(5,728,576)
3	Final True-up Over/(Under) for the period January 2007 - December 2007 (FORM 42-1A, Line 7, filed on April 2, 2008)	1,833,204	1,283,719	57,456	3,174,379
4	Total Jurisdictional Amount to be Recovered/(Refunded) in the projection period January 2009 - December 2009 (Line 1 - Line 2 - Line 3)	30,318,655	60,795,624	2,517,262	93,631,540
5	Total Projected Jurisdictional Amount Adjusted for Taxes (Line 4 x Revenue Tax Multiplier 1.00072)	30,340,484	60,839,397	2,519,074	93,698,955

Notes:
Allocation to energy and demand in each period are in proportion to the respective period split of costs.
True-up costs are split in proportion to the split of actual demand-related and energy-related costs from respective true-up periods.
Totals may not add due to rounding.

Notes:

(A) The Gross-up factor for taxes uses 0.61425, which reflects the Federal Income Tax Rate of 35%; the monthly Equity Component of 6.2013% reflects an 11% return on equity.
(B) Line 8a times Line 9
(C) Line 8b times Line 10
(D) Line 5 is reported on Capital Schedule
(E) Line 7 is reported on O&M Schedule

In accordance with FPSC Order No. PSC-94-0393-FOF-EI, FPL has recorded the gains on sales of emissions allowances as a regulatory liability.

Totals may not add due to rounding.

FLORIDA POWER & LIGHT COMPANY
PROJECT DESCRIPTION AND PROGRESS

Project Title: Air Operating Permit Fees - O & M
Project No. 1

Project Description:
The Clean Air Act Amendments of 1990, Public Law 101-549, and Florida Statutes 403.0872, require each major source of air pollution to pay an annual license fee. The amount of the fee is based on each source's previous year's emissions. It is calculated by multiplying the applicable annual operation license fee factor ($25 per ton for both Florida and Georgia) by the tons of each air pollutant emitted by the unit during the previous year and regulated in each unit's air operating permit, up to a total of 4,000 tons per pollutant. The major regulated pollutants at the present time are sulfur dioxide (SO2), nitrogen oxides (NOx) and particulate matter. The fee covers units in FPL's service area, as well as Unit 4 of Plant Scherer located in Juliette, Georgia, within the Georgia Power Company service area. Scherer Unit 4's annual air operating permit fee is approximately $100,000. FPL's share of ownership of that unit is 76.36%. The fees for FPL's units are paid to the Florida Department of Environmental Protection (FDEP) generally in February of each year, whereas FPL pays its share of the fees for Scherer Unit 4 to Georgia Power Company on a monthly basis.

Project Accomplishments:
(January 1, 2008 to December 31, 2008)
The monthly fees for 2007 emissions at Scherer have been paid and continue to be paid in 2008. 2007 air operating permit fees for the Florida facilities were calculated in January 2008 utilizing 2007 operating information. They were paid to the FDEP in February, 2008.

Project Fiscal Expenditures:
(January 1, 2008 to December 31, 2008)
Project expenditures are estimated to be $324,282 (16.5%) lower than originally projected. This variance is primarily due to higher usage of natural gas as a fuel across the FPL fleet due to the higher costs of residual oil. Permit fees are based on emissions, which are proportionate to the type of fuel used at each Florida facility. Utilizing natural gas in lieu of residual oil significantly reduces SO2, Particulate Matter (PM) and NOx emissions.

Project Progress Summary:
The monthly fees for 2007 emissions at Scherer have been paid and continue to be paid in 2008. 2007 air operating permit fees for the Florida facilities were calculated in January 2008 utilizing 2007 operating information. They were paid to the FDEP in February 2008.

Project Projections:
(January 1, 2009 to December 31, 2009)
Estimated project expenditures for the period January 2009 through December 2009 are expected to be $1,958,100.

FLORIDA POWER & LIGHT COMPANY
PROJECT DESCRIPTION AND PROGRESS

Project Title: Continuous Emission Monitoring Systems (CEMS) - O & M
Project No. 3a

Project Description:
The Clean Air Act Amendments of 1990, Public Law 101-549, established requirements for the monitoring, record keeping, and reporting of SO2, NOx, CO, Carbon Dioxide (CO2/O2) emissions, as well as opacity data from affected air pollution sources. FPL has 57 units which are affected and which have installed CEMS to comply with these requirements.

40 CFR Part 75 includes the general requirements for the installation, certification, operation and maintenance of CEMS and specific requirements for the monitoring of pollutants and opacity. These Systems continuously extract and analyze gaseous samples for each power plant stack and have automated data acquisition and reporting capability. Operation and maintenance of these systems in accordance with the provisions of 40 CFR Part 75 is an ongoing activity which follow the Title IV CEMS Quality Assurance Program Manual.

Project Accomplishments:
(January 1, 2008 to June 1, 2008)
Relative Accuracy Tests and Linearity Tests continue to be performed as scheduled. QA/QC maintenance continues to be performed on the analyzers per the requirements of the Title IV CEM Quality Assurance Program Manual. Calibration span gases and CEMS required parts continue to be purchased. In addition, analysis of fuel oil for sulfur content, heat of combustion and carbon continues to be performed per the requirements of 40 CFR Part 75, Appendix D. CEMS 24/7 Software Support contract with General Electric (CEMS NETDAHS) continues to be maintained to ensure integrity of the CEMS Systems and to ensure compliance with EPA and State Agencies. Additionally said software has been upgraded to comply with the new EPA reporting requirements.

Project Fiscal Expenditures:
(January 1, 2008 to December 31, 2008)
Project expenditures are estimated to be $205,903 (27.4%) higher than originally projected. The increased estimate was due largely to the additional cost of the CEMS software upgrade. This upgrade was needed to meet the EPA's mandate of reporting in XML format starting 1/1/2009. Additionally the higher cost of replacement parts for the new model analyzers installed at the end of 2007 and in the first half of 2008 is reflected.

Project Progress Summary:
(January 1, 2008 to December 31, 2008)
This is an ongoing project. Each reporting period will include the cost of quality assurance activities, training, spare parts, calibration gas, and software support.

Project Projections:
(January 1, 2009 to December 31, 2009)
Estimated project expenditures for the period January 2009 through December 2009 are expected to be $999,894.

FLORIDA POWER & LIGHT COMPANY
PROJECT DESCRIPTION AND PROGRESS

Project Title: Maintenance of Stationary Above Ground Fuel Storage Tanks - O&M
Project No. 5a

Project Description:
Florida Administrative Code (F.A.C.) Chapter 62-761, previously 17-762, which became effective on March 12, 1991, provides standards for the maintenance of stationary above ground fuel storage tank systems. These standards impose various implementation schedules for inspections/repairs and upgrades to fuel storage tanks.

PMT Tanks 1371/A (with the capacity 500,000 BBLS), TPE Tank 808 (capacity 200,000 BBLS), PFL Light Oil Tank #5 (capacity 80,000 BBLS) and TPE Light oil Tank # 901 are due for API in-service inspections. All inspections except TPE tank 901 were performed by TEAM in April, 2008. No discrepancies were reported and all fuel storage tanks appear to be suitable for continued services. The next due dates for external inspection was determined by API certified inspector after 5 years. TPE Tank 901 is due in July, 2008.

Project Accomplishments:
(January 1, 2008 to December 31, 2008)
Work continued on miscellaneous maintenance of above ground fuel storage tanks and piping systems. All required API 653 external inspections & API 570 will be completed for this year and all 2008 tank registration fees have been paid.

Project Fiscal Expenditures:
(January 1, 2008 to December 31, 2008)
Project expenditures are estimated to be $836,100 (123.5%) higher than originally projected. The following project activities were identified after the filing of the original estimates for 2008:
1) Turkey Point Unit 1 Metering Tank Roof Replacement and Bottom Plate Projection Repairs project. The cross-tie valve between the two units' metering tanks was not functional and replacement and repairs took longer than expected to complete.
2) External coating of Port Everglades Terminal above grade piping. The scope of this activity was increased due to additional piping and the move from epoxy coating to silicon coating which has a longer life.
3) Performing API 570 inspections on bulk light oil piping at Ft. Lauderdale and Port Everglades power plants.
4) Martin Plant Units 1 &2 Metering Tanks painting.
5) Port Everglades Terminal Tank 805 API out-of- service inspection.
6) Painting of Fort Myers Plant Units 1&2 Tanks. The initial plan was to paint entire roof of tank No.1 and touchup the roof of Tank No. 2. The entire roofs of both tanks were painted.
7) Fort Myers Plant Tank No. 2 visual and settlement survey. Due to a leak discovered on one of the leak detection ports, a visual and settlement survey was implemented on the tank.

Project Progress Summary:
(January 1, 2008 to December 31, 2008)
This is an ongoing project. Each reporting period will include ongoing maintenance of above ground fuel storage tanks in accordance with F.A.C. Chapter 62-761. We have replaced the roof of PCC 1& PTF 1 Metering Tanks which were out of compliance due to the holes in the roof and for this purpose we had to evacuate, clean, and gas free the tank in order to be able to perform hot work on the roof of the tank. Decision was made to conduct the API 653 internal inspection and tank strapping at the same time so we don't need to take the tank out of service a few years later, and clean and gas freeing it just because of API internal inspection. Both projects have been successfully completed, PCC on March, and PTF on May, 2008. TPE tank 805 was due for API out-of-service inspection in April, 2008. The tank was taken out from service, evacuated, cleaned and gas freed for this inspection. There are some code required repairs which is in progress.

Project Projections:
(January 1, 2009 to December 31, 2009)
Estimated project fiscal expenditures for the period January 2009 through December 2009 are expected to be $1,067,572.

FLORIDA POWER & LIGHT COMPANY
PROJECT DESCRIPTION AND PROGRESS

Project Title: Oil Spill Cleanup/Response Equipment - O&M
Project No. 8a

Project Description:
The Oil Pollution Act of 1990 (OPA '90) mandates that all liable parties in the petroleum handling industry file plans by August 18, 1993. In these plans, a liable party must identify (among other items) its spill management team, organization, resources and training. Within this project, FPL developed the plans for ten power plants, five fuel oil terminals, three pipelines, and one corporate plan. Additionally, FPL purchased the mandated response resources and provided for mobilization to a worst case discharge at each site.

Project Accomplishments:
(January 1, 2008 to December 31, 2008)
Plan updates have continued to be performed and filed for all sites as required. The Corporate Oil Spill Response Plan has been updated to include the new NIMS ICS requirements. Routine maintenance of all oil spill equipment has continued throughout the year as well as the performance of spill management drills including a corporate team drill and deployment drills throughout the system. There has also been training for some new team members. Finally, a boat lift was installed at the Riviera Plant to allow for quicker deployment time. During the third and fourth quarters boat lifts will also be installed at the Turkey Point and Cape Canaveral sites.

Project Fiscal Expenditures:
(January 1, 2008 to December 31, 2008)
The variance is expected to be $456, or -0.2%.

Project Progress Summary:
(January 1, 2008 to December 31, 2008)
This is an ongoing project. Each reporting period will include ongoing maintenance of all oil spill equipment in accordance with OPA 90. Additionally, following a formal assessment of the oil spill program, FPL retained a contractor to perform the mandated OSRO (oil spill removal organization) function. This contractor will also perform maintenance (required) on the oil spill equipment at all of the power plants as well as perform an annual (required) equipment deployment drill at these facilities. We will be installing boat lifts at Cape Canaveral and Turkey Point Plants during the third and fourth quarter.

Project Projections:
(January 1, 2009 to December 31, 2009)
Estimated project fiscal expenditures for the period January 2009 through December 2009 are expected to be $241,800. In addition to the ongoing operation described in the 2008 summary, FPL has 1) retained a spill management company to assist in corporate-level responses, 2) improved/enhanced the Fleet's ability to mobilize spill equipment (specifically boats), and 3) continue to certify all oil spill response members in the NIMS mandated Incident Command System (ICS).

FLORIDA POWER & LIGHT COMPANY
PROJECT DESCRIPTION AND PROGRESS

Project Title: RCRA Corrective Action - O & M
Project No. 13

Project Description:
Under the Hazardous and Solid Waste Amendments of 1984 (amending the Resource Conservation and Recovery Act, or RCRA), the U.S. EPA has the authority to require hazardous waste treatment facilities to investigate whether there have been releases of hazardous waste or constituents from non-regulated units on the facility site. If contamination is found to be present at levels that represent a threat to human health or the environment, the facility operator can be required to undertake "corrective action" to remediate the contamination. In April 1994, the U.S. EPA advised FPL that it intended to initiate RCRA Facility Assessments (RFAs) at FPL's nine former hazardous waste treatment facility sites. The RFA is the first step in the RCRA Corrective Action process. At a minimum, FPL will be responding to the agency's requests for information concerning the operation of these power plants, their waste streams, their former hazardous waste treatment facilities, and their non-regulated Solid Waste Management Units (SWMUs). FPL may also conduct assessments of human health risks resulting from possible releases from the SWMU's in order to demonstrate that any residual contamination does not represent an undue threat to human health or the environment. Other response actions could include a voluntary clean-up or compliance with the agency's imposition of the full gamut of RCRA Corrective Action requirements, including RCRA Facility Investigation, Corrective Measures Study, and Corrective Measures Implementation.

Project Accomplishments:
(January 1, 2008 to December 31, 2008)
EPA and the FDEP have agreed that no further action is required at the Fort Myers, Cape Canaveral, and Martin Power Plants. EPA and the FDEP agree that no further action is required at the Putnam Power Plant, except for the petroleum clean-up that is going forward under the FDEP District Office waste clean-up oversight. The EPA withdrew the 2007 order. In January, 2005, FPL entered into a bilateral Agreement with the FDEP to complete the assessments at the Sanford, Manatee, Saint Lucie, and Turkey Point Plants. During 2005, FPL prepared documents for the Sanford Plant that were submitted to the FDEP. In March 2007, a draft Facility Evaluation Report was received and reviewed by FPL. The draft report was returned to FDEP and a final report was received in the second quarter of 2007, awarding No Further Action for the Sanford Power Plant. Document preparation for the Manatee Plant was completed during third quarter 2007 and submitted to FDEP. A Facility Evaluation took place in the third quarter of 2007 and the site received the final report from the Department granting No Further Action. Site preparation activities were completed at Turkey Point Plant during the third & fourth quarter of 2007. A Facility Evaluation took place in the fourth quarter of 2007 and the site received the draft report from the Department granting No Further Action. The final report from the Department for the Turkey Point Plant is expected to be received shortly.

Project Fiscal Expenditures:
(January 1, 2008 to December 31, 2008)
Project expenditures are estimated to be $57,022 (46.7%) lower than originally projected. Estimates were included in 2008 for further action that might be required by FDEP at Turkey Point or Manatee Plant after 2007. However, FPL completed all work associated with RCRA at the Manatee and Turkey Point Fossil sites in 2007. The FDEP has granted final "No Further Action" for the Manatee Plant. The FDEP is finalizing the draft report approved by FPL for the Turkey Point Plant. This draft report recommended No Further Action for the site.

Project Progress Summary:
(January 1, 2008 to December 31, 2008)
The Power Generation Division completed all work associated with RCRA at the Manatee and Turkey Point Fossil sites in 2007. The FDEP has granted final No Further Action for the Manatee Plant. The FDEP is finalizing the draft report approved by FPL for the Turkey Point Plant. This draft report recommended No Further Action for the site. No additional work was recommended by the Department in order to reach a No Further Action agreement. No other activities are scheduled for 2008. The final report from the Department granting No Further Action for the Turkey Point Plant is expected to be received shortly.

Project Projection:
(January 1, 2009 to December 31, 2009)
Projections for 2009 are $50,000.

FLORIDA POWER & LIGHT COMPANY
PROJECT DESCRIPTION AND PROGRESS

Project Title: NPDES Permit Fees - O & M
Project No. 14

Project Description:
In compliance with State of Florida Rule 62-4.052, FPL is required to pay annual regulatory program and surveillance fees for any permits it requires to discharge wastewater to surface waters under the National Pollution Discharge Elimination System. These fees effect the Florida legislature's intent that the Florida Department of Environmental Protection's (FDEP) costs for administering the NPDES program be borne by the regulated parties, as applicable. The fees for each permit type are as set forth in the rule, with an effective date of May 1, 1995, for their implementation.

Project Accomplishments:
(January 1, 2008 to December 31, 2008)
The NPDES permit fees were paid to FDEP for Power Generation Operating Plants.

Project Fiscal Expenditures:
(January 1, 2008 to December 31, 2008)
The variance in project expenditures is estimated to be $30,505 less than (19.7% lower) the original estimate. This reflects inadvertently budgeting the permit renewal application fees as ECRC expenditures. Permit renewal application fees are not classified as ECRC recoverable and thus have been removed from the ECRC true-up calculation.

Project Progress Summary:
(January 1, 2008 to December 31, 2008)
The NPDES annual regulatory program and surveillance fees were paid to FDEP for Power Generation Operating Plants.

Project Projections:
(January 1, 2009 to December 31, 2009)
Estimated project expenditures for the annual regulatory program and surveillance fees for the period January 2009 through December 2009 are expected to be $124,900. The regulatory program and surveillance fees will be due in January, 2009.

FLORIDA POWER & LIGHT COMPANY
PROJECT DESCRIPTION AND PROGRESS

Project Title: Disposal of Noncontainerized Liquid Waste - O&M
Project 17a

Project Description:
FPL manages ash from heavy oil fired power plants using a wet ash system. Ash from the dust collector and economizer is sluiced to surface ash basins. The ash sludge is then pH adjusted to precipitate metals. In order to comply with Florida Administrative Code 62-701.300 (10), the ash is then de-watered using a plate/frame filter-press in order to dispose of it in a Class I landfill or ship by railcar to a processing facility for beneficial reuse.

Project Accomplishments:
(January 1, 2008 to December 31, 2008)
Ash work is complete at Manatee, and Turkey Point. Port Everglades will be complete in July. Remaining on the schedule for 2008 are Cape Canaveral, Sanford and Martin. Approximately $25,000 will be spent on Maintenance Costs to replace worn hoses, filter cloths and a pump.

Project Fiscal Expenditures:
(January 1, 2008 to December 31, 2008)
Project expenditures are estimated to be $32,803 (11.0%) higher than originally projected. The variance is primarily due to greater than anticipated ash accumulation in the storage basins at the Turkey Point site. As a result of the increase in ash material to be handled for removal, the site incurred extra expenses due to the use of additional moving equipment to support the job. Also, the time associated with the contractor completing the job contributed to the increases in manpower hours.

Project Progress Summary:
(January 1, 2008 to December 31, 2008)
This is an ongoing project. The frequency of basin clean out is a function of basin capacity and rate of sludge/ash generation. Typically, FPL generates 5,000 tons (@ 50% solids) of sludge per year.

Project Projections:
(January 1, 2009 to December 31, 2009)
Project fiscal expenditures for the period January 2009 through December 2009 are now estimated at $323,000.

FLORIDA POWER & LIGHT COMPANY
PROJECT DESCRIPTION AND PROGRESS

Project Title: Substation Pollutant Discharge Prevention & Removal - O&M
Project No. 19a, 19b, 19c

Project Description:
Florida Statute Chapter 376 Pollutant Discharge Prevention and Removal requires that any person discharging a pollutant, defined as any commodity made from oil or gas, shall immediately undertake to contain, remove and abate the discharge to the satisfaction of the department. Florida Statute Chapter 403 holds it is prohibited to cause pollution so as to harm or injure human health or welfare, animal, plant, or aquatic life or property. This project includes the prevention and removal of pollutant discharges at FPL substations and will prevent further environmental degradation. Additionally, remediation activities will be conducted in Dade and Broward counties which adhere to county regulations as defined in municipal codes.

Project Accomplishments:
(January 1, 2008 to December 31, 2008)
We have repaired leaks and/or regasketed 37 distribution transformers and 6 transmission transformers using 3 vendors. However, obtaining equipment clearances to make the necessary repairs has slowed this work down a bit. It is anticipated that this work will increase toward the end of the year once the cooler weather arrives and equipment clearances can be more easily obtained. In addition, we have also conducted minor oil spill clean-ups as a result of equipment leaks at 31 units. There is no equipment encapsulation work scheduled from this year. However, encapsulation work will continue for the remaining units in 2009. Environmental remediation work continues in Miami-Dade County at 7 substations due to various degrees of lead and arsenic contamination.

Project Fiscal Expenditures:
(January 1, 2008 to December 31, 2008)
Project expenditures are estimated to be:
- 19a The variance in project expenditures is estimated to be $665,806 or 68.8% higher than projected. Three vendors are being used to conduct equipment leak repairs, as opposed to the previous use of only one vendor; therefore, significantly more repairs are expected to be completed this year.
- 19b The variance in project expenditures is estimated to be $14,110 or 4.0% lower than projected.
- 19c No variance is anticipated.

Project Progress Summary:
(January 1, 2008 to December 31, 2008)
The equipment leak repair and regasketing work continues. We are in the progress of developing a complex data base to provide greater efficiency in managing this work. We are currently using 3 leak repair vendors to provide faster leak repairs. However, obtaining equipment clearances during the summer peak season has slowed this work down a bit. But it is anticipated that this work will increase during the fall once cooler weather arrives. The arsenic in soils and groundwater is being addressed at 7 substation locations in Miami-Dade County. The closure of 2 of the substations is anticipated in 2009.

Project Projections:
(January 1, 2009 to December 31, 2009)
Estimated project fiscal expenditures for the period January 2009 through December 2009 are expected to be:
- 19a $2,693,288
- 19b 728,712
- 19c ($560,232)

FLORIDA POWER & LIGHT COMPANY
PROJECT DESCRIPTION AND PROGRESS

Project Title: Wastewater/Stormwater Discharge Elimination & Reuse - O&M
Project No. 20

Project Description:
Pursuant to 33 U.S.C. Section 1342 and 40 CFR 122, FPL is required to obtain NPDES permits for each power plant facility. The last permits issued contain requirements to develop and implement a Best Management Practice Pollution Prevention Plan (BMP3 Plan) to minimize or eliminate, whenever feasible, the discharge of regulated pollutants, including fuel oil and ash, to surface waters. In addition, the 1997 Federal Ambient Water Quality Criteria requires FPL to meet surface water standards for any wastewater discharges to groundwater at all plants, and the Dade County DERM requires Turkey Point and Cutler Plant wastewater discharges into canals to meet county water quality standards found in Section 24-11, Code of Metropolitan Dade County.

In order to address these requirements, FPL has undertaken a multifaceted project which includes activities such as ash basin lining, installation of retention tanks, tank coating, sump construction, installation of pumps, motor, and piping, boiler blowdown recovery, site preparation, separation of stormwater and ashwater systems, separation of potable and service water systems, and the associated engineering and design work to implement these projects.

Project Accomplishments:
(January 1, 2008 to December 31, 2008)
The project is on hold due to the Pt. Everglades ESP Project.

Project Fiscal Expenditures:
(January 1, 2008 to December 31, 2008)
Project expenditures are estimated to be $0.

Project Progress Summary:
(January 1, 2008 to December 31, 2008)
The project is on hold due to the Pt. Everglades ESP Project.

Project Projections:
(January 1, 2009 to December 31, 2009)
Estimated project fiscal expenditures for the period January 2009 through December 2009 are expected to be $0.

FLORIDA POWER & LIGHT COMPANY
PROJECT DESCRIPTION AND PROGRESS

Project Title: St. Lucie Turtle Net – O&M
Project No. 21

Project Description:
The Turtle Net project says that FPL is limited in the number of lethal turtle takings permitted at its St. Lucie Power Plant by the Incidental Take Statement contained in the Endangered Species Act Section 7 Consultation Biological Opinion, issued to FPL on May 4, 2001 by the National Marine Fisheries Service ("NMFS"). The number of lethal takings permitted in a given year is calculated by taking one percent of the total number of loggerhead and green turtles captured in that year. (The Incidental Take Statement separately limits the number of lethal takings of Kemp's Ridley turtles to two per year over the next ten years, and the number of lethal takings of either hawksbill or leatherback turtles to one of those species every two years over the next ten years). Based on the number of captured turtles in 2001, the lethal take limit for loggerhead and green turtles in that year was six (references; Nuclear Regulatory Commission letter dated May 18, 2001 included as Exhibit 1, Document No. 1, Endangered Species Act Section 7 Consultation Biological Opinion Incidental Take Statement dated May 4, 2001 included as Exhibit 1, Document No. 2, Appendix B To Facility Operating License No. NPF-16 St. Lucie Unit 2, Environmental Protection Plan, Non-Radiological, Amendment No. 103 included as Exhibit 1, Document No. 3). In 2001, FPL experienced six lethal takings of loggerhead and green turtles at the St. Lucie Power Plant, indicating that its existing measures to limit such takings were performing marginally.

The existing net is in need of maintenance. To facilitate this work, a temporary net will be situated to allow removal of the existing net. The new net having been properly coated for UV protection and anti-fouling will be installed replacing the existing net. The existing net will be repaired and maintained as a spare to allow rotation of the nets for future maintenance.

Project Accomplishments:
(January 1, 2008 to December 31, 2008)
The original estimate was related to the cost to re-coat the net once removed. When the net was being removed, a significant amount of sea grass was found to be tangled in the net which needed to be removed and required the net to be cut. The cost to repair the net as well as re-coat it is greater than the cost to purchase a new net; therefore a new net will be purchased. The cost of the new net is considered a capital expenditure, whereas the re-coating would have been an O&M expense.

Project Fiscal Expenditures:
(January 1, 2008 – December 31, 2008)
Project expenditures are estimated to be $0.

Project Progress Summary:
(January 1, 2008 to December 31, 2008)
The existing turtle net will be removed to be recoated and the new net will be installed in the interim. The new net will serve as a backup.

Project Projections:
(January 1, 2009 to December 31, 2009)
Estimated project fiscal expenditures for the period January 2009 through December 2009 are $0.

FLORIDA POWER & LIGHT COMPANY
PROJECT DESCRIPTION AND PROGRESS

Project Title: Pipeline Integrity Management (PIM) – O&M
Project No. 22

Project Description:
FPL is required to develop a written pipeline integrity management program for its hazardous liquid / gas pipelines. This program must include the following elements: (1) a process for identifying which pipeline segments could affect a high consequence area; (2) a baseline assessment plan; (3) an information analysis that integrates all available information about the integrity of the entire pipeline and the consequences of a failure; (4) the criteria for determining remedial actions to address integrity issues raised by the assessments and information analysis; (5) a continual process of assessment and evaluation of pipeline integrity; (6) the identification of preventive and mitigative measures to protect the high consequence area; (7) the methods to measure the program's effectiveness; (8) a process for review of assessment results and information analysis by a person qualified to evaluate the results and information; and, (9) record keeping.

Project Accomplishments:
(January 1, 2008 to December 31, 2008)
The baseline assessments were undertaken for the corporate hazardous liquid / gas pipelines and associated evaluations has been completed. One additional dig on Martin 30" pipeline has been conducted by Southern Cathodic Protection Company earlier this year and another one is planned for later this year. Martin Terminal 18" pipeline is scheduled for smart pig this year to determine the corrosion rate by comparing the tool's data to previous run dated 2003 for future appropriate countermeasures.

Project Fiscal Expenditures:
(January 1, 2008 to December 31, 2008)
Project expenditures are estimated to be $154,465 (59.4%) higher than originally projected. The following additional project activities were identified after the original 2008 projections were filed:
1) An area with insufficient cover was identified along the Martin Terminal 30" pipeline with the length of 270 feet, which needs to be addressed to stay in compliance with DOT regulations.
2) One dig was performed on January 31, 2008 on the Martin Terminal 30" pipeline and another dig is scheduled for later this year after the peak season.
3) Corroded pipe-shoes on the Martin Terminal 30" above grade DOT piping were replaced. Thirty pipe-shoes were ordered to install, saddle and replace bad pipe-shoes.
4) The 2" supply and return lines to the Martin Terminal boilers were corroded badly and multiple holes were identified. Since the boilers are running with mineral oil and not with bunker C, a decision was made to remove the lines instead of replacing / repairing them.

Project Progress Summary:
(January 1, 2008 to December 31, 2008)
This is an ongoing project. Martin 18" dual (gas/oil) pipeline is due for in-line-inspection in December this year. Two assessment and evaluation digs, will be conducted following the in-line inspection (smart pig) as required. (As a DOT requirement after each in-line-inspection – smart pig – the data regarding the anomalies, dents, need to be validated by performing two, three and maybe even more as necessary confirmatory digs and conducting the direct assessment and inspection on the location of the detected anomalies). UTMs and magnetic particle testing is a part of these direct assessment. Since the inspection on Martin 18" pipeline will be implemented late November this year, the DOT confirmatory digs will be conducted in 2009.

Project Projections:
(January 1, 2009 to December 31, 2009)
Estimated project fiscal expenditures for the period January 2009 through December 2009 are expected to be $40,000.

FLORIDA POWER & LIGHT COMPANY
PROJECT DESCRIPTION AND PROGRESS

Project Title: SPCC (Spill Prevention, Control, and Countermeasures) - O&M
Project No. 23

Project Description:
The EPA first established the SPCC Program in 1973 when the agency issued the Oil Pollution Prevention Regulation (i.e., SPCC rule) to address the oil spill prevention provisions contained in the Federal Water Pollution Control Act of 1972 (later amended as the Clean Water Act). The purpose of the regulation was to prevent discharges of oil from reaching the navigable waters of the U.S. or adjoining shorelines and to prepare facility personnel to respond to oil spills. The SPCC regulation requires certain facilities to prepare and implement SPCC Plans and address oil spill prevention requirements including the establishment of procedures, methods, equipment, and other requirements to prevent discharges of oil as described above. Specifically, the rule applies to any owner or operator of a non-transportation related facility that:

- has a combined aboveground oil storage capacity of more than 1320 gallons, or a total underground oil storage capacity exceeding 42,000 gallons (Note: the underground storage capacity does not apply to those tanks subject to all of the technical requirements of the federal underground storage tank rule found in 40 CFR 280 or a State approved program); and

- which due to its location, could be reasonably expected to discharge oil in quantities that may be harmful into or upon the navigable waters of the United States or adjoining shorelines.

In January 1988, a large storage tank owned by Ashland Oil Company at a site in western Pennsylvania collapsed, releasing approximately 750,000 gallons of diesel fuel to the Monongahela River. Following calls for new tank legislation, an EPA task force recommended expanded regulation of aboveground tanks within the framework of existing legislative authority. The result was EPA's SPCC rulemaking package, the first phase of which was proposed in 1991. Due to a series of agency delays primarily resulting from the 1989 Exxon Valdez oil spill that required EPA to issue the Facility Response Plan rule under the Oil Pollution Act of 1990, the final SPCC Rule was not published until July of 2002.

Project Accomplishments:
(January 1, 2008 to December 31, 2008)
As of January 1, 2008, the responsibility of managing the SPCC plans for all substations has been transferred from the Distribution Environmental Group to the Transmission Environmental Group. The revisions to approximately 625 SPCC plans are currently being conducted, and the plans are being rechecked for accuracy. Due to the transition of responsibilities, there were no oil diversionary structures installed at any substation from January to August, and none are expected to be installed for the remaining of 2008. However, diversionary structures are scheduled to be installed at certain substations in 2009. In addition, SPCC-required quarterly inspections of all substations are being performed.

Project Fiscal Expenditures:
(January 1, 2008 to December 31, 2008)
Project expenditures are estimated to be $367,325 (94.9%) higher than originally projected, primarily due to expenditures for additional required facility upgrades that were identified during development of the SPCC plans. The additional upgrades include nitrogen blanketing systems for corrosion protection of double wall piping at Cape Canaveral, Putnam and Lauderdale Plants. These upgrades were not anticipated at the time FPL filed its original projections for 2008. In addition, work for new secondary containment for a transformer at Port Everglades was switched from Capital to O&M.

Project Progress Summary:
(January 1, 2008 to December 31, 2008)
Due to the large amount of quarterly substation inspections reports that are being generated, we are in the process of developing a complex data base to manage all the inspection information. This will provide us better efficiencies in managing this data. This data will link up with the data base currently being developed for the equipment leak repair program.

Project Projections:
(January 1, 2009 to December 31, 2009)
Estimated project expenditures for the period January 2009 through December 2009 are expected to be $688,000, which includes required updates to the Facility Response Plans.

FLORIDA POWER & LIGHT COMPANY
PROJECT DESCRIPTION AND PROGRESS

Project Title: Manatee Reburn – O&M
Project No. 24

Project Description:
This project involves installation of reburn technology in Manatee Units 1 and 2. Reburn is an advanced nitrogen oxides (NOx) control technology that has been developed for, and applied successfully in, commercial applications to utility and large industrial boilers. The process is a proven advanced technology, with applications of a reburn-like flue gas incineration technique dating back to the late 1960s, and developments for applications to large coal fired power plants in the United States dating back to the early to mid 1980s.

Reburn is an in-furnace NOx control technology that employs fuel staging in a configuration where a portion of the fuel is injected downstream of the main combustion zone to create a second combustion zone, called the reburning zone. The reburning zone is operated under conditions where NOx from the main combustion zone is converted to elemental nitrogen (which makes up 79% of the atmosphere). The basic front wall-fired boiler reburning process divides the furnace into three zones.

In the 1996-97 time period, FPL invested a considerable effort evaluating the Manatee Units for the application of reburn technology. FPL has recently reviewed the reburn system designs previously proposed for the Manatee units, and concluded that a design for either oil or gas reburn would require very similar characteristics. This will require reburn fuel injectors to be located at the elevation of the present top row of burners, with reburn injectors on the boiler front and rear walls. For the present application the injectors will be required to have a dual fuel (oil and gas) capability. In order to provide adequate residence time for the reburn process, it is proposed to locate the reburn overfire air (OFA) ports between the boiler wing walls and to angle them slightly to provide better mixing with the boiler flow. Because of the complexity of the boiler flow field and the port location, it was determined that OFA booster fans would be required to assist the air-fuel mixing and complete the burnout process. Installation of reburn technology for Manatee Units 1 and 2 offers the potential to reduce NOx emissions through a "pollution prevention" approach that does not require the use of reagents, catalysts, and pollution reduction or removal equipment. FDEP and FPL agree that reburn technology is the most cost-effective alternative to achieve significant reductions in NOx emissions from Manatee Units 1 and 2.

Project Accomplishments:
(January 1, 2008 to December 31, 2008)
Installation of the Unit 1 & 2 reburn equipment is complete. The units are operating reliably and have completed the process of optimization. The new systems have achieved significant NOx emission reductions. The PMT Reburn O&M ECRC dollars cover all on-going burner and equipment maintenance costs associated with the project.

Project Fiscal Expenditures:
(January 1, 2008 to December 31, 2008)
Estimated project expenditures for the period January 2008 through December 2008 are expected to be $499,997. No variance estimated.

Project Progress Summary:
(January 2008 - December 2008)
Unit 1 & Unit 2 are operating as referenced above. Final report is being compiled to present to DEP. We then agree on new permit limits for Nox. Once new limit is established, project is complete and expenditures will be based on runtime and available maintenance time. No variance forecasted.

Project Projections:
(January 1, 2009 to December 31, 2009)
Estimated project expenditures for the period January 2009 through December 2009 are expected to be $500,000.

