CHAPTER III

Projection of Incremental Resource Additions

(This page is left intentionally blank.)

III. Projection of Incremental Resource Additions

III.A FPL's Resource Planning:

FPL utilizes its well established integrated resource planning (IRP) process in whole or in part as analysis needs warranted, to determine when new resources are needed, what the magnitude of the needed resources are, and what type of resources should be added. The timing and type of new power plants, the primary subjects of this document, are determined as part of the IRP process work.

This section describes FPL's basic IRP process. Some of the key assumptions, in addition to a new load forecast, that were used in developing the resource plan presented in this Site Plan are also discussed.

Four Fundamental Steps of FPL's Resource Planning:

There are 4 fundamental steps to FPL's resource planning. These steps can be described as follows:

Step 1: Determine the magnitude and timing of FPL's new resource needs;

Step 2: Identify which resource options and resource plans can meet the determined magnitude and timing of FPL's resource needs (i.e., identify competing options and resource plans);

Step 3: Evaluate the competing options and resource plans in regard to system economics and non-economic factors; and,

Step 4: Select a resource plan and commit, as needed, to near-term options.

Figure III.A.1 graphically outlines the 4 steps.

Overview of FPL's IRP Process

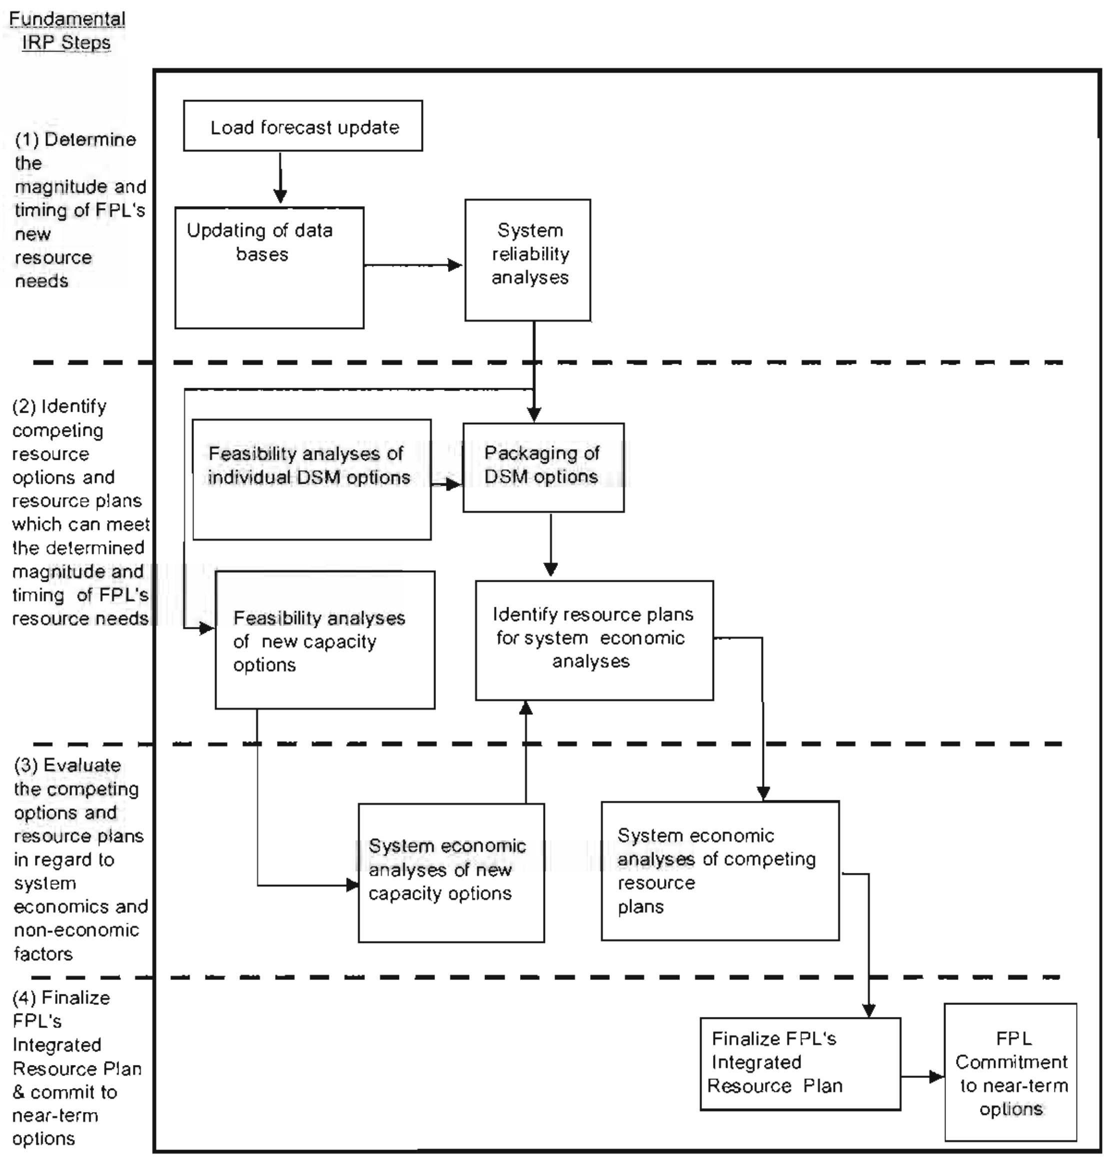

Figure III.A.1: Overview of FPL's IRP Process

Step 1: Determine the Magnitude and Timing of FPL's New Resource Needs:

The first of the four resource planning steps, determining the magnitude and timing of FPL's resource needs, is essentially a determination of the amount of capacity or megawatts (MW) of load reduction, new capacity additions, or a combination of both load reduction and new capacity additions that are needed to maintain system reliability. Also determined in this step is when the MW additions are needed to meet FPL's reliability criteria. This step is often referred to as a reliability assessment, or resource adequacy, analysis for the utility system.

Step 1 typically starts with an updated load forecast. Several databases are also updated in this first fundamental step, not only with the new information regarding forecasted loads, but also with other information that is used in many of the fundamental steps in resource planning. Examples of this new information include, but are not limited to: delivered fuel price projections, current financial and economic assumptions, and power plant capability and operating assumptions. FPL also includes key assumptions regarding three specific resource areas: (1) near-term construction capacity additions, (2) firm capacity power purchases, and (3) DSM implementation.

The first of these assumptions is based on new generating capacity additions that have been approved by the Florida Public Service Commission (FPSC) through Determination of Need proceedings that evaluated both the need for, and the cost-effectiveness of, each of the new capacity additions. These generating capacity additions have also either received the necessary Site Certification approvals from either the Secretary of the Florida Department of Environmental Protection (FDEP) or the Governor and Cabinet (acting as the Siting Board), or these approvals have been applied for. (There is also work in progress to obtain the necessary federal and state licenses, permits, and approvals for construction and operation of two new nuclear units whose earliest practical deployment dates continue to be outside of the 2012 – 2021 reporting period of this Site Plan.)

