Schedule B-3 (2008) | 13 MONTH AVERAGE BALANCE SHEET - SYSTEM BASIS |

FLORIDA PUBLIC SERVICE COMMISSION

COMPANY:FLORIDA PUBLIC UTILITIES
Consolidated Electric Division
DOCKET NO.: 070304-EI

EXPLANATION: Derive the 13-month average system balance sheet by primary account by month for the test year, the prior year and the most recent historical year. For accounts including non-electric utility amounts, show these amounts as a separate subaccount.

Type of Data Shown:
Projected Test Year Ended 12/31/2008
Witness: Jim Mesite

Schedule B-8 (2007) MONTHLY PLANT BALANCES TEST YEAR - 13 MONTHS

FLORIDA PUBLIC SERVICE COMMISSION

COMPANY:FLORIDA PUBLIC UTILITIES
Consolidated Electric Division
DOCKET NO.: 070304-EI

EXPLANATION: Provide the monthly plant balances for each account or sub-account to which an individual depreciation rate is applied. These balances should be the ones used to compute the monthly depreciation expenses excluding any amortization/recovery schedules.

Type of Data Shown:
Prior Year Ended 12/31/2007
Witness: Jim Mesite

Supporting Schedules: Recap Schedules: B-1 (2007), B-3 (2007)

Schedule B-8 (2008) | MONTHLY PLANT BALANCES TEST YEAR - 13 MONTHS |

FLORIDA PUBLIC SERVICE COMMISSION

COMPANY:FLORIDA PUBLIC UTILITIES
Consolidated Electric Division
DOCKET NO.: 070304-EI

EXPLANATION: Provide the monthly plant balances for each account or sub-account to which an individual depreciation rate is applied. These balances should be the ones used to compute the monthly depreciation expenses excluding any amortization/recovery schedules.

Type of Data Shown:
Projected Test Year Ended 12/31/2008
Witness: Jim Mesite

FLORIDA PUBLIC SERVICE COMMISSION

COMPANY: FLORIDA PUBLIC UTILITIES
Consolidated Electric Division
DOCKET NO.: 070304-EI

EXPLANATION: Provide the monthly plant balances for each account or sub-account to which an individual depreciation rate is applied. These balances should be the ones used to compute the monthly depreciation expenses excluding any amortization/recovery schedules.

Type of Data Shown:
Projected Test Year Ended 12/31/2008
Witness: Jim Mesite

FLORIDA PUBLIC SERVICE COMMISSION

COMPANY:FLORIDA PUBLIC UTILITIES
Consolidated Electric Division
DOCKET NO.: 070304-EI

EXPLANATION: Provide the monthly reserve balances for each account or sub-account to which an individual depreciation rate is applied.

Type of Data Shown:
Prior Year Ended 12/31/2007
Witness: Jim Mesite

FLORIDA PUBLIC SERVICE COMMISSION

COMPANY: Florida Public Utilities Company
Consolidated Electric Division
DOCKET NO.: 070304-EI

EXPLANATION: Supply a proposed public notice of the company's request for a rate increase suitable for publication.

Type of Data Shown:
Projected Test Year Ended 12/31/08

Witness: Cheryl Martin

IMPORTANT

NOTICE TO CUSTOMERS

On August 20, 2007, Florida Public Utilities Company filed a Petition with the Florida Public Service Commission seeking approval to increase rates and charges to produce an additional $******** in revenues. They are also requesting interim rate relief for an additional $******* in revenues. This increase is needed in order to enable the Company to continue to provide sufficient, adequate and efficient service and to afford the Company an opportunity to earn a fair rate of return. A comparison of current and proposed Customer Facilities Charges, Energy Charges, Demand Charges and Service Charges are shown below and more details are contained in the Minimum Filing Requirements, which also contain detailed financial, accounting, tariff and engineering data supporting the request. These and the synopsis of the case are available for review at the business offices at the following locations during regular work hours.

2825 Pennsylvania Avenue	911 South 8th Street
Marianna, Florida 32448-4004	Fernandina Beach, Florida 32034
850-526-6800	904-261-3663

The Public Service Commission has scheduled hearings on this Petition for ***** **, 2007, in Tallahassee and a final decision is scheduled for ***** **, 2008. In addition, the PSC has scheduled service hearings at the following time and place:

****** **, 2007, **:** p.m.	****** **, 2007, **:** p.m.
Fernandina Beach City Commission Chambers	Jackson County Commission Meeting Room
204 Ash Street	2864 Madison Street
Fernandina Beach, Florida 32034	Marianna, Florida 32446

At the service hearings, customers will be afforded an opportunity to present comments to the Commission regarding the proposal and service of the company.

Customers wishing to address the Commission are urged to appear early as the hearing will be adjourned if no one is in attendance.

Any person requiring some accommodation at the service hearings because of physical impairment should call the Commission's Division of the Commission Clerk and Administrative Services at 850-413-6770 at least five calendar days prior to the hearing. Any person who is hearing or speech impaired should contact the Florida Public Service Commission by using the Florida Relay Service, which can be reached at 1-800-955-8771 (TDD).

Any customer comments regarding the Company's service or the proposed rate increase should be addressed to: Director, Division of the Commission Clerk and Administrative Services, Florida Public Service Commission, 2540 Shumard Oak Boulevard, Tallahassee, Florida 32399-0850. Such comments should refer to Docket No. 070304-EI, which is the docket number that has been assigned to this proceeding.

For your information, we are also providing the address and telephone number of the Florida Public Service Commission's Consumer Affairs Division: Division of Consumer Affairs, Florida Public Service Commission, 2540 Shumard Oak Boulevard, Tallahassee, Florida 32399-0850, 1-800-342-3552 (Toll Free Number). Following is a comparison of current and proposed base rates:

FORECASTING METHODOLOGY - CUSTOMERS, ENERGY USAGE, PEAK DEMAND

In preparing the forecast for the 2008 test year, we first developed three years of historical data (4/2004 to 3/2007). The data included the number of customers, sales, and billed peak demands for each rate classification and service territory. The rate classifications are Residential (RS), General Service (GS), General Service Demand (GSD), General Service Large Demand (GSLD), General Service Large Demand Industrial (GSLD1), Outdoor Lighting (OL), and Street Lighting (SL).

Forecasts of sales by service classification were developed by building up from separate forecasts for sales per customer and number of customers. We first examined the historical relationship between sales per customer and cooling degree days (CDD), heating degree days (HDD), and a time trend. Sales per customer for 2007 and 2008 were forecast using 10-year average CDD and HDD, and the time trend. Forecasts of the number of customers in each service classification were developed using a time trend based on 4/2004 to 3/2007 data. Sales by service classification were forecast as the product of the sales per customer forecast and the number of customer forecast for each service classification. We also adjusted projected consumption for the decrease in usage due to the recent large fuel rate increases.

Forecasts of billing demands by service classification were based on the historical relationship of billing demand per customer with CDD, HDD, and a time trend, combined with the forecast of the number of customers by class. This method was only used for the GSD and GSLD classes.

Because the class contains only two customers and these are large industrial customers, the Fernandina Beach GSLD1 class was forecast using a direct forecast for KWH, billed demand, and kVar adjusted for the impact of the recent fuel increases on their demand.

Determinants for outdoor lighting and street lighting classes were forecast using the customer growth from their respective service territories. Recent growth in lighting revenues is not expected to be matched in the future, so the growth rate of the number of customers was used as a proxy for the expected growth of lighting determinants. The determinants for CSL, OL, SL1, and SL2 were frozen at 2006 levels because the rates are closed to new enrollment.

CONSTRUCTION BUDGET

Florida Public Utilites' construction budget is based on several different variables, each of which is driven by customer growth and usage. The main goal of the Construction Budget is to ensure prompt service to all new customers while ensuring that the integrity and reliability of the entire distribution system is maintained. Several different factors influencing the Construction Budget are as follows:

1. Customer Growth and Usage

The addition of new customers requires construction based on the customer and the type of usage required. Due to the growth, much of the construction budget is a result of serving the needs of new customers.

2. Five Year Distribution Plan

This plan is updated on a yearly basis in order to ensure that the long range integrity and reliability of the system is maintained. Total substation and feeder loads are analyzed to determine the best way to serve current and future loads. This analysis also takes into consideration voltage levels, power factors, and construction standards.

3. Depreciation

The depreciation, deterioration, and replacement of plant is also considered in determining the total construction budget. This is used to allow replacement of facilities while not adversely affecting total plant.

4. Energy Supply

Work with Gulf Power and JEA is essential. Communication concerning future load additions and reliability is ongoing. This allows both parties to look into the future and make appropriate plans.

Each of these factors is considered when developing the yearly construction budgets. Reviews at the Divisional and Corporate levels also provide adequate oversight into the expenditures in this budget.

OPERATION AND MAINTENANCE EXPENSES WITHOUT PURCHASED POWER

FPU's Operation and Maintenance expenses are calculated using projections based on customer growth (see page 2 for details on forecasting this), inflation, payroll increases and special project costs. This provides adequate controls in order for the total O & M Budget amounts to be monitored.

Prior to preparing the O & M Budget, all O & M related special projects are identified. These may include special maintenance projects, small equipment purchases, training, donations, etc. After these projects are identfied and the associated costs are determined, they are compiled with historical values for each account. This combination is then forecast into the test year using projection factors based on customer and payroll growth, and expected inflation.

After preparation, the O & M Budget along with all indentified special and new projects is submitted for Divisional and Corporate approval.

F schedules. I think there are a few "blanks" to be filled in on F9. I have not sent F1 and F2 – they are just the pdfs of the annual reports and SEC filings.

Subject: Rate case schedules

Please send the Bs, Cs, Ds, Gs and Fs for a final review before they get ready for print version. We can review them one more time for critical items. Send to both Jim and Mehrdad and Doreen since I will be out until Wed. Mark will be your contact if you need anything relating to Cost of service or rates . If you do need to talk to me before Wed, just let Mehrdad know. Thanks Cheryl

EXPLANATION: If a projected test year is used, for each sales forecasting model, give a quantified explanation of the impact of changes in the inputs to changes in outputs.

Type of Data Shown:
Projected Test Year Ended 12/31/2008
Projected Prior Year Ended 12/31/2007

Witness: Mark Cutshaw

Model____________________

Line No.	Input Variable	Percent Change (Input)	Output Variable Affected	Percent Change (Output)

The variables contained in the forecasting models consist of weather variables and a time trend. Specifically, cooling degree days (CDD) and heating degree days (HDD) are included. We illustrate the effect of a change in the weather-normalized CDD and HDD below. Row 1 of the table below shows the forcast 2008 sales for FPU at expected CDD and HDD, based on 10-year averages. The values in rows 2 through 5 show the forecast sales if the CDD and HDD deviate from the expected value by +/- 10%.

Scenario	Forecast Sales*	% D from Base
Base	772,728	–
+10% CDD	784,523	1.5%
-10% CDD	760,933	-1.5%
+10% HDD	776,796	0.5%
-10% HDD	768,660	-0.5%

* Sales are in MWh; forecast sales excludes lighting, which is not temperature sensitive.

For residential classes,
HDD is calculated as MAX[65 - (max T + min T)/2, 0], summed over all days of the year.
CDD is calculated as MAX[(max T + min T)/2 - 70, 0], summed over all days of the year.

For non-residential classes,
HDD is calculated as MAX[54 - (max T + min T)/2, 0], summed over all days of the year.
CDD is calculated as MAX[(max T + min T)/2 - 62, 0], summed over all days of the year.

Normal HDD and CDD values were calculated as the 10-year average from April 1997 through March 2007.

Marianna weather is taken from National Climactic Data Center Cooperative Station ID #088758, Tallahassee FL Regional Airport

Fernandina weather is taken from National Climactic Data Center Cooperative Station ID #082944, Fernandina Beach, FL

In the regression model output that follows, "cus_***" is the number of customers in the class; "upc_***" is the use per customer; "dpc_***" is the demand per customer; "trend" is an annual time trend; "hdd65" is heating degree days using a 65 degree threshold; "cdd70" is cooling degree days using a 70 degree threshold; "hdd54" is heating degree days using a 54 degree threshold; "cdd62" is cooling degree days using a 62 degree threshold; and "_cons" is the estimated constant term.

F schedules. I think there are a few "blanks" to be filled in on F9. I have not sent F1 and F2 – they are just the pdfs of the annual reports and SEC filings.

FLORIDA PUBLIC SERVICE COMMISSION

COMPANY: Florida Public Utilities Company
Consolidated Electric Division
DOCKET NO.: 070304-EI

EXPLANATION: For a projected test year, provide a schedule of assumptions used in developing projected or estimated data. As a minimum, state assumptions used for balance sheet, income statement and sales forecast.

Type of Data Shown:

Projected Year Ended 12/31/2007
Projected Test Year Ended 12/31/2008
Witness: Cheryl Martin, Mark Cutshaw

I. BALANCE SHEET (13-Month Average)

The Consolidated Electric Operations is an operating division of Florida Public Utilities Company (FPU) and as such does not have a complete balance sheet of its own. Many of the balance sheet items are commonly shared with all divisions of FPU including the wholly-owned subsidiary, Flo-Gas Corporation (Flo-Gas). It is therefore, necessary to allocate these amounts based on various allocation bases.

Schedule H(B-3) reflects the 13 month average consolidated balance sheet with separate columns indicating 13-month averages for consolidated amounts, the allocated amount, and the basis and percentage for the allocation. Detail of working capital components, including adjustments and eliminations is contained on Schedule H(B-17). Utility Plant in Service, the associated Reserve, and Construction Work-In-Process are directly charged to the Consolidated Electric Division except for common plant. Common plant, reserve, and CWIP are allocated to the Consolidated Electric Division based upon percentages calculated in our allocation study. The detail of plant data is contained on the various H(B Schedules). Common Equity, Preferred Equity, Long-Term Debt, and Notes Payable were allocated to the Consolidated Electric Division as a pro-rata share of total FPU capitalization as compared to total Electric Division rate base. Projected balance sheet accounts use various direct projection methods, as well as various projection factors including customer growth, inflation and plant. Methods are indicated on the Projection Schedules included in section H (Bs).

II. INCOME STATEMENT

OPERATING REVENUES

Operating revenues are directly charged to the Consolidated Electric Division. Revenues are calculated by multiplying the KWH sales by the rates approved by the Florida Public Service Commission for base rates, fuel, and conservation. Projected revenues are based on the billing determinant forecasts described on Schedules F-5 and F-6. See Schedule H(C-5) for revenues.

OPERATION AND MAINTENANCE EXPENSES

Most of these expenses are directly charged to the Consolidated Electric Division except for Corporate clearing and administrative and general accounts. These accounts were allocated to the Consolidated Electric Division based upon various percentages. These percentages are based on historic payroll, revenues, customers, sales, etc. Projected expenses are based on the either direct forecasts, or projection factors applied to the historic year 12/31/2006. See schedule H(C-7) for the related factors and methodologies.

DEPRECIATION and AMORTIZATION EXPENSES

Depreciation was calculated by using the existing Florida Public Service Commission approved depreciation rates. The projected test year will have to be updated before final rates are approved for new rates in our pending depreciation study filed with the Florida Public Service Commission in June 2007.
Amortization expenses were based on direct projections shown on schedule H(C-19)

TAXES

Income taxes, current and deferred, were computed using an effective tax rate of 37.63%. See Schedule C-22 for details.
Taxes other than income taxes were projected based on various trends using the historical year 2006 as a basis. See Schedule H (C--20) for the factors used.

Consolidated Electric Division
DOCKET NO.: 070304-EI

EXPLANATION: By rate schedule, calculate revenues under present and proposed rates for the rates for the test year. If any customers are to be transferred from one schedule to another, show revenues separately for the transfer group. Correction factors are used for historical test years only. The total base revenue by class must equal that shown in Schedule E-13a. The billing units must equal those shown in Schedule E-15. PROVIDE TOTAL NUMBER OF BILLS, MWHs AND BILLING KWH FOR EACH RATE SCHEDULE (including standard and time of use customers) AND TRANSFER GROUP.

Type of Data Shown:

Subject: RE: Rate case schedules
Attachments: D's-Final-NoLinks.xls

Here are the D Schedules

From: Martin Cheryl [mailto:cherylmartin@fpuc.com]
Sent: Monday, August 13, 2007 11:54 AM
To: Mike Welsh
Cc: Robert Camfield; Cox Doreen; Khojasteh Mehrdad; Mesite Jim
Subject: Rate case schedules

Please send the Bs, Cs, Ds, Gs and Fs for a final review before they get ready for print version. We can review them one more time for critical items. Send to both Jim and Mehrdad and Doreen since I will be out until Wed. Mark will be your contact if you need anything relating to Cost of service or rates . If you do need to talk to me before Wed, just let Mehrdad know. Thanks Cheryl

Cheryl Martin
Controller
Florida Public Utilities Company

FLORIDA PUBLIC SERVICE COMMISSION COMPANY: Florida Public Utilities Consolidated Electric Division DOCKET NO.: 070304-EI	EXPLANATION: Supply a statement of the company's policy on treatment of profit or loss from reacquired bonds. Detail any profit or loss on recquired bonds for the test year and prior year.	Type of Data Shown: Projected Test Year Ended 12/31/08 Prior Year Ended 12/31/07 HistoricYear Ended 12/31/06 Witness: Doreen Cox, Robert Camfield

In the interest of its retail customers and shareholders, the policy of Florida Public Utilities Company on this issue is to profitably reacquire outstanding debt when economic and capital market conditions afford such opportunities. History suggests, however, that conditions vary substantially from one time to another, such that favorable opportunities to reacquire debt will occur infrequently and randomly. The Company will share the profits and losses associated with reacquired debt fairly with its retail customers.

Attachments: C-MFRS-8-13-07-NoLinks.xls; HC-MFRS-8-13-07-NoLinks.xls

Here are the C-Schedules

From: Martin Cheryl [mailto:cherylmartin@fpuc.com]
Sent: Monday, August 13, 2007 11:54 AM
To: Mike Welsh
Cc: Robert Camfield; Cox Doreen; Khojasteh Mehrdad; Mesite Jim
Subject: Rate case schedules

Please send the Bs, Cs, Ds, Gs and Fs for a final review before they get ready for print version. We can review them one more time for critical items. Send to both Jim and Mehrdad and Doreen since I will be out until Wed. Mark will be your contact if you need anything relating to Cost of service or rates . If you do need to talk to me before Wed, just let Mehrdad know. Thanks Cheryl

Company: Florida Public Utilities Company

For the Year Ended December 31, 2006

Provide the following information regarding all non-tariffed services and products provided by the utility.

Description of Product or Service (a)	Account No. (b)	Regulated or Non-regulated (c)
None		

FLORIDA PUBLIC SERVICE COMMISSION

COMPANY:FLORIDA PUBLIC UTILITIES
Consolidated Electric Division
DOCKET NO.: 070304-EI

EXPLANATION: Provide an analysis of all non-utility operations such as orange groves, parking lots, etc. that utilized all or part of any utility plant that are not included in Schedule C-31.

Type of Data Shown:
Projected Test Year Ended 12/31/2008
Prior Year Ended 12/31/2007
Historical Year Ended 12/31/2006
Witness: Jim Mesite

Please send the Bs, Cs, Ds, Gs and Fs for a final review before they get ready for print version. We can review them one more time for critical items. Send to both Jim and Mehrdad and Doreen since I will be out until Wed. Mark will be your contact if you need anything relating to Cost of service or rates . If you do need to talk to me before Wed, just let Mehrdad know. Thanks Cheryl

OPERATION AND MAINTENANCE EXPENSES -- PRIOR YEAR 2007

FLORIDA PUBLIC SERVICE COMMISSION

COMPANY FLORIDA PUBLIC UTILITIES
Consolidated Electric Division
DOCKET NO : 070304-EI

EXPLANATION: If the requested revenue requirements are based on a historical test year, provide actual monthly operation and maintenance expense by primary account for the test year.

Type of Data Shown:
Prior Year Ended 12/31/2007
Witness: Mehrdad Khojasteh

If the requested revenue requirements are based on a historical test year, provide actual monthly operation and maintenance expense by primary account for the test year.

OPERATION AND MAINTENANCE EXPENSES -- PRIOR YEAR 2007

OPERATION AND MAINTENANCE EXPENSES -- PRIOR YEAR 2007

FLORIDA PUBLIC SERVICE COMMISSION

COMPANY:FLORIDA PUBLIC UTILITIES
Consolidated Electric Division
DOCKET NO.: 070304-EI

EXPLANATION

If the requested revenue requirements are based on a historical test year, provide actual monthly operation and maintenance expense by primary account for the test year.

Type of Data Shown:
Prior Year Ended 12/31/2007
Witness: Mehrdad Khojasteh

If the requested revenue requirements are based on a historical test year, provide actual monthly operation and maintenance expense by primary account for the test year.

FLORIDA PUBLIC SERVICE COMMISSION

COMPANY: Florida Public Utilities Company
Consolidated Electric Division

DOCKET NO.: 070304-EI

EXPLANATION: Provide a schedule detailing transactions with affiliated companies and related parties for the test year including intercompany charges, licenses, contracts and fees.

Type of Data Shown:
Projected Test Year Ended 12/31/08
Historical Year Ended 12/31/06
Witness: Mehrdad Khojasteh

Line No.	Name of Company or Related Party	Relation to Utility	Type of Service Provided or Received	Effective Contract Date	Charges During year: Amount 2006	Charges During year: Amount 2008 Projected*	Acct. No.	Allocation Method Used to Allocate Charges Between Companies
1	Flo-gas Corporation	Wholly-Owned Subsidiary	Materials & Supplies		139,282	149,032	146	Actual use of materials
2								
3	Flo-gas Corporation	Wholly-Owned Subsidiary	Transportation		172,127	184,176	146	Actual use of vehicles and various allocation basis
4								
5	Flo-gas Corporation	Wholly-Owned Subsidiary	Shared expenses charged to clearing accounts		738,899	790,622	146	Various allocation basis
6								
7	Flo-gas Corporation	Wholly-Owned Subsidiary	Labor		3,181,787	3,630,419	146	Actual use of personnel and various allocation basis
8			TOTAL NET AMOUNT		4,232,095	4,754,249		

9
10 All transactions are allocated if they affect the affiliated operations of Flo-Gas Corporation. The basis depends on the nature of the transaction with the bulk of the allocations
11 in the corporate office building and Administrative & General expenses. The primary allocation factors are as follows:
12 * Projections based on inflation, payroll and customer factors.
13

Line No.	NATURE	ALLOCATION BASIS
14	NATURE	ALLOCATION BASIS
15		
16	Corporate Office Structure	Use study and utility plant in service
17		
18	Property Insurance	Utility plant in service
19		
20	A & G Salaries	Utility Plant in Service
21		
22	Customer Accounts Expense	Customers
23		
24	Pensions and Employee Benefits	Payroll base
25		
26	Outside Professional Services &	Adjusted gross profit
27	General Liability Insurance	
28		

29 Through the allocation process all charges affecting the affiliated company have benn eliminated from the historic and projected test years.
30 All the various allocation factors are available in Special Job 61-227 at our Corporate Office.

Cc: Cox Doreen; Khojasteh Mehrdad; Mesite Jim
Subject: RE: Rate case schedules
Attachments: B-MFRS-8-13-07-NolLinks.xls; HB-MFRS-8-13-08-NoLinks.xls

Here are the B Schedules

From: Martin Cheryl [mailto:cherylmartin@fpuc.com]
Sent: Monday, August 13, 2007 11:54 AM
To: Mike Welsh
Cc: Robert Camfield; Cox Doreen; Khojasteh Mehrdad; Mesite Jim
Subject: Rate case schedules

Please send the Bs, Cs, Ds, Gs and Fs for a final review before they get ready for print version. We can review them one more time for critical items. Send to both Jim and Mehrdad and Doreen since I will be out until Wed. Mark will be your contact if you need anything relating to Cost of service or rates . If you do need to talk to me before Wed, just let Mehrdad know. Thanks Cheryl

Cheryl Martin
Controller

113 Note: Electric Depreciation rates per Docket No. 020853-EI, Order NO. PSC-03-1473-PAA-EI. Amortization per Rule 25 6.0142,List of Retirement Units (Electrical Plant). Common Depreciation rates per Docket No. 040352-GU, Order NO. PSC-04-1045-PAA-GU.

Supporting Schedules:B-3 (2006), B-8 (2006) Recap Schedules: B-1 (2006), B-3 (2006),

Schedule B-8 (2006)
FLORIDA PUBLIC SERVICE COMMISSION

COMPANY:FLORIDA PUBLIC UTILITIES
Consolidated Electric Division
DOCKET NO.: 070304-EI

MONTHLY PLANT BALANCES TEST YEAR - 13 MONTHS

EXPLANATION: Provide the monthly plant balances for each account or sub-account to which an individual depreciation rate is applied. These balances should be the ones used to compute the monthly depreciation expenses excluding any amortization/recovery schedules.

Type of Data Shown:
Historic Year Ended 12/31/2006
Witness: Jim Mesite

DEPRECIATION RESERVE BALANCES BY ACCOUNT AND SUB-ACCOUNT

FLORIDA PUBLIC SERVICE COMMISSION
COMPANY:FLORIDA PUBLIC UTILITIES
Consolidated Electric Division
DOCKET NO.: 070304-EI

EXPLANATION: Provide the depreciation reserve balances for each account or sub-account to which an individual depreciation rate is applied. (Include Amortization/Recovery schedule amounts)

Subject: Rate case schedules

Please send the Bs, Cs, Ds, Gs and Fs for a final review before they get ready for print version. We can review them one more time for critical items. Send to both Jim and Mehrdad and Doreen since I will be out until Wed. Mark will be your contact if you need anything relating to Cost of service or rates . If you do need to talk to me before Wed, just let Mehrdad know. Thanks Cheryl

Recap Schedules: B-1 (2008), B-3 (2008), Schedule B-8 (2007) | MONTHLY PLANT BALANCES TEST YEAR - 13 MONTHS | Page 1 of 2

FLORIDA PUBLIC SERVICE COMMISSION

COMPANY:FLORIDA PUBLIC UTILITIES
Consolidated Electric Division
DOCKET NO.: 070304-EI

EXPLANATION: Provide the monthly plant balances for each account or sub-account to which an individual depreciation rate is applied. These balances should be the ones used to compute the monthly depreciation expenses excluding any amortization/recovery schedules.

Supporting Schedules:

Recap Schedules: B-1 (2007), B-3 (2007)

Schedule B-8 (2008) | MONTHLY PLANT BALANCES TEST YEAR - 13 MONTHS | Page 1 of 2

FLORIDA PUBLIC SERVICE COMMISSION

EXPLANATION: Provide the monthly plant balances for each account or sub-account to which an individual depreciation rate is applied. These balances should be the ones used to compute the monthly depreciation expenses excluding any amortization/recovery schedules.

Type of Data Shown:
Projected Test Year Ended 12/31/2008
Witness: Jim Mesite

COMPANY:FLORIDA PUBLIC UTILITIES
Consolidated Electric Division
DOCKET NO.: 070304-EI

Here are the D Schedules

From: Martin Cheryl [mailto:cherylmartin@fpuc.com]
Sent: Monday, August 13, 2007 11:54 AM
To: Mike Welsh
Cc: Robert Camfield; Cox Doreen; Khojasteh Mehrdad; Mesite Jim
Subject: Rate case schedules

Please send the Bs, Cs, Ds, Gs and Fs for a final review before they get ready for print version. We can review them one more time for critical items. Send to both Jim and Mehrdad and Doreen since I will be out until Wed. Mark will be your contact if you need anything relating to Cost of service or rates . If you do need to talk to me before Wed, just let Mehrdad know. Thanks Cheryl

FLORIDA PUBLIC SERVICE COMMISSION COMPANY: Florida Public Utilities Consolidated Electric Division DOCKET NO.: 070304-EI	EXPLANATION: Supply a statement of the company's policy on treatment of profit or loss from reacquired bonds. Detail any profit or loss on recquired bonds for the test year and prior year.	Type of Data Shown: Projected Test Year Ended 12/31/08 Prior Year Ended 12/31/07 HistoricYear Ended 12/31/06 Witness: Doreen Cox, Robert Camfield

In the interest of its retail customers and shareholders, the policy of Florida Public Utilities Company on this issue is to profitably reacquire outstanding debt when economic and capital market conditions afford such opportunities. History suggests, however, that conditions vary substantially from one time to another, such that favorable opportunities to reacquire debt will occur infrequently and randomly. The Company will share the profits and losses associated with reacquired debt fairly with its retail customers.

FLORIDA PUBLIC SERVICE COMMISSION

COMPANY: FLORIDA PUBLIC UTILITIES
CONSOLIDATED ELECTRIC DIVISION

DOCKET NO.: 070304-EI

EXPLANATION: 1.) If the test year is projected, provide a summary of financing plans and assumptions.

2.) Provide the company's capital structure objectives, the basis for assumptions (such as those for issue cost and interest rates), and any other significant assumptions.
Provide a statement of the Company's policy on the timing of the entrance into capital markets.

Type of Data Shown:
Projected Test Year Ended 12/31/08
Witness: Doreen Cox, Robert Camfield, George E

Financing Plans for the Year Ending 2008

			For Bonds			For Stock			
Line No.	Type of Issue	Date of Issue/ Retirement	Capitalization (Thousands)	Interest Rate	Life in Years	No. of Shares	Market Price	Issue Costs	Principal Amount
1	Common Stock	Jun-08				1,250,000	12	900,000	15,000,000
2									
3									
4									
5									
6									
7									
8	Capital Structure Objectives:				Percent of Total				
9									
10	Short-term Debt				2 - 14%				
11	Long-term Debt				40 - 45%				
12	Preferred Stock				0 - 1%				
13	Common Equity				43 - 56%				
14									
15									
16	Interest Rate Assumptions:		Short Term Interest Rates will gradually increase through 2008. The volatility of prior years is not expected.						
17									
18									
19	Company's Policy on the Timing of Entrance into Capital Markets:								
20	Cash requirements are forecasted to increase significantly due to environmental clean-up, land purchase, LT Debt payments and Pension Contributions.								
21	The Company plans to use a combination of short term borrowing and an Equity Offering in 2008 to finance future growth and capital expenditures.								
22	The timing of the Equity Offering is largely dependent on projected capital expenditures and environmental expenses.

There is no AFUDC so that cell on C23 would be 0. Cheryl

Doreen: Here is the latest version of the C Schedules. (I had sent version 3 last week for review). Anyway, you will find C-23 here. As you will see there is one cell highlighted in red. I still need to know if there is a value that needs to go here or if this item is zero.

Robert
Do we have Sch C-23 (old C-44) available yet? If so, please forward us a copy - it's a supporting schedule needed for the tax rate.
Thanks
Doreen

Mike,

OK, it is 7.72% overall, using the 6.32%, as I had originally calculated. Robert

Robert
I agree with your method of calculating the Interest on the Customer Deposits which result in a cost rate of 6.32% (12 Mth Int / 13 Mth Avg Cust Dep Bal). As we discussed the Surveillance Report is using a different methodology (13 Mth Int Exp / 13 Mth Avg) resulting in a Cost Rate of 6.61%. I will discuss with Cheryl on her return, but have forwarded the revised schedule using 6.32%.
Thanks
Doreen

Subject: RE: rate case

Doreen,

I accept your corrections and edits, which include:

1) Your addition of the Loss on reacquired debt. I did not have these data available, or at least I did know where the data were reported.

2) Remaining balances on unamortized issuance expenses, where you had pulled these data from financial records, I had estimated them.

There remains a couple of points:

First, your version of my spreadsheet does not utilize the calculated cost of LT Debt, or of ST Debt. The calculated LT Debt rate is 8.03%, vs. the surveillance value of 8.02% (my first calculated value was also 8.02%). In the case of ST Debt, the daily vs. month-end balances issue (which I brought up earlier) suggests that the observed and calculated values can diverge significantly.

Second, the customer deposits rate of 6.61% is significantly above the value that I had calculated, 6.32%. This is a significant difference that I cannot explain. While it is appropriate to utilize the value reported in the surveillance reports (6.61%), the difference suggests that our methodology, as used to obtain '07 and '08 may be in error. I can't figure out the reason for the discrepancy, though I have not looked into the surveillance report in depth.

MIKE: The rate of return value provided on tab D-1a,'06 - currently at 7.73% - of the attached file (D's 06,07_a DC, RC) should be used for the determination of the revenue requirement amount for interim relief.
This value includes a 10.50% return on equity, and should hold, notwithstanding Doreen's review of the customer deposits interest rate issue discussed above. If Doreen adopts 6.32% in lieu of 6.61% (as currently used) for deposits, the overall rate of return for interim relief remains virtually unchanged (7.72%).

Robert

Subject: RE: rate case

Robert:
Please find attached a revised Cost of Capital Worksheet and D schedules.

The changes to the Cost of Capital Worksheet are twofold:
1 The Deferred Taxes have been revised to reconcile to the Surveillance Report which excludes fuel under-recoveries which are not allowed by the PSC for determining working capital.
2 Regulatory Assets & Liabilities are also excluded and remain as reconciling items to the Surveillance Report.
3 Additional total lines have been added to show totals excluding Flo-Gas Equity.

Schedules Ds
Please note that I have made changes or updates to the cells highlighted in yellow. The

projected rate base figures for 2007 and 2008 are not yet available, so the figures in blue are just hypothetical. We should have the projected rate base by mid-week.

The MFR requirements, not yet addressed have been highlighted in green.

Please review and let us know if you have any questions, or would like to discuss.
Thanks
Doreen

Doreen,

Attached please find the latest set of D Schedules. I think these schedules are correct. Nonetheless, the schedules need your review, particularly as regards to the calculation of long-term debt costs as related to issuance expenses and amortization of expenses.

I will return to the office tomorrow morning.

Thanks, Robert

Subject: RE: rate case

As discussed in the last Electric Rate Case we filed the Schedule D's including Flo-Gas Equity and using Year-end balances (the way FPU deems to be correct). The staff however, adjusted the capital structure to exclude Flo-Gas and use the 13 Mth Average.

As agreed we will use the Commission's methodology of excluding Flo-Gas and using the 13 month average. We will however state what we believe to be the correct approach in our testimony.

Robert

Please note.

Subject: RE: Ratio Analysis
Attachments: Purchased power compliance ratios.xls

Hi Doreen:

I prepared my side-by-side calculations of the purchased power ratios and have a bit of a difference in the numbers. I have attached the computation prepared for quarters past, updated for 03/07 amounts.

Thanks,
April Lundgren
x 1788

Using the relevant treasury yields as a benchmark and assuming an equivalent spread to the benchmarks as compared to today...

Current (30 year retail offerings):
insured taxable: 5.65% - 5.75%
insured tax-exempt: 4.45% - 4.55%
rated taxable (BBB range): 6.15%-6.35%

December 2005 mid month approximate range
insured taxable: 5.75% - 5.90% range
insured tax-exempt: 4.55% - 4.65%
rated taxable (BBB range): 6.25%-6.45%

Doreen?

From: Mike Welsh [mailto:mpwelsh@CAEnergy.com]
Sent: Friday, August 03, 2007 7:50 AM
To: Khojasteh Mehrdad
Cc: Cox Doreen
Subject: RE: Revised C-11

I understand the issue with what would have appeared to be a large jump in the bad debt rate for the projected year 2008.

The issue I was asking about relates to which bad debt rate to use for calculating the gross up factor used in determining the 2008 revenue requirement. Currently I would be using whatever the 2008 estimated rate turns out to be. However, I was wondering since in C-11 we are now showing an average for 2006-2008, whether there was some thought that we would use the average 2006-2008 in the gross up factor instead of the projected 2008 bad debt rate. Just let me know.

From: Khojasteh Mehrdad [mailto:mkhojasteh@fpuc.com]

Subject: RE: Revised C-11

We felt the previous rate was too high. It is used on some of Doreen's schedules.

Thanks,

Mehrdad Khojasteh

Mike,

I have attached a revised C-11. We revised the 2008 bad debt rate on the C-11 you sent us. The cells that were revised are highlighted in pink.

If you have any questions or comments, please let me know.

Mehrdad Khojasteh

Subject: RE: Revised C-11

I understand the issue with what would have appeared to be a large jump in the bad debt rate for the projected year 2008.

The issue I was asking about relates to which bad debt rate to use for calculating the gross up factor used in determining the 2008 revenue requirement. Currently I would be using whatever the 2008 estimated rate turns out to be. However, I was wondering since in C-11 we are now showing an average for 2006-2008, whether there was some thought that we would use the average 2006-2008 in the gross up factor instead of the projected 2008 bad debt rate. Just let me know.

Mike,

I have attached a revised C-11. We revised the 2008 bad debt rate on the C-11 you sent us. The cells that were revised are highlighted in pink.

If you have any questions or comments, please let me know.

Mehrdad Khojasteh

Subject: RE: Revised C-11

I understand the issue with what would have appeared to be a large jump in the bad debt rate for the projected year 2008.

The issue I was asking about relates to which bad debt rate to use for calculating the gross up factor used in determining the 2008 revenue requirement. Currently I would be using whatever the 2008 estimated rate turns out to be. However, I was wondering since in C-11 we are now showing an average for 2006-2008, whether there was some thought that we would use the average 2006-2008 in the gross up factor instead of the projected 2008 bad debt rate. Just let me know.

They really belong as part of the cost of debt. You, Doreen, and I need to discuss the theory. Thanks.

George,

Can we incorporate the fees for unused balances of the ST Debt Facility, within the cost of rate for ST Debt? I recall from previous conversations that such fees are accounted for elsewhere within the operating expenses.

Subject: Short-term debt

Doreen,
George,

The observed short-term debt cost rate for FPU, based on month-end balances, is 3.28% for 2006. This interest rate level is remarkably low in view of the contractual rate, which I estimate to be 6.03%, also for '06. I have reasoned that the actual contractual rate is applicable to daily balances, and so if the daily balances are substantially below month-end balances, then 3.28% is conceivable. However, the differences between the daily average and month-end balances would need to be very large in order to ever obtain 3.28%. The result is a substantial understatement of true interest costs for ST Debt, and what I suggest is this:

1) calculate the daily balances, by month, and use the average daily balance in lieu of month-end balances. Essentially, short-term debt is a special case because of the variation in balances over the course of the month, and year.

2) use this daily balance approach for the determination of cost of capital for all years. The result is a more accurate reflection of the weighted average cost of capital, which is inherently higher than that suggested by month balances.

This is an important issue, and we should turn to it immediately.

I should mention that, if I don't have the story right - daily vs. month-end balances, then something else is wrong, and we need to understand why such large differences in the calculated vs. actual cost rates.

Thanks, Robert

This is more like it. We have achieve two things:

1) higher interest rate for ST Debt
2) lower balances of ST Debt for inclusion within the capital structure.

Great job. Thanks, Robert

But what a great theory discussion you two can have, should the payments on the line be included. I say yes. ☺

Attached is a worksheet showing two methodologies for calculating ST cost – end of month balance and average monthly balance. Details per month of the balances are also included.

Please call at your convenience to discuss.
Thanks

Let me take a closer look at how the 3.28% was calculated for the Surveillance Report.

Subject: Short-term debt

Doreen,
George,

The observed short-term debt cost rate for FPU, based on month-end balances, is 3.28% for 2006. This interest rate level is remarkably low in view of the contractual rate, which I estimate to be 6.03%, also for '06. I have reasoned that the actual contractual rate is applicable to daily balances, and so if the daily balances are substantially below month-end balances, then 3.28% is conceivable. However, the differences between the daily average and month-end balances would need to be very large in order to ever obtain 3.28%. The result is a substantial understatement of true interest costs for ST Debt, and what I suggest is this:

1) calculate the daily balances, by month, and use the average daily balance in lieu of month-end balances. Essentially, short-term debt is a special case because of the variation in balances over the course of the month, and year.