FLORIDA POWER & LIGHT COMPANY
PROJECT DESCRIPTION AND PROGRESS

Project Title: Pt. Everglades ESP Technology – O&M
Project No. 25

Project Description:
The requirements of the Clean Air Act direct the EPA to develop health-based standards for certain "criteria pollutants". i.e. ozone (O3), sulfur dioxide (SO2), carbon monoxide (CO), particulate matter (PM), nitrogen oxides (NOx), an lead (Pb). EPA developed standards for the criteria pollutants and regulates the emissions of those pollutants from major sources by way of the Title V permit program. Florida has been granted authority from the EPA to administer its own Title V program which is at least as stringent as the EPA requirements. Florida is able to issue, renew and enforce Title V air operating permits for sources within the state via 403.061 Florida Statutes and Chapter 62-213 F.A.C., which is administered by the State of Florida Department of Environmental Protection ("DEP"). The Title V program addresses the six criteria pollutants mentioned earlier, and includes hazardous air pollutants (HAP). The EPA sets the limits of emissions of Hazardous Air Pollutants through the Maximum Achievable Control Technology (MACT). The original Port Everglades Title V permit, issued in 1998, expired in 2003. The renewal permit issued January 1, 2004 is now expiring December 31, 2008. A renewal permit application has been submitted and is pending DEP review. The DEP's Title V permit for FPL Port Everglades plant requires FPL to install and maintain Electrostatic Precipitators at all four Port Everglades units to address local concerns and to insure compliance with the National Ambient Air Quality Stands and the EPA MACT Standards.

Project Accomplishments:
(January 1, 2008 to December 31, 2008)
The ESP engineering design for Units 1–4 was completed in 2004. All four Units' ESPs were completed between 2005 and 2007 and are operational (O&M activities started in April 2005 for this project).

Project Fiscal Expenditures:
(January 1, 2008 to December 31, 2008)
Project expenditures are estimated to be $360,685 (15.3%) lower than originally projected. Fuel economics to date have dictated that the units at the Port Everglades Plant be run on gas due to fuel oil's rising costs. Consequently, fuel oil chemical additives usage has decreased and the ESPs have not had to be operated as much as was originally projected for 2008, which reduced the equipment deterioration and generated significantly less ash for disposal.

Project Progress Summary:
(January 2008 - December 2008)
Construction on all four electrostatic precipitators was completed and all four units ESPS are operational.

Project Projections:
(January 1, 2009 to December 31, 2009)
Estimated project expenditures for the period January 2009 through December 2009 are expected to be $2,276,313.

FLORIDA POWER & LIGHT COMPANY
PROJECT DESCRIPTION AND PROGRESS

Project Title: UST Replacement/Removal – O&M
Project No. 26

Project Description:
The Florida Administrative Code (FAC) Chapter 62-761.500, dated July 13, 1998, requires the removal or replacement of existing Category-A and Category-B storage tank systems with systems meeting the standards of Category-C storage tank systems by December 31, 2009. UST Category-A tanks are single-walled tanks or underground single-walled piping with no secondary containment that was installed before June 30, 1992.

UST Category-B tanks are tanks containing pollutants after June 30, 1992 or a hazardous substance after January 1, 1994 that shall have a secondary containment. Small diameter piping that comes in contact with the soil that is connected to a UST that shall have secondary containment if installed after December 10, 1990.

UST and AST Category-C tanks under F.A.C. 62-761.500 are tanks that shall have some or all of the following; a double wall, be made of fiberglass, have exterior coatings that protect the tank from external corrosion, secondary containment (e.g., concrete walls and floor) for the tank and the piping, and overfill protection.

FPL has six Category-A and two Category-B Storage Tank Systems that must be removed or replaced in order to meet the performance standards of Rule 61-761.500. In 2004 FPL will replace the two single-walled USTs located at the Turkey Point Nuclear Plant Units 1 and 2 with ASTs providing secondary containment (concrete walls and floor) surrounding the tanks. Also in 2004, FPL will remove one single-walled UST located at the Ft. Lauderdale Plant and will not replace the tank. In 2005-2006 FPL will replace the single-walled USTs located at the Area Office Broward (one UST in 2005), Customer Service East Office (one UST in 2006), Juno Beach Office (one UST in 2005), and General Office (2 USTs in 2005), with double-walled tanks providing electronic leak detection. Additionally, the AST to be installed at the Area Broward Office will be concrete vaulted.

The removal and replacement of the USTs will be performed by outside contractors. Additionally, closure assessments will be performed in accordance with 62-761.800 and closure assessment reports will be submitted to local Counties, and the Department of Environmental Services (DEP).

Project Accomplishments:
(January 1, 2008 to December 31, 2008)
There were no activities in 2008.

Project Fiscal Expenditures:
(January 1, 2008 to December 31, 2008)
Project expenditures are for 2008 are $0.

Project Progress Summary:
(January 1, 2008 to December 31, 2008)
Initial review of the scope of work has been completed.

Project Projections:
(January 1, 2009 to December 31, 2009)
There are no activities planned for 2009.

FLORIDA POWER & LIGHT COMPANY
PROJECT DESCRIPTION AND PROGRESS

Project Title: Lowest Quality Water Source (LQWS) – O&M
Project No. 27

Project Description:
Project Description:
Section 366.8255 of the Florida Statutes provides for the recovery through the ECRC of "environmental compliance costs" which are costs incurred in complying with "environmental rules or regulations." The LQWS Project is required in order to comply with permit conditions in the Consumptive Use Permits (CUPs) issued by the St. Johns River Water Management District (SJRWMD or the District)) for the Sanford Plant. Those permit conditions are intended to preserve Florida's groundwater, which is an important environmental resource. The permit conditions therefore "apply to electric utilities and are designed to protect the environment" as contemplated by section 366.8255. The SJRWMD adopted a policy in 2000 that, upon permit renewal, a user of the District's water is required to use the lowest quality of water that is technically, environmentally and economically feasible for its needs. This policy was implemented for the Sanford Plant in their current CUPs. For the Sanford facility, Condition 15 of CUP No. 9202, issued in June 2000, requires the lowest quality of water to be used that is feasible to meet the needs of the facility. The LQWS project at Sanford Plant is currently operational.

Project Accomplishments:
(January 1, 2008 to December 31, 2008)
The project at the Sanford Plant is currently operational.

Project Fiscal Expenditures:
(January 1, 2008 to December 31, 2008)
The variance in project expenditures is $54,797 or 18.2% lower than originally budgeted. Unplanned maintenance and repairs were performed, which required having the system out of service.

Project Progress Summary:
(January 2008 - December 2008)
The project at the Sanford Plant is currently operational.

Project Projections:
(January 1, 2009 to December 31, 2009)
Estimated project fiscal expenditures for the period January 2009 through December 2009 are expected to be $258,471 for the Sanford Plant.

FLORIDA POWER & LIGHT COMPANY
PROJECT DESCRIPTION AND PROGRESS

PROJECT TITLE: 316b
PROJECT No: 28

Project Description:
The Phase II Rule implements section 316 (b) of the Clean Water Act (CWA) for certain existing power plants that employ a cooling water intake structure and that withdraw 50 million gallons per day (MGD) or more of water from rivers, streams, lakes, reservoirs, estuaries, oceans or other waters of the United States (WUS) for cooling purposes. The Phase II Rule establishes national requirements applicable to, and that reflect the best technology available (BTA) for, the location, design, construction and capacity of existing cooling water intake structures (CWIS) to minimize adverse environmental impact. The Phase II Rule has implications at the following FPL facilities: Cape Canaveral, Cutler, Fort Myers, Lauderdale, Port Everglades, Riviera, Sanford, Martin, Manatee and St. Lucie Power Plants.

Project Accomplishments:
(January 1, 2008 to December 31, 2008)
One-year biological sampling programs have been completed at Cape Canaveral, Cutler, Fort Myers, Port Everglades, Riviera, and St. Lucie Power Plants. The data collected during these studies have been analyzed and reported on and are being used to develop compliance strategies for each plant. The Proposal for Information Collection (PIC) for each plant were previously submitted the Florida Department of Environmental Protection and the US EPA. The second set of 316(b) submittals - CWA 316(b) Supporting Information Documents - were submitted in 2008 for Lauderdale and Port Everglades Plants. The CWA 316(b) Supporting Information Documents for Riviera and Ft. Myers will be submitted later in 2008.

Project Fiscal Expenditures:
(January 1, 2008 to Dec 30, 2008)
Project expenditures are estimated to be $1,048,591 (73.1%) lower than projected. This variance is primarily due to economies of scale achieved through developing the database and report formats for one plant and using them across all plants. Additional economies of scale were achieved by combining meetings. The remanding of the 316(b) Phase II Rule by the Second Circuit Court also resulted in the development of more streamlined reports and significantly reduced the meeting requirements projected in 2008. Finally, per Order No. PSC-04-0987-PAA-EI issued on October 11, 2004, $129,000 of 2007 expenses were credited to the 316(b) project for the netting of environmentally-related study costs assumed to be in base rates. This amount could not be determined until actual expenses for 2007 were available in early 2008.

Project Progress Summary:
(January 1, 2008 to December 30, 2008)
One-year biological sampling programs were completed at Cape Canaveral, Cutler, Fort Myers, Port Everglades, Riviera, and St. Lucie Power Plants. The second set of 316(b) submittals - CWA 316(b) Supporting Information Documents - were submitted in 2008 for Lauderdale and Port Everglades Plants to the FDEP.

Project Projections:
(January 1, 2009 to December 2009)
Estimated project fiscal expenditures for the period January 2009 through December 2009 are expected to be $607,000.

FLORIDA POWER & LIGHT COMPANY
PROJECT DESCRIPTION AND PROGRESS

Project Title: SCR Consumables - O&M
Project No. 29

Project Description:
The Manatee Unit 3 and Martin Unit 8 Expansion Project Final Orders of Certification under the Florida Power Plant Siting Act and the PSD Air Construction Permit require the installation of SCRs on each of the plants' four Heat Recovery System Generators (HRSG) for the control of nitrogen oxide (NOx) emissions. The Florida Department of Environmental Protection (FDEP) made the determination that the SCR system is considered Best Available Control Technology (BACT) for these types of units, with concurrence from the U.S. Environmental Protection Agency (EPA). The operation of the SCR will cause FPL to incur O&M costs for certain products that are consumed in the SCRs. These include anhydrous ammonia, calibration gases, and equipment wear parts requiring periodic replacement such as controllers, ammonia detectors, heaters, pressure relief valves, dilution air blower components, NOX control analyzers and components.

Project Accomplishments:
(January 1, 2008 to December 31, 2008)
The SCR systems are operational on both Manatee Unit 3 and Martin Unit 8. The SCR Systems are not anticipated to become operational until 2009 at the SJRPP site.

Project Fiscal Expenditures:
(January 1, 2008 to December 31, 2008)
The variance in project expenditures is estimated to be $493,270 or 57.7% lower than projected. Estimates related to ammonia consumption by the SCRs at SJRPP related to CAIR compliance were inadvertently included in the original estimates for this project.

Project Progress Summary:
(January 2008- December 2008)
The SCR systems are operating reliably on both Manatee Unit 3 and Martin Unit 8. Our costs for 2008 will be more than originally estimated, due to the higher cost of the anhydrous ammonia.

Project Projections:
(January 1, 2009 to December 31, 2009)
Estimated project fiscal expenditures for the period January 2009 through December 2009 are expected to be $350,000 for PMR/PMT.

FLORIDA POWER & LIGHT COMPANY
PROJECT DESCRIPTION AND PROGRESS

Project Title: Hydrobiological Monitoring Program (HBMP) - O&M
Project No. 30

Project Description:
The Hydrobiological Monitoring Program is required by the Water Management District in the Conditions of Certification for the new Manatee Unit 3. The program involves the data collection of river chemistry, flow and vegetation conditions to demonstrate that the plant's withdrawals do not impact the environment in and along the river. The Hydrobiological Monitoring Program is a 10 year study which started in 2003 during the construction phase of Unit 3 and will be completed in 2013.

Project Accomplishments:
(January. 1, 2008 to December 31, 2008)
Continue with river monitoring, calibration, maintenance and data collection. Vegetative mapping, aerial photography and mapping was conducted in October 2007. Additional studies are being conducted during summer due to drought conditions and use of Emergency Diversion Schedule.

Project Fiscal Expenditures:
(January 1, 2008 to December 31, 2008)
Project expenditures are estimated to be $20,401 (50.5%) lower than projected. The variance is primarily due to lower than projected costs for monitoring and reporting requirements.

Project Progress Summary:
(January 1, 2008 to December 31, 2008)
This is an ongoing project. Interpretive report due in 2009.

Project Projections:
(January 1, 2009 to December 31, 2009)
Project estimates for January 2009 through December 2009 are expected to be $40,000.

FLORIDA POWER & LIGHT COMPANY
PROJECT DESCRIPTION AND PROGRESS

Project Title: CAIR – O&M
Project No. 31

Project Description:
The CAIR Project was initiated to implement strategies to comply with CAIR Annual and Ozone Season NOx emissions requirements. The CAIR project to date has included the Black & Veatch (B&V) study of FPL's control and allowance management options, an engineering study conducted by Aptech for the reliable cycling of the 800 MW units, the costs for the operation of SCR's under construction on SJRPP Units 1 and 2, costs for the operation of the Scrubber and SCR being installed on Scherer Unit 4, and the installation of CEMS for the peaking gas turbine units. The 800 MW Cycling Project was added to CAIR after 2006 submittal. Aptech Engineering provided engineering services for the first phase of a multiphase scope of work that will assure that the operating reliability is maintained in the new operating mode. FPL anticipates changing the operating mode of its four 800 MW units at Martin and Manatee Plants. The "study cost" so far to Aptech Engineering have been paid. They have identified several countermeasures that are being prioritized and scheduled for implementation in 2008 – 2011. The update to the Gas Turbine Peaking Unit are likely to change as a result of contractual guarantees related to necessary overhaul schedules, component and materials costs and labor estimates.

Project Accomplishments:
(January 1, 2008 to December 31, 2008)
All planned testing for 2008 has been scheduled. The testing at the Fort Myers site has been completed. The testing for the Port Everglades and the Fort Lauderdale GT power parks has been scheduled and will be completed by the third quarter of 2008.

Project Fiscal Expenditures:
(January 1, 2008 to December 31, 2008)
Project expenditures are estimated to be $552,892 (30.8%) lower than projected. Installation of the Boiler and Main Steam Drains at the Martin and Manatee Plants associated with the 800 MW Unit Cycling Project was listed as an O&M expense in the original projections and was subsequently re-classified as a Capital expenditure.

Project Progress Summary:
(January 1, 2008 to December 31, 2008)
The 800 MW Cycling Project identified countermeasures to assist with assuring operating reliability are currently in-progress with Project scope, Outage planning, and implementation for 2008 including; Condenser Tube replacements, Steam Turbine projects, Boiler projects, and Balance of Plant projects. The projected schedule to begin cycling is; PMR 2 in December 2009, PMR 1 in December 2010, with PMT 1 and PMT 2 scheduled for June 2010. The Power Generation Division is scheduled to complete the required testing at the Port Everglades, Fort Lauderdale & Fort Myers GT power parks by the third quarter of 2008. Additional required testing will occur in a five year cycle per the rule. FPL projects operation and maintenance costs for the SCR on SJRPP to begin in the first quarter of 2009 as construction is completed and the controls are put into service. O&M costs associated with the Scrubber and SCR's at plant Scherer will occur starting in 2012 when the construction is completed.

Project Projections:
(January 1, 2009 to December 31, 2009)
Total estimated 2009 O&M costs are $1,611,396.

FLORIDA POWER & LIGHT COMPANY
PROJECT DESCRIPTION AND PROGRESS

Project Title: BART Project – O&M
Project No. 32

Project Description:
Conduct air dispersion modeling to determine the visibility impacts to Federally Mandated Class 1 Areas (National Parks, National Wilderness Areas, etc.) from FPL's BART-Eligible units. The Regional Haze Rule, renamed the Clean Air Visibility Rule, (CAVR) mandates that certain vintage electric generating units (ca. 1962-1977) install Best Available Retrofit Technology (BART) if it is shown, via modeling that a unit causes or contributes to visibility impairment in any Class 1 Area.

Project Accomplishments:
(January. 1, 2008 to December 31, 2008)

- Compile Emissions Inventory of BART-Eligible sources – Complete May 2006
- Perform modeling - First round complete June 2006
- Conduct BART Control Technology Analysis – Pending
- Prepare BART Application Packages – Fall 2006

Project Fiscal Expenditures:
(January 1, 2008 to December 31, 2008)
Project expenditures are estimated to be $1,355, whereas FPL did not anticipate any 2008 expenditures for this project originally. During negotiations with the Florida DEP regarding FPL's proposed compliance plan for BART at the Turkey Point Fossil plant in the first quarter of 2008, the Department requested additional information and analyses. To provide the requested information FPL needed to engage an air modeling consultant to analyze the visibility improvements related to FPL's plan.

Project Progress Summary:
(January 1, 2008 to December 31, 2008)
BART Application for exempt facilities (PCC, PMR, PMT, PPE, PRV) submitted to FDEP 1/31/07. BART Determination for PTF submitted to FDEP 1/31/07. FDEP requested additional information on PTF 2/26/07 which necessitated additional Golder support. Response to FDEP additional information submitted to FDEP 5/3/07.

Project Projections:
(January 1, 2009 to December 31, 2009)
Project estimates for Jan 2009 through December 2009 are expected to be zero. No additional modeling expenses are anticipated for 2009. PGD may incur engineering expenses regarding the installation of new cyclone separators for PTF 1&2 BART Determination. This will be determined at a later date.

FLORIDA POWER & LIGHT COMPANY
PROJECT DESCRIPTION AND PROGRESS

Project Title: St. Lucie Cooling Water System Inspection and Maintenance – O&M
Project No. 34

Project Description:
The purpose of the proposed St. Lucie Plant Cooling Water System Inspection and Maintenance Project (the "Project") is to inspect and, as necessary, maintain the cooling water system at FPL's St. Lucie nuclear plant (the "Cooling System") such that it minimizes injuries and/or deaths of endangered species and thus helps FPL to remain in compliance with the federal Endangered Species Act, 16 U.S.C. Section 1531, et seq. (the "ESA") The St. Lucie Plant is an electric generating station on Hutchinson Island in St. Lucie County, Florida. The plant consists of two nuclear-fueled 850 net MWe units, both of which use the Atlantic Ocean as a source of water for once-through condenser cooling. This cooling water is supplied to the units via the Cooling System. The St. Lucie Plant cannot operate without the Cooling System. Compliance with the ESA is a condition to the operation of the St. Lucie Plant. Inspection and cleaning of the intake pipes is an "environmental compliance cost" under section 366.8255, Florida Statutes. The specific "environmental law or regulation" requiring inspection and cleaning of the intake pipes are terms and conditions that will be imposed pursuant to a Biological Opinion ("BO") that is to be issued by the National Oceanic and Atmospheric Administration ("NOAA") pursuant to section 7 of the ESA. NOAA will finalize the BO in 2007. NOAA sent the Nuclear Regulatory Commission ("NRC") a letter dated December 19, 2006, confirming its intent to issue the BO and stating the requirements that will be imposed pursuant to the BO with respect to inspection and cleaning of the intake pipes.

Project Accomplishments:
(January 8, 2008 thru December 31, 2008)
Inspections have been completed on all intake and discharge lines. Currently we are reviewing bids for the cleaning of the intake lines for SL2 fall 2007. We expect the cleaning to be completed prior to the end of the year. Should the cleaning not be completed in 2007 we will be continuing in the SL1 outage.

Project Fiscal Expenditures:
(January 8, 2008 to December 31, 2008)
Project expenditures are estimated to be $4,554,865 or 1030.5% higher than originally projected. This variance is primarily due to weather delays, whereby some scope of work has been carried over into 2008 instead of substantially completed in 2007 as originally projected. In addition, the level of effort required to remove concrete debris was greater than anticipated.

Project Progress Summary:
(January 8, 2008 to December 31, 2008)
The inspections of the ocean intakes and discharges were completed during the SL1 Spring 2007 outage in April and May. Cleaning of select areas of the three ocean intake pipes and velocity caps is scheduled for the SL2 outage planned for the Fall 2007, October 1- Dec 25.

Project Projections:
(January 1, 2009 to December 31, 2009)
Project estimates for January 2009 through December 2009 are expected to be $1,800,000. This projection is an estimate in anticipation of delays that may occur due to bad weather. Project work can only be performed during planned outages. Any weather delays that occur during the outage beginning in October 20, 2008, could prohibit the completion of work and would be deferred to the next outage, occurring in April 2009.

FLORIDA POWER & LIGHT COMPANY
PROJECT DESCRIPTION AND PROGRESS

Project Title: Martin Plant Water System – O&M
Project No. 35

Project Description:
The Martin Drinking Water System is required to comply with the requirements the Florida Department of Environmental regulations rules for drinking water systems. The Florida Department of Environmental Protection (FDEP) determined the system must be brought into compliance with newly imposed drinking water rules for TTHM (trihalomethanes) and HAA5 (Haleo Acetic Acid). The upgrades to the potable water system will cause FPL to incur Capital costs for major component upgrades to the system in order to comply with the new requirements. These include Nano filtration, air stripping, carbon and multimedia filtration. The operation of the Potable system will cause FPL to incur O&M costs for certain products that are consumed during the water treatment process. These include carbon and multimedia bed media and nano filtration media.

Project Accomplishments:
(January 1, 2008 to December 31, 2008)
The project was delayed pending meeting with the agency on proposed design. No O&M dollars for 2008. Contract has been awarded. Permit applications have been submitted. The agency is The increased estimate was due largely to the additional cost of the CEMS software upgrade. This upgrade was needed to meet the EPAs mandate of reporting in XML format starting 1/1/2009. Additionally the higher cost of replacement parts for the new model analyzers installed end of last year (2007) and first half of this year (2008) was factored in.

Project Fiscal Expenditures:
(January 1, 2008 to December 31, 2008)
Zero Dollars estimated Project expenditures are estimated to be $0 versus an original projection of $17,000. The Florida DEP requested a meeting to discuss the proposed design and implementation plan, which has delayed the work schedule. Preliminary approval was given based on the proposed concept of treatment. Construction applications and fees have been submitted to the FDEP. Permit issuance is expected in July 2008.

Project Progress Summary:
(January 1, 2008 to December 31, 2008)
Zero Dollars estimated for 2008. The project was delayed pending meeting with the agency on proposed design.

Project Projections:
(January 1, 2009 to December 31, 2009)
The 2009 estimate remains at the current estimate of $17,000 for projected replacement used media beds.

FLORIDA POWER & LIGHT COMPANY
PROJECT DESCRIPTION AND PROGRESS

Project Title: Low Level Radioactive Waste – O&M
Project No. 36

Project Description: The Barnwell, South Carolina radioactive waste disposal facility is the only site of its kind presently available to FPL for disposal of Low Level Waste (LLW) such as radioactive spent resins, filters, activated metals, and other highly contaminated materials. The Barnwell facility ceased accepting LLW from FPL June 30th, 2008. This project will construct a LLW storage facility for class B and C radioactive waste at the St. Lucie Plant (PSL). Turkey Point (PTN) will be implementing a similar project; however the PTN project will start later than the PSL project since PTN has some limited existing LLW storage capacity. Where practical, this project will be implemented as part of a fleet approach. The objective at PSL and PTN is to ensure construction of a LLW storage facility with sufficient capacity to store all LLW B and C class waste generated at each plant site over a 5 year period. This will allow continued uninterrupted operation of the PSL and PTN nuclear units until an alternate solution becomes available. The LLW on site storage facilities at PSL and PTN will also provide a "buffer" storage capacity for LLW even if an alternate solution becomes feasible, should the alternate solution be delayed or interrupted at a later date.

Project Accomplishments:
(January 1, 2008 to December 31, 2008)
Field work has been performed at PSL and PTN to determine the potential location for each site's LLW storage facility. Project planning is going forward. Conceptual designs for LLW storage facilities are being developed and evaluated by Engineering and Nuclear Projects. The Nuclear Projects Department has worked with each site's Radiation Protection Department to develop several measures to ensure LLW storage capability exists at PSL and PTN until the LLW storage facilities can be completed at PSL and PTN. For PSL this consists of the purchase of a LS3 portable Ground Shield, two rain covers and additional insertable cylindrical shielding for existing concrete Ground Shields to meet RP surface dose rate restrictions for the storage casks. For Turkey Point the interim measures being considered to ensure LLW storage capacity is available until a facility is constructed includes purchasing new rigging to allow safely moving existing ground shields so that they can be used to store LLW.

Project Fiscal Expenditures:
(January 1, 2008 to December 31, 2008)
Project expenditures are estimated to be $120,271, versus an original estimate of $0. The original estimate assumed all costs were capital. The $120,271 represents estimated costs for compressing waste to smaller volume.

Project Progress Summary:
(January 1, 2008 to December 31, 2008)
The project for PSL and PTN is on schedule. Initial scoping work is progressing and conceptual designs for LLW storage facilities are under development and evaluation to choose the optimal solution for each site. Interim measures to provide limited LLW storage capacity have been implemented to allow LLW storage until LLW storage facilities are completed at the sites. The PTN facility is still in the early stages of scope development due to the fact that the need for a LLW storage facility is not as urgent as PSL.

Project Projections:
(January 1, 2009 to December 31, 2009)
Project estimates for January 2009 through December 2009 are expected to be $1,000,000.

FLORIDA POWER & LIGHT COMPANY
PROJECT DESCRIPTION AND PROGRESS

Project Title: Low NOx Burner Technology – Capital
Project No. 2

Project Description:
Under Title I of the Clean Air Act Amendments of 1990, Public Law 101-349, utilities with units located in areas designated as "non-attainment" for ozone will be required to reduce NO_x emissions. The Dade, Broward and Palm Beach county areas were classified as "moderate non-attainment" by the EPA. FPL has six units in this affected area.

LNBT meets the requirement to reduce NO_x emissions by delaying the mixing of the fuel and air at the burner, creating a staged combustion process along the length of the flame. NO_x formation is reduced because peak flame temperatures and availability of oxygen for combustion is reduced in the initial stages.

Project Accomplishments:
(January 1, 2008 to December 31, 2008)
All six units are in service and operational.

Project Fiscal Expenditures:
(January 1, 2008 to December 31, 2008)
The variance in depreciation and return is $399 or 0.05% lower than projected.

Project Progress Summary:
(January 1, 2008 to December 31, 2008)
Dade, Broward and Palm Beach Counties have now been re-designated as "attainment" for ozone with air quality maintenance plans. This re-designation still requires that all controls, such as LNBT, placed in effect during the "non-attainment" be maintained.

The LNBT burners are installed at all of the six units and design enhancements are complete.

Project Projections:
(January 1, 2009 to December 31, 2009)
Estimated project fiscal expenditures (depreciation and return) for the period January 2009 through December 2009 are expected to be $787,974.

FLORIDA POWER & LIGHT COMPANY
PROJECT DESCRIPTION AND PROGRESS

Project Title: Continuous Emission Monitoring System (CEMS) – Capital
Project No. 3b

Project Description:
The Clean Air Act Amendments of 1990, Public Law 101-549, established requirements for the monitoring, record keeping and reporting of SO2, NOx and carbon dioxide (CO2) emissions, as well as volumetric flow, heat input, and opacity data from affected air pollution sources. FPL has 57 units which are affected and which have installed CEMS to comply with these requirements.

40 CFR Part 75 includes the general requirements for the installation, certification, operation and maintenance of CEMS and specific requirements for the monitoring of pollutants, opacity, heat input, and volumetric flow. These regulations are very comprehensive and specific as to the requirements for CEMS, and in essence, they define the components needed and their configuration. Periodically, these systems extract and analyze gaseous samples for each power plant stack and have automated data acquisition and reporting capability.

Project Accomplishments (January 1, 2008 to December 31, 2008)
The 2006 Continuous Emission Monitoring System Capital Project necessary to replace the CEMS CO2 emission analyzers at FPL generating units have been installed and successfully recertified at all facilities with only Martin units 3 & 4 remaining. All of the applicable SO2 analyzers were successfully replaced by the 2 Qtr 2008.

Project Fiscal Expenditures: (January 1, 2008 to December 31, 2008)
The variance in depreciation and return is $35,059 or 3.4% higher than projected. This variance is primarily due to the procurement of a much lower cost per unit pricing from the vendor (California Analytical). In addition, several installations and in-service dates shifted from 2007 to 2008 due to equipment availability delays and schedule changes.

Project Progress Summary:
(January 1, 2008 to December 31, 2008)
All of the analyzers have been installed and successfully recertified with only Martin units 3 & 4 remaining. These are scheduled for the third quarter of 2008.

Project Projections:
(January 1, 2009 to December 31, 2009)
Estimated project fiscal expenditures (depreciation and return) for the period January 2009 through December 2009 are expected to be $1,025,943.

FLORIDA POWER & LIGHT COMPANY
PROJECT DESCRIPTION AND PROGRESS

Project Title: Clean Closure Equivalency – Capital
Project No. 4b

Project Description:
In compliance with 40 CFR 270.1(c)(5) and (6), FPL developed CCEDs for nine FPL power plants to demonstrate to the U.S. EPA that no hazardous waste or hazardous constituents remain in the soil or water beneath the basins which had been used in the past to treat corrosive hazardous waste. The basins, which are still operational as part of the wastewater treatment systems at these plants, are no longer used to treat hazardous waste.

To demonstrate clean closure, soil sampling and ground water monitoring plans, implementation schedules, and related reports must be submitted to the EPA. Capital costs are for the installation of monitoring wells (typically four per site) necessary to collect ground water samples for analysis.

Project Accomplishments:
(January 1, 2008 to December 31, 2008)
All activities are complete.

Project Fiscal Expenditures:
(January 1, 2008 to December 31, 2008)
The variance in depreciation and return is $0.

Project Progress Summary:
(January 1, 2008 to December 31, 2008)
All activities are complete.

Project Projections:
(January 1, 2009 to December 31, 2009)
Estimated project fiscal expenditures (depreciation and return) for the period January 2009 through December 2009 are expected to be $3,692.

FLORIDA POWER & LIGHT COMPANY
PROJECT DESCRIPTION AND PROGRESS

Project Title: Maintenance of Stationary Above Ground Fuel Storage Tanks – Capital
Project No.5b

Project Description:
Florida Administrative Code (F.A.C.) Chapter 17-762, which became effective on March 12, 1991, provides standards for the maintenance of stationary above ground fuel storage tank systems. These standards impose various implementation schedules for inspections/repairs and upgrades to fuel storage tanks.

The capital project associated with complying with the new standards includes the installation of items for each tank such as liners, cathodic projection systems and tank high-level alarms.

Project Accomplishments:
(January 1, 2008 to December 31, 2008)
Installation of new radar level detector on PMR 1 & 2 metering tank will be installed in the 4th quarter. Abandoned 8" and 12" underground fuel oil piping in the Port of Palm Beach was removed and the project completed.

Project Fiscal Expenditures:
(January 1, 2008 to December 31, 2008)
The variance in depreciation and return is $2,872, or 0.2% higher than projected.

Project Progress Summary:
(January 1, 2008 to December 31, 2008)
Installation of new radar level detector on PMR 1 & 2 metering tank will be installed in the 4th quarter. Abandoned 8" and 12" underground fuel oil piping in the Port of Palm Beach was removed and the project completed.

Project Projections:
(January 1, 2009 to December 31, 2009)
No new expenditures for 2009. Estimated project fiscal expenditures (depreciation and return) for the period January 2009 through December 2009 are expected to be $1,648,976.

FLORIDA POWER & LIGHT COMPANY
PROJECT DESCRIPTION AND PROGRESS

Project Title: Relocate Turbine Lube Oil Underground Piping to Above Ground – Capital
Project No. 7

Project Description:
In accordance with criteria contained in Chapter 62-762 of the Florida Administrative Code (F.A.C.) for storage of pollutants, FPL initiated the replacement of underground Turbine Lube Oil piping to above ground installations at the St. Lucie Nuclear Power Plant.

Project Accomplishments:
(January 1, 2008 to December 31, 2008)
All activities are complete.

Project Fiscal Expenditures:
(January 1, 2008 to December 31, 2008)
The variance in depreciation and return is $2.

Project Progress Summary:
(January 1, 2008 to December 31, 2008)
This project is complete.

Project Projections:
(January 1, 2009 to December 31, 2009)
Estimated project fiscal expenditures (depreciation and return) for the period January 2009 through December 2009 is $1,517.

FLORIDA POWER & LIGHT COMPANY
PROJECT DESCRIPTION AND PROGRESS

Project Title: Oil Spill Cleanup/Response Equipment – Capital
Project No. 8b

Project Description:
The Oil Pollution Act of 1990 (OPA '90) mandates that all liable parties in the petroleum handling industry file plans by August 18, 1993. In these plans, a liable party must identify (among other items) its spill management team, organization, resources and training. Within this project, FPL developed the plans for ten power plants, five fuel oil terminals, three pipelines, and one corporate plan. Additionally, FPL purchased the mandated response resources and provided for mobilization to a worst case discharge at each site.

Project Accomplishments (January 1, 2008 to December 31, 2008)
All equipment is being maintained and replaced as necessary to maintain compliance with regulatory guidelines for response readiness.

Project Fiscal Expenditures:
(January 1, 2008 to December 31, 2008)
The variance in depreciation and return is $5,408, or 6.4% higher than projected.

Project Progress Summary:
(January 1, 2008 to December 31, 2008)
All deadlines, both state and federal, have been met. Ongoing costs will be annual in nature and will consist of equipment upgrades/replacements. In 2008, PGD will have purchased the following: (1) boom reel, (2) Conex boxes, (1) 18-ft flatbed trailer, (1) oil mop skimmer, and other equipment to be determined. PGD continues to assess our oil spill readiness at all applicable Florida facilities and are is taking action based on these assessments.

Project Projections:
(January 1, 2009 to December 31, 2009)
Estimated project fiscal expenditures (depreciation and return) for the period January 2009 through December 2009 are expected to be $111,495.

FLORIDA POWER & LIGHT COMPANY
PROJECT DESCRIPTION AND PROGRESS

Project Title: Relocate Storm Water Runoff – Capital

Project No. 10

Project Description:
The new National Pollutant Discharge Elimination System (NPDES) permit, Permit No. FL0002206, for the St. Lucie Plant, issued by the United States Environmental Protection Agency contains new effluent discharge limitations for industrial-related storm water from the paint and land utilization building areas. The new requirements become effective on January 1, 1994. As a result of these new requirements, the effected areas will be surveyed, graded, excavated and paved as necessary to clean and redirect the storm water runoff. The storm water runoff will be collected and discharged to existing water catch basins on site.

Project Accomplishments:
(January 1, 2008 to December 31, 2008)
All activities are complete.

Project Fiscal Expenditures:
(January 1, 2008 to December 31, 2008)
The variance in depreciation and return is $0.

Project Progress Summary:
(January 1, 2008 to December 31, 2008)
All activities are complete.

Project Projections:
(January 1, 2009 to December 31, 2009)
Estimated project fiscal expenditures (depreciation and return) for the period January 2009 through December 2009 are expected to be $9,377.

FLORIDA POWER & LIGHT COMPANY
PROJECT DESCRIPTION AND PROGRESS

Project Title: Disposal of Non-Contaminated Liquid Waste – Capital
Project No.17b

Project Description:
FPL manages ash from heavy oil fired power plants using a wet ash system. Ash from the dust collector and economizer is sluiced to surface ash basins. The ash sludge is then pH adjusted to precipitate metals. In order to comply with Florida Administrative Code 62-701.300 (10), the ash is then de-watered using a plate/frame filter-press in order to dispose of it in a Class I landfill or ship by railcar to a processing facility for beneficial reuse.

Project Accomplishments:
(January 1, 2008 to December 31, 2008)
All activities are complete.

Project Fiscal Expenditures:
(January 1, 2008 to December 31, 2008)
Project expenditures are estimated to be $0.

Project Progress Summary:
(January 1, 2008 to December 31, 2008)
All activities are complete.