Several new generating unit additions will occur in the 2012 – 2021 reporting time frame of this document. These generating unit additions include:

- Two existing generating plant sites, each featuring two older fossil fuel-fired steam generating units, are currently in the process of being modernized by removing the existing generating units and replacing them with one new, highly efficient combined cycle (CC) unit. The new CC plant at FPL's Cape Canaveral site is projected to be placed in-service in mid-2013. This new CC unit is projected to have a peak Summer output of 1,210 MW and will be called the Cape Canaveral Next Generation Clean Energy Center (CCEC). The new CC unit at FPL's Riviera site is projected to be placed in-service in mid-2014 and it is expected to have a peak Summer output of 1,212 MW. This new plant will be called the Riviera Beach Next Generation Clean Energy Center (RBEC). These modernizations were approved by the FPSC in September 2008. The site certification application for Cape Canaveral was granted in October 2009. The site certification application for Riviera Beach was granted in November 2009.

- Similar to the two modernization projects mentioned above, the four existing steam units at the Port Everglades site will be removed and replaced with a new highly efficient CC unit. This unit, called the Port Everglades Next Generation Clean Energy Center (PEEC), is projected to be in-service in mid-2016 and is projected to have a peak Summer output of 1,277 MW. The FPSC voted to approve this modernization project on March 27, 2012. The site certification process is underway.
- FPL will be adding approximately 490 MW of generating capacity at its existing nuclear power plants at the Turkey Point and St. Lucie sites. 31 MW of this increased capacity has already been added at St. Lucie Unit 2 and this additional nuclear capacity is already benefiting FPL's customers. The remaining increased capacity is scheduled to come in-service in the 2012 – 2013 time period. These capacity uprates were approved by the FPSC in January 2008. The Final Order for the Site Certification was issued in September 2008 for the St. Lucie uprates and in October 2008 for the Turkey Point uprates.
- In the fourth quarter of 2011, FPL started upgrading the 7FA combustion turbines (CT) that are components of several of its CC units. These upgrades will economically benefit FPL's customers by increasing the MW output of these CC units by approximately 228 MW (Summer peak value) in total. As reflected in Schedule 1, 26 MW of the increased capacity from these CT upgrades is already in service at Martin 8. The remaining upgrades are projected to be completed during the 2012 through 2015 time period.

These new generating units and generating capacity additions were selected for a variety of reasons including cost-effectiveness, significant system fuel savings, fuel diversity, mitigation of regional generation/load imbalances, and significant system emission reductions, including greenhouse gas emission reductions.