2) use this daily balance approach for the determination of cost of capital for all years. The result is a more accurate reflection of the weighted average cost of capital, which is inherently higher than that suggested by month balances.

This is an important issue, and we should turn to it immediately.

I should mention that, if I don't have the story right - daily vs. month-end balances, then something else is wrong, and we need to understand why such large differences in the calculated vs. actual cost rates.

Thanks, Robert

They really belong as part of the cost of debt. You, Doreen, and I need to discuss the theory. Thanks.

George,

Can we incorporate the fees for unused balances of the ST Debt Facility, within the cost of rate for ST Debt? I recall from previous conversations that such fees are accounted for elsewhere within the operating expenses.

Subject: Short-term debt

Doreen,
George,

The observed short-term debt cost rate for FPU, based on month-end balances, is 3.28% for 2006. This interest rate level is remarkably low in view of the contractual rate, which I estimate to be 6.03%, also for '06. I have reasoned that the actual contractual rate is applicable to daily balances, and so if the daily balances are substantially below month-end balances, then 3.28% is conceivable. However, the differences between the daily average and month-end balances would need to be very large in order to ever obtain 3.28%. The result is a substantial understatement of true interest costs for ST Debt, and what I suggest is this:

1) calculate the daily balances, by month, and use the average daily balance in lieu of month-end balances. Essentially, short-term debt is a special case because of the variation in balances over the course of the month, and year.

2) use this daily balance approach for the determination of cost of capital for all years. The result is a more accurate reflection of the weighted average cost of capital, which is inherently higher than that suggested by month balances.

This is an important issue, and we should turn to it immediately.

I should mention that, if I don't have the story right - daily vs. month-end balances, then something else is wrong, and we need to understand why such large differences in the calculated vs. actual cost rates.

Thanks, Robert

This is more like it. We have achieve two things:

1) higher interest rate for ST Debt
2) lower balances of ST Debt for inclusion within the capital structure.

Great job. Thanks, Robert

But what a great theory discussion you two can have, should the payments on the line be included. I say yes. ☺

Attached is a worksheet showing two methodologies for calculating ST cost – end of month balance and average monthly balance. Details per month of the balances are also included.

Please call at your convenience to discuss.
Thanks

Subject: Short-term debt

Doreen,
George,

The observed short-term debt cost rate for FPU, based on month-end balances, is 3.28% for 2006. This interest rate level is remarkably low in view of the contractual rate, which I estimate to be 6.03%, also for '06. I have reasoned that the actual contractual rate is applicable to daily balances, and so if the daily balances are substantially below month-end balances, then 3.28% is conceivable. However, the differences between the daily average and month-end balances would need to be very large in order to ever obtain 3.28%. The result is a substantial understatement of true interest costs for ST Debt, and what I suggest is this:

1) calculate the daily balances, by month, and use the average daily balance in lieu of month-end balances. Essentially, short-term debt is a special case because of the variation in balances over the course of the month, and year.

2) use this daily balance approach for the determination of cost of capital for all years. The result is a more accurate reflection of the weighted average cost of capital, which is inherently higher than that suggested by month balances.

This is an important issue, and we should turn to it immediately.

I should mention that, if I don't have the story right - daily vs. month-end balances, then something else is wrong, and we need to understand why such large differences in the calculated vs. actual cost rates.

Thanks, Robert

Categories: Elec Rate Case

Got it...Thank you. We should clarify with George and Cheryl how they would like to have this issue handled.

Robert

Robert
Pending our discussion with George, please see attached. I have revised the Bank Fee of .10% on the available line which is payable every June to be a flat rate - it was previously shown for one month only.
Thanks
Doreen

Subject: RE: Short-term debt

This is more like it. We have achieve two things:

1) higher interest rate for ST Debt
2) lower balances of ST Debt for inclusion within the capital structure.

Great job. Thanks, Robert

Robert

Attached is a worksheet showing two methodologies for calculating ST cost - end of month balance and average monthly balance. Details per month of the balances are also included.

Please call at your convenience to discuss.

Thanks

Doreen

Let me take a closer look at how the 3.28% was calculated for the Surveillance Report.

From: Robert Camfield [mailto:rjcamfield@CAEnergy.com]

To: Cox Doreen; Bachman George
Cc: Martin Cheryl; Mike Welsh
Subject: Short-term debt

Doreen,

George,

The observed short-term debt cost rate for FPU, based on month-end balances, is 3.28% for 2006. This interest rate level is remarkably low in view of the contractual rate, which I estimate to be 6.03%, also for '06. I have reasoned that the actual contractual rate is applicable to daily balances, and so if the daily balances are substantially below month-end balances, then 3.28% is conceivable. However, the differences between the daily average and month-end balances would need to be very large in order to ever obtain 3.28%. The result is a substantial understatement of true interest costs for ST Debt, and what I suggest is
this:

1) calculate the daily balances, by month, and use the average daily balance in lieu of month-end balances. Essentially, short-term debt is a special case because of the variation in balances over the course of the month, and year.

2) use this daily balance approach for the determination of cost of capital for all years. The result is a more accurate reflection of the weighted average cost of capital, which is inherently higher than that suggested by month balances.

This is an important issue, and we should turn to it immediately.

I should mention that, if I don't have the story right - daily vs.
month-end balances, then something else is wrong, and we need to understand why such large differences in the calculated vs. actual cost rates.

Thanks, Robert

Marc
With regard to your data request for the captioned projects:

1. Summer Glen
   Attached is a summary as at April 2007 of the capital expenditures under IR# 21319. Please note that the IR has not yet been closed and these construction costs may therefore not be the final. There has been no depreciation on these assets as the IR has not yet been closed.

2. Lauderhill
   Attached is a Fixed Asset Analysis that was done in Nov 2005 using the Net Book Value as per the Fixed Assets Register to estimate the value of the assets that were convertible to Natural Gas.

   What Jim was out-lining below was the methodology applied in previous conversions to determine net asset values. The column headed "Assets" in the worksheet attached will provide you with the un-depreciated values. We would have to determine from George whether a straight line depreciation would be sufficient, or whether we need to be consistent with the methodology applied in previous conversions and update the schedules accordingly.

Hopefully this clarifies some of the issues.
Thanks
Doreen

Subject: RE: Summer Glenn and Lauderhill System Data

Doreen:

To reiterate some of what we discussed this morning...

Summer Glenn has not been closed so there is no depreciation. Since it is not closed, it would seem that a simple transfer of the 1070 balance of the pertinent accounts would take care of the conversion to NG. The non-converted unclosed items should be closed and/or expensed as appropriate.

However, if this system is gassed and producing revenue (as MLS' e-mail seems to indicate), why is it not yet closed, at least partially? Perhaps, it should be transferred and partially closed ASAP. The remaining items should be also accounted for ASAP.

As for Lauderhill, typically once the plant accounts have been identified for transfer, the reserve is transferred by account at the same ratio as the amount of transferred plant to the total plant account: i.e., if $24K from account 1010.376 is being transferred and the 1010.376 account balance is $71K, then 24/71^{sts} of the balance in 1080.376 is transferred as well. This is the methodology that the FPSC has historically accepted for conversions and other regulated/non-regulated transfers.

Thank you,

Jim

Jim
Please see request from Marc and file attached showing the un-depreciated investment in the Summer Glen propane system as at Feb 2007. Would you be able to assist with the calculation of the accumulated depreciation on those assets as at Feb 2007?
Thanks
Doreen

Subject: Summer Glenn and Lauderhill System Data

Doreen, Can you isolate the total plant (depreciated and undepreciated) for Summer Glenn by type of plant (mains, services, bulk plant)? Also can you dig up the same categories of data for the Lauderhill distribution system?

KO, Can you provide to me the latest 12 months sales data (therms and $ without taxes) for customers on the Summer Glenn system and for customers on the Lauderhill System? If I could get a listing showing Customer Name, Address, rate, usage, $, that would be terrific.

Doreen & KO, Both systems are expected to be converted to natural gas, so my main purpose is to reasonably estimate the impacts on 121 and 991. Thanks

Calvin / Kevin, Please send me the 7100 Reports filed this February 2007 for Gas Operations, specifically the ones for Summer Glenn and Lauderhill's distribution system. I would appreciate getting the Reports by Tuesday 7am. Thanks

Sincerely,
Marc L. Schneidermann

Do we have a 2nd Draft available for review?

Thanks

Doreen Cox

Financial Analyst

(561) 838-1797

DIRECT TESTIMONY

DOREEN COX
ROBERT CAMFIELD

COST OF EQUITY AND RATE OF RETURN REQUIREMENTS
of
FLORIDA PUBLIC UTILITIES COMPANY

Q. Please state your name, title, and business address.

A. Witness Cox. My name is Doreen Cox. I am a Financial Analyst with Florida Public Utilities Company. My business address is 401 South Dixie Highway, West Palm Beach, Florida, 33401.

Witness Camfield. My name is Robert Camfield. I am Vice President with Christensen Associates Energy Consulting LLC, and my business address is Suite 700, 4610 University Avenue, Madison, Wisconsin, 53705.

Q. What is the scope of your testimony?

A. The scope of our testimony is twofold. First, we address the issue of the cost of common equity to Florida Public Utilities Company. Estimates of the equity cost rate underlie our common equity rate of return recommendation. Second, we integrate the equity rate of return with the other financial components of Florida

Public Utilities Company's capital structure to determine the weighted average cost of capital and accompanying overall rate of return recommendation. Our rate of return recommendation should be used by the Commission to set retail electricity prices of Florida Public Utilities Company in the current docket.

Deleted: gas

Q. Please review your professional background and experience that qualifies you to provide such recommendations.

A. Witness Cox. I received a Bachelor of Science Degree in Management from the University of West Indies in 1979, with a concentration in Accounting. I subsequently earned a Master of Science Degree in Accounting, also from the University of West Indies. I am a member of the Jamaican Institute of Chartered Accountants.

I joined Florida Public Utilities Company in 1999, and I hold the position of Financial Analyst, which reports to the Chief Financial Officer. In this position, I support the CFO, the Accounting and Finance Divisions of Florida Public Utilities. My position covers a variety of operating and planning responsibilities including project assessment, budget and financial projections, and cash flow analysis. I assist in the preparation of quarterly reports to our Board of Directors, and the compliance monitoring with respect to the Financial Covenants of Florida Public Utilities Company's long- and short-term sources of external funds.

Deleted: Department, and the Marketing

Deleted: and support.

Formatted: No underline

Witness Camfield. Yes. I joined the Michigan Public Service Commission in 1976 as a staff economist. During my tenure with the Michigan Commission, I was involved in several retail electricity and natural gas pricing issues, and I testified in rate case proceedings regarding cost of capital and retail gas tariff design. I joined the New Hampshire Public Service Commission in 1979 as the senior economist, and held the position of chief economist beginning in 1981. As Chief Economist, I was responsible for the administration of the economics department of the Commission Staff. I oversaw the analysis of regulatory issues, the coordination and guidance of staff participation in regulatory proceedings, the preparation and development of testimony, and I provided policy advice to the Commission on a variety of issues such as construction work in progress, financial planning, and the determination of PURPA Section 133 rates. I joined Southern Company in 1983, and held positions in several departments including Pricing and Economic Analysis at Georgia Power Company, Costing Analysis of Southern Company Services, and Southern Company's Strategic Planning Group. In 1994, I joined Laurits R. Christensen Associates, Inc. ("Christensen Associates") as a senior economist, and currently hold the position of Vice President with Christensen Associates Energy Consulting LLC., a subsidiary consulting group of Christensen Associates.

My experience covers a gamut of issues facing regulated industries. I have been involved in the negotiation of power supply contracts and the terms of franchise licenses. My overseas assignments are several, and I have managed a large market restructuring project in Central Europe. I have served on national and regional advisory panels, and I have advised integrated electric utilities, independent power producers, transmission and distribution companies, utility associations, offices of consumer advocate, and regulatory agencies on numerous policy and technical issues. Innovations include two-part tariffs for transmission services, web-based self-designing retail electric products, marginal cost-based cost-of-service methods, and principles for efficient pricing of distribution services. I have published chapters in technical books, reports, and articles in noted journals such as *The Electricity Journal, IEEE Transactions on Power Systems*, and *CIGRE.* Currently, I serve as Program Director of the Edison Electric Institute's Market Design and Transmission Pricing School.

Q. Can you please review the statutory mandates that guide the determination of rate of return for public utilities?

A. Yes, the statutory principles of rate of return for public utilities substantially rest with two decisions of the Supreme Court of the United States. In the Bluefield Water Works and Improvement Co. v. Public Service Commission of West Virginia case (262 U.S. 679, 1923), the U.S. Supreme Court set forth its view on fair rate of return, as follows:

> "...A public utility is entitled to such rates as will permit it to earn a return on the value of the property which it employs for the convenience of the public equal to that generally being made at the same time and in the same general part of the country on investments in other business undertakings which are attended by corresponding risks and uncertainties; but it has no

constitutional right to profits such as are realized or anticipated in highly profitable enterprises or speculative ventures. The return should be reasonably sufficient to assure confidence in the financial soundness of the utility and should be adequate, under efficient and economical management, to maintain and support its credit and enable it to raise the money necessary for the proper discharge of its public duties. A rate of return may be reasonable at one time and become too high or too low by changes affecting opportunities for investment, the money market and business conditions generally."

A second landmark decision of U.S. Supreme Court echoed, fortified, and expanded upon the fair return standard established by the "Bluefield" decision cited above for capital committed to public utilities. This second decision is the Federal Power Commission v. Hope Natural Gas Company case (320 U.S. 391, 1944). A most relevant passage of this latter decision is as follows:

> "From the investor or company point of view it is important that there be enough revenue not only for operating expenses but also for the capital costs of the business. These include service on the debt and dividends on the stock… By that standard the return to the equity owner should be commensurate with return on investments in other enterprises having corresponding risks. That return, moreover, should be sufficient to assure confidence in the financial integrity of the enterprise, so as to maintain its credit and attract capital."

These longstanding decisions provide the recognized framework for the fair rate of return on capital committed by investors to public service. In these decisions, the U.S. Supreme Court codified, in clear and readily understandable terms, a statutory benchmark that serves as the basis to set fair and equitable prices for retail public services such as natural gas, while also providing a fair rate of return on the capital provided by investors. Though they reach back many years, these decisions remain to this day the cornerstone for the determination of rate of return requirements. The challenge for regulators, regulated utilities, and interested parties to regulatory proceedings is to operationalize these principles in contemporary regulatory processes.

Q. Please provide an overview of your approach to the determination of the rate of return requirements for Florida Public Utilities Company.

A. Our approach follows the prescribed methodology of the Florida Public Service Commission to determine the overall weighted average cost of capital ("WACC") and the overall rate of return, for regulatory purposes. Specifically, we develop a forward-looking consolidated capital structure for the year 2008 with the exclusion of capital structure balances associated with the Company's propane subsidiary, Flo-Gas. For determining retail prices in the instant docket, the recommended capital structure is determined on the basis of the 13-month average balances of the components that comprise the capital structure of the Company. We develop a traditional capital structure including the key elements of long-term debt, short-term

Deleted: s

Deleted: FloGas

debt, preferred stock, and common shareholder equity. Similarly, we develop a regulatory capital structure that contains, in addition to these components, balances for customer deposits, accumulated deferred taxes and accumulated investment tax credits of the Company dedicated to providing retail electricity services. Traditional elements of the capital structure are scaled pro rata, such that the regulatory capital structure, in total, matches the rate base attributable to the provision for electricity services.

It is good regulatory policy to accurately capture the means by which Florida Public Utilities Company underwrites its assets and rate within the regulatory capital structure, providing that such structure contains an appropriate balance of equity and debt, given the regulatory and operational business risks facing the Company. Contemporary business, regulatory, and financial risks confronting energy utilities are higher than in past years. Consequently, and consistent with the business objectives of providing low-cost and reliability service, Florida Public Utilities will fund its assets with larger equity participation in total capital than in years past and, to this end, the year-end 2008 capital structure is a better representation of the expected capital structure of the Company. This is because the year-end balances capture the prospective weight, on average, that common equity will assume within the Company's capital structure. Furthermore, the year-end balances of the components of capital provide a better balance of debt and equity for the purpose of minimizing the weighted average cost of capital. Accordingly, the adoption of the projected year-end capital structure to determine retail prices, which would constitute a departure of the Florida PSC from its general policy of using the 13-

month average capital structure, would be in the long-term interests of retail consumers and the Company as well. Accordingly, we offer the year-end capital structure as an alternative to the 13-month average approach.

The cost rates applied to the 13-month 2008 balances of long-term debt and preferred stock include the interest rate on the face amount and issuance costs unique to each individual issue, and related debt expenses where appropriate. The cost rate applied to customer deposits balances is based upon market segment-specific interest rates, as determined by the Commission. The balances for accumulated deferred taxes and investment tax credits are included in the regulatory capital structure at cost rates of zero and the overall cost of capital stated on a traditional basis, respectively.

Deleted: i

Deleted: T

Deleted: C

Deleted: - Zero Cost

Deleted: What about the Non-Zero Cost Tax Credits???

The rate of return for common equity is determined by applying four capital cost assessment methodologies including Discounted Cash Flow, Capital Asset Pricing Model, and an assessment of Realized Historical Returns. The latter approach constitutes a benchmark by which investors gauge the prospects attending financial assets and, along with other information, form expectations of future returns. By assumption and empirical assessment, efficient markets value (price) financial assets accordingly. These three methods are well founded by modern finance theory and are often used to determine the cost rate for common equity capital. A fourth methodology, referred to as *ex post* Risk Premium, infers the underlying opportunity cost of capital on a basis of the relative risks of debt and equity capital.

Deleted: form

Deleted: such as

Deleted: d

Q. Can you please summarize your findings and recommendations?

Deleted: 66

A. Yes. Our studies give rise to an overall rate of return recommendation of 8.07%. The determination of the 8.07% rate of return is shown on Exhibit 1, which reveals the balance amounts for each financial component of the capital structure, the share that each component represents, the attending cost rate, and the overall rate of return. As mentioned above, the overall rate of return recommendation is based upon a 13-month 2008 regulatory capital structure that, consistent with utility regulatory policy in the State of Florida incorporates customer deposits, accumulated deferred income taxes, and investment tax credit balances.

The recommended 8.07% overall return level incorporates a common equity return of 11.50%. As mentioned, the opportunity cost of shareholders of Florida Public Utilities Company is assessed with four analysis methods. The results of studies employing these valuation methods are shown on Exhibit 2, along with the equity return recommendation.

Deleted: sis

Deleted: tical

This recommendation, if adopted by the Florida Public Service Commission, will enable Florida Public Utilities Company to continue to provide highly reliable electricity service to its customers at favorable prices. At the same time, the recommendation provides an adequate level of compensation to the shareholders of Florida Public Utilities Company on the capital that they have committed to the Company. Satisfactory returns to equity also enable the Company to continue to attract long- and short-term debt at favorable terms and interest rates that, in both the near-term future and the long-run, are in the best interest of retail electricity consumers.

Fair and adequate allowed returns to capital are vital, and we cannot over-emphasize to the Commission the importance of setting the overall rate of return at a sufficient level, particularly in the current environment of considerable levels of risk and uncertainty. The determination of an adequate return level by the Florida Public Service Commission signals to the investment community including mutual funds, long-term private investors, speculators, mortgage bankers, and commercial banks that the business and regulatory environment in which Florida Public Utilities Company operates has continuity and stability over the long term. Importantly, it also signals that the Commission is supportive of the Company and the job that we do on an on-going basis for retail consumers.

Q. Electricity is intermingled with and highly dependent upon energy markets, particularly markets for primary fuels. Can you please provide a profile of contemporary electricity markets and the implications for electricity distributors and the cost of equity capital?

Deleted: t

Deleted: the

A. Infrastructure industries, including the electricity services industry in particular, is undergoing significant restructuring with no immediate end in sight. The dimensions of restructuring assume a number of dimensions including service

Deleted: ha

unbundling in both retail and wholesale markets including competitive entry, new mechanisms to determine the prices for services. At the wholesale level, utilities face and are part of the expansion of wholesale services and contract mechanisms to hedge varying degrees of risks; divestiture of generation; and the appearance of wide scale participation in wholesale electricity commodity markets by power traders and speculators, who are deeply involved in commodity markets generally. Wholesale markets are being organized through the auspices of regional transmission organizations referred to as RTOs. RTOs serve as the agent for markets as a whole, where regional markets are unbundled according to time (hourly markets), space (locational pricing of energy), and services including energy, reserves (including regulation, spin, non-spin, and supplemental categories), as well as financial transmission rights (FTRs) of various types. While wide scale change has been in the works for years and is arguably most pronounced at the wholesale level, as precipitated in a major way by the Energy Act of 1992, significant change has been and is currently underway within retail markets as well. At the retail level, regulated utilities face a gamut of changes regarding new regulatory governance arrangements including pre-approval, decoupling, and various performance assessment mechanisms; auctions for provider of last resort ("POLR") services; renewable resource portfolio standards, and new rules and requirements regarding reliability requirements, aside from the new reliability (and implied cost) commitments imposed on service providers by the North American Electric Reliability Council ("NERC"), which has been recently appointed by the

Federal Energy Regulatory Commission ("FERC") as the national reliability organization ("ERO").

Driven to improve earnings performance and exploit growth opportunities, many integrated electric utilities have since the late-1980s pursued non-regulated business ventures including activities fairly far afield from electricity services such as real estate and insurance, and diversified energy services including distribution operations, nuclear generation, and renewable resources, and power trading. In a number of cases, generation (and to a lesser extent transmission) assets have been sold off to independent generation companies or unregulated generation entities have been formed from the generation business units of the integrated utilities. At this point a much larger range of business activities and business organizations and entity structure is present within the electricity services sector of the economy, obtained through competitive entry and consolidation of functionality across entities. The financial performance of entities within the electricity services industry, included the expected returns to capital and the risks attending those returns, and is much more closely linked to energy markets, generally.

The net result is generally positive, as competitive entry arguably obtains reduced costs to the benefit of consumers, at least in the long run. Nonetheless, these changes in structure, much of which have been accompanied by and ushered in through regulatory changes, have also raised capital risks associated with electricity

Deleted: all

Deleted: s

services, as perceived by investors. This backdrop of higher capital risks occur at a time when electricity service providers including Florida Public Utilities Company face steadily expanding electricity service demands and an array of new requirements covering, among other things, capital renewal at a time of fast rising costs for electrical equipment.

(further discussion forthcoming)

Q. Your testimony mentions capital risks and capital renewal. Perhaps you can elaborate on the meaning of capital, and how it comes about.

A. Capital refers to economic resources. Capital is accumulated savings over time, where savings refers to the proportion of the output of an economy that is not consumed as current goods and services. Essentially, savings is the share of output held back and invested in—i.e., put into—capital resources. In the broadest interpretation, capital is output-producing goods (and services). The cumulative level of investment over time, covering many years and centuries, constitutes the capital stock of an economy and a society. It is useful to mention that capital can assume various investment forms aside from financial assets in private and public companies and other entities. The stock of capital includes real estate, household goods, education, public property and infrastructure such as libraries, museums, parks, roads, and transit systems. Individuals, firms, and government entities invest funds in capital resources if the expected flows of benefits realized by the investments in the future are equal to or greater than the value of current consumption given up or foregone.

Formatted: Space After: 0 pt

Q. Please review the notions of cost of capital, opportunity cost of capital, and discuss how risk affects the opportunity cost of capital.

Deleted: ¶

Formatted: Indent: Left: 0", Space After: 0 pt

A. The cost of capital is the compensation required by investors for postponing consumption, for expected inflation, and for exposure to capital risks of various dimensions. *Cost of capital* refers to the underlying interest rate used to discount expected benefit flows of capital resources including returns to financial assets, and is sometimes referred to as the rate of discount, or simply the discount rate.

Financial assets include a multitude of debt vehicles, equity, and derivatives, and are tailored to participants of capital markets including household, small business, corporate, and government segments. Participants across these segments can supply capital—i.e., investors including lenders and holders of common and preferred stock—and also demand capital (borrowers and common stock issuing companies). Commercial banks, credit unions, finance companies, capital exchanges, and investment banks serve as intermediaries that provide the institutional means that facilitates the interaction and linkage of the supply and demand sides of financial markets. These functions essentially include lending, borrowing, and the issuance of equity vehicles. Banks and credit unions borrow (and store) financial assets that in turn are invested in the form of debt and to a lesser extent equity.

Deleted: t

Household debt vehicles include, for example, personal loans covering appliances, household services, and credit card mechanisms through finance companies and banks, and real estate and so-called home equity loans. Business loads include short-term loans and lines of credit with banks, inventory financing through business wholesalers, and commercial paper of various terms. Corporate debt can be in the form of lines of credit with banks, and mortgage and debenture bonds, while government debt can be in the form of revenue bonds of cities, and short- and long-term debt of various terms.

Deleted: mortgages

Equity refers to common and preferred stock, where the investor assumes a share in the ownership of a corporate entity. In some cases, debt instruments can participate in equity returns and have rights of conversion to common stock. Derivatives refers to options and forward contracts that are specifically designed for speculation and risk hedging, where the market worth of the derivative is determined by investor expectations in the underlying price of a financial asset or commodity.

The underlying cost of capital is relevant to investors and, in the large, individuals and entities (including government entities) that provide savings and thus the accumulation of capital within the macro economy. In the case of financial assets, expected benefits are in the form of future cash flows including interest payments, dividend payments, market appreciation, and return of principal. When investors supply funds to entities such as utilities and government entities and municipalities, not only are they postponing consumption—giving up the value of alternative

Formatted: Indent: Left: 0.38", Space After: 0 pt

Deleted: . in the case of

Deleted: the

Deleted: le

expenditures in some other way, they are also exposing funds to the devaluation of ongoing inflation and various uncertainties and risk attending future cash flows. Investors are willing to incur these risk factors only if they are adequately compensated. While the market prices of other inputs including labor, materials, energy can be easily verifiable, the cost of capital—essentially, the price of capital—is not easily discerned and, all too often, requires estimation through the cautious application of analytical methods.

The cost of capital, however, remains positive (>0) absent inflation and risks, as savers require compensation for foregoing the right to use the funds saved for consumption of goods and services—essentially, the time value of money.

The cost of capital is determined by the demand for capital, supply of savings, expectations of inflation, and perceptions of risks harbored by participants in capital markets. The demand for and supply of capital are determined by expectations of future levels of economic activity, while expected inflation is driven largely by monetary policy over the relevant timeframe. Perceptions of risk, in turn, cover many dimensions including uncertain government policy and the effects of natural phenomena such as weather. The cost of capital—the discount rate stated in nominal terms—increases with rising demand for capital, with expectations of higher rates of inflation, and with heightened perceptions of risk.

Deleted: ¶

Deleted: The cost of capital, however, remains positive (>0) absent inflation and risks, as savers require compensation for foregoing the right to use the funds saved for consumption of goods and services—essentially, the time value of money. ¶

Dimensions of risk also cover idiosyncratic risks associated with specific capital resources, such as that of individual entities or companies. Accordingly, financial markets will re-price downward the bonds of a private company, should the *current* financial condition of the company suddenly decline. Essentially, the decrease in the company's current condition, reflected as reduced interest coverage—causes the expectation of the future condition of the company to also decline. Expectations of future financial conditions (possible states) of the specific company are idiosyncratic risks. Because cost of capital rises with increased risks, the price of the bonds decline. Bond prices and discount rates, in the form of the net interest rates or bond yields (and yield to maturity), move in opposite directions; bond yields increase as bond prices decline, and decrease as bond prices rise.

Resources migrate to the highest valued use and worth, given perceived risks, such that the returns to capital are equivalent to opportunity costs. The various forms of capital compete among themselves for savings and with other non-capital resource inputs and opportunities. Similarly, the vehicles of investment of individual entities, such as the specific bonds of a municipality or the common stock of a company, must compete for savings through a process of capital attraction. That is, if the outlook for earnings of a company rises, participants in capital markets—investors—allocate more capital to the company by bidding up the price of the stock thus increasing the company's market capitalization. Conversely, perceptions of heightened risks associated with the debt of a company or municipality precipitates a decline in the market value of the outstanding bonds, as capital migrates from the company/municipality to other resource opportunities. Thus, the prices of financial assets of entities including debt and equity securities are highly sensitive to perceptions of risk. Capital markets trade off risks and expected returns, given the overall menu of available choices, as alternative opportunities. At an undefined point in time such that levels of supply and demand for capital and expectations of inflation are roughly equivalent (as a matter of consensus), the cost of capital is a matter of risk. Essentially, then, the cost of a specific source of capital is basically determined by the underlying riskiness of that investment in view of alternative opportunities that, together, represent the investors' current opportunity set. Hence, cost of capital associated with specific investment opportunities, are only differentiated by risks, as the other factors that impact cost of capital—i.e., supply-demand, inflation expectations—are common to all investments, and capital more generally. Competitive capital markets, through the process of assessing, buying, and selling, ensure that the expected payoff in the form of market rate of return is approximately equal to that of other investments of equivalent risk. In short, debt and equity investment vehicles of comparable risk are priced the same. If not, investors as participants in capital markets will bid up securities with comparatively low risks and bid down others with comparatively high risks. If investor perceptions of capital risks attending a utility increase—or the expectations for returns decline—markets bid down the securities of the utility. This implies that a utility will be unable to attract capital on equivalent terms, a result that is manifested in either of two ways: the quantity of capital acquired, in the form of new securities offerings, is reduced for a given level of return (stated in

Deleted: g

dollars), or a higher prospective rate of return attends the new offerings—it costs more to obtain an equivalent quantity of capital.

As mentioned above, investor rate of return is the discount rate that causes the present value of the expected cash flows, as receipts realized by investors, to equal the market value of the financial asset. From the utility side, the cost of funds raised to the utility through the sale of securities is equal to the discounted present value of the cash outflows to be paid by the utility, as expected by investors. But since the (positive) cash flows stream to the investor is identical to the cash outflows of the utility, the two discount rates must be identical, abstracting from the effects of flotation costs, which causes the costs to the issuer to exceed the return required by investors to the extent that flotation costs decrease the net amount of funds actually available to the issue. In other words, the cost of capital to the utility is synonymous with the investors' expected rate of return. Hence, the cost of capital is the discounted expected cash flows necessary for the security to "pay the price"—i.e., in order to satisfy investors' required rate of return.

When capital markets are sufficiently competitive, they ensure that the market value and worth of financial vehicles of the outstanding debt and equity—as held by the investment community, which can include households, financial institutions, government entities, and non-financial companies, is set (i.e., priced) at a level such that the returns to capital approximate the cost of capital. Because investors are averse to risks, competitive financial markets price financial assets inversely according to perceptions of risks, all other factors held constant.

Q. Why is this conceptual construct relevant and how does it relate to Florida Public Utilities and its capital needs?

Formatted: Indent: Left: 0", Hanging: 0.38", Space After: 0 pt

Formatted: Space After: 0 pt

A. As discussed, capital resources are the result of cumulative investment, and are obtained or funded directly or indirectly from savings of households and firms over time. Savings is the share of income of the economy as a whole that is not expended as consumption within a current period, and is typically measured as dollars or percentage shares in either quarterly or annual periods. This means that the capital resources employed by Florida Public Utilities Company including power delivery systems such as transformers and lines, meters, trucks and vehicles, computer systems, software, office facilities and buildings, inventory and stores, and land are costly, where cost is reflected as the annual carrying charges on capital, measured in the form of the net utility rate base.

Whereas the cost of skilled labor, materials and supplies, purchases of generation and transmission services, or other inputs used into the production process of utilities are expressed in money terms – *e.g.*, purchased power stated as dollars per megawatt hour – the cost of capital is expressed as an interest rate, typically shown as an annual percentage of the principal amount committed by investors. The cost of capital – or perhaps more accurately, the *cost rate of capital* – to the firm can be referred to as the *required rate of return* (%) on the capital resources committed by investors. In the case of public utilities, invested capital is referred to as the rate base, valued at either original cost or fair market value. For the determination of setting retail prices in the U.S., the regulatory convention is to value the capital of public utilities at original cost.

To facilitate the commitment of capital (investment) by savers and their agents to the firm, the firm offers property rights, including bonds or promissory notes to debt holders and shares of stock to equity investors. These property rights define the commercial terms and conditions under which savers and their agents, as investors, commit capital. Property rights are capital (financial) assets, and are generally tradable. Financial assets are claims on the income of the firm as compensation for the commitment of capital, and are the financial obligations of the firm. Shares of stock constitute ownership in the firm.

In the case of long-term debt – *i.e.*, mortgage bonds, debentures, and long-term notes – the interest on the principal (face) amount of a bond (debt) or the coupon rate on the share of preferred stock defines the level of compensation. Often, the interest rate is a predefined annual rate that remains fixed over the term of the debt. However, long-term debt instruments can have a number of other provisions that, in essence, provide for more complete contracting by managing risks through risk sharing between the debt holders and the borrower (the firm). These provisions can include 1) adjustments to the rate of interest to reflect contemporary market conditions *and* rates of inflation, 2) participation in earnings of the firm, 3) conversion rights, and 4) voting rights in the management of the firm.

In the case of short-term promissory notes, agreements with commercial banks define the mechanism by which interest, stated in dollars, is determined. Often, the commercial terms of promissory notes define interest to be paid monthly on the outstanding daily balance (principal) outstanding. The rate of interest applied to the outstanding balance is typically tied (indexed) to the interest rate on obligations of some widely known financial market – say, the London Inter Bank Offer Rate (LIBOR) or Fed Funds – which also varies daily or monthly.

Common stock property rights are somewhat different from other financial obligations because, as owners of the firm, the returns to shareholders are residual amounts following the compensation of other resources employed by the firm including debt obligations. Common equity is essentially compensated last, and bears the burden of much of the business, regulatory, and financial risks of the firm. For this reason, common equity is, in virtually all cases, more costly than other forms of financial instruments.

As with other markets, capital markets have primary and secondary dimensions. Primary markets are the institutions and processes that facilitate the initial sale of the financial obligations of the firm to initial investors, whereas secondary markets are structured market processes that provide the means by which investors can purchase and sell existing rights, including shares of stock and debt obligations. Financial instruments can assume many forms, and debt securities (bonds) and equity shares are actively traded in financial markets, which are generally considered to be highly liquid and competitive. However, to the degree that the financial obligations 1) carry specialized and non-common commercial terms, and 2) for firms that are of small scale, the secondary – and to a lesser extent, primary market – is less liquid. In short, the pool of buyers and sellers is limited; thus, the volume of transactions is comparatively small and sometimes intermittent. Relatively low levels of liquidity imply higher transaction costs and risks to investors, which translates directly into higher costs of capital to the firm.

Competition is a term that describes some markets, and markets are said to be competitive if certain conditions exist. Markets can be characterized as competitive if they involve: 1) a very large number of buyers and sellers, 2) information relevant to the determination of prices is readily available, complete and not costly, and 3) transactions costs are low. Because of the workably competitive nature of financial markets, arbitrage opportunities are more or less exhausted. This means that, for both primary and secondary markets, financial property rights trade at levels (prices) such that perceived risks and opportunity for prospective returns to capital are appropriately balanced and approximate that of other investment opportunities. Thus, above-normal returns, which implicitly include compensation for risks, cannot be seemingly realized by investors over prospective periods in systematic fashion.

Formatted: Indent: Left: 0.38", Space After: 0 pt

Deleted: and

Deleted: systematically

Deleted: .

Competition inherent to U.S. and worldwide financial markets ensures that the prices of common shares (share prices) and bonds are at a level that reflects the opportunity cost of capital. As an example, assume that the perceived risks attending the returns to common shareholders of firm A are equivalent to that of firm B and other firms. If the share prices of firm A suggest a market return 10%, while the prices of firm B and other firms of comparable risks suggest (allow) market returns of 13%, the market price of firm A will fall to a level that provides a basis for market returns of just 13%, prospectively. A price that allowed for a 10% prospective market return is insufficient in the presence of opportunities for market return of 13% on alternate investments of comparable risk. Essentially, the 13% market rate of return on investment alternatives constitutes the opportunity cost of capital. Most remarkable is the expedience – literally, in minutes – with which share prices adjust to levels that appropriately balance prospective returns to equilibrium levels *based upon perceptions of risks*. In short, equivalent and comparable risks translate directly into comparable rates of return, which is the cost of capital of common shareholders in – and thus of – the firm.

As mentioned early on, the cost of capital is a function of the demand for and supply of capital, investor expectations of inflation, and investor perceptions of risks. Because the conditions of demand and supply as well as expectations of inflation are more-or-less common to financial markets at any point in time, financial vehicles are differentiated by risks. Hence, the expected returns and prices of bonds and common shares (normalized for denomination and size) at any point in time are largely if not exclusively differentiated by perceptions of risk.

Formatted: Space After: 0 pt

Q. Would you please review the capital structure, interest coverage requirements, and the implications for sufficient coverage?

A. Interest coverage refers to the times that debt interest is covered by income, and is the most important measure of investment risk of corporate debt. Interest coverage is a major concern of Florida Public Utilities Company as it is the basis upon which the Company maintains its favorable credit standing with markets and continues to obtain long- and short-term debt at favorable rates of interest. Pre- and After-Tax Interest coverage under the recommended capital structure and rate return is **XXX** and **XXX** times, respectively.

For purposes of comparison, we also show interest coverage over the historical timeframe on Exhibit 13. As can be seen the coverage implied by the recommended rate of return is adequate though not at a robust level. Two conclusions are reached:

1) While the implied coverage level is acceptable, the Company must sustain a flow of earnings at consistent levels in order to maintain adequate coverage and also satisfy debt covenants.

2) Contingency events and business conditions that give rise to sudden and unexpected changes in revenue or cost flows can imply immediate shortfall in coverage. In short, the coverage level obtained from earnings

at the recommended rate of return is only adequate in today's environment of higher capital risks.

The importance of coverage cannot be overstated. Indeed, in discussions with investment banks, commercial banks, and stock analysts regarding the financial conditions and soundness of the Company, a salient point of concern continues to be coverage of debt. Lending entities, private investors, and investment banks continue to emphasize the importance of consistently-realized adequate interest coverage as the essential measure of the Company's capability to service long- and short-term corporate debt.

Deleted: about

As can be seen, the recommended rate of return requirement, 8.07%, provides satisfactory interest coverage. And although the overall return recommendation provides adequate coverage, it is certainly not abundant. Hence, it is absolutely necessary that Florida Public Utilities Company realize adequate and sustained flows of income to ensure that the Company satisfies credit risk requirements. Coverage is our window of access to capital at favorable rates of interest and under reasonable terms, enables the Company to provide electricity services. Setting the overall rate of return at a satisfactory level of 8.07% is necessary and in the best interest of retail electricity consumers.

Q. **What is the appropriate capital structure for determining retail prices in this docket?**

Formatted: Space After: 0 pt

A. In the absence of large-scale subsidiary operations, the Florida Commission should generally utilize a consolidated capital structure where such approach provides a reasonable balance between debt and equity. Under such conditions, the Commission is assured that the service provider is, in the best interest of retail consumers, underwriting its assets dedicated to providing utility services at least cost.