Project Projections:
(January 1, 2009 to December 31, 2009)
Estimated project fiscal expenditures (depreciation and return) for the period January 2009 through December 2009 are $0.

FLORIDA POWER & LIGHT COMPANY
PROJECT DESCRIPTION AND PROGRESS

Project Title: Wastewater Discharge Elimination & Reuse – Capital
Project No.20

Project Description:
Pursuant to 33 U.S.C. Section 1342 and 40 CFR 122, FPL is required to obtain NPDES permits for each power plant facility. The last permits issued contain requirements to develop and implement a Best Management Practice Pollution Prevention Plan (BMP3 Plan) to minimize or eliminate, whenever feasible, the discharge of regulated pollutants, including fuel oil and ash, to surface waters. In addition, the 1997 Federal Ambient Water Quality Criteria requires FPL to meet surface water standards for any wastewater discharges to groundwater at all plants and the Dade County DERM requires Turkey Point and Cutler Plant wastewater discharges into canals to meet county water quality standards found in Section 24-11, Code of Metropolitan Dade County.

In order to address these requirements, FPL has undertaken a multifaceted project which includes activities such as ash basin lining, installation of retention tanks, tank coating, sump construction, installation of pumps, motor, and piping, boiler blowdown recovery, site preparation, separation of stormwater and ashwater systems, separation of potable and service water systems, and the associated engineering and design work to implement these projects.

Project Accomplishments:
(January 1, 2008 to December 31, 2008)
All activities are complete.

Project Fiscal Expenditures:
(January 1, 2008 to December 31, 2008)
The variance in depreciation and return is estimated to be $0.

Project Progress Summary:
(January 1, 2008 to December 31, 2008)
All activities are complete.

Project Projections:
(January 1, 2009 to December 31, 2009)
Estimated project fiscal expenditures (depreciation and return) for the period January 2009 through December 2009 are expected to be $236,106.

FLORIDA POWER & LIGHT COMPANY
PROJECT DESCRIPTION AND PROGRESS

Project Title: St. Lucie Turtle Net – Capital
Project No. 21

Project Description:
The Turtle Net project says that FPL is limited in the number of lethal turtle takings permitted at its St. Lucie Power Plant by the Incidental Take Statement contained in the Endangered Species Act Section 7 Consultation Biological Opinion, issued to FPL on May 4, 2001 by the National Marine Fisheries Service ("NMFS"). The number of lethal takings permitted in a given year is calculated by taking one percent of the total number of loggerhead and green turtles captured in that year. (The Incidental Take Statement separately limits the number of lethal takings of Kemp's Ridley turtles to two per year over the next ten years, and the number of lethal takings of either hawksbill or leatherback turtles to one of those species every two years over the next ten years). Based on the number of captured turtles in 2001, the lethal take limit for loggerhead and green turtles in that year was six (references; Nuclear Regulatory Commission letter dated May 18, 2001 included as Exhibit 1, Document No. 1, Endangered Species Act Section 7 Consultation Biological Opinion Incidental Take Statement dated May 4, 2001 included as Exhibit 1, Document No. 2, Appendix B To Facility Operating License No. NPF-16 St. Lucie Unit 2, Environmental Protection Plan, Non-Radiological, Amendment No. 103 included as Exhibit 1, Document No. 3). In 2001, FPL experienced six lethal takings of loggerhead and green turtles at the St. Lucie Power Plant, indicating that its existing measures to limit such takings were performing marginally.

The existing net is in need of maintenance. To facilitate this work, a temporary net will be situated to allow removal of the existing net. The new net having been properly coated for UV protection and anti-fouling will be installed replacing the existing net. The existing net will be repaired and maintained as a spare to allow rotation of the nets for future maintenance.

Project Accomplishments:
(January 1, 2008 to December 31, 2008)
The original estimate was related to the cost to re-coat the net once removed. When the net was being removed, a significant amount of sea grass was found to be tangled in the net which needed to be removed and required the net to be cut. The cost to repair the net as well as re-coat it is greater than the cost to purchase a new net; therefore a new net will be purchased.

Project Fiscal Expenditures:
(January 1, 2008 – December 31, 2008)
The variance is estimated to be $1,107, or 0.9% higher than originally anticipated due to a new net is required since the existing net was cut during removal.

Project Progress Summary:
(January 1, 2008 to December 31, 2008)
The original estimate was related to the cost to re-coat the net once removed. When the net was being removed, a lot of sea grass was tangled in the net and the net needed to be cut to remove. The cost to re-coat and repair the net is greater than the cost to purchase a new net. The new net is considered a capital cost.

Project Projections:
(January 1, 2009 to December 31, 2009)
Estimated project fiscal expenditures (depreciation and return) for the period January 2009 through December 2009 are expected to be $137,914.

FLORIDA POWER & LIGHT COMPANY
PROJECT DESCRIPTION AND PROGRESS

Project Title: Pipeline Integrity Management (PIM) - Capital
Project No.22

Project Description:
FPL is required to develop a written pipeline integrity management program for its hazardous liquid pipelines. This program must include the following elements: (1) a process for identifying which pipeline segments could affect a high consequence area; (2) a baseline assessment plan; (3) an information analysis that integrates all available information about the integrity of the entire pipeline and the consequences of a failure; (4) the criteria for determining remedial actions to address integrity issues raised by the assessments and information analysis; (5) a continual process of assessment and evaluation of pipeline integrity; (6) the identification of preventive and mitigative measures to protect the high consequence area; (7) the methods to measure the program's effectiveness; (8) a process for review of assessment results and information analysis by a person qualified to evaluate the results and information; and, (9) record keeping.

Project Accomplishments: (January 1, 2008 to December 31, 2008)
No projects for 2008 cycle.

Project Fiscal Expenditures:
(January 1, 2008 to December 31, 2008)
The variance in depreciation and return is estimated to be $14,717, or 100% lower than projected. The installation of leak detection devices at the Martin 30" pipeline has been postponed. Further analysis is being conducted on other technology options.

Project Progress Summary:
(January 1, 2008 to December 31, 2008)
No projects for 2008 cycle.

Project Projections:
(January 1, 2009 to December 31, 2009)
Estimated project fiscal expenditures (depreciation and return) for the period January 2009 through December 2009 are expected to be $6,395.

FLORIDA POWER & LIGHT COMPANY
PROJECT DESCRIPTION AND PROGRESS

Project Title: SPCC (Spill Prevention, Control, and Countermeasures) – Capital
Project No.23

Project Description:
The EPA first established the SPCC Program in 1973 when the agency issued the Oil Pollution Prevention Regulation (i.e., SPCC rule) to address the oil spill prevention provisions contained in the Federal Water Pollution Control Act of 1972 (later amended as the Clean Water Act). The purpose of the regulation was to prevent discharges of oil from reaching the navigable waters of the U.S. or adjoining shorelines and to prepare facility personnel to respond to oil spills. The SPCC regulation requires certain facilities to prepare and implement SPCC Plans and address oil spill prevention requirements including the establishment of procedures, methods, equipment, and other requirements to prevent discharges of oil as described above. Specifically, the rule applies to any owner or operator of a non-transportation related facility that:

- Has a combined aboveground oil storage capacity of more than 1320 gallons, or a total underground oil storage capacity exceeding 42,000 gallons (Note: the underground storage capacity does not apply to those tanks subject to all of the technical requirements of the federal underground storage tank rule found in 40 CFR 280 or a State approved program); and

- Which due to its location, could be reasonably expected to discharge oil in quantities that may be harmful into or upon the navigable waters of the United States or adjoining shorelines.

In January 1988, a large storage tank owned by Ashland Oil Company at a site in western Pennsylvania collapsed, releasing approximately 750,000 gallons of diesel fuel to the Monongahela River. Following calls for new tank legislation, an EPA task force recommended expanded regulation of aboveground tanks within the framework of existing legislative authority. The result was EPA's SPCC rulemaking package, the first phase of which was proposed in 1991. Due to a series of agency delays primarily resulting from the 1989 Exxon Valdez oil spill that required EPA to issue the Facility Response Plan rule under the Oil Pollution Act of 1990, the final SPCC Rule was not published until July of 2002.

Project Accomplishments:
(January 1, 2008 to December 31, 2008)
Required facility upgrades have been identified, and contracts have been awarded to provide the engineering, procurement, and construction for the capital upgrades. The upgrades are scheduled to be completed by the end of 2008. Capital upgrades will be executed at the following facilities: Sanford Plant, Martin Plant, Martin Terminal, Port Everglades Plant, Manatee Plant, Manatee Terminal, Turkey Point Plant, and Cape Canaveral Plant.

Project Fiscal Expenditures:
(January 1, 2008 to December 31, 2008)
The variance in depreciation and return is $22,485 or 1.0% lower than projected.

Project Progress Summary:
(January 1, 2009 to December 31, 2009)
By the end of 2008, we plan to have all required facility upgrades completed. It should be noted that the current EPA compliance deadline for implementation of the SPCC plans is July 1, 2009.

Project Projections:
(January 1, 2009 to December 31, 2009)
Estimated project fiscal expenditures (depreciation and return) for the period January 2009 through December 2009 are expected to be $2,525,090.

FLORIDA POWER & LIGHT COMPANY
PROJECT DESCRIPTION AND PROGRESS

Project Title: Manatee Reburn – Capital
Project No.24

Project Description:
This project involves installation of reburn technology in Manatee Units 1 and 2. Reburn is an advanced nitrogen oxides (NOx) control technology that has been developed for, and applied successfully in, commercial applications to utility and large industrial boilers. The process is a proven advanced technology, with applications of a reburn-like flue gas incineration technique dating back to the late 1960s, and developments for applications to large coal fired power plants in the United States dating back to the early to mid 1980s.

Reburn is an in-furnace NOx control technology that employs fuel staging in a configuration where a portion of the fuel is injected downstream of the main combustion zone to create a second combustion zone, called the reburning zone. The reburning zone is operated under conditions where NOx from the main combustion zone is converted to elemental nitrogen (which makes up 79% of the atmosphere). The basic front wall-fired boiler reburning process is shown conceptually in Figure 1 (see below), and divides the furnace into three zones.

In the 1996-97 time period, FPL invested a considerable effort evaluating the Manatee Units for the application of reburn technology. FPL has recently reviewed the reburn system designs previously proposed for the Manatee units, and concluded that a design for either oil or gas reburn would require very similar characteristics. This will require reburn fuel injectors to be located at the elevation of the present top row of burners, with reburn injectors on the boiler front and rear walls. For the present application the injectors will be required to have a dual fuel (oil and gas) capability. In order to provide adequate residence time for the reburn process, it is proposed to locate the reburn overfire air (OFA) ports between the boiler wing walls and to angle them slightly to provide better mixing with the boiler flow. Because of the complexity of the boiler flow field and the port location, it was determined that OFA booster fans would be required to assist the air-fuel mixing and complete the burnout process. Installation of reburn technology for Manatee Units 1 and 2 offers the potential to reduce NOx emissions through a "pollution prevention" approach that does not require the use of reagents, catalysts, pollution reduction or removal equipment. FDEP and FPL agree that reburn technology is the most cost-effective alternative to achieve significant reductions in NOx emissions from Manatee Units 1 and 2.

Project Accomplishments:
(January 1, 2008 to December 31, 2008)
Installation of the Unit 1 and Unit 2 equipment is complete, started up and completed process optimization of the new systems to ensure minimal emissions. Unit 1 is out of warranty. Unit 2 is still under warranty.

Project Fiscal Expenditures:
(January 1, 2008 to December 31, 2008)
The variance in depreciation and return is $253,766, or 5.1% lower than projected.

Project Progress Summary:
(January 1, 2008 to December 31, 2008)
Unit 1 and 2 both completed.

Project Projections:
(January 1, 2009 to December 31, 2009)
Estimated project fiscal expenditures (depreciation and return) for the period January 2009 through December 2009 are expected to be $4,609,917.

FLORIDA POWER & LIGHT COMPANY
PROJECT DESCRIPTION AND PROGRESS

Project Title: Pt. Everglades ESP Technology – Capital
Project No.25

Project Description:
The requirements of the Clean Air Act direct the EPA to develop health-based standards for certain "criteria pollutants". i.e. ozone (O_3), sulfur dioxide (SO_2), carbon monoxide (CO), particulate matter (PM), nitrogen oxides (NOx), an lead (Pb). EPA developed standards for the criteria pollutants and regulates the emissions of those pollutants from major sources by way of the Title V permit program. Florida has been granted authority from the EPA to administer its own Title V program which is at least as stringent as the EPA requirements. Florida is able to, issue, renew and enforce Title V air operating permits for sources within the state via 403.061 Florida Statutes and Chapter 62-213 F.A.C., which is administered by the State of Florida Department of Environmental Protection ("DEP"). The Title V program addresses the six criteria pollutants mentioned earlier, and includes hazardous air pollutants (HAP). The EPA sets the limits of emissions of Hazardous Air Pollutants through the Maximum Achievable Control Technology (MACT). The original Port Everglades Title V permit, issued in 1998, expires on December 31, 2003 and must be renewed. The DEP's Final Title V permit for FPL Port Everglades plant requires FPL to install Electrostatic Precipitators at all four Port Everglades units to address local concerns and to insure compliance with the National Ambient Air Quality Stands and the EPA MACT Standards.

Project Accomplishments:
(January 1, 2008 to December 31, 2008)
During June, all major mechanical and electrical work was completed. All contractor punchlist items for the ESP were completed. Restoration of the plant property and grounds started during June. A Project Punchlist has been formalized with the plant and is being pursued.

Project Fiscal Expenditures:
(January 1, 2008 to December 31, 2008)
Estimated depreciation and return is $333,754 or 2.8% lower than projected. Combinations of factors have led to the projected decrease in fiscal expenditures. Taking into account the supply of electricity, as compared to customer demand throughout the fleet, unit efficiency has usually demanded these units run less than anticipated. In addition, fuel economics to-date have also demanded the consumption of the least expensive fuel source, primarily natural gas, requiring less operation from the ESP's as initially predicted for 2007. This combination of unit efficiency and fuel economics has further lead to reduced equipment deterioration, with less generation of ash for disposal, requiring less overall maintenance activities.

Project Progress Summary:
(January 2008 - December 2008)
Construction on the Unit 3 electrostatic precipitator was completed in spring 2007 as the Unit went operational in May 2007. Therefore, at this time, all four ESP's (Units 1 through 4) have construction activities completed and are operational. The Units 1, 2 and 4 precipitators met all performance guarantees and permit requirements. Preliminary results of Unit 3 performance test exceeded all performance guarantees. The Unit 1, 2 and 4 stack emissions were well below the new Title V permit requirements of .03 lb/mmbtu particulate and 20% opacity. Enclosure of ash truck loading bay is planned to contain fugitive airborne ash during truck loadings. The Ash Enclosure design, material and erection contract will be turned over to the plant for implementation (scheduled for Fall 2007).

Project Projections:
(January 1, 2009 to December 31, 2009)
Estimated project fiscal expenditures (depreciation and return) for the period January 2009 through December 2009 are expected to be $11,251,101.

FLORIDA POWER & LIGHT COMPANY
PROJECT DESCRIPTION AND PROGRESS

Project Title: UST Replacement/Removal – Capital
Project No. 26

Project Description:
The Florida Administrative Code (FAC) Chapter 62-761.500, dated July 13, 1998, requires the removal or replacement of existing Category-A and Category-B storage tank systems with systems meeting the standards of Category-C storage tank systems by December 31, 2009. UST Category-A tanks are single-walled tanks or underground single-walled piping with no secondary containment that was installed before June 30, 1992.

UST Category-B tanks are tanks containing pollutants after June 30, 1992 or a hazardous substance after January 1, 1994 that shall have a secondary containment. Small diameter piping that comes in contact with the soil that is connected to a UST that shall have secondary containment if installed after December 10, 1990.

UST and AST Category-C tanks under F.A.C. 62-761.500 are tanks that shall have some or all of the following; a double wall, be made of fiberglass, have exterior coatings that protect the tank from external corrosion, secondary containment (e.g., concrete walls and floor) for the tank and the piping, and overfill protection.

FPL has six Category-A and two Category-B Storage Tank Systems that must be removed or replaced in order to meet the performance standards of Rule 61-761.500. In 2004 FPL will replace the two single-walled USTs located at the Turkey Point Nuclear Plant Units 1 and 2 with ASTs providing secondary containment (concrete walls and floor) surrounding the tanks. Also in 2004, FPL will remove one single-walled UST located at the Ft. Lauderdale Plant and will not replace the tank. In 2005-2006 FPL will replace the single-walled USTs located at the Area Office Broward (one UST in 2005), Customer Service East Office (one UST in 2006), Juno Beach Office (one UST in 2005), and General Office (2 USTs in 2005), with double-walled tanks providing electronic leak detection. Additionally, the AST to be installed at the Area Broward Office will be concrete vaulted.

The removal and replacement of the USTs will be performed by outside contractors. Additionally, closure assessments will be performed in accordance with 62-761.800 and closure assessment reports will be submitted to local Counties, and the Department of Environmental Services (DEP).

Project Accomplishments:
(January 1, 2008 to December 31, 2008)
There were no activities in 2008.

Project Fiscal Expenditures:
(January 1, 2008 to December 31, 2008)
Depreciation and return is estimated to be $66,966, versus an original estimate of $0.

Project Progress Summary:
(January 2008 - December 2008)
Initial review of the scope of work has been completed.

Project Projections:
(January 1, 2009 to December 31, 2009)
Estimated project fiscal expenditures (depreciation and return) for the period January 2009 through December 2009 are expected to be $65,488.

FLORIDA POWER & LIGHT COMPANY
PROJECT DESCRIPTION AND PROGRESS

Project Title: CAIR Compliance – Capital
Project No. 31

Project Description:
The CAIR Project was initiated to implement strategies to comply with CAIR Annual and Ozone Season NOx emissions requirements. The CAIR project to date has included the Black & Veatch (B&V) study of FPL's control and allowance management options, an engineering study conducted by Aptech for the reliable cycling of the 800 MW units, the installation of SCR's on SJRPP Units 1 and 2, installation of a Scrubber and SCR on Scherer Unit 4, and the installation of CEMS for the peaking gas turbine units. The 800 MW Cycling Project was added to CAIR after 2006 submittal. Aptech Engineering provided engineering services for the first phase of a multiphase scope of work that will assure that the operating reliability is maintained in the new operating mode. FPL anticipates changing the operating mode of its four 800 MW units at Martin and Manatee Plants. The "study cost" so far to Aptech Engineering have been paid. They have identified several countermeasures that are being prioritized and scheduled for implementation in 2008 – 2011. Project completion is scheduled for the first quarter of 2009. The Scrubber and SCR installation on Scherer Unit 4 are projected to be completed in the first quarter of 2012. The update to the Gas Turbine Peaking Unit CEMS requirements identified the need to implement a revised CEMS monitoring program for those units which will now require CEMS under the CAIR program requirements. FPL has determined that the implementation of the Low Mass Emissions option under 40 CFR Part 75 as the preferred option. The CEMS installations will require emissions testing of representative units and the procurement and installation of a Continuous Emissions Monitor at the Port Everglades GTs, Lauderdale GTs and Fort Myers GTs.

Project Accomplishments:
(January. 1, 2008 to December 31, 2008)

- Completed B & V study of CAIR compliance options
- Completed 800 MW Cycling Engineering Study

Project Fiscal Expenditures:
(January 1, 2008 to December 31, 2008)
The variance in the return on CWIP is estimated to be $2,200,113 or 37.3% higher than projected. The variance is primarily due to higher than projected material costs for structural steel and higher than projected labor costs for the SCR installation on Units 1 and 2 at SJRPP.

Project Progress Summary:
(January 1, 2008 to December 31, 2008)

The 800 MW Cycling Project identified countermeasures to assist with assuring operating reliability are currently in-progress with Project scope, Outage planning, and implementation for 2008 including; Condenser Tube replacements, Steam Turbine projects, Boiler projects, and Balance of Plant projects. The projected schedule to begin cycling is; PMR 2 in December 2009, PMR 1 in December 2010, with PMT 1 and PMT 2 scheduled for June 2010.

Installation of the SCR on SJRPP Unit 2 is complete with the installation of the SCR on Unit 1 approximately 60% complete. Installation of the Scrubber and SCR on Scherer Unit 4 will be completed in 2012. foundation work for the controls has begun and construction of common plant equipment for the CAIR controls is also underway.

Project Projections:
(January 1, 2009 to December 31, 2009)
Estimated project fiscal expenditures (depreciation and return) for the period January 2009 through December 2009 are expected to be $23,103,538.

FLORIDA POWER & LIGHT COMPANY
PROJECT DESCRIPTION AND PROGRESS

Project Title: CAMR Compliance – Capital
Project No. 33

Project Description:
The Clean Air Mercury Rule (CAMR) was promulgated by the Environmental Protection Agency (EPA) on March 15, 2005, imposing nation-wide standards of performance for mercury (Hg) emissions from existing and new coal-fired electric utility steam generating units. In addition to the CAMR, the Georgia Environmental Protection Division (EPD) adopted state specific rules as part of its Multi-Pollutant Rules requiring the installation of mercury controls on coal fired electric generating units within Georgia including all four units at Plant Scherer. The CAMR, and the Georgia Multi-Pollutant rule, are designed to reduce emissions of Hg through implementation of coal-fired generating unit Hg controls. In addition, CAMR requires the installation of Hg Continuous Emission Monitoring Systems (HgCEMS) to monitor compliance with the emission requirements. The State of Florida has begun the implementation of the requirements for reduction of Hg through rule making process. Plant St. John's River Power Park (SJRPP) Units 1 & 2, in which FPL has 20% ownership shares, are affected units under this rule and will require the installation of HgCEMS. Similarly the State of Georgia, in addition to the adoption of their state specific mercury reduction requirements under the Multi-Pollutant rule, has also begun their rule making process to implement the federal rule which will affect FPL's ownership share of Plant Scherer Unit 4 requiring the installation of HgCEMS and Hg controls.

Project Accomplishments:
(January 1, 2008 to December 31, 2008)
FPL completed the evaluation of mercury control options for Plant Scherer and approved the co-owner plan to proceed with the installation of a baghouse/sorbant-injection system on its ownership share of Plant Scherer. In June 2007 FPL issued a limited notice to proceed to the controls contractor BE&K. Contracts with engineering firm, Advatech, has been signed.

Project Fiscal Expenditures:
(January 1, 2008 to December 31, 2008)
Estimated depreciation and return are $2,524,933, or 61.7% lower than projected. The variance is primarily a result of changes in project schedule for the baghouse and sorbent injection installation on Scherer Unit 4, which delayed equipment procurement and certain construction activities to future years.

Project Progress Summary:
(January 1, 2008 to December 31, 2008)
The FPL CAMR project at Plant Scherer includes FPL's costs from the installation of a Baghouse, a mercury sorbant injection system with associated controls and material handling equipment, and capital additions to Plant Scherer common areas to accommodate sorbant delivery and storage and spent sorbant disposal. Mercury controls at Plant Scherer are being installed on all 4 units at the plant to comply with the Georgia Multi-Pollutant Rule. Installation of controls requires a specific sequence for the construction of the controls and material handling systems. To date engineering and design work for the baghouses and sorbant handling equipment was initiated in April of 2007 with design work completed in 2008. Installation of the mercury controls has begun on all four units at Plant Scherer including foundation work presently underway for Unit 4 controls. Foundation piles are being installed for Unit 4 controls while construction of common facility components of controls has also begun. Installation of the mercury monitor is projected to be completed by December 2008 with the baghouse on Unit 4 projected to be completed in early 2010. The FPL CAMR project at SJRPP includes FPL's costs from the installation of HgCEMS which have been completed on Units 1 and 2.

Project Projections:
(January 1, 2009 - December 31, 2009)
Estimated project fiscal expenditures (depreciation and return) for the period January 2009 through December 2009 are projected to be $5,934,022.

FLORIDA POWER & LIGHT COMPANY
PROJECT DESCRIPTION AND PROGRESS

Project Title: St. Lucie Cooling Water System Inspection and Maintenance – Capital
Project No. 34

Project Description:
The purpose of the proposed St. Lucie Plant Cooling Water System Inspection and Maintenance Project (the "Project") is to inspect and, as necessary, maintain the cooling water system at FPL's St. Lucie nuclear plant (the "Cooling System") such that it minimizes injuries and/or deaths of endangered species and thus helps FPL to remain in compliance with the federal Endangered Species Act, 16 U.S.C. Section 1531, et seq. (the "ESA") The St. Lucie Plant is an electric generating station on Hutchinson Island in St. Lucie County, Florida. The plant consists of two nuclear-fueled 850 net MWe units, both of which use the Atlantic Ocean as a source of water for once-through condenser cooling. This cooling water is supplied to the units via the Cooling System. The St. Lucie Plant cannot operate without the Cooling System. Compliance with the ESA is a condition to the operation of the St. Lucie Plant. Inspection and cleaning of the intake pipes is an "environmental compliance cost" under section 366.8255, Florida Statutes. The specific "environmental law or regulation" requiring inspection and cleaning of the intake pipes are terms and conditions that will be imposed pursuant to a Biological Opinion ("BO") that is to be issued by the National Oceanic and Atmospheric Administration ("NOAA") pursuant to section 7 of the ESA. NOAA will finalize the BO in 2007. NOAA sent the Nuclear Regulatory Commission ("NRC") a letter dated December 19, 2006, confirming its intent to issue the BO and stating the requirements that will be imposed pursuant to the BO with respect to inspection and cleaning of the intake pipes.

Project Accomplishments:
(January 8, 2008 thru December 31, 2008)
Inspections have been completed on all intake and discharge lines. Currently we are reviewing bids for the cleaning of the intake lines for SL2 fall 2007. We expect the cleaning to be completed prior to the end of the year. Should the cleaning not be completed in 2007 we will be continuing in the SL1 outage.

Project Fiscal Expenditures:
(January 8, 2008 to December 31, 2008)
Depreciation and return are estimated to be $0.

Project Progress Summary:
(January 8, 2008 to December 31, 2008)
The inspections of the ocean intakes and discharges were completed during the SL1 Spring 2007 outage in April and May. Cleaning of select areas of the three ocean intake pipes and velocity caps is scheduled for the SL2 outage planned for the Fall 2007, October 1- Dec 25.

Project Projections:
(January 1, 2009 to December 31, 2009)
Estimated project fiscal expenditures (depreciation and return) for January 2009 through December 2009 are expected to be $19,518.

FLORIDA POWER & LIGHT COMPANY
PROJECT DESCRIPTION AND PROGRESS

Project Title: Martin Plant Drinking Water System Compliance – Capital
Project No. 35

Project Description:
The Martin Drinking Water System is required to comply with the requirements the Florida Department of Environmental regulations rules for drinking water systems. The Florida Department of Environmental Protection (FDEP) determined the system must be brought into compliance with newly imposed drinking water rules for TTHM (trihalomethanes) and HAA5 (Haleo Acetic Acid). The upgrades to the potable water system will cause FPL to incur Capital costs for major component upgrades to the system in order to comply with the new requirements. These include Nano filtration, air stripping, carbon and multimedia filtration. The operation of the Potable system will cause FPL to incur O&M costs for certain products that are consumed during the water treatment process. These include carbon and multimedia bed media and nano filtration media.

Project Accomplishments:
(January 1, 2008 to December 31, 2008)
The Florida DEP requested a meeting to discuss the proposed design and implementation plan, which has delayed the work schedule. Preliminary approval was given based on the proposed concept of treatment. Construction applications and fees have been submitted to the FDEP. On 08/20/2008 FDEP South East District has requested additional information prior to granting permits for construction, project will be delayed until permitting is approved. Permit issuance is expected in September 2008.

Project Fiscal Expenditures:
(January 1, 2008 to December 31, 2008)
Depreciation and return are estimated to be $4,574, or 31.5% lower than projected. The project approval delays have resulted in delay in implementation.

Project Progress Summary:
(January 1, 2008 to December 31, 2008)
The project is awaiting the final construction approval by FDEP.

Project Projections:
(January 1, 2009 to December 31, 2009)
Estimated project fiscal expenditures (depreciation and return) for January 2009 through December 2009 are expected to be $27,801.

FLORIDA POWER & LIGHT COMPANY
PROJECT DESCRIPTION AND PROGRESS

Project Title: Low Level Radioactive Waste - Capital
Project No. 36

Project Description:
The Barnwell, South Carolina radioactive waste disposal facility is the only site of its kind presently available to FPL for disposal of Low Level Waste (LLW) such as radioactive spent resins, filters, activated metals, and other highly contaminated materials. The Barnwell facility ceased accepting LLW from FPL June 30th, 2008. This project will construct a LLW storage facility for class B and C radioactive waste at the St. Lucie Plant (PSL). Turkey Point (PTN) will be implementing a similar project; however the PTN project will start later than the PSL project since PTN has some limited existing LLW storage capacity. Where practical, this project will be implemented as part of a fleet approach. The objective at PSL and PTN is to ensure construction of a LLW storage facility with sufficient capacity to store all LLW B and C class waste generated at each plant site over a 5 year period. This will allow continued uninterrupted operation of the PSL and PTN nuclear units until an alternate solution becomes available. The LLW on site storage facilities at PSL and PTN will also provide a "buffer" storage capacity for LLW even if an alternate solution becomes feasible, should the alternate solution be delayed or interrupted at a later date.

Project Accomplishments:
(January 1, 2008 to December 31, 2008)
Field work has been performed at PSL and PTN to determine the potential location for each site's LLW storage facility. Project planning is going forward. Conceptual designs for LLW storage facilities are being developed and evaluated by Engineering and Nuclear Projects. The Nuclear Projects Department has worked with each site's Radiation Protection Department to develop several measures to ensure LLW storage capability exists at PSL and PTN until the LLW storage facilities can be completed at PSL and PTN. For PSL this consists of the purchase of a LS3 portable Ground Shield, two rain covers and additional insertable cylindrical shielding for existing concrete Ground Shields to meet RP surface dose rate restrictions for the storage casks. For Turkey Point the interim measures being considered to ensure LLW storage capacity is available until a facility is constructed includes purchasing new rigging to allow safely moving existing ground shields so that they can be used to store LLW.

Project Fiscal Expenditures:
(January 1, 2008 to December 31, 2008)
Depreciation and return are estimated to be $0.

Project Progress Summary:
(January 1, 2008 to December 31, 2008)
The project for PSL and PTN is on schedule. Initial scoping work is progressing and conceptual designs for LLW storage facilities are under development and evaluation to choose the optimal solution for each site. Interim measures to provide limited LLW storage capacity have been implemented to allow LLW storage until LLW storage facilities are completed at the sites. The PTN facility is still in the early stages of scope development due to the fact that the need for a LLW storage facility is not as urgent as PSL.

Project Projections:
(January 1, 2009 to December 31, 2009)
Estimated project fiscal expenditures (depreciation and return) for January 2009 through December 2009 are expected to be $27,338.

FLORIDA POWER & LIGHT COMPANY
PROJECT DESCRIPTION AND PROGRESS

Project Title: DeSoto Next generation Solar Energy Center – Capital
Project No. 37

Project Description:
The DeSoto Next Generation Solar Energy Center ("DeSoto Solar") project is a zero greenhouse gas emitting renewable generation project which on August 4, 2008, the Commission found in Order Number PSC-08-0491-PAA-EI, to be eligible for recovery through the ECRC pursuant to House Bill 7135. The DeSoto Solar project is a 25 MW solar photovoltaic generating facility which will convert sunlight directly into electric power. The facility will utilize a tracking array that is designed to follow the sun as it traverses through the sky. In addition to the tracking array this facility will utilize cutting edge solar panel technology. The project will involve the installation of the solar PV panels and tracking system and electrical equipment necessary to convert the power from direct current to alternating current and to connect the system to the FPL grid.

Project Accomplishments:
(January 1, 2008 to December 31, 2008)
In May 2008, FPL received County zoning approval (through a special exception) to build the solar facility. An Environmental Resource Permit application was filed in June 2008. In June 2008, FPL retained an Engineering Procurement and Construction (EPC) Contractor to design and construct the facility.

Project Fiscal Expenditures:
(January 1, 2008 to December 31, 2008)
Return on CWIP is estimated to be $29,115. The costs incurred through the end of June 2008 are $257,739. The expected costs for the remainder of 2008 are $6,038,824.

Project Progress Summary:
(January 1, 2008 to December 31, 2008)
The ERP permit is expected to be issued by the Florida Department of Environmental Protection in November 2008. Engineering design is underway with site construction expected to commence in January 2009.

Project Projections:
(January 1, 2009 to December 31, 2009)
Estimated project fiscal expenditures (return on CWIP) for January 2009 through December 2009 are expected to be $11,224,044. Projected costs for January 2009 through December 2009 are $166,429,700.

FLORIDA POWER & LIGHT COMPANY
PROJECT DESCRIPTION AND PROGRESS

Project Title: Space Coast Next generation Solar Energy Center - Capital
Project No. 38

Project Description:
The Space Coast Next Generation Solar Energy Center ("Space Coast Solar") project is a zero greenhouse gas emitting renewable generation project which on August 4, 2008, the Commission found in Order Number PSC-08-0491-PAA-EI, to be eligible for recovery through the ECRC pursuant to House Bill 7135. The Space Coast Solar project is a 10 MW solar photovoltaic (PV) generating facility which will convert sunlight directly into electric power. The facility will utilize a fixed PV array oriented to capture the maximum amount of electricity from the sun over the entire year. The project will involve the installation of the solar PV panels and support structures and electrical equipment necessary to convert the power from direct current to alternating current and to connect the system to the FPL grid.

Project Accomplishments:
(January 1, 2008 to December 31, 2008)
In June 2008, FPL entered into a long term lease with NASA for use of the land to build the solar facility. In July 2008, an Environmental Resource Permit application was filed with the Water Management District, and an Army Corps of Engineers Nationwide Permit application was filed. In July 2008, FPL retained an Engineering Procurement and Construction (EPC) Contractor to design and construct the facility.

Project Fiscal Expenditures:
(January 1, 2008 to December 31, 2008)
Return on CWIP is estimated to be $4,681. The costs incurred through the end of June 2008 are $269,960, including approximately $37,000 expended in late 2007. The remaining costs for 2008 are expected to be $742,326.

Project Progress Summary:
(January 1, 2008 to December 31, 2008)
The ERP and AOCE permits expected to be issued in January 2009. Engineering design is underway with site construction expected to commence in September 2009.

Project Projections:
(January 1, 2009 to December 31, 2009)
Estimated project fiscal expenditures (return on CWIP) for January 2009 through December 2009 are expected to be $1,508,123. Projected costs for January 2009 through December 2009 are $27,030,686.

FLORIDA POWER & LIGHT COMPANY
PROJECT DESCRIPTION AND PROGRESS

Project Title: Martin Next Generation Solar Energy Center - Capital
Project No. 39

Project Description:
The Martin Next Generation Solar Energy Center ("Martin Solar") project is a zero greenhouse gas emitting renewable generation project which on August 4, 2008, the Commission found in Order Number PSC-08-0491-PAA-EI, to be eligible for recovery through the ECRC pursuant to House Bill 7135. The Martin Solar project is a 75 MW solar thermal steam generating facility which will be integrated into the existing steam cycle for the Martin Unit 8 natural gas-fired combined cycle power plant. The steam to be supplied by Martin Solar will be used to supplement the steam currently generated by the heat recovery steam generators. The project will involve the installation of parabolic trough solar collectors that concentrate solar radiation. The collectors will track the sun to maintain the optimum angle to collect solar radiation. The collectors will concentrate the sun's energy on heat collection elements located in the focal line of the parabolic reflectors. These heat collection elements contain a heat transfer fluid which is heated by the concentrated solar radiation to approximately 750 degrees Fahrenheit. The heat transfer fluid is then circulated to heat exchangers that will produce up to 75 MW of steam that will be routed to the existing natural gas-fired combined cycle Unit 8 heat recovery steam generators.