The second of these assumptions involves firm capacity power purchases. FPL's current projection of firm capacity purchases has changed from the projection in the 2011 Site Plan. FPL has three additional short-term purchases for the year 2012 only. These purchases consist of a 125 MW agreement with TECO and two purchases totaling 305 MW from CT facilities in DeSoto County. FPL's current projection also includes an additional 70 MW from the Palm Beach Solid Waste Authority (SWA) starting in year 2016. However, the total projected incremental capacity from Palm Beach SWA has decreased by 35 MW compared to the 2011 Site Plan projection. Also, FPL now projects that its purchase agreement with Jacksonville Electric Authority (JEA) for St. Johns Regional Power Park (SJRPP)-based capacity and energy will allow FPL to continue to receive purchased capacity and energy until the Spring of 2017. At that time, FPL projects that Internal Revenue Service (IRS) regulations regarding the amount of energy that FPL can receive will result in the suspension of any further capacity and energy by FPL.[5]

In total, the projected firm capacity purchases are from a combination of utility and independent power producers. Details, including the annual total capacity values for these purchases, are presented in Chapter I in Tables I.B.1 and I.B.2. These purchased capacity amounts were incorporated in FPL's resource planning work.

The third of these assumptions involves a projection of the amount of additional DSM that is anticipated to be implemented annually over the ten-year period. Since 1994, FPL's resource planning work has assumed that, at a minimum, the DSM MW called for in FPL's approved DSM Plan will be achieved. The resource plan presented in FPL's 2012 Site Plan fully accounts for the DSM Plan direction provided by the FPSC in 2011.

These key assumptions, plus the other updated information described above, are then applied in the first fundamental step: the determination of the magnitude and the timing of FPL's future resource needs. This determination is accomplished by system reliability analyses which for FPL are currently based on dual planning criteria of a minimum peak period reserve margin of 20% (FPL applies this to both Summer and Winter peaks) and a maximum loss-of-load probability (LOLP) of 0.1 day per year. Both of these criteria are commonly used throughout the utility industry.

[5] FPL's projected suspension date for the SJRPP purchase is based on a system reliability perspective; i.e., the earliest projected date at which the suspension of capacity and energy could occur.

Historically, two types of methodologies, deterministic and probabilistic, have been utilized in system reliability analysis. The calculation of excess firm capacity at the annual system peaks (reserve margin) is the most common method, and this relatively simple deterministic calculation can be performed on a spreadsheet. It provides an indication of the adequacy of a generating system's capacity resources compared to its load during peak periods. However, deterministic methods do not take into account probabilistic-related elements such as the impact of individual unit failures. For example: two 50 MW units which can be counted on to run 90% of the time are more valuable in regard to utility system reliability than is one 100 MW unit which can also be counted on to run 90% of the time. Probabilistic methods also recognize the value of being part of an interconnected system with access to multiple capacity sources.

For this reason, probabilistic methodologies have been used to provide an additional perspective on the reliability of a generating system. There are a number of probabilistic methods that are being used to perform system reliability analyses. Among the most widely used is loss-of-load probability (LOLP) which FPL utilizes. Simply stated, LOLP is an index of how well a generating system may be able to meet its demand (i.e., a measure of how often load may exceed available resources). In contrast to reserve margin, the calculation of LOLP looks at the daily peak demands for each year, while taking into consideration such probabilistic events as the unavailability of individual generators due to scheduled maintenance or forced outages.

LOLP is expressed in units of the "number of times per year" that the system demand could not be served. The standard for LOLP accepted throughout the industry is a maximum of 0.1 day per year. This analysis requires a more complicated calculation methodology than does the reserve margin analysis. LOLP analyses are typically carried out using computer software models such as the Tie Line Assistance and Generation Reliability (TIGER) program used by FPL.

The result of the first fundamental step of resource planning is a projection of how many new MW of resources are needed to meet both reserve margin and LOLP criteria, and thus maintain system reliability, and when the MW are needed. Information regarding the timing and magnitude of these resource needs is then used in the second fundamental step: identifying resource options and resource plans that can meet the determined magnitude and timing of FPL's resource needs.

Step 2: Identify Resource Options and Plans That Can Meet the Determined Magnitude and Timing of FPL's Resource Needs:

The initial activities associated with this second fundamental step of resource planning generally proceed concurrently with the activities associated with Step 1. During Step 2, preliminary economic screening analyses of new capacity options that are very similar in regard to certain key characteristics may be conducted to determine which new capacity options appear to be the most competitive on FPL's system. This preliminary analysis work can also help identify capacity size (MW) values, projected construction/permitting schedules, and operating parameters and costs. Similarly, preliminary economic screening analyses of new DSM options and/or continued growth in existing DSM options are often conducted.