Deleted: can be well

This can be viewed as a principle that defines criteria useful to the Commission in regulatory decisions regarding the issue of the appropriate capital structure for the determination of retail prices. Specifically, and as a general rule, the Commission should only deviate from a consolidated capital structure when this condition – i.e., an appropriate balance between debt and equity – is not satisfied. The corollary to this principle is that the Commission and its staff should never remove or add accounting-based line items from a consolidated capital structure that is appropriately balanced. Two facts of financial accounting underlie this corollary, as follows:

Deleted: statement

Deleted: is essentially

Deleted: – a principle of financial prudence –

Deleted: sets forth

Deleted: a

Deleted: for

Deleted: to apply in its

Deleted: on the

Deleted: ratemaking purposes

Deleted: That is,

Deleted: ¶

1) A firm cannot ever trace and identify, as a matter of dollar flows, specific sources of funds to specific uses of funds. The Treasury of a firm essentially constitutes a pool or inventory of current funds, cash, that continually experiences fund inflows and outflows. One cannot say that a specific source of funds is earmarked for a specific use. As an example, one cannot say that cash flow returns and operating income that arise from the Company's electricity operations are used solely to underwrite resources for the electricity business. Electricity-sourced cash flows are, in fact, used across the combined

Deleted: , dollars,

operations of the natural gas, electricity, and propane businesses of the Company – and similarly for the natural gas and propane operations.

2) The Company's balances of long-term debt, short-term debt, preferred stock, and common equity stated on a consolidated basis represent the accrual over years of the net flows of funds of the Company including external and internal sources. The balances for these financing vehicles can and should be used as the basis by which the Company underwrites any and all of its assets, stated on either a consolidated or an individual basis. This is simply a business, accounting, and financial fact.

There is no reasonable basis, thus, to exclude Flo-Gas balances from the Company's capital structure for purposes of setting retail electricity prices in the current docket. Indeed, exclusion of Flo-Gas balances may harm retail electricity consumers in various ways, aside from the inherent contradiction to the realities and facts of financial accounting identified above.

Second, exclusion of Flo-Gas balances from the capital structures used to set prices for the regulated operations, including electricity and natural gas, implicitly assigns common equity, which is comparatively high cost, to the Company's unregulated propane operations, placing the propane operations at a competitive disadvantage with other propane companies. One can expect that other companies will leverage assets in a manner similar to that of the Company, in order to finance propane and competitive, non-regulated energy services. As a consequence, the Company needs to follow a similar policy. If the Company is required to assign only equity to non-

regulated operations, it is implicitly forced to charge correspondingly higher prices in order to generate adequate returns.

Third, the consolidated capital structure of Florida Public Utilities Company stated on 13-month average basis for 2008 represents a sound balance of debt and equity financing that fully satisfies the financial needs of the Company, particularly in view of the comparatively small size of Florida Public Utilities. This is evidenced by the comparative sample of electric utilities used to determine the cost of capital. Specifically, equity participation within the Company's 2008 capital structure resides within one standard deviation of the average participation of the sample. Hence, the Company's financing policy and strategy conforms to a reasonableness standard, in addition to fully satisfying the financial prudence and flow of funds criteria outlined above.

Nonetheless, the recommended weighted average cost of capital presented within our testimony follows the Commission's prescription. Namely, the Flo-Gas balances are excluded from common shareholder equity for purposes of determining the overall rate of return to set retail electricity prices within the immediate docket.

Formatted: Space After: 0 pt

A. Yes. Florida Public Utilities Company has raised long-term debt from time to time based upon the need for capital and our Company's financial policy of maintaining a balanced capital structure. Because of our conservative management philosophy, we have consistently raised new debt issues at favorable rates of interest at the time of issue. Contributing to favorable interest rates are the conservative sinking fund provisions of the earlier higher cost debt issues of the late-1980s – early-1990s. The cost rate of 7.96% for long-term debt, shown in the column entitled "Annual Cost Based Rate" of Exhibit 3, reflects the weighted average cost of the five issues of long-term mortgage bonds of the Company, currently. These debt issues have face interest rates of 4.90% to 10.03%, and were issued by the Company over the period 1988 – 2001. The balances shown reflect the amounts that the Company expects to carry on its balance sheet on average over the year 2008 and beyond. The Company does not plan to issue long-term debt during the interim two years. The 7.96% overall cost of long-term debt reflects issuance costs and losses on reacquired debt, which causes the effective cost rate to be somewhat greater than that of the weighted cost of the face interest rates alone. The 7.96% overall cost rate for long term debt is calculated using the amortization schedule for debt expenses. This costing procedure follows the conventional accounting approach to determining the cost rate for long-term debt, and is consistent with the policy endorsed by the Florida Public Service Commission.

Q. Please review the cost rate of short-term debt and related issues?

A. Florida Public Utilities Company maintains, and expects to maintain over the foreseeable future, a short-term debt facility that makes available short-term debt at a cost rate determined by London Inter Bank Offer Rate (LIBOR). The short-term debt cost rate is equal to the 30-day LIBOR plus 90 basis points, plus other charges related to unused facility balances as well as fees charged for the facility itself. The amount of capital available through the Company's short-term debt facility is equal to $15 million currently, and is expected to decline to $12 million beginning in June of 2008. The change in the level of short-term funds available corresponds with the issuance of additional shares of common equity, which is scheduled for the middle of 2008.

Deleted: .

The key short-term interest rate is the Fed Funds rate. Historically, Fed Funds have traded 18 Basis Points below LIBOR over the 1990 – 2006 timeframe. The interest rate on Fed Funds is determined by the monetary policy of the Board of Governors of the Federal Reserve Bank, and closely follows that of short-term U.S. Treasury Bills. Historically, Federal Funds "trade" at interest rates slightly above that of 90-day T-Bills. At this point, we anticipate with the apparent consensus view that monetary policy and thus the short term interest rates will hold firm at current levels over the foreseeable future, which implies a fed funds rate of 5.25%, which implies a LIBOR interest rate of 5.43%. In turn, this result translates into a cost rate of 6.33% for the outstanding balances on short-term debt balances, once the margin above LIBOR is recognized. The fees associated with the unused credit line and direct charges when coupled to charges for the outstanding balances obtains an overall effective short-term debt interest rate of 6.81%, which is applied to the 13-month average balances of short-term debt.

It is useful to briefly describe the longer history, as it relates to the determination of short-term interest rates. Specifically, the Federal Reserve followed a policy interest rate targeting for a number of years prior to late-1979, when money supply targeting was abruptly adopted. The result was high and volatile short-term interest

Deleted: rather

rates though money supply targeting arguably reduced substantially the high levels of inflation and inflation expectations of the early 1980s. From the mid-1980s forward, monetary policy has been more accommodative of economic conditions and needs, with the long-term objective of containing overall inflation at moderate levels. As observed during the 1990s, the Federal Reserve has employed an array of indicators and metrics to determine monetary policy including reserve targeting. As a general rule, reserve targeting gives rise to greater variation in short-term interest rates, while interest rate targeting, which suggests greater variation in the supply of reserves, suggests less variation but, depending upon the stage of the economy, substantially higher or lower interest rates. At this writing, short-term interest rates, with fed funds residing at 5.25%, are expected to hold over the foreseeable future barring changes in the expected level of economic activity or current escalation of core inflation.

The use of the current 5.25% fed funds interest rate as the basis for the Company's effective short-term debt cost rate is in keeping with the Commission's decisions regarding the Company's rate change filings of 2003 and 2004. Also and as mentioned above, this interest rate level appears at this time to be likely to hold over the foreseeable future.

Deleted: than currently observed.

Finally, we wish to discuss methodology used to determine the effective interest rate for 2006. The interest rate charges on the Company's short-term debt facility is based on daily balances. If the daily balances closely approximate month-end balances, month-end balances provide a useful basis to determine the average short-term debt cost rate, where the cost rate is determined by dividing interest charges by the outstanding balances. Where the daily balances deviate significantly from the month end balances, however, this approach will not obtain accurate reflection of the Company's true cost rate on short-term funds. This was the case for the Company during 2006. Accordingly, the short-term debt interest rate for the historical year 2006 is developed using the average daily balances, which accurately reflects the true cost rate incurred by the Company on short-term debt during that year.

Q. Please review the cost rate of preferred stock?

A. Florida Public Utilities preferred stock consists of a single issue of 6000 shares that dates to December 28, 1945 at a coupon rate of 4.75%, as shown on Exhibit 5.

Q. You briefly discussed methods for the determination of the cost of equity capital in the summary of your approach to rate of return. Can you elaborate on the methods?

Formatted: Space After: 0 pt

A. Yes. We begin by reiterating three essential points. First, the cost of equity of the firm – and of investors in the firm – is a function of perceptions of risk, the demand for and supply of capital, and expectations of inflation. Second, the cost of common equity of the firm is equal to the opportunity cost of capital incurred by common shareholders of the firm contemporaneously, though the experience of long-term history guides the assessment of opportunity costs. Third, the cost of equity of the firm is equal to the expected market rate of return on alternative investments of comparable risks available to shareholders – *i.e.,* the opportunity cost of capital.

The determination of the opportunity cost rate for equity capital is challenging for two reasons. In the case of debt, both the market price and future expected cash flow returns to capital are observable by inspection. Thus, the net expected yield to maturity, which reflects the opportunity cost of capital to holders of debt, can be determined directly. This *is* the market rate of return, *ex ante.* For purposes of determining the overall utility rate of return, however, the cost rate of long-term debt is that which is set at the time of issuance in primary financial markets.

In contrast, expectations of investors about the prospective cash flows and market returns on common equity cannot be observed directly, and must be inferred with estimation procedures. Also, allowed equity rate of return is typically set according to the current and expected cost of capital, though much of the equity investment was committed in many years past.

In the determination of cost rate for debt obligations, investors' perceptions of risks are implicit in the primary and secondary market prices of the debt obligations themselves, and need not be known or even estimated. In contrast, the determination of the cost of common equity involves the perceptions of future risks harbored by investors, as a matter of the consensus view. Perceptions of risk are also not observable directly, and thus must be inferred.

In short, the cost of common equity can only be discerned through the proper and careful application of well established methods that provide the cornerstone for modern finance theory. While the methods employed herein are well-established, the procedures to determine the cost of equity capital require estimation of key parameters.

As mentioned, the recommendation for the rate of return on equity for Florida Public Utilities Company is developed by applying four estimation methods. These procedures include variations of the constant growth Discounted Cash Flow model (DCF), and the Capital Asset Pricing Model (CAPM). These classical approaches are commonly recognized within modern finance theory and are readily utilized by the investment community. The results of these two formal models of the cost of capital are augmented by historical returns realized by utility and non-utility companies of comparable risks, and results inferred from the so-called risk-premium methodology.

The constant growth Discounted Cash Flow (DCF) model was originally developed by Myron Gordon in 1957, and was advanced actively during the early 1960s. In its classical form, the derived DCF model defines the cost of capital as the sum of the adjusted dividend yield, and expectations of future growth in cash flows to investors including dividends and future appreciation in share prices. The classical (one-stage) DCF model is as follows:

$$k_{e,j} = D_{0,j}(1+E(g_j))/P_{0,j} + E(g_j)$$

with,

$k_{e,j}$ = cost of equity capital, asset j

$D_{0,j}$ = current dividends per common share, asset j

$E(g_j)$ = expected growth in future cash flow returns to investors in asset j

$P_{0,j}$ = current price per common share, asset j

Formatted: Space After: 0 pt

The one-stage form of DCF model is an elegant and intuitively tractable model with two terms, a mathematical result derived from the constant growth present value model. A cursory review of historical returns of equities suggests substantial variation in growth in the internal returns to capital and market appreciation is both the typical and dominant pattern. It is palpable that the *expected path of future returns* harbored by investors may assume a pattern of non-constant growth. This means that, at least under some market conditions, the constant growth form of discounted cash flow may not represent investor expectations of growth with sufficient accuracy. Arguably, other forms of DCF may serve as better approximations of investor expectations.

Formatted: Space After: 0 pt, Tabs: 3.13", Left

A plausible means to better model expectations of varying growth might be with stochastic models, where the path of returns and growth is a function of time, with a random component. However, stochastic models introduce considerable complexity. As a first order approximation to stochastic processes, multiple step constant growth models known as multi-stage DCF can serve nicely. Essentially, multi-stage DCF is a variation of present value theory which postulates that future returns assume a pattern of several growth steps or stages. While any number of stages of constant growth is possible, two- or three- stages are typically applied. In stylized fashion, the Three-Stage DCF model is shown below:

$$P_{0,j} = (1+g_j)/(k_{e,j}-g_j)\{D_{0,j}(1 - F^5_j) + D_{5,j}(F^5_j - F^{10}_j) + D_{10,j}(F^{10}_j)$$

with,

$k_{e,j}$ = cost of equity capital, asset j

$D_{t,j}$ = current and future dividends per common share, asset j

$E(g_j)$ = expected growth in future cash flow returns to investors in asset j

$P_{0,j}$ = current price per common share, asset j

F = $(1+E(g_j))/(1+k_{e,j})$

Formatted: Space After: 0 pt

Formatted: Space After: 0 pt

Appendix I provides a step-by-step derivation of the classical and multi-stage discounted cash flow models shown above.

The Capital Asset Price Model (CAPM) was developed by William Sharpe (1961) and John Lintner (1964). CAPM was derived from mean-variation analysis and, in particular, portfolio selection developed by H. Markowitz (1952). The derived CAPM shows how the valuation of a financial asset (price) is based upon two components: risk free returns and an *adjusted risk-based return.* Surrogates for risk free returns can be observed directly in capital markets, and include market returns on short- and intermediate-term debt. As a general rule, the cost rates and market returns on government debt obligations serve as appropriate surrogates.

The adjusted risk-based return is based upon three factors: 1) the covariation of the returns to the asset and that of markets for risky assets, 2) the statistical variance of returns of the market for risky assets, and 3) the *difference* between expected overall returns on risky assets, and risk free returns. The third parameter is referred to as the excess return, and is equal to the difference between the overall returns to risky assets for the market as a whole, and the risk free return rate. The CAPM is shown below:

$$k_{e,j} = r_f + B_{jm}*(r_m - r_f) \qquad \text{with, } B_{jm} = \sigma_{jm}/\sigma_m^2$$

where,

$k_{e,j}$ = cost of capital for risky asset *j*, stated in percentage terms

r_f = risk free rate of return

B_{jm} = ratio of the covariation between risky asset *j* and the market as a whole, σ_{jm}, and the variance of market returns, σ_m^2

r_m = rate of return on the market as a whole

Formatted: Space After: 0 pt

Appendix II derives the Capital Asset Pricing Model, as shown above.

The efficient market hypothesis plays an essential role in the determination of the cost of capital. Specifically, the working assumption, which is largely though not completely borne out by empirical analysis, is that capital markets are fairly efficient. This means that the supply and demand for risky financial assets, as reflected in bid and ask prices to buy and sell shares, result in financial assets being traded at price levels where *rates of return above the cost of capital cannot be systematically realized.* Above-normal returns – returns above the cost of capital – are realized only randomly. Essentially, the opportunities to systematically realize returns above the underlying cost of capital are exhausted by the competitive market process.

Estimating the cost of capital though not trivial can be fairly straightforward, and both the DCF and CAPM approaches provide a useful framework. The risks to investors in various sectors of the energy services industry cannot ever be known directly; risks – and hence the implied cost of capital – can only be inferred. Specifically, the determination of useful estimates of the cost of common equity capital within either framework requires a discerning application of theory through careful analysis such as that presented herein. In particular, the determination of the cost of equity capital faces two overarching challenges, as follows:

- both approaches are forward looking and thus the results are highly dependent upon useful estimates of investor expectations about future market performance.
- The underlying assumptions for DCF and CAPM include, among other things, an efficient market and rational behavior of investors such that all opportunities for above- and below-normal returns to capital are exhausted on an expected value basis. In short, capital markets value financial assets

at the implied opportunity costs of capital, given investor perceptions of risk.

It is useful to mention that the notion of *risky assets* can apply to any real or financial asset wherein the prospective returns from holding the asset are uncertain. Risky assets include commodity contracts, financial property rights, financial derivatives, and real assets such as transmission facilities. Risk assessment and option theory, moreover, can be applied to the analysis of unbundled services, such as electricity transmission development plans. Within the context of this discussion, however, risky assets refers to financial obligations of firms – common stock – and asset values refers to prices of common stock as observed on major stock exchanges.

Measurement of historical returns and risk metrics are increasingly used as a basis to assess plausible returns in the future. As discussed, efficient markets suggest that *all* financial assets are priced at levels such that the *expected* future returns of individual assets are equivalent to the underlying opportunity cost. Thus, if historical returns guide expectations of future returns, historical returns provide a useful benchmark and, within reasonable bounds, reflect the opportunity cost of capital. In this respect, the Historical Returns methodology can be viewed as a market-based approach of Comparable Earnings, and thus fully satisfies *Bluefield* and *Hope* criteria. The key to successfully applying this approach is to identify and measure historical returns in a manner that reasonable reflects expectations of investors about the future outlook.

Historically realized returns and future expected returns of financial assets are ordered according to risks. This ordering according to risks is a natural and inevitable result of competitive financial markets: because risk is costly, higher costs must be offset by higher returns. While it is not based upon an explicit model, the analysis of the risk premia among classes of risky assets provides a means to infer the underlying opportunity cost of capital. The underlying concept of the risk premium approach is that *differences* in perceptions of risks among financial assets such as equities and debt are revealed in differences between the historical market returns. The historical differences between equity and debt returns – *i.e.*, the Risk Premium – can thus serve as a surrogate for the compensation for risk in the future. Risk premia, when combined with the expected cost of debt prospectively, provides a useful benchmark to gauge the underlying cost of equity capital.

Deleted: s

Application of the Risk Premium approach contains two potential pitfalls, as follows:

- the opportunity cost of common equity capital, stated in nominal terms, is sensitivity to the demand for and supply of capital;
- the observed risk premia between debt and equity is quite sensitivity to expected inflation, and Risk Premium analysis must account for expected inflation in the future. That is, the underlying rate of inflation and

conditions of the historical period over which risk premiums are estimated must match that of the expected conditions of the relevant period over which the common equity recommendation is being applied, and over which retail electricity prices are being set.

Q. You discuss the importance of comparability and measures of risk as the basis to determine the cost of common equity. Please elaborate.

A. As defined by the "Bluefield" and "Hope" decisions of the U.S. Supreme Court, a public utility is (to paraphrase) entitled to a rate of return on shareholder capital committed for the convenience and necessity of the public equivalent to that realized by companies in other businesses of comparable risk. Thus, the immediate task at hand is comparability: to identify and select companies of comparable business, regulatory, and financial risks to that of Florida Public Utilities Company. Once selected, we determine the cost of common equity for the sample(s) of comparable companies that, by definition, is the opportunity cost of capital.

The starting point is the market portfolio; that is, we begin with virtually all common shares traded on U.S. equity exchange markets. Specifically, we have drawn heavily though not exclusively from a set of data sources including the Value Line data banks, to which we have full access. The Value Line data banks cover some 7000 listings. For these listings, Value Line reports a wide range of financial data, business descriptions and classification, historical price experience, and various diagnostic statistics of interest.

Deleted: 8

From the market portfolio we proceed to develop two samples. One sample known as the *Electric Utilities* sample is limited to electricity service providers that have modest yet significant market participation, and are of comparable risk to Florida Public Utilities Company. The second sample relaxes the "line of business" restriction, and covers natural gas distribution companies. This sample is referred to as the *Comparable Risk Gas Distribution Utilities* sample. The second sample closely matches the market participation of Florida Public Utilities Company, while also satisfying comparable risk criteria.

The determination of the first sample involves two steps. The first step is to conduct an initial screen according to the defined selection criteria. As mentioned, these criteria are as follows:

- Liquidity: companies that are of modest size but yet have sufficient market presence and participation to ensure sufficient market activity and transaction volume; and,
- Business Line: companies whose primary business line is retail electricity services.

This first screen produced the twenty two electric utility companies shown on Exhibit 6-A, including Florida Public Utilities Company. As can be seen, the revenues of these

companies range from $XX for Y1, to over $XX for Y2.

Some of these twenty two companies have substantial involvement in non-gas retail business lines. On the surface, we might expect that such endeavors to diversify the

Deleted: gas

overall business would tend to reduce variation in earnings, variation in internal cash flow, and variation in market returns thus reducing overall investment risk. Hence, members of the utility sample are gas distribution utility companies that are largely if not exclusively in the retail electric business – sometimes referred to as a *pure play*. The second selection step of determining the utility sample applies risk criteria. These criteria include three dimensions or metrics:

Deleted: gas

Deleted: Not sure if this should be referring to gas or electric??

- the coefficient of variation in earnings per share over five and ten years;
- the coefficient of variation in internal cash flow per share over five and ten years; and,
- market Beta, which as discussed above is the ratio of the covariation of the market returns of the individual companies and the market as a whole; and the statistical variance of the returns of the market.

On another note. The ST rate has to be as filed with our ROR using that same methodology. I agree for projections we should use the daily average instead of month end, but we lost that issue in our rate proceeding so for historic and interim purposes we have to use the approved methodology for rate computation. For 2008 we should use the daily average and provide testimony why that is appropriate vs. month end. Thanks Cheryl Martin

Subject: Update

Cheryl,
Doreen,

With the exception of customer deposits, the substantive D Schedules for the years 2006 and 2007 are completed, and I intend to complete customer deposits for these two years later on tonight. Remaining to be completed are the historical capital structure for the historical years 2002 - 2006 inclusive (D-2) as well as the financial ratios for '06 and '07 (D-7). These latter two elements plus D-9 affect the request for interim relief and are important; I will try to get them completed by tomorrow COB; the operative constraint is historical data which should be available via the 10-K's filed with the SEC, and inputs from other schedules. Nonetheless, I think things are in good shape, though Doreen may find flaws in this initial work.

There are two issues that I wish to bring up, however:

1) The short-term debt rate for 2006 is significantly understated because of computational method. That is, the actual interest expense to cover short-term balances is determined daily, while the balances used to compute the 2006 rate, for regulatory purposes, utilizes month-end balances. Apparently, the month-end balances are much higher than the daily balances; hence, the computated average interest rate over the course of 2006 (3.53%) appears to be significantly understated. Accordingly, for 2006 I use an imputed interest rate (6.03%) based on the commercial terms for FPUC's S-T debt facility, which is based on the observed average 1-month LIBOR rates for the 12-months of 2006. However, this approach still understates the overall cost of capital, because the short term debt balances are overstated within the overall capital structure. The better way, I believe, is to use the observed average daily balances, which are accurate and also in-keeping with the fair representation of the balances of S-T debt carried by FPU, on average. Month-end balances for the other components of the capital structure is a good representation of

average balances, as the balances for these items do not vary much over the course of the month. In the case of S-T debt, however, the month-end balances appear to be much higher than daily balances. Doreen and I discussed this issue earlier today.

2) For the determination of the average outstanding long-term debt (L-T), I am subtracting the average monthly balances of unamortized issuance expense and other balances associated with reacquisition of L-T debt, in lieu of year-end balances. This approach is in keeping with the principle of average capital structure, and also provides for higher amounts to be taken from the outstanding principle amounts for the various issues of L-T debt.

Talk with you soon.

Regards,
Robert

Subject: 2006ROR_4thqtr revised 3_22_2007.xls

Robert:

Please see tab ROR-DEBT for the interest expense for 2006. In November there is a credit balance due to an adjustment for an over-accrual for $4,067.86. The interest expense for that month was $1,586.98.

Thanks

Doreen

Subject: Update

Cheryl,
Doreen,

With the exception of customer deposits, the substantive D Schedules for the years 2006 and 2007 are completed, and I intend to complete customer deposits for these two years later on tonight. Remaining to be completed are the historical capital structure for the historical years 2002 - 2006 inclusive (D-2) as well as the financial ratios for '06 and '07 (D-7). These latter two elements plus D-9 affect the request for interim relief and are important; I will try to get them completed by tomorrow COB; the operative constraint is historical data which should be available via the 10-K's filed with the SEC, and inputs from other schedules. Nonetheless, I think things are in good shape, though Doreen may find flaws in this initial work.

There are two issues that I wish to bring up, however:

1) The short-term debt rate for 2006 is significantly understated because of computational method. That is, the actual interest expense to cover short-term balances is determined daily, while the balances used to compute the 2006 rate, for regulatory purposes, utilizes month-end balances. Apparently, the month-end balances are much higher than the daily balances; hence, the computated average interest rate over the course of 2006 (3.53%) appears to be significantly understated. Accordingly, for 2006 I use an imputed interest rate (6.03%) based on the commercial terms for FPUC's S-T debt facility, which is based on the observed average 1-month LIBOR rates for the 12-months of 2006. However, this approach still understates the overall cost of capital, because the short term debt balances are overstated within the overall capital structure. The better way, I believe, is to use the observed average daily balances, which are accurate and also in-keeping with the fair representation of the balances of S-T debt carried by FPU, on average. Month-end balances for the other components of the capital structure is a good representation of average balances, as the balances for these items do not vary much over the course of the month. In the case of S-T debt, however, the month-end balances appear to be much higher than daily balances. Doreen and I discussed this issue earlier today.

2) For the determination of the average outstanding long-term debt (L-T), I am subtracting the average monthly balances of unamortized issuance expense and other balances associated with reacquisition of L-T debt, in lieu of year-end balances. This approach is in keeping with the principle of average capital structure, and also provides for higher amounts to be taken from the outstanding principle amounts for the various issues of L-T debt.

Talk with you soon.

Regards,
Robert

On another note. The ST rate has to be as filed with our ROR using that same methodology. I agree for projections we should use the daily average instead of month end, but we lost that issue in our rate proceeding so for historic and interim purposes we have to use the approved methodology for rate computation. For 2008 we should use the daily average and provide testimony why that is appropriate vs. month end. Thanks Cheryl Martin

Remaining to be completed are the historical capital structure for the historical years 2002 - 2006 inclusive (D-2) as well as the financial ratios for '06 and '07 (D-7). These latter two elements plus D-9 affect the request for interim relief and are important; I will try to get them completed by tomorrow COB; the operative constraint is historical data which should be available via the 10-K's filed with the SEC, and inputs from other schedules. Nonetheless, I think things are in good shape, though Doreen may find flaws in this initial work.

There are two issues that I wish to bring up, however:

1) The short-term debt rate for 2006 is significantly understated because of computational method. That is, the actual interest expense to cover short-term balances is determined daily, while the balances used to compute the 2006 rate, for regulatory purposes, utilizes month-end balances. Apparently, the month-end balances are much higher than the daily balances; hence, the computated average interest rate over the course of 2006 (3.53%) appears to be significantly understated. Accordingly, for 2006 I use an imputed interest rate (6.03%) based on the commercial terms for FPUC's S-T debt facility, which is based on the observed average 1-month LIBOR rates for the 12-months of 2006. However, this approach still understates the overall cost of capital, because the short term debt balances are overstated within the overall capital structure. The better way, I believe, is to use the observed average daily balances, which are accurate and also in-keeping with the fair representation of the balances of S-T debt carried by FPU, on average. Month-end balances for the other components of the capital structure is a good representation of average balances, as the balances for these items do not vary much over the course of the month. In the case of S-T debt, however, the month-end balances appear to be much higher than daily balances. Doreen and I discussed this issue earlier today.

2) For the determination of the average outstanding long-term debt (L-T), I am subtracting the average monthly balances of unamortized issuance expense and other balances associated with reacquisition of L-T debt, in lieu of year-end balances. This approach is in keeping with the principle of average capital structure, and also provides for higher amounts to be taken from the outstanding principle amounts for the various issues of L-T debt.

Talk with you soon.

Regards,
Robert

Subject: 2006ROR_4thqtr revised 3_22_2007.xls

Robert:

Please see tab ROR-DEBT for the interest expense for 2006. In November there is a credit balance due to an adjustment for an over-accrual for $4,067.86. The interest expense for that month was $1,586.98.

Thanks

Doreen

Subject: RE: Update on cost of capital

So if 11.5 is a fair rate I can't wait to see what public counsel proposes after the last rate proceeding. I'm not sure what they use as a basis. We should pick consultants and have them pick a neutral third party to assess it. Not sure where the staff will settle but it should be close to this I would think.

Robert thanks for the update - that certainly is good news that we are able to justify 11.50%. I'm looking forward to receiving the draft testimony.

Subject: Update on cost of capital

Doreen,
Cheryl,

I have made substantial progress toward completion of the cost of capital analysis this weekend, and intend to have, pretty much, a complete case in your hands late this week. In the last couple of years, there appears to be divergence from historical relationships, for key data series - inflation expectations, risks/cost of capital, yields. Capital market data is always noisy. Nonetheless, my models and conceptual approach don't appear to fit as well as earlier, DCF in particular. However, it is likely that 11.50% will hold.

Robert

To: Mike Welsh
Cc: Cox Doreen
Subject: Update On Schedule D-2

Mike,

I have discussed the issue of consistency between historical and forecast balances for capital with Doreen. We will incorporate the Flo-Gas balances within the statement of year-end equity balances, as the applicant is instructed to do so. Also, the reacquired debt balances will be shown in L-T Debt. I will need to develop these balances, which I will do tonight.

Robert

Subject: Update

Doreen,

Just a comment...Mike mentioned to me that the caption for schedule D-2 indicates that the capital balances shown on the schedule should reflect the most recent 5-years, where the last year extends through the projected year. The schedule is labeled, on the other hand, as "5-year history" such that, as you have it, balances through '06 would seem appropriate. Robert

Subject: RE: Update

On another note. The ST rate has to be as filed with our ROR using that same methodology. I agree for projections we should use the daily average instead of month end, but we lost that issue in our rate proceeding so for historic and interim purposes we have to use the approved methodology for rate computation. For 2008 we should use the daily average and provide testimony why that is appropriate vs. month end. Thanks Cheryl Martin

Subject: Update

Cheryl,
Doreen,

With the exception of customer deposits, the substantive D Schedules for the years 2006 and 2007 are completed, and I intend to complete customer deposits for these two years later on tonight. Remaining to be completed are the historical capital structure for the historical years
2002 - 2006 inclusive (D-2) as well as the financial ratios for '06 and
'07 (D-7). These latter two elements plus D-9 affect the request for interim relief and are important; I will try to get them completed by tomorrow COB; the operative constraint is historical data which should be available via the 10-K's filed with the SEC, and inputs from other schedules. Nonetheless, I think things are in good shape, though Doreen may find flaws in this initial work.

There are two issues that I wish to bring up, however:

1) The short-term debt rate for 2006 is significantly understated because of computational method. That is, the actual interest expense to cover short-term balances is determined

daily, while the balances used to compute the 2006 rate, for regulatory purposes, utilizes month-end balances. Apparently, the month-end balances are much higher than the daily balances; hence, the computated average interest rate over the course of 2006 (3.53%) appears to be significantly understated.
Accordingly, for 2006 I use an imputed interest rate (6.03%) based on the commercial terms for FPUC's S-T debt facility, which is based on the observed average 1-month LIBOR rates for the 12-months of 2006.
However, this approach still understates the overall cost of capital, because the short term debt balances are overstated within the overall capital structure. The better way, I believe, is to use the observed average daily balances, which are accurate and also in-keeping with the fair representation of the balances of S-T debt carried by FPU, on average. Month-end balances for the other components of the capital structure is a good representation of average balances, as the balances for these items do not vary much over the course of the month. In the case of S-T debt, however, the month-end balances appear to be much higher than daily balances. Doreen and I discussed this issue earlier today.

2) For the determination of the average outstanding long-term debt (L-T), I am subtracting the average monthly balances of unamortized issuance expense and other balances associated with reacquisition of L-T debt, in lieu of year-end balances. This approach is in keeping with the principle of average capital structure, and also provides for higher amounts to be taken from the outstanding principle amounts for the various issues of L-T debt.

Talk with you soon.

Regards,
Robert

To: Robert Camfield
Cc: Martin Cheryl
Subject: 2006ROR_4thqtr revised 3_22_2007.xls

Robert:

Please see tab ROR-DEBT for the interest expense for 2006. In November there is a credit balance due to an adjustment for an over-accrual for $4,067.86. The interest expense for that month was $1,586.98.

Thanks

Doreen

My apologies.

I guess I wasn't following the discussion of the G rate schedules closely enough. I thought the discussion focused on the accounting for the customers with discounts.

No need to resend anything. I will go through the email traffic and make the requested adjustments.

Mike
I'm not seeing the changes that Cheryl, Mark and I communicated to you on the Gs earlier this week, such as the rate correction on G-22 GS from 0.01373 to 0.01473, rounding, adding Mark as a witness etc... Do we need to re-send those changes, or do you have them still pending?
Thanks
Doreen

If we could have issued the bond to purchase the land is would have been nice. But we will have to investigate the return from a regulatory viewpoint on capitalizing land from a capital lease arrangement. If it looks feasible we'll call the town manager. Do you know the terms of the lease (i.e. rate, timing, buy-out) proposed?

George & Marc,

If Lake Park is offering good terms on a loan I'd recommend we pursue it. A low cost municipal bond is worth acquiring and I can request approval from our lender. Do we have the details (amount, terms, etc) so we can decide if it's worth pursuing?

Marc,

This property will be required to be pledged under the Indenture of Mortgage of which SunTrust is the Trustee.

It is important that IF we want to consider any financing offered we must clear this with our bank first. We will be in violation of our covenants if take the financing without approval.

Thanks.

Marc,

Will FPUC be financing this deal with a lender, using bond proceeds or paying cash? I assume this property will be encumbered by the Indenture in favor of SunTrust Bank? Just a couple of items that I wanted to mention to you now so I would not forget in the morning.

Regards,

George

I believe the muni bond is a dead deal. They would finance using a bond only if they were to buy the property and lease it back to us under a capital lease arrangement.

George (Bachman), Do you want me to still try or do you want to have someone in Accounting call Maria Davis (Town Manager) @ 881-3304?

George & Marc,

If Lake Park is offering good terms on a loan I'd recommend we pursue it. A low cost municipal bond is worth acquiring and I can request approval from our lender. Do we have the details (amount, terms, etc) so we can decide if it's worth pursuing?

Marc,

This property will be required to be pledged under the Indenture of Mortgage of which SunTrust is the Trustee.

It is important that IF we want to consider any financing offered we must clear this with our bank first. We will be in violation of our covenants if take the financing without approval.

Thanks.

George,
Skip the lease concept. There isn't time to effectively do it and besides the Town had a list of renovations of parks, etc. as well as annual sponsorship of activities that they wanted us to support.

Sincerely,
Marc L. Schneidermann

If we could have issued the bond to purchase the land is would have been nice. But we will have to investigate the return from a regulatory viewpoint on capitalizing land from a capital lease arrangement. If it looks feasible we'll call the town manager. Do you know the terms of the lease (i.e. rate, timing, buy-out) proposed?

Subject: Regarding Schedule

Cheryl,

For our call at 3pm EST, we should discuss schedule. My team will provide a status report of the work performed so far. There are a couple of points that I wish to raise with you prior to our call, as follows:

1) For the cost of capital analysis, we have acquired the data set, but have not formatted the data for use in the development of the cost of common equity. This will come together expeditiously. However, cost of capital is at the front of the rate case preparation, as it drives revenue requirements. I will need to work closely with Doreen over the next 2-3 weeks to get that together.

2) It will be necessary to fully capture future operating expense levels in the forecast test periods. Let's discuss methodology and approach, for both operating expenses and capital expenditures.

Robert

Attachments: C-11Revised080207MP.xls

Mike,

I have attached a revised C-11. We revised the 2008 bad debt rate on the C-11 you sent us. The cells that were revised are highlighted in pink.

If you have any questions or comments, please let me know.

Mehrdad Khojasteh

FLORIDA PUBLIC SERVICE COMMISSION

COMPANY:FLORIDA PUBLIC UTILITIES
Consolidated Electric Division
DOCKET NO.: 070304-EI

EXPLANATION: Provide the following information concerning bad debts for the four most recent historical years and the test year. In addition, provide a calculation of the bad debt component of the Revenue Expansion Factor.

Type of Data Shown:
Projected Test Year Ended 12/31/2008
Prior Year Ended 12/31/2007
Historical Years Ended 12/31/2002, 04, 05 and 06
Witness: Mehrdad Khojasteh

Line No.	(1) Year	(2) Write-Offs (Retail)	(3) Gross Revenues From Sales Of Electricity (Retail)	(4) Adjustments to Gross Revenues (Specify)	(5) Adjusted Gross Revenues	(6) Bad Debt Factor (2)/(5)
1.	2002	75,649	41,335,703	$ -	$ 41,335,703	0.1830%
2.	2003	77,141	39,478,461	-	$ 39,478,461	0.1954%
3.	2004	76,668	40,424,735	$ -	$ 40,424,735	0.1897%
4.	2005	87,665	47,686,561	$ -	$ 47,686,561	0.1838%
5.	Total	317,123	168,925,460	$ -	$ 168,925,460	0.1877%
6.	2006 Test Year	87,213	47,686,566	$ -	$ 47,686,566	0.1829%
7.	prior Year 2007	90,352	53,115,151	$ -	$ 53,115,151	0.1701%
8.	Test Year 2008	144,563	61,822,965	$ -	$ 61,822,965	0.2338%

Calculation of the Bad Debt Component included in the Revenue Expansion Factor:

Average Rate 0.2000%

Subject:	Revised Exhibit 1
Attachments:	Revised Exhibit 1, P-2 and P-3.xls

Revised
iit 1, P-2 and

Mike,

Attached are revised Pages 2 and 3 of Exhibit 1, which should be incorporated into the file entitled COC Exhibits sent most recently by Cheryl and, subsequently, by Doreen. I will not resend file COC Exhibits in view of its large size.

Remaining work on COC is as follows:

Doreen: please review the discussion on capital structure.
Bruce: please review and edit in final.

These edited versions should be sent to me. In turn, I will forward the result to Mike, with copies to Doreen and Cheryl.

Thanks, Robert

Doreen,

Attached is the latest draft testimony version4 in tracked and untracked forms.

Doreen: Please review and make additions. Specifically, I do not know what to say about the interest coverage.
Bruce: Please edit.
Mike: I will send the exhibits in final form momentarily.

Thanks,
Robert

DIRECT TESTIMONY

DOREEN COX
ROBERT CAMFIELD

COST OF EQUITY AND RATE OF RETURN REQUIREMENTS
of
FLORIDA PUBLIC UTILITIES COMPANY

Q. Please state your name, title, and business address.

A. Witness Cox. My name is Doreen Cox. I am a Financial Analyst with Florida Public Utilities Company. My business address is 401 South Dixie Highway, West Palm Beach, Florida, 33401.

Witness Camfield. My name is Robert Camfield. I am Vice President with Christensen Associates Energy Consulting LLC, and my business address is Suite 700, 4610 University Avenue, Madison, Wisconsin, 53705.

Q. What is the scope of your testimony?

A. The scope of our testimony is twofold. First, we address the issue of the cost of common equity to Florida Public Utilities Company. Estimates of the equity cost rate underlie our common equity rate of return recommendation. Second, we integrate the equity rate of return with the other financial components of Florida Public Utilities Company's capital structure to determine the weighted average cost of capital and accompanying overall rate of return recommendation. Our rate of return recommendation should be used by the

Commission to set retail electricity prices of Florida Public Utilities Company in the current docket.

Q. Please review your professional background and experience that qualifies you to provide such recommendations.

A. Witness Cox. I received a Bachelor of Science Degree in Management from the University of the West Indies in 1979, with a concentration in Accounting. In 1990, I earned a Master of Science Degree in Accounting, also from the University of the West Indies. I am a member of the Jamaican Institute of Chartered Accountants.