Project Accomplishments:
(January 1, 2008 to December 31, 2008)
The project filed for the necessary permit modifications, the Site Certification Conditions of Certification and the Army Corp or Engineers Fill permit in May of 2008. The modification to the Fill permit was issued on July 28, 2008. The modified Conditions of Certification are expected to be issued by the Florida Department of Environmental Protection on August 21, 2008. The project commenced initial engineering in July, 2008.

Project Fiscal Expenditures:
(January 1, 2008 to December 31, 2008)
Return on CWIP is estimated to be $81,892. The costs incurred through the end of June, 2008 are $766,731, which includes $68,000 which was incurred in late 2007.

Project Progress Summary:
(January 1, 2008 to December 31, 2008)
The project has received its modified Fill permit from the Army Corps of Engineers and is expected to receive the modified conditions of certification shortly. Engineering has commenced along with procurement activities for the major equipment. All contracts are expected to be in place to support a construction start in January, 2009.

Project Projections:
(January 1, 2009 to December 31, 2009)
Estimated project fiscal expenditures (return on CWIP) for January 2009 through December 2009 are expected to be $11,788,849. Projected costs for January 2009 through December 2009 are $210,005,000.

FLORIDA POWER & LIGHT COMPANY
DOCKET NO. 080007-EI
ENVIRONMENTAL COST RECOVERY CLAUSE
FPL SUPPLEMENTAL CAIR/CAMR/CAVR FILING
APRIL 2, 2008

Per Order No. 07-0922-FOF-EI, issued on November 16, 2007, the discussion below provides FPL's current estimates of project activities and associated costs related to its Clean Air Interstate Rule (CAIR), Clean Air Mercury Rule (CAMR) and Clean Air Visibility Rule (CAVR)/ BART Projects.

Clean Air Interstate Rule (CAIR) Compliance Project Update:

SJRPP SCR and Ammonia Injection Systems - The installation of Selective Catalytic Reduction Systems (SCR) and Ammonia Injection Systems on St. Johns River Power Park (SJRPP) Units 1 and 2 remains at $45.5 million. Construction of the SCRs is on schedule with the Unit 2 SCR nearing completion and Unit 1 ductwork fabrication and installation underway.

Estimated CAIR O&M expenses for 2008 and 2009 are $360,000 and $600,000 respectively. Estimated annual O&M expenses beginning 2012 are $1.2 million (FPL 20% ownership). O&M activities for the SCR include incremental operating staff, ammonia consumption, maintenance of the SCR ammonia injection skid and SCR auxiliary equipment.

Scherer SCR and FGD - Current capital cost estimates for the installation of Wet Flue Gas Desulfurization (FGD) Scrubber and Selective Catalytic Reduction System (SCR) with Ammonia Injection System on Scherer Unit 4 is $392.6 million. The construction of plant infrastructure required for the reagent supply and waste by-product removal from the emission controls being implemented at Plant Scherer is currently underway and FPL's share of the costs for those facilities needed for support of Unit 4 are included in the project costs. Specific engineering and design work on the FGD & SCR for Unit 4 has begun and costs for these activities will be presented for review and recovery. The Scherer Unit 4 control installation costs were evaluated to ensure that the proposed project remains a prudent expenditure for FPL's customers, through an analysis that included projected future costs for CO2 and other emissions from Electric Generating Units (EGUs) as well as the project's emission control costs. The results of the study indicate that customers are projected to receive substantial savings though the implementation of the controls rather than prematurely shutting down Unit 4 in order to avoid incurring compliance costs.

Georgia Power Company has not provided O&M estimates for the SCR and FGD for 2012 and beyond. O&M activities for the SCR include incremental operating staff, ammonia consumption, maintenance of the SCR ammonia injection skid and SCR

FLORIDA PUBLIC SERVICE COMMISSION
DOCKET NO. 080007-EI EXHIBIT 6
COMPANY Florida Power & Light Co. (Direct)
WITNESS R. R. Labauve (RRL-1)
DATE 11-04-08

auxiliary equipment. O&M activities for the FGD include limestone consumption, limestone and by-product handling operation, FGD operations, FGD tower and auxiliary equipment maintenance.

800 MW unit cycling project - The 800 MW unit cycling project is currently underway, with anticipated completion in 2010 at the Martin and Manatee Plants. Mr. LaBauve introduced this project in his September 1, 2006 testimony and had subsequently provided an estimate for implementation of the projects with a total capital cost of $103.8 million. Project work at the Martin and Manatee Plants for 2008 will include condenser tube replacements, steam turbine projects, boiler projects, and balance of plant changes for one unit at each plant for a total estimated capital cost of $40.1 million and an estimated O&M expense of $1.7 million. Similar project work for the remaining 800 MW units at Martin and Manatee is planned for 2009 with an estimated Capital Cost of $41.2 million and an O&M cost estimated at $2.1 million. FPL plans to complete the project work at the Manatee and Martin plants in 2010 with an estimated total project cost of $104.8 million in Capital costs and $5.3 million in O&M expenses.

The Reburn and Low NOx Burner projects at Cape Canaveral, Port Everglades, Turkey Point and Putnam plants are still on hold.

Rule Challenge - FPL's appeal of the Division of Administrative Hearings (DOAH) ruling in favor of the Florida Department of Environmental Protection (FDEP) was denied on November 7, 2007. The Third District Court of Appeals ruled that the DOA was justified in determining that the FDEP CAIR rules were a valid exercise of delegated legislative authority. FPL is participating with other litigants in the federal appeal of the CAIR rule where the court has established a schedule for briefing the issues. Initial briefs were filed March 5, 2007 by FPL. In July 2007 FPL attorneys participated in the development of "reply briefs" to other litigants. Final briefs have now been submitted. Oral arguments were presented to the DC Circuit Court on March 25, 2008 and a final decision by the court is expected later in 2008.

CEMS Plan for GTs - The Low Mass Emitting (LME) Continuous Emissions Monitoring Systems (CEMS) have been installed at the Fort Myers, Port Everglades, and Fort Lauderdale Gas Turbine Parks as required by the Clean Air Interstate Rule (CAIR). The entire capital project was completed in 2007 with no additional capital expense expected at the current time.

During 2008, the CEMS systems must be tested to verify that they meet the EPA and DEP performance specifications for the CAIR program. It is anticipated that $65,000 will be spent on these testing activities. The testing activities will be required every five years at current operating conditions. In addition, it is anticipated that $5,000 per year will be spent on routine maintenance of the CEMS systems. It should be noted that the LME option is available for a gas turbine only if its emissions remain under EPA-prescribed thresholds. If any gas turbine emits more than 50 tons of NOx or 25 tons of SO2 in a given calendar year, the testing for that gas turbine will be required every year,

instead of every 5 years. That would increase the testing costs for non-qualifying gas turbines to $65,000 per year, along with $5,000 per year for maintenance.

Purchases of allowances - Future purchases of allowances will be made as needed for compliance with the annual and ozone season NOx requirements. FPL has revised its estimate to reflect the changes which were made in the projected operation of FPL fossil generating units and purchase power. Reductions in NOx emissions from the implementation of the 800 MW unit cycling project have been included in the forecasted unit emissions. FPL's revised estimate projects a shortage of both NOx Ozone Season and NOx Annual Allowances for the initial 2009 and 2010 compliance years, but projects an excess of annual NOx allowances in subsequent years. FPL has projected Ozone Season NOx Allowance compliance costs of $1.2 million and $0.3 million in 2009 and 2010 respectively. FPL also projects Annual NOx Allowance compliance costs of $10.3 million and $2.7 million for 2009 and 2010 respectively. FPL projects an excess of both NOx Ozone Season and NOx Annual Allowances beginning in 2011 and continuing in subsequent years as a result of reductions in system emissions as the West County Energy Center Units come on line. FPL has estimated an average annual excess of approximately $14.8 Million for the 2011 through 2020 period. Please note, however, that FPL's actual NOx allowance requirements depend upon a number of factors that are difficult to predict, and it is possible that FPL's actual allowance requirements will differ significantly from the future year allowance projection. It is also likely that the future actual prices for the NOx allowances will differ substantially from the projected prices.

Climate Change - FPL continues to monitor the development of CO2 compliance policy and regulation as it relates to electric generating facilities. FPL believes that the future implementation of CO2 regulation on power plants may become an important consideration in the evaluation and implementation of pollution controls on generating units including those required to comply with CAIR and the Georgia Multi-pollutant rule. On July 13, 2007 Governor Charlie Christ signed three Executive Orders initiating Florida's energy policy: Executive Order 07-126, titled "Leadership by Example: Immediate Actions to Reduce Greenhouse Gas Emissions from Florida State Government"; Executive Order 07-127, "Immediate Actions to Reduce Greenhouse Gas Emissions within Florida"; and Executive Order 07-128, "Florida Governor's Action Team on Energy and Climate Change." Executive Order 07-127 directed the FDEP to initiate rulemaking to establish maximum emission levels of greenhouse gases for electric utilities. The standard will require a reduction of emissions to 2000 levels by 2017, to 1990 levels by 2025, and by 80 percent of 1990 levels by 2050. The FDEP proposes to create new rule Chapter 62-285, F.A.C., Greenhouse Gas Emissions Reduction, and develop new Rule 62-285.300, F.A.C., Electric Utility Greenhouse Gas Reduction Program, to accomplish this purpose. The effect of the rule would be to reduce greenhouse gas emissions from EGUs. The FDEP held two workshops in 2007 for the development of rule 62-285 to implement the Governor's executive order 07-127 to provide an opportunity for comments and recommendations at the outset of the proposed rule development projects. The FDEP did not offer any rule proposals at these workshops. FPL is participating in the Rule Development Workshops to represent the interests of its customers.

Specific rulemaking has not been proposed by the FDEP detailing how electric utilities would be impacted by the new rule, including the point of regulation for the Greenhouse Gas emissions. FPL has evaluated its present CO2 emissions from electric generation including the projected emissions through 2017. Future reductions of CO2 emissions may be required depending on the final rule. FPL is currently evaluating strategies which can be implemented to reduce CO2 emissions which include, but not limited to: expansion of nuclear generation; expanded use of Demand Side Management and Energy Efficiency programs; repowering of existing fossil generating plants; an increased use of renewable generation that includes solar, wind, and biomass; Carbon Capture and Sequestration at fossil generating plants. As FPL evaluates its needs for additional generating sources in its annual planning cycle during the preparation of the Ten Year Site Plan, the Greenhouse Gas emissions from existing and new sources will be evaluated for compliance with the targets established within the Governor's Executive Order 07-127.

FPL has not proposed a specific project at this time for compliance with the Governor's Executive Order. FPL anticipates that if reductions are required to comply with the targets established in a new rule to implement the order, specific projects may be required to reduce emissions below the current projected emissions from the generation of electricity to meet the customer demand. If FPL has to reduce emissions, specific projects will be identified to provide the reductions required to meet the CO2 targets. These will be provided to the Commission with the appropriate details and costs for review. FPL has conducted a review of the 800 MW cycling project, the Plant Scherer CAIR and Mercury controls, and the SJRPP CAIR and Mercury projects and has concluded that the continuation of the projects would be more cost effective than the alternative of discontinuing those projects.

Actual CAIR Capital expenses through 2007 are $26.1 million.

CAIR CAPITAL COST ESTIMATES ($Millions)			
PROJECT	**2008**	**2009**	**TOTAL PROJECT**
SJRPP-SCR/Ammonia Injection System	17.0	7.9	45.5
Scherer-SCR/FGD	45.6	90.6	392.6
800 MW Unit Cycling - Martin	24.4	22.7	50.1
800 MW Unit Cycling - Manatee	15.7	18.5	54.7
CEMS at GTs	Capital project completed	Capital project completed	Capital project completed
Allowances	N/A	N/A	N/A

Allowances	0	11.5	N/A
CO2 Compliance	Not yet available	Not yet available	Not yet available

Note: FPL is projecting $3.0 million for purchases of allowances in 2010.

Clean Air Mercury Rule (CAMR) Compliance Project Update:

On February 8, 2008 the U.S. District Court of Appeals ruled that EPA's delisting rule for Mercury emissions from coal-fired EGUs utility boilers and the Clean Air Mercury Rule were unlawful and vacated both rules. EPA may appeal the decision of the Court of Appeals before the Supreme Court prior to March 24, 2008. The vacature of the CAMR rule places in jeopardy the rules of many states, including Florida and Georgia that had been approved to implement the CAMR requirements using the federal rule as the enforceable standard.

The Georgia Environmental Protection Division (EPD) promulgated two major rules to implement mercury reductions within Georgia that included a rule to adopt the CAMR federal mercury cap and trade program: Rule 391-3-1-.02(15) – "*Georgia Mercury Trading Rule*" and a Georgia state specific Multi-pollutant rule: Rule 391-3-1-.02(2)(sss) – " *Multipollutant Control for Electric Utility Steam Generating Units*". The Multipollutant rule was promulgated to specify the implementation of specific air pollution control equipment for reductions in mercury, sulfur dioxide, and nitrogen oxides emissions from coal-fired EGUs. The rule requires controls to be implemented on specific EGUs within the state to control the emissions of Sulfur Dioxide (SO2), Nitrogen Oxides (NOx) and mercury (Hg). Section 4(i) of the Multipollutant Rule requires that Scherer Unit 4 may not be operated after April 30, 2010, unless it is equipped and operated with sorbent injection and a baghouse. A copy of the relevant sections of 391-3-1-.02(2) (sss) have been provided as Exhibit 1.

With the vacature of the Delisting rule EPA is now likely to proceed with evaluation and implementation of the existing rule requiring Maximum Available Control Technology (MACT) for mercury emissions from coal-fired EGUs. Prior to the implementation of

the Delisting and CAMR rules the MACT analyses had determined that the use of sorbant injection systems were effective in the removal of mercury and established the CAMR Phase I and II mercury budgets based on the implementation of the technology on coal-fired EGUs by 2018. The Georgia Multipollutant rule requires that each of the four units at Plant Scherer implement a Sorbant injection system with a baghouse collection device for removal of mercury. Therefore, installation of the mercury controls that would have been needed to comply with the CAMR requirements remains necessary to comply with the requirements of the Georgia Multipollutant rule, so the vacature of CAMR does not change the compliance obligations at Plant Scherer, including FPL's share of Unit 4. Installation of the Mercury Continuous Emissions Monitoring System (HgCEMS) that was planned to comply with CAMR likewise will be needed to comply with the monitoring and reporting requirements of the Multipollutant rule and ultimately to demonstrate compliance with monitoring of the final MACT rule. Specifically, FPL will comply with the mercury reduction requirements of the Georgia Multi-Pollutant rule using the following projects identified previously under CAMR:

1. Installation of Fabric Filter Bag House and Mercury Sorbant Injection System on Scherer Unit 4.
2. Installation of HgCEMS on Scherer Unit 4.
3. Installation of HgCEMS on SJRPP Units 1 & 2 that are currently under construction (certification testing and operation delayed until the monitoring requirements begin for Mercury MACT compliance.)

FPL has revised the cost estimates for the installation of mercury controls at plant Scherer as a result of estimated increases in labor and material costs.

FPL plans to petition the Commission for approval of a modification to its Clean Air Mercury Rule (CAMR) Project to recognize that the activities planned for Plant Scherer to comply with the now-vacated CAMR will be implemented instead to comply with the Georgia Multi-Pollutant Rule. FPL continues to believe that mercury controls being installed at Plant Scherer to comply with the Georgia rule will be equivalent to those which are likely to be required under a MACT rule. For the SJRPP units FPL, and majority owner JEA, had planned to comply with the Phase I of the CAMR through the co-benefits removal of mercury by the SCR and Scrubber for units burning bituminous coals. The planned addition of the SCR on both SJRPP units to comply with CAIR would achieve the co-benefit reductions as both units had been constructed with Scrubbers installed. FPL will evaluate the future mercury control requirements for Plant Scherer and SJRPP as the EPA reviews its options in response to the CAMR vacature. FPL and JEA will evaluate the appropriate technology for implementation at SJRPP to comply with a future Mercury reduction requirement.

Actual CAMR Capital expenses through 2007 are $6.0 million.

CAMR CAPITAL COST ESTIMATES ($Millions)			
PROJECT	**2008**	**2009**	**TOTAL PROJECT**
SJRPP-Mercury CEMS	.060	0	.475
Scherer-Sorbant Injection/Baghouse/ Mercury CEMS	40.0	49.5	99.6

Clean Air Visibility Rule (CAVR) / Best Available Retrofit Technology (BART) Project Update:

FPL has successfully demonstrated through modeling that all the applicable units under the particulate control portion of the BART regulations, with the exception of Turkey Point Units 1 & 2, do not cause a significant amount of particulate visibility impairment. Due to this demonstration, no further action will be required to comply with particulate emissions, except at Turkey Point Units 1&2.

Negotiations are continuing with the FDEP regarding Turkey Point Units 1 & 2. The last information provided to the FDEP revolved around two different compliance options for particulate control:

1. Installation of Electrostatic Precipitators (ESPs)
2. Alternative Emission Reduction Strategy
    a. Installation of modern multi-cyclone separators, and
    b. Switching to a lower sulfur fuel (1.0% to 0.7%)

FPL continues discussions with the FDEP to convince the agency that ESPs are not reasonable due to significant capital and on-going O&M costs. The multi-cyclone separators and fuel option provides more visibility improvement at a much lower overall cost.

The two projects compare as follows:

1. ESPs - $92 MM Capital with $13MM increased O&M/year
2. Alternative Emission reduction strategy - $7.3 MM Capital with $1.9MM increased O&M/Year

The FDEP's final decision is expected by May 2008. Once the final requirements have been determined, the required implementation date will not be until December 2013. However, installation will be conducted using a staged approach, with work done during the unit outages currently scheduled between now and 2013, in order to minimize effect on total system load and availability.

By December 2012, FPL will be required by the FDEP's Reasonable Further Progress rule to submit additional CAVR reduction evaluations for sulfur dioxide emissions from the following units:

1. Turkey Point Units 1 & 2
2. Port Everglades Units 3 & 4
3. Manatee Units 1 & 2

FPL is considering various option strategies to achieve the required reductions in sulfur dioxide emissions from these eight units cost-effectively. At this time the cost of compliance for the required sulfur dioxide emissions is not known. It should be noted that there is a potential that future sulfur dioxide emission controls required for CAVR compliance would provide co-benefit to the Company for compliance with CAIR.

Actual CAVR Capital expenses through 2007 are $0.0. Capital estimates for 2008 and beyond for Turkey Point Units 1 & 2 Particulate Control efforts and SO2 reductions at Turkey Point Units 1&2, Port Everglades Units 3&4, and Manatee Units 1&2 are not yet available.

Actual CAVR O&M expenses through 2007 are $0.040 Million. O&M estimates for 2008 are $20,000 for negotiations with the FDEP. O&M estimated for 2009 are undetermined.

Executive Order 07-127

STATE OF FLORIDA
OFFICE OF THE GOVERNOR
EXECUTIVE ORDER NUMBER 07-127

Establishing Immediate Actions to Reduce Greenhouse Gas Emissions within Florida

WHEREAS, with nearly 1,350 miles of coastline and a majority of citizens living near that coastline, Florida is more vulnerable to rising ocean levels and violent weather than any other state; and

WHEREAS, global climate change is one of the most important issues facing the State of Florida this century; and

WHEREAS, Florida is the second fastest growing state in the union with respect to the annual increase of new greenhouse gas emissions; and

WHEREAS, immediate actions are available and required to reduce emissions of greenhouse gases within Florida; and

WHEREAS, efforts are underway at the national level to begin addressing greenhouse gas emissions; and

WHEREAS, Florida has committed to becoming a leader in reducing emissions of greenhouse gases which are causing changing Earth's climate; and

WHEREAS, Florida, together with international leaders and experts, is hosting the Serve to Conserve Climate Change Summit on July 12 and 13,2007 in Miami, Florida;

NOW, THEREFORE., I, CHARLIE CRIST,

as Governor of Florida, in obedience to my solemn constitutional duty to take care that the laws be faithfully executed, and pursuant to the Constitution and laws of the State of Florida, do hereby promulgate the following Executive Order, to take immediate effect:

Section 1. I hereby establish greenhouse gas emission reduction targets for the State of Florida as follows: by 2017, reduce greenhouse gas emissions to 2000 levels; by 2025, reduce greenhouse gas emissions to 1990 levels; by 2050, reduce greenhouse gas emissions by 80% of 1990 levels.

FLORIDA PUBLIC SERVICE COMMISSION
DOCKET NO. 080007-EI EXHIBIT 7
COMPANY FL Power & Light Co. (Direct)
WITNESS R. R. Labauve (RRL-2)
DATE 11-04-08

Section 2. I hereby direct the following actions by members of my Administration in order to produce immediate reductions in greenhouse gas emissions within Florida;

1. The Secretary of Environmental Protection shall immediately develop rules as authorized under Chapter 403, Florida Statutes, to achieve the following:
    - Adoption of a maximum allowable emissions level of greenhouse gases for electric utilities in the State of Florida. The standard will require at minimum, three reduction milestones as follows: by 2017, emissions not greater than Year 2000 utility sector emissions; by 2025, emissions not greater than Year 1990 utility sector emissions; by 2050, emissions not greater than 20% of Year 1990 utility sector emissions (i.e., 80% reduction of 1990 emissions by 2050); Adoption of the California motor vehicle emission standards in Title 13 of the California Code of Regulations, effective January 1,2005, upon approval by the U.S. Environmental Protection Agency of the pending waiver, which includes emission standards for greenhouse gases, submitted by the California Air Resources Board; and Adoption of a statewide diesel engine idle reduction standard.
2. The Secretary of Community Affairs shall immediately:
    - Convene the Florida Building Commission for the purpose of revising the Florida Energy Code for Building Construction to increase the energy performance of new construction in Florida by at least 15% from the 2007 Energy Code. The Commission should consider incorporating standards for appliances and standard lighting in the Florida Energy Code. Target implementation date for the revised Florida Energy Code for Building Construction is January 1, 2009;
    - Initiate rulemaking of the Florida Energy Conservation Standards, Chapter 9B-44, Florida Administrative Code, with an objective to increase the efficiency of applicable consumer products authorized under s. 553.957, Florida Statutes, by 15% from current standards for implementation by July 1,2009.

Section 3. I hereby request the Florida Public Service Commission to take the following actions for the electric utility sector in order to open the market to clean, renewable energy technologies, thus avoiding future greenhouse gas emissions:

- Not later than September 1,2007, initiate rulemaking to require that utilities produce at least 20% of their electricity from renewable sources (Renewable Portfolio Standard) with a strong focus on solar and wind energy;

- Not later than September 1, 2007, initiate rulemaking to reduce the cost of connecting solar and other renewable energy technologies to Florida's power grid by adopting the Institute of Electrical and Electronics Engineers (IEEE) Standard 1547 for Interconnecting Distributed Resources with Electric Power Systems as the uniform statewide interconnection standard for all utilities; and

- Not later than September 1,2007, initiate rulemaking to authorize a uniform, statewide method to enable residential and commercial customers who generate electricity from on-site renewable technologies of up to 1 megawatt in capacity to offset their consumption over a billing period by allowing their electric meters to tum backwards when they generate electricity (net metering).

Section 4. All state agencies departments under the direction of the Governor are hereby directed, and all other state agencies are hereby requested, to assist those carrying out the directions in this Executive Order.

IN TESTIMONY WHEREOF, I have hereunto set my hand and have caused the Great Seal of the State of Florida to be affixed at Tallahassee, The Capitol, this 13th day of July,

Governor: Charlie Crist

ATTEST:

Secretary of State: Kurt S. Browning

CHAPTER 2008-227

HOUSE BILL NO. 7135

An act relating to energy; amending s. 74.051, F.S.; providing that it is the intent of the Legislature for a court, when practicable, to conduct a hearing and issue an order on a petition for a taking within a specified time; amending s. 110.171, F.S.; requiring each state agency to complete a telecommuting program by a specified date which includes a listing of the job classifications and positions that the state agency considers appropriate for telecommuting; providing requirements for the telecommuting program; requiring each state agency to post the telecommuting program on its Internet website; amending s. 163.04, F.S.; clarifying that condominium declarations may not prohibit renewable energy devices; removes three-story height restriction for installation of solar collectors on condominiums; amending s. 186.007, F.S.; authorizing the Executive Office of the Governor to include in the state comprehensive plan goals, objectives, and policies related to energy and global climate change; amending s. 187.201, F.S.; expanding the air quality, energy, and land use goals of the State Comprehensive Plan to include the development of low-carbon-emitting electric power plants, the reduction of atmospheric carbon dioxide, the promotion of the use and development of renewable energy resources, and provide for the siting of low carbon emitting electric power plants, including nuclear plants; amending ss. 196.012 and 196.175, F.S.; deleting outdated, obsolete language; removing the expiration date of the property tax exemption for real property on which a renewable energy source device is installed and revising the options for calculating the amount of the exemption; amending s. 206.43, F.S.; requiring each terminal supplier, importer, blender, and wholesaler to provide in a report to the Department of Revenue the number of gallons of blended and unblended gasoline sold; amending s. 212.08, F.S.; revising the definition of "ethanol"; specifying eligible items as limited to one refund; requiring a person who receives a refund to notify a subsequent purchaser of such refund; transferring certain duties and responsibilities from the Department of Environmental Protection to the Florida Energy and Climate Commission; requiring the Florida Energy and Climate Commission to adopt, by rule, an application form for claiming a tax exemption; amending s. 220.191, F.S.; providing that certain qualifying projects are eligible to transfer capital investment tax credits to other businesses under certain circumstances; providing limitations on the use of such transferred credits; specifying requirements for such transfers; amending s. 220.192, F.S.; defining terms related to a tax credit; allowing the tax credit to be transferred for a specified period; providing procedures and requirements; requiring the Department of Revenue to adopt rules for implementation and administration of the program; transferring certain duties and responsibilities from the Department of Environmental Protection to the Florida Energy and Climate Commission; amending s. 220.193, F.S.; defining the terms "sale" or "sold"; defining the term "taxpayer"; providing for retroactivity; providing that

CODING: Words ~~stricken~~ are deletions; words underlined are additions.

the use of the renewable energy production credit does not reduce the alternative minimum tax credit; amending s. 253.02, F.S.; authorizing the Board of Trustees of the Internal Improvement Trust Fund to delegate authority to grant easements across lands owned by the Board of Trustees of the Internal Improvement Trust Fund to the Secretary of Environmental Protection under certain conditions; amending s. 255.249, F.S.; requiring state agencies to annually provide telecommuting plans to the Department of Management Services; amending s. 255.251, F.S.; creating the "Florida Energy Conservation and Sustainable Buildings Act"; amending s. 255.252,

FLORIDA PUBLIC SERVICE COMMISSION
DOCKET NO. 080007-EI EXHIBIT 8
COMPANY Florida Power+Light Co. (Direct)
WITNESS R. R. Labauve (RRL-3)
DATE 11-04-08

F.S.; providing findings and legislative intent; providing that it is the policy of the state that buildings constructed and financed by the state be designed to meet the United States Green Building Council (USGBC) Leadership in Energy and Environmental Design (LEED) rating system, the Green Building Initiative's Green Globes rating system, the Florida Green Building Coalition standards, or a nationally recognized green building rating system as approved by the department; requiring each state agency occupying space owned or managed by the department to identify and compile a list of projects suitable for a guaranteed energy, water, and wastewater performance savings contract; amending s. 255.253, F.S.; defining terms relating to energy conservation for buildings; amending s. 255.254, F.S.; prohibiting a state agency from leasing or constructing a facility without having secured from the department a proper evaluation of life-cycle costs for the building; amending s. 255.255, F.S.; requiring the department to use sustainable building ratings for conducting a life-cycle cost analysis; amending s. 255.257, F.S.; requiring all state agencies to adopt an energy efficiency rating system as approved by the department for all new buildings and renovations to existing buildings; requiring all county, municipal, school district, water management district, state university, community college, and Florida state court buildings to meet certain energy efficiency standards for construction; providing applicability; creating a sustainable building training certification program within St. Petersburg College; specifying program components; creating s. 286.29, F.S.; requiring the Department of Management Services to develop the Florida Climate-Friendly Preferred Products List; requiring state agencies to consult the list and purchase products from the list if the price is comparable; requiring state agencies to contract for meeting and conference space with facilities having the "Green Lodging" designation; authorizing the Department of Environmental Protection to adopt rules; requiring the department to establish voluntary technical assistance programs for various businesses; requiring state agencies, state universities, community colleges, and local governments that purchase vehicles under a state purchasing plan to maintain vehicles according to minimum standards and follow certain procedures when procuring new vehicles; requiring state agencies to use ethanol and biodiesel-blended fuels when available; amending s. 287.063, F.S.; prohibiting the payment term for equipment from exceeding the useful life of the equipment unless the contract provides for the replacement or the extension of the useful

CODING: Words ~~stricken~~ are deletions; words underlined are additions.

life of the equipment during the term of the loan; amending s. 287.064, F.S.; authorizing an extension of the master equipment financing agreement for energy conservation equipment; requiring the guaranteed energy, water, and wastewater savings contractor to provide for the replacement or the extension of the useful life of the energy conservation equipment during the term of the contract; amending s. 287.16, F.S.; requiring the Department of Management Services to analyze specified fuel usage by the Department of Transportation; amending s. 288.1089, F.S.; defining the term "alternative and renewable energy"; revising provisions relating to innovation incentive awards to include alternative and renewable energy projects; specifying eligibility requirements for such projects; requiring Enterprise Florida, Inc., to solicit comments and recommendations from the Florida Energy and Climate Commission in evaluating such projects; amending s. 316.0741, F.S.; requiring all hybrid and other low-emission and energy-efficient vehicles that do not meet the minimum occupancy requirement and are driven in a high-occupancy-vehicle lane to comply with federally mandated minimum fuel economy standards; authorizing specified vehicles to use certain high-occupancy-vehicle lanes without payment of tolls; amending s. 337.401, F.S.; requiring the Department of Environmental Protection to adopt rules relating to the placement of and access to aerial and underground electric transmission lines having certain specifications; defining the term "base-load generating facilities"; amending s. 339.175, F.S.; requiring each metropolitan planning organization to develop a long-range transportation plan and an annual project priority list that, among other considerations, provide for sustainable growth and reduce greenhouse gas emissions; amending

s. 350.01, F.S.; conforming the beginning of a Public Service Commission member's term as chair with the beginning of terms of commissioners; correcting cross-references; amending s. 350.012, F.S.; renaming the Committee on Public Service Commission Oversight, a standing joint committee of the Legislature, as the "Committee on Public Counsel Oversight"; deleting the committee's authority to recommend to the Governor nominees to fill vacancies on the Public Service Commission; amending s. 350.03, F.S.; clarifying the power of the Governor to remove and fill commission vacancies as set forth in the State Constitution; amending s. 350.031, F.S.; increasing the number of members on the council; requiring the President of the Senate and the Speaker of the House of Representatives to appoint a chair and vice chair to the council in alternating years; removing spending authority for the council to advertise vacancies; requiring the council to submit recommendations for vacancies on the Public Service Commission to the Governor; requiring the council to nominate a minimum of three persons for each vacancy; revising the date that recommendations for vacancies must be submitted; providing that a successor Governor may remove an appointee only as provided; providing for the council to fill a vacancy on the commission if the Governor fails to do so; authorizing a successor governor to recall an unconfirmed appointee under certain circumstances; amending ss. 350.061 and 350.0614, F.S., relating to the appoint

CODING: Words ~~stricken~~ are deletions; words underlined are additions.

ment, oversight, and compensation of the Public Counsel; conforming provisions to changes made by the act; amending s. 366.04, F.S.; requiring an affected municipal electric utility to conduct a referendum election of all its retail electric customers to determine whether to require the municipal electric utility to provide a proposed charter transferring the operations of the utility to an electric utility authority; amending s. 366.81, F.S.; providing legislative intent; amending s. 366.82, F.S.; defining the term "demand-side renewable energy"; requiring the Public Service Commission to adopt goals for increasing the development of demand-side renewable energy systems energy resources; providing for cost-effectiveness tests; requiring the Florida Energy and Climate Commission to be a party in the proceedings to adopt goals; providing for an appropriations; providing for cost recovery; authorizing the commission to provide financial rewards and penalties; authorizing the commission to allow an investor-owned utility to earn an additional return on equity for exceeding energy efficiency and conservation goals; amending s. 366.8255, F.S.; redefining the term "environmental compliance costs" to include costs or expenses prudently incurred for scientific research and geological assessments of carbon capture and storage for the purpose of reducing an electric utility's greenhouse gas emissions; amending s. 366.91, F.S.; clarifying the definition of "biomass" to include waste and byproducts; requiring each public utility, and each municipal electric utility and rural electric utility cooperative that sells electricity at retail, to develop a standardized interconnection and net metering program for customer-owned renewable generation; authorizing net metering to be available when a utility purchases power generated from biogas produced by anaerobic digestion under certain conditions; amending s. 366.92, F.S.; directing the Public Service Commission to adopt a renewable portfolio standard; providing definitions; providing for renewable energy credits; providing for cost recovery; prohibiting the renewable portfolio standard rule from taking effect until ratified by the Legislature; amending s. 366.93, F.S.; revising the definitions of "cost" and "preconstruction"; requiring the Public Service Commission to establish rules relating to cost recovery for the construction of new, expanded, or relocated electrical transmission lines and facilities for a nuclear power plant; amending s. 377.601, F.S.; revising legislative intent with respect to the need to implement alternative energy technologies; providing for the transfer of the Florida Energy Commission in the Office of Legislative Services to the Florida Energy and Climate Commission in the Executive Office of the Governor; creating s. 377.6015, F.S.; providing for the membership, meetings, duties, and responsibilities of the Florida Energy and Climate Commission; providing rulemaking authority; amending s. 377.602, F.S.; revising the definition of

"energy resources"; providing for conforming changes; providing for the type two transfer of the state energy program in the Department of Environmental Protection to the Florida Energy and Climate Commission in the Executive Office of the Governor; amending ss. 377.603, 377.604, 377.605, 377.606, 377.608, 377.701, 377.703, and 377.705, F.S.; providing for conforming changes;

CODING: Words ~~stricken~~ are deletions; words underlined are additions.