FPL typically utilizes the P-MArea production cost model and a Fixed Cost Spreadsheet, and/or the Strategist model, as well as spreadsheet analyses, to perform the preliminary economic screening of generation resource options. For the preliminary economic screening analyses of DSM resource options, FPL typically uses its DSM cost-effectiveness model which is an FPL spreadsheet model utilizing the FPSC's approved methodology for performing preliminary cost-effectiveness screening of individual DSM measures and programs. FPL also utilizes its non-linear programming model for analyzing the potential for lowering system peak loads through additional load management/demand response capability. Then FPL typically utilizes its linear programming model to develop DSM portfolios that are subsequently used in developing resource plans for final system analyses of DSM-based resource plans.

The individual new resource options emerging from these preliminary economic screening analyses are then typically "packaged" into different resource plans which are designed to meet the system reliability criteria. In other words, resource plans are created by combining individual resource options so that the timing and magnitude of FPL's projected new resource needs are met. The creation of these competing resource plans is typically carried out using spreadsheet and/or dynamic programming techniques.

At the conclusion of the second fundamental resource planning step, a number of different combinations of new resource options (i.e., resource plans) of a magnitude and timing necessary to meet FPL's resource needs are identified.

Step 3: Evaluate the Competing Options and Resource Plans in Regard to System Economics and Non-Economic Factors:

At the completion of fundamental steps 1 & 2, the most viable new resource options have been identified, and these resource options have been combined into a number of resource plans which meet the magnitude and timing of FPL's resource needs. The stage is set for evaluating these resource options and resource plans in final, or system, economic analyses that attempt to account for all of the impacts to the FPL system from the competing resource options/resource plans. (These system impacts are typically not accounted for in preliminary economic screening analyses.) In FPL's 2011 and early 2012 resource planning work, once the resource plans were developed, FPL utilized the P-MArea production cost model and a Fixed Cost Spreadsheet, and/or the Strategist model, to perform the system economic analyses.

The basic economic analyses of the competing resource plans focus on total system economics. The standard basis for comparing the economics of competing resource plans is their relative impact on FPL's electricity rate levels, with the objective generally being to minimize FPL's projected levelized system average electric rate (i.e., a Rate Impact Measure or RIM methodology). In cases in which the DSM contribution was assumed as a given and the only competing options were new generating units and/or purchase options, comparisons of competing resource plans' impacts on electricity rates and on system revenue requirements will yield identical outcomes in regard to the relative rankings of the resource options being evaluated. Consequently, the competing options and plans in such cases were evaluated on a cumulative present value revenue requirement (CPVRR) basis.

Other factors are also included in FPL's evaluation of resource options and resource plans. While these factors may have an economic component or impact, they are often discussed in quantitative, but non-economic terms, such as percentages, tons, etc. rather than in terms of dollars. These factors are often referred to by FPL as "system concerns" that include (but are not necessarily limited to) maintaining/enhancing fuel diversity in the FPL system, system emission levels, and maintaining a regional balance between load and generating capacity, particularly in the Southeastern Florida counties of Miami-Dade and Broward. In conducting the evaluations needed to determine which resource options and resource plans are best for FPL's system, the non-economic evaluations are conducted with an eye to whether the system concern is positively or negatively impacted by a given resource option or resource plan.

Step 4: Finalizing FPL's Current Resource Plan

The results of the previous three fundamental steps are typically used to develop the current resource plan. This plan is presented in the following section.

III.B Projected Incremental Resource Additions/Changes

FPL's projected incremental generation capacity additions/changes for 2012 through 2021 are depicted in Table III.B.1. These capacity additions/changes result from a variety of actions that primarily consist of: (i) changes to existing units (which are frequently achieved as a result of plant component replacements during major overhauls), (ii) increases in generating capacity at FPL's four existing nuclear units, (iii) the temporary return of certain generating units from Inactive Reserve status to active service, then returning these units to Inactive Reserve status, (iv) changes in the amounts of purchased power being delivered under existing contracts as per the contract schedules or by entering into new purchase contracts, (v) the modernizations of FPL's existing Cape Canaveral, Riviera, and Port Everglades sites by the removal of the steam generating units that were previously, or are currently, on the sites and the addition of one new, very fuel-efficient CC generating unit at each site, and (vi) upgrades to the CTs at a number of existing combined cycle plants.

Although the DSM additions that are consistent with the FPSC's directions regarding FPL's DSM Plan are not explicitly presented in this table, these DSM additions have been fully accounted for in all of FPL's resource planning work reflected in this document. The DSM Plan projects annual DSM additions through 2019. For planning purposes, FPL currently projects an additional 100 MW (Summer) of DSM per year for the subsequent two years (2020 and 2021) addressed in this document. In addition, the projected MW reductions from these DSM additions are reflected in the projected reserve margin values shown in the table below and in Schedules 7.1 and 7.2 presented later in this chapter. (Subsequent analyses will ultimately determine the actual levels of DSM that should be implemented in these later years.)