I joined Florida Public Utilities Company in 1999, and I hold the position of Financial Analyst, which reports to the Chief Financial Officer (CFO). In this position, I support the CFO as well as the Accounting and Finance Divisions of Florida Public Utilities Company. My position covers a variety of operating and planning responsibilities including project assessment, budget and financial projections, and cash flow analysis. I assist in the preparation of quarterly reports to our Board of Directors, and the compliance monitoring with respect to the Financial Covenants of Florida Public Utilities Company's long- and short-term sources of external funds. In was a witness in the Natural Gas rate relief proceedings before the FPSC, Docket Number 040216-GU.

Witness Camfield. I joined the Michigan Public Service Commission in 1976 as a staff economist. During my tenure with the Michigan Commission, I was involved in several retail electricity and natural gas pricing issues, and I testified in rate case proceedings regarding cost of capital and retail gas tariff design. I joined the New Hampshire Public Service Commission in 1979 as Senior Economist, and held the position of Chief Economist beginning in 1981. As Chief Economist, I was responsible for the administration of the Economics Department of the Commission Staff. I oversaw the analysis of regulatory issues, the coordination and guidance of Staff participation in regulatory proceedings, the preparation and development of testimony, and I provided policy advice to the Commission on a variety of issues such as construction work in progress, financial planning, and the determination of PURPA Section 133 rates. I joined Southern Company in 1983, and held positions in several departments including Pricing and Economic Analysis at Georgia Power Company, Costing Analysis of Southern Company Services, and Southern Company's Strategic Planning Group. In 1994, I joined Laurits R. Christensen Associates, Inc. ("Christensen Associates") as a senior economist, and currently hold the position of Vice President with Christensen Associates Energy Consulting LLC., a subsidiary consulting group of Christensen Associates.

My experience covers a gamut of issues facing regulated industries. I have been involved in the negotiation of power supply contracts and the terms of franchise licenses. My overseas assignments are several, and I have managed a large market restructuring project in Central Europe. I have served on national and regional advisory panels, and I have advised integrated electric utilities, independent power producers, transmission and distribution companies, utility associations, offices of consumer advocate, and regulatory agencies on numerous policy and technical issues. Innovations include two-part tariffs for transmission services, web-based self-designing retail electric products, marginal cost-based cost-of-service methods, and principles for efficient pricing of distribution services. I have published chapters in technical books, reports, and articles in noted journals such as *The Electricity Journal, IEEE Transactions on Power Systems*, and *CIGRE.* Currently, I serve as Program Director of the Edison Electric Institute's Market Design and Transmission Pricing School.

Q. Would you please review the statutory mandates that guide the determination of rate of return for public utilities?

A. Yes, the statutory principles of rate of return for public utilities substantially rest with two decisions of the Supreme Court of the United States. In the Bluefield Water Works and Improvement Co. v. Public Service Commission of West Virginia case (262 U.S. 679, 1923), the U.S. Supreme Court set forth its view on fair rate of return, as follows:

"…A public utility is entitled to such rates as will permit it to earn a return on the value of the property which it employs for the convenience of the public equal to that generally being made at the same time and in the same general part of the country on investments in other business undertakings which are attended by corresponding risks and uncertainties; but it has no constitutional right to profits such as are realized or anticipated in highly profitable enterprises or speculative ventures. The return should be reasonably sufficient to assure confidence in the financial soundness of the utility and should be adequate, under efficient and economical management, to maintain and support its credit and enable it to raise the money necessary for the proper discharge of its public duties. A rate of return may be reasonable at one time and become too high or too low by changes affecting opportunities for investment, the money market and business conditions generally."

A second landmark decision of U.S. Supreme Court echoed, fortified, and expanded upon the fair return standard established by the "Bluefield" decision cited above for capital committed to public utilities. This second decision is the Federal Power Commission v. Hope Natural Gas Company case (320 U.S. 391, 1944). A relevant passage of this latter decision is as follows:

"From the investor or company point of view it is important that there be enough revenue not only for operating expenses but also for the capital costs of the business. These include service on the debt and dividends on the stock... By that standard the return to the equity owner should be commensurate with return on investments in other enterprises having corresponding risks. That return, moreover, should be sufficient to assure confidence in the financial integrity of the enterprise, so as to maintain its credit and attract capital."

These longstanding decisions provide the recognized framework for the fair rate of return on capital committed by investors to public service. In these decisions, the U.S. Supreme Court codified, in clear and readily understandable terms, a statutory benchmark that serves as the basis to set fair and equitable prices for retail public services such as natural gas, while also providing a fair rate of return on the capital provided by investors. Though they reach back many years, these decisions remain to this day the cornerstone for the determination of rate of return requirements. The challenge for regulators, regulated utilities, and interested parties to regulatory proceedings is to operationalize these principles in contemporary regulatory processes.

Q. Please provide an overview of your approach to the determination of the rate of return requirements for Florida Public Utilities Company.

A. Our approach follows the prescribed methodology of the Florida Public Service Commission to determine the overall weighted average cost of capital ("WACC") and the overall rate of return, for regulatory purposes. Specifically, we develop a forward-looking consolidated capital structure for the year 2008 with the exclusion of capital structure balances associated with the Company's propane subsidiary, Flo-Gas. For determining retail prices in the instant docket, the recommended capital structure is determined on the basis of the 13-month average balances of the components that comprise the capital structure of the Company. We develop a traditional capital structure including the key elements of long-term debt, short-term debt, preferred stock, and common shareholder equity. Similarly, we develop a regulatory capital structure that contains, in addition to these components, balances for customer deposits, accumulated deferred taxes and accumulated investment tax credits of the Company dedicated to providing retail electricity services. Traditional elements of the capital structure are scaled pro rata, such that the regulatory capital structure, in total, matches the rate base attributable to the provision of electricity services.

It is good regulatory policy to accurately capture the means by which Florida Public Utilities Company underwrites its assets and rate within the regulatory capital structure, providing that such structure contains an appropriate balance of equity and debt, given the regulatory and operational business risks facing the Company. Contemporary business, regulatory, and financial risks confronting energy utilities are higher than in past years. Consequently, and consistent with the business objectives of providing low-cost and reliable service, Florida Public Utilities will fund its assets with larger equity participation in total capital than in years past and, to this end, the year-end 2008 capital structure is a better representation of the expected capital structure of the Company. This is because the year-end balances capture the prospective weight, on average, that common equity will assume within the Company's capital structure. Furthermore, the year-end balances of the components of capital provide a better balance of debt and equity for the purpose of minimizing the weighted average cost of capital. Accordingly, the adoption of the projected year-end capital structure to determine retail prices, which would constitute a departure of the Florida PSC from its general policy of using the 13-month average capital structure, would be in the long-term interests of retail consumers and the Company as well. Accordingly, we offer the year-end capital structure as an alternative to the 13-month average approach.

The cost rates applied to the 13-month 2008 balances of long-term debt and preferred stock include the interest rate on the face amount and issuance costs unique to each individual issue, and related debt expenses where appropriate. The cost rate applied to customer deposits balances is based upon market segment-specific interest rates, as determined by the Commission. The balances for accumulated deferred taxes and investment tax credits are included in the regulatory capital structure at cost rates of zero and the overall cost of capital stated on a traditional basis, respectively.

The rate of return for common equity is determined by applying four capital cost assessment methodologies including Discounted Cash Flow, Capital Asset Pricing Model, Risk Premia, and an assessment of Realized Historical Returns. The fourth approach constitutes a benchmark by which investors gauge the future earnings prospects of financial assets and, along with other information, form expectations of future returns. By assumption and empirical assessment, efficient markets value (price) financial assets accordingly. These four methods are well founded by modern finance theory and are often used to determine the cost rate for common equity capital. The Risk Premia methodology infers the underlying opportunity cost of capital on a basis of the relative risks of debt and equity capital.

Q. Can you please summarize your findings and recommendations?

A. Yes. Our studies give rise to an overall rate of return recommendation of 8.07%. The determination of the 8.07% rate of return is shown in Exhibit 1, which reveals the balance amounts for each financial component of the capital structure, the share that each component represents, the attending cost rate, and the overall rate of return. As mentioned above, the overall rate of return recommendation is based upon a 13-month 2008 regulatory capital structure that, consistent with utility regulatory policy in the State of Florida incorporates customer deposits, accumulated deferred income taxes, and investment tax credit balances.

The recommended 8.07% overall return level incorporates a common equity return of 11.50%. As mentioned, the opportunity cost of shareholders of Florida Public Utilities Company is assessed with four valuation methods. The results of studies based on the valuation methods are shown in Exhibit 2, along with the equity return recommendation.

This recommendation, if adopted by the Florida Public Service Commission, will enable Florida Public Utilities Company to continue to provide highly reliable electricity service to its customers at favorable prices. At the same time, the recommendation provides an adequate level of compensation to the shareholders of Florida Public Utilities Company on the capital that they have committed to the Company. Satisfactory returns to equity also enable the Company to continue to attract long- and short-term debt at favorable terms and interest rates that, in both the near-term future and the long-run, are in the best interests of retail electricity consumers.

Fair and adequate allowed returns to capital are vital, and we cannot over-emphasize to the Commission the importance of setting the overall rate of return at a sufficient level, particularly in the current environment of considerable levels of risk and uncertainty. The determination of an adequate return level by the Florida Public Service Commission signals to the investment community including mutual funds, long-term private investors, speculators, mortgage bankers, and commercial banks that the business and regulatory environment in which Florida Public Utilities Company operates has continuity and stability over the long term. Importantly, it also signals that the Commission is supportive of the Company and the job that we do on an ongoing basis for retail consumers.

Q. Electricity is intermingled with and highly dependent upon energy markets, particularly markets for primary fuels. Can you please provide a profile of contemporary electricity markets and the implications for electricity distributors and the cost of equity capital?

A. Infrastructure industries, including the electricity services industry in particular, are undergoing significant restructuring with no immediate end in sight. This restructuring assumes a number of dimensions including service unbundling in both retail and wholesale markets, competitive entry and new mechanisms to determine the prices for services. At the wholesale level, utilities face and are part of the expansion of wholesale services and contract mechanisms to hedge varying degrees of risks; divestiture of generation; and the appearance of wide-scale participation in wholesale electricity commodity markets by power traders and speculators who are deeply involved in commodity markets generally. Wholesale markets are being organized under the auspices of regional transmission organizations referred to as RTOs. RTOs serve as the agent for markets as a whole, where regional markets are unbundled according to time (hourly markets), space (locational pricing of energy), and services including energy, reserves (including regulation, spin, non-spin, and supplemental categories), as well as financial transmission rights (FTRs) of various types. While wide-scale change has been in the works for years and is arguably most pronounced at the wholesale level, as precipitated by the Energy Act of 1992, significant change has been and is currently underway within retail markets as well. At the retail level, regulated utilities face a gamut of changes regarding new regulatory governance arrangements including pre-approval, decoupling, and various performance assessment mechanisms; auctions for provider of last resort ("POLR") services; renewable resource portfolio standards, and new rules and requirements regarding reliability requirements, aside from the new reliability (and implied cost) commitments imposed on service providers by the North American Electric Reliability Council ("NERC"), which has been recently designated by the Federal Energy Regulatory Commission ("FERC") as the national electric reliability organization ("ERO").

Driven to improve earnings performance and exploit growth opportunities, many integrated electric utilities have since the late-1980s pursued non-regulated business ventures including activities fairly far afield from electricity services such as real estate and insurance, as well as diversified energy services including distribution operations, nuclear generation, renewable resources, and power trading. In a number of cases, generation (and to a lesser extent transmission) assets have been sold off to independent generation companies or unregulated generation entities have been formed from the generation business units of the integrated utilities. Thus, deregulation has resulted in an increasingly broad range of business activities, business organizations and entity structures within the electricity services sector of the economy, obtained through competitive entry and consolidation of functionality across entities. The financial performance of entities within the electricity services industry including the expected returns to capital and financial risks, is much more closely linked to energy markets, generally, than was previously the case.

The net result is generally positive, as competitive entry arguably obtains reduced costs to the benefit of consumers, at least in the long run. Nonetheless, these changes in structure, much of which have been accompanied by and ushered in through regulatory changes, have also raised capital risks associated with electricity services, as perceived by investors. This backdrop of higher capital risks occurs at a time when electricity service providers, including Florida Public Utilities Company, face steadily expanding electricity service demands and an array of new requirements covering, among other things, capital renewal at a time of fast rising costs for electrical equipment.

Q. Your testimony mentions capital risks and capital renewal. Perhaps you can elaborate on the meaning of capital, and how it comes about.

A. Capital refers to economic resources of a durable nature that contribute to production of good and services, or may provide services directly. Capital resources of an economy are readily at hand; examples include manufacturing equipment, software, commercial buildings, residential dwellings, streets and highways, airports and, importantly, the accumulation of skills and knowledge of the workforce. Capital is accumulated savings over time, where savings refers to the proportion of the output of an economy that is not consumed as current goods and services. Essentially, savings is the share of output held back and invested in—i.e., put into—capital resources. The cumulative level of investment over time, covering decades, constitutes the capital stock of an economy and a society. It is useful to mention that capital can assume various investment forms aside from financial assets in private and public companies and other entities. The stock of capital includes real estate, durable household goods, education, public property and infrastructure such as libraries, museums, parks, roads, and transit systems. Individuals, firms, and government entities invest funds in capital resources if the expected flows of benefits realized by the investments in the future are equal to or greater than the value of current consumption given up or foregone.

Q. Please review the notions of cost of capital, opportunity cost of capital, and discuss how risk affects the opportunity cost of capital.

A. The cost of capital is the compensation required by investors for postponing consumption, for expected inflation, and for exposure to capital risks of various dimensions. *Cost of capital* refers to the underlying interest rate used to discount expected benefit flows of capital resources including returns to financial assets, and is sometimes referred to as the rate of discount, or simply the discount rate.

Financial assets include a multitude of debt vehicles, equity, and derivatives, and are tailored to participants of capital markets including household, small business, corporate, and government segments. Participants across these segments—*i.e.*, investors including lenders and holders of common and preferred stock— can supply capital while other participants (such as borrowers and common stock issuing companies) demand capital. Commercial banks, credit unions, finance companies, capital exchanges, and investment banks serve as intermediaries that provide the institutional means that facilitate the interaction and linkage of the supply and demand sides of financial markets. These functions essentially include lending, borrowing, and the issuance of equity vehicles. Banks and credit unions borrow (and store) financial assets that in turn are invested in the form of debt and to a lesser extent equity.

Household debt vehicles include, for example, personal loans covering appliances, household services, and credit card mechanisms through finance companies and banks, and real estate and so-called home equity loans. Business loans include short-term loans and lines of credit with banks, inventory financing through business wholesalers, and commercial paper of various terms. Corporate debt can be in the form of lines of credit with banks, and mortgage and debenture bonds, while government debt can be in the form of revenue bonds of cities, and short- and long-term debt of various terms.

Equity refers to common and preferred stock, where the investor assumes a share in the ownership of a corporate entity. In some cases, debt instruments can participate in equity returns and have rights of conversion to common stock. Derivatives refers to options and forward contracts that are specifically designed for speculation and risk hedging, where the market worth of the derivative is determined by investor expectations in the underlying price of a financial asset or commodity.

Q. What factors contribute to the underlying cost of capital regarding financial assets?

A. The underlying cost of capital is determined by investors and, in the large, by individuals and entities (including government entities) that provide savings and thus the accumulation of capital within the economy. In the case of financial assets, expected benefits are in the form of future cash flows including interest payments, dividend payments, market appreciation, and return of principal. When investors supply funds to entities such as utilities and government entities and municipalities, not only are they postponing consumption—giving up the value of alternative expenditures in some other way, they are also exposing funds to the devaluation of ongoing inflation and various uncertainties and risk attending future cash flows. Investors are willing to incur these risk factors only if they are adequately compensated. While the market prices of other inputs including labor, materials, energy can be easily verifiable, the cost of capital—essentially, the price of capital—is not easily discerned and, all too often, requires estimation through the cautious application of analytical methods.

The cost of capital, however, remains positive absent inflation and risks, as savers require compensation for foregoing the right to use the funds saved for consumption of goods and services—essentially, the time value of money.

The cost of capital is determined by the demand for capital, supply of savings, expectations of inflation, and perceptions of risks harbored by participants in capital markets. The demand for and supply of capital are determined by expectations of future levels of economic activity, while expected inflation is driven largely by monetary policy over the relevant timeframe. Perceptions of risk, in turn, cover many dimensions including uncertain government policy and the effects of natural phenomena such as weather. The cost of capital—the discount rate stated in nominal terms—increases with rising demand for capital, with expectations of higher rates of inflation, and with heightened perceptions of risk. Arguably, risk is the key contributing factor for the estimation of the cost of capital.

Q. Please elaborate on capital risks, and estimation of the cost of capital.

A. In addition to the global risks alluded to above (weather, government policy, etc.) dimensions of risk also cover idiosyncratic factors associated with specific capital resources, such as that of individual entities or companies. Accordingly, financial markets will re-price downward the bonds of a private company, should the *current* financial condition of the company suddenly decline. Essentially, the decrease in the company's current condition, reflected as reduced interest coverage—causes the expectation of the future condition of the company to also decline. Expectations of future financial conditions (possible states) of the specific company are idiosyncratic risks. Because cost of capital rises with increased risks, the price of the bonds decline. Bond prices and discount rates, in the form of the net interest rates or bond yields (and yield to maturity), move in opposite directions; bond yields increase as bond prices decline, and decrease as bond prices rise.

Resources migrate to the highest valued use and worth, given perceived risks, such that the returns to capital are equivalent to opportunity costs. The various forms of capital compete among themselves for savings and with other non-capital resource inputs and opportunities. Similarly, the vehicles of investment of individual entities, such as the specific bonds of a municipality or the common stock of a company, must compete for savings through a process of capital attraction. That is, if the outlook for earnings of a company rises, participants in capital markets—investors—allocate more capital to the company by bidding up the price of the stock thus increasing the company's market capitalization. Conversely, perceptions of heightened risks associated with the debt of a company or municipality precipitates a decline in the market value of the outstanding bonds, as capital migrates from the company/municipality to other resource opportunities. Thus, the prices of financial assets of entities including debt and equity securities are highly sensitive to perceptions of risk. Capital markets trade off risks and expected returns, given the overall menu of available choices, as alternative opportunities.

At an undefined point in time such that levels of supply and demand for capital and expectations of inflation are roughly equivalent (as a matter of consensus), the cost of capital is a matter of risk. Essentially, then, the cost of a specific source of capital is basically determined by the underlying riskiness of that investment in view of alternative opportunities that, together, represent the investors' current opportunity set. Hence, the cost of capital associated with specific investment opportunities, is differentiated by risks alone, as the other factors that impact the cost of capital—*i.e.*, supply-demand balance, inflation expectations—are common to all investments, and capital more generally. Competitive capital markets, through the process of assessing, buying, and selling, ensure that the expected payoff in the form of market rate of return is approximately equal to that of other investments of equivalent risk. In short, debt and equity investment vehicles of comparable risk are priced the same. If not, investors as participants in capital markets will bid up securities with comparatively low risks and bid down others with comparatively high risks. If investor perceptions of capital risks attending a utility increase—or the expectations for returns decline—markets bid down the securities of the utility. This implies that a utility will be unable to attract capital on equivalent terms, a result that is manifested in either of two ways: the quantity of capital acquired, in the form of new securities offerings, is reduced for a given level of return (stated in dollars), or a higher prospective rate of return attends the new offerings—it costs more to obtain an equivalent quantity of capital.

As mentioned above, investor rate of return is the discount rate that causes the present value of the expected cash flows, as receipts realized by investors, to equal the market value of the financial asset. From the utility side, the cost of funds raised by the utility through the sale of securities is equal to the discounted present value of the cash outflows to be paid by the utility, as expected by investors. But since the (positive) cash flows stream to the investor is identical to the cash outflows of the utility, the two discount rates must be identical, abstracting from the effects of flotation costs, which causes the costs to the issuer to exceed the return required by investors to the extent that flotation costs decrease the net amount of funds actually available to the issue. In other words, the cost of capital to the utility is synonymous with the investors' expected rate of return. Hence, the cost of capital is the discounted expected cash flows necessary for the security to "pay the price"—*i.e.*, in order to satisfy investors' required rate of return.

When capital markets are sufficiently competitive, they ensure that the market value and worth of financial vehicles of the outstanding debt and equity—as held by the investment community, which can include households, financial institutions, government entities, and non-financial companies, is set (*i.e.*, priced) at a level such that the returns to capital approximate the cost of capital. Because investors are averse to risks, competitive financial markets price financial assets inversely according to perceptions of risks, all other factors held constant.

Q. Why is this construct relevant and how does it relate to Florida Public Utilities Company and its capital needs?

A. As discussed, capital resources are the result of cumulative investment, and are obtained or funded directly or indirectly from savings of households and firms over time. Savings is the share of income of the economy as a whole that is not expended as consumption within a current period, and is typically measured as dollars or percentage shares in either quarterly or annual periods. This means that the capital resources employed by Florida Public Utilities Company including power delivery systems such as transformers and lines, meters, trucks and vehicles, computer systems, software, office facilities and buildings, inventory and stores, and land are costly, where cost is reflected as the annual carrying charges on capital, measured in the form of the net utility rate base.

Whereas the cost of skilled labor, materials and supplies, purchases of generation and transmission services, or other inputs used in the production process of utilities are expressed in money terms – *e.g.,* purchased power stated as dollars per megawatt hour – the cost of capital is expressed as an interest rate, typically shown as an annual percentage of the principal amount committed by investors. The cost of capital – or perhaps more accurately, the *cost rate of capital* – to the firm can be referred to as the *required rate of return* (%) on the capital resources committed by investors. In the case of public utilities, invested capital is referred to as the rate base, valued at either original cost or fair market value. For the determination of setting retail prices in the U.S., the regulatory convention is to value the capital of public utilities at original cost.

To facilitate the commitment of capital (investment) by savers and their agents to the firm, the firm offers property rights, including bonds or promissory notes to debt holders and shares of stock to equity investors. These property rights define the commercial terms and conditions under which savers and their agents, as investors, commit capital. Property rights are capital (financial) assets, and are generally tradable. Financial assets are claims on the income of the firm as compensation for the commitment of capital, and are the financial obligations of the firm. Shares of stock constitute ownership in the firm.

In the case of long-term debt – *i.e.*, mortgage bonds, debentures, and long-term notes – the interest on the principal (face) amount of a bond (debt) or the coupon rate on the share of preferred stock defines the level of compensation. Often, the interest rate is a predefined annual rate that remains fixed over the term of the debt. However, long-term debt instruments can have a number of other provisions that, in essence, provide for more complete contracting by managing risks through risk sharing between the debt holders and the borrower (the firm). These provisions can include 1) adjustments to the rate of interest to reflect contemporary market conditions *and* rates of inflation, 2) participation in earnings of the firm, 3) conversion rights, and 4) voting rights in the management of the firm.

In the case of short-term promissory notes, agreements with commercial banks define the mechanism by which interest, stated in dollars, is determined. Often, the commercial terms of promissory notes define interest to be paid monthly on the outstanding daily balance (principal) outstanding. The rate of interest applied to the outstanding balance is typically tied (indexed) to the interest rate on obligations of some widely known financial market – say, the London Interbank Offer Rate (LIBOR) or Fed Funds – which also varies daily or monthly.

Common stock property rights are somewhat different from other financial obligations because, as owners of the firm, the returns to shareholders are residual amounts following the compensation of other resources employed by the firm including debt obligations. Common equity is essentially compensated last, and bears the burden of much of the business, regulatory, and financial risks of the firm. For this reason, common equity is, in virtually all cases, more costly than other forms of financial instruments.

As with other markets, capital markets have primary and secondary dimensions. Primary markets are the institutions and processes that facilitate the initial sale of the financial obligations of the firm to initial investors, whereas secondary markets are structured market processes that provide the means by which investors can purchase and sell existing rights, including shares of stock and debt obligations. Financial instruments can assume many forms, and debt securities (bonds) and equity shares are actively traded in financial markets, which are generally considered to be highly liquid and competitive. However, to the degree that financial obligations 1) carry specialized and non-common commercial terms, and 2) secondary – and to a lesser extent, primary – markets are less liquid, holders of such obligations assume higher risks, other factors held constant. This is the case where the pool of buyers and sellers is limited and the volume of transactions is comparatively small. Relatively low levels of liquidity imply higher transaction costs and risks to investors, which translates directly into higher costs of capital to the firm.

Competition is a term that describes some markets, and markets are said to be competitive if certain conditions exist. Markets can be characterized as competitive if they involve: 1) a very large number of buyers and sellers, 2) information relevant to the determination of prices is readily available, complete and not costly, and 3) transactions costs are low. Because of the workably competitive nature of financial markets, arbitrage opportunities are more or less exhausted. This means that, for both primary and secondary markets, financial property rights trade at levels (prices) such that perceived risks and opportunities for prospective returns to capital are appropriately balanced and approximate those of other investment opportunities. Thus, above-normal returns, which implicitly include compensation for risks, cannot be seemingly realized by investors over prospective periods in systematic fashion.

Competition inherent to U.S. and worldwide financial markets ensures that the prices of common shares (share prices) and bonds are at a level that reflects the opportunity cost of capital. As an example, assume that the perceived risks attending the returns to common shareholders of firm A are equivalent to those of firm B and other firms. If the share prices of firm A suggest a market return of 10%, while the prices of firm B and other firms of comparable risks suggest (allow) market returns of 13%, the market price of firm A will fall to a level that provides a basis for market returns of just 13%, prospectively. A price that allowed for a 10% prospective market return is insufficient in the presence of opportunities for market return of 13% on alternate investments of comparable risk. Essentially, the 13% market rate of return on investment alternatives constitutes the opportunity cost of capital. Most remarkable is the expedience –

literally, in minutes – with which share prices adjust to levels that appropriately balance prospective returns to equilibrium levels *based upon perceptions of risks*. In short, equivalent and comparable risks translate directly into comparable rates of return, which is the cost of capital of common shareholders in – and thus of – the firm.

As mentioned early on, the cost of capital is a function of the demand for and supply of capital, investor expectations of inflation, and investor perceptions of risks. Because the conditions of demand and supply as well as expectations of inflation are more-or-less common to financial markets at any point in time, financial vehicles are differentiated by risks. Hence, the expected returns and prices of bonds and common shares (normalized for denomination and size) at any point in time are largely if not exclusively differentiated by perceptions of risk.

Q. How is this general discussion of capital markets relevant to Florida Public Utilities Company?

A. Because the cost of capital is positively related to risks, continuity of regulatory policy mitigates capital risks of Florida Public Utilities Company to the benefit of retail consumers by providing a sustained regulatory environment that facilitates a steady flow of revenue that closely adheres to the costs of electricity services.

Q. Would you please review the capital structure, interest coverage requirements, and the implications for sufficient coverage?

A. Interest coverage refers to the times that debt interest is covered by income, and is the most important measure of investment risk of corporate debt. Interest coverage is a major concern of Florida Public Utilities Company as it is the basis upon which the Company maintains its favorable credit standing with markets and continues to obtain long- and short-term debt at favorable rates of interest. Interest coverage under the recommended capital structure and rate of return for the Company's consolidated electricity services business unit is estimated to be 4.06, compared to 2.5 times using current rates Please reference Exhibit 12, Page 2

For purposes of comparison, we also show interest coverage over the historical timeframe on Exhibit 12, page 2. As can be seen, the coverage implied by the recommended rate of return is adequate though not at a robust level. Two conclusions are reached:

1) While the implied coverage level is acceptable, the Company must sustain a flow of earnings at consistent levels in order to maintain adequate coverage and also satisfy debt covenants.
2) Contingency events and business conditions that give rise to sudden and unexpected changes in revenue or cost flows can imply immediate shortfall in coverage. In short, the coverage level obtained from earnings at the recommended rate of return is only adequate in today's environment of higher capital risks.

The importance of coverage cannot be overstated. Indeed, in discussions with investment banks, commercial banks, and stock analysts regarding the financial condition and soundness of the Company, a salient point of concern continues to be coverage of debt. Lending entities, private investors, and investment banks continue to emphasize the importance of consistently-realized adequate interest coverage as the essential measure of the Company's capability to service long- and short-term corporate debt.

As can be seen, the recommended rate of return requirement, 8.07%, provides satisfactory interest coverage. And although the overall return recommendation provides adequate coverage, it is certainly not abundant. Hence, it is absolutely necessary that Florida Public Utilities Company realize adequate and sustained flows of income to ensure that the Company satisfies credit risk requirements. Coverage is our window of access to capital at favorable rates of interest and under reasonable terms, enables the Company to provide electricity services. Setting the overall rate of return at a satisfactory level of 8.07% is necessary and in the best interest of retail electricity consumers.

Q. What is the appropriate capital structure for determining retail prices in this docket?

A. Two fundamental issues are present. First, should the Commission utilize a consolidated capital structure for setting retail electricity prices and under what conditions should the Commission depart from a consolidated capital structure? Second, should an average or year-end capital structure be utilized?

Issue 1: Conditions to Justify Departures from the Consolidated Capital Structure. In the absence of large-scale subsidiary operations, the Florida Commission should generally utilize a consolidated capital structure where such approach provides a reasonable balance between debt and equity. Under such conditions, the Commission is assured that the service provider is, in the best interest of retail consumers, underwriting its assets dedicated to providing utility services at least cost.

This can be viewed as a principle that defines criteria useful to the Commission in regulatory decisions regarding the issue of the appropriate capital structure for the determination of retail prices. Specifically, and as a general rule, the Commission should only deviate from a consolidated capital structure when this condition – *i.e.*, an appropriate balance between debt and equity – is not satisfied. The corollary to this principle is that the Commission and its staff should never remove or add accounting-based line items from a consolidated capital structure that is appropriately balanced. Two facts of financial accounting underlie this corollary, as follows:

1) A firm cannot ever trace and identify, as a matter of dollar flows, specific sources of funds to specific uses of funds. The Treasury of a firm essentially constitutes a pool or inventory of current funds, cash, that continually experiences fund inflows and outflows. One cannot say that a specific source of funds is earmarked for a specific use. As an example, one cannot say that cash flow returns and operating income that arise from the Company's electricity operations are used solely to underwrite resources for the electricity business. Electricity-sourced cash flows are, in fact, used across the combined operations of the natural gas, electricity, and propane businesses of the Company – and similarly for the natural gas and propane operations.

2) The Company's balances of long-term debt, short-term debt, preferred stock, and common equity stated on a consolidated basis represent the accrual over years of the net flows of funds of the Company including external and internal sources. The balances for these financing vehicles can and should be used as the basis by which the Company underwrites any and all of its assets, stated on either a consolidated or an individual basis. This is simply a business, accounting, and financial fact.

There is no reasonable basis, thus, to exclude Flo-Gas balances from the Company's capital structure for purposes of setting retail electricity prices in the current docket. Indeed, exclusion of Flo-Gas balances may harm retail electricity consumers in various ways, aside from the inherent contradiction to the realities and facts of financial accounting identified above.

Second, exclusion of Flo-Gas balances from the capital structures used to set prices for the regulated operations, including electricity and natural gas, implicitly assigns common equity, which is comparatively high-cost, to the Company's unregulated propane operations, placing the propane operations at a competitive disadvantage with other propane companies. One can expect that other companies will leverage assets in a manner similar to that of the Company, in order to finance propane and competitive, non-regulated energy services. As a consequence, the Company needs to follow a similar policy. If the Company is required to assign only equity to non-regulated operations, it is implicitly forced to charge correspondingly higher prices in order to generate adequate returns.

Third, the consolidated capital structure of Florida Public Utilities Company stated on 13-month average basis for 2008 represents a sound balance of debt and equity financing that fully satisfies the financial needs of the Company, particularly in view of the comparatively small size of Florida Public Utilities. This is evidenced by the comparative sample of electric utilities used to determine the cost of capital. Specifically, equity participation within the Company's 2008 capital structure resides within one standard deviation of the average participation of the sample. Hence, the Company's financing policy and strategy conforms to a reasonableness standard, in addition to fully satisfying the financial prudence and flow of funds criteria outlined above.

Nonetheless, the recommended weighted average cost of capital presented within our testimony follows the Commission's prescription. Namely, the Flo-Gas balances are excluded from common shareholder equity for purposes of determining the overall rate of return to set retail electricity prices within the immediate docket.

Issue 2: Average or Year-End Capital Structure. This second issue implies two subsidiary questions: is the average or year-end capital structure the most representative on a forward-looking basis beyond 2008. As shown on Exhibit 1, page 1, the average capital structure for 2008 for Florida Public Utilities Company contains equity participation of 40% and 50%, respectively, under regulatory and traditional methods of stating the underlying invested capital. As a result of the issuance of common equity shares at mid-year 2008, the average balances approach inherently does not take account of the level of equity participation beyond 2008, the period over which the retail prices will be in effect.

The appropriate correction for this understatement of the overall cost of capital for the Company, which is inherent with the use of average capital balances in the face of the pending issuance of new shares, is to use a year-end capital structure. The result of such approach is shown on pages 2 and 3 of Exhibit 1, where the year-end based weighted average cost of capital is presented, shown with and without Flo-Gas balances. Specifically, year-end balances reflect equity participation of 42% and 54% for the regulatory and traditional capital structure. This higher equity participation level translates into weighted average cost of capital results of 8.13%, stated for regulatory purposes. In short, the average capital structure for 2008 leaves Florida Public Utilities Company short by 6 basis points, which implies an unrecognized revenue shortfall of about $40,000, stated on a going-forward basis.

Q. Can you please review your recommendation for the cost rate of long-term debt?

A. Yes. Florida Public Utilities Company has raised long-term debt from time to time based upon the need for capital and our Company's financial policy of maintaining a balanced capital structure. Because of our conservative management philosophy, we have consistently raised new debt issues at favorable rates of interest at the time of issue. Contributing to favorable interest rates are the conservative sinking fund provisions of the earlier higher-cost debt issues of the late-1980s – early-1990s.

The cost rate of 7.96% for long-term debt, shown in the column entitled "Annual Cost Based Rate" of Exhibit 3, reflects the weighted average cost of the five issues of long-term mortgage bonds of the Company, currently. These debt issues have face interest rates of 4.90% to 10.03%, and were issued by the Company over the period 1988 – 2001. The balances shown reflect the amounts that the Company expects to carry on its balance sheet on average over the year 2008 and beyond. The Company does not plan to issue long-term debt during the interim two years.

The 7.96% overall cost rate of long-term debt reflects issuance costs and losses on reacquired debt, which causes the effective cost rate to be somewhat greater than that of the weighted cost of the face interest rates alone. The 7.96% overall cost rate for long-term debt is calculated using the amortization schedule for debt expenses. This costing procedure follows the conventional accounting approach to determining the cost rate for long-term debt, and is consistent with the policy endorsed by the Florida Public Service Commission.

Q. Would you please review the cost rate of short-term debt and related issues?

A. Florida Public Utilities Company maintains, and expects to maintain over the foreseeable future, a short-term debt facility that makes available short-term debt at a cost rate determined by London Interbank Offer Rate (LIBOR). The short-term debt cost rate is equal to the 30-day LIBOR plus 90 basis points, plus other charges related to unused facility balances as well as fees charged for the facility itself. The Company currently has a $12 million line of credit with

Bank of America, which upon 30 days notice can be increased to a maximum of $20 million. Based on current cash flow projections we anticipate increasing the line to $15 million by November 2007. We anticipate lowering the line of credit to $12 million after the issuance of additional shares of common equity, which is scheduled for the middle of 2008.

The interest rate margin above LIBOR (90 basis points) for the Company's current short-term debt facility is somewhat above that of the Company's previous short-term debt facility, which reached the end of its contract in March 2003. The higher margin requirements, as imposed by financial lending institutions internationally, reflect higher perceived risks, both generally and within energy markets, than in previous years.

The expected effective short-term debt cost rate incurred by the Company for short-term debt, for use to determine prices in the current docket, is determined by first projecting the Federal Funds rates in the U.S. for the timeframe over which the retail electricity prices will apply. Then, given the historical relationship between LIBOR and the rate for U.S. Fed Funds, the LIBOR rate is estimated. Once determined, the short-term debt cost to Florida Public Utilities is obtained by recognition of the 90 basis points margin above LIBOR plus other charges covering the unused balances and the fee for the availability of the credit facility.

The key short-term interest rate is the Fed Funds rate. Historically, Fed Funds have traded 18 Basis Points below LIBOR over the 1990 – 2006 timeframe.

The interest rate on Fed Funds is determined by the monetary policy of the Board of Governors of the Federal Reserve Bank, and closely follows that of short-term U.S. Treasury Bills. Historically, Federal Funds "trade" at an interest rate slightly above that of 90-day T-Bills. At this point, the apparent consensus view is that monetary policy and thus the short-term interest rates will hold firm at or near current levels over the foreseeable future, which implies a fed funds rate of 5.25% currently and, in turn, a LIBOR interest rate of 5.43%. In turn, this result translates into a cost rate of 6.33% for the outstanding balances on short-term debt balances, once the margin above LIBOR is recognized. The fees associated with the unused credit line and direct charges when coupled to charges for the outstanding balances obtain an overall effective short-term debt interest rate of 6.81%, which is applied to the 13-month average balances of short-term debt.

It is useful to briefly describe the longer history, as it relates to the determination of short-term interest rates. Specifically, the Federal Reserve followed a policy of interest rate targeting for a number of years prior to late 1979, when money supply targeting was abruptly adopted. The result was high and volatile short-term interest rates, although money supply targeting arguably reduced substantially the high levels of inflation and inflation expectations of the early 1980s. From the mid-1980s forward, monetary policy has been more accommodative of economic conditions and needs, within the long-term objective of containing overall inflation at moderate levels. As observed during the 1990s, the Federal Reserve has employed an array of indicators and metrics to determine monetary policy, including reserve targeting. As a general rule, reserve targeting gives rise to greater variation in short-term interest rates, while interest rate targeting, which suggests greater variation in the supply of reserves, results in less variation. At this writing, short-term interest rates, with Fed Funds residing at 5.25%, are expected to hold steady to slightly declining over the foreseeable future, barring changes in the expected level of economic activity or current escalation of core inflation.

The use of the current 5.25% Fed Funds interest rate as the basis for the Company's effective short-term debt cost rate is in keeping with the Commission's decisions regarding the Company's rate change filings of 2003 and 2004. Also, and as mentioned above, it appears that this interest rate level is likely to hold over the foreseeable future.

Finally, we wish to discuss the methodology used to determine the effective interest rate for 2006. The interest rate charges on the Company's short-term debt facility are based on daily balances. If the daily balances closely approximate month-end balances, month-end balances provide a useful basis to determine the average short-term debt cost rate. Where the daily balances deviate significantly from the month end balances, however, this approach will not provide an accurate reflection of the Company's true cost of short-term debt. This was the case for the Company during 2006. Accordingly, the short-term debt cost rate for the historical year 2006 has been developed using the average daily balances which accurately reflect the true cost rate incurred by the Company on short-term debt during that year.

Q. Please review the cost rate of preferred stock.

A. Florida Public Utilities preferred stock consists of a single issue of 6000 shares that dates to December 28, 1945 at a coupon rate of 4.75%, as shown on Exhibit 5.

Q. You briefly discussed methods for the determination of the cost of common equity capital in the summary of your approach to rate of return. Can you elaborate on these methods?