amending s. 377.801, F.S.; providing a short title; amending s. 377.802, F.S.; providing the purpose of the Florida Energy and Climate Protection Act; amending s. 377.803, F.S.; revising definitions; clarifying the definition of "renewable energy" to include biomass, as defined in s. 366.91, F.S.; amending s. 377.804, F.S., relating to the Renewable Energy and Energy-Efficient Technologies Grants Program; providing for the program to include matching grants for technologies that increase the energy efficiency of vehicles and commercial buildings; providing for the solicitation of expertise of other entities; providing application requirements; amending s. 377.806, F.S.; conforming provisions relating to the Solar Energy System Incentives Program, to changes made by this act; requiring all eligible systems under the program to comply with the Florida Building Code; revising rebate eligibility requirements for solar thermal systems to include the installation of certain products by roofing contractors; creating s. 377.808, F.S.; establishing the "Florida Green Government Grants Act"; providing for grants to be awarded to local governments in the development of programs that achieve green standards; amending ss. 380.23 and 403.031, F.S.; conforming cross-references; creating s. 403.44, F.S.; creating the Florida Climate Protection Act; defining terms; requiring the Department of Environmental Protection to establish the methodologies, reporting periods, and reporting systems that must be used when major emitters report to The Climate Registry; authorizing the department to adopt rules for a cap-and-trade regulatory program to reduce greenhouse gas emissions from major emitters; providing for the content of the rule; prohibiting the rules from being adopted until after January 1, 2010, and from becoming effective until ratified by the Legislature; amending s. 403.502, F.S.; providing legislative intent; amending s. 403.503, F.S.; defining the term "alternate corridor" and redefining the term "corridor" for purposes of the Florida Electrical Power Plant Siting Act; amending s. 403.504, F.S.; requiring the Department of Environmental Protection to determine whether a proposed alternate corridor is acceptable; amending s. 403.506, F.S.; exempting an electric utility from obtaining certification under the Florida Electrical Power Plant Siting Act before constructing facilities for a power plant using nuclear materials as fuel; providing that a utility may obtain separate licenses, permits, and approvals for such construction under certain circumstances; exempting such provisions from review under ch. 120, F.S.; amending s. 403.5064, F.S.; requiring an applicant to submit a statement to the department if such applicant opts for consideration of alternate corridors; amending s. 403.5065, F.S.; providing for conforming changes; amending

s. 403.50663, F.S.; providing for notice of meeting to the general public; amending s. 403.50665, F.S.; requiring an application to include a statement on the consistency of directly associated facilities constituting a "development"; requiring the Department of Environmental Protection to address at the certification hearing the issue of compliance with land use plans and zoning ordinances for a proposed substation located in or along an alternate corridor; amending

s. 403.507, F.S.; providing for reports to be submitted to the department no later than 100 days after certification application has been

CODING: Words ~~stricken~~ are deletions; words underlined are additions.

determined complete; amending s. 403.508, F.S.; providing for land use and certification hearings; amending s. 403.509, F.S.; requiring the Governor and Cabinet sitting as the siting board to certify the corridor having the least adverse impact; authorizing the board to deny certification or allow a party to amend its proposal; amending

s. 403.511, F.S.; providing for conforming changes; amending s. 403.5112, F.S.; providing for filing of notice; amending s. 403.5113, F.S.; providing for postcertification amendments and postcertification review; amending s. 403.5115, F.S.; requiring the applicant proposing the alternate corridor to publish all notices relating to the application; requiring that such notices comply with certain requirements; requiring that notices be published at least 45 days before the rescheduled certification hearing; requiring applicants to make specified efforts to provide notice to certain landowners and to file a list of such notification with the Department of Environmental Protection's Siting Coordination Office; amending ss. 403.516, 403.517, and 403.5175, F.S.; providing conforming changes and cross-references; amending s. 403.518, F.S.; authorizing the Department of Environmental Protection to charge an application fee for an alternate corridor; amending ss. 403.519, 403.5252, 403.526, 403.527, 403.5271, 403.5272, 403.5312, 403.5363, 403.5365, and 403.814, F.S., relating to determinations of need, public notice requirements, and general permits; conforming provisions to changes made by the act; creating s. 403.7055, F.S.; encouraging counties in the state to form regional solutions to the capture and reuse or sale of methane gas from landfills and wastewater treatment facilities; requiring the Department of Environmental Protection to provide guidelines and assistance; amending s. 489.145, F.S.; creating s. 403.7032, F.S.; providing legislative findings regarding recycling; providing for a long-term goal of reducing the amount of solid waste disposed of in the state by a certain percentage; requiring the Department of Environmental Protection to develop a comprehensive recycling program and submit such program to the Legislature by a specified date; requiring the Legislature's approval before implementing such program; requiring that such program be developed in coordination with other state and local entities, private businesses, and the public; requiring that the program contain certain components; creating s. 403.7033, F.S., requiring a departmental analysis of particular recyclable materials; requiring a submission of a report; amending s. 403.706, F.S., requiring every county to implement a composting plan to attain certain goals by a date certain; provides for goal modifications upon demonstrated need to the department; amending s. 489.145, F.S.; revising provisions of the Guaranteed Energy, Water, and Wastewater Performance Savings Contracting Act; requiring that each proposed contract or lease contain certain agreements concerning operational cost-saving measures; requiring the Office of the Chief Financial Officer to review contract proposals; redefining terms; requiring that certain baseline information, supporting information, and documentation be included in contracts; requiring the Office of the Chief Financial Officer to review contract proposals; providing audit requirements; requiring contract approval by the Chief Financial Officer; amending

CODING: Words ~~stricken~~ are deletions; words underlined are additions.

s. 526.06, F.S.; revising provisions for the sale of gasoline blended with ethanol; providing specifications for transitioning to ethanol-blended fuels; creating s. 526.201, F.S.; creating the "Florida Renewable Fuel Standard Act"; creating s. 526.202, F.S.; establishing legislative findings for the act; creating s. 526.203, F.S.; providing definitions, fuel standard, exemptions, and reporting; creating s. 526.204, F.S.; providing for waivers; providing for suspension of standard requirement during declared emergencies; creating s. 526.205, F.S.; providing for enforcement of the act; providing for extensions; creating s. 526.206, F.S.; providing for rulemaking authority by the Department of Revenue and the Department of Agriculture and Consumer Services; creating s. 526.207, F.S.; requiring studies and reports by the Florida Energy and Climate Commission; amending s. 553.73, F.S.; requiring that the Florida Building Commission select the most recent International Energy Conservation Code as a foundation code; providing for modification of the International Energy Conservation Code by the commission under certain circumstances; creating s. 553.9061, F.S.; requiring the Florida Building Commission to establish a schedule of increases in the energy performance of buildings subject to the Florida Energy Efficiency Code for Building Construction; providing energy-efficiency performance options and elements for achieving performance goals; requiring the commission to adopt rules and implement a cost-effectiveness

test; amending s. 553.909, F.S.; requiring the Florida Energy Efficiency Code for Building Construction to set minimum requirements for certain commercial or residential appliances; requiring the Agency for Enterprise Information Technology to define specified objective standards and conduct evaluations relating to energy efficiency; requiring the agency to submit a report; providing report requirements; requiring the agency to submit specified recommendations; providing for the inclusion of specifications in certain plans and processes; creating s. 1004.648, F.S.; establishing the Florida Energy Systems Consortium consisting of all the state universities; providing for membership and duties of the consortium; providing for a director, an oversight board, and a steering committee; requiring the consortium to submit an annual report; requiring an economic impact analysis on the effects of granting financial incentives to energy producers who use woody biomass as fuel; providing that certain vehicle emission standards are subject to ratification by the Legislature prior to implementation or modification by the Department of Environmental Protection; requiring the Department of Education and the Department of Environmental Protection to develop an awards or recognition program for outstanding efforts in conservation, energy and water use reduction, environmental enhancement, and conservation-related educational curriculum development; encouraging the departments to seek private sector funding for the program; repealing s. 377.901, F.S., relating to the Florida Energy Commission; requiring the Public Service Commission to provide a report to the Governor and the Legislature on utility revenue decoupling; providing effective dates.

CODING: Words ~~stricken~~ are deletions; words underlined are additions.

10. Permits required for the taking of marine mammals under the Marine Mammal Protection Act of 1972, as amended, 16 U.S.C. s. 1374.

Section 64. Subsection (20) of section 403.031, Florida Statutes, is amended to read:

403.031 Definitions.—In construing this chapter, or rules and regulations adopted pursuant hereto, the following words, phrases, or terms, unless the context otherwise indicates, have the following meanings:

(20) "Electrical power plant" means, for purposes of this part of this chapter, any electrical generating facility that uses any process or fuel and that is owned or operated by an electric utility, as defined in s. 403.503(14)~~(13)~~, and includes any associated facility that directly supports the operation of the electrical power plant.

Section 65. Section 403.44, Florida Statutes, is created to read:

403.44 Florida Climate Protection Act.—

(1) The Legislature finds it is in the best interest of the state to document, to the greatest extent practicable, greenhouse gas emissions and to pursue a market-based emissions abatement program, such as cap and trade, to address greenhouse gas emissions reductions.

(2) As used in this section, the term:

(a) "Allowance" means a credit issued by the department through allotments or auction which represents an authorization to emit specific amounts of greenhouse gases, as further defined in department rule.

(b) "Cap and trade" or "emissions trading" means an administrative approach used to control pollution by providing a limit on total allowable emissions, providing for allowances to emit pollutants, and providing for the transfer of the allowances among pollutant sources as a means of compliance with emission limits.

(c) "Greenhouse gas" or "GHG" means carbon dioxide, methane, nitrous oxide, and fluorinated gases such as hydrofluorocarbons, perfluorocarbons, and sulfur hexafluoride.

(d) "Leakage" means the offset of emission abatement that is achieved in one location subject to emission control regulation by increased emissions in unregulated locations.

(e) "Major emitter" means an electric utility regulated under this chapter.

(3) A major emitter shall be required to use The Climate Registry for purposes of emission registration and reporting.

(4) The department shall establish the methodologies, reporting periods, and reporting systems that shall be used when major emitters report to The Climate Registry. The department may require the use of quality-assured data from continuous emissions monitoring systems.

CODING: Words ~~stricken~~ are deletions; words underlined are additions.

(5) The department may adopt rules for a cap-and-trade regulatory program to reduce greenhouse gas emissions from major emitters. When developing the rules, the department shall consult with the Florida Energy and Climate Commission and the Florida Public Service Commission and may consult with the Governor's Action Team for Energy and Climate Change. The department shall not adopt rules until after January 1, 2010. The rules shall not become effective until ratified by the Legislature.

(6) The rules of the cap-and-trade regulatory program shall include, but are not limited to:

(a) A statewide limit or cap on the amount of greenhouse gases emitted by major emitters.

(b) Methods, requirements, and conditions for allocating the cap among major emitters.

(c) Methods, requirements, and conditions for emissions allowances and the process for issuing emissions allowances.

(d) The relationship between allowances and the specific amounts of greenhouse gas emissions they represent.

(e) The length of allowance periods and the time over which entities must account for emissions and surrender allowances equal to emissions.

(f) The timeline of allowances from the initiation of the program through to 2050.

(g) A process for the trade of allowances between major emitters, including a registry, tracking, or accounting system for such trades.

(h) Cost containment mechanisms to reduce price and cost risks associated with the electric generation market in this state. Cost containment mechanisms to be considered for inclusion in the rules include, but are not limited to:

1. Allowing major emitters to borrow allowances from future time periods to meet their greenhouse gas emission limits.

2. Allowing major emitters to bank greenhouse gas emission reductions in the current year to be used to meet emission limits in future years.

3. Allowing major emitters to purchase emissions offsets from other entities that produce verifiable reductions in unregulated greenhouse gas emissions or that produce verifiable reductions in greenhouse gas emissions through voluntary practices that capture and store greenhouse gases that otherwise would be released into the atmosphere. In considering this cost containment mechanism, the department shall identify sectors and activities outside of the capped sectors, including other state, federal, or international activities, and the conditions under which reductions there can be credited against emissions of capped entities in place of allowances issued by the department. The department shall also consider potential methods and their effectiveness to avoid double-incentivizing such activities.

CODING: Words ~~stricken~~ are deletions; words underlined are additions.

4. Providing a safety valve mechanism to ensure that the market prices for allowances or offsets do not surpass a predetermined level compatible with the affordability of electric utility rates and

the well-being of the state's economy. In considering this cost containment mechanism, the department shall evaluate different price levels for the safety valve and methods to change the price level over time to reflect changing state, federal, and international markets, regulatory environments, and technological advancements.

In considering cost containment mechanisms for inclusion in the rules, the department shall evaluate the anticipated overall effect of each mechanism on the abatement of greenhouse gas emissions and on electricity ratepayers and the benefits and costs of each to the state's economy, and shall also consider the interrelationships between the mechanisms under consideration.

□ (i) A process to allow the department to exercise its authority to discourage leakage of GHG emissions to neighboring states attributable to the implementation of this program.
□ (j) Provisions for a trial period on the trading of allowances before full implementation of a trading system.
□ (7) In recommending and evaluating proposed features of the cap-andtrade system, the following factors shall be considered:
□ (a) The overall cost-effectiveness of the cap-and-trade system in combination with other policies and measures in meeting statewide targets.
□ (b) Minimizing the administrative burden to the state of implementing, monitoring, and enforcing the program.
(c) Minimizing the administrative burden on entities covered under the cap.
(d) The impacts on electricity prices for consumers.
□ (e) The specific benefits to the state's economy for early adoption of a cap-and-trade system for greenhouse gases in the context of federal climate change legislation and the development of new international compacts.
□ (f) The specific benefits to the state's economy associated with the creation and sale of emissions offsets from economic sectors outside of the emissions cap.
□ (g) The potential effects on leakage if economic activity relocates out of the state.
□ (h) The effectiveness of the combination of measures in meeting identified targets.
□ (i) The implications for near-term periods of long-term targets specified in the overall policy.

CODING: Words ~~stricken~~ are deletions; words underlined are additions.

□ (j) The overall costs and benefits of a cap-and-trade system to the state economy.
□ (k) How to moderate impacts on low-income consumers that result from energy price increases.
□ (l) Consistency of the program with other state and possible federal efforts.
□ (m) The feasibility and cost-effectiveness of extending the program scope as broadly as possible among emitting activities and sinks in Florida.
□ (n) Evaluation of the conditions under which Florida should consider linking its trading system to the systems of other states or other countries and how that might be affected by the potential inclusion in the rule of a safety valve.
□ (8) Recognizing that the international, national, and neighboring state policies and the science of climate change will evolve, prior to submitting the proposed rules to the Legislature for consideration, the department shall submit the proposed rules to the Florida Energy and Climate Commission, which shall review the proposed rules and submit a report to the Governor, the President of the Senate, the Speaker of the House of Representatives, and the department. The report shall address:
□ (a) The overall cost-effectiveness of the proposed cap-and-trade system in combination with other policies and measures in meeting statewide targets.
□ (b) The administrative burden to the state of implementing, monitoring, and enforcing the program.

□ (c) The administrative burden on entities covered under the cap.
□ (d) The impacts on electricity prices for consumers.
□ (e) The specific benefits to the state's economy for early adoption of a cap-and-trade system for greenhouse gases in the context of federal climate change legislation and the development of new international compacts.
□ (f) The specific benefits to the state's economy associated with the creation and sale of emissions offsets from economic sectors outside of the emissions cap.
□ (g) The potential effects on leakage if economic activity relocates out of the state.
□ (h) The effectiveness of the combination of measures in meeting identified targets.
□ (i) The economic implications for near-term periods of short-term and long-term targets specified in the overall policy.
□ (j) The overall costs and benefits of a cap-and-trade system to the economy of the state.

CODING: Words ~~stricken~~ are deletions; words underlined are additions.

□ (k) The impacts on low-income consumers that result from energy price increases.
□ (l) The consistency of the program with other state and possible federal efforts.
□ (m) The evaluation of the conditions under which the state should consider linking its trading system to the systems of other states or other countries and how that might be affected by the potential inclusion in the rule of a safety valve.
□ (n) The timing and changes in the external environment, such as proposals by other states or implementation of a federal program that would spur reevaluation of the Florida program.
□ (o) The conditions and options for eliminating the Florida program if a federal program were to supplant it.
□ (p) The need for a regular reevaluation of the progress of other emitting regions of the country and of the world, and whether other regions are abating emissions in a commensurate manner.
□ (q) The desirability of and possibilities of broadening the scope of the state's cap-and-trade system at a later date to include more emitting activities as well as sinks in Florida, the conditions that would need to be met to do so, and how the program would encourage these conditions to be met, including developing monitoring and measuring techniques for land use emissions and sinks, regulating sources upstream, and other considerations.

Section 66. Section 403.502, Florida Statutes, is amended to read:

403.502 Legislative intent.—The Legislature finds that the present and predicted growth in electric power demands in this state requires the development of a procedure for the selection and utilization of sites for electrical generating facilities and the identification of a state position with respect to each proposed site and its associated facilities. The Legislature recognizes that the selection of sites and the routing of associated facilities, including transmission lines, will have a significant impact upon the welfare of the population, the location and growth of industry, and the use of the natural resources of the state. The Legislature finds that the efficiency of the permit application and review process at both the state and local level would be improved with the implementation of a process whereby a permit application would be centrally coordinated and all permit decisions could be reviewed on the basis of standards and recommendations of the deciding agencies. It is the policy of this state that, while recognizing the pressing need for increased power generation facilities, the state shall ensure through available and reasonable methods that the location and operation of electrical power plants will produce minimal adverse effects on human health, the environment, the ecology of the land and its wildlife, and the ecology of state waters and their aquatic life and will not unduly conflict with the goals established by the applicable local comprehensive plans. It is the intent to seek courses of action that will fully balance the increasing

Executive Summary

In the 2007 Environmental Cost Recovery Clause (ECRC) Docket (No. 070007-EI), the Public Service Commission approved Progress Energy Florida's (PEF's) updated Integrated Clean Air Compliance Plan (Plan D) as a reasonable and prudent means to comply with the requirements of the Clean Air Interstate Rule (CAIR), the Clean Air Mercury Rule (CAMR), the Clean Air Visibility Rule (CAVR) and related regulatory requirements. In its final order, the Commission also directed PEF to file as part of its ECRC true-up testimony "a yearly review of the efficacy of its Plan D and the cost-effectiveness of PEF's retrofit options for each generating unit in relation to expected changes in environmental regulations." This report provides the required review.

The primary components of PEF's Compliance Plan "D" are summarized as follows:

Sulfur Dioxide (SO_2):

- Installation of wet scrubbers (FGD) on Crystal River Units 4 and 5
- Fuel switching at Crystal River Units 1 and 2 to burn low sulfur coal
- Fuel switching at Anclote Units 1 and 2 to burn low sulfur oil
- Purchases of SO_2 allowances

Nitrogen Oxides (NOx):

- Installation of low NOx burners (LNBs) and selective catalytic reduction (SCR) on Crystal River Units 4 and 5
- Installation of LNBs and separated over-fire air (LNB/SOFA) or alternative NOx controls at Anclote Units 1 and 2
- Purchase of annual and ozone season NOx allowances

Mercury:

- Co-benefit of wet scrubbers and SCRs at Crystal River Units 4 and 5
- Installation of powdered activated carbon (PAC) injection on Crystal River Unit 2
- Purchase of mercury (Hg) allowances

As detailed in PEF's 2007 ECRC filing, PEF decided upon Plan D based on a quantitative and qualitative evaluation of the ability of alternative plans to meet environmental requirements, while managing risks and controlling costs. That evaluation demonstrated that Plan D is PEF's most cost-effective alternative to meet the applicable regulatory requirements.

The Plan is expected to meet environmental requirements by striking a balance between reducing emissions, primarily through the installation of controls on PEF's largest and newest coal units (Crystal River Units 4 and 5), and making strategic use of emission allowance markets.

In accordance with the Commission's final order in the 2007 ECRC docket, PEF has reviewed the efficacy of Plan D and the cost-effectiveness of retrofit options in relation to expected changes in environmental regulations. With regard to Plan D's efficacy, PEF remains confident that Plan D will have the desired effect of achieving timely compliance with the applicable regulations in a cost-effective manner. PEF has achieved significant project milestones, including execution of all major contracts and commencement of construction activities, including installation of steel support for the Crystal River Unit 4 and 5 control projects. Although there are uncertainties associated with all major construction projects of this type, the Crystal River projects currently are on-schedule to achieve compliance with the applicable regulations as contemplated in PEF's 2007 ECRC filings.

No new or revised environmental regulations have been adopted that have a direct bearing on PEF's compliance plan. Although discussion of potential regulation of carbon dioxide (CO_2) emissions continues, no legislation or regulations have been adopted to date. In any event, there currently are no demonstrated retrofit options to reduce CO_2 emissions from fossil fuel-fired electric generating units such as Crystal River Units 4 and 5, which are the primary focus of PEF's compliance plan. Likewise, replacement of coal-fired generation from Crystal River Units 4 and 5 with natural-gas fired generation is not a feasible or cost-effective option because it cannot be implemented in time to meet the 2009 and 2010 CAIR deadlines and it would put PEF in the vulnerable position of relying solely on SO_2 and NOx allowance purchases to achieve compliance during the five to six year interim period it would take to construct a new generating facility. Furthermore, replacing coal-fired generation with gas-fired generation would decrease PEF's fuel diversity and potentially increase fuel price volatility.

As a result of a recent federal appeals court decision vacating the federal CAMR regulations, the U.S. Environmental Protection Agency (EPA) may be required to adopt new standards for utility mercury emissions. This development does not immediately impact PEF's implementation of Plan D because the plan does not contemplate installation of mercury-specific controls until 2017. Thus, Plan D provides PEF flexibility to respond if and when EPA adopts any new mercury standards.

I. Introduction

In its final order in the 2007 Environmental Cost Recovery Clause (ECRC) Docket (No. 070007-EI), the Public Service Commission approved Progress Energy Florida's (PEF's) updated Integrated Clean Air Compliance Plan (Plan D) as a reasonable and prudent means to comply with the requirements of the Clean Air Interstate Rule (CAIR), the Clean Air Mercury Rule (CAMR), the Clean Air Visibility Rule (CAVR) and related regulatory requirements. *In re Environmental Cost Recovery Clause*, Order No. PSC-07-0922-FOF-EI, p. 8 (Nov. 16, 2007). The Commission specifically found that "PEF's updated Integrated Clean Air Compliance Plan represents the most cost-effective alternative for achieving and maintaining compliance with CAIR, CAMR, and CAVR, and related regulatory requirements, and it is reasonable and prudent for PEF to recover prudently incurred costs to implement the plan." *Id.* In its final order, the Commission also directed PEF to file as part of its ECRC true-up testimony "a yearly review of the efficacy of its Plan D and the cost-effectiveness of PEF's retrofit options for each generating unit in relation to expected changes in environmental regulations." *Id.* The purpose of this report is to provide the required review.

II. PEF's Integrated Clean Air Compliance Plan

A. Background

The CAIR, CAMR and CAVR programs require PEF and other utilities to significantly reduce emissions of sulfur dioxide (SO_2), nitrogen oxides (NOx) and mercury. Under CAIR and CAMR, these reductions must be met in incremental phases. Phase I begins in 2009 for NOx and in 2010 for both SO_2 and mercury. Phase II begins in 2015 for both NOx and SO_2 and in 2018 for mercury.

In March 2006, PEF submitted a report and supporting testimony presenting its integrated plan for complying with the new rules, as well as the process PEF utilized in evaluating alternative plans. The analysis included an examination of the projected emissions associated with several alternative plans and a comparison of economic impacts, in terms of cumulative present value of revenue requirements. PEF's Integrated Clean Air Compliance Plan, designated in the report as Plan D, was found to be the most cost-effective compliance plan for CAIR, CAMR, and CAVR from among five alternative plans.

In June 2007, PEF submitted an updated report and supporting testimony summarizing the status of the Plan and an updated economic analysis incorporating certain plan revisions necessitated by changed circumstances. Consistent with the approach utilized in 2006, PEF performed a quantitative evaluation to compare the ability of the modified alternative plans to meet environmental requirements, while managing risks and controlling costs. That evaluation demonstrated that Plan D, as revised, is PEF's most cost-effective alternative to meet the applicable regulatory requirements. Based on that analysis, the Commission approved PEF's Plan D as reasonable and prudent and held that PEF should recover the prudently incurred costs of implementing the plan.

B. PEF's Plan "D"

PEF's compliance plan (Plan D) meets the applicable environmental requirements by striking a good balance between reducing emissions, primarily through installation of controls on PEF's largest and newest coal units (Crystal River Units 4 and 5), and making use of the allowance markets to comply with CAIR and CAMR requirements. It also provides flexibility by making strategic use of allowance markets to account for a small portion of the reductions required by CAIR. Should it appear that allowance prices are going to be higher than currently projected, should PEF experience higher load growth than expected, or if plans for future baseload units change, PEF may then add controls on Crystal River Units 1 and 2, if necessary, possibly taking advantage of any technology improvements that may be made in the interim. The Plan also allows time for mercury control technologies to advance. Thus, the Integrated Clean Air Compliance Plan enables PEF to manage its risks. Specific components of the Plan are summarized below.

1. CAIR SO_2 Plan

The most significant component of PEF's Integrated Clean Air Compliance Plan is the installation of flue gas desulfurization (FGD) systems, also known as wet scrubbers, on Crystal River Units 4 and 5 to comply with CAIR's SO_2 requirements. PEF also plans to purchase limited SO_2 allowances. The plan also includes switching Crystal River Units 1 and 2 to burn low-sulfur (1.2 lbs SO_2/mmBtu) "compliance" coal, and burning low sulfur oil at Anclote Units 1 and 2. However, the final decision to switch fuels will be made closer to implementation time. The fuel to be burned by PEF at these units will be that which has the lowest overall cost when

the cost of allowances is factored into the overall cost along with other relevant fuel selection considerations.

2. CAIR NOx Plan

The primary component of PEF's NOx compliance plan is the installation of low NOx burners (LNBs) and selective catalytic reduction (SCR) systems on Crystal River Units 4 and 5. Currently, the Plan also includes installation of LNB/SOFA controls to reduce NOx emissions from the Anclote units. However, additional study of this option is required. These control options are among the lowest incremental cost options available, and provide most, but not all, of the NOx reductions required by CAIR. Alternative technology trials and studies for alternative NOx controls are being evaluated to more thoroughly quantify costs, effectiveness, benefits, and risks. Technologies being evaluated for studies and trials include, but are not limited to, Selective Non-Catalytic Reduction, fuel oil additives, and burner tip modifications. To achieve compliance with CAIR, PEF plans to take strategic advantage of CAIR's cap-and-trade feature by purchasing some annual and ozone season NOx allowances.

3. CAMR Mercury Plan

Installation of wet scrubbers and SCRs on Crystal River Units 4 and 5 will provide a co-benefit of reducing mercury emissions. PEF expects mercury emission reductions to be greater than required between 2010 and 2011 under the as-adopted CAMR program, and Plan D would rely on being able to bank the excess reductions for use in later years. Plan D contemplates use of CAMR's cap-and-trade feature after 2018. The Plan also includes installing powder-activated carbon (PAC) injection systems with additional polishing filters on Crystal River Unit 2 in 2017 to further reduce mercury emissions. The polishing filters would provide PEF the ability to continue selling the fly ash produced rather than disposing of the ash in a landfill, thereby avoiding additional landfill costs.

As discussed more fully below, a federal appeals court recently vacated the federal CAMR regulations. This development does not have any immediate, significant impact on PEF's implementation of Plan D because the plan does not contemplate installation of any mercury-specific controls until 2017. However, PEF will continue ongoing design of Continuous Mercury Monitors (CMMS) for Crystal River Units 1 and 2 because significant work has already been started and CMMS will likely be required in any rule the U.S. Environmental

Protection Agency (EPA) adopts in response to the federal court's vacation of CAMR.[1] PEF will continue to monitor the regulatory developments related to utility mercury emissions as well as research and development of mercury control technologies to ensure that the most reliable and cost-effective control technology is used when the time arrives for compliance.

4. CAVR Visibility Plan

PEF operates four units that are potentially subject to Best Available Retrofit Technology (BART) under CAVR, including Anclote Units 1 and 2 and Crystal River Units 1 and 2. As indicated above, PEF's Compliance Plan includes switching to low-sulfur oil and the installation of LNBs at Anclote Units 1 and 2, which will bring the Anclote units into compliance with CAIR. Per the Florida Department of Environmental Protection's (FDEP's) BART requirements, Rule 62-296.340, F.A.C., a BART determination is not required for SO_2 and NOx for any BART-eligible source that is subject to CAIR. Therefore, visibility impacts from particulate matter emissions are only evaluated for the BART determination. The results of the modeling for Crystal River Units 1 and 2 showed visibility impacts at or above regulatory threshold levels. For that reason, PEF currently is in discussions with the FDEP to determine whether and to what extent any additional controls may be required.

III. Efficacy of PEF's Plan D

As noted above, in its Final Order in Docket No. 070007- EI, the Commission requested a review of the efficacy of PEF's Integrated Clean Air Compliance Plan (Plan D) and the cost-effectiveness of PEF's retrofit options for each generating unit in relation to expected changes in environmental regulations. With regard to Plan D's efficacy, PEF remains confident that Plan D will have the desired effect of achieving timely compliance with the applicable regulations in a cost-effective manner. As noted below, however, there are uncertainties that could affect the timing and costs of implementation.

---

[1] In light of the significant pollution control projects being implemented for Crystal River Units 4 and 5, EPA granted PEF's petition for alternative mercury monitoring for those units; effectively extending the CMMS requirements for those units. As a result, PEF does not intend to go forward with design and testing of CMMS for Units 4 and 5 at this time. If, however, the rule survives as a result of any rehearing or appeal, PEF will have to perform testing this year on Units 4 and 5 to establish an emission rate to use next year for those units. Those tests will have to be repeated at least semi-annually and possibly quarterly until we install and certify the CMMS.

A. Project Milestones

PEF remains on schedule to complete installation of controls on Crystal River Units 4 and 5 as contemplated in PEF's 2007 ECRC filing. As discussed in last year's filing, PEF has executed contracts for specific project components, including contracts with:

- The Stebbins Engineering and Manufacturing Company to design, fabricate, construct, and assemble the two FGD Absorber Towers for the Crystal River Units 4 and 5 scrubber projects;

- CERAM Environmental, Inc., to design, fabricate, deliver, and test the SCR catalyst for the Crystal River Units 4 and 5 SCR projects;

- Commonwealth Dynamics, Inc., to design, fabricate and construct the Flue Gas Chimney for the Crystal River Units 4 and 5 scrubber projects; and

- Babcock & Wilcox to design and provide the major equipment for the Crystal River scrubber, LNB, and SCR projects.

Moreover, in October 2007, PEF entered into an over-arching engineering, procurement and construction (EPC) contract with Environmental Partners Crystal River (EPCR).[2] Since the Commission's final order in the 2007 ECRC docket, PEF has been working with EPCR to ensure that the Crystal River project remains on schedule to meet the in-service dates discussed in PEF's 2007 ECRC filings. The following table shows the upcoming major milestones for the Crystal River Clean Air project.

[2] All of the major Crystal River contracts were submitted for the Commissions review in the 2007 ECRC docket. *See* Hearing Exhibit Nos. 23 (TC-3) through 29 (TC-9) admitted into evidence at Hearing Transcript, p. 9 (Nov. 6, 2007).

B. Projects Costs

As of December 2007, PEF had incurred approximately $329 million in capital costs for the Crystal River projects. This figure includes approximately $301 million in contract billings, $21 million of owner's costs, and $7 million of AFUDC. The contract billings include payments for: major construction work, design and engineering work, procurement of major equipment, and environmental permits.

C. *Uncertainties*

While a significant amount of study, engineering, and analysis has been completed and construction has begun on the Crystal River projects, there are still a number of uncertainties that could affect project schedules and the costs. Although most of PEF's contracts contain provisions for liquidated damages for delays, the non-performance of contractors, force majeure events, and other uncertainties could adversely impact project schedules and costs. The primary risks identified on the PEF CAIR compliance projects are as follows:

- **Current and future craft labor availability**: The current market for craft labor is in short supply due to the high number of ongoing complex construction projects. The risk is that EPCR could potentially have difficulty staffing enough qualified onsite labor to complete the project according to schedule.

- **EPCR adherence to the outage schedules:** EPCR has finalized the schedule according to the planned outage dates. PEF personnel will monitor the schedule and identify any potential issues.

- **Modification to ESP crane arrangement:** The proposed crane arrangement by General Electric/Aker Kvaerner (GE/AK) interferes with plant equipment as well as EPCR's outage lifting plans for the SCR duct and steel. PEF is working with GE/AK and EPCR to modify the lifting plans in order to monitor adherence to the critical path.

- **Condition of Certification (COC) Modification delay:** A lengthy delay in the potable water design could create a delay in receiving the necessary modifications to the existing Conditions of Certification for Crystal River Units 4 and 5.

- **Coal pile liner and/or settling pond liner not approved:** The design of the coal pile liner and the percolation pond liner must be approved by FDEP. If the submitted design is not approved, then redesign would be necessary with construction schedule slippage.

Primary risks to date are discussed above; however, emergent risks could still occur. Project contingency has been developed to cover these project unknowns, and PEF project staff members are actively engaged to minimize or avoid any project schedule impacts.

IV. Retrofit Options in Relation to Expected Changes in Environmental Regulations

Since PEF's filing in the 2007 ECRC docket, no new or revised environmental regulations have been adopted that have a direct bearing on Plan D. Furthermore, at this time, it is not possible to predict the timing or requirements of any environmental regulations that may be adopted in the future. The following discussion addresses two potential regulatory developments that have been the topic of discussion since the Commission's final order in Docket No. 070007-EI.

A. Potential Greenhouse Gas Regulation

When PEF committed to placing environmental controls on Crystal River Units 4 and 5, climate change issues were only beginning to be discussed. At that time, PEF had to commit to installing controls in order to meet the fast approaching 2009 and 2010 CAIR compliance deadlines. Since PEF's 2007 CAIR filing, Governor Crist issued Executive Order 07-127 directing FDEP to promulgate regulations requiring reductions in utility carbon dioxide (CO_2) emissions. However, no such regulations have been adopted to date. FDEP currently is still in the early stages of developing a plan for implementing the Governor's CO_2 emission reduction goals. Numerous key issues, including the basic approach (i.e., cap-and-trade v. carbon tax or fee) remain unresolved. Until legislation is enacted or regulations are adopted at the state or federal level, the potential impact of CO_2 regulation will remain uncertain.

At this time, there are no retrofit options commercially available to reduce CO_2 emissions from fossil fuel-fired electric generating units such as Crystal River Units 4 and 5, which are the primary focus of PEF's compliance plan. Carbon capture and sequestration technology has never been utilized on an electric generating unit. Until numerous technological, regulatory and liability issues are resolved, it will be impossible to determine whether carbon capture and sequestration would be a feasible or cost-effective means of complying with a CO_2 regulatory regime, particularly when the requirements of the yet-to-be-adopted regulatory regime remain unknown.

Replacing coal-fired generation from Crystal River Units 4 and 5 with lower CO_2-emitting natural gas-fired combined cycle generation[3] would not be feasible or cost-effective in light of the imminent 2009 and 2010 CAIR deadlines. Due to construction and permitting lead times, sufficient combined-cycle generation could not be placed on-line until the 2014-2015 timeframe. Thus, if PEF were to abandon Plan D in favor of replacing Units 4 and 5 with gas-fired generation, PEF would have to rely solely on allowance markets to achieve and maintain CAIR compliance for five to six years until the combined cycle generation could be placed in service. Given the uncertainty of the CAIR allowance markets, PEF cannot reasonably assume sufficient allowances would be available at reasonable price if PEF were left in the extremely vulnerable position of relying solely on allowance purchases to achieve compliance. Furthermore, replacing Crystal River 4 and 5 with gas-fired generation would decrease PEF's fuel diversity and potentially increase fuel price volatility.

B. Recent Developments Related to CAMR

As noted above, the U.S. Court of Appeals for the District of Columbia (D.C.) Circuit recently issued an opinion vacating the federal CAMR regulations. *See, New Jersey v. U.S. Environmental Protection Agency*, ___ F. 3d ___, 2008 WL 341338 (D.C. Cir. Feb. 8, 2008). In 2005, EPA originally promulgated CAMR under Section 111 of the Clean Air Act (CAA), rather than CAA Section 112, which requires EPA to establish Maximum Achievable Control Technology (MACT) standards for hazardous air pollutants. EPA's decision to proceed under CAA Section 111 was based on its rescission of a prior 2000 finding that mercury emissions from electric utilities should be regulated under CAA Section 112. In its decision, the D.C. Circuit court vacated EPA's rescission of its 2000 finding, holding that the CAA required EPA, prior to making such a rescission, to determine that no utility-unit's mercury emissions exceeded a level that would "protect public health with an ample margin of safety and [have] no adverse environmental effect." Based on this threshold conclusion, the court then vacated CAMR because it was based on EPA's rescission.