Table III.B.1: Projected Capacity Changes for FPL

Year	Projected Capacity Changes	Net Capacity Changes (MW) Winter [1]	Summer [2]
2012	Sanford Unit 5 CT Upgrade	---	19
	St. Lucie Unit 1 Uprate - Outage [5]	(853)	---
	St. Lucie Unit 1 Uprates - Completed	---	129
	Turkey Point Unit 3 Uprates - Completed	---	123
	St. Lucie Unit 2 Uprate - Outage [5]	---	(745)
	Changes to Existing Purchases [3]	375	470
	Scherer Unit 4	---	(30)
	Manatee Unit 2	---	(3)
	Inactive Reserve Units (PE Units 3 & 4) -return to active status [7]	765	761
	Manatee Unit 2 ESP - Outage [6]	(822)	---
2013	Cape Canaveral Next Generation Clean Energy Center [4]	---	1,210
	Changes to Existing Purchases [3]	(555)	(430)
	Manatee Unit 2	(3)	---
	Sanford Unit 5 CT Upgrade	19	9
	Martin Unit 8 CT Upgrade	10	10
	Sanford Unit 4 CT Upgrade	22	31
	Scherer Unit 4	(28)	---
	St. Lucie Unit 1 Uprates - Completed	129	---
	St. Lucie Unit 2 Uprates - Completed	84	84
	Turkey Point Unit 3 Uprates - Completed	123	---
	Turkey Point Unit 4 Uprates - Completed	---	123
	Turkey Point Unit 4 Uprates - Outage [5]	(717)	---
	Inactive Reserve Unit (PE Units 3 & 4) - return to inactive status [7]	(765)	(761)
	Manatee Unit 1 ESP - Outage [6]	(822)	---
	Martin Unit 1 ESP - Outage [6]	---	(826)
2014	Cape Canaveral Next Generation Clean Energy Center [4]	1,355	---
	Sanford Unit 4 CT Upgrade	16	---
	Sanford Unit 5 CT Upgrade	19	10
	Manatee Unit 3 CT Upgrade	---	19
	Turkey Point Unit 5 CT Upgrade	---	33
	Turkey Point Unit 4 Uprates - Completed	123	---
	Martin Unit 1 ESP - Outage [6]	(832)	---
	Martin Unit 2 ESP - Outage [6]	---	(826)
	Riviera Beach Next Generation Clean Energy Center [4]	---	1,212
2015	Manatee Unit 3 CT Upgrade	39	20
	Turkey Point Unit 5 CT Upgrade	33	---
	Ft. Myers Unit 2 CT Upgrade	---	51
	Riviera Beach Next Generation Clean Energy Center [4]	1,344	---
2016	Changes to Existing Purchases [3]	(858)	(858)
	Ft. Myers Unit 2 CT Upgrade	51	---
	Turkey Point Unit 1 operation changed to synchronous condenser	---	(396)
	Port Everglades Next Generation Clean Energy Center [4]	---	1,277
2017	Changes to Existing Purchases [3]	---	(375)
	Turkey Point Unit 1 operation changed to synchronous condenser	(398)	---
	Port Everglades Next Generation Clean Energy Center [4]	1,429	---
2018	Changes to Existing Purchases [3]	(383)	---
2019	---	---	---
2020	---	---	---
2021	Short Term Purchase	---	250

(1) Winter values are forecasted values for January of the year shown.
(2) Summer values are forecasted values for August of the year shown.
(3) These are firm capacity and energy contracts with QF, utilities, and other entities. See Table I.B.1 and Table I.B.2 for more details.
(4) All new unit additions are scheduled to be in-service in June of the year shown. All additions assumed to start in June are included in the Summer reserve margin calculation starting in that year and in the Winter reserve margin calculation starting with the next year.
(5) Outages for uprate work.
(6) Outages for ESP work.
(7) A number of existing FPL power plants have been removed from service and placed on Inactive Reserve status. See Chapter III for a discussion of the units on Inactive Reserves.

III.C Discussion of the Projected Resource Plan and Issues Impacting FPL's Resource Planning Work

As indicated in the Executive Summary, FPL's resource planning efforts in 2011 and early 2012 were influenced by a number of factors. Furthermore, these factors are expected to continue to influence FPL's resource planning work for the foreseeable future. There are 5 such factors that are of primary importance:

1) Maintaining/enhancing fuel diversity in the FPL system;
2) Maintaining a balance between load and generating capacity in Southeastern Florida, particularly in Miami-Dade and Broward Counties;
3) Growing dependence upon DSM resources to maintain FPL system reliability;
4) Securing additional natural gas (and doing so in a manner that enhances the reliability of the natural gas supply system); and,
5) Possible establishment of "Clean Energy Standards" or another mechanism to promote large scale utilization of renewable energy.