A. Yes. We begin by reiterating three essential points. First, the cost of equity of the firm – and of investors in the firm – is a function of perceptions of risk, the demand for and supply of capital, and expectations of inflation. Second, the cost of common equity of the firm is equal to the opportunity cost of capital incurred by common shareholders of the firm contemporaneously, though the experience of long-term history guides the assessment of opportunity costs. Third, the cost of equity of the firm is equal to the expected market rate of return on alternative investments of comparable risks available to shareholders – *i.e.,* the opportunity cost of capital.

The determination of the opportunity cost rate for equity capital is challenging for two reasons. In the case of debt, both the market price and future expected cash flow returns to capital are observable by inspection. Thus, the net expected yield to maturity, which reflects the opportunity cost of capital to holders of debt, can be determined directly. This *is* the market rate of return, *ex ante*. For purposes of determining the overall utility rate of return, however, the cost rate of long-term debt is that which is set at the time of issuance in primary financial markets.

In contrast, expectations of investors about the prospective cash flows and market returns on common equity cannot be observed directly, and must be inferred with estimation procedures. Also, the allowed equity rate of return is typically set according to the current and expected cost of capital, though much of the equity investment was committed in many years past.

In the determination of cost rate for debt obligations, investors' perceptions of risks are implicit in the primary and secondary market prices of the debt obligations themselves, and need not be known or even estimated. In contrast, the determination of the cost of common equity involves the perceptions of future risks harbored by investors, as a matter of the consensus view. Perceptions of risk are also not observable directly, and thus must be inferred. In short, the cost of common equity can only be discerned through the proper and careful application of well-established methods that provide the cornerstone for modern finance theory. While the methods employed herein are well-established, the procedures to determine the cost of equity capital require estimation of key parameters.

As mentioned, the recommendation for the rate of return on equity for Florida Public Utilities Company is developed by applying four estimation methods. These procedures include variants of the constant growth Discounted Cash Flow model (DCF), and the Capital Asset Pricing Model (CAPM). These classical approaches are commonly recognized within modern finance theory and are readily utilized by the investment community. The results of these two formal models of the cost of capital are augmented by historical returns realized by utility and non-utility companies of comparable risks, and results inferred from the risk-premium methodology. These four methods are discussed below.

The constant growth Discounted Cash Flow (DCF) model was originally developed by Myron Gordon in 1957, and was advanced actively during the early 1960s. In its classical form, the derived DCF model defines the cost of capital as the sum of the adjusted dividend yield, and expectations of future growth in cash flows to investors including dividends and future appreciation in share prices. The classical (one-stage) DCF model is as follows:

$$k_{e,j} = D_{0,j}(1+E(g_j))/P_{0,j} + E(g_j)$$

with,

$k_{e,j}$ = cost of equity capital, asset j

$D_{0,j}$ = current dividends per common share, asset j

$E(g_j)$ = expected growth in future cash flow returns to investors in asset j

$P_{0,j}$ = current price per common share, asset j

The one-stage form of DCF model is an elegant and intuitively tractable model with two terms, a mathematical result derived from the constant growth present value model. A cursory review of historical returns of equities suggests substantial variation in growth in the internal returns to capital and market appreciation is both the typical and dominant pattern. It is plausible that the *expected path* of future returns harbored by investors may assume a pattern of non-constant growth. This means that, at least under some market conditions, the constant growth form of discounted cash flow may not represent investor expectations of growth with sufficient accuracy. Arguably, other forms of DCF may serve as better approximations of investor expectations.

A plausible means to better model expectations of varying growth might be with stochastic models, where the path of returns and growth is a function of time, with a random component. However, stochastic models introduce considerable complexity. As a first-order approximation to stochastic processes, multiple-step constant growth models known as multi-stage DCF can serve nicely. Essentially, multi-stage DCF is a variation of present value theory which postulates that future returns assume a pattern of several growth steps or stages. While any number of stages of constant growth is possible, two or three stages are typically applied. In stylized fashion, the Three-Stage DCF model is shown below:

$$P_{0,j} = (1+g_j)/(k_{e,j}-g_j)\{D_{0,j}(1 - F^5_j) + D_{5,j}(F^5_j - F^{10}_j) + D_{10,j}(F^{10}_j)$$

with,

$k_{e,j}$ = cost of equity capital, asset j

$D_{t,j}$ = current and future dividends per common share, asset j

$E(g_j)$ = expected growth in future cash flow returns to investors in asset j

$P_{0,j}$ = current price per common share, asset j

F_j $= (1+E(g_j))/(1+k_{e,j})$

Appendix I provides a step-by-step derivation of the classical and multi-stage discounted cash flow models shown above.

The Capital Asset Price Model (CAPM) was developed by William Sharpe (1961) and John Lintner (1964). CAPM was derived from mean-variation analysis and, in particular, portfolio selection developed by H. Markowitz (1952). The derived CAPM shows how the valuation of a financial asset (price) is based upon two components: risk-free returns and an *adjusted risk-based return.* Surrogates for risk-free returns can be observed directly in capital markets, and include market returns on short- and intermediate-term debt. As a general rule, the cost rates and market returns on government debt obligations serve as appropriate surrogates.

The adjusted risk-based return is based upon three factors: 1) the covariation of the returns to the asset and that of markets for risky assets, 2) the statistical variance of returns of the market for risky assets, and 3) the *difference* between expected overall returns on risky assets, and risk free returns. The third parameter is referred to as the excess return, and is equal to the difference between the overall returns to risky assets for the market as a whole, and the risk free return rate. The CAPM is shown below:

$$k_{e,j} = r_f + B_{jm} * (r_m - r_f) \qquad \textit{with, } B_{jm} = \sigma_{jm} / \sigma_m^2$$

where,

$k_{e,j}$ = cost of capital for risky asset j, stated in percentage terms

r_f = risk-free rate of return

B_{jm} = ratio of the covariation between risky asset j and the market as a whole, σ_{jm}, and the variance of market returns, σ_m^2

r_m = rate of return on the market as a whole

Appendix II derives the Capital Asset Pricing Model, as shown above. The efficient market hypothesis plays an essential role in the determination of the cost of capital. Specifically, the working assumption, which is largely though not completely borne out by empirical analysis, is that capital markets are fairly efficient. This means that the supply and demand for risky financial assets, as reflected in bid and asked prices to buy and sell shares, result in financial assets being traded at price levels where *rates of return above the cost of capital cannot be systematically realized.* Above-normal returns – returns above the cost of capital – are realized only randomly. Essentially, the opportunities to systematically realize returns above the underlying cost of capital are exhausted by the competitive market process.

Estimating the cost of capital, though not trivial, can be fairly straightforward, and both the DCF and CAPM approaches provide a useful framework. The risks to investors in various sectors of the energy services industry cannot ever be known directly; risks – and hence the implied cost of capital – can only be inferred. Specifically, the determination of useful estimates of the cost of common equity capital within either framework requires a discerning application of theory through careful analysis, such as that presented herein. In particular, the determination of the cost of equity capital faces two overarching challenges, as follows:

- both approaches are forward looking and thus the results are highly dependent upon useful estimates of investor expectations about future market performance.

- The underlying assumptions for DCF and CAPM include, among other things, an efficient market and rational behavior of investors such that all opportunities for above- and below-normal returns to capital are exhausted on an expected value basis. In short, capital markets value financial assets at the implied opportunity costs of capital, given investor perceptions of risk.

It is useful to mention that the notion of *risky assets* can apply to any real or financial asset wherein the prospective returns from holding the asset are uncertain. Risky assets include commodity contracts, financial property rights, financial derivatives, and real assets such as transmission facilities. Risk assessment and option theory, moreover, can be applied to the analysis of unbundled services, such as electricity transmission development plans. Within the context of this discussion, however, risky assets refers to financial obligations of firms – common stock – and asset values refers to prices of common stock as observed on major stock exchanges.

Measurement of historical returns and risk metrics are increasingly used as a basis to assess plausible returns in the future. As discussed, efficient markets suggest that *all* financial assets are priced at levels such that the *expected* future returns of individual assets are equivalent to the underlying opportunity cost. Thus, if historical returns guide expectations of future returns, historical returns provide a useful benchmark and, within reasonable bounds, reflect the opportunity cost of capital. In this respect, the Historical Returns methodology can be viewed as a market-based approach of Comparable Earnings, and thus fully satisfies the *Bluefield* and *Hope* criteria. The key to successfully applying this approach is to identify and measure historical returns in a manner that reasonably reflects expectations of investors about the future outlook.

Historically realized returns and future expected returns of financial assets are ordered according to risks. This ordering according to risks is a natural and inevitable result of competitive financial markets: because risk is costly, higher costs must be offset by higher returns. While it is not based upon an explicit model, the analysis of the risk premia among classes of risky assets provides a means to infer the underlying opportunity cost of capital. The underlying concept of the risk premium approach is that *differences* in perceptions of risks among financial assets such as equities and debt are revealed in differences between the historical market returns. The historical differences between equity and debt returns – *i.e.,* risk premia – can thus serve as a surrogate for the compensation for risk over future timeframes. Risk premia, when combined with the expected cost of short-term debt, prospectively, provides a useful benchmark to gauge the underlying cost of equity capital.

Application of the Risk Premium approach contains two potential pitfalls, as follows:

- the opportunity cost of common equity capital, stated in nominal terms, is sensitive to the demand for and supply of capital;
- risk premia among debt and equity instruments are also quite sensitive to expected inflation. Thus, Risk Premium analysis must account for expected inflation in the future. That is, the underlying rate of inflation

and conditions of the historical period over which risk premia are estimated must match that of the expected conditions of the relevant period over which the common equity recommendation is being applied, and over which retail electricity prices are being set.

Q. You discuss the importance of comparability and measures of risk as the basis to determine the cost of common equity. Please elaborate.

A. As defined by the "Bluefield" and "Hope" decisions of the U.S. Supreme Court, a public utility (to paraphrase), is entitled to a rate of return on shareholder capital committed for the convenience and necessity of the public equivalent to that realized by companies in other businesses of comparable risk. Thus, the immediate task at hand is comparability: to identify and select companies of comparable business, regulatory, and financial risks to that of Florida Public Utilities Company. Once selected, we estimate the cost of common equity for the sample(s) of comparable companies that, by definition, is the opportunity cost of capital and thus Florida Public Utilities Company. The key distinction regarding comparability is market size, as recent empirical evidence convincingly demonstrates that, predominantly because of information inefficiencies and uncertainty, the cost of capital rises with progressively smaller companies, all other factors held constant.

The starting point is the market portfolio; that is, we begin with virtually all common shares traded on U.S. equity markets. Specifically, we have drawn heavily—though not exclusively—from a set of data sources and information including the Value Line data banks which cover some 7,000 companies with equity shares listed on capital market exchanges in the U.S. With few exceptions, the shares of interest are traded on the New York Stock Exchange and the exchange operated by the National Association of Securities Dealers referred to as NASDAQ. For these equity listings, Value Line reports a wide range of financial data, business descriptions and classification, historical price experience, and various diagnostic statistics of interest.

From the market portfolio we proceed to develop two samples. One sample, referred to as the Mid-Sized Electric Utility sample, is limited to retail electricity service providers that have modest yet significant levels of market participation and, with the exception of size-related capital risks, are of comparable risk to that of Florida Public Utilities Company. The second sample is referred to as the Gas Utility sample, and is composed of retail natural gas service providers. Our studies demonstrate that, as a practical matter, the level of capital risks and thus the opportunity cost of capital for the two samples, electric utilities and natural gas utilities, is comparable. It is useful to mention that for purposes of determining the equity rate of return requirements, Christensen Associates Energy Consulting has often drawn a third sample referred to as *comparable risk non-utility companies*, as our methods tend to demonstrate that, particularly within contemporary capital markets with high levels of international capital flows, comparable risk is the predominant selection criterion; line of business appears to have only a modest level of relevance to cost of capital, once the comparable risk criteria are satisfied. Thus, samples can be drawn from a broad range of business fields, generally speaking.

The determination of the first sample, the mid-sized electric utilities, involves two steps. The first step is to conduct an initial screen according to the predefined selection criteria. As mentioned, these criteria are as follows:

- *Liquidity*: companies that are of modest size but yet have sufficient market presence and participation to ensure sufficient market activity and transaction volume;
- *Business Line*: companies whose primary business line is retail electricity services; and,
- *Reasonably consistent financial experience.*

This first screen produced the 17 electric utility companies shown on Exhibit 10, page 1, including Florida Public Utilities Company, from an initial list of over 30 mid-sized entities from across the electric utility industry. As can be seen, the market capitalization of these companies, measured by common shares outstanding and market prices during 2005 range from $77 million for Florida Public Utilities Company to slightly greater than $4.6 billion for SCANA (South Carolina Electric and Gas). The non-weighted average size of Sample 1, the electric utilities, is $1.6 billion, as shown. Also shown on page 1 of Exhibit 10 is operating revenues, assets, operating margins, and CAPM Betas. CAPM Betas, which are arguably the most significant measure of capital risk, are shown in the adjusted form for 2005 and for 2001-2004 on average. In particular, note that CAPM Betas have risen, suggesting significantly higher capital associated energy markets including electric service providers.

Some of these 17 electric companies have substantial involvement in non-electric retail business lines including natural gas. It is virtually impossible these days to assemble a sample of companies that are exclusively in the retail electric business – sometimes referred to as a *pure play*. This should not matter, at least on the surface, if the sample is determined on a basis of comparable risks. Indeed, endeavors to diversify risk over alternative business lines tends to reduce variation in earnings, variation in internal cash flow, and variation in market returns, thus reducing overall investment risk and the cost of capital.

The second selection step of determining the utility sample applies risk criteria. These criteria include five dimensions, or metrics:

1. *Equity Participation in Total Capital*;

2. *Coefficient of Variation in Internal Cash Flow* per share over five and ten years;

3. *CAPM Beta* which, as discussed above, is the ratio of the covariation of the market returns of a specific stock of a company and the market as a whole, and the statistical variance of the returns of the market; and,

4. *Variation in Market Returns*, which is measured as the coefficient of variation of monthly market prices—essentially, an index of volatility in market value (market capitalization).

The mean-variation theory on which Capital Asset Pricing Model is based suggests that risk metrics other than CAPM Beta do not matter, for the determination of portfolios that efficiently trade-off risks and potential future return levels. However, empirical evidence suggests that a) internal financial metrics such as items 1-3 above are also utilized by investors to value equities, and b) CAPM theory (as with other capital market theories) does not necessarily explain historical market returns particularly well. Thus, it appears that to a substantial degree information other than CAPM Beta is also relevant to investors in the valuation of equities.

Nonetheless, the risk metrics for each of the 17 initial members of the Mid-Sized Electric Utility sample, as arrayed on Exhibit 10, page 2, are determined. Those electric utility companies with risk metrics that generally fall within one standard deviation of that of the average for the sample of electric utilities as first drawn or are reasonably close to the metrics for Florida Public Utilities Company are retained in sample one, the electric utility sample. It is these utility companies that, by this arguably objective approach, satisfy the criteria of comparable risk and thus that of Supreme Court guidelines regarding fair rate of return and contained within the Bluefield Waterworks and Hope decisions. The companies utilized for the determination of the cost of capital are denoted in the far right column of page 2, Exhibit 10.

Turning to sample 2, the natural gas utilities, the selection process proceeds in similar fashion using equivalent criteria to those employed to determine the electric utility sample (sample 1). That is, a sample is first drawn on a basis of market liquidity and business line. The selected natural gas utilities are shown on Exhibit 10, page 3, where market capitalization, CAPM Betas are presented along with revenues, assets, and operating margins. As observed, the selected natural gas companies range in size, measured by market capitalization, from

$219 million to 2.8 billion in 2005. Page 4 of Exhibit 10 contains equity participation, CAPM Betas, variation in market returns, as well as the statistical variation in cash flows. As observed, these companies, though of comparatively modest scale, are all significantly larger than Florida Public Utilities Company.

It should be mentioned that, with respect to the selection of both samples, the study will take occasional exception to the stated selection criteria where historical experience contains anomalies of various types, and when good sense suggests the exclusion or inclusion of specific companies. As an example, the 10-year coefficient of variation in cash flow for some companies may reside slightly outside one standard deviation of the statistical distribution of the sample. Or, low equity participation may not appear to translate into particularly high variation in market variation or Beta; an example is Southwest Gas. Regarding the CAPM Betas, the values are shown in increments of 0.05, and Betas for several members of the sample are somewhat below one standard deviation and, for others, somewhat above.

Once determined, the two samples including the Mid-Sized Electric Utilities (Sample 1) and Gas Utilities (Sample 2) are then used as the basis to estimate the cost of equity capital to Florida Public Utilities Company within the immediate proceeding. The estimate of the cost of capital, and thus the recommended return on common equity, is reflected as an interest rate that, by objective criteria of comparable risks, is the opportunity cost of capital incurred by the common shareholders of Florida Public Utilities Company.

Market Liquidity is a necessary selection criterion, as stated above. The selection process resulted in generally smaller-sized electric and gas utilities that have sufficient liquidity. However, the selected utility companies of the two samples are substantially larger than Florida Public Utilities Company. Because the cost of equity capital appears to increase progressively with smaller size, other factors constant, the implication is that the cost of equity capital, as estimated for the two samples, may not fully capture the inherent capital risks incurred by investors of Florida Public Utilities Company. This is discussed later within the testimony, and the exhibits present levels of risk premia associated with small sized equities.

Q. The outlook for the U.S. economy plays heavily in the formation by investors of the future expectations of financial markets. Because future economic performance is used to estimate the cost of common equity, it is useful to elaborate on the inherent linkage between economic performance and the cost of equity.

A. As mentioned above, future returns to capital and thus estimation of cost of capital are inherently expectational in nature. The assessment of equity costs involves implicit and explicit estimates of investor expectations about inflation, interest rates, and future market performance. This is particularly important, as near-term interest rates and market experience and conditions do not necessarily reflect long-term expectations of and about capital markets as a whole. The basis of selection of historical timeframes is overall macroeconomic performance. That is, the analyses incorporate observed market returns from timeframes where the overall economic performance, measured in terms of growth in productivity and real output, are equivalent to the outlook today.

The relationships between factor inputs and the real output of goods and services of the economy are crucial to U.S. citizens, and to capital markets and investors. This is because resource productivity, to a large extent, determines the future level of real output of the economy as a whole. Productivity growth, when coupled with the growth in the aggregate pool of capital and labor resources, translates directly into real output, employment, savings, earnings, and market performance. Furthermore, real output is a significant element within overall economic and social well being.

The current outlook for macroeconomic growth calls for prospective long-term productivity change to range between 2.00 and 2.60% annually. This is a more-or-less consensus view held by well-known macroeconomists and economic forecasters, although expected productivity has declining recently from the exceptionally high levels beginning in the early to mid-1990s. Three years previous, long-term productivity appeared to be capable of upwards of 2.75% over the extended future. And while this range of productivity is fairly high by overall long-term historical standards, it is consistent with selected periods of the post-War period including the 1950's, 1960's, and 1990's. Specifically, productivity rose at annual rates of 2.4%, 3.0%, and 2.1% during the 1950s, much of the 1960s, and the latter 1990s, respectively. Of particular interest and crucial to the immediate analyses, productivity increased very sharply beginning about 1994, departing substantially from the low productivity growth of the previous two decades.

Productivity growth slowed significantly during 2000 and 2001, as overall economic activity attenuated amid the stress attributable to a number of factors and events of a transient nature that, in total, ultimately precipitated the modest recession of early 2001. Since then, the economy has resumed a recovery path and productivity growth appears to have accelerated to pre-recession levels. Indeed, overall productivity growth of 2003-2005 observed a return to high rates, which continues to contribute significantly to ongoing earnings performance and significant market returns realized by investors within equity markets internationally.

In short, the U.S. economy is well positioned to realize and sustain substantial, if not high, rates of growth in productivity and real output, along with full employment and modest inflation over the foreseeable long-term future. Investors generally share this consensus view and, accordingly, the analyses herein draws upon realized overall market rates of return and interest rates as representative surrogates for the period of time that the retail prices for Florida Public Utilities Company are likely to be in place. The average percentage market return over the historical timeframes mentioned above, as gauged by the S&P 500 index, was slightly above 13.0%, reaching back to the 1970s, and higher within recent years except for the years of major market corrections, 2000 and 2002.

Overall economic performance and long-term growth can, however, be attenuated by events of a transitory nature and various long-term processes that can contribute to capital risks such as the costs to maintain environmental quality, or world-wide cultural friction. An immediate example is the decline in credit market liquidity observed in recent weeks. Finally, it is important to mention the impact of government fiscal policy and global demand for capital on interest rates. As mentioned, the cost of capital is a function of the demand and supply of funds, and we expect U.S. and world demand for capital to remain at high levels, thus placing steady pressure on interest rates. As a result, interest rates are likely to remain at current levels, which approach long-term trends, although short-term interest rates in the short run may decline somewhat from current levels.

Q. What are the analysis results obtained from the application of the cost of common equity methodologies?

A. The task before us is to estimate the cost of capital over the relevant and foreseeable timeframe for which retail electricity rates are to be effective. This means that the analyses should, to the degree possible, recognize future events and market conditions that might be reasonably expected by investors.

As mentioned, the analyses include Discounted Cash Flow, Capital Asset Pricing Model, Risk Premium methods, and Historical Market Returns, with the first two approaches representing formal models of capital valuation. The Discounted Cash Flow analysis is applied to the sample of natural gas companies only. All analyses are shown as a range of plausible values, as the analysis of the cost of common equity is confronted with the problem of observability that inherently results in unknown levels of model estimation error.

The assessment of the opportunity cost of capital involves obtaining and processing a considerable amount of data, and using these data within structured analysis procedures that begins with selection, as discussed above. Data are obtained from several sources including Ibbotson Associates, MarketVector, UBS PaineWebber, Value Line Investment Survey, and Zacks Security Market Research.

The single stage *Discounted Cash Flow Analyses* for the Mid-Sized Electric Utilities (sample 1) and Gas Utilities (sample 2) are presented on pages 1 and 2 of Exhibit 7. As shown, the DCF results suggest that the underlying cost of common equity capital for the sample of electric utilities resides within the range of 9.0 – 9.9% with a corresponding weighted average of 9.6%. Similar results for the sample of gas utilities are 9.0 – 10.4%, with a weighted average of 9.5%. A key point is that these analyses are for a sample of companies which, as mentioned, are significantly larger than Florida Public Utilities Company and, absent further adjustment for size premia associated with very small capitalization companies such as the Company, will systematically understate the cost of common equity capital.

While nettlesome details are always present within capital market analyses, the classical DCF model consists of the two essential components of prospective dividend yield, and expected growth. For the sample of Mid-Sized Electric utilities, the analyses and the resulting estimates of the opportunity cost of capital reveal that the adjusted one year prospective yield lies within the range of 4.5% - 5.4%, while the corresponding estimates of expected growth of future cash flows are within the range of 3.3% - 4.7%. Analysis results are shown on a simple- and weighted-average basis, with the weights based upon the market capitalization of the sample utilities. The multi-stage DCF estimates of the cost of equity capital obtain similar results and are not shown.

The essential element for both single- and multi-stage DCF analysis is to appropriately assess investor expectations of growth of capitalization value and dividends. The analyses rely upon the historical experience of the sample companies to develop reasonable estimates of growth of internal cash and earnings. My studies generally rely on a combination of historical experience and analyst projections of cash flow and earnings growth, as implicitly contained within the valuation of investors, including larger institutions and individual investors. Timeframe is important and, for the immediate study, analyst views appear to be highly similar to those of historical experience. The study relies on long-term historical experience as the basis for expected growth in the future. The immediately study utilizes historical cash flow and earnings per share growth, which is measured in two ways for single-stage DCF. Specifically, historical growth experience is assessed over successive five-year periods, as well as by logarithmic trend-based analysis over ten years.

We should mention that while the immediate study utilizes historical growth experience, other studies by Christensen Associates Energy Consulting, depending on timeframe, have also drawn on and applied analyst expectations of future growth within the DCF formulation of the cost of capital. Historical growth and analyst expectations of growth are positively correlated and, not surprisingly, our studies suggests that, other factors held constant, differences among the dividend yields and other metrics for companies actively traded on equity markets are explained by historical growth analyst expectations of future growth. Generally speaking, analyst expectations are above those of historical experience and, were analyst expectations incorporated within the current analyses, it is likely that the DCF model would obtain higher estimates of the cost of common equity than those obtained via historical growth alone.

As mentioned above, the DCF analyses, as with CAPM and Risk Premium methods incorporate an adjustment for issuance costs of 6%, which translates into about 33 basis points. However, the cost of capital studies presented herein incorporate no allowance for market pressure or quarterly dividends. Empirical evidence suggests that market pressure is very small to non-existent, at least for larger capitalization companies. Had the analyses incorporated an adjustment for quarterly payment of dividends, the result would be—depending on perspective (frequency of payment or frequency of discounting)—to alter the estimated cost of capital by about 20 – 30 basis points.

As with Discounted Cash Flow, the *Capital Asset Pricing Model* is applied to both the Mid-Sized Electric Utility and the Gas Utility samples. The CAPM analyses are shown on Exhibit 6, pages 1 (sample 1) and 2 (sample 2). The application of CAPM requires estimates of the risk-free rate, investor expectations of overall market returns, and market Betas which account for and embody systematic risk with reference to equity markets as a whole. Incorporating estimates of market rates of return and short-term interest rates into the CAPM formulation along with the market Betas results in estimates of the cost of common equity for Florida Public Utilities Company.

Expected market returns for equity markets in the large are captured by the S&P500 Index, measured with the inclusion of dividend payments. The expected value of future returns of course is a key element to the application of the Capital Asset Pricing Model. Plausible measures of expected market returns used in CAPM can be gleaned from timeframes of similar economic performance to that of the period for which the cost of capital is estimated – mid-year 2006 and prior to the run-up in equity markets of the second half of that year. For this timeframe, the CAPM analysis utilizes the experience of U.S. equity markets for the period 1970 forward, which is equal to 13.0% through 2005. Realized market returns, for monthly and annual periods as well as for decades, vary greatly as shown within the table referred to as "Market Inputs: Dividend Yields and Overall Returns". Here, we observe significant differences in return levels experienced by investors across decades. This is also shown within the table entitled "Variation in Yields and Returns" where, as can be seen toward the right, the standard deviation in monthly returns varies greatly—by over 20% during the 1970s and since 1999—the years 2000 and 2002 in particular. This level of variation for equity market returns is not unusual, and demonstrates the order of magnitude of the greater risk assumed by investors in equities in comparison to the inherent risks within debt markets, which are much lower. In short, equity market returns of well above 10% are absolutely necessary in order to compensate investors for the level of risks that they inherently assume. Though drawn from a sufficiently long interval, this level of expected market return is not unusually high; indeed, it is significantly diminished from previous eras including the 1950s, the 1960s, and the 1994 – 1999 period in particular. Stated without reinvested dividends, these decade-long eras reveal overall equity market returns of close to 15%. These timeframes represent periods of overall productivity that approximates, but is arguably somewhat above, expectations of mid-year 2006, when the cost of capital was estimated within the immediate docket, or currently. Not surprising, productivity expectations are somewhat diminished from those of the 1950s, 1960s and the surge of the 1990s continuing into 2003-2004. Nonetheless, should expectations of future market returns be somewhat greater, the CAPM analyses understate the cost of capital to Florida Public Utilities Company; conversely, lower expectations imply that the cost of capital is somewhat overstated.

Market Betas for the companies of the two samples are drawn from the 2005-ending experience, as we observe a substantial increase in market Betas for the sample vis-à-vis the average Beta over the previous four years. Notably, the variation of CAPM Beta for the electric utilities of sample 1 is significantly higher than that for the gas utility sample, as demonstrated by the differences between the standard deviation of the sample (referred to "S.D.") for 2005 with respect to the average Beta for 2001-2004. Nevertheless, the CAPM Betas for 2005 for the two samples are closely comparable, overall; hence, the CAPM analyses produce similar cost of capital estimates. Specifically, CAPM analyses for the Mid-Sized Electric Utility sample suggest a cost of common equity to Florida Public Utilities Company of 9.6% - 13.3% with a weighted average midpoint of 11.3%, while the corresponding analyses for the Gas Utilities sample obtain 9.4% - 13.2% with a midpoint value also of 11.3%, shown with the inclusion of issuance costs.

As discussed earlier, the *Risk Premium* methodology infers the cost of common equity capital from the premia of realized equity returns with reference to rates of return on debt. The immediate studies rely upon historically observed risk premia for common stocks over that of intermediate term government debt for timeframes that reflect the current outlook for the U.S. economy as regards to advances of productivity and real output. This analysis suggests that the overall market returns prospectively are somewhat less (12.25%) on average across scenarios than the overall market return inputs used with the CAPM analysis.

Of particular interest, these timeframes experienced modest rates of inflation, which is important to the determination of risk premia over forward timeframes. Specifically, risk premia tend to decline as inflation rises. This is because inflation risk – *i.e.,* uncertainty regarding the future level of expected inflation – rises with higher inflation. Unlike equity returns which are somewhat hedged against inflation (higher nominal revenues, operating income, and net income), high inflation implies losses for debt holders. Hence, capital markets capitalize the uncertainty attending higher inflation in higher market costs of debt. Second, high inflation appears to be commensurate with lower returns to equity holders, a result of less favorable economic conditions. Together, risk premia tend to be significantly reduced during periods of relatively high inflation and less favorable economic and business conditions.

The manifestation of inflation risk and business conditions within risk premia between equity and debt is shown on Exhibit 8. The 1950s, 1960s, and 1990s reveal risk premia of 10.6 – 11.7%, with correspondingly inflation of 2.4%. This is in sharp contrast to the U.S. experience of the 1970s and 1980s, with risk premia of 3.0% - 4.3% and corresponding inflation of 5.7% over the period. The main point, for purposes of assessing capital costs prospectively, is that risk premia must be developed from historical timeframes where underlying inflation matches that of the current and prospective period for which rate of return is being determined – 2008 forward. Thus, the analyses draw risk premia from the 1950s, 1960s and, where corresponding rates of change in overall prices were experienced. And as discussed above, these historical timeframes match the current outlook fairly well from the perspective of productivity and market returns.

The essential elements of the risk premium analysis includes 1) the risk-free holding period return, 2) the risk premia between equity and debt, and 3) cost rate adjustments for industry and size differences with respect to U.S. equity markets overall. Specifically, the approach adds risk premia to the risk-free holding period return. Consistent with the CAPM analyses, the risk premium analyses use the cost rate for 1-year treasury securities, as expected over the prospective timeframe, as the baseline cost rate. Essentially, the cost rate for 1-year Treasury securities is the basis for the risk-free holding period return.

Debt cost rates are differentiated by term. Thus, the analyses incorporate an upward adjustment for the historical spread between 1-year and 4-year treasuries, as the historical risk premia are based upon realized market returns between equities and intermediate term government debt. Together, the cost rate 1-year Treasuries, the spread between 1- and 4-year Treasury securities, and the historical debt-equity risk premia provide an estimate of the cost of common equity for equity markets as a whole. As shown in the table entitled "Equity Market Return" of pages 1 and 2 of Exhibit 8, the analysis obtains a cost of equity for equity markets of 11.5 – 13.0%, which confirms the historical analysis utilized in the CAPM analyses discussed above.

Further adjustments are necessary in order to fairly assess the cost of equity capital for investors in Florida Public Utilities Company, including 1) a differential for lower market risks of utilities generally, referred to as "diversifiable risks" and 2) the small size premia (small firm effect) referred to as "small cap equities". (Adjustments are shown for small and very small-sized companies.) The effects of these adjustments are shown in the section entitled "Cost Rate Adjustments" of Exhibit 10, pages 1 and 2. The CAPM analysis reviewed earlier is the basis to determine how diversifiable risks associated with samples 1 and 2, including the Mid-Sized Electric Utilities and Gas Utilities respectively, are below those of the composite market (CAPM Betas of 0.75).

As shown, this adjustment lowers the common equity cost rate by -2.2% and -2.5% respectively, for the electric and gas utility samples.

The differential for the small size premia recognizes that the cost of equity is higher for small firms, other factors held constant. Empirically, the Small Firm Effect is the difference between realized market returns and the cost of equity capital, as estimated by CAPM over many years. As shown on page 2 of Exhibit 2, the small size premia can be well over four percentage points for very small-sized companies such as Florida Public Utilities Company. The Risk Premium analysis takes a conservative approach and uses the Low Capitalization Risk Premium, with a plausible range 1.5 – 2.8%. Incorporating these two adjustments into the analysis across the two samples suggests that the cost of equity capital lies within the range of 12.0 – 12.2%. Recognition of issuance expenses associated with incremental shares of common equity provides a Risk Premium cost of capital range of 12.3 – 12.5% for the two samples, with corresponding ranges.

The fourth analysis approach relies upon *Historical Returns* to determine estimates of expectations of future returns harbored by investors. The estimates are drawn from the historical market returns over the late 1996 – 2005 timeframe. This timeframe includes years of exceptionally low and exceptionally high rates of return that, overall, are fairly well balanced. The historical realized returns for the Mid-Sized Electric Utilities are presented on pages 1-3 of Exhibit 9, while realized returns for the Gas Utilities are shown on pages 4-6. For each of the two samples—Mid-Sized Electric Utilities and Gas

Utilities—historical returns are shown in three ways including "Average Returns Per Annum" (1996-2001 – 1996-2005); "Five-Year Returns" for consecutive 5-year periods (1996-2001 – 2000-2005); and "Cumulative Returns" (1996-2001 – 1996-2005). As shown, the results, which are determined on a simple- and weighted-average basis, suggest that investors can expect to realize future rates of return of between 10.1 – 12.5%. Realized historical returns realized by investors conform to the cost of capital estimates obtained by the formal cost of capital models, Discounted Cash Flow, CAPM, and Risk Premium methods.

Q. What conclusions are reached by your analysis and what is your rate of return recommendation?

A. The analysis of the opportunity cost of capital incurred by common shareholders of Florida Public Utilities Company is summarized in Exhibit 2. Exhibit 2 compiles the results of the four analysis methods including the DCF, CAPM, Risk Premium, and Historical Returns approaches. As mentioned earlier, the DCF, CAPM and Historical Returns are estimated for mid-sized companies that, while not large, have much larger market capitalization than Florida Public Utilities Company. The clear implication is that estimates of the cost of equity capital for Florida Public Utilities Company based on these three methods are conservative. As shown on page 2 of Exhibit 2, small size premia for Florida Public Utilities Company are about 2.00 percentage points or somewhat higher.

Mid-point values are shown in this summary, though ranges of values are presented within the exhibits presenting the detailed results for each approach.

The ranges for the cost of equity estimates are based on statistics drawn from the analyses themselves, and could be presented as either larger (wider) or smaller (narrower) ranges of plausible values. The analyses suggest that, for common shareholders of Florida Public Utilities Company to be adequately compensated on the capital committed to public service, and to fully satisfy the statutory requirements defined by the U.S. Supreme Court, the rate of return on common equity must be set at a level equal to 11.5% or higher.

Q. Does this conclude your testimony?

A. It does.

To:	Kitner Don
Cc:	Lynch Daniel; Palmer Tiffany; Cox Doreen
Subject:	Revised NPV - Fisherman's Cove
Attachments:	Fisherman's Cove NPV Revised 7.3.07.xls

Don,

Attached, you will find the revised version of the subject development. I reduced the mains cost by $18,300, the cost of the access fees, and moved that expense to the access fee block on the form. The amount per customer, $18,300 / 66 = $277.27 per customer.

The ROR moved up slightly as a result from 15% to 16% ROR.

Thanks,

Marc S. Seagrave

Procedure for using the Net Present Value (NPV) Template for Investment Analysis

Procedure #	
Effective Date	9/16/2002
Revision #	
Prepared By	D Cox
Approved By	G Bachman

OBJECTIVE

The Net Present Value (NPV) Template is to be used as an analytical tool for evaluating potential revenue generating investments. The template looks at the net present value of all cash outflows (such as the cost of the investment) and cash inflows (returns), using a given discount rate (required rate of return). The investment is acceptable if the NPV is zero or positive.

INPUT AREAS

The general input areas are shaded in light blue - all relevant cells should be updated for all projects. Enter data as follows:

1 **Project Title**	Short description of investment.
2 **Year Project Begins**	Projected year that the project will commence.
3 **Increase Margins By**	These cells adjust the non-fuel charge rates. For regulated projects that will be using existing rates **NOTHING** should be entered in these cells. The meter customer rate is to used to determine if the rate of return is met. If met, the margin can then be increased for analytical purposes and to maximize competitive rates.
4 **Annual Gallons per Customer**	Estimate average annual therm usage per class of customer - residential, commercial, industrial etc..
5 **Piping Expense**	Estimated Piping Expense per class of customer if applicable.
6 **Cost of Service per Customer**	Estimated cost of providing service to each class of customer.
7 **Access Fee**	Developer Access Fee per customer if applicable.
8 **New Residential Customers**	Estimated number of residential customer turn-ons per year.
9 **New Commercial Customers**	Estimated number of commercial customer turn-ons per year.
10 **New Industrial Customers**	Estimated number of industrial customer turn-ons per year.
11 **Other Income**	Other "non base revenue" estimated positive cash flows to be generated by the project for each year. Note - pass-through revenues, such as fuel and gross receipts tax are not to be included.
12 **Other Expenses**	Other expenses estimated to be incurred from the project for each year eg. Sales Rep Commssions. Note - pass-through expenses, such as fuel and gross receipts tax are not to be included.
13 **Capital Expenditures**	Annual projected capital expenditure (investment), excluding services.
14 **Upfront Capital Expenditure less (Contributions)**	Estimated amount of investment to be made prior to commencement of revenue flows,
15 **Prepared By**	Type name on worksheet and initial printed copy. **Non-acquisition projects skip to number 26**

ADDITIONAL INPUT - ACQUISITION RELATED INVESTMENTS

For acquisition-type investment analysis, cells in the green shaded areas also need to be updated as follows:

16 **Purchase Price**	Anticipated price to be paid for acquired company.
17 **Share Price**	Anticipated price at which new shares would be issued.
18 **Annual Dividends**	Projected dividend payment on new common shares issued.
19 **Legal Fees and Closing Fees**	Professional and other acquisition related fees - expensed in the first year.
20 **O&M**	Operation & Maintenance expense override - enter a dollar amount here if you wish to override the O&M % of Revenue automatic calculation in cell F83.
21 **Projected O&M Savings**	Anticipated O&M savings expected from acquisition related synergies.
22 **Annual Addition O&M cost per new customer**	Estimated additional O&M expenses to be incurred for each new customer in subsequent years. ie Projected O&M costs / Number of New Customers
23 **Portion of Purchase Price as Goodwill**	Difference between purchase price and fair market value of assets less liabilities.
24 **Prior Year Earnings Common Stock**	Annual earnings for Common Stockholders in the year prior to commencement of project.
25 **Prior Year Average Shares Outstanding**	Average common shares outstanding in year prior to commencement of project.

Procedure for using the Net Present Value (NPV) Template for Investment Analysis

Procedure #	
Effective Date	9/16/2002
Revision #	
Prepared By	D Cox
Approved By	G Bachman

GENERAL INFORMATION

26 Contracts with Access Fees (up-front payments to Developers) should be carefully worded to ensure that there is a corresponding clause for a penalty for units not connected. The payments to the Developer should be entered on the cash flow analysis as a capital expenditure in the year that it is anticipated that the payment will be made. The access fee should be treated as an up-front capital expenditure.