[3] The CO_2 emission rate for natural gas-fired combined cycle (NG/CC) units is approximately 50% of the emission rate for coal-fired generating units. Thus, replacing coal-fired generation with NG/CC would not eliminate costs associated with any to-be-adopted CO_2 regulatory regime.

If the D.C. Circuit's opinion stands, EPA will be required to re-evaluate whether utility mercury emissions should be regulated under CAA Section 112 and, if so, to adopt new rules establishing MACT standards. EPA has not announced any rulemaking schedule in response to the D.C. Circuit's decision. Thus, it is impossible to predict when EPA will begin the regulatory process, much less the date any rulemaking will be finalized. In any event, because PEF's Plan D relies on the co-benefit of SCR/scrubbers rather than mercury-specific controls until 2017, the Plan provides flexibility to respond to any rules EPA may adopt in response to the D.C. Circuit's decision.

V. Conclusion

Based on project milestones achieved to date, PEF remains confident that Plan D will have the desired effect of achieving timely compliance with the applicable regulations in a cost-effective manner. No new or revised environmental regulations have been adopted that have a direct bearing on PEF's compliance plan. Although discussion of potential regulation of CO_2 emissions continues, no legislation or regulations have been adopted to date and there currently are no demonstrated retrofit options to reduce CO_2 emissions from fossil fuel-fired electric generating units. Furthermore, replacing coal-fired generation from Crystal River Units 4 and 5 with lower CO_2-emitting natural gas-fired combined cycle generation would not be feasible or cost-effective in light of the imminent 2009 and 2010 CAIR deadlines. Although EPA may be required to adopt new standards for utility mercury emissions as a result of a federal court decision vacating the federal CAMR rules, this development does not immediately impact PEF's implementation of Plan D because the plan does not contemplate installation of mercury-specific controls until 2017. For these reasons, PEF's Plan D continues to represent the most cost-effective alternative for achieving and maintaining compliance with the applicable regulatory requirements.

Notes:
(A) Credit in March due to impairment of portion of original work for tank at Turner plant that subsequently failed (Project 4.1a on Capital Program Detail file). The failed technology used was approved by the DEP at that time. The expense is recovered on Line 4 of 42-5E.
(B) Line 6 x 11.16% x 1/12. Based on ROE of 11.75%, weighted cost of equity component of capital structure of 6.55%, and statutory income tax rate of 38.575% (expansion factor of 1.628002). Based on 2005 rate case settlement in Dkt. 050078-EI.
(C) Depreciation calculated in Above Ground Tank Secondary Containment section of Capital Program Detail file only on assets placed inservice. Calculated on that schedule as Line 2 x rate x 1/12. Rate based on Exhibit 2 in the 2005 rate case settlement in Dkt. 050078-EI.
(D) Property tax calculated in Above Ground Tank Secondary Containment section of Capital Program Detail file only on assets placed inservice. Calculated on that schedule as Line 2 x rate x 1/12. Based on 2007 Effective Tax Rate on original cost.
(E) Line 9a x Line 10
(F) Line 9b x Line 11
(G) Credit in March due to portion of the previously recovered return on investment, including interest, related to the original work for tank at Turner plant that subsequently failed (Project 4.1a on Capital Program Detail file).

Notes:
(A) AFUDC calculation based on 2005 Rate Case Settlement in Dkt. 050078-EI.
(B) Return on equity and debt calculated only on assets placed in service which appear in CAIR Crystal River AFUDC section of Capital Program Detail file. Calculated on that schedule as Line 6 x rate x 1/12. Rate based on ROE of 11.75%, weighted cost of equity component of capital structure of 6.85%, and statutory income tax rate of 38.575% (expansion factor of 1.628002). Based on 2005 rate case settlement in Dkt. 050078-EI.
(C) Depreciation calculated only on assets placed inservice which appear in CAIR Crystal River AFUDC section of Capital Program Detail file. Calculated on that schedule as Line 2 x rate x 1/12. Rate based on Exhibit 2 in the 2005 rate case settlement in Dkt. 050078-EI.
(D) Property taxes calculated only on assets placed inservice which appear in CAIR Crystal River AFUDC section of Capital Program Detail file. Calculated on that schedule as Line 2 x rate x 1/12. Based on 2007 Effective Tax Rate on original cost.

(C) Line 2 x rate x 1/12. Depreciation rate based on 5 year life of project, as stated in Dkt. 060162-EI.
(D) Line 2 x rate x 1/12. Based on 2007 Effective Tax Rate on original cost.
(E) Line 9a x Line 10
(F) Line 9b x Line 11
(G) Beginning in July, this schedule only includes a credit for depreciation expense that is included in base rates for breakers that were replaced by upgraded breakers to compensate for increased load due to the Modular Cooling Towers. It was determined that only a credit for depreciation expense is required per Order No. PSC-99-2513-FOF-EI so the return and property tax credits for January to June 2008 were reversed in July.

Notes:
(A) AFUDC calculation based on 2005 Rate Case Settlement in Dkt. 050078-EI.
(B) Return on equity and debt calculated only on assets placed in service which appear in CAIR Crystal River AFUDC section of Capital Program Detail file. Calculated on that schedule as Line 6 x rate x 1/12. Rate based on ROE of 11.75%, weighted cost of equity component of capital structure of 6.85%, and statutory income tax rate of 38.575% (expansion factor of 1.628002). Based on 2005 rate case settlement in Dkt. 050078-EI.
(C) Depreciation calculated only on assets placed in-service which appear in CAIR Crystal River AFUDC section of Capital Program Detail file. Calculated on that schedule as Line 2 x rate x 1/12. Rate based on Exhibit 2 in the 2005 rate case settlement in Dkt. 050078-EI.
(D) Property taxes calculated only on assets placed in-service which appear in CAIR Crystal River AFUDC section of Capital Program Detail file. Calculated on that schedule as Line 2 x rate x 1/12. Based on 2007 Effective Tax Rate on original cost.

PROGRESS ENERGY FLORIDA
Environmental Cost Recovery Clause (ECRC)
JANUARY 2009 - DECEMBER 2009
Description and Progress Report for
Environmental Compliance Activities and Projects

Project Title: **Substation Environmental Investigation, Remediation, and Pollution Prevention**
Project No. 1

Project Description:
Chapter 376, Florida Statutes, requires that any person discharging a prohibited pollutant shall undertake to contain, remove, and abate the discharge to the satisfaction of the Florida Department of Environmental Protection. Similarly, Chapter 403, Florida Statutes provides that it is prohibited to cause pollution so as to harm or injure human health or welfare, animal, plant, or aquatic life or property. For Progress Energy Florida to continue to comply with these statutes, it is conducting environmental investigation, remediation, and pollution prevention activities associated with its substation facilities to determine the existence of pollutant discharges, and if present, their removal and remediation. Activities also include development and implementation of best management and pollution prevention measures at these facilities.

Project Accomplishments:
PEF has conducted environmental remediations at 40 substations during 2008. PEF is currently on target to meet the schedule for substation remediations agreed to with the FDEP for 2008.

Project Fiscal Expenditures:
January 1, 2008 to December 31, 2008: Project expenditures are estimated to be $2,736,930 higher than originally projected. This variance is primarily due to higher than expected remediation costs at several substation sites.

Project Progress Summary:
PEF is on schedule according to the approved Substation Inspection Plan and the Substation Assessment and Remedial Action Plan.

Project Projections:
Estimated project expenditures for the period January 2009 through December 2009 are expected to be $6,831,238.

PROGRESS ENERGY FLORIDA
Environmental Cost Recovery Clause (ECRC)
JANUARY 2009 - DECEMBER 2009
Description and Progress Report for
Environmental Compliance Activities and Projects

Project Title: **Distribution System Environmental Investigation, Remediation, and Pollution Prevention**
Project No. 2

Project Description:
Chapter 376, Florida Statutes, requires that any person discharging a prohibited pollutant shall undertake to contain, remove, and abate the discharge to the satisfaction of the Florida Department of Environmental Protection. Similarly, Chapter 403, Florida Statutes provides that it is prohibited to cause pollution so as to harm or injure human health or welfare, animal, plant, or aquatic life or property. For Progress Energy Florida to continue to comply with these statutes, it is conducting environmental investigation, remediation, and pollution prevention activities associated with its distribution system facilities to determine the existence of pollutant discharges, and if present, their removal and remediation. Activities also include development and implementation of best management and pollution prevention measures at these facilities.

Project Accomplishments:
Progress Energy conducted environmental inspections on 9,659 sites during 2008. In addition, Progress Energy is expecting to complete remediations on 1,136 distribution padmount transformer sites in 2008. All remediations have been conducted in accordance with the FDEP approved Environmental Remediation Strategy.

Project Fiscal Expenditures:
January 1, 2008 to December 31, 2008: Project expenditures are estimated to be $427,507 higher than originally projected. This variance is primarily due to a higher number of sites being remediated than originally anticipated in the 2008 work plan, including carryover from the 2007 work plan.

Project Progress Summary:
This project is on schedule according to the approved Distribution System Investigation, Remediation and Pollution Prevention Program.

Project Projections:
Estimated project expenditures for the period January 2009 through December 2009 are expected to be approximately $8 million. Progress Energy is expecting to complete remediations on approximately 900 sites.

PROGRESS ENERGY FLORIDA
Environmental Cost Recovery Clause (ECRC)
JANUARY 2009 - DECEMBER 2009
Description and Progress Report for
Environmental Compliance Activities and Projects

Project Title: **Pipeline Integrity Management, Review/Update Plan and Risk Assessments**
Project No. 3

Project Description:
The U.S. Department of Transportation ("USDOT") Regulation 49 CFR Part 195, as amended effective February 15, 2002 and the new regulation published at 67 Federal Register 2136 on January 16, 2002 requires PEF to implement a Pipeline Integrity Management Program. Prior to the February 15, 2002 amendments, the USDOT's pipeline integrity management regulations applied only to operators with 500 miles or more of hazardous liquid and carbon dioxide pipelines that could affect high consequence areas. The amendments which became effective on February 15, 2002 extended the requirements for implementing integrity management to operators who have less than 500 miles of regulated pipelines. As such, PEF must improve the integrity of pipeline systems in order to protect public safety and the environment, as well as comply with continual assessment and evaluation of pipeline systems integrity through inspection or testing, data integration and analysis, and follow up with remedial, preventative, and mitigative actions.

PEF owns one hazardous liquid pipeline that is subject to the new regulation and must comply with the new requirements for the Bartow/Anclote 14-inch hot oil pipeline, extending 33.3 miles from the Company's Bartow Plant north of St. Petersburg.

Project Accomplishments:
During 2008, PEF continued work on the PIM program. This effort included ongoing activities as required by the integrity management regulation as well as projects to address protection of valve mechanisms along U.S. Highway 19 and remote control of valves designed to isolate sections of the pipeline in the event of a leak.

Project Fiscal Expenditures:
January 1, 2008 to December 31, 2008: O&M project expenditures are estimated to be $146,057 higher than originally projected. This variance is due to an increase in the scope of work. An additional $332,707 in capital costs were incurred due to higher than expected costs for the installation of the Pipeline Controls upgrade project.

Project Progress Summary:
Review and updates to the integrity management plan and risk analyses continue on target. Compliance work will continue through the end of 2008, and into the future.

Project Projections:
Estimated project O&M expenditures for the period January 2009 through December 2009 are expected to be $1,101,000; estimated capital expenditure for the period are expected to be $60,000.

PROGRESS ENERGY FLORIDA
Environmental Cost Recovery Clause (ECRC)
JANUARY 2009 - DECEMBER 2009
Description and Progress Report for
Environmental Compliance Activities and Projects

Project Title: **Above Ground Storage Tank Secondary Containment**
Project No. 4

Project Description:
Florida Department of Environmental Protection Rule 62-761.510(3) states that the Company is required to make improvements to many of its above ground petroleum storage tanks in order to comply with those provisions. Subsection (d) of that rule requires all internally lined single bottom above ground storage tanks to be upgraded with secondary containment, including secondary containment for piping in contact with the soil. Rule 62-761.500(1)(e) also requires that dike field area containment for pre-1998 tanks be upgraded, if needed, to comply with the requirement.

Project Accomplishments:
Activities during 2007 included continued work on above ground storage tank systems at Debary, Turner 7, and Turner 8.

Project Fiscal Expenditures:
January 1, 2008 to December 31, 2008: O&M project expenditures are estimated to be $368,303 higher than original projection due to costs for additional work necessary to bring Turner Tank 8 into compliance with secondary containment requirement. Capital project expenditures will be approximately $1,809,738 higher than the original projection due to the upgrades of two tanks at the Turner combustion turbine facility.

Project Progress Summary:
PEF will continually evaluate its compliance program, including project prioritization, schedule, and technology applications.

Project Projections:
Estimated capital expenditures for the period January 2009 through December 2009 are expected to be approximately $1.3 million. The costs are associated with work at the Bartow and Higgins combustion turbine sites.

PROGRESS ENERGY FLORIDA
Environmental Cost Recovery Clause (ECRC)
JANUARY 2009 - DECEMBER 2009
Description and Progress Report for
Environmental Compliance Activities and Projects

Project Title: **SO_2 and NOXEmissions**
Project No. 5

Project Description:
In accordance with Title IV of the Clean Air Act, CFR 40 Part 73 and Part 76, and Florida Statute Regulation 62-214, PEF manages the company's SO2 and NOX emissions allowance inventory for the purpose of offsetting sulfur dioxide and nitrogen oxides emissions in compliance with the Federal Acid Rain Program.

Project Accomplishments:
For purposes of compliance with an affected unit's sulfur dioxide and nitrogen oxides emissions requirements under the Acid Rain Program, the air quality compliance costs are administered by an authorized account representative who evaluates a variety of resources and options. Activities performed include purchases of SO2 and NOX emissions allowances as well as auctions and transfers of SO2 emissions allowances.

Project Fiscal Expenditures:
January 1, 2008 to December 31, 2008: Project expenditures are estimated to be $1,649,557 lower than originally projected. This variance is primarily driven by a decrease in projected tons of emissions attributable to lower SO2 content in fuel, as well as lower projected energy requirements. There were no NOX allowance expenditures in 2008 as they will not take effect until 2009.

Project Progress Summary:
PEF continually evaluates its compliance strategy to manage the most cost effective program and to mitigate higher gas prices which can impact our fuel mix as it relates to emissions as a result of residual oil.

Project Projections:
Estimated SO2 and NOX project expenditures for the period January 2009 through December 2009 are expected to be $4,688,137 and $67,288,060, respectively.

PROGRESS ENERGY FLORIDA
Environmental Cost Recovery Clause (ECRC)
JANUARY 2009 - DECEMBER 2009
Description and Progress Report for
Environmental Compliance Activities and Projects

Project Title: **Phase II Cooling Water Intake**
Project No. 6

Project Description:
Section 316(b) of the Federal Clean Water Act, requires that "the location, design, construction, and capacity of cooling water intake structures reflect the best technology available for minimizing adverse environmental impact." 33 U.S.C. Section 1326. In the past, EPA and the state regulatory agency implemented Section 316(b) on a case-by-case basis. In the new Phase II rules, EPA has established "national performance standards" for determining compliance with Section 316(b) at certain existing electric generating facilities. See 40 CFR 125.94(b). The process of compliance involves planning and scheduling efforts, conducting certain biological studies, and evaluation of options for compliance. These compliance options involve engineering measures, operational measures, restorative measures and/or cost assessment measures. See generally 40 CFR 125.94 and 125.95.

Project Accomplishments:
PEF facilities subject to EPA's new Phase II rules include Anclote, Bartow, Crystal River and Suwannee plants. Early in 2004 PEF requested competitive bids for an environmental consultant to support the development of a Compliance Strategy and Implementation Plan (CSIP); that contract was secured and the CSIP is now complete. The consultant completed a Proposals for Information Collection (PICs) for Anclote and Bartow, Suwannee and Crystal River and they have been submitted to FDEP. FDEP approved all the PICs, and field work is now underway.

Project Fiscal Expenditures:
January 2008 - December 2008: PEF's projected expenditures will be approximately $38,128 less than the original projection for 2008. This variance is primarily attributable to lower than expected costs to complete reports summarizing the results of the completed biological studies. Work has been suspended on the project pending completion of additional rulemaking by the U.S. Environmental Protection Agency (EPA) in response to the Second U.S. Circuit Court of Appeals' vacatur of the Phase II cooling water intake rules.

Project Progress Summary:
The original baseline biological studies have been completed. Work has been suspended pending completion of additional rulemaking.

Project Projections:
Due to the vacatur, the estimated project O&M expenditures for the period January 2009 through December 2009 are projected to be $0.

PROGRESS ENERGY FLORIDA
Environmental Cost Recovery Clause (ECRC)
JANUARY 2009 - DECEMBER 2009
Description and Progress Report for
Environmental Compliance Activities and Projects

Project Title: **CAIR and CAMR**
Project No. 7

Project Description:
Clean Air Interstate Rule (CAIR), 40 CFR 24, 262, imposes significant new restrictions on emissions of sulfur dioxide ("SO2") and nitrogen oxides ("NOx") from power plants in 28 eastern states, including Florida and the District of Columbia. The CAIR rule apportions region-wide SO2 and NOx emission reduction requirements to the individual states, and further requires each affected state to revise its State Implementation Plans ("SIP") by September 2006 to include measures necessary to achieve its emission reduction budget within the prescribed deadlines. The Clean Air Mercury Rule (CAMR), 40 CFR Part 60 Subpart Da and 40 CFR Part 60 Subpart HHHH, employs a cap on total mercury emissions from coal-fired power plants in order to achieve significant emissions reductions. Mercury emissions from new and existing coal-fired utility units will be capped at specified nationwide levels.

Project Accomplishments:
Progress Energy expects to achieve several significant project milestones in 2009. In May 2009, we expect to place the Crystal River Unit 5 low NOx burners ("LNB") and selective catalytic ("SCR") system and the urea to ammonia hydrolyzer into service. Additionally, in November 2009, we expect to place the Unit 5 Flue Gas Desulfurization ("FGD" or "scrubber") system and chimney into service.

Project Fiscal Expenditures:
January 2008 - December 2008: PEF's expenditures for the Crystal River Projects in 2008 will be approximately $527 million, which is approximately $42 million less than projected in last year's docket. Of this difference, approximately $12 million is attributable to the fact that last year's projections were based on contract prices that were not finalized until PEF executed the Engineering Procurement and Construction (EPC) contract for the Project after the projects were submitted. The remaining variance is attributable to work on particulate controls for which PEF is no longer requesting ECRC recovery.

Project Progress Summary:
PEF will continue to regularly track project expenditures against the detailed project scopes to ensure that PEF receives what it contracted for and that any scope changes are properly evaluated and documented. We also will continue to conduct regularly scheduled meetings with the primary contractors and senior management to maintain supervision of the project, to ensure that management remains fully informed, and to ensure that management expectations are communicated to the outside vendors and the project team.

Project Projections:
Estimated project expenditures for the period January 2009 through December 2009 are expected to be approximately $215.9 million relating to the SCR and FGD systems at both Crystal River Units 4 and 5.

PROGRESS ENERGY FLORIDA
Environmental Cost Recovery Clause (ECRC)
JANUARY 2009 - DECEMBER 2009
Description and Progress Report for
Environmental Compliance Activities and Projects

Project Title: **Arsenic Groundwater Standard**
Project No. 8

Project Description:
On January 22, 2001, the U.S. Environmental Protection Agency (USEPA) adopted a new maximum contaminant level (MCL) for arsenic in drinking water, replacing the previous standard of 0.050 mg/L with a new MCL of 0.010 mg/L (10ppb). Effective January 1, 2005, FDEP established the USEPA MCL as Florida's drinking water standard. See Rule 62-550, F.A.C. The new standard has implications for land application and water reuse projects in Florida because the drinking water standard has been established as the groundwater standard by Rule 62-520.420(1), F.A.C. Lowering the arsenic standard will require new analytical methods for sampling groundwater at numerous PEF sites.

Project Accomplishments:
Sampling of existing monitoring wells continues as required by the groundwater monitoring plan. As results are gathered and submitted to FDEP, PEF will be able to determine future compliance activities and costs. The industrial wastewater permit, including the groundwater monitoring plan, was issued on January 9, 2007.

Project Fiscal Expenditures:
January 2008 - December 2008: O&M costs are expected to be $77,669 lower than originally forecasted as work continues with FDEP to establish an arsenic compliance plan and schedule.

Project Progress Summary:
PEF will continually evaluate analytical results and maintain ongoing communication with FDEP regarding compliance strategies.

Project Projections:
Estimated project expenditures for the period January 2009 through December 2009 are expected to be $77,669 for analytical testing and consultant costs associated with development of compliance strategies. These strategies will depend upon analytical results and discussions with FDEP.

PROGRESS ENERGY FLORIDA
Environmental Cost Recovery Clause (ECRC)
JANUARY 2009 - DECEMBER 2009
Description and Progress Report for
Environmental Compliance Activities and Projects

Project Title: **Sea Turtle - Coastal Street Lighting**
Project No. 9

Project Description:
PEF owns and leases high pressure sodium streetlights throughout its service territory, including areas along the Florida coast. Pursuant to Section 161.163, Florida Statutes, the Florida Department of Environmental Protection (FDEP), in collaboration with the Florida Fish and Wildlife Conservation Commission (FFWCC) and the U.S. Fish & Wildlife Service (USFWS), has developed a model Sea Turtle lighting ordinance. The model ordinance is used by the local governments to develop and implement local ordinances within their jurisdiction. To date, Sea Turtle lighting ordinances have been adopted in Franklin County, Gulf County and the City of Mexico Beach in Bay County, all of which are within PEF's service territory. Since 2004, officials from the various local governments, as well as FDEP, FFWC, and USFWS, have advised PEF that lighting it owns and leases is affecting turtle nesting areas that fall within the scope of these ordinances, As a result, the local governments are requiring PEF to take additional measures to satisfy new criteria being applied to ensure compliance with the ordinances.

Project Accomplishments:
PEF has worked with Franklin County to determine the most cost-effective compliance measures for affected lighting on St. George Island. Compliance measures that have been performed include retrofitting existing streetlights, monitoring them for effectiveness, and making modifications to the retrofitted lights where applicable. Project studies are ongoing with University of Florida and are expected to continue through 2010.

Project Fiscal Expenditures:
January 1, 2008 to December 31, 2008: Project revenue requirements are estimated to be $175,165 lower than originally projected due to lower costs of the joint study performed with the University of Florida.

Project Progress Summary:
PEF is on schedule with the activities identified for this program.

Project Projections:
Estimated project expenditures for the period January 2009 through December 2009 are expected to be $5,000 in O&M costs and $20,000 in capital expenditures to ensure ongoing compliance with sea turtle ordinances.

PROGRESS ENERGY FLORIDA
Environmental Cost Recovery Clause (ECRC)
JANUARY 2009 - DECEMBER 2009
Description and Progress Report for
Environmental Compliance Activities and Projects

Project Title: **Underground Storage Tanks**
Project No. 10

Project Description:
FDEP rules require that underground pollutant storage tanks and small diameter piping be upgraded with secondary containment by December 31, 2009. See Rule 62-761.510(5), F.A.C. PEF has identified four tanks that must comply with this rule: two at the Crystal River power plant and two at the Bartow power plant. The necessary work was performed in 2006.

Project Accomplishments:
Work on Crystal River and Bartow USTs was completed in the fourth quarter 2006.

Project Fiscal Expenditures:
$0 was projected to be spent in 2008.

Project Projections:
No project capital expenditures are anticipated for the period January 2009 through December 2009.

PROGRESS ENERGY FLORIDA
Environmental Cost Recovery Clause (ECRC)
JANUARY 2009 - DECEMBER 2009
Description and Progress Report for
Environmental Compliance Activities and Projects

Project Title: **Modular Cooling Towers**
Project No. 11

Project Description:
The project involves installation and operation of modular cooling towers in the summer months to minimize "de-rates" of PEF's Cyrstal River Units 1 and 2 necessary to comply with the NPDES permit limit for the temperature of cooling water discharged from the units.

Project Accomplishments:
Vendors of modular cooling towers were evaluated regarding cost of installation and operation. The Florida Department of Environmental Protection reviewed the project and approved operation. A vendor was selected and the towers were installed during the second quarter of 2006.

Project Fiscal Expenditures:
Project O&M costs of approximately $3.4 million per year are expected, including unit mobilization and setup, rental fees, de-mobilization and fill replacement.

Project Progress Summary:
Modular cooling towers began operation in June 2006 and have successfully minimized de-rates of Units 1 and 2.

Project Projections:
Estimated project expenditures are expected to be approximately $3.4 million for the period January 2009 thru December 2009.

PROGRESS ENERGY FLORIDA
Environmental Cost Recovery Clause (ECRC)
JANUARY 2009 - DECEMBER 2009
Description and Progress Report for
Environmental Compliance Activities and Projects

Project Title: **Crystal River Thermal Discharge Compliance Project**
Project No. 11.1

Project Description:
This project will evaluate and implement the best long term solution to maintain compliance with the thermal discharge limit in FDEP industrial wastewater permit for Crystal River 1 & 2 that is currently being addressed in the short term by the Modular Cooling Towers approved in Docket # 060162- EI for ECRC recovery.

Project Accomplishments:
The Study phase of the project is complete. The recommendation is to replace the modular cooling towers in coordination with the cooling solution for the CR3 EPU discharge canal cooling solution. The best way to accomplish the recommendation is being evaluated.

Project Fiscal Expenditures:
$0 was projected to be spent in 2008.

Project Progress Summary:
The conceptual design is complete. The final design contract offering is being prepared and is expected to be issued this year.

Project Projections:
Estimated project expenditures are expected to be approximately $11.9 million for the period January 2009 thru December 2009.

COMPANY TECO (Direct)
WITNESS Howard T. Bryant (HTB-3)
DATE 11-04-08

Tampa Electric Company
Environmental Cost Recovery Clause (ECRC)
Total Jurisdictional Amount to Be Recovered

For the Projected Period
January 2009 to December 2009

Line	Energy ($)	Demand ($)	Total ($)
1. Total Jurisdictional Revenue Requirements for the projected period			
a. Projected O&M Activities (Form 42-2P, Lines 7, 8 & 9)	$5,259,690	$334,116	$5,593,806
b. Projected Capital Projects (Form 42-3P, Lines 7, 8 & 9)	44,122,542	152,790	44,275,332
c. Total Jurisdictional Revenue Requirements for the projected period (Lines 1a + 1b)	49,382,232	486,906	49,869,138
2. True-up for Estimated Over/(Under) Recovery for the current period January 2008 to December 2008 (Form 42-2E, Line 5 + 6 + 10)	(7,776,704)	29,611	(7,747,093)
3. Final True-up for the period January 2007 to December 2007 (Form 42-1A, Line 3)	12,598,033	(132,380)	12,465,653
4. Total Jurisdictional Amount to Be Recovered/(Refunded) in the projection period January 2009 to December 2009 (Line 1 - Line 2- Line 3)	44,560,903	589,675	45,150,578
5. Total Projected Jurisdictional Amount Adjusted for Taxes (Line 4 x Revenue Tax Multiplier)	$44,592,987	$590,100	$45,183,087

Notes: Allocation to energy and demand in each period is in proportion to the respective period split of costs indicated on Lines 7 and 8 of Forms 42-5 and 42-7 of the actuals and estimates.

Environmental Compliance Activities and Projects

Project Title: Big Bend Unit 3 Flue Gas Desulfurization Integration

Project Description:

This project involved the integration of Big Bend Unit 3 flue gases into the Big Bend Unit 4 Flue Gas Desulfurization ("FGD") system. The integration was accomplished by installing interconnecting ductwork between Unit 3 precipitator outlet ducts and the Unit 4 FGD inlet duct. The Unit 4 FGD outlet duct was interconnected with the Unit 3 chimney via new ductwork and a new stack breaching. New ductwork, linings, isolation dampers, support steel, and stack annulus pressurization fans were procured and installed. Modifications to the materials handling systems and controls were also necessary.

Project Accomplishments:

Fiscal Expenditures: The actual/estimated depreciation plus return for the period January 2008 through December 2008, is $808,109 compared to the original projection of $808,109, representing no variance.

The actual/estimated O&M expense for the period January 2008 through December 2008 is $3,287,684 compared to the original projection of $3,688,900 representing a variance of 10.9%. This variance is due to a lower cost of consumables for gypsum production as well as a decrease in maintenance costs.

Progress Summary: The project is complete and in-service.

Projections: Estimated depreciation plus return for the period January 2009 through December 2009, is expected to be $786,042.

Estimated O&M costs for the period January 2009 through December 2009 are projected to be $3,658,000.

Project Title: Big Bend Units 1 & 2 Flue Gas Conditioning

Project Description:

The existing electrostatic precipitators were not designed for the range of fuels needed for compliance with the Clean Air Act Amendments ("CAAA"). Flue gas conditioning was required to assure operation of the generating units in accordance with applicable permits and regulations. This equipment is still required to ensure compliance with the CAAA in the event the FGD system on Units 1 & 2 is not operating.

The project involved the addition of molten sulfur unloading, storage and conveying to sulfur burners and catalytic converters where SO_2 is converted to SO_3. The control and injection system then injects this into the ductwork ahead of the electrostatic precipitators.

Project Accomplishments:

Fiscal Expenditures: The actual/estimated depreciation plus return for the period January 2008 through December 2008 is $459,431 compared to the original projection of $459,431 representing no variance.

The actual/estimated O&M expense for this project for the period January 2008 through December 2008 is $0 and did not vary from the original projection.

Progress Summary: The project is complete and in-service.

Projections: Estimated depreciation plus return for the period January 2009 through December 2009 is projected to be $440,693.

Estimated O&M costs for the period January 2009 through December 2009 are projected to be $0.

Project Title: Big Bend Unit 4 Continuous Emissions Monitors

Project Description:

Continuous emissions monitors (CEMs) were installed on the flue gas inlet and outlet of Big Bend Unit 4 to monitor compliance with the CAAA requirements. The monitors are capable of measuring, recording and electronically reporting SO_2, NO_x and volumetric gas flow out of the stack. The project consisted of monitors, a CEM building, the CEMs control and power cables to supply a complete system.

40 CFR Part 75 includes the general requirements for the installation, certification, operation and maintenance of CEMs and specific requirements for the monitoring of pollutants, opacity and volumetric flow. These regulations are very comprehensive and specific as to the requirements for CEMs, and in essence, they define the components needed and their configuration.

Project Accomplishment:

Fiscal Expenditures: The actual/estimated depreciation plus return for the period January 2008 through December 2008 is $82,704 compared to the original projection of $82,704 representing no variance.

Progress Summary: The project is complete and in-service.

Projections: Estimated depreciation plus return for the period January 2009 through December 2009 is projected to be $80,584.

Project Title: Big Bend Unit 1 Classifier Replacement

Project Description:

The boiler modifications at Big Bend Unit 1 are part of Tampa Electric's NO_X compliance strategy for Phase II of the CAAA. The classifier replacements will optimize coal fineness by providing a uniform particle size. This finer classification, combined with the equalized distribution of coal to outlet pipes and furnaces, will enable a uniform, staged combustion. As a result, firing systems will operate at lower NO_X levels.

Project Accomplishments:

Fiscal Expenditures: The actual/estimated depreciation plus return for the period January 2008 through December 2008 is $143,853 compared to the original projection of $143,853 representing no variance.

Progress Summary: The project was placed in-service December 1998.

Projections: Estimated depreciation plus return for the period January 2009 through December 2009 is projected to be $138,796.

Project Title: Big Bend Units 1 & 2 FGD

Project Description:

The Big Bend Units 1 & 2 FGD system consists of equipment capable of removing SO_2 from the flue gas generated by the combustion of coal. The FGD was installed in order to comply with Phase II of the CAAA. Compliance with Phase II is required by January 1, 2000. The CAAA impose SO_2 emission limits on existing steam electric units with an output capacity of greater than 25 megawatts and all new utility units. Tampa Electric conducted an exhaustive analysis of options to comply with Phase II of the CAAA that culminated in the selection of the FGD project to serve Big Bend Units 1 & 2.

In Docket No. 980693-EI, Order No. PSC-99-0075-FOF-EI, issued January 11, 1999, the Commission found that the FGD project was the most cost-effective alternative for compliance with the SO_2 requirements of Phase II of the CAAA.

Project Accomplishments:

Fiscal Expenditures: The actual/estimated depreciation plus return for the period January 2008 through December 2008 is $8,919,694 compared to the original projection of $8,915,093 representing an insignificant variance.

The actual/estimated O&M expense for the period January 2008 through December 2008 is $6,337,155 as compared to the original estimate of $7,243,000 resulting in a variance of 12.5%. This variance is primarily due to the re-allocation of 2008 maintenance activities with the scheduled outages for 2009.

Progress Summary: The project was placed in-service in December 1999.

Projections: Estimated depreciation plus return for the period January 2009 through December 2009 is expected to be $8,957,227.

Estimated O&M costs for the period January 2009 through December 2009 are projected to be $7,482,800.

Project Title: Big Bend Section 114 Mercury Testing Platform

Project Description:

The Mercury Emissions Information Collection Effort is mandated by the EPA. The EPA asserts that Section 114 of the CAAA grants to the EPA the authority to request the collection of information necessary for it to study whether it is appropriate and necessary to develop performance or emission standards for electric utility steam generating units.

In a letter dated November 25, 1998, Tampa Electric was notified by the EPA that, pursuant to Section 114 of the CAAA, the company was required to periodically sample and analyze coal shipments for mercury and chlorine content during the period January 1, 1999 through December 31, 1999.

In addition to coal sampling, stack testing and analyses are also required. Tampa Electric received a second letter from EPA, dated March 11, 1999, requiring Tampa Electric to perform specialized mercury testing of the inlet and outlet of the last emission control device installed for Big Bend Units 1, 2 or 3, and Polk Unit 1 as part of the mercury data collection. Part of the cost incurred to perform the stack testing is due to the need to construct special test facilities at the Big Bend stack testing location to meet EPA's testing requirements.

Project Accomplishments:

Fiscal Expenditures: The actual/estimated depreciation plus return for the period January 2008 through December 2008, is $13,858 compared to the original projection of $13,858 representing no variance.

Progress Summary: The project was placed in-service in December 1999 and was completed in May 2000.

Projections: Estimated depreciation plus return for the period January 2009 through December 2009 is expected to be $13,577.

Project Title: Big Bend FGD Optimization and Utilization

Project Description:

In order to meet the requirements of the FDEP Consent Final Judgment and the EPA Consent Decree, Tampa Electric was required to optimize the SO_2 removal efficiency and operations of the Big Bend Units 1, 2 and 3 FGD systems. Tampa Electric performed activities in three key areas to improve the performance and reliability of the Big Bend Units 1, 2 and 3 FGD systems. The majority of the improvements required on the Unit 3 tower module included the tower piping, nozzle and internal improvements, ductwork improvements, electrical system reliability improvements, tower control improvements, dibasic acid system improvements, booster fan reliability, absorber system improvements, quencher system improvements, and tower demister improvements. Big Bend Units 1 and 2 FGD system improvements included additional preventative maintenance, oxidation air control improvements, and tower water, air reagent and start-up piping upgrades. In order to ensure reliability of the FGD systems, improvements to the common limestone supply, gypsum de-watering stack reliability and wastewater treatment plant were also being performed.

Project Accomplishments:

Fiscal Expenditures: The actual/estimated depreciation plus return for the period January 2008 through December 2008 is $2,590,639 compared to the original projection of $2,590,639 representing no variance.