These 5 factors, and their various impacts on FPL's resource planning efforts including the current resource plan that is presented in this Site Plan, are briefly discussed below.

1. **Maintaining/Enhancing System Fuel Diversity;**

FPL is currently dependent upon using natural gas to generate more than half of the electricity it delivers to its customers. In the future, the percentage of FPL's electricity that is generated by natural gas is projected to increase. Therefore, FPL is continually seeking opportunities to maintain and enhance the fuel diversity of its system.

In 2007, following express direction by the Commission to do so, FPL sought approval from the FPSC to add two new advanced technology coal units to its system. These two new units would have been placed in-service in 2013 and 2014. However, in part due to concerns over potential greenhouse gas emission legislation/regulation, FPL was unable to obtain approval for these units. Several other factors are currently unfavorable to new coal units compared to new CC units. The first of these factors is a significant reduction in the fuel cost difference between coal and natural gas compared to the fuel cost difference projected in 2007 that favored coal; i.e., the projected cost advantage of coal versus natural gas has been significantly reduced. Second is the continuation of significantly higher capital cost for coal units compared to capital cost for CC units. Third is the increased fuel efficiency of new CC units compared to projected CC unit efficiencies in 2007. Fourth are the stricter non-greenhouse gas environmental regulations that are more unfavorable to new coal units than to new CC units. Consequently, FPL does not believe that new advanced technology coal units are currently economically, politically, or environmentally viable fuel diversity enhancement options in Florida.

Therefore, FPL has turned its attention to nuclear energy and renewable energy to enhance its fuel diversity and to using natural gas more efficiently. In regard to nuclear energy, FPL previously obtained approval to increase capacity at each of its four existing nuclear units. In total, these capacity uprates will add approximately 490 MW of nuclear capacity and energy for FPL's customers. 31 MW of increased nuclear capacity from the uprates have been achieved at St. Lucie Unit 2 and this increased nuclear capacity is already benefiting FPL's customers. The remaining increased nuclear capacity from the uprates project is scheduled to come on-line during 2012 through early 2013. In 2008, the FPSC approved the need for these uprates and authorized FPL to recover uprates-related expenditures that are approved as a result of annual nuclear cost recovery filings.

FPL is continuing its work to obtain all of the licenses, permits, and approvals that would be necessary to construct and operate two new nuclear units at its Turkey Point site in the future. These licenses, permits, and approvals will provide FPL with the opportunity to construct these nuclear units at Turkey Point for a commercial operations date expected to be up to 20 years from the time the licenses and permits are granted, and then to operate the units for at least 40 years thereafter. The earliest practical deployment dates for the two new units continue to be beyond the 10-year reporting period for this Site Plan. Therefore, these units are not shown in this document.

FPL also has been involved in activities to investigate adding or maintaining renewable resources as a part of its generation supply. One of these activities is a variety of discussions with the owners of existing facilities aimed at maintaining or extending current agreements that are scheduled to end during the ten-year reporting period of this document. FPL also sought and received approval from the FPSC in 2008 to add 110 MW through three new FPL-owned solar facilities: one solar thermal facility and two photovoltaic (PV) facilities. One 25 MW PV facility began commercial operation in 2009. The remaining two solar facilities, a 10 MW PV facility and a 75 MW solar thermal steam generating facility, began commercial operation in 2010. The addition of these renewable energy facilities was made possible due to enabling legislation from the Florida Legislature in 2008. FPL remains strongly supportive of Federal and/or State legislation that enables electric utilities to add renewable energy resources and authorize the utilities to recover appropriate costs for these resources.

In regard to using natural gas more efficiently, FPL received approvals in 2008 from the FPSC to modernize the existing Cape Canaveral and Riviera plant sites with new, highly efficient CC units that replace the former steam generating units on each of those sites. The modernizations of Cape Canaveral and Riviera are currently underway and are projected to go in-service on time in mid-2013 and mid-2014, respectively. On March 27, 2012, FPL received FPSC approval to proceed with a similar modernization project at the Port Everglades site which is scheduled for completion in mid-2016. The modernization of Port Everglades will retain the capability of receiving water-borne delivery of oil as a backup fuel.

In the future, FPL will continue to identify and evaluate alternatives that may maintain or enhance system fuel diversity. Moreover, FPL is also maintaining the ability to utilize fuel oil at existing units that have that capability. FPL is in the process of installing electrostatic precipitators (ESPs) at its four 800 MW steam generating units at the Martin and Manatee sites which will enable FPL to retain the ability to burn oil, as needed, at these sites while retaining the flexibility to use natural gas when economically attractive. Furthermore, FPL continues to evaluate the potential for greater diversity in the delivery of natural gas through a new, third natural gas pipeline. A third pipeline would result in a more reliable, and more economic and more diverse, natural gas supply for FPL's customers and the state of Florida.