27 On the Income Statement Section of the NPV analysis it is assumed that the up-front access fee is capitalized and will be depreciated at the same rate as other capital expenditure items. The actual contract should be worded such that we incur an access fee liability up front, with offsetting penalties for accounts not signed on, instead of using piping allowances. The payment schedule will coincide with the timing of accounts signing and turning on.

NPV MODEL ASSUMPTIONS

28 Inflation is not included in either revenues or expenses - null effect, in addition to which the discount rate includes the inflation risk.

29 Asset Remaining Value - represents the value of the investment at the end of the analysis. Can also be seen as representative of the future income streams beyond the time frame of the template. For regulated companies it is calculated as the average of the last three years Net Income Before Interest, Taxes and Depreciation times a multiplier of 8. A multiplier of 6 is used for non-regulated projects.

30 Required Return - the return that the shareholders demand depending on the riskiness of the investment.

31 Ratio of Debt Financing - assumes that future projects will be financed by debt and equity equally.

32 O&M Expenses - "R" = 31% Base Revenue "NR" = 35% Base Revenue (Budgeted Expenses). For acquisitions this percentage can be replaced by a $ amount by entering the estimated O&M expenses in cell B94.

33 Interest Rate - Weighted Average Cost of Debt.

34 Depreciation Book % - Book Depreciation Rate.

35 Income Tax % - Income Tax Rate.

ACQUISITION ASSUMPTIONS

36 For the cumulative net cash flow, the stock value is added back in because it is not an actual cash outlay.

Procedure for using the Net Present Value (NPV) Template for Investment Analysis

Approved By	G Bachman

PROCESS

37 Prepare NPV analysis for all revenue producing projects and attach detailed capital expenditure estimates from engineering. For AEP projects prepare and attach AEP worksheet also.
38 **Ensure that the variables, such as rates, are correct and review to ensure that the results, such as revenues and expenses seem reasonable.**
39 Submit NPV (& AEP) worksheets for approval as per steps below.
40 Prepare IR after approval has been granted.
41 Submit approved IR , AEP worksheet and NPV to General Accounting.
42 A copy of all approved NPVs and AEPs must also be forwarded to the Accounting Department for the attention of the Executive Assistant.

Marc,
Attached is the approval package for River Oaks. This is an existing community in DeBary near I-4 that wants natural gas in their community. 16 residential and 1-commercial accounts are ready to commit to install natural gas. Each will pay a $225.00 non-refundable contribution to off-set the ECC associated with the installation. An additional 7 residents will also pay the $225.00 further off-setting the ECC amount. They feel having natural gas available will increase the value of their house. The ECC is $10,969 with $5,625 being paid upfront leaving a balance of $5,344 to be collected utilizing the AEP surcharge.

As before please do not change the RNGS's as the ones attached are the only versions that have been approved at the division.
Thanks,

Don Kitner
General Manager, Central Florida
386-668-9201

HOA AGREEMENT

THIS HOA AGREEMENT (this "Agreement") is made and entered into effective this ____ day of ____________, 2007 (the "Effective Date"), by and between Florida Public Utilities Company, a Florida corporation ("Company"), and River Oaks CSA Inc., a Florida homeowners association ("HOA") (Company and HOA may sometimes be collectively referred to as the "Party" or "Parties").

W I T N E S S E T H

WHEREAS, HOA intends to give permission to Company to install a natural gas distribution system within the community named River Oaks, located in Volusia County, Florida (the "Project") in order to make natural gas available to interested residents that have signed individual natural gas agreements with Company and have paid their necessary contribution for service to be installed to their homes. HOA has agreed to permit Company to install such a system to service the Project, pursuant to the terms and conditions hereinafter set forth.

NOW, THEREFORE, in consideration of the mutual covenants set forth herein, and for other good and valuable considerations, the receipt and sufficiency of which are hereby acknowledged, Company and HOA hereby agree as follows.

1. **Installation of Gas Distribution System**.

1.1. Installation. Company agrees to install a natural gas distribution system within the residential portions of the Project, including all necessary distribution lines, meters and ancillary facilities (collectively, the "Gas Distribution System") as Company deems reasonably necessary to provide natural gas service to owners, occupants and residents within the Project. From time to time, Company shall install additional lines, meters and ancillary facilities ("System Extensions") which Company deems reasonably necessary to extend the Gas Distribution System to other areas of the Project in order to supply gas service to non-residential portions of the Project that apply for and qualify for gas service from Company. For purposes of this Agreement, the term "Gas Distribution System" shall include any System Extensions that are added by Company.

1.2. Location. The location of the gas lines and all infrastructure and improvements relating to the Gas Distribution System shall be subject to HOA's prior written approval, which approval shall not be unreasonably withheld or delayed. Prior to commencing installation of the Gas Distribution System, Company shall provide, for HOA's review and comment, plans and specifications in accordance with which the Gas Distribution System is to be installed (Gas Distribution System Plans and Specifications"). Upon completion of installation of each three thousand (3000) linear feet of the Gas Distribution System (each being a "Completed Portion"), Company shall commence restoration of those portions of the Project disturbed by Company during installation of the Completed Portion and shall continue diligently such restoration work until complete. Restoration work shall be completed so that the surface of the land shall be restored to substantially the same condition existing immediately prior to commencement of the installation of the Completed Portion.

1.3. <u>Preparation for Installation and Easements</u>.

1.3.1. HOA agrees to provide adequate physical and legal access (including the easements described below) to all areas of the Project where portions of the Gas Distribution System are to be installed to access, maintain and operate the Gas Distribution System. Such easements are identified in the plat referenced in 1.3.2.

1.3.2. HOA has provided Company a plat of all or a portion of the Project (recorded in Official Records Book 19, Page 125, Public Records of Volusia County, Florida), which depicts the location of streets, lots and easements encompassed therein (the "Plat"). If additional plats ("Additional Plats") are created for the Project, HOA shall provide Company a copy thereof within ten (10) days after recording. The Plat and all Additional Plats (whether or not provided to Company) shall be collectively referred to herein as "Project Plats". Notwithstanding any provision contained herein to the contrary and in addition to the easements referenced in Section 1.3.1 hereof, HOA hereby grants Company an easement over those portions of the Project designated on Project Plats as a utility easement or right-of-way (public or private) (or other similar designations) for purposes of installing, operating, maintaining, repairing and replacing the Gas Distribution System.

1.3.3. HOA reserves the right to relocate any easement granted to Company if HOA deems such relocation to be necessary for the development of the Project. If Company has not installed the portion of the Gas Distribution System proposed to be installed in the relocated easement, but has commenced the design and engineering thereof prior to the date Company receives written notice from HOA of its desire to amend an easement, HOA shall be required (prior to amendment of the easement) to reimburse Company for Company's actual, out-of-pocket expenses incurred in redesigning and/or reengineering the applicable portion of the Gas Distribution System. If HOA desires to relocate any easement relating to a portion of the Gas Distribution System after the system has been installed, HOA must first, (a) obtain Company prior written consent (which consent shall not be unreasonably withheld or delayed) and (b) reimburse Company for all costs incurred by Company in relocating the Gas Distribution System, including, but not limited to the cost of redesigning and/or reengineering the Gas Distribution System, and the cost of all materials and labor therefore.

FPU Initials: ________
Date: ________
Builder Initials: ________
Date: ________

1.4. Coordination of Installation. Company agrees to cooperate with HOA with respect to the construction of the Gas Distribution System so as to minimize interference with or delay to HOA's construction and development of the Project. HOA will notify the Company in writing of any proposed or anticipated construction schedule for the Project. HOA acknowledges that Company will rely upon the HOA's Construction Schedule for purposes of coordinating its acquisition of materials, mobilization of equipment and labor at the worksite and installation of the Gas Distribution System.

1.5. Ownership of Gas Distribution System; Maintenance. Notwithstanding any provision contained herein to the contrary, the Gas Distribution System shall remain the exclusive property of Company at all times during the term of this Agreement and following its expiration or earlier termination. Company shall have the sole obligation and responsibility for the maintenance of the Gas Distribution System. Company shall at all times maintain the Gas Distribution System in accordance with the requirements of all appropriate governmental and regulatory agencies.

1.6. Supply Date. Subject to any delay caused by Force Majeure or the actions or inactions of HOA, Company agrees that the Gas Distribution System installation shall commence when 16 residents have executed an individual gas service agreement, 25 non-refundable improvement of facilities forms are executed and 1 commercial gas service agreement has been executed.

1.7. Minimum Required Appliance Installation. A minimum of 3600 therms collectively from appliances listed on the Appliance Therm Rate Schedule is required. The Company has provided the HOA a copy of an Appliance Therm Rate Schedule for the Project, which is attached hereto as Exhibit "A" and incorporated herein (the "Appliance Therm Rate Schedule"). The HOA also agrees to the installation of a 400,000 BTU Spa Heater, 400,000 BTU Pool Heater, a Gas Grill and Gas Water Heater at the HOA's clubhouse.

2. **Successors, Assigns And Assignment**. The HOA and the Company each bind itself, its successors, assigns and legal representatives to the other party in respect to all covenants, agreements and obligations contained in this Agreement. If HOA desires to convey to other HOA or HOAs any or all of the land upon which the Project is to be constructed, such conveyance may not be undertaken and shall not be effective until such HOA or HOAs expressly assumes all of the obligations and responsibilities of HOA hereunder (to the reasonable satisfaction of Company). Similarly, if HOA desires to assign this Agreement or any portion hereof to a homeowner's association, as a condition of such assignment, the homeowner's association shall pass a valid and appropriate resolution expressly assuming all of the obligations and responsibilities of HOA hereunder (such resolution being to the reasonable satisfaction of Company).

3. **Force Majeure**. Neither Party shall be liable to the other for any failure to perform pursuant to the terms and conditions of this Agreement to the extent such performance

FPU Initials: ________
Date: ________
Builder Initials: ________
Date: ________

was prevented by an event of Force Majeure. The term "Force Majeure" shall mean Acts of God, strikes, lockouts, or other industrial disturbance, acts of the public enemy, wars, riots, epidemics, industrial disturbances that affect the Parties or its customers, breakage or non-foreseeable accident to machinery or lines of pipe, and any other causes, whether of the kind herein enumerated or otherwise, not within the control of the Party whose performance is affected and which, in each of the above cases, by the exercise of due diligence such Party is unable to prevent or overcome utilizing commercially reasonable efforts; such term shall likewise include the inability of a Party to acquire, or delays on the part of such Party in acquiring at reasonable cost and by the exercise of reasonable diligence, servitudes, rights of way, grants, permits, permissions, licenses, materials or supplies which are required to enable such Party to fulfill its obligations hereunder. The Party whose performance is excused by an event of Force Majeure shall promptly notify the other Party in writing of such occurrence and its estimated duration, shall promptly remedy such Force Majeure if and to the extent reasonably possible and shall resume such performance as soon as possible; provided, however, that neither Party shall be required to settle any labor dispute against its will.

4. **Duration**.

4.1. Expiration; Automatic Extension. Subject to Subsection 4.2 hereof, this Agreement shall automatically expire twenty (20) years after execution of Agreement. The term of this Agreement shall be automatically extended for terms of one (1) year periods unless written notice is provided at least ninety (90) days but no greater than one hundred twenty (120) days prior to the expiration of the initial term of this Agreement or any extension thereto by one Party to the other Party that it will not allow the extension of the term of this Agreement.

4.2. Early Termination. Notwithstanding any provision contained herein to the Contrary, either Party may terminate this Agreement by providing the other at least fifteen (15) days prior written notice if the 17 required services have been activated with 3600 therms.

4.3. Survival of Easements. Notwithstanding the expiration or earlier termination of this Agreement (regardless of the cause therefore), the easements created herein and required to be granted herein shall survive, and the rights, privileges and responsibilities created therein shall not be adversely affected by, the termination or expiration of this Agreement

5. **Notices**. Any notices sent by either party to the other pursuant to this Agreement shall be sent by either U.S. mail, postage prepaid, return requested, or by receipted overnight national delivery service (e.g., Federal Express), and shall, if not sooner received, be deemed received three (3) business days after deposit in the United States Mail, or one business day after receipt by any overnight national delivery service, as aforesaid. All

notices shall be addressed to each party at the following address, or such other address as either party may hereafter designate to the other party in writing:

If to HOA:	River Oaks CSA Inc. P O Box 7149 Daytona Beach, Florida 32116 Attn: Joe Alemany Fax No. 386.XXX.XXXX Phone No. 386.753.1758
If to Company:	Florida Public Utilities Company 401 South Dixie Highway West Palm Beach, Florida 33401-5807 Attn: Marc Seagrave, Director of Marketing Fax No. 561.833.8562 Phone No. 561.838.1714
with a copy to:	P.O. Box 530969 DeBary, Florida 32753-0969 Attn: Donald Kitner, Director Fax No. 386.668.2692 Phone No. 386.668.2600

6. **<u>Governing Law: Dispute Resolution</u>**. This Agreement shall be governed by and construed in accordance with the laws of the State of Florida without reference to the laws of any other jurisdiction. HOA and Company agree to submit any disputes arising under this agreement to non-binding mediation; provided, that applicable statutes of limitation will be tolled during the pendency of such mediation. In the event Company and HOA cannot in good faith agree on a mediator within fifteen (15) days of the request of either party for mediation, or, if the parties remain in dispute following mediation, any such dispute will be resolved by final, binding arbitration. Arbitration shall be accomplished expeditiously in Orange County, Florida, and shall be conducted by the American Arbitration Association (in accordance with its rules) which will appoint three arbitrators, one of which must be an attorney. The arbitrators shall render a written judgment accompanied by findings of fact and conclusions of law, which are subject to review by the appellate courts of the State of Florida. Judgment upon the award rendered by the arbitrator(s) may be entered in any Court having jurisdiction thereof. The parties shall share equally the arbitrators' fees and costs until the prevailing party is determined or the parties have agreed in writing to an alternate allocation of fees and costs. In any suit or arbitration proceeding brought by either party, the prevailing party will be entitled to recover attorneys' fees, costs and expenses actually incurred by the prevailing party in such suit or arbitration proceeding or in any appeal. The parties consent that any arbitration may be consolidated with any other arbitration concerning this Agreement to which Company or HOA is a party and that a

dispute shall not be submitted to such binding arbitration if there are any third parties who are not subject to such binding arbitration but who are proper parties to such dispute. This Section 7 shall survive expiration or any termination of this Agreement.

7. **Indemnity; Damages to Property; Limitation on Liability**.

7.1. Company agrees to protect, defend, reimburse, indemnify and hold the HOA, its agents and employees and each of them, hereinafter collectively referred to, for the purposes of this paragraph, as HOA, free and harmless from and against any and all claims or damages (including attorneys' fees) incurred by HOA by reason of the negligent or intentional acts of the Company; provided however, that Company shall not be responsible to HOA for damages resulting out of bodily injury or damages to property which are attributable to the negligent acts or omissions of HOA, its respective agents, servants, employees, officers, tenants, residents or homeowners.

7.2. HOA agrees to protect, defend, reimburse, indemnify and hold the Company, its agents, and employees and each of them, hereinafter collectively referred to, for the purposes of this paragraph, as Company, free and harmless from and against any and all claims or damages (including attorneys' fees) incurred by Company by reason of the negligent or intentional acts of HOA and its respective agents, servants, employees, officers, tenants, residents or homeowners; provided however, that Builder shall not be responsible to Company for damages resulting out of bodily injury or damages to property which are attributable to the negligent acts or omissions of Company.

7.3. Any damage to the Project caused by Company, its agents or employees, shall be promptly repaired to the reasonable satisfaction of HOA at Company's expense. Any damage caused to Company's equipment by HOA, its agents, employees, contractors, subcontractors, tenants, residents or homeowners shall be promptly repaired by Company at HOA's expense. HOA will take all reasonable precautions to notify its agents, employees, contractors, subcontractors, tenants, residents and homeowners of the location of Company's equipment.

7.4. Neither the Company nor HOA shall have liability to the other party or any third party for any special, indirect, incidental or consequential damages or loss of any kind, including, without limitation, loss of profits or savings, loss of use, or similar damages, whether based on strict liability, or negligence, whether resulting from installation, use or maintenance of the Gas Distribution System, breach of this Agreement or otherwise, except for direct, specific damages to the extent caused by either party's negligence or misconduct.

7.5. This Section 7 shall survive the expiration or early termination of this Agreement.

8. **Miscellaneous**. This Agreement constitutes the entire understanding and agreement between the Parties and supersedes any and all prior negotiations, understandings or agreements with respect to this subject matter. This Agreement may be amended only by written instrument signed by both of the Parties. Whenever possible, each provision of this Agreement shall be interpreted in such manner as to be effective and valid under Florida law, but if any provision of this Agreement or the application thereof to any Party or circumstance is prohibited by or invalid under applicable law, that provision shall be effective only to the extent of such prohibition or invalidity, without invalidating the remaining provisions of this Agreement or the application of the same. Nothing contained herein shall be construed as a joint venture, partnership or any other similar relationship between Company and HOA. The captions, headings, titles, and subtitles herein are inserted for convenience of reference only and are to be ignored in any construction of the provisions of this Agreement. This Agreement shall be binding upon, and shall inure to the benefit of, the Parties, and their respective successors and assigns, and no assignment shall relieve either Party of such Party's obligations hereunder without written consent of the other Party. This Agreement shall be subject to all applicable laws, rules, orders, permits, and regulations of any federal, state, or local governmental authority having jurisdiction over the Parties, their facilities, or the transactions contemplated. This Agreement may be executed in one or more counterparts, each of which shall be deemed to be an original, but all of which together shall constitute one in the same instrument.

9. **Recording**. This Agreement may be recorded by Company among the Public Records of the County in which the Project is located.

10. **Exclusivity**. During the term of this Agreement and for a period of ten (10) years thereafter, HOA shall not install, cause to be installed, or allow to be installed any other gas distribution system in the Project or any other system or mechanism for delivery of natural gas or propane gas to residents in the Project. HOA agrees that Company has an exclusive right to provide natural gas services to the Project and that HOA will not grant, or allow others to grant any easement or right-of-way for purposes of delivering natural gas service. HOA certifies that there is no existing contractual agreement with any third party for the provision of natural gas service to the Project, with the exception of this Agreement.

[remainder of page intentionally left blank]

IN WITNESS WHEREOF, the Parties have caused this Agreement to be signed by their respective duly authorized officers as of the date first above written.

Marc,
Attached is the approval package for River Oaks. This is an existing community in DeBary near I-4 that wants natural gas in their community. 16 residential and 1-commercial accounts are ready to commit to install natural gas. Each will pay a $225.00 non-refundable contribution to off-set the ECC associated with the installation. An additional 7 residents will also pay the $225.00 further off-setting the ECC amount. They feel having natural gas available will increase the value of their house. The ECC is $10,969 with $5,625 being paid upfront leaving a balance of $5,344 to be collected utilizing the AEP surcharge.

As before please do not change the RNGS's as the ones attached are the only versions that have been approved at the division.
Thanks,

Don Kitner
General Manager, Central Florida
386-668-9201

Instructions for using the AEP & Net Present Value (NPV) Templates

Revised 5/18/2005

OBJECTIVE

The AEP & Net Present Value (NPV) Templates are to be used as an analytical tool for evaluating potential revenue generating investments and to determine the AEP surcharge rate for the recovery of the Excess Construction Costs.

INPUT

The general input areas are shaded in light blue - all relevant cells should be updated for all projects. Enter data as follows:

1 **Project Name**	Short description of investment.
2 **Beginning In Year**	Projected year that the project will commence.
3 **Piping Allowance**	Estimated Piping Allowance per class of customer if not capitalized (see note 24).
4 **Occupancy Rate**	Anticipated occupancy level.
5 **Cost of Service per Customer**	Estimated cost of providing service to each class of customer.
6 **Mains**	Cost of installing main per year.
7 **New Residential Customers**	Estimated residential customer added each month for each year.
8 **Therms per Customer each Month**	Average monthly therms per residential customer.
9 **New General Service Customers**	Estimated General Service customers added each month for each year.
10 **Therms per Customer each Month**	Average monthly therms per General Service customer.
11 **New Large Volume Customers**	Estimated Large Volume customer added each month for each year.
12 **Therms per Customer each Month**	Average monthly therms per Large Volume customer.
13 **Gas Lighting Service**	Estimated other customer added each month for each year.
14 **Therms per Customer each Month**	Average monthly therms per other customer.
15 **Customer Charge**	Estimated Customer Charge for Other Customers added.
16 **Other Income**	Other "non base revenue" estimated positive cash flows to be generated by the project for each year. Note - pass-through revenues, such as fuel and gross receipts tax are not to be included.
17 **Other Expenses**	Other expenses estimated to be incurred from the project for each year eg Sales Rep Commissions. Note - pass-through expenses, such as fuel and gross receipts tax are not to be included.
18 **AEP Worksheet**	Enter AEP surcharge rate that provides cost recovery within 8-10 years.

GENERAL INFORMATION

19 Contracts with Access Fees (up-front payments to Developers) should be carefully worded to ensure that there is a corresponding clause for a penalty for units not connected. The payments to the Developer should be entered on the cash flow analysis as a capital expenditure in the year that it is anticipated that the payment will be made. The access fee should be treated as an up-front capital expenditure.

20 On the Income Statement Section of the NPV analysis it is assumed that the up-front access fee, including piping allowance (capitalized) will be depreciated at the same rate as the other capital expenditure items. The actual contract, however, should be worded such that it allows us to depreciate the piping allowance over the life of the contract.

Instructions for using the AEP & Net Present Value (NPV) Templates

NPV MODEL ASSUMPTIONS

25 Inflation is not included in either revenues or expenses - null effect, in addition to which the discount rate includes the inflation risk.

26 Asset Remaining Value - represents the value of the investment at the end of the analysis. Can also be seen as representative of the future income streams beyond the time frame of the template. For regulated companies it is calculated as the average of the last three years Net Income Before Interest, Taxes and Depreciation times a multiplier of 8. A multiplier of 6 is used for non-regulated projects.

27 Required Return - WACC as per Year End Survellance Report using Cost of Equity Rate as per last Rate Case.

28 Ratio of Debt Financing - assumes that future projects will be financed by debt and equity equally.

29 O&M Expenses - "R" = 31% Base Revenue "NR" = 35% Base Revenue (Budgeted Expenses). For acquisitions this percentage can be replaced by a $ amount by entering the estimated O&M expenses in cell B94.

30 Interest Rate - Weighted Average Cost of Debt.

31 Depreciation Book % - Book Depreciation Rate.

32 Income Tax % - Income Tax Rate.

PROCESS

33 **Ensure that the variables, such as rates, are correct and review to ensure that the results, such as revenues and expenses seem reasonable.**

34 Submit NPV (& AEP) worksheets for approval as per steps below.

35 Prepare IR after approval has been granted.

36 Submit approved IR , AEP worksheet and NPV to General Accounting.

37 A copy of all approved NPVs and AEPs must also be forwarded to the Accounting Department for the attention of the Executive Assistant.

TEMPLATE REVISION LOG

NPV Rev #	AEP Rev #	Date	Name	Changes Made	Approved By
		1/22/2004	DC	Made template a R only - NR will be done on the original 15 year template.	GB, DK
		1/27/2004	DC	Change Months on Input Sheet to "Month 1", "Month 2" etc	GB, DK
		1/27/2004	DC	Added detailed approval section on AEP Worksheet	DK
		1/28/2004	DC	Corrected AEP cell # C35 to reference Input S23	DK
		1/29/2004	DC	Changed AEP Deferred Costs formulas (Col K35 - K 44) so that Deferred Charges do not exceed amounts projected to be spent. Revised comment. Confirmed with MN and BG that costs are allocated first to ECC in the books.	DK, GB
		1/29/2004	DC	Changed NPV Cell B23 to an "IF" Statement, so that projects that do not have an ECC show aero contribution on the NPV.	DK
		1/29/2004	DC	Put if statement on AEP worksheet so that projects that do not have an ECC do not calculate a Deferred Debit, interest etc..	
11.4	1.2	7/8/2004	DC	Updated Non-Fuel Rates as per Interim Rates approved by PSC effective for Meter Reads August 2004. NSB template removed - rates for rest of Company to be used as rates will eventually be the same at final hearing.	GB, DK
11.5		10/6/2004	DC	Revised formula for the contribution on the NPV to be zero when there is no AEP surcharge even though there may be a small ECC.	GB
11.6		11/18/2004	DC	Updated Non-Fuel Rates as per Rates approved by PSC effective 11/18/04	MS, DK, GB
		11/18/2004	DC	Updated Interest Rate - See back-up WACD - Gas Rate Case	GB
		11/18/2004	DC	Updated ROR to reflect WACC approved in NG Rate Case effective 11/18/04	GB
	1.3	11/18/2004	DC	Updated ROR as per WACC approved in Gas Rate Case 10/18/04 effective 11/18/04	GB
		11/18/2004	DC	Added Gas Lighting Service - checked by DK 10/29/04	GB, DK
11.7	1.4	2/18/2005	DC	Update ROR to reflect Year-end Surveillance Rate	GB
12	2	3/9/2005	DC	Link AEP & NPV to Input Sheet so that revenues are recognized in the month of projecte not year-end turn-ons.	GB, DK
12.1	2.1	3/31/2005	DC	Updated ROR to reflect final Year-end Surveillance Report Rate	CM
12.2	12.2	4/21/2005	DC	Updated O&M % to reflect Budget 2005 (adjusted for Propane savings $604 less tax)	GB
12.2		2/24/2006	DC	Updated Avg Shares Outstansing and Available for Common as at 12/31/2005	GB
12.3	12.3	4/6/2006	DC	Update ROR to reflect Dec 2005 Average Mid-Point Surveillance Rate	GB

Marc,
Attached is the approval package for River Oaks. This is an existing community in DeBary near I-4 that wants natural gas in their community. 16 residential and 1-commercial accounts are ready to commit to install natural gas. Each will pay a $225.00 non-refundable contribution to off-set the ECC associated with the installation. An additional 7 residents will also pay the $225.00 further off-setting the ECC amount. They feel having natural gas available will increase the value of their house. The ECC is $10,969 with $5,625 being paid upfront leaving a balance of $5,344 to be collected utilizing the AEP surcharge.

As before please do not change the RNGS's as the ones attached are the only versions that have been approved at the division.
Thanks,

Don Kitner

Marc,
Attached is the approval package for River Oaks. This is an existing community in DeBary near I-4 that wants natural gas in their community. 16 residential and 1-commercial accounts are ready to commit to install natural gas. Each will pay a $225.00 non-refundable contribution to off-set the ECC associated with the installation. An additional 7 residents will also pay the $225.00 further off-setting the ECC amount. They feel having natural gas available will increase the value of their house. The ECC is $10,969 with $5,625 being paid upfront leaving a balance of $5,344 to be collected utilizing the AEP surcharge.

As before please do not change the RNGS's as the ones attached are the only versions that have been approved at the division.
Thanks,

Don Kitner
General Manager, Central Florida
386-668-9201

HOA AGREEMENT

THIS HOA AGREEMENT (this "Agreement") is made and entered into effective this ____ day of ___________, 2007 (the "Effective Date"), by and between Florida Public Utilities Company, a Florida corporation ("Company"), and River Oaks CSA Inc., a Florida homeowners association ("HOA") (Company and HOA may sometimes be collectively referred to as the "Party" or "Parties").

WITNESSETH

WHEREAS, HOA intends to give permission to Company to install a natural gas distribution system within the community named River Oaks, located in Volusia County, Florida (the "Project") in order to make natural gas available to interested residents that have signed individual natural gas agreements with Company and have paid their necessary contribution for service to be installed to their homes. HOA has agreed to permit Company to install such a system to service the Project, pursuant to the terms and conditions hereinafter set forth.

NOW, THEREFORE, in consideration of the mutual covenants set forth herein, and for other good and valuable considerations, the receipt and sufficiency of which are hereby acknowledged, Company and HOA hereby agree as follows.

1. **Installation of Gas Distribution System**.

1.1. Installation. Company agrees to install a natural gas distribution system within the residential portions of the Project, including all necessary distribution lines, meters and ancillary facilities (collectively, the "Gas Distribution System") as Company deems reasonably necessary to provide natural gas service to owners, occupants and residents within the Project. From time to time, Company shall install additional lines, meters and ancillary facilities ("System Extensions") which Company deems reasonably necessary to extend the Gas Distribution System to other areas of the Project in order to supply gas service to non-residential portions of the Project that apply for and qualify for gas service from Company. For purposes of this Agreement, the term "Gas Distribution System" shall include any System Extensions that are added by Company.

1.2. Location. The location of the gas lines and all infrastructure and improvements relating to the Gas Distribution System shall be subject to HOA's prior written approval, which approval shall not be unreasonably withheld or delayed. Prior to commencing installation of the Gas Distribution System, Company shall provide, for HOA's review and comment, plans and specifications in accordance with which the Gas Distribution System is to be installed (Gas Distribution System Plans and Specifications"). Upon completion of installation of each three thousand (3000) linear feet of the Gas Distribution System (each being a "Completed Portion"), Company shall commence restoration of those portions of the Project disturbed by Company during installation of the Completed Portion and shall continue diligently such restoration work until complete. Restoration work shall be completed so that the surface of the land shall be restored to substantially the same condition existing immediately prior to commencement of the installation of the Completed Portion.

1.3. Preparation for Installation and Easements.

1.3.1. HOA agrees to provide adequate physical and legal access (including the easements described below) to all areas of the Project where portions of the Gas Distribution System are to be installed to access, maintain and operate the Gas Distribution System. Such easements are identified in the plat referenced in 1.3.2.

1.3.2. HOA has provided Company a plat of all or a portion of the Project (recorded in Official Records Book 19, Page 125, Public Records of Volusia County, Florida), which depicts the location of streets, lots and easements encompassed therein (the "Plat"). If additional plats ("Additional Plats") are created for the Project, HOA shall provide Company a copy thereof within ten (10) days after recording. The Plat and all Additional Plats (whether or not provided to Company) shall be collectively referred to herein as "Project Plats". Notwithstanding any provision contained herein to the contrary and in addition to the easements referenced in Section 1.3.1 hereof, HOA hereby grants Company an easement over those portions of the Project designated on Project Plats as a utility easement or right-of-way (public or private) (or other similar designations) for purposes of installing, operating, maintaining, repairing and replacing the Gas Distribution System.

1.3.3. HOA reserves the right to relocate any easement granted to Company if HOA deems such relocation to be necessary for the development of the Project. If Company has not installed the portion of the Gas Distribution System proposed to be installed in the relocated easement, but has commenced the design and engineering thereof prior to the date Company receives written notice from HOA of its desire to amend an easement, HOA shall be required (prior to amendment of the easement) to reimburse Company for Company's actual, out-of-pocket expenses incurred in redesigning and/or reengineering the applicable portion of the Gas Distribution System. If HOA desires to relocate any easement relating to a portion of the Gas Distribution System after the system has been installed, HOA must first, (a) obtain Company prior written consent (which consent shall not be unreasonably withheld or delayed) and (b) reimburse Company for all costs incurred by Company in relocating the Gas Distribution System, including, but not limited to the cost of redesigning and/or reengineering the Gas Distribution System, and the cost of all materials and labor therefore.

1.4. Coordination of Installation. Company agrees to cooperate with HOA with respect to the construction of the Gas Distribution System so as to minimize interference with or delay to HOA's construction and development of the Project. HOA will notify the Company in writing of any proposed or anticipated construction schedule for the Project. HOA acknowledges that Company will rely upon the HOA's Construction Schedule for purposes of coordinating its acquisition of materials, mobilization of equipment and labor at the worksite and installation of the Gas Distribution System.

1.5. Ownership of Gas Distribution System; Maintenance. Notwithstanding any provision contained herein to the contrary, the Gas Distribution System shall remain the exclusive property of Company at all times during the term of this Agreement and following its expiration or earlier termination. Company shall have the sole obligation and responsibility for the maintenance of the Gas Distribution System. Company shall at all times maintain the Gas Distribution System in accordance with the requirements of all appropriate governmental and regulatory agencies.

1.6. Supply Date. Subject to any delay caused by Force Majeure or the actions or inactions of HOA, Company agrees that the Gas Distribution System installation shall commence when 16 residents have executed an individual gas service agreement, 25 non-refundable improvement of facilities forms are executed and 1 commercial gas service agreement has been executed.

1.7. Minimum Required Appliance Installation. A minimum of 3600 therms collectively from appliances listed on the Appliance Therm Rate Schedule is required. The Company has provided the HOA a copy of an Appliance Therm Rate Schedule for the Project, which is attached hereto as Exhibit "A" and incorporated herein (the "Appliance Therm Rate Schedule"). The HOA also agrees to the installation of a 400,000 BTU Spa Heater, 400,000 BTU Pool Heater, a Gas Grill and Gas Water Heater at the HOA's clubhouse.

2. **Successors, Assigns And Assignment**. The HOA and the Company each bind itself, its successors, assigns and legal representatives to the other party in respect to all covenants, agreements and obligations contained in this Agreement. If HOA desires to convey to other HOA or HOAs any or all of the land upon which the Project is to be constructed, such conveyance may not be undertaken and shall not be effective until such HOA or HOAs expressly assumes all of the obligations and responsibilities of HOA hereunder (to the reasonable satisfaction of Company). Similarly, if HOA desires to assign this Agreement or any portion hereof to a homeowner's association, as a condition of such assignment, the homeowner's association shall pass a valid and appropriate resolution expressly assuming all of the obligations and responsibilities of HOA hereunder (such resolution being to the reasonable satisfaction of Company).

3. **Force Majeure**. Neither Party shall be liable to the other for any failure to perform pursuant to the terms and conditions of this Agreement to the extent such performance

was prevented by an event of Force Majeure. The term "Force Majeure" shall mean Acts of God, strikes, lockouts, or other industrial disturbance, acts of the public enemy, wars, riots, epidemics, industrial disturbances that affect the Parties or its customers, breakage or non-foreseeable accident to machinery or lines of pipe, and any other causes, whether of the kind herein enumerated or otherwise, not within the control of the Party whose performance is affected and which, in each of the above cases, by the exercise of due diligence such Party is unable to prevent or overcome utilizing commercially reasonable efforts; such term shall likewise include the inability of a Party to acquire, or delays on the part of such Party in acquiring at reasonable cost and by the exercise of reasonable diligence, servitudes, rights of way, grants, permits, permissions, licenses, materials or supplies which are required to enable such Party to fulfill its obligations hereunder. The Party whose performance is excused by an event of Force Majeure shall promptly notify the other Party in writing of such occurrence and its estimated duration, shall promptly remedy such Force Majeure if and to the extent reasonably possible and shall resume such performance as soon as possible; provided, however, that neither Party shall be required to settle any labor dispute against its will.

4. **Duration**.

4.1. Expiration; Automatic Extension. Subject to Subsection 4.2 hereof, this Agreement shall automatically expire twenty (20) years after execution of Agreement. The term of this Agreement shall be automatically extended for terms of one (1) year periods unless written notice is provided at least ninety (90) days but no greater than one hundred twenty (120) days prior to the expiration of the initial term of this Agreement or any extension thereto by one Party to the other Party that it will not allow the extension of the term of this Agreement.

4.2. Early Termination. Notwithstanding any provision contained herein to the Contrary, either Party may terminate this Agreement by providing the other at least fifteen (15) days prior written notice if the 17 required services have been activated with 3600 therms.

4.3. Survival of Easements. Notwithstanding the expiration or earlier termination of this Agreement (regardless of the cause therefore), the easements created herein and required to be granted herein shall survive, and the rights, privileges and responsibilities created therein shall not be adversely affected by, the termination or expiration of this Agreement

5. **Notices**. Any notices sent by either party to the other pursuant to this Agreement shall be sent by either U.S. mail, postage prepaid, return requested, or by receipted overnight national delivery service (e.g., Federal Express), and shall, if not sooner received, be deemed received three (3) business days after deposit in the United States Mail, or one business day after receipt by any overnight national delivery service, as aforesaid. All

notices shall be addressed to each party at the following address, or such other address as either party may hereafter designate to the other party in writing:

If to HOA:	River Oaks CSA Inc. P O Box 7149 Daytona Beach, Florida 32116 Attn: Joe Alemany Fax No. 386.XXX.XXXX Phone No. 386.753.1758
If to Company:	Florida Public Utilities Company 401 South Dixie Highway West Palm Beach, Florida 33401-5807 Attn: Marc Seagrave, Director of Marketing Fax No. 561.833.8562 Phone No. 561.838.1714
with a copy to:	P.O. Box 530969 DeBary, Florida 32753-0969 Attn: Donald Kitner, Director Fax No. 386.668.2692 Phone No. 386.668.2600

6. **Governing Law: Dispute Resolution**. This Agreement shall be governed by and construed in accordance with the laws of the State of Florida without reference to the laws of any other jurisdiction. HOA and Company agree to submit any disputes arising under this agreement to non-binding mediation; provided, that applicable statutes of limitation will be tolled during the pendency of such mediation. In the event Company and HOA cannot in good faith agree on a mediator within fifteen (15) days of the request of either party for mediation, or, if the parties remain in dispute following mediation, any such dispute will be resolved by final, binding arbitration. Arbitration shall be accomplished expeditiously in Orange County, Florida, and shall be conducted by the American Arbitration Association (in accordance with its rules) which will appoint three arbitrators, one of which must be an attorney. The arbitrators shall render a written judgment accompanied by findings of fact and conclusions of law, which are subject to review by the appellate courts of the State of Florida. Judgment upon the award rendered by the arbitrator(s) may be entered in any Court having jurisdiction thereof. The parties shall share equally the arbitrators' fees and costs until the prevailing party is determined or the parties have agreed in writing to an alternate allocation of fees and costs. In any suit or arbitration proceeding brought by either party, the prevailing party will be entitled to recover attorneys' fees, costs and expenses actually incurred by the prevailing party in such suit or arbitration proceeding or in any appeal. The parties consent that any arbitration may be consolidated with any other arbitration concerning this Agreement to which Company or HOA is a party and that a

dispute shall not be submitted to such binding arbitration if there are any third parties who are not subject to such binding arbitration but who are proper parties to such dispute. This Section 7 shall survive expiration or any termination of this Agreement.

7. **Indemnity; Damages to Property; Limitation on Liability**.

7.1. Company agrees to protect, defend, reimburse, indemnify and hold the HOA, its agents and employees and each of them, hereinafter collectively referred to, for the purposes of this paragraph, as HOA, free and harmless from and against any and all claims or damages (including attorneys' fees) incurred by HOA by reason of the negligent or intentional acts of the Company; provided however, that Company shall not be responsible to HOA for damages resulting out of bodily injury or damages to property which are attributable to the negligent acts or omissions of HOA, its respective agents, servants, employees, officers, tenants, residents or homeowners.

7.2. HOA agrees to protect, defend, reimburse, indemnify and hold the Company, its agents, and employees and each of them, hereinafter collectively referred to, for the purposes of this paragraph, as Company, free and harmless from and against any and all claims or damages (including attorneys' fees) incurred by Company by reason of the negligent or intentional acts of HOA and its respective agents, servants, employees, officers, tenants, residents or homeowners; provided however, that Builder shall not be responsible to Company for damages resulting out of bodily injury or damages to property which are attributable to the negligent acts or omissions of Company.