Progress Summary: The project was placed in-service in January 2002.

Projections: Estimated depreciation plus return for the period January 2009 through December 2009 is expected to be $2,532,454.

Project Title: Big Bend PM Minimization and Monitoring

Project Description:

In order to meet the requirements of the FDEP Consent Final Judgment and the EPA Consent Decree, Tampa Electric is required to develop a Best Operational Practices ("BOP") study to minimize emissions from each electrostatic precipitator ("ESP") at Big Bend, as well as perform a best available control technology ("BACT") analysis for the upgrade of each existing ESP. The company is also required to install and operate particulate matter continuous emission monitors on Big Bend Units 1, 2 and 3 FGD systems. Tampa Electric has identified improvements that are necessary to optimize ESP performance such as modifications to the turning vanes and precipitator distribution plates, and upgrades to the controls and software system of the precipitators. Tampa Electric has incurred costs associated with the recommendations of the BOP study and the BACT analysis in 2001 and will continue to experience O&M and capital expenditures during 2002 and beyond.

Project Accomplishments:

Fiscal Expenditures: The actual/estimated depreciation plus return for the period January 2008 through December 2008 is $1,084,033 as compared to the original projection of $1,127,247 resulting in an insignificant variance.

The actual/estimated O&M expense the period January 2008 through December 2008 is $438,402 as compared to the original projection of $450,000 resulting in a variance of 2.6%. This variance is due to the decrease in inspection work during the Unit 3 outage as well as the overall improved precipitator performance.

Progress Summary: This project was placed in-service July 2005.

Projections: Estimated depreciation plus return for the period January 2009 through December 2009 is expected to be $1,124,629.

Estimated O&M costs for the period January 2009 through December 2009 are projected to be $455,000.

Project Title: Big Bend NO_x Emissions Reduction

Project Description:

In order to meet the requirements of the FDEP Consent Final Judgment and the EPA Consent Decree, Tampa Electric is required to spend up to $3 million with the goal to reduce NO_x emissions at Big Bend Station. The Consent Decree requires that by December 31, 2002, the company must achieve at least a 30 percent reduction beyond 1998 levels for Big Bend Units 1 and 2 and at least a 15 percent reduction in NO_x emissions from Big Bend Unit 3. Tampa Electric has identified projects that are the first steps to decrease NO_x emissions in these units such as burner and windbox modifications and the installation of a neural network system on each of the Big Bend units.

Project Accomplishments:

Fiscal Expenditures: The actual/estimated depreciation plus return for the period January 2008 through December 2008 is $798,805 as compared to the original projection of $872,714 resulting in an insignificant variance.

The actual/estimated O&M expense the period January 2008 through December 2008 is $512,435 as compared to the original projection of $350,000 resulting in a variance of 46.4%. This variance is due to unanticipated inspections on boiler tubes and burner modifications.

Progress Summary: The project was placed in-service January 2008.

Projections: Estimated depreciation plus return for the period January 2009 through December 2009 is expected to be $793,965.

Estimated O&M costs for the period January 2009 through December 2009 are projected to be $358,000.

Project Title: Big Bend Fuel Oil Tank No. 1 Upgrade

Project Description:

The Big Bend Fuel Oil Tank No. 1 Upgrade is a 500,000 gallon field-erected fuel storage tank that is required to meet the requirements of FDEP Rule 62-762 as an existing field-erected above ground storage tank containing a regulated pollutant (diesel fuel). The rule required various modifications and a complete internal inspection by the end of 1999.

The scope of work for this project included cleaning and inspecting the tank in accordance with API 653 specifications, coating the internal floor plus 30 inches up the tank wall, installing an AEI Segundo bottom to the tank as well as installing a leak detection system, installing a spill containment for piping fittings and valves surrounding the tank, installing a new truck unloading facility and spill containment for the truck unloading facility, installing level instrumentation for overfill protection, installing secondary containment for below ground piping or reroute to above ground, and conducting a tank closure assessment.

Project Accomplishments:

Fiscal Expenditures: The actual/estimated depreciation plus return for the period January 2008 through December 2008 is $56,068 compared to the original projection of $56,068 representing no variance.

Progress Summary: The project was placed in-service October 1998.

Projections: Estimated depreciation plus return for the period January 2009 through December 2009 is projected to be $54,560.

Project Title: SO_2 Emission Allowances

Project Description:

The acid rain control title of the CAAA sets forth a comprehensive regulatory mechanism designed to control acid rain by limiting sulfur dioxide emissions by electric utilities. The CAAA requires reductions in SO_2 emissions in two phases. Phase I began on January 1, 1995 and applies to 110 mostly coal-fired utility plants containing about 260 generating units. These plants are owned by some 40 jurisdictional utility systems that are expected to reduce annual SO_2 emissions by as much as 4.5 million tons. Phase II began on January 1, 2000, and applies to virtually all existing steam-electric generating utility units with capacity exceeding 25 megawatts and to new generating utility units of any size. The EPA issues to the owners of generating units allowances (defined as an authorization to emit, during or after a specified calendar year, one ton of SO_2) equal to the number of tons of SO_2 emissions authorized by the CAAA. EPA does not assess a charge for the allowances it awards.

Project Accomplishments:

Fiscal Expenditures: The actual/estimated return on average net working capital for the period January 2008 through December 2008 is ($5,743) compared to the original projection of ($9,165) representing a 37.3% variance. The variance is due to the sale of SO_2 allowances originally projected to occur in 2008 but transpired throughout 2007.

The actual/estimated O&M for the period January 2008 through December 2008 is ($18,765,601) compared to the original projection of ($29,413,430) representing a variance of 36.2%. The significant variance is due to the sale of SO_2 allowances originally projected to occur in 2008 that actually transpired in 2007.

Progress Summary: SO_2 emission allowances are being used by Tampa Electric to meet compliance standards for Phase I of the CAAA.

Project Projections: Estimated return on average net working capital for the period January 2009 through December 2009 is projected to be ($1,669).

Estimated O&M costs for the period January 2009 through December 2009 are projected to be ($12,123,542).

Project Title: National Pollutant Discharge Elimination System ("NPDES") Annual Surveillance Fees

Project Description:

Chapter 62-4.052, Florida Administrative Code ("F. A. C."), implements the annual regulatory program and surveillance fees for wastewater permits. These fees are in addition to the application fees described in Rule 62-4.050, F. A. C. Tampa Electric's Big Bend, Hookers Point, Polk Power and Gannon Stations are affected by this rule.

Project Accomplishments:

Fiscal Expenditures: The actual/estimated O&M expense for the period January 2008 through December 2008 is $34,500 compared to the original projection of $34,500 representing no variance.

Progress Summary: NPDES Surveillance fees are paid annually for the prior year.

Projections: Estimated O&M costs for the period January 2009 through December 2009 are projected to be $34,500.

Project Title: Gannon Thermal Discharge Study

Project Description:

This project is a direct requirement from the FDEP in conjunction with the renewal of Tampa Electric's Industrial Wastewater Facility Permit under the provisions of Chapter 403, Florida Statutes, and applicable rules of the Florida Administrative Code, which constitute authorization for the company's Gannon Station facility to discharge to waters of the State under the NPDES. The FDEP permit is Permit No. FL0000809. Specifically, Tampa Electric is required to perform a 316(a) determination for Gannon Station to ensure the protection and propagation of a balanced, indigenous population of shellfish, fish and wildlife with in the primary area of study. The project will have two facets: 1) develop the plan of study and identify the thermal plume, and 2) implement the plan of study through appropriate sampling to make the determination if any adverse impacts are occurring.

Project Accomplishments:

Fiscal Expenditures: The actual/estimated O&M expense for the period January 2008 through December 2008 is $76,005 compared to the original projection of $50,000, which represents a variance of 52.0%. The variance is due to the need for additional data collection than what was originally planned.

Progress Summary: This project was approved by the Commission in Docket No. 010593-EI on September 4, 2001. The project is expected to continue through at least 2009.

Projections: Estimated O&M costs for the period January 2009 through December 2009 are projected to be $50,000.

Project Title: Polk NO_x Emissions Reduction

Project Description:

This project is designed to meet a lower NO_x emissions limit established by the FDEP for Polk Unit 1 by July 1, 2005. The lower limit of 15 parts per million by volume dry basis at 15 percent O_2 is specified in FDEP Permit No. PSD-FL-194F issued February 5, 2002. The project will consist of two phases: 1) the humidification of syngas through the installation of a syngas saturator; and 2) the modification of controls and the installation of additional guide vanes to the diluent nitrogen compressor.

Project Accomplishments:

Fiscal Expenditures: The actual/estimated depreciation plus return for the period January 2008 through December 2008 is $207,879 as compared to the original projection of $207,879 representing no variance.

The actual/estimated O&M for the period January 2008 through December 2008 is $46,667 compared to the original projection of $65,000, which represents a variance of 28.2 %. The variance is due to a unit outage during the second quarter of 2008.

Progress Summary: The project was placed in-service January 2005.

Project Projections: Estimated depreciation plus return for the period January 2009 through December 2009 is projected to be $201,701.

Estimated O&M costs for the period January 2009 through December 2009 are projected to be $75,000.

Project Title: Bayside SCR Consumables

Project Description:

This project is necessary to achieve the NO_x emissions limit of 3.5 parts per million established by the FDEP Consent Final Judgment and the EPA Consent Decree for the natural gas-fired Bayside Power Station. To achieve this NO_x limit, the installation of selective catalytic reduction (SCR) systems is required. An SCR system requires consumable goods – primarily anhydrous ammonia – to be injected into the catalyst bed in order to achieve the required NO_x emissions limit. Principally, the project is designed to capture the cost of consumable goods necessary to operate the SCR systems.

Project Accomplishments:

Fiscal Expenditures: The actual/estimated O&M expense for the period January 2008 through December 2008 is $108,068 compared to the original projection of $70,000 resulting in a variance of 54.4%. The variance is due to the increase in price and consumption of ammonia.

Progress Summary: This project was approved by the Commission in Docket No. 021255-EI, Order No. PSC-03-0469-PAA-EI, issued April 4, 2003. As an O&M project, expenses are ongoing annually.

Projections: Estimated O&M costs for the period January 2009 through December 2009 are projected to be $82,000.

Project Title: Big Bend Unit 4 Separated Overfire Air ("SOFA")

Project Description:

This project is necessary to assist in achieving the NO_x emissions limit established by the FDEP Consent Final Judgment and the EPA Consent Decree for Big Bend Unit 4. A SOFA system stages secondary combustion air to prevent NO_x formation that would otherwise require removal by post-combustion technology. In-furnace combustion control through a SOFA system is the most cost-effective means to reduce NO_x emissions prior to the application of these technologies. Costs associated with the SOFA system will entail capital expenditures for equipment installation and subsequent annual maintenance.

Project Accomplishments:

Fiscal Expenditures: The actual/estimated depreciation plus return for the period January 2008 through December 2008 is $332,096 compared to the original projection of $332,096 representing no variance.

The actual/estimated O&M for the period January 2008 through December 2008 is $32,976 compared to the original projection of $50,000, which represents a variance of 34.0%. This variance is due to less maintenance activity than anticipated.

Progress Summary: The project was placed in-service November 2004.

Projections: Estimated depreciation plus return for the period January 2009 through December 2009 is projected to be $324,949.

Estimated O&M costs for the period January 2009 through December 2009 are projected to be $50,000.

Project Title: Big Bend Unit 1 Pre-SCR

Project Description:

In order to meet the requirements of the FDEP Consent Final Judgment and the EPA Consent Decree, Tampa Electric is required to make additional reductions of NO_x emissions at Big Bend Station on a per unit basis at prescribed times from 2009 through 2010. Based on a comprehensive study, Tampa Electric has declared the future fuel for Big Bend Station to be coal which will necessitate the installation of cost-effective SCR technology on the generating units to meet NO_x emissions requirements. Therefore, this project is a necessary precursor to an SCR system designed to reduce inlet NO_x concentrations to the SCR system thereby mitigating overall capital and O&M costs. The Big Bend Unit 1 Pre-SCR technologies include a neural network system, secondary air controls and windbox modifications.

Project Accomplishments:

Fiscal Expenditures: The actual/estimated depreciation plus return for the period January 2008 through December 2008 is $280,044 compared to the original projection of $279,624 resulting in an insignificant variance.

The actual/estimated O&M for the period January 2008 through December 2008 is $30,000 compared to the original projection of $75,000, which represents a variance of 60.0%. This variance is due to the delay of the in-service date for the capital project.

Progress Summary: This project was approved by the Commission in Docket No. 040750-EI, Order No. PSC-04-1080-CO-EI, issued November 4, 2004.

Projections: Estimated depreciation plus return for the period January 2009 through December 2009 is projected to be $279,459.

Estimated O&M costs for the period January 2009 through December 2009 are projected to be $77,000.

Project Title: Big Bend Unit 3 Pre-SCR

Project Description:

In order to meet the requirements of the FDEP Consent Final Judgment and the EPA Consent Decree, Tampa Electric is required to make additional reductions of NO_x emissions at Big Bend Station on a per unit basis at prescribed times from 2009 through 2010. Based on a comprehensive study, Tampa Electric has declared the future fuel for Big Bend Station to be coal, which will necessitate the installation of cost-effective SCR technology on the generating units to meet NO_x emissions requirements. Therefore, this project is a necessary precursor to an SCR system designed to reduce inlet NO_x concentrations to the SCR system thereby mitigating overall capital and O&M costs. The Big Bend Unit 3 Pre-SCR technologies include a neutral network system, secondary air controls, windbox modifications and primary coal/air flow controls.

Project Accomplishments:

Fiscal Expenditures: The actual/estimated depreciation plus return for the period January 2008 through December 2008 is $356,032 compared to the original projection of $437,512 resulting in a variance of 18.6%. This variance is due to the deferment of activities and associated costs to 2009 after the completion of the outage scheduled for the end of 2008.

The actual/estimated O&M for the period January 2008 through December 2008 is $2 compared to the original projection of $0 resulting in an insignificant variance.

Progress Summary: This project was approved by the Commission in Docket No. 040750-EI, Order No. PSC-04-1080-CO-EI, issued November 4, 2004.

Projections: Estimated depreciation plus return for the period January 2009 through December 2009 is projected to be $370,508.

Estimated O&M costs for the period January 2009 through December 2009 are projected to be $0.

Project Title: Clean Water Act Section 316(b) Phase II Study

Project Description:

This project is a direct requirement from the EPA to reduce impingement and entrainment of aquatic organisms related to the withdrawal of waters for cooling purposes through cooling water intake structures. The Phase II Rule requires that power plants meeting certain criteria to comply with national performance standards for impingement and entrainment. Accordingly, Tampa Electric must develop its compliance strategies for its H. L. Culbreath Bayside Power and the Big Bend Power Stations and then submit these strategies for approval through a Comprehensive Demonstration Study to the FDEP.

Project Accomplishments:

Fiscal Expenditures: The actual/estimated O&M for the period January 2008 through December 2008 is $124,395 compared to the original projection of $150,000, which represents a variance of 17.1%. This variance is due to the decrease in contractor costs to complete the impingement study reports.

Progress Summary: This project was approved by the Commission in Docket No. 041300-EI, Order No. PSC-05-0164-PAA-EI, issued February 10, 2005.

Projections: Estimated O&M costs for the period January 2009 through December 2009 are projected to be $150,000.

Project Title: Big Bend Unit 1 SCR

Project Description:

In order to meet the requirements of the FDEP Consent Final Judgment and the EPA Consent Decree, Tampa Electric is required to make additional reductions of NO_x emissions at Big Bend Station on a per unit basis at prescribed times from 2009 through 2010. Based on a comprehensive study, Tampa Electric has declared the future fuel for Big Bend Station to be coal, which will necessitate the installation of cost-effective SCR technology on the generating units to meet NO_x emissions requirements. This project is associated with the installation of an SCR system on Big Bend Unit 1 and is scheduled to go in-service May 2010.

Project Accomplishments:

Fiscal Expenditures: Based on the Commission's previous ruling in Docket No. 980693-EI, Tampa Electric will not seek ECRC recovery of capital costs for this project until May 2010, the expected in-service date for the project. At that time, the associated depreciation expense and allowance for funds used during construction will be requested for ECRC recovery.

Progress Summary: This project was approved by the Commission in Docket No. 041376-EI, Order No. PSC-05-0616-CO-EI, issued June 3, 2005.

Projections: Estimated depreciation plus return for the period January 2009 through December 2009 is projected to be $0.

Estimated O&M costs for the period January 2009 through December 2009 are projected to be $0.

Project Title: Big Bend Unit 2 SCR

Project Description:

In order to meet the requirements of the FDEP Consent Final Judgment and the EPA Consent Decree, Tampa Electric is required to make additional reductions of NO_x emissions at Big Bend Station on a per unit basis at prescribed times from 2009 through 2010. Based on a comprehensive study, Tampa Electric has declared the future fuel for Big Bend Station to be coal, which will necessitate the installation of cost-effective SCR technology on the generating units to meet NO_x emissions requirements. This project is associated with the installation of an SCR system on Big Bend Unit 2 and is scheduled to go in-service April 2009.

Project Accomplishments:

Fiscal Expenditures: Based on the Commission's previous ruling in Docket No. 980693-EI, Tampa Electric will not seek ECRC recovery of capital costs for this project until April 2009, the expected in-service date for the project. At that time, the associated depreciation expense and allowance for funds used during construction will be requested for ECRC recovery.

Progress Summary: This project was approved by the Commission in Docket No. 041376-EI, Order No. PSC-05-0616-CO-EI, issued June 3, 2005.

Projections: Estimated depreciation plus return for the period January 2009 through December 2009 is projected to be $8,589,946.

Estimated O&M costs for the period January 2009 through December 2009 are projected to be $1,807,700.

Project Title: Big Bend Unit 3 SCR

Project Description:

In order to meet the requirements of the FDEP Consent Final Judgment and the EPA Consent Decree, Tampa Electric is required to make additional reductions of NO_x emissions at Big Bend Station on a per unit basis at prescribed times from 2009 through 2010. Based on a comprehensive study, Tampa Electric has declared the future fuel for Big Bend Station to be coal which will necessitate the installation of cost-effective SCR technology on the generating units to meet NO_x emissions requirements. This project is associated with the installation of an SCR system on Big Bend Unit 3 and is scheduled to go in-service May 2009.

Project Accomplishments:

Fiscal Expenditures: The actual/estimated depreciation plus return for the period January 2008 through December 2008 is $5,432,066 compared to the original projection of $8,778,536, which represents variance of 38.1%. This variance is due to turbine rotor repair that caused the delay in commercial operation.

The actual/estimated O&M for the period January 2008 through December 2008 is $1,200,000 compared to the original projection of $1,606,900 representing a variance of 25.3%. The variance is due to the delay in commercial operation.

Progress Summary: This project was approved by the Commission in Docket No. 041376-EI, Order No. PSC-05-0616-CO-EI, issued June 3, 2005.

Projections: Estimated depreciation plus return for the period January 2009 through December 2009 is projected to be $11,134,898.

Estimated O&M costs for the period January 2009 through December 2009 are projected to be $2,204,900.

Project Title: Big Bend Unit 4 SCR

Project Description:

In order to meet the requirements of the FDEP Consent Final Judgment and the EPA Consent Decree, Tampa Electric is required to make additional reductions of NO_x emissions at Big Bend Station on a per unit basis at prescribed times from 2009 through 2010. Based on a comprehensive study, Tampa Electric has declared the future fuel for Big Bend Station to be coal which will necessitate the installation of cost-effective SCR technology on the generating units to meet NO_x emissions requirements. This project is associated with the installation of an SCR system on Big Bend Unit 4 and is scheduled to go in-service June 2009.

Project Accomplishments:

Fiscal Expenditures: The actual/estimated depreciation plus return for the period January 2008 through December 2008 is $8,408,013 compared to the original projection of $6,125,701, which represents variance 0f 37.1%. This variance is due to an inadvertent error found in the formula for the amount of average return on investment for the months of January through May 2008 of the 2008 Projection filing.

The actual/estimated O&M for the period January 2008 through December 2008 is $1,331,036 compared to the original projection of $1,610,000 representing a variance of 17.3%. The variance is due to the decreased usage of ammonia.

Progress Summary: This project went in to service in May 2008.

Projections: Estimated depreciation plus return for the period January 2009 through December 2009 is projected to be $8,232,074.

Estimated O&M costs for the period January 2009 through December 2009 are projected to be $1,252,800.

Project Title: Arsenic Groundwater Standard Program

Project Description:
The Arsenic Groundwater Standard Program that is required by the Environmental Protection Agency and the Department of Environmental Protection became effective January 1, 2005. It requires regulated entities of the State of Florida to monitor the drinking water and groundwater Maximum Contaminant Level ("MCL") for arsenic under the federal rule known as the Safe Drinking Water Act.

Project Accomplishments:

Fiscal Expenditures: The actual/estimated O&M for the period January 2008 through December 2008 is $98,651 compared to the original projection of $57,000, which represents a variance of 73.1%. The FDEP requested to extend the data collection period, therefore requiring additional testing.

Progress Summary: In Docket No. 050683-EI, Order No. PSC-06-0138-PAA-EI, issued February 23, 2008, the Commission granted Tampa Electric cost recovery approval for prudent costs associated with this project.

Projections: Estimated O&M costs for the period January 2009 through December 2009 are projected to be $114,000.

Project Title: Big Bend Flue Gas Desulfurization ("FGD") System Reliability

Project Description:
The Big Bend FGD Reliability project is necessary to maintain the FGD system operations that are required by the Consent Decree. Tampa Electric is required to operate the FGD systems at Big Bend Station whenever coal is combusted in the units with few exceptions. The compliance dates for the strictest operational characteristics are January 1, 2010 for Big Bend Unit 3 and January 1, 2013 for Big Bend Units 1 and 2.

Project Accomplishments:

Fiscal Expenditures: The actual/estimated depreciation plus return for the period January 2008 through December 2008 is $1,532,141 compared to the original projection of $1,549,199, resulting in an insignificant variance.

Progress Summary: In Docket No. 050598-EI, Order No. PSC-06-0602-PAA-EI, issued July 10, 2008, the Commission granted cost recovery approval for prudent costs associated with this project.

Projections: Estimated depreciation plus return for the period January 2009 through December 2009 is projected to be $1,380,800.

Tampa Electric Company

Description and Progress Report for
Environmental Compliance Activities and Projects

Project Title: Clean Air Mercury Rule ("CAMR")

Project Description:
The EPA established standards of performance for mercury for new and existing coal-fired electric utility steam generating units as defined in the federal CAA Section 111, effective January 2009. CAMR will permanently cap and reduce mercury emissions nation-wide in two phases: Phase I cap is 38 tons per year with a compliance date of 2010 and Phase II cap is 15 tons per year with a compliance date of 2018. Tampa Electric's Big Bend and Polk Power Stations will be affected by the nation-wide mercury emissions reduction rule. According to Rule, the company must install emission-monitoring systems that sample mercury found in flue gas on Big Bend Units 1 through 4 and Polk Unit 1.

Project Accomplishments:

Fiscal Expenditures: The actual/estimated depreciation plus return for the period January 2008 through December 2008 is $70,383 compared to the original projection of $119,317, which represents a variance of 41.0%. The variance is due to the decrease in the scope of the project as a result of the Circuit Court decision to vacate the rule.

Progress Summary: A petition was filed on August 30, 2008 seeking Commission approval of cost recovery through the ECRC for the new CAMR program.

Projections: Estimated depreciation plus return for the period January 2009 through December 2009 is projected to be $110,652.

Estimated O&M costs for the period January 2009 through December 2009 are projected to be $0.

P.O. Box 6526
Tallahassee, Florida 32314

Re: Request for Clarification of Department Policy after EPA Suspension of 316(b) Phase II Existing Facilities Rule

Dear Mr. Borkowski,

This letter is in response to your June 4, 2007 letter and is intended to clarify the Florida Department of Environmental Protection's (Department) future plans and implementation of Section 316(b) of the Clean Water Act (CWA 316(b)) regarding Phase II "Existing Facilities." You specifically had an interest in the need to complete a Comprehensive Demonstration Study (CDS).

As you know, CWA 316(b) requires "that the location, design, construction and capacity of the cooling water intake structures reflect the best technology available [BTA] for minimizing adverse environmental impacts."

In light of the ruling in Riverkeeper Inc. v. EPA, 475 F. 3d 83 (2d Cir. Jan 25 2007) and EPA's subsequent suspension of majority of their rule, the Department plans to revise its rules regarding Phase II "Existing Facilities." In the near future, the Department will begin rulemaking that will amend its current rules that adopt by reference the suspended federal rules. The Department's amended rules will be applied either at permit renewal (for permits that do not incorporate the suspended EPA rules) or in a permit reopening (for permits that currently incorporate the suspended EPA rules).

Despite the Court's ruling and EPA's suspension of the rule, the requirements of CWA 316(b) still exist and need to be addressed. Thus, all facilities subject to CWA 316(b) must meet BTA. The Department will implement the requirements of CWA 316(b) on a Best Professional Judgment basis. Historically, this has been conducted in a three step-process:

- Evaluation of site specific entrainment and impingement impacts
- Identification and evaluation of measures to minimize adverse impacts
- Design and implementation of specific measures, if needed, to minimize any identified adverse impacts

The Department believes that some form of Comprehensive Demonstration Study (CDS), especially the biological studies used to determine baseline conditions, and evaluation of control technologies and operational strategies is an integral part of this three-step process. All of the Florida power plants with once through cooling water systems have provided a proposal for information collection, and nine plants are expected to complete their CDS by January 2008, with another eleven plants expected to complete their CDS throughout the remainder of 2008. Very few plants have not started or are at the very early stages of this information collection.

FLORIDA PUBLIC SERVICE COMMISSION
DOCKET NO. 080007-EI EXHIBIT 23
COMPANY Gulf Power Co. (Direct)
WITNESS James O. Vick (JOV-1)
DATE 11-04-08

EPA has provided guidance to the states on the implementation of 316(b) requirements in light of the rule suspension. We are currently reviewing the EPA guidance and plan to develop Florida specific guidance in the near future to coincide with our rulemaking to repeal the suspended EPA rule.

If you have any further questions, please feel free to contact me.

Sincerely,

Phil Coram, P.E.

NOTICE OF AGENCY ACTION
Individual Water Use Permit No. 19850074
Consumptive Use Permit Application No. I06475

Dear Permitee:

Your Individual Water Use Permit was approved by the Governing Board of the Northwest Florida Water Management District at a public hearing on January 27, 2005. The permit issued is subject to the terms and conditions set forth in the enclosed permit document. As you are legally responsible for compliance with the conditions of the permit please read the document thoroughly. Pay close attention to any condition(s) of the permit which require the one-time or periodic submittal of information to the District.

If the property where the withdrawal facility is located changes ownership, the permit must be transferred. A permit transfer request must be made on NWFWMD Form A2-F and approved by the Executive Director. If the permit is not transferred you may remain responsible for compliance with the conditions of the permit.

If you have any questions concerning the permit document or if the District can be of any other service, please let us know.

Sincerely,

Angela Chelette, Chief
Bureau of Ground Water
Division of Resource Regulation

NORTHWEST FLORIDA WATER MANAGEMENT DISTRICT
INDIVIDUAL WATER USE PERMIT
(NWFWMD Form No. A2-E)

Permit granted to:

Gulf Power Company
Crist Electrical Generating Plant
One Energy Place

Pensacola, Florida 32520-0328
(Legal Name and Address)

Permit No.: 19850074 Modification/Renewal

Date Permit Granted: January 27, 2005

Permit Expires On: February 1, 2010

Source Classification: Sand-and-Gravel Aquifer
Governor's Bayou/
Escambia River

Use Classification: Public Supply
Power Generation

County: Escambia Area: C

Location: Section 25 1/4 Section

Application No.: I06475

Township 1 North Range 30 West

Terms and standard conditions of this Permit are as follows:

1. That all statements in the application and in supporting data are true and accurate and based upon the best information available, and that all conditions set forth herein will be complied with. If any of the statements in the application and in the supporting data are found to be untrue and inaccurate, or if the Permittee fails to comply with all of the conditions set forth herein, then this Permit shall be revoked as provided by Chapter 373.243, Florida Statutes.

2. This Permit is predicated upon the assertion by the Permittee that the use of water applied for and granted is and continues to be a reasonable and beneficial use as defined in Section 373.019(4), Florida Statutes, is and continues to be consistent with the public interest, and will not interfere with any legal use of water existing on the date this Permit is granted.

3. This Permit is conditioned on the Permittee having obtained or obtaining all other necessary permit(s) to construct, operate and certify withdrawal facilities and the operation of water system.

4. This Permit is issued to the Permittee contingent upon continued ownership, lease or other present control of property rights in underlying, overlying, or adjacent lands. This Permit may be assigned to a subsequent owner as provided by Chapter 40A-2.351, Florida Administrative Code, and the acceptance by the transferee of all terms and conditions of the Permit.

5. This Permit authorizes the Permittee to make a combined average annual withdrawal of **257,500,000*** gallons of water per day, a maximum combined withdrawal of **305,400,000**** gallons during a single day, and a combined monthly withdrawal of **9,366,700,000***** gallons. Withdrawals for the individual facilities are authorized as shown in the table below in paragraph six. However, the total combined amount of water withdrawn by all facilities listed in paragraph six shall not exceed the amounts identified above.

6. Individual Withdrawal Facility Authorization

7. The use of the permitted water withdrawal is restricted to the use classification set forth by the Permit. Any change in the use of said water shall require a modification of this Permit.

8. The District's staff, upon proper identification, will have permission to enter, inspect and observe permitted and related facilities in order to determine compliance with the approved plans, specifications and conditions of this Permit.

9. The District's staff, upon providing prior notice and proper identification, may request permission to collect water samples for analysis, measure static and/or pumping water levels and collect any other information deemed necessary to protect the water resources of the area.

10. The District reserves the right, at a future date, to require the Permittee to submit pumpage records for any or all withdrawal point(s) covered by this Permit.

11. Permittee shall mitigate any significant adverse impact caused by withdrawals permitted herein on the resource and legal water withdrawals and uses, and on adjacent land use, which existed at the time of permit application. The District reserves the right to curtail permitted withdrawal rates if the withdrawal causes significant adverse impact on the resource and legal uses of water, or adjacent land use, which existed at the time of permit application.

12. Permittee shall not cause significant saline water intrusion or increased chloride levels. The District reserves the right to curtail permitted withdrawal rates if withdrawals cause significant saline water intrusion or increased chloride levels.

13. The District, pursuant to Section 373.042, Florida Statutes, at a future date, may establish minimum and/or management water levels in the aquifer, aquifers, or surface water hydrologically associated with the permitted withdrawals; these water levels may require the Permittee to limit withdrawal from these water sources at times when water levels are below established levels.

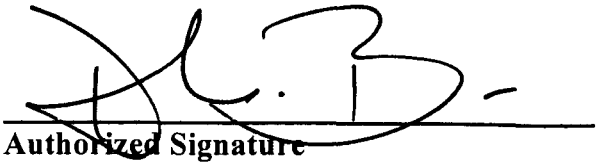
14. Nothing in this Permit should be construed to limit the authority of the Northwest Florida Water Management District to declare water shortages and issue orders pursuant to Section 373.175, Florida Statutes, or to formulate and implement a plan during periods of water shortage pursuant to Section 373.246, Florida Statutes, or to declare Water Resource Caution Areas pursuant to Chapters 40A-2.801, and 62-40.41, Florida Administrative Code

(a) In the event of a declared water shortage, water withdrawal reductions shall be made as ordered by the District.

(b) In the event of a declared water shortage or an area as a Water Resource Caution Area, the District may alter, modify or inactivate all or parts of this permit.

15. The Permittee shall properly plug and abandon any well determined unsuitable for its intended use, not properly operated and maintained, or removed from service. The well(s) shall be plugged and abandoned to District Standards in accordance with Section 40A-3.531, Florida Administrative Code.

16. Any Specific Permit Condition(s) enumerated in Attachment A are herein made a part of this Permit.



Authorized Signature
Northwest Florida Water Management District

ATTACHMENT

Individual Water Use Permit No. 19850074
Individual Water Use Application No. I06475

1. The Permittee shall include the Individual Water Use Permit number and each well's Florida Unique Identification Number (e.g., AAA###) when submitting reports or otherwise corresponding with the District.

2. The Permittee shall maintain, in working order, in-line totaling flow meters on the well head of each production well.

3. The Permittee shall record the data required on Water Use Summary Reporting Form NWFWMD A2-I, and submit copies to the District by January 31 of each year. The withdrawals shall be reported separately by source (ground water and surface water). The ground and surface water withdrawals shall also be provided as a combined total. The Permittee, if preferred, may submit the report electronically by downloading the correct form from the District website, filling it out properly, and e-mailing it to compliance@nwfwmd.state.fl.us. The report for the year 2005 is due by January 31, 2006.

4. The Permittee, by January 31 of each year, shall report the following information:

   a. Water quality sample results from withdrawal well AAA6421 (CEPG #3) collected during the first two weeks of each month and analyzed for sodium, chloride, sulfate, bicarbonate, carbonate, calcium, magnesium, potassium, specific conductance, total dissolved solids and pH. Prior to sampling, the Permittee shall purge three to five well volumes from the well, and shall report with the test results, the purging duration, volume and rate used.

   b. Static water level data for each production well during the first two weeks of January, April, July, and October. The water level data shall be referenced to mean sea level.

   The Permittee, if preferred, may submit the reports electronically by e-mailing the data to compliance@nwfwmd.state.fl.us.

   The Permittee shall immediately initiate monthly collection, analysis, and reporting of ground-water quality samples and ground-water levels from all withdrawal wells identified in this permit, should drawdowns or water quality exceed a level of concern, as determined by the District. In this event, the Permittee shall, within 30 days, submit a written plan to the District identifying the specific actions it will implement to address the issue(s) of concern including monthly recording of the required data.

5. The Permittee shall continue to return at least 95% of the surface water withdrawn from Governor's Bayou/Escambia River. The Permittee shall submit a statement to this effect by January 31 of each year. The first statement is due by January 31, 2006.

6. The Permittee shall implement measures to increase water conservation and efficiency at the facility. The Permittee, by January 31 of each year, shall submit to the District a report detailing the actions taken, and the progress during the previous year, in achieving the stated goal. The first submittal is due by January 31, 2006.

7. The Permittee shall mitigate interference to existing users that is attributable to the withdrawal amounts authorized herein, should it occur. The Permittee shall report the occurrence of any such interference to the District and shall identify the mitigation action undertaken to address the interference.

Mr. Mike Markey
Gulf Power Company
One Energy Place
Pensacola, Florida 32520-0328

RE: Individual Water Use Permit No. 19850074
Specific Condition No. 6

Dear Mr. Markey:

The District understands that Gulf Power is working to obtain reuse water from Emerald Coast Utilities Authority and that this is part of Gulf Power's water conservation effort in accordance with Specific Condition No. 6 of the Individual Water Use Permit. Obtaining 17-20 million gallons of reuse water per day for cooling and for emissions reduction would result in a significant benefit to the water resources of the area by reducing demand for ground water and surface water. If I can provide any other information or endorsement in support of this effort, please contact me.

Sincerely,

Angela Chelette, P.G.