2. **Maintaining a Balance Between Load and Generation in Southeastern Florida:**

   In recent years, an imbalance was projected to develop between regionally installed generation and regional peak load in Southeastern Florida. With such an imbalance, a significant amount of energy required in the Southeastern Florida region during peak periods would need to be provided either by operating less efficient generating units located in Southeastern Florida out of economic dispatch, or by importing the energy through the transmission system from plants located outside the region. FPL's prior planning work concluded that either additional installed generating capacity in this region, or additional installed transmission capacity capable of delivering more electricity from outside the region, would be required to address this imbalance.

Partly because of the lower transmission-related costs resulting from their location, four recent capacity addition decisions (Turkey Point Unit 5 and WCEC Units 1, 2, & 3) were determined to be the most cost-effective options to meet FPL's capacity needs in the near-term. In addition, FPL will be adding increased capacity at FPL's existing two nuclear units at Turkey Point in 2012 and 2013. The recently approved Port Everglades modernization project scheduled for completion in 2016 will also significantly aid in mitigating this imbalance. Adding this additional generation capacity contributes to addressing the imbalance between generation and load in Southeastern Florida for the approximately the remainder of this decade.

The planned two new nuclear units at FPL's Turkey Point site will also address the imbalance issue for an additional period of time. Due to steadily increasing load in the Southeastern region, the Southeastern Florida imbalance issue will remain an important consideration in FPL's on-going resource planning work in future years.

3. Growing Dependence Upon DSM Resources to Maintain System Reliability:

In late 2009, the FPSC imposed significantly higher DSM Goals than had been deemed appropriate in previous DSM Goals dockets. The FPSC's 2011 DSM Plan decision lowered these required levels of DSM, but only by a relatively small amount.

As a result, FPL is projected to become increasingly dependent upon DSM resources, instead of generation resources, to maintain system reliability. Schedules 7.3 and 7.4 demonstrate this point. These schedules are presented in the back portion of this chapter. Both of these schedules use Schedule 7.1, which presents FPL's projected Summer reserve margins, as a starting point.

In Schedule 7.3, Column (14), FPL projects what a "generation-only" reserve margin would be for each year in the 10-year reporting period, after accounting for all approved generation additions through 2016, by making two changes in Schedule 7.1. First, the projected DSM values in Column (8) have been zeroed out to remove the projected contribution from DSM. Second, the projected addition of a 250 MW short-term power purchase in 2021 has been removed. These two changes result in a projection of reserve margins that are based solely on generation resources that currently exist or which have been approved by the FPSC.

The result is a projected generation-only reserve margin in the range of approximately 16% to 13% through 2016, but which decreases steadily thereafter to 4.5% by 2021.

In Schedule 7.4, the projected addition of the projected 2021 PPA has been added back in as reflected by the values in Column (1). The projected generation-only reserve margin for the year 2021 now increases, but only to 5.5%. Although marginally higher than the 4.5% value for 2021 projected in Schedule 7.3, the 5.5% value is also considerably lower than the 16% to 13% range for the years 2012 through 2016. In the years from 2017 through 2020, the projected generation-only reserve margin steadily decreases to less than 6.5% by 2020 and under 6% by 2021.

Therefore, FPL's projected system reserves, already dependent to a significant degree upon DSM resources, are becoming increasingly more dependent upon DSM. Stated another way, the FPL system's ability to continue to provide reliable electricity service to FPL's customers is becoming increasingly dependent upon DSM. FPL currently believes that generation-only reserves at these projected low levels may not be adequate, and FPL will continue to evaluate the appropriateness of a minimum generation-only requirement as part of its on-going resource planning work.

4. **Securing Additional Natural Gas:**

The recent trend of increasing reliance upon natural gas to produce electricity for FPL's customers is projected to continue due to FPL's growing load. The addition of the highly fuel-efficient Cape Canaveral, Riviera, and Port Everglades modernizations will serve to reduce the growth in natural gas use from what it otherwise might have been due to the high fuel-efficiency levels of these new CC units, but these efficiencies do not offset the effects of FPL's growing load. Therefore, FPL will need to secure more natural gas supply and more gas transportation capacity. The issue is how to secure these additional natural gas resources in a manner that is economical for FPL's customers and which maintains and/or enhances the reliability of natural gas supply and deliverability to FPL's generating units.