7.3. Any damage to the Project caused by Company, its agents or employees, shall be promptly repaired to the reasonable satisfaction of HOA at Company's expense. Any damage caused to Company's equipment by HOA, its agents, employees, contractors, subcontractors, tenants, residents or homeowners shall be promptly repaired by Company at HOA's expense. HOA will take all reasonable precautions to notify its agents, employees, contractors, subcontractors, tenants, residents and homeowners of the location of Company's equipment.

7.4. Neither the Company nor HOA shall have liability to the other party or any third party for any special, indirect, incidental or consequential damages or loss of any kind, including, without limitation, loss of profits or savings, loss of use, or similar damages, whether based on strict liability, or negligence, whether resulting from installation, use or maintenance of the Gas Distribution System, breach of this Agreement or otherwise, except for direct, specific damages to the extent caused by either party's negligence or misconduct.

7.5. This Section 7 shall survive the expiration or early termination of this Agreement.

8. **Miscellaneous**. This Agreement constitutes the entire understanding and agreement between the Parties and supersedes any and all prior negotiations, understandings or agreements with respect to this subject matter. This Agreement may be amended only by written instrument signed by both of the Parties. Whenever possible, each provision of this Agreement shall be interpreted in such manner as to be effective and valid under Florida law, but if any provision of this Agreement or the application thereof to any Party or circumstance is prohibited by or invalid under applicable law, that provision shall be effective only to the extent of such prohibition or invalidity, without invalidating the remaining provisions of this Agreement or the application of the same. Nothing contained herein shall be construed as a joint venture, partnership or any other similar relationship between Company and HOA. The captions, headings, titles, and subtitles herein are inserted for convenience of reference only and are to be ignored in any construction of the provisions of this Agreement. This Agreement shall be binding upon, and shall inure to the benefit of, the Parties, and their respective successors and assigns, and no assignment shall relieve either Party of such Party's obligations hereunder without written consent of the other Party. This Agreement shall be subject to all applicable laws, rules, orders, permits, and regulations of any federal, state, or local governmental authority having jurisdiction over the Parties, their facilities, or the transactions contemplated. This Agreement may be executed in one or more counterparts, each of which shall be deemed to be an original, but all of which together shall constitute one in the same instrument.

9. **Recording**. This Agreement may be recorded by Company among the Public Records of the County in which the Project is located.

10. **Exclusivity**. During the term of this Agreement and for a period of ten (10) years thereafter, HOA shall not install, cause to be installed, or allow to be installed any other gas distribution system in the Project or any other system or mechanism for delivery of natural gas or propane gas to residents in the Project. HOA agrees that Company has an exclusive right to provide natural gas services to the Project and that HOA will not grant, or allow others to grant any easement or right-of-way for purposes of delivering natural gas service. HOA certifies that there is no existing contractual agreement with any third party for the provision of natural gas service to the Project, with the exception of this Agreement.

[remainder of page intentionally left blank]

IN WITNESS WHEREOF, the Parties have caused this Agreement to be signed by their respective duly authorized officers as of the date first above written.

Marc,
Attached is the approval package for River Oaks. This is an existing community in DeBary near I-4 that wants natural gas in their community. 16 residential and 1-commercial accounts are ready to commit to install natural gas. Each will pay a $225.00 non-refundable contribution to off-set the ECC associated with the installation. An additional 7 residents will also pay the $225.00 further off-setting the ECC amount. They feel having natural gas available will increase the value of their house. The ECC is $10,969 with $5,625 being paid upfront leaving a balance of $5,344 to be collected utilizing the AEP surcharge.

As before please do not change the RNGS's as the ones attached are the only versions that have been approved at the division.
Thanks,

Don Kitner
General Manager, Central Florida
386-668-9201

Instructions for using the AEP & Net Present Value (NPV) Templates

Revised 5/18/2005

OBJECTIVE

The AEP & Net Present Value (NPV) Templates are to be used as an analytical tool for evaluating potential revenue generating investments and to determine the AEP surcharge rate for the recovery of the Excess Construction Costs.

INPUT

The general input areas are shaded in light blue - all relevant cells should be updated for all projects. Enter data as follows:

1	**Project Name**	Short description of investment.
2	**Beginning in Year**	Projected year that the project will commence.
3	**Piping Allowance**	Estimated Piping Allowance per class of customer if not capitalized (see note 24).
4	**Occupancy Rate**	Anticipated occupancy level.
5	**Cost of Service per Customer**	Estimated cost of providing service to each class of customer.
6	**Mains**	Cost of installing main per year.
7	**New Residential Customers**	Estimated residential customer added each month for each year.
8	**Therms per Customer each Month**	Average monthly therms per residential customer.
9	**New General Service Customers**	Estimated General Service customers added each month for each year.
10	**Therms per Customer each Month**	Average monthly therms per General Service customer.
11	**New Large Volume Customers**	Estimated Large Volume customer added each month for each year.
12	**Therms per Customer each Month**	Average monthly therms per Large Volume customer.
13	**Gas Lighting Service**	Estimated other customer added each month for each year.
14	**Therms per Customer each Month**	Average monthly therms per other customer.
15	**Customer Charge**	Estimated Customer Charge for Other Customers added.
16	**Other Income**	Other "non base revenue" estimated positive cash flows to be generated by the project for each year. Note - pass-through revenues, such as fuel and gross receipts tax are not to be included.
17	**Other Expenses**	Other expenses estimated to be incurred from the project for each year eg Sales Rep Commissions. Note - pass-through expenses, such as fuel and gross receipts tax are not to be included.
18	**AEP Worksheet**	Enter AEP surcharge rate that provides cost recovery within 8-10 years.

GENERAL INFORMATION

19 Contracts with Access Fees (up-front payments to Developers) should be carefully worded to ensure that there is a corresponding clause for a penalty for units not connected. The payments to the Developer should be entered on the cash flow analysis as a capital expenditure in the year that it is anticipated that the payment will be made. The access fee should be treated as an up-front capital expenditure.

20 On the Income Statement Section of the NPV analysis it is assumed that the up-front access fee, including piping allowance (capitalized) will be depreciated at the same rate as the other capital expenditure items. The actual contract, however, should be worded such that it allows us to depreciate the piping allowance over the life of the contract.

Instructions for using the AEP & Net Present Value (NPV) Templates

NPV MODEL ASSUMPTIONS

25 Inflation is not included in either revenues or expenses - null effect, in addition to which the discount rate includes the inflation risk.
26 Asset Remaining Value - represents the value of the investment at the end of the analysis. Can also be seen as representative of the future income streams beyond the time frame of the template. For regulated companies it is calculated as the average of the last three years Net Income Before Interest, Taxes and Depreciation times a multiplier of 8. A multiplier of 6 is used for non-regulated projects.
27 Required Return - WACC as per Year End Survellance Report using Cost of Equity Rate as per last Rate Case.
28 Ratio of Debt Financing - assumes that future projects will be financed by debt and equity equally.
29 O&M Expenses - "R" = 31% Base Revenue "NR" = 35% Base Revenue (Budgeted Expenses). For acquisitions this percentage can be replaced by a $ amount by entering the estimated O&M expenses in cell B94.
30 Interest Rate - Weighted Average Cost of Debt.
31 Depreciation Book % - Book Depreciation Rate.
32 Income Tax % - Income Tax Rate.

PROCESS

33 **Ensure that the variables, such as rates, are correct and review to ensure that the results, such as revenues and expenses seem reasonable.**
34 Submit NPV (& AEP) worksheets for approval as per steps below.
35 Prepare IR after approval has been granted.
36 Submit approved IR , AEP worksheet and NPV to General Accounting.
37 A copy of all approved NPVs and AEPs must also be forwarded to the Accounting Department for the attention of the Executive Assistant.

TEMPLATE REVISION LOG

NPV Rev #	AEP Rev #	Date	Name	Changes Made	Approved By
		1/22/2004	DC	Made template a R only - NR will be done on the original 15 year template.	GB, DK
		1/27/2004	DC	Change Months on Input Sheet to "Month 1", "Month 2" etc	GB, DK
		1/27/2004	DC	Added detailed approval section on AEP Worksheet	DK
		1/28/2004	DC	Corrected AEP cell # C35 to reference Input S23	DK
		1/29/2004	DC	Changed AEP Deferred Costs formulas (Col K35 - K 44) so that Deferred Charges do not exceed amounts projected to be spent. Revised comment. Confirmed with MN and BG that costs are allocated first to ECC in the books.	DK, GB
		1/29/2004	DC	Changed NPV Cell B23 to an "IF" Statement, so that projects that do not have an ECC show aero contribution on the NPV.	DK
		1/29/2004	DC	Put if statement on AEP worksheet so that projects that do not have an ECC do not calculate a Deferred Debit, interest etc..	
11.4	1.2	7/8/2004	DC	Updated Non-Fuel Rates as per Interim Rates approved by PSC effective for Meter Reads August 2004. NSB template removed - rates for rest of Company to be used as rates will eventually be the same at final hearing.	GB, DK
11.5		10/6/2004	DC	Revised formula for the contribution on the NPV to be zero when there is no AEP surcharge even though there may be a small ECC.	GB
11.6		11/18/2004	DC	Updated Non-Fuel Rates as per Rates approved by PSC effective 11/18/04	MS, DK, GB
		11/18/2004	DC	Updated Interest Rate - See back-up WACD - Gas Rate Case	GB
		11/18/2004	DC	Updated ROR to reflect WACC approved in NG Rate Case effective 11/18/04	GB
	1.3	11/18/2004	DC	Updated ROR as per WACC approved in Gas Rate Case 10/18/04 effective 11/18/04	GB
		11/18/2004	DC	Added Gas Lighting Service - checked by DK 10/29/04	GB, DK
11.7	1.4	2/18/2005	DC	Update ROR to reflect Year-end Surveillance Rate	GB
12	2	3/9/2005	DC	Link AEP & NPV to Input Sheet so that revenues are recognized in the month of projecte not year-end turn-ons.	GB, DK
12.1	2.1	3/31/2005	DC	Updated ROR to reflect final Year-end Surveillance Report Rate	CM
12.2	12.2	4/21/2005	DC	Updated O&M % to reflect Budget 2005 (adjusted for Propane savings $604 less tax)	GB
12.2		2/24/2006	DC	Updated Avg Shares Outstansing and Available for Common as at 12/31/2005	GB
12.3	12.3	4/6/2006	DC	Update ROR to reflect Dec 2005 Average Mid-Point Surveillance Rate	GB

Marc,
Attached is the approval package for River Oaks. This is an existing community in DeBary near I-4 that wants natural gas in their community. 16 residential and 1-commercial accounts are ready to commit to install natural gas. Each will pay a $225.00 non-refundable contribution to off-set the ECC associated with the installation. An additional 7 residents will also pay the $225.00 further off-setting the ECC amount. They feel having natural gas available will increase the value of their house. The ECC is $10,969 with $5,625 being paid upfront leaving a balance of $5,344 to be collected utilizing the AEP surcharge.

As before please do not change the RNGS's as the ones attached are the only versions that have been approved at the division.
Thanks,

Don Kitner

From:	Kitner Don
Sent:	Saturday, February 24, 2007 8:15 AM
To:	Cox Doreen; Bachman George
Subject:	River Oaks
Attachments:	Copy of REGULATED 15 YEAR 2-24-07.xls; Copy of ADDRESSES WITH LOT NUMBERS-REVISED 12-01-06.xls

Doreen,
Attached is the Customer list indicating minimum appliances. We actually anticipate more but this is what customers reasonably indicated. The AEP template does not have a cell for upfront contributions so I subtracted the $5625 contribution from the main installation costs. If this will not work let me know how to enter the contribution. Net ECC is $5,344 with an Average Rate of ROI of 10%.

Don Kitner
General Manager, Central Florida

Instructions for using the AEP & Net Present Value (NPV) Templates

Revised 5/18/2005

OBJECTIVE

The AEP & Net Present Value (NPV) Templates are to be used as an analytical tool for evaluating potential revenue generating investments and to determine the AEP surcharge rate for the recovery of the Excess Construction Costs.

INPUT

The general input areas are shaded in light blue - all relevant cells should be updated for all projects. Enter data as follows:

1	**Project Name**	Short description of investment.
2	**Beginning In Year**	Projected year that the project will commence.
3	**Piping Allowance**	Estimated Piping Allowance per class of customer if not capitalized (see note 24).
4	**Occupancy Rate**	Anticipated occupancy level.
5	**Cost of Service per Customer**	Estimated cost of providing service to each class of customer.
6	**Mains**	Cost of installing main per year.
7	**New Residential Customers**	Estimated residential customer added each month for each year.
8	**Therms per Customer each Month**	Average monthly therms per residential customer.
9	**New General Service Customers**	Estimated General Service customers added each month for each year.
10	**Therms per Customer each Month**	Average monthly therms per General Service customer.
11	**New Large Volume Customers**	Estimated Large Volume customer added each month for each year.
12	**Therms per Customer each Month**	Average monthly therms per Large Volume customer.
13	**Gas Lighting Service**	Estimated other customer added each month for each year.
14	**Therms per Customer each Month**	Average monthly therms per other customer.
15	**Customer Charge**	Estimated Customer Charge for Other Customers added.
16	**Other Income**	Other "non base revenue" estimated positive cash flows to be generated by the project for each year. Note - pass-through revenues, such as fuel and gross receipts tax are not to be included.
17	**Other Expenses**	Other expenses estimated to be incurred from the project for each year eg Sales Rep Commissions. Note - pass-through expenses, such as fuel and gross receipts tax are not to be included.
18	**AEP Worksheet**	Enter AEP surcharge rate that provides cost recovery within 8-10 years.

GENERAL INFORMATION

19 Contracts with Access Fees (up-front payments to Developers) should be carefully worded to ensure that there is a corresponding clause for a penalty for units not connected. The payments to the Developer should be entered on the cash flow analysis as a capital expenditure in the year that it is anticipated that the payment will be made. The access fee should be treated as an up-front capital expenditure.

20 On the Income Statement Section of the NPV analysis it is assumed that the up-front access fee, including piping allowance (capitalized) will be depreciated at the same rate as the other capital expenditure items. The actual contract, however, should be worded such that it allows us to depreciate the piping allowance over the life of the contract.

Instructions for using the AEP & Net Present Value (NPV) Templates

NPV MODEL ASSUMPTIONS

25 Inflation is not included in either revenues or expenses - null effect, in addition to which the discount rate includes the inflation risk.

26 Asset Remaining Value - represents the value of the investment at the end of the analysis. Can also be seen as representative of the future income streams beyond the time frame of the template. For regulated companies it is calculated as the average of the last three years Net Income Before Interest, Taxes and Depreciation times a multiplier of 8. A multiplier of 6 is used for non-regulated projects.

27 Required Return - WACC as per Year End Survellance Report using Cost of Equity Rate as per last Rate Case.

28 Ratio of Debt Financing - assumes that future projects will be financed by debt and equity equally.

29 O&M Expenses - "R" = 31% Base Revenue "NR" = 35% Base Revenue (Budgeted Expenses). For acquisitions this percentage can be replaced by a $ amount by entering the estimated O&M expenses in cell B94.

30 Interest Rate - Weighted Average Cost of Debt.

31 Depreciation Book % - Book Depreciation Rate.

32 Income Tax % - Income Tax Rate.

PROCESS

33 **Ensure that the variables, such as rates, are correct and review to ensure that the results, such as revenues and expenses seem reasonable.**

34 Submit NPV (& AEP) worksheets for approval as per steps below.

35 Prepare IR after approval has been granted.

36 Submit approved IR , AEP worksheet and NPV to General Accounting.

37 A copy of all approved NPVs and AEPs must also be forwarded to the Accounting Department for the attention of the Executive Assistant.

Construction and Revenue Summary:

Estimated Construction Cost (CC):	$ 17,498	Four year Construction Costs
Four Years Revenue (MACC)*:	12,154	Four years revenue
Net Excess Construction Cost (ECC):	$ 5,344	

Calculation of AEP Surcharge:

AEPS= (ECC+(ROR*T1*.5*ECC))/T2*TH)

ECC	5,344	As computed on Wkst
ROR	8.070%	Company's Authorized Rate
T1	10	Years for collection
T2	1	(1 if total therms used forT1)
TH	26,613	Total 10 year therms
AEPS	$ 0.282	Original calculation

Manual Input: Override Computed AEPS ______

and Rate breakdown

Summary of projected Therms:

Year	Total Annual Residential Usage	Total Annual General Serv Usage	Total Annual Large Volume Usage	Total Annual Gas Light Usage	Total Therm Load Added
1	1632	542	0	0	2174
2	2304	650	0	0	2954

Doreen,
Attached is the Customer list indicating minimum appliances. We actually anticipate more but this is what customers reasonably indicated. The AEP template does not have a cell for upfront contributions so I subtracted the $5625 contribution from the main installation costs. If this will not work let me know how to enter the contribution. Net ECC is $5,344 with an Average Rate of ROI of 10%.

Subject: Short-term debt
Categories: Elec Rate Case

Doreen,
George,

The observed short-term debt cost rate for FPU, based on month-end balances, is 3.28% for 2006. This interest rate level is remarkably low in view of the contractual rate, which I estimate to be 6.03%, also for '06. I have reasoned that the actual contractual rate is applicable to daily balances, and so if the daily balances are substantially below month-end balances, then 3.28% is conceivable. However, the differences between the daily average and month-end balances would need to be very large in order to ever obtain 3.28%. The result is a substantial understatement of true interest costs for ST Debt, and what I suggest is this:

1) calculate the daily balances, by month, and use the average daily balance in lieu of month-end balances. Essentially, short-term debt is a special case because of the variation in balances over the course of the month, and year.

2) use this daily balance approach for the determination of cost of capital for all years. The result is a more accurate reflection of the weighted average cost of capital, which is inherently higher than that suggested by month balances.

This is an important issue, and we should turn to it immediately.

I should mention that, if I don't have the story right - daily vs. month-end balances, then something else is wrong, and we need to understand why such large differences in the calculated vs. actual cost rates.

Thanks, Robert

Subject: ST interest expense in 2006 compared to 2005

We say st interest expense went up over 2005, but the balance in ST debt went down. We say it is because the rates were higher in 2006 but I wonder is it also perhaps because the average ST debt throughout the year could have been higher in 2006 compared to 2005. What do you think?

Thanks,

Cheryl Martin

Attachments:	Cost Estimation sheet costs 03-2007.xls; Cost Estimation Spreadsheet - 052506 - v 2.xls

Team,

We are very happy to announce that we are just about ready to begin use of the attached installation cost spreadsheet company-wide. The spreadsheet that is attached is pre-loaded with installation costs but not specific to division. I have attached a data page for your division to input your local installation prices. We will load the data page into your division's estimation sheet, save the originals on the corporate marketing P: Drive and send you an original for your use.

Some of the data input areas, such as electrical and plumbing are new. We will expand these categories as we go forward and find that we need additional inputs. Please complete the data inputs for your division as soon as possible. As soon as we receive the data back, we will load your spreadsheet and save a protected version for your staff's use.

The new format was modified from the SF version in use as of today. Central Florida actually developed this new version with input from SF. This will be used in the new project management system.

Any questions, comments or suggestions please contact me if they are positive or Don Kitner if your suggestions are negative or require a lot of work to incorporate.

Thanks!

Marc S. Seagrave

Subject: Standby Rate Information

Attachments: Standby Rate ELHIGH_30pt.xls; Industrial Billing Consumption.xls

Dan,
Attached the GSD and GSLD spreadsheet that I think you can use for the Standby rate calculation. You may have to sort the data to get all the GSLD accounts together. I have also included the historical information on the GSLD1 customers in the Industrial Billing Consumption file. You can use the tabs for "Jefferson-Smurfit 2006" and "Rayonier 2006" to get the Maximum Demands for these.

Let me know if you have questions or if you need more information. Thanks.

Mark Cutshaw, General Manager
Florida Public Utilities Company

Subject: Standby Rate Information
Attachments: Standby Rate ELHIGH_30pt.xls; Industrial Billing Consumption.xls

Dan,
Attached the GSD and GSLD spreadsheet that I think you can use for the Standby rate calculation. You may have to sort the data to get all the GSLD accounts together. I have also included the historical information on the GSLD1 customers in the Industrial Billing Consumption file. You can use the tabs for "Jefferson-Smurfit 2006" and "Rayonier 2006" to get the Maximum Demands for these.

Let me know if you have questions or if you need more information. Thanks.

Mark Cutshaw, General Manager

Marc,
The attached project is the second project brought to us by TECO Partners (Fisherman's Cove the first). The developer/builder purchased this completed subdivision of around 100 lots but 23 were already built. All infrastructure is complete, with the exception of gas. The builder wants to begin construction now and needs to know the status of the gas. Please process ASAP.
Thanks,

Don Kitner
General Manager, Central Florida

RNGS FORM INSTRUCTIONS

All cells that are shaded yellow are available for input

Project, Rep and Tracking Information

1 Enter the name of the project in this section

2 Select your name from the drop down menu next to "Marketing Rep" *

*If your name is not in the drop down list (or incorrect info), have the form administrator add it to the "Rep Info" tab

3 Enter the name of the developer, project location (cross streets) and the city that the project is in.
You can obtain the "Development Code" from the Marketing Analyst

Job Information Sections

4

Gas Type:	- Select Natural or Propane
Metered or Bulk	- For all Natural Gas Accounts select metered, if LP select either metered or bulk
Request for:	- This drop down box is to be used to identify the type of request (New Service, Main Extension, Add Load, Relocation, Abandonment, Reactivation)
Request for:	- Same as above, used when more than one of the above selections is applicable

5

Converted from:	- Enter the fuel type, price and Company if the account is a Competitive Take-over
Gas Pressure:	- Select the correct gas pressure
Turn-On Charge	- Enter the dollar amount of the turn-on charge that will be charged to activate the account
Pressure Factor:	- Enter the pressure factor

Customer Contact Information

6 Builder Contact Information Section: Enter contact Name, Phone numbers, Fax number and email when applicable.

Customer Information

7 This section lists the details about the customers involved in the project. Enter the number of customers, rate and monthley charge for each class of customer

Construction Information

8 Enter the cost of the main, and the total cost of each type of customer's services (all the services combined)
The cost per customer will be generated below.

Residential Applaince Information

9 Enter the quantity of each type of appliance. For example, if there are 10 homes and each will have a range, dryer and a 50 gallon W/H, the enter "10" next to each of those appliances. There is a free format line available if an unsual type appliance will be installed.

Commecial Applaince Information (GS and Large Volume)

10
11 Enter the quantity, type of equipment, Btu rating, and the number of hours per year that the appliance will be used. The therms will calculate based on the Btu and the number of hours that the appliance will run.

Marc,
The attached project is the second project brought to us by TECO Partners (Fisherman's Cove the first). The developer/builder purchased this completed subdivision of around 100 lots but 23 were already built. All infrastructure is complete, with the exception of gas. The builder wants to begin construction now and needs to know the status of the gas. Please process ASAP.
Thanks,

Don Kitner

Instructions for using the AEP & Net Present Value (NPV) Templates

Revised 5/18/2005

OBJECTIVE

The AEP & Net Present Value (NPV) Templates are to be used as an analytical tool for evaluating potential revenue generating investments and to determine the AEP surcharge rate for the recovery of the Excess Construction Costs.

INPUT

The general input areas are shaded in light blue - all relevant cells should be updated for all projects. Enter data as follows:

1	**Project Name**	Short description of investment.
2	**Beginning in Year**	Projected year that the project will commence.
3	**Piping Allowance**	Estimated Piping Allowance per class of customer if not capitalized (see note 24).
4	**Occupancy Rate**	Anticipated occupancy level.
5	**Cost of Service per Customer**	Estimated cost of providing service to each class of customer.
6	**Mains**	Cost of installing main per year.
7	**New Residential Customers**	Estimated residential customer added each month for each year.
8	**Therms per Customer each Month**	Average monthly therms per residential customer.
9	**New General Service Customers**	Estimated General Service customers added each month for each year.
10	**Therms per Customer each Month**	Average monthly therms per General Service customer.
11	**New Large Volume Customers**	Estimated Large Volume customer added each month for each year.
12	**Therms per Customer each Month**	Average monthly therms per Large Volume customer.
13	**Gas Lighting Service**	Estimated other customer added each month for each year.
14	**Therms per Customer each Month**	Average monthly therms per other customer.
15	**Customer Charge**	Estimated Customer Charge for Other Customers added.
16	**Other Income**	Other "non base revenue" estimated positive cash flows to be generated by the project for each year. Note - pass-through revenues, such as fuel and gross receipts tax are not to be included.
17	**Other Expenses**	Other expenses estimated to be incurred from the project for each year eg Sales Rep Commissions. Note - pass-through expenses, such as fuel and gross receipts tax are not to be included.
18	**AEP Worksheet**	Enter AEP surcharge rate that provides cost recovery within 8-10 years.

GENERAL INFORMATION

19 Contracts with Access Fees (up-front payments to Developers) should be carefully worded to ensure that there is a corresponding clause for a penalty for units not connected. The payments to the Developer should be entered on the cash flow analysis as a capital expenditure in the year that it is anticipated that the payment will be made. The access fee should be treated as an up-front capital expenditure.

20 On the Income Statement Section of the NPV analysis it is assumed that the up-front access fee, including piping allowance (capitalized) will be depreciated at the same rate as the other capital expenditure items. The actual contract, however, should be worded such that it allows us to depreciate the piping allowance over the life of the contract.

Instructions for using the AEP & Net Present Value (NPV) Templates

NPV MODEL ASSUMPTIONS

25 Inflation is not included in either revenues or expenses - null effect, in addition to which the discount rate includes the inflation risk.
26 Asset Remaining Value - represents the value of the investment at the end of the analysis. Can also be seen as representative of the future income streams beyond the time frame of the template. For regulated companies it is calculated as the average of the last three years Net Income Before Interest, Taxes and Depreciation times a multiplier of 8. A multiplier of 6 is used for non-regulated projects.
27 Required Return - WACC as per Year End Survellance Report using Cost of Equity Rate as per last Rate Case.
28 Ratio of Debt Financing - assumes that future projects will be financed by debt and equity equally.
29 O&M Expenses - "R" = 31% Base Revenue "NR" = 35% Base Revenue (Budgeted Expenses). For acquisitions this percentage can be replaced by a $ amount by entering the estimated O&M expenses in cell B94.
30 Interest Rate - Weighted Average Cost of Debt.
31 Depreciation Book % - Book Depreciation Rate.
32 Income Tax % - Income Tax Rate.

PROCESS

33 **Ensure that the variables, such as rates, are correct and review to ensure that the results, such as revenues and expenses seem reasonable.**
34 Submit NPV (& AEP) worksheets for approval as per steps below.
35 Prepare IR after approval has been granted.
36 Submit approved IR , AEP worksheet and NPV to General Accounting.
37 A copy of all approved NPVs and AEPs must also be forwarded to the Accounting Department for the attention of the Executive Assistant.

Marc,
The attached project is the second project brought to us by TECO Partners (Fisherman's Cove the first). The developer/builder purchased this completed subdivision of around 100 lots but 23 were already built. All infrastructure is complete, with the exception of gas. The builder wants to begin construction now and needs to know the status of the gas. Please process ASAP.
Thanks,

Don Kitner

FLORIDA PUBLIC UTILITIES

Sugar Mill Gardens, New Smyrna Beach

- Project consists of sixty-three (77) single-family homes of which 72 will be required to be gas compliant; typical lot is 75' x 115', located in New Smyrna Beach, FL on the NW corner of Pioneer Trail and Sugar Mill Dr..
- FPU to extend natural gas main approximately 350 feet. As a result, this will become an AEP project with a thirty cent ($0.35) contribution per therm. Project estimated to be paid off after year eight.
- The developer is Land Planners & Associates, Inc. This developer purchased this project form original developer with the streets in.
- This project was brought to FPU by TECO Partners and will be the second project with this developer; the first being Fisherman's Cove in Edgewater.
- Minimum GCU for each home will be one large tankless water heater and a range.
- Piping allowance of $150.00 was included for the spa heater, fireplace and summer kitchen @ $50 each. However no revenues for these appliances are included in the analysis.
- NPV yields a 16 % Average ROR on investment.
- The gas mains will consist of approximately 350 feet of 2" PE main, 6150 feet of 1 ¼" PE main, and approximately 4620 feet of 3/4" service line.

WHEREAS, Company desires to install a natural gas distribution system within the Project in order to make service available from time to time to owners, occupants and residents of the Project and Developer has agreed to permit Company to install such a system to service the Project, pursuant to the terms and conditions hereinafter set forth.

NOW, THEREFORE, in consideration of the mutual covenants set forth herein, and for other good and valuable considerations, the receipt and sufficiency of which are hereby acknowledged, Company and Developer hereby agree as follows.

1. **Installation of Gas Distribution System**.

1.1. Installation. Company agrees to install a natural gas distribution system within the residential portions of the Project, including all necessary distribution lines, meters and ancillary facilities (collectively, the "Gas Distribution System") as Company deems reasonably necessary to provide natural gas service to owners, occupants and residents within the Project. From time to time, Company shall install additional lines, meters and ancillary facilities ("System Extensions") which Company deems reasonably necessary to extend the Gas Distribution System to other areas of the Project in order to supply gas service to non-residential portions of the Project that apply for and qualify for gas service from Company. For purposes of this Agreement, the term "Gas Distribution System" shall include any System Extensions that are added by Company.

1.2. Location. The location of the gas lines and all infrastructure and improvements relating to the Gas Distribution System shall be subject to Developer's prior written approval, which approval shall not be unreasonably withheld or delayed. Prior to commencing installation of the Gas Distribution System, Company shall provide, for Developer's review and comment, plans and specifications in accordance with which the Gas Distribution System is to be installed ("Gas

Distribution System Plans and Specifications"). Upon completion of installation of each three thousand (3000) linear feet of the Gas Distribution System (each being a "Completed Portion"), Company shall commence restoration of those portions of the Project disturbed by Company during installation of the Completed Portion and shall continue diligently such restoration work until complete. Restoration work shall be completed so that the surface of the land shall be restored to substantially the same condition existing immediately prior to commencement of the installation of the Completed Portion.

1.3. Preparation for Installation and Easements.

1.3.1. Developer agrees to provide adequate physical and legal access (including the easements described below) to all areas of the Project where portions of the Gas Distribution System are to be installed to access, maintain and operate the Gas Distribution System. Such easements are identified in the plat referenced in 1.3.2.

1.3.2. Developer has provided Company a preliminary plat, and at a later date will provide Company a plat of all or a portion of the Project (recorded in Official Records Book ______, Page ______, Public Records of Seminole County, Florida), which depicts the location of streets, lots and easements encompassed therein (the "Plat"). If additional plats ("Additional Plats") are created for the Project, Developer shall provide Company a copy thereof within ten (10) days after recording. The Plat and all Additional Plats (whether or not provided to Company) shall be collectively referred to herein as "Project Plats". Notwithstanding any provision contained herein to the contrary and in addition to the easements referenced in Section 1.3.1 hereof, Developer hereby grants Company an easement over those portions of the Project designated on Project's Plats as a utility easement or right-of-way (public or private) (or other similar designations) for purposes of installing, operating, maintaining, repairing and replacing the Gas Distribution System.

1.3.3. Developer reserves the right to relocate any easement granted to Company if Developer deems such relocation to be necessary for the development of the Project. If Company has not installed the portion of the Gas Distribution System proposed to be installed in the relocated easement, but has commenced the design and engineering thereof prior to the date Company receives written notice from Developer of its desire to amend an easement, Developer shall be required (prior to amendment of the easement) to reimburse Company for Company's actual, out-of-pocket expenses incurred in redesigning and/or reengineering the applicable portion of the Gas Distribution System. If Developer desires to relocate any easement relating to a portion of the Gas Distribution System after the

system has been installed, Developer must first, (a) obtain Company prior written consent (which consent shall not be unreasonably withheld or delayed) and (b) reimburse Company for all costs incurred by Company in relocating the Gas Distribution System, including, but not limited to the cost of redesigning and/or reengineering the Gas Distribution System, and the cost of all materials and labor therefore.

1.4. Coordination of Installation. Company agrees to cooperate with Developer with respect to the construction of the Gas Distribution System so as to minimize interference with or delay to Developer's construction and development of the Project. Developer shall provide Company a copy of its anticipated construction schedule for the Project, a true and correct copy of which is attached hereto as Exhibit "B" and incorporated herein (the "Developer's Construction Schedule"). Developer acknowledges that Company will rely upon the Developer's Construction Schedule for purposes of coordinating its acquisition of materials, mobilization of equipment and labor at the worksite and installation of the Gas Distribution System. Company will install said system within 60 days following the grading of easements and written notification from Developer to proceed.

1.5. Ownership of Gas Distribution System; Maintenance. Notwithstanding any provision contained herein to the contrary, the Gas Distribution System shall remain the exclusive property of Company at all times during the term of this Agreement and following its expiration or earlier termination. Company shall have the sole obligation and responsibility for the maintenance of the Gas Distribution System. Company shall at all times maintain the Gas Distribution System in accordance with the requirements of all appropriate governmental and regulatory agencies.

1.6. Supply Date. Subject to any delay caused by Force Majeure or the actions or inactions of Developer, Company agrees that the Gas Distribution System shall be complete and operational to provide natural gas service to the first completed residential structure utilizing natural gas service, in the Project, at least ten (10) calendar days prior to the issuance of Certificate of Occupancy (CO) for the first residential structure within the Project.

2. Minimum Gas Compliant Units; Installation of Internal Piping

2.1. Minimum GCU.

2.1.1. Developer acknowledges that Company will make a substantial economic investment in order to construct the Gas Distribution System and that Company is willing to undertake such investment given Company's anticipated usage of the Gas Distribution System by current and future owners, occupants or residents in the Project. In consideration for the

substantial investment made by Company in constructing the Gas Distribution System and the mutual covenants contained herein, Developer agrees that seventy-two (72) residential units in the Project shall have installed therein (a) a large gas Tankless Water Heater and (b) a gas Range or Cooktop and Wall Oven ("Minimum Required GCU.") In addition, Developer agrees that any model and speculative residential unit in the Project shall have installed therein the same gas appliances as the GCU, plus any two additional gas appliances for the purpose of featuring gas within the community. Each residential unit constructed in compliance with the foregoing two sentences shall be referred to herein as a "Gas Compliant Unit" or "GCU" and each of the appliances installed in a GCU shall be referred to herein as an "Appliance" and collectively as the "Appliances."

2.1.2. Developer shall, within fifteen (15) days after completion of the last GCU in the Project, pay Company an omission fee ("Omission Fee") equal to the Omission Rate (as hereinafter defined) multiplied by the integer obtained by subtracting the actual number of GCU in the Project from the Minimum Required GCU. The Omission Rate shall equal $525.00 x (1+ (Time x .04)). Time shall mean the number of years (and partial years) between the Effective Date and the date upon which the Omission Fee is paid. Nothing contained in this Section 2.1.2 shall be construed as limiting other remedies available to Company as result of the Developer's failure to comply with the Minimum Required GCU requirement set forth herein.

2.2. Installation. Developer shall provide all labor, materials, equipment and supervision to install (at no cost to Company) (a) each Appliance and (b) all internal piping, venting and other equipment (the "Internal Piping") necessary to service the gas appliances installed in each GCU. Company to connect Internal Piping to the external gas meter installed by Company at an external location (reasonably selected by Company) at each GCU.

2.3. Ownership of Internal Piping, Appliances and External Piping.

2.3.1. All piping, meters, vents and other equipment installed by Company, at Company's expense, between the main line of the Gas Distribution System and the external meter installed by Company at each GCU (including such meter) (the "External Piping") shall be the exclusive property of the Company. Company shall at all times maintain the External Piping, including the meter, in accordance with the requirements of all appropriate governmental agencies.

2.3.2. The Internal Piping and the Appliances shall be the exclusive property of the Developer and its successors and assigns. Developer or the successor

or assign of Developer with respect to each GCU shall at all time during and following the expiration or earlier termination of this Agreement, service, maintain, repair and replace the Internal Piping and the Appliances.

3. **Payment to Developer for each GCU.**

3.1 Company shall pay Developer the applicable amount set forth in the payment schedule attached hereto as Exhibit 'C" for each Qualified GCU (as hereinafter defined) constructed in the Project (the "GCU Payment"). A GCU shall be deemed a Qualified GCU only after (a) the Company commences supplying natural gas service to the unit (i.e., the GCU is occupied by a rate paying customer) and (b) Company receives a Compliance Affidavit from Developer with respect to said unit in the form attached hereto as Exhibit "D".

3.2 GCU Payments shall be made semi-annually by Company to Developer for the term of this Agreement in the following manner:

3.2.1 For Qualified GCU that receive natural gas service from the Company for the first time ever between January 1 and June 30 of each year, payment shall be made on July 25 of such year.

3.2.2 For Qualified GCU that receive natural gas service from the Company for the first time ever between July 1 and December 31 of each year. Payment shall be made on January 25 of the next year.

4. **Successors, Assigns And Assignment**. The Developer and the Company each bind itself, its successors, assigns and legal representatives to the other party in respect to all covenants, agreements and obligations contained in this Agreement. If Developer desires to convey to other Developer or Developers any or all of the land upon which the Project is to be constructed, such conveyance may not be undertaken and shall not be effective until such Developer or Developers expressly assumes all of the obligations and responsibilities of Developer hereunder (to the reasonable satisfaction of Company). Similarly, if Developer desires to assign this Agreement or any portion hereof to a homeowner's association, as a condition of such assignment, the homeowner's association shall pass a valid and appropriate resolution expressly assuming all of the obligations and responsibilities of Developer hereunder (such resolution being to the reasonable satisfaction of Company).

5. **Force Majeure**. Neither Party shall be liable to the other for any failure to perform pursuant to the terms and conditions of this Agreement to the extent such performance was prevented by an event of Force Majeure. The term "Force Majeure" shall mean Acts of God, strikes, lockouts, or other industrial disturbance, acts of the

public enemy, wars, riots, epidemics, industrial disturbances that affect the Parties or its customers, breakage or non-foreseeable accident to machinery or lines of pipe, and any other causes, whether of the kind herein enumerated or otherwise, not within the control of the Party whose performance is affected and which, in each of the above cases, by the exercise of due diligence such Party is unable to prevent or overcome utilizing commercially reasonable efforts; such term shall likewise include the inability of a Party to acquire, or delays on the part of such Party in acquiring at reasonable cost and by the exercise of reasonable diligence, servitudes, rights of way, grants, permits, permissions, licenses, materials or supplies which are required to enable such Party to fulfill its obligations hereunder. The Party whose performance is excused by an event of Force Majeure shall promptly notify the other Party in writing of such occurrence and its estimated duration, shall promptly remedy such Force Majeure if and to the extent reasonably possible and shall resume such performance as soon as possible; provided, however, that neither Party shall be required to settle any labor dispute against its will.

6. **Duration**.

6.1. Expiration; Automatic Extension. Subject to Subsection 6.2 hereof, this Agreement shall automatically expire twenty (20) years after execution of Agreement. The term of this Agreement shall be automatically extended for terms of one (1) year periods unless written notice is provided at least ninety (90) days but no greater than one hundred twenty (120) days prior to the expiration of the initial term of this Agreement or any extension thereto by one Party to the other Party that it will not allow the extension of the term of this Agreement.

6.2. Early Termination. Notwithstanding any provision contained herein to the Contrary, either Party may terminate this Agreement by providing the other at least fifteen (15) days prior written notice if the Minimum Required GCU has been constructed.