Notes:
(A) Description and reason for 'Other' adjustments to net Investment for this project, if applicable
(B) Beginning Balances: Crist $29,626,570; Smith $212,250; Daniel $0, Scholz $0. Ending Balances: Crist $49,165,896; Smith $11,368,753, Daniel $4,020,088, Scholz $656,162.
(C) Description of Adjustments to Reserve for Gross Salvage and Other Recoveries and Cost of Removal
(D) The equity component has been grossed up for taxes. The approved ROE is 12%.
(E) Crist: 3.2%, Plant Smith Steam 2.5%, Smith CT 0.4%, Daniel 3.1%, Scholz 4.2%. Portion of PE 1222 is transmission 0.1833%, 0.1917%, 0.3417%, 0.2167%.
(F) Portion of PE 1222 applicable 7 year amortization period beginning in 2008.
(G) Description and reason for "Other" adjustments to investment expenses for this project.
(H) Line 9a x Line 10 x 1.0007 line loss multiplier
(I) Line 9b x Line 11
(J) Project #1222 qualifies for AFUDC treatment. As portions of the project are moved to P-I-S, they are included in the ECRC.

Schedule 1P

Gulf Power Company
Environmental Cost Recovery Clause (ECRC)
Total Jurisdictional Amount to be Recovered

For the Projected Period
January 2009 - December 2009

Line No.		Energy ($)	Demand ($)	Total ($)
1	Total Jurisdictional Rev. Req. for the projected period			
	a Projected O & M Activities (Schedule 2P, Lines 7, 8 & 9)	38,347,456	2,668,005	41,015,461
	b Projected Capital Projects (Schedule 3P, Lines 7, 8 & 9)	40,547,658	3,198,466	43,746,124
	c Total Jurisdictional Rev. Req. for the projected period (Lines 1a + 1b)	78,895,114	5,866,471	84,761,585
2	True-Up for Estimated Over/(Under) Recovery for the period January 2008 - December 2008 (Schedule 1E, Line 3)	(2,508,465)	(301,825)	(2,810,290)
3	Final True-Up for the period January 2007 - December 2007 (Schedule 1A, Line 3)	1,295,632	174,839	1,470,471
4	Total Jurisdictional Amount to be Recovered/(Refunded) in the projection period January 2009 - December 2009 (Line 1c - Line 2 - Line 3)	80,107,947	5,993,457	86,101,404
5	Total Projected Jurisdictional Amount Adjusted for Taxes (Line 4 x Revenue Tax Multiplier)	80,165,625	5,997,772	86,163,397

Notes:
Allocation to energy and demand in each period are in proportion to the respective period split of costs indicated on Lines 7 & 8 of Schedules 5E & 7E and 5A & 7A.

Notes:
(A) Description and reason for 'Other' adjustments to net Investment for this project, if applicable
(B) Beginning Balances: Crist $49,165,896; Smith $11,346,149; Daniel $4,020,088, Scholz $656,162. Ending Balances: Crist $566,700,055; Smith $15,586,062, Daniel $4,187,364, Scholz $656,162.
(C) Description of Adjustments to Reserve for Gross Salvage and Other Recoveries and Cost of Removal
(D) The equity component has been grossed up for taxes. The approved ROE is 12%.
(E) Crist: 3.2%, Plant Smith Steam 2.5%, Smith CT 0.4%, Daniel 3.1%, Scholz 4.2%. Portion of PE 1222 is transmission 2.2%, 2.3%, 4.1%, 2.6%.
(F) Portion of PE 1222 has a applicable 7 year amortization period beginning in 2008.
(G) Description and reason for "Other" adjustments to investment expenses for this project.
(H) Line 9a x Line 10 x 1.0007 line loss multiplier
(I) Line 9b x Line 11
(J) Project #1222 qualifies for AFUDC treatment. As portions of the project are moved to P-I-S, they are included in the ECRC.
(K) Smith beginning balances differ from 2008 estimated/actual true-up due to updated projections.

Description and Progress Report of
Environmental Compliance Activities and Projects

Title: Air Quality Assurance Testing
PEs 1006 and 1244

FPSC Approval: Order No. PSC-94-0044-FOF-EI

Description:
This line item includes the audit test trailer and associated support equipment used to conduct Relative Accuracy Test Audits (RATAs) on the Continuous Emission Monitoring Systems (CEMs) as required by the 1990 Clean Air Act Amendments (CAAA).

Accomplishments:
The RATA test trailer CEM system was replaced during the 2002-2003 recovery period. The CEMs trailer was also replaced in 2005. These replacements provide Gulf with the accuracy and reliability needed to accurately measure SO_2, NOx, and CO_2 and to further maintain compliance with CAAA requirements.

Project-to-Date: Plant-in-service of $220,294 projected at December 2009.

Progress Summary: In-Service

Projections: N/A

Title: Crist 5, 6 & 7 Precipitator Projects
PEs 1038, 1119, 1216, 1243, and 1249

FPSC Approval: Order No. PSC-94-0044-FOF-EI

Description:
The Crist precipitator projects are necessary to improve particulate removal capabilities as a result of burning low sulfur coal. The larger more efficient precipitators with increased collection areas improve particulate collection efficiency.

Accomplishments:
The precipitators have successfully reduced particulate emissions while burning low sulfur coal. The upgraded Crist Unit 7 precipitator was placed in service during 2004 as part of the FDEP agreement.

Project-to-Date: Plant-in-service of $15,031,878 projected at December 2009.

Progress Summary: In-Service

Projections: N/A

Title: Crist 7 Flue Gas Conditioning
PE 1228

FPSC Approval: Order No. PSC-94-0044-FOF-EI

Description:
This project included the injection of sulfur trioxide into the flue gas to enhance particulate removal and improve the collection characteristics of fly ash. Retirement of the Plant Crist Unit 7 flue gas conditioning system was completed during July 2005.

Accomplishments:
The system enhanced particulate removal in the precipitator.

Project-to-Date: $0

Progress Summary: Retired

Projections: N/A

Environmental Compliance Activities and Projects

Title: Low NO_x Burners, Crist 6 & 7
PEs 1234, 1236, 1242, and 1284

FPSC Approval: Order No. PSC-94-0044-FOF-EI

Description:
Low NO_x burners are unique burners installed to decrease the NO_x emissions that are formed in the combustion process. This equipment was installed to meet the requirements of the 1990 Clean Air Act Amendments.

Accomplishments:
The Low NO_x burner system has proven effective in reducing NO_x emissions. The low NO_x burners on Crist Unit 7 were replaced during 2003-2004 time frame and the Crist Unit 6 burners were replaced during December 2005.

Project-to-Date: Plant-in-service of $9,097,923 projected at December 2009.

Progress Summary: In-Service

Projections: N/A

Gulf Power Company

January 2009-December 2009

Description and Progress Report of
Environmental Compliance Activities and Projects

Title: CEMs – Plant Crist, Scholz, Smith, and Daniel
PEs 1001, 1154, 1164, 1217, 1240, 1245, 1286, 1289, 1290, 1311, 1316, 1323, 1324, 1357, 1364, 1440, 1441, 1442, 1444, 1445, 1454, 1459, 1460, 1558, 1570, 1658, 1829, and 1830

FPSC Approval: Order No. PSC-94-0044-FOF-EI

Description:
The Continuous Emission Monitoring (CEM) line item includes dilution extraction emission monitors that measure the concentrations of sulfur dioxide (SO_2), carbon dioxide (CO_2) and nitrogen oxides (NO_x) in the flue gas. Opacity and flow monitors were also installed under this line item. All CEMs monitors were installed pursuant to the 1990 Clean Air Act Amendments (CAAA).

Accomplishments:
The systems at both Gulf and Mississippi Power continue to successfully exceed routine quality assurance/quality control (QA/QC) audits as required by the 1990 CAAA.

Project-to-Date: Plant-in-service of $5,222,602 projected at December 2009.

Progress Summary:
Crist 4, 5, 6 and 7 CEMS equipment replacements (gas analyzers, opacity monitors, and common CEMS equipment), Scholz 1 & 2 CEMS analyzer replacements, and Smith 1 gas analyzers and opacity monitor replacements were completed in 2001 and 2002. The Plant Crist Unit 6 & 7 and the Plant Scholz Units 1&2 flow monitors were replaced during 2005. The Plant Daniel Units 1&2 gas analyzers were replaced during 2005 and the flow monitors were replaced during 2007. During 2008, the opacity, flow, and gas monitors at Plant Smith and opacity and gas monitors at Plant Scholz are being replaced.

Projections:
During the 2009 recovery period, the CEMs project includes the replacement of opacity monitors at Plant Crist on Units 4 and 5 and the installation of CEMs equipment for the new Plant Crist scrubber stack. The existing Crist Units 4 and 5 opacity monitors are approaching the end of their useful lives and will be retired upon replacement. CEMs equipment will be installed in the scrubber stack to monitor SO_2, NOx, CO_2 and flow pursuant to the CAAA. The 2009 scrubber CEMs expenditures include a new CEMs shelter as well as the monitoring equipment. The 2009 expenditures are expected to be approximately $439,830.

Title: Substation Contamination Mobile Groundwater Treatment System
PEs 1007, 3400, and 3412

FPSC Approval: Order No. PSC-95-1051-FOF-EI

Description:
Three groundwater treatment systems were purchased for the treatment of contaminated groundwater at substation sites.

Accomplishments:
Systems have proven effective in groundwater remediation.

Project-to-Date: Plant-in-service of $918,024 projected at December 2009.

Progress Summary: In-Service

Projections: N/A

Title: Raw Water Flow Meters; Crist and Smith
PEs 1155 and 1606

FPSC Approval: Order No. PSC-96-1171-FOF-EI

Description:
The Raw Water Flow Meters capital project was necessary for Gulf to comply with the Plant Crist and Plant Smith Consumptive Use and Individual Water Use permits issued by the Northwest Florida Water Management District (NWFWMD). These permits require the installation and monitoring of in-line totaling water flow meters on all existing and future water supply wells. Gulf incurred costs related to the installation and operation of new in-line totaling water flow meters at Plant Crist and Plant Smith for implementation of this new activity.

Accomplishments:
The raw water flow meters have been installed at Plant Crist and Plant Smith.

Project-to-Date: Plant-in-service of $242,943 projected at December 2009.

Progress Summary: In-Service

Projections: N/A

Title: Crist Cooling Tower Cell
PE 1232

FPSC Approval: Order No. PSC-94-0044-FOF-EI

Description:
The Crist Cooling Tower cell is a pollution control device which allows condenser cooling water to be continually reinjected into the condenser. The cooling tower reduces water discharge temperatures to meet the National Pollution Discharge Elimination System (NPDES) industrial wastewater requirements.

Accomplishments:
Plant Crist has maintained compliance with the temperature discharge limits as required by the facility's NPDES Permit. The original cooling tower cell was retired during July 2007 when the new Crist Unit 7 cooling tower was placed-in-service.

Project-to-Date: $0

Progress Summary: Retired

Projections: N/A

Title: Crist 1-5 Dechlorination
PE 1248

FPSC Approval: Order No. PSC-94-1207-FOF-EI

Description:
State and Federal Pollution Discharge Elimination System permits require significant reductions in chlorine discharge from the plant. The Crist Units 1-5 dechlorination system injects sodium bisulfite into the cooling water canal to chemically eliminate the residual chlorine present in the plant discharge effluent.

Accomplishments:
The system has been effective in maintaining chlorine discharge limits.

Project-to-Date: Plant-in-service of $305,323 projected at December 2009.

Progress Summary: In-Service

Projections: N/A

Title: Crist Diesel Fuel Oil Remediation
PE 1270

FPSC Approval: Order No. PSC-94-1207-FOF-EI

Description:
Monitoring wells were installed in the vicinity of the Crist diesel tank systems to determine if groundwater contamination was present. The project also included the installation of an impervious cap to reduce migration of contaminants to groundwater.

Accomplishments: Monitoring wells and an impervious cap were installed.

Project-to-Date: Plant-in-service of $68,923 projected at December 2009.

Progress Summary: In-Service

Projections: N/A

Title: Crist Bulk Tanker Unloading Secondary Containment
PE 1271

FPSC Approval: Order No. PSC-94-1207-FOF-EI

Description:
The Crist Bulk Tanker Unloading Secondary Containment project was necessary to address deficiencies identified during the August 1992 Plant Crist Environmental Audit and to minimize the potential risk of an uncontrolled discharge of pollutants into the waters of the United States. Secondary containment must be installed for tank unloading racks pursuant to the Federal Spill Prevention Control and Countermeasures (SPCC) regulation (40 CFR Part 112).

Accomplishments:
The Plant Crist unloading area secondary containment complies with current SPCC regulatory requirements.

Project-to-Date: Plant-in-service of $101,495 projected at December 2009.

Progress Summary: In-Service

Projections: N/A

Title: Crist IWW Sampling System
PE 1275

FPSC Approval: Order No. PSC-94-1207-FOF-EI

Description:
The 1993 revision to Plant Crist's National Pollutant Discharge Elimination System (NPDES) industrial wastewater permit moved the compliance point from the end of the discharge canal to a point upstream of Thompson's Bayou. To allow for this sample point modification, an access dock was constructed in the discharge canal. The Crist Industrial Wastewater (IWW) project also included a small building for monitoring and sampling equipment.

Accomplishments:
The dock is complete and samples are being collected at the required compliance point.

Project-to-Date: Plant-in-service of $59,543 projected at December 2009.

Progress Summary: In-Service

Projections: N/A

Title: Sodium Injection System
PEs 1214 and 1413

FPSC Approval: Order No. PSC-99-1954-FOF-EI

Description:
The Sodium Injection System line item includes silo storage systems and associated components that inject sodium carbonate directly onto the coal feeder belt to enhance precipitator performance when burning low sulfur coal. Sodium injection is used at Plant Smith on Units 1 and 2 and at Plant Crist on Units 4 and 5. The injection of sodium carbonate as an additive to low sulfur coal reduces opacity levels to maintain compliance with the Clean Air Act provisions.

Accomplishments:
The silo storage and injection system components at Plants Smith and Crist have been installed. These systems are fully operational.

Project-to-Date: Plant-in-service of $391,119 projected at December 2009.

Progress Summary: In Service

Projections: N/A

Title: Smith Waste Water Treatment Facility
PEs 1466 and 1643

FPSC Approval: Order No. PSC-94-0044-FOF-EI

Description:
During the 1990's a waste water treatment facility was installed at Plant Smith to replace the septic tank system that was installed in the early 1960's. In April 2004 a new waste water treatment facility with additional capacity was installed to replace the facility installed in the 1990's. The new treatment includes aeration and chlorination of the waste water prior to discharge in the Plant Smith ash pond.

Accomplishments: Plant Smith has maintained compliance with the NPDES industrial wastewater permit.

Project-to-Date: Plant-in-service of $178,962 projected at December 2009.

Progress Summary: In-Service

Projections: N/A

Title: Daniel Ash Management Project
PEs 1535, 1555, and 1819

FPSC Approval: Order No. PSC-94-0044-FOF-EI

Description:
The original Daniel Ash Management project included the installation of a dry ash transport system, lining the bottom of the ash pond, closure and capping of the existing fly ash pond, and the expansion of the landfill area. During 2006 plant Daniel completed construction of a new on-site ash storage facility in preparation for the completion and closure of the existing landfill area.

Accomplishments: No reportable exceedances have occurred since system installation. Construction of the new on-site ash storage facility was completed in 2006.

Project-to-Date: Plant-in-service of $15,026,825 projected at December 2009.

Progress Summary: In-Service

Projections: The Daniel Ash Management project is projected to have cost of removal expenses and retirements during 2009 for closure of the existing ash storage facility.

Title: Smith Water Conservation
PEs 1620 and 1638

FPSC Approval: Order No. PSC-01-1788-FOF-EI

Description:
This project is a water conservation and consumptive use efficiency program to reduce the demand for groundwater and the potential for saltwater intrusion. Plant Smith's individual water use permit issued by the Northwest Florida Water Management District includes a specific condition requesting a 25% reduction in the use of groundwater. Phase I of the Smith Water Conservation project consisted of adding pumps, piping, valves and controls to reclaim water from the ash pond. Phase II, the Smith Closed Loop Cooling System for the laboratory sampling system, was installed during 2005 to further reduce groundwater usage.

Accomplishments: Plant Smith estimated that the closed loop cooling project reduced water consumption by approximately 125,000 gallons per day.

Project-to-Date: Plant-in-service of $134,135 projected at December 2009.

Progress Summary: In-Service

Projections: N/A

Title: Underground Fuel Tank Replacement
PE 4397

FPSC Approval: Order No. PSC-94-0044-FOF-EI

Description:
The Underground Fuel Tank Replacement Program provided for the replacement of Gulf's underground storage tanks with new above ground tanks (ASTs). The installation of ASTs significantly reduced the risk of potential petroleum product discharges, groundwater contamination, and subsequent remediation activities.

Accomplishments:
All underground storage tanks have been replaced with above ground tank systems.

Project-to-Date: $0

Title: Crist FDEP Agreement for Ozone Attainment

PEs 1031, 1199, 1250, and 1287

FPSC Approval: Order No. PSC-02-1396-FOF-EI

Description:
The Florida Department of Environmental Protection (FDEP) and Gulf Power entered into an agreement on August 28, 2002 to support Escambia/Santa Rosa County area's effort to maintain compliance with the 8-hour ozone ambient air quality standards. This agreement included a requirement for Gulf to install Selective Catalytic Reduction (SCR) controls on Crist Unit 7, relocate the Crist Unit 7 precipitator, and install a NO_x reduction technology on Plant Crist Unit 6, and Units 4 and 5 if necessary, to meet the NO_x standard specified in the Agreement.

Accomplishments: The new Crist Unit 7 precipitator and SCR were placed in service during 2004 and 2005, respectively. The Crist Unit 6 Selective Non-Catalytic Reduction (SNCR)/low NOx burners with Over-Fired Air (OFA) technologies were then placed in service during November 2005. The Crist Unit 4 and Unit 5 SNCRs were subsequently placed in service during April 2006.

Project-to-Date: Plant-in-service of $135,744,919 projected at December 2009.

Progress Summary: In-Service

Projections: During 2009, Gulf will be replacing a layer of the Crist Unit 7 SCR catalyst. This new layer of catalyst is part of the on-going periodic catalyst maintenance and management activity. The projected 2009 expenditures for the Crist FDEP Agreement projects are $720,000. Gulf has also projected cost of removal expenses and retirements during 2009 for this project.

Title: SPCC Compliance
PEs 1272 & 1401

FPSC Approval: Order No. PSC-03-1348-FOF-EI

Description:
The SPCC Compliance projects were required as the result of a more stringent July 17, 2002 revision to Title 40 Code of Federal Regulation Part 112, which is commonly referred to as the Spill Prevention Control and Countermeasures (SPCC) regulation. The recent regulatory revision specifically included oil-containing electrical equipment within the scope of the regulation. Therefore, oil-filled electrical equipment that has the potential to discharge to navigable waters must be provided with appropriate containment and/or diversionary structures to prevent such a discharge. The 2002 revisions also resulted in oil storage containers having a capacity greater than or equal to 55 gallons being classified as bulk storage containers that are subject to the secondary containment requirements in 40 CFR Part 112.8(c).

The 2006 SPCC project at Plant Crist was designed to route stormwater from the switchyard drains to the new oil skimming sump where any potential spill would be captured, preventing the oil from reaching surface water. During 2009, Plant Smith plans to install secondary containment for a small fuel tank and a padmount transformer.

Accomplishments: Construction on the Plant Crist switchyard sump was completed during 2006.

Project-to-Date: Plant-in-service of $944,839 projected at December 2009.

Progress Summary: In-service

Projections: The projected 2009 expenditures for the Plant Smith SPCC Compliance project are $25,000.

Title: Crist Common FTIR Monitor
PE 1297

FPSC Approval: Order No. PSC-03-1348-FOF-EI

Description:
The purchase of a Fourier Transform Infrared (FTIR) spectrometer, a device used to measure and analyze various low concentration stack gas emissions, was required at Plant Crist under Title V regulations. The purchase of this instrument enabled Gulf Power to measure ammonia slip emissions as required by the Crist Unit 7 Selective Catalytic Reduction (SCR) air construction permit.

Accomplishments: The FTIR is fully operational.

Project-to-Date: Plant-in-service of $62,870 projected at December 2009.

Progress Summary: In-Service

Projections: N/A

Title: Precipitator Upgrades for Compliance Assurance Monitoring
PEs 1175, 1191, 1305, 1461, and 1462

FPSC Approval: Order No. PSC-04-1187-FOF-EI

Description: Compliance Assurance Monitoring (CAM) Precipitator Upgrades are required to comply with the new CAM regulations. CAM requirements are regulated under Title V of the 1990 Clean Air Act Amendments (CAAA) which requires a method of continuously monitoring particulate emissions. Opacity can be used as a surrogate parameter if the precipitator demonstrates a correlation between opacity and particulate matter. Gulf demonstrated this correlation by stack testing in 2003 and 2004, and the results were included as part of the CAM plans in Gulf's Title V Air Permits effective January 2005. Several precipitator upgrades have been necessary to meet the more stringent surrogate opacity standards under CAM.

Accomplishments: The Plant Smith Unit 2 and Unit 1 precipitator upgrades were placed in service during April 2005 and May 2007, respectively. The Plant Scholz Unit 2 precipitator upgrade was completed during December of 2007. The Plant Crist Units 4 and 5 precipitator upgrades were placed in-service during March of 2008.

Project-to-Date: Plant-in-service of $29,766,045 projected at December 2009.

Progress Summary: See Accomplishments

Title: Plant Groundwater Investigation
PEs 1218 and 1361

FPSC Approval: Order No. PSC-05-1251-FOF-EI

Description: The Florida Department of Environmental Protection (FDEP) lowered the arsenic groundwater standard from 0.05 mg/L to 0.01 mg/L effective January 1, 2005. Historical groundwater monitoring data from Plants Crist and Scholz indicated that these facilities may be unable to comply with the lower standard.

Accomplishments: The Plant Scholz project has been delayed until Gulf receives FDEP's formal response to the Plant Scholz groundwater study. The Plant Crist project has been canceled because Gulf has been released from any remedial action at this site.

Project-to-Date: $0

Progress Summary: See Accomplishments

Environmental Compliance Activities and Projects

Title: Plant Crist Water Conservation Project
PEs 1227 & 1298

FPSC Approval: Order No. PSC-05-1251-FOF-EI

Description:
This project is part of the Plant Crist water conservation and consumptive use efficiency program to reduce the demand for groundwater and surface water withdrawals. Specific Condition six of the Northwest Florida Water Management District Individual Water Use Permit Number19850074 issued January 27, 2005 requires Plant Crist to implement measures to increase water conservation and efficiency at the facility. The first Plant Crist Water Conservation project was placed in service during 2006. This project included installing automatic level controls on the fire water tanks to reduce groundwater usage. Gulf Power has entered into negotiations with the Emerald Coast Utilities Authority (ECUA) to begin utilizing reclaimed water from ECUA's proposed wastewater treatment to reduce the demand for groundwater and surface water withdrawals. The Northwest Florida Water Management District has agreed that this is a valid project to pursue for continued implementation of the water conservation effort. Gulf expects to place portions of this project in-service during 2009.

Accomplishments: Level controls were installed on the fire tank system during 2006.

Project-to-Date: Plant-in-service of $1,373,735 projected at December 2009.

Progress Summary: See Accomplishments

Projections: Expenditures totaling $1.3 million are projected to be incurred for portions of the Plant Crist Water Conservation project that will be placed-in-service during 2009.

Environmental Compliance Activities and Projects

Title: Plant NPDES Permit Compliance Projects
PE 1204 and 1299

FPSC Approval: Order No. PSC-05-1251-FOF-EI

Description: The water quality based copper effluent limitations included in Chapter 62 Part 302, Florida Administrative Code (F.A.C.) were amended in April 2002 with an effective date of May 2002. The more stringent hardness based standard is included by reference in the Plant Crist National Pollution Discharge Elimination System (NPDES) industrial wastewater permit.

Accomplishments: Plant Crist installed stainless steel condenser tubes on Unit 6 during June 2006 in an effort to meet the revised water quality standards during times of lower hardness in the river water. Plant Crist also plans to install a chemical treatment system during 2008 to reduce iron and copper concentrations in the ash pond discharge.

Project-to-Date: Plant-in-service of $5,977,707 projected at December 2009.

Progress Summary: In-Service

Projections: N/A

Gulf Power Company
Environmental Cost Recovery Clause (ECRC)
January 2009-December 2009

Description and Progress Report of
Environmental Compliance Activities and Projects

Title: CAIR / CAMR/CAVR Compliance Program
PEs 1034, 1035, 1036, 1037, 1095, 1222, 1362, 1468, 1469, 1512, 1513, 1646, 1647, 1684, 1810, 1824, and 1826

FPSC Approval: Order No. PSC-06-0972-FOF-EI

Description: This line item includes the prudently incurred costs for compliance with the Clean Air Interstate Rule (CAIR), Clean Air Mercury Rule (CAMR), and Clean Air Visibility Rule (CAVR).

Accomplishments:
Immediately after passage of EPA's CAIR and CAMR in 2005, Gulf began extensive engineering, design, and other planning activities to determine the most cost effective strategy for compliance with the CAIR, CAMR, and CAVR requirements. On March 29, 2007, Gulf petitioned the Commission for approval of the Company's plan to achieve and maintain compliance with the CAIR, CAMR, and CAVR. On June 22, 2007, the Office of Public Counsel ("OPC"), the Florida Industrial Power Users' Group ("FIPUG") and Gulf filed a petition for approval of a stipulation regarding the substantive provisions of Gulf's CAIR/CAMR/CAVR Compliance Plan (the "Plan"). That stipulation identified 10 specific components of Gulf's Plan as being reasonable and prudent for implementation and set forth a process for review in connection with the three remaining components of the Plan. On August 14, 2007, the Commission voted to approve the stipulation with the provision that Gulf provide an annual status report regarding cost-effectiveness and prudence of the phases in its Plan into which the Company is moving. The approved plan includes a more detailed discussion of the planning process and evaluation utilized by Gulf to select the most reasonable and prudent strategy for compliance with these regulations on a plant and/or unit specific basis.

Project-to-Date: Plant-in-service of $586,662,113 projected at December 2009.

Progress Summary: See Accomplishments

Projections:
For the purpose of the 2009 projection of ECRC revenue requirements, expenditures totaling approximately $519 million are projected to be incurred for capital projects included in the CAIR/CAMR/CAVR Compliance Program. These capital projects include the Crist Units 4 through 7 scrubber project ($517.5 million), Low NOx burners at Plant Daniel on Unit 2 ($167,276), and Selective Non-Catalytic Reduction (SNCR) technologies at Plant Smith on Unit 1 ($3.9 million) and Unit 2 ($371,502).

Title: General Water Quality
PE 1280

FPSC Approval: Order No. PSC-06-0972-FOF-EI

Description: Gulf Power purchased a boat during 2007 for surface water sampling required by the Plants Crist, Smith and Scholz National Pollutant Discharge Elimination System (NPDES) permits. The permits have new conditions which require Gulf to establish a biological evaluation plan and implementation schedule for each plant.

Accomplishments: The General Water Quality sampling boat was purchased during 2007. It is currently being used to conduct Gulf's surface water sampling for Plants Crist, Smith, and Scholz.

Project-to-Date: Plant-in-service of $23,654 projected at December 2009.

Progress Summary: In-Service

Projections: N/A

Description and Progress Report of
Environmental Compliance Activities and Projects

Title: Mercury Allowances

FPSC Approval: Stipulation approved by the Commission on August 14, 2007

Description:
Mercury Allowances were included as part of Gulf's March 2007 CAIR/CAMR/CAVR Compliance Program. The purchase of allowances in conjunction with the retrofit projects comprised the most reasonable, cost-effective means for Gulf to meet the CAIR, CAMR and CAVR requirements. On February 8, 2008, the U.S. Court of Appeals for the District of Columbia Circuit issued an opinion vacating EPA's CAMR. The vacatur became effective with the issuance of the court's mandate on March 14, 2008, nullifying CAMR mercury emission control obligations and monitoring requirements. In response to the CAMR vacatur, mercury allowances have been removed from Gulf's Compliance Plan.

Environmental Cost Recovery Clause (ECRC)
January 2009-December 2009

Description and Progress Report of
Environmental Compliance Activities and Projects

Title: Annual NO_x Allowances

FPSC Approval: Stipulation approved by the Commission on August 14, 2007

Description:
Although the retrofit installations set forth in Gulf's CAIR/CAMR/CAVR Compliance Program significantly reduce emissions, they will not result in Gulf achieving CAIR / CAMR compliance levels without the purchase of some emission allowances. Thus, Gulf's CAIR/CAMR/CAVR Compliance Program calls for the purchase of allowances. The purchase of allowances in conjunction with the retrofit projects comprises the most reasonable, cost-effective means for Gulf to meet CAIR and CAVR requirements.

Accomplishments: N/A

Project-to-Date: N/A

Progress Summary:

Annual NOx allowance expenses have been included in Gulf's 2009 projection filing because CAIR will remain in effect unless and until the court issues a mandate in the case.

Projections: The 2009 projection expenses for annual allowances are $18.6 million. This projection will be updated if the CAIR is ultimately vacated.

Title: SO_2 Allowances

FPSC Approval: Order No. PSC-94-0044-FOF-EI

Description:
Part of Gulf's strategy to comply with the Acid Rain Program under the Clean Air Act Amendments of 1990 was to bring several of Gulf's Phase II generating units into compliance early and bank the SO_2 allowances associated with those units. SO_2 reductions under the CAIR program utilizes this program requiring an increased rate of surrender beginning in 2010. Gulf's bank has slowly been drawn down over the years due to more allowances being consumed than are allocated to Gulf by EPA. Gulf proposed to meet this shortfall by executing forward contracts to secure allowances supplemented with forward contracts, swaps, and spot market purchases of allowances as prices dictate.

Accomplishments: Gulf executed forward contacts to secure allowances during 2007.

Project-to-Date: N/A

Progress Summary: See Accomplishments

Projections: Gulf expects to purchase $8.8 million of SO_2 allowances in 2009. Based on allowance usage, the expenses (net of gains) are projected to be approximately $5.9 million.

O & M Line Item 1.3

Title: Title V

FPSC Approval: Order No. PSC-95-0384-FOF-EI

Description:
Title V expenses are associated with the preparation of the Clean Air Act Amendments (CAAA) Title V permit applications and the subsequent implementation of Title V permits. Renewal of the Title V permits is on a five year cycle (i.e. 2005, 2010, etc).

Accomplishments:
Title V permits for Plants Crist, Smith, and Scholz were issued by FDEP in 1999. The Title V permit for the Pea Ridge Generating Facility was issued in July, 2000. During 2004, the Title V renewal applications were submitted for Plant Crist, Smith, and Scholz. The final permits were issued in December 2004 and February 2005.

Title: Emission Monitoring

FPSC Approval: Order No. PSC-94-0044-FOF-EI

Description:
The Emission Monitoring program provides quality assurance/quality control testing for Continuous Emission Monitoring systems, including Relative Accuracy Test Audits and Linearity Tests, as required by the Clean Air Act Amendments (CAAA) of 1990. Other activities within this category include testing for the Periodic Monitoring and Compliance Assurance Monitoring (CAM) requirements associated with the CAAA of 1990.

Accomplishments:
All systems are in compliance.

Fiscal Expenditures: N/A

Title: Ash Pond Diversion Curtains

FPSC Approval: Order No. PSC-98-1764-FOF-EI

Description:
The installation of additional flow diversion curtains in the Plant Crist ash pond were required to effectively increase water retention time in the ash pond. Diversion curtains allow for the sedimentation/precipitation treatment process to be more effective in reducing levels of suspended particulate from the Plant Crist ash pond outfall. Plant Crist plans to replace the existing ash curtains and dredge the pond during 2009.

Accomplishments:
Ash pond diversion curtains have been installed at Plant Crist.

Fiscal Expenditures: N/A

Title: Mercury Emissions

FPSC Approval: Order No. PSC-99-0912-FOF-EI

Description: The Mercury Emissions program pertains to requirements for Gulf to periodically analyze coal shipments for mercury and chlorine content. The Environmental Protection Agency (EPA) mandated that shipments of coal would be analyzed for mercury and chlorine only during 1999. No further notices of continued sampling requirements of coal shipments beyond 1999 have been issued by EPA, therefore no expenses have been planned for this activity.

Accomplishments:
Coal shipments were analyzed as required during 1999. Sampling and analytical requirements are not expected during 2009.

Fiscal Expenditures: N/A

Progress Summary: See Accomplishments

Projections: N/A

Title: Gulf Coast Ozone Study (GCOS)

FPSC Approval: Order No. PSC-00-0476-FOF-EI

Description:
This project referred to Gulf's participation in the Gulf Coast Ozone Study (GCOS) which was a joint modeling analysis between Gulf Power and the State of Florida to provide an improved basis for assessment of eight-hour ozone air quality for Northwest Florida. The goal of the project was to develop strategies for ozone ambient air attainment to supplement the Florida Department of Environmental Protection (FDEP) studies to the Environmental Protection Agency (EPA) for Escambia and Santa Rosa counties.

Accomplishments: The GCOS project was completed during 2006.

Fiscal Expenditures: N/A

Progress Summary: See Accomplishments

O & M Line Item 1.18

Title: SPCC Substation Project

FPSC Approval: Order No. PSC-03-1348-FOF-EI

Description:
On July 17, 2002 EPA published a revision to Title 40 Code of Regulation Part 112, commonly referred to as the Spill Prevention Control and Countermeasures (SPCC) regulation. The revision expanded applicability of the rule to include oil containing electrical transformers and regulators, which had previously been excluded from the SPCC regulations. Gulf was required to install additional containment and/or diversionary structures or equipment at several substations to prevent a potential discharge of mineral oil to navigable waters of the United States or adjoining shorelines.

Accomplishments: Gulf has assessed its substations to determine which are subject to the revised SPCC regulations. Additional containment has been added to the substations that were identified as having a reasonable risk of discharging oil into navigable waters of the United States or adjoining shorelines.

Fiscal Expenditures: N/A

O & M Line Item 1.20

Title: CAIR/CAMR/CAVR Compliance Plan

FPSC Approval: Order No. PSC-06-0972-FOF-EI

Description: This line item includes the O&M expenses associated with the stipulated portions of Gulf's CAIR, CAMR, and CAVR Compliance program and the Climate Registry. Immediately after the passage of the EPA's CAIR and CAMR in 2005, Gulf began extensive engineering, design, and other planning activities to determine the most cost effective strategy for compliance with the CAIR, CAMR, and CAVR requirements. On March 29, 2007, Gulf petitioned the Commission for approval of the Company's plan to achieve and maintain compliance with the CAIR, CAMR, and CAVR. On June 22, 2007, the Office of Public Counsel ("OPC"), the Florida Industrial Power Users' Group ("FIPUG") and Gulf filed a petition for approval of a stipulation regarding the substantive provisions of Gulf's CAIR/CAMR/CAVR Compliance Plan (the "Plan"). That stipulation identified 10 specific components of Gulf's Plan as being reasonable and prudent for implementation and set forth a process for review in connection with the three remaining components of the Plan. On August 14, 2007, the Commission voted to approve the stipulation with the provision that Gulf provide an annual status report regarding cost-effectiveness and prudence of the phases in its Plan into which the Company is moving. The approved plan includes a more detailed discussion of the planning process and evaluation utilized by Gulf to select the most reasonable and prudent strategy for compliance with these regulations on a plant and/or unit specific basis.
Gulf Power expects to begin incurring annual costs associated with joining the Climate Registry during 2009. Gulf also anticipates incurring expenses for monitoring and reporting greenhouse gas emissions.

Accomplishments: Gulf will begin incurring O&M expenses associated with the Crist Units 4 through 7 scrubber, Smith Units 1 and 2 SNCRs, and Scholz mercury monitoring system during 2009. Gulf also expects to begin incurring annual costs associated with joining the climate registry in 2009.

Fiscal Expenditures: N/A

Progress Summary: See Accomplishments

Projections: $6,013,528