6.3. Survival of Easements. Notwithstanding the expiration or earlier termination of this Agreement (regardless of the cause therefore), the easements created herein and required to be granted herein shall survive, and the rights, privileges and responsibilities created therein shall not be adversely affected by, the termination or expiration of this Agreement

7. **Notices**. Any notices sent by either party to the other pursuant to this Agreement shall be sent by either U.S. mail, postage prepaid, return requested, or by receipted overnight national delivery service (e.g., Federal Express), and shall, if not sooner received, be deemed received three (3) business days after deposit in the United States Mail, or one business day after receipt by any overnight national delivery service, as aforesaid. All notices shall be addressed to each party at the following

8. **Governing Law: Dispute Resolution**. This Agreement shall be governed by and construed in accordance with the laws of the State of Florida without reference to the laws of any other jurisdiction. Developer and Company agree to submit any disputes arising under this agreement to non-binding mediation; provided, that applicable statutes of limitation will be tolled during the pendency of such mediation. In the event Company and Developer cannot in good faith agree on a mediator within fifteen (15) days of the request of either party for mediation, or, if the parties remain in dispute following mediation, any such dispute will be resolved by final, binding arbitration. Arbitration shall be accomplished expeditiously in Orange County, Florida, and shall be conducted by the American Arbitration Association (in accordance with its rules) which will appoint three arbitrators, one of which must be an attorney. The arbitrators shall render a written judgment accompanied by findings of fact and conclusions of law, which are subject to review by the appellate courts of the State of Florida. Judgment upon the award rendered by the arbitrator(s) may be entered in any Court having jurisdiction thereof. The parties shall share equally the

arbitrators' fees and costs until the prevailing party is determined or the parties have agreed in writing to an alternate allocation of fees and costs. In any suit or arbitration proceeding brought by either party, the prevailing party will be entitled to recover attorneys' fees, costs and expenses actually incurred by the prevailing party in such suit or arbitration proceeding or in any appeal. The parties consent that any arbitration may be consolidated with any other arbitration concerning this Agreement to which Company or Developer is a party and that a dispute shall not be submitted to such binding arbitration if there are any third parties who are not subject to such binding arbitration but who are proper parties to such dispute. This Section 8 shall survive expiration or any termination of this Agreement.

9. **Indemnity; Damages to Property; Limitation on Liability**.

Formatted: Bullets and Numbering

9.1. Company agrees to protect, defend, reimburse, indemnify and hold the Developer, its agents and employees and each of them, hereinafter collectively referred to, for the purposes of this paragraph, as Developer, free and harmless from and against any and all claims or damages (including attorneys' fees) incurred by Developer by reason of the negligent or intentional acts of the Company; provided however, that Company shall not be responsible to Developer for damages resulting out of bodily injury or damages to property which are attributable to the negligent acts or omissions of Developer, its respective agents, servants, employees, officers, tenants, residents or homeowners.

Formatted: Bullets and Numbering

9.2. Developer agrees to protect, defend, reimburse, indemnify and hold the Company, its agents, and employees and each of them, hereinafter collectively referred to, for the purposes of this paragraph, as Company, free and harmless from and against any and all claims or damages (including attorneys' fees) incurred by Company by reason of the negligent or intentional acts of Developer and its respective agents, servants, employees, officers, tenants, residents or homeowners; provided however, that Developer shall not be responsible to Company for damages resulting out of bodily injury or damages to property which are attributable to the negligent acts or omissions of Company.

Formatted: Bullets and Numbering

9.3. Any damage to the Project caused by Company, its agents or employees, shall be promptly repaired to the reasonable satisfaction of Developer at Company's expense. Any damage caused to Company's equipment by Developer, its agents, employees, contractors, subcontractors, tenants, residents or homeowners shall be promptly repaired by Company at Developer's expense. Developer will take all reasonable precautions to notify its agents, employees, contractors, subcontractors, tenants, residents and homeowners of the location of Company's equipment.

9.4. Neither the Company nor Developer shall have liability to the other party or any third party for any special, indirect, incidental or consequential damages or loss of any kind, including, without limitation, loss of profits or savings, loss of use, or similar damages, whether based on strict liability, or negligence, whether resulting from installation, use or maintenance of the Gas Distribution System, breach of this Agreement or otherwise, except for direct, specific damages to the extent caused by either party's negligence or misconduct.

9.5. This Section 9 shall survive the expiration or early termination of this Agreement.

10. **Miscellaneous**. This Agreement constitutes the entire understanding and agreement between the Parties and supersedes any and all prior negotiations, understandings or agreements with respect to this subject matter. This Agreement may be amended only by written instrument signed by both of the Parties. Whenever possible, each provision of this Agreement shall be interpreted in such manner as to be effective and valid under Florida law, but if any provision of this Agreement or the application thereof to any Party or circumstance is prohibited by or invalid under applicable law, that provision shall be effective only to the extent of such prohibition or invalidity, without invalidating the remaining provisions of this Agreement or the application of the same. Nothing contained herein shall be construed as a joint venture, partnership or any other similar relationship between Company and Developer. The captions, headings, titles, and subtitles herein are inserted for convenience of reference only and are to be ignored in any construction of the provisions of this Agreement. This Agreement shall be binding upon, and shall inure to the benefit of, the Parties, and their respective successors and assigns, and no assignment shall relieve either Party of such Party's obligations hereunder without written consent of the other Party. This Agreement shall be subject to all applicable laws, rules, orders, permits, and regulations of any federal, state, or local governmental authority having jurisdiction over the Parties, their facilities, or the transactions contemplated. This Agreement may be executed in one or more counterparts, each of which shall be deemed to be an original, but all of which together shall constitute one in the same instrument.

11. **Recording**. This Agreement may be recorded by Company among the Public Records of the County in which the Project are located.

12. **Exclusivity**. During the term of this Agreement and for a period of ten (10) years thereafter, Developer shall not install, cause to be installed, or allow to be installed any other gas distribution system in the Project or any other system or mechanism for delivery of natural gas or propane gas to residents in the Project. Developer agrees that Company has an exclusive right to provide natural gas services to the Project and that Developer will not grant, or allow others to grant any easement or right-of-way for purposes of delivering natural gas service. Developer certifies that there is no

Marc,
The attached project is the second project brought to us by TECO Partners (Fisherman's Cove the first). The developer/builder purchased this completed subdivision of around 100 lots but 23 were already built. All infrastructure is complete, with the exception of gas. The builder wants to begin construction now and needs to know the status of the gas. Please process ASAP.
Thanks,

Don Kitner

ARTICLES OF INCORPORATION

OF

SUGAR MILL GARDENS RESIDENTIAL
HOMEOWNERS' ASSOCIATION, INC.
(A Florida Not For Profit Corporation)

Filed August 29, 2006 - Secretary of State, Tallahassee, Florida

We, the undersigned, hereby associate ourselves together for the purpose of forming a non-profit corporation under the laws of the State of Florida, pursuant to Chapter 617, Florida Statutes, and hereby certify as follows:

ARTICLE I

The name of this Corporation shall be: ***SUGAR MILL GARDENS RESDIENTIAL HOMEOWNERS' ASSOCIATION, INC.*** Principal office and mailing address being 2248 State Road 44, New Smyrna Beach, Florida 32168.

ARTICLE II

The general purpose of this non-profit corporation is to be the "Homeowners' Association" (as defined in the Homeowners' Association's Act, Chapter 720, Florida Statutes), for the operation of the community subdivision known as ***SUGAR MILL GARDENS RESIDENTIAL*** to be located in New Smyrna Beach, Volusia County, Florida, and to operate and administer said community and the land comprising the community to the jurisdiction and control of the Association.

ARTICLE III

All persons who are owners of parcels within said community shall automatically be members of this corporation. Such membership shall automatically terminate when such person is no longer an owner of a parcel. Membership in the corporation shall be limited to such community parcel owners.

Subject to the foregoing, admission to and termination of membership shall be governed by the Declaration of Covenants, Conditions and Restrictions that shall be filed for said community among the Public Records of Volusia County, Florida.

ARTICLE IV

This Corporation shall have perpetual existence.

ARTICLE V

The name and residence address of the subscriber to these Articles of Incorporation is as follows:

DALE L. WILLIAMS
148 Breezeway Court
New Smyrna Beach, Florida 32169

ARTICLE VI

Section 1.The affairs of the Corporation shall be managed and governed by a Board of Directors composed of not less than three hor more than the number specified in the By-laws. The Directors, shall be elected at the annual meeting of the membership, for a term of one year, or until their successors shall be elected and shall qualify. Provisions for such election and provisions respecting the removal, disqualification and resignation of directors and for filling vacancies of the Board of Directors, shall be established by the By-laws.

Section 2. The principal officers of the corporation shall be: President, Secretary and Treasurer, and any other office as the Board of Directors may deem necessary, who shall each be elected from time to time in the manner set forth in the By-laws adopted by the Corporation.

ARTICLE VII

The names of the officers who are to serve until the election of officers, pursuant to the terms of the Declaration of Covenants, Conditions and Restrictions and By-laws, are as follows:

President	*DALE L. WILLIAMS*
Secretary	*ROBERT LEE*
Treasurer	*LAWRENCE SMITH*

ARTICLE VIII

The following shall constitute the first Board of Directors and shall serve until the first election of the Board of Directors at the first regular meeting of the membership:

DALE L. WILLIAMS

LAWRENCE SMITH

ROBERT LEE

ARTICLE IX

The By-laws of the Corporation shall initially be made and adopted by its first Board of Directors and attached to the Declaration of Covenants, Conditions & Restrictions to be filed in the Public Records of Volusia County, Florida. The By-laws may be altered, amended or rescinded at any duly called meeting of the members in the manner provided by the By-laws.

ARTICLE X

Section 1. Proposals for the alteration, amendment or rescission of these Articles of Incorporation which do not conflict with the Homeowners Association Act, the Declaration of Covenants, Conditions & Restrictions, or applicable law may be made by a majority of the Board of Directors or a majority of the voting members of the Association. Such proposals shall set forth the proposed alteration, amendment or rescission, shall be in writing, filed by the Board of Directors or a majority of voting members, and delivered to the President. The President shall thereupon call a Special Meeting of the Association not less than ten (10) days nor later than sixty (60) days from receipt of the proposed amendment, the notice for which shall be given in the manner provided in the By-laws. An affirmative vote of two-thirds (2/3) of the Board of Directors, and an affirmative vote of a majority of all voting members of the Association shall be required for the requested alteration, amendment or rescission. In the event of termination, dissolution or final liquidation of the Association, the responsibility for the operation and maintenance of the surface water or stormwater management system must be transferred to and accepted by an entity which would comply with Section 40C-42.027, F.A.C., and be approved by the St. Johns River Water Management District prior to such termination, dissolution or liquidation.

ARTICLE XI

This Corporation shall have all of the powers set forth in Section 617.0302 Florida Statutes, all of the powers set forth in the Homeowners' Association Act of the State of Florida, and all powers granted to it by the Declaration of Covenants, Conditions & Restrictions and exhibits annexed thereto. In addition thereto the Association shall operate, maintain and manage the surface water or stormwater management system(s) in a manner consistent with the St. Johns River Water Management District Permit No. 40-127-90311-1 requirements and applicable District rules, and shall assist in the enforcement of the Declaration of Covenants and Restrictions which relate to the surface water or stormwater management system.

The Association shall levy and collect adequate assessments against members of the Association for the costs of maintenance and operation of the surface water or stormwater management system.

ARTICLE XII

There shall be no dividends paid to any of the members, nor shall any part of the income of the Corporation be distributed to its Board of Directors or officers. In the event there are any excess receipts over disbursements as a result of performing services, such excess shall be applied against future expenses. The Corporation may pay compensation in a reasonable amount to its members, directors and officers for services rendered, may confer benefits upon its members in conformity with its purposes, and upon dissolution or liquidation, may make distribution to its members as is permitted by the Court having jurisdiction thereof, and no such payment, benefit or distribution shall be deemed to be a dividend or distribution of income.

ARTICLE XIII

The street address of the initial registered office of this Corporation shall be 418 Canal Street, New Smyrna Beach, Volusia County, Florida 32168, and the name of the initial registered agent of this Corporation at that address is ***SID C. PETERSON, JR.***

ARTICLE XIV

Thirty percent (30%) of the members entitled to vote, represented in person or by proxy, shall constitute a quorum at a meeting of the members. The affirmative vote of a majority of the members represented at the meting and entitled to vote on the subject matter shall be the act of the members, unless the vote of a greater number is required by these Articles or the By-laws.

ARTICLE XV

The Association shall indemnify and hold harmless every director and every officer, their heirs, executors and administrators, to the fullest extent allowed by law including, without limitation, against all loss, costs and expenses (including reasonable attorneys fees) incurred by them in connection with any action, suit or proceeding to which they may be made a party by reason of their being or having been a director or officer of the corporation (except as to matters wherein they shall be finally adjudged in such action, suit or proceeding to be liable for, or guilty of, gross negligence or willful misconduct). The Corporation shall, to the extent it is available, obtain insurance covering all of its officers and directors against liability or loss in connection with the foregoing matters for which indemnification is appropriate and for such other matters as is allowed by law. The foregoing rights shall be in addition to and not exclusive of all other rights to which such director or officer may be entitled.

IN WITNESS WHEREOF, the undersigned as Incorporator has executed the foregoing Articles of Incorporation on this 25th day of August, 2006.

DALE L. WILLIAMS

STATE OF FLORIDA

COUNTY OF VOLUSIA

BEFORE ME, a Notary Public, personally appeared, *DALE L. WILLIAMS*, who is personally known to me or who has produced Personally Known as identification and who executed the foregoing Articles of Incorporation of *SUGAR MILL GARDENS RESIDENTIAL HOMEOWNERS' ASSOCIATION, INC., a Florida Corporation, not-for-profit,* for the purposes therein expressed.

WITNESS MY HAND and official seal at the State and County aforesaid, this 25th day of August, 2006.

My Commission Expires:

SIDNEY C. PETERSON, II
MY COMMISSION # DD 359823
EXPIRES: November 5, 2008
Bonded Thru Notary Public Underwriters

CERTIFICATE CHANGING PLACE OF BUSINESS OR DOMICILE FOR THE SERVICE OF PROCESS WITHIN THIS STATE, NAMING AGENT UPON WHOM PROCESS MAY BE SERVED.

In pursuance of Chapter 48.091, Florida Statutes, the following is submitted in compliance with said Act:

First – ***SUGAR MILL GARDENS RESIDENTIAL HOMEOWNERS' ASSOCIATION, INC.***, desiring to organize under the laws of the State of Florida, with its principal office as indicated in the Articles of Incorporation, at the City of New Smyrna Beach, County of Volusia, State of Florida, has named ***SID C. PETERSON, JR.***, 418 Canal Street, New Smyrna Beach, Florida 32168 Volusia County, Florida, as its agent to accept service of process within this State.

ACKNOWLEDGEMENT: (MUST BE SIGNED BY DESIGNATED AGENT)

Having been named to accept service of process for the above stated corporation, at place designated in this Certificate, I hereby accept to act in this capacity, and agree to comply with the provisions of said Act relative to keeping open said office.

DEPARTMENT OF THE TREASURY

RESIDENTIAL

Federal Tax ID / EIN

This is your provisional Employer Identification Number:

20-5462764

Today's Date is: August 30, 2006 GMT

You will receive a confirmation letter in U.S. mail within fifteen days.

The letter will also contain useful tax information for your business or organization.

If you have input any of the information on your application in error, please wait seven days and contact the EIN Toll Free area at 1-800-829-4933, Monday - Friday, 7:30am - 5:30pm. If you do not want to call, please make corrections on the letter you receive confirming your EIN and return it to the IRS.

If you are going to complete other on-line applications that require your Employer Identification Number(EIN) you can copy it by performing the following steps:

1) Use your mouse to highlight your EIN (blue number on top of page) by moving your pointer on top of the number.
2) Press the Ctrl key at the same time pressing the C key.

Once you copy your EIN you can paste it in the appropriate place by pressing the Ctrl key at the same time pressing the V key.

You may click on the buttons below for different print options or to fill out another Form SS-4.

Review and Print Form SS-4 Fill Out Another Form SS-4

Click here to return to the Internet Employer Identification Number landing (start) page.

Form **SS-4**

Marc,
The attached project is the second project brought to us by TECO Partners (Fisherman's Cove the first). The developer/builder purchased this completed subdivision of around 100 lots but 23 were already built. All infrastructure is complete, with the exception of gas. The builder wants to begin construction now and needs to know the status of the gas. Please process ASAP.
Thanks,

Don Kitner

Instructions for using the AEP & Net Present Value (NPV) Templates

Revised 5/18/2005

OBJECTIVE

The AEP & Net Present Value (NPV) Templates are to be used as an analytical tool for evaluating potential revenue generating investments and to determine the AEP surcharge rate for the recovery of the Excess Construction Costs.

INPUT

The general input areas are shaded in light blue - all relevant cells should be updated for all projects. Enter data as follows:

1	**Project Name**	Short description of investment.
2	**Beginning in Year**	Projected year that the project will commence.
3	**Piping Allowance**	Estimated Piping Allowance per class of customer if not capitalized (see note 24).
4	**Occupancy Rate**	Anticipated occupancy level.
5	**Cost of Service per Customer**	Estimated cost of providing service to each class of customer.
6	**Mains**	Cost of installing main per year.
7	**New Residential Customers**	Estimated residential customer added each month for each year.
8	**Therms per Customer each Month**	Average monthly therms per residential customer.
9	**New General Service Customers**	Estimated General Service customers added each month for each year.
10	**Therms per Customer each Month**	Average monthly therms per General Service customer.
11	**New Large Volume Customers**	Estimated Large Volume customer added each month for each year.
12	**Therms per Customer each Month**	Average monthly therms per Large Volume customer.
13	**Gas Lighting Service**	Estimated other customer added each month for each year.
14	**Therms per Customer each Month**	Average monthly therms per other customer.
15	**Customer Charge**	Estimated Customer Charge for Other Customers added.
16	**Other Income**	Other "non base revenue" estimated positive cash flows to be generated by the project for each year. Note - pass-through revenues, such as fuel and gross receipts tax are not to be included.
17	**Other Expenses**	Other expenses estimated to be incurred from the project for each year eg Sales Rep Commissions. Note - pass-through expenses, such as fuel and gross receipts tax are not to be included.
18	**AEP Worksheet**	Enter AEP surcharge rate that provides cost recovery within 8-10 years.

GENERAL INFORMATION

19 Contracts with Access Fees (up-front payments to Developers) should be carefully worded to ensure that there is a corresponding clause for a penalty for units not connected. The payments to the Developer should be entered on the cash flow analysis as a capital expenditure in the year that it is anticipated that the payment will be made. The access fee should be treated as an up-front capital expenditure.

20 On the Income Statement Section of the NPV analysis it is assumed that the up-front access fee, including piping allowance (capitalized) will be depreciated at the same rate as the other capital expenditure items. The actual contract, however, should be worded such that it allows us to depreciate the piping allowance over the life of the contract.

Instructions for using the AEP & Net Present Value (NPV) Templates

NPV MODEL ASSUMPTIONS

25 Inflation is not included in either revenues or expenses - null effect, in addition to which the discount rate includes the inflation risk.
26 Asset Remaining Value - represents the value of the investment at the end of the analysis. Can also be seen as representative of the future income streams beyond the time frame of the template. For regulated companies it is calculated as the average of the last three years Net Income Before Interest, Taxes and Depreciation times a multiplier of 8. A multiplier of 6 is used for non-regulated projects.
27 Required Return - WACC as per Year End Surveillance Report using Cost of Equity Rate as per last Rate Case.
28 Ratio of Debt Financing - assumes that future projects will be financed by debt and equity equally.
29 O&M Expenses - "R" = 31% Base Revenue "NR" = 35% Base Revenue (Budgeted Expenses). For acquisitions this percentage can be replaced by a $ amount by entering the estimated O&M expenses in cell B94.
30 Interest Rate - Weighted Average Cost of Debt.
31 Depreciation Book % - Book Depreciation Rate.
32 Income Tax % - Income Tax Rate.

PROCESS

33 **Ensure that the variables, such as rates, are correct and review to ensure that the results, such as revenues and expenses seem reasonable.**
34 Submit NPV (& AEP) worksheets for approval as per steps below.
35 Prepare IR after approval has been granted.
36 Submit approved IR , AEP worksheet and NPV to General Accounting.
37 A copy of all approved NPVs and AEPs must also be forwarded to the Accounting Department for the attention of the Executive Assistant.

From: Kitner Don
Sent: Wednesday, August 08, 2007 5:18 PM
To: Cox Doreen
Subject: SummerGlen
Attachments: AEP-NPV Summer Glen 8-1-07.xls; Large volume.pdf; General service.pdf; Gas light.pdf; ~~Residential service.pdf~~

Doreen,
Attached is the revised AEP/NPV template with Dan's adjusted cost estimates. All service sizing with the exception of the gas light services are the costs of a long side and a short size averaged together.
Call if you have any questions.
Thanks,

Don Kitner
General Manager, Central Florida

Instructions for using the AEP & Net Present Value (NPV) Templates

Revised 5/18/2005

OBJECTIVE

The AEP & Net Present Value (NPV) Templates are to be used as an analytical tool for evaluating potential revenue generating investments and to determine the AEP surcharge rate for the recovery of the Excess Construction Costs.

INPUT

The general input areas are shaded in light blue - all relevant cells should be updated for all projects. Enter data as follows:

1	**Project Name**	Short description of investment.
2	**Beginning In Year**	Projected year that the project will commence.
3	**Piping Allowance**	Estimated Piping Allowance per class of customer if not capitalized (see note 24).
4	**Occupancy Rate**	Anticipated occupancy level.
5	**Cost of Service per Customer**	Estimated cost of providing service to each class of customer.
6	**Mains**	Cost of installing main per year.
7	**New Residential Customers**	Estimated residential customer added each month for each year.
8	**Therms per Customer each Month**	Average monthly therms per residential customer.
9	**New General Service Customers**	Estimated General Service customers added each month for each year.
10	**Therms per Customer each Month**	Average monthly therms per General Service customer.
11	**New Large Volume Customers**	Estimated Large Volume customer added each month for each year.
12	**Therms per Customer each Month**	Average monthly therms per Large Volume customer.
13	**Gas Lighting Service**	Estimated other customer added each month for each year.
14	**Therms per Customer each Month**	Average monthly therms per other customer.
15	**Customer Charge**	Estimated Customer Charge for Other Customers added.
16	**Other Income**	Other "non base revenue" estimated positive cash flows to be generated by the project for each year. Note - pass-through revenues, such as fuel and gross receipts tax are not to be included.
17	**Other Expenses**	Other expenses estimated to be incurred from the project for each year eg Sales Rep Commissions. Note - pass-through expenses, such as fuel and gross receipts tax are not to be included.
18	**AEP Worksheet**	Enter AEP surcharge rate that provides cost recovery within 8-10 years.

GENERAL INFORMATION

19 Contracts with Access Fees (up-front payments to Developers) should be carefully worded to ensure that there is a corresponding clause for a penalty for units not connected. The payments to the Developer should be entered on the cash flow analysis as a capital expenditure in the year that it is anticipated that the payment will be made. The access fee should be treated as an up-front capital expenditure.

20 On the Income Statement Section of the NPV analysis it is assumed that the up-front access fee, including piping allowance (capitalized) will be depreciated at the same rate as the other capital expenditure items. The actual contract, however, should be worded such that it allows us to depreciate the piping allowance over the life of the contract.

Instructions for using the AEP & Net Present Value (NPV) Templates

NPV MODEL ASSUMPTIONS

25 Inflation is not included in either revenues or expenses - null effect, in addition to which the discount rate includes the inflation risk.

26 Asset Remaining Value - represents the value of the investment at the end of the analysis. Can also be seen as representative of the future income streams beyond the time frame of the template. For regulated companies it is calculated as the average of the last three years Net Income Before Interest, Taxes and Depreciation times a multiplier of 8. A multiplier of 6 is used for non-regulated projects.

27 Required Return - WACC as per Year End Survellance Report using Cost of Equity Rate as per last Rate Case.

28 Ratio of Debt Financing - assumes that future projects will be financed by debt and equity equally.

29 O&M Expenses - "R" = 31% Base Revenue "NR" = 35% Base Revenue (Budgeted Expenses). For acquisitions this percentage can be replaced by a $ amount by entering the estimated O&M expenses in cell B94.

30 Interest Rate - Weighted Average Cost of Debt.

31 Depreciation Book % - Book Depreciation Rate.

32 Income Tax % - Income Tax Rate.

PROCESS

33 **Ensure that the variables, such as rates, are correct and review to ensure that the results, such as revenues and expenses seem reasonable.**

34 Submit NPV (& AEP) worksheets for approval as per steps below.

35 Prepare IR after approval has been granted.

36 Submit approved IR , AEP worksheet and NPV to General Accounting.

37 A copy of all approved NPVs and AEPs must also be forwarded to the Accounting Department for the attention of the Executive Assistant.

CEO		

Construction and Revenue Summary:

Estimated Construction Cost (CC):	$ 891,030	Four year Construction Costs
Four Years Revenue (MACC)*:	600,042	Four years revenue
Net Excess Construction Cost (ECC):	$ 290,988	

Calculation of AEP Surcharge:

AEPS= (ECC+(ROR*T1*.5*ECC))/T2*TH)

ECC	290,988	As computed on Wkst
ROR	7.950%	Company's Authorized Rate
T1	10	Years for collection
T2	1	(1 if total therms used forT1)
TH	1,878,617	Total 10 year therms
AEPS	$ 0.216	Original calculation

Manual Input: Override Computed AEPS $ 0.300

and Rate breakdown

Summary of projected Therms:

Year	Total Annual Residential Usage	Total Annual General Serv Usage	Total Annual Large Volume Usage	Total Annual Gas Light Usage	Total Therm Load Added
1	122148	4200	30000	8640	164988
2	133380	4200	30000	8640	176220

Doreen,
Attached is the revised AEP/NPV template with Dan's adjusted cost estimates. All service sizing with the exception of the gas light services are the costs of a long side and a short size averaged together.
Call if you have any questions.
Thanks,

Don Kitner
General Manager, Central Florida

Subject: SummerGlen
Attachments: AEP-NPV Summer Glen 8-1-07.xls; Large volume.pdf; General service.pdf; Gas light.pdf; Residential service.pdf

Doreen,
Attached is the revised AEP/NPV template with Dan's adjusted cost estimates. All service sizing with the exception of the gas light services are the costs of a long side and a short size averaged together.
Call if you have any questions.
Thanks,

Don Kitner

To: Cox Doreen
Subject: testimony

You and Robert and including testimony about why the cost of capital corporate should be allocated to all utilities including flogas proportionally. FLogas does share in our ST debt etc etc etc. Correct?

Cheryl Martin
Controller
Florida Public Utilities Company
(561) 838-1725

Instructions for using the AEP & Net Present Value (NPV) Templates

Revised 5/18/2005

OBJECTIVE

The AEP & Net Present Value (NPV) Templates are to be used as an analytical tool for evaluating potential revenue generating investments and to determine the AEP surcharge rate for the recovery of the Excess Construction Costs.

INPUT

The general input areas are shaded in light blue - all relevant cells should be updated for all projects. Enter data as follows:

1	**Project Name**	Short description of investment.
2	**Beginning in Year**	Projected year that the project will commence.
3	**Piping Allowance**	Estimated Piping Allowance per class of customer if not capitalized (see note 24).
4	**Occupancy Rate**	Anticipated occupancy level.
5	**Cost of Service per Customer**	Estimated cost of providing service to each class of customer.
6	**Mains**	Cost of installing main per year.
7	**New Residential Customers**	Estimated residential customer added each month for each year.
8	**Therms per Customer each Month**	Average monthly therms per residential customer.
9	**New General Service Customers**	Estimated General Service customers added each month for each year.
10	**Therms per Customer each Month**	Average monthly therms per General Service customer.
11	**New Large Volume Customers**	Estimated Large Volume customer added each month for each year.
12	**Therms per Customer each Month**	Average monthly therms per Large Volume customer.
13	**Gas Lighting Service**	Estimated other customer added each month for each year.
14	**Therms per Customer each Month**	Average monthly therms per other customer.
15	**Customer Charge**	Estimated Customer Charge for Other Customers added.
16	**Other Income**	Other "non base revenue" estimated positive cash flows to be generated by the project for each year. Note - pass-through revenues, such as fuel and gross receipts tax are not to be included.
17	**Other Expenses**	Other expenses estimated to be incurred from the project for each year eg Sales Rep Commissions. Note - pass-through expenses, such as fuel and gross receipts tax are not to be included.
18	**AEP Worksheet**	Enter AEP surcharge rate that provides cost recovery within 8-10 years.

GENERAL INFORMATION

19 Contracts with Access Fees (up-front payments to Developers) should be carefully worded to ensure that there is a corresponding clause for a penalty for units not connected. The payments to the Developer should be entered on the cash flow analysis as a capital expenditure in the year that it is anticipated that the payment will be made. The access fee should be treated as an up-front capital expenditure.

20 On the Income Statement Section of the NPV analysis it is assumed that the up-front access fee, including piping allowance (capitalized) will be depreciated at the same rate as the other capital expenditure items. The actual contract, however, should be worded such that it allows us to depreciate the piping allowance over the life of the contract.

Instructions for using the AEP & Net Present Value (NPV) Templates

NPV MODEL ASSUMPTIONS

25 Inflation is not included in either revenues or expenses - null effect, in addition to which the discount rate includes the inflation risk.
26 Asset Remaining Value - represents the value of the investment at the end of the analysis. Can also be seen as representative of the future income streams beyond the time frame of the template. For regulated companies it is calculated as the average of the last three years Net Income Before Interest, Taxes and Depreciation times a multiplier of 8. A multiplier of 6 is used for non-regulated projects.
27 Required Return - WACC as per Year End Survellance Report using Cost of Equity Rate as per last Rate Case.
28 Ratio of Debt Financing - assumes that future projects will be financed by debt and equity equally.
29 O&M Expenses - "R" = 31% Base Revenue "NR" = 35% Base Revenue (Budgeted Expenses). For acquisitions this percentage can be replaced by a $ amount by entering the estimated O&M expenses in cell B94.
30 Interest Rate - Weighted Average Cost of Debt.
31 Depreciation Book % - Book Depreciation Rate.
32 Income Tax % - Income Tax Rate.

PROCESS

33 **Ensure that the variables, such as rates, are correct and review to ensure that the results, such as revenues and expenses seem reasonable.**
34 Submit NPV (& AEP) worksheets for approval as per steps below.
35 Prepare IR after approval has been granted.
36 Submit approved IR , AEP worksheet and NPV to General Accounting.
37 A copy of all approved NPVs and AEPs must also be forwarded to the Accounting Department for the attention of the Executive Assistant.

Construction and Revenue Summary:

Estimated Construction Cost (CC):	$ 18,259	(Total from input on next page)
Customer Contribution	7,500	
Four Years Revenue (MACC)*:	10,605	Four years revenue
Net Excess Construction Cost (ECC):	$ 155	

Calculation of AEP Surcharge:

AEPS= (ECC+(ROR*T1*.5*ECC))/T2*TH)

ECC	155	As computed on Wkst
ROR	8.070%	Company's Authorized Rate
T1	10	Years for collection
T2	1	(1 if total therms used forT1)
TH	26,400	Total 10 year therms
AEPS	$ 0.008	Original calculation

Manual Input: Override Computed AEPS ________

and Rate breakdown

** Rate Breakdown:		AEPS / therm	Ratio : This % of therms per class are counted in 10 year therm total
RS	Residential	0.000	100.0000%
GS	General Service	0.000	66.4191%
LVS	Large Volume Service	0.000	49.2532%
Gas Lights		0.000	36.5929%

Summary of projected Therms:

TEMPLATE REVISION LOG

NPV Rev #	AEP Rev #	Date	Name	Changes Made	Approved By
		1/22/2004	DC	Made template a R only - NR will be done on the original 15 year template.	GB, DK
		1/27/2004	DC	Change Months on Input Sheet to "Month 1", "Month 2" etc	GB, DK
		1/27/2004	DC	Added detailed approval section on AEP Worksheet	DK
		1/28/2004	DC	Corrected AEP cell # C35 to reference Input S23	DK
		1/29/2004	DC	Changed AEP Deferred Costs formulas (Col K35 - K 44) so that Deferred Charges do not exceed amounts projected to be spent. Revised comment. Confirmed with MN and BG that costs are allocated first to ECC in the books.	DK, GB
		1/29/2004	DC	Changed NPV Cell B23 to an "IF" Statement, so that projects that do not have an ECC show aero contribution on the NPV.	DK
		1/29/2004	DC	Put if statement on AEP worksheet so that projects that do not have an ECC do not calculate a Deferred Debit, interest etc..	
11.4	1.2	7/8/2004	DC	Updated Non-Fuel Rates as per Interim Rates approved by PSC effective for Meter Reads August 2004. NSB template removed - rates for rest of Company to be used as rates will eventually be the same at final hearing.	GB, DK
11.5		10/6/2004	DC	Revised formula for the contribution on the NPV to be zero when there is no AEP surcharge even though there may be a small ECC.	GB
11.6		11/18/2004	DC	Updated Non-Fuel Rates as per Rates approved by PSC effective 11/18/04	MS, DK, GB
		11/18/2004	DC	Updated Interest Rate - See back-up WACD - Gas Rate Case	GB
		11/18/2004	DC	Updated ROR to reflect WACC approved in NG Rate Case effective 11/18/04	GB
	1.3	11/18/2004	DC	Updated ROR as per WACC approved in Gas Rate Case 10/18/04 effective 11/18/04	GB
		11/18/2004	DC	Added Gas Lighting Service - checked by DK 10/29/04	GB, DK
11.7	1.4	2/18/2005	DC	Update ROR to reflect Year-end Surveillance Rate	GB
12	2	3/9/2005	DC	Link AEP & NPV to Input Sheet so that revenues are recognized in the month of projecte not year-end turn-ons.	GB, DK
12.1	2.1	3/31/2005	DC	Updated ROR to reflect final Year-end Surveillance Report Rate	CM
12.2	12.2	4/21/2005	DC	Updated O&M % to reflect Budget 2005 (adjusted for Propane savings $604 less tax)	GB
12.2		2/24/2006	DC	Updated Avg Shares Outstansing and Available for Common as at 12/31/2005	GB
12.3	12.3	4/6/2006	DC	Update ROR to reflect Dec 2005 Average Mid-Point Surveillance Rate	GB

Instructions for using the AEP & Net Present Value (NPV) Templates

Revised 5/18/2005

OBJECTIVE

The AEP & Net Present Value (NPV) Templates are to be used as an analytical tool for evaluating potential revenue generating investments and to determine the AEP surcharge rate for the recovery of the Excess Construction Costs.

INPUT

The general input areas are shaded in light blue - all relevant cells should be updated for all projects. Enter data as follows:

1	**Project Name**	Short description of investment.
2	**Beginning In Year**	Projected year that the project will commence.
3	**Piping Allowance**	Estimated Piping Allowance per class of customer if not capitalized (see note 24).
4	**Occupancy Rate**	Anticipated occupancy level.
5	**Cost of Service per Customer**	Estimated cost of providing service to each class of customer.
6	**Mains**	Cost of installing main per year.
7	**New Residential Customers**	Estimated residential customer added each month for each year.
8	**Therms per Customer each Month**	Average monthly therms per residential customer.
9	**New General Service Customers**	Estimated General Service customers added each month for each year.
10	**Therms per Customer each Month**	Average monthly therms per General Service customer.
11	**New Large Volume Customers**	Estimated Large Volume customer added each month for each year.
12	**Therms per Customer each Month**	Average monthly therms per Large Volume customer.
13	**Gas Lighting Service**	Estimated other customer added each month for each year.
14	**Therms per Customer each Month**	Average monthly therms per other customer.
15	**Customer Charge**	Estimated Customer Charge for Other Customers added.
16	**Other Income**	Other "non base revenue" estimated positive cash flows to be generated by the project for each year. Note - pass-through revenues, such as fuel and gross receipts tax are not to be included.
17	**Other Expenses**	Other expenses estimated to be incurred from the project for each year eg Sales Rep Commissions. Note - pass-through expenses, such as fuel and gross receipts tax are not to be included.
18	**AEP Worksheet**	Enter AEP surcharge rate that provides cost recovery within 8-10 years.

GENERAL INFORMATION

19 Contracts with Access Fees (up-front payments to Developers) should be carefully worded to ensure that there is a corresponding clause for a penalty for units not connected. The payments to the Developer should be entered on the cash flow analysis as a capital expenditure in the year that it is anticipated that the payment will be made. The access fee should be treated as an up-front capital expenditure.

20 On the Income Statement Section of the NPV analysis it is assumed that the up-front access fee, including piping allowance (capitalized) will be depreciated at the same rate as the other capital expenditure items. The actual contract, however, should be worded such that it allows us to depreciate the piping allowance over the life of the contract.

Instructions for using the AEP & Net Present Value (NPV) Templates

NPV MODEL ASSUMPTIONS

25 Inflation is not included in either revenues or expenses - null effect, in addition to which the discount rate includes the inflation risk.
26 Asset Remaining Value - represents the value of the investment at the end of the analysis. Can also be seen as representative of the future income streams beyond the time frame of the template. For regulated companies it is calculated as the average of the last three years Net Income Before Interest, Taxes and Depreciation times a multiplier of 8. A multiplier of 6 is used for non-regulated projects.
27 Required Return - WACC as per Year End Survellance Report using Cost of Equity Rate as per last Rate Case.
28 Ratio of Debt Financing - assumes that future projects will be financed by debt and equity equally.
29 O&M Expenses - "R" = 31% Base Revenue "NR" = 35% Base Revenue (Budgeted Expenses). For acquisitions this percentage can be replaced by a $ amount by entering the estimated O&M expenses in cell B94.
30 Interest Rate - Weighted Average Cost of Debt.
31 Depreciation Book % - Book Depreciation Rate.
32 Income Tax % - Income Tax Rate.

PROCESS

33 **Ensure that the variables, such as rates, are correct and review to ensure that the results, such as revenues and expenses seem reasonable.**
34 Submit NPV (& AEP) worksheets for approval as per steps below.
35 Prepare IR after approval has been granted.
36 Submit approved IR , AEP worksheet and NPV to General Accounting.
37 A copy of all approved NPVs and AEPs must also be forwarded to the Accounting Department for the attention of the Executive Assistant.

Construction and Revenue Summary:

Estimated Construction Cost (CC):	$ 18,259	(Total from input on next page)
Customer Contribution	7,500	
Four Years Revenue (MACC)*:	10,605	Four years revenue
Net Excess Construction Cost (ECC):	$ 155	

Calculation of AEP Surcharge:

AEPS= (ECC+(ROR*T1*.5*ECC))/T2*TH)

ECC	155	As computed on Wkst
ROR	8.070%	Company's Authorized Rate
T1	10	Years for collection
T2	1	(1 if total therms used forT1)
TH	26,400	Total 10 year therms
AEPS	$ 0.008	Original calculation

Manual Input: Override Computed AEPS ____________
and Rate breakdown

	** Rate Breakdown:	AEPS / therm	Ratio : This % of therms per class are counted in 10 year therm total
RS	Residential	0.000	100.0000%
GS	General Service	0.000	66.4191%
LVS	Large Volume Service	0.000	49.2532%
Gas Lights		0.000	36.5929%

Summary of projected Therms:

Year	Total Annual Residential Usage	Total Annual General Serv Usage	Total Annual Large Volume Usage	Total Annual Gas Light Usage	Total Therm Load Added