FPL has historically purchased the gas transportation capacity required for new natural gas supply from two existing natural gas pipeline companies. As more natural gas is delivered through two pipelines entering Florida, the impact of a supply disruption on either pipeline becomes more problematic. Therefore, FPL sought approval in 2009 from the FPSC for the construction of a new, third natural gas pipeline into Florida capable of serving future gas-fired generation needs for FPL and others in the state. Such a third pipeline was projected to have benefits for FPL and its customers by increasing the diversity of FPL's fuel supply sources, increasing the physical reliability of the pipeline delivery system, and enhancing competition among pipelines. However, the application for an FPL-owned pipeline was denied by the FPSC in 2009. FPL is continuing to evaluate alternatives to increase the diversity of natural gas deliveries in order to meet the future gas requirements of FPL and the State of Florida.

5. **Possible Establishment of "Clean Energy Standards":**

At the time this document is being prepared, neither the United States nor the State of Florida has established a "Clean Energy Standard" which would require that a certain amount of energy be supplied by "clean" energy sources. A similar "Renewable Portfolio Standard" proposal was prepared by the FPSC and sent to the Florida Legislature for their consideration, including an option to change the standard to a Clean Energy Standard, during the 2009 legislative session. However, no such legislation was enacted during the 2009 session or in subsequent legislative sessions. Such legislation, or other legislative initiatives regarding clean energy contributions, may occur in the future. If such legislation is enacted in a future year, FPL will then determine what steps need to be taken to comply with the legislation. Such steps would then be discussed in FPL's Site Plan in the year following the enactment of such legislation.

III.D Demand Side Management (DSM)

During 2011 and early 2012, FPL offered the following DSM programs to its customers:

Residential DSM Programs

1. **Residential Building Envelope:** Offers rebates to residential customers to install energy-efficient reflective roof and ceiling insulation measures.

2. **Duct System Testing and Repair:** Provides reduced cost duct system testing to identify leaks in air conditioning duct systems, and encourages the repair of those leaks by qualified contractors. Rebates are offered for duct system repair.

3. **Residential Air Conditioning:** Offers rebates to customers to purchase higher efficiency air conditioning and heating equipment. The program includes additional rebates for plenum repair measure and air handler units with electronically commutated motors.

4. **Residential Load Management (On Call Program):** Offers load control of major appliances/household equipment in exchange for monthly electric bill credits. Direct load control equipment is installed on selected customer end-use equipment allowing FPL to control these customer loads as needed. Qualifying equipment includes central electric air conditioners, central electric heaters, conventional electric water heaters, and swimming pool pumps.

5. **Residential New Construction (BuildSmart):** Encourages the design and construction of energy-efficient homes by offering education to contractors on energy efficiency measures, and providing construction design reviews and home inspections.

6. **Residential Low Income Weatherization:** Combines energy audits and incentives to encourage low income housing administrators to retrofit homes with energy efficiency measures. The housing authorities include: weatherization agency providers (WAPS), non-weatherization agency providers (non-WAPS), and other providers approved by FPL. The rebates are used by these providers to leverage their funds to increase the overall energy efficiency of the homes they are retrofitting. FPL offers rebates for HVAC maintenance, reduced air infiltration measures, and room air conditioning replacement.

7. **Residential Conservation Service:** Offers a walk-through energy audit, a computer-generated Class A audit, and a customer-assisted energy audit. For customer-assisted energy audits, mail-in, phone, and Internet audit options are available. (Note that FPL does not count demand and energy savings from this program towards its DSM Goals.)

Business DSM Programs

1. **Business Heating, Ventilating, and Air Conditioning (HVAC):** Offers business customers financial rebates to upgrade to higher efficiency HVAC equipment that

exceed the minimum efficiencies mandated by the U.S. Department of Energy. The current FPL program includes rebates for: 1) thermal storage; 2) chillers; 3) energy recovery ventilator units; 4) direct expansion (DX) units and efficient air conditioning room units; 5) demand control ventilation systems including kitchen hood control; and 6) electrically commutated motors for air conditioning systems.

2. **Business Efficient Lighting:** Offers business customers financial rebates to install high efficiency lighting measures at the time of replacement. FPL's program addresses linear fluorescent, plus other, efficient lighting technologies.

3. **Business Building Envelope:** Offers financial rebates to customers to install high efficiency building envelope measures such as roof/ceiling insulation, reflective roof coatings, and window treatments.

4. **Business Custom Incentive:** Serves as a "catch-all" program for customer-specific cost-effective efficiency measures which are not included in other FPL programs. DSM measures must reduce or shift at least 25 kW during peak hours, have verifiable demand and energy savings, and pass FPL's preliminary cost-effectiveness screening testing.

5. **Business On Call:** Offers load control of central air conditioning units to both small non–demand-billed, and medium demand-billed, customers in exchange for monthly electric bill credits.

6. **Commercial Industrial Demand Reduction (CDR):** Reduces peak demand by allowing the direct control of customer loads of 200 kW or greater during periods of extreme demand or capacity shortages. Participants contract for a firm demand level which may not be exceeded during load control periods. In return, participants receive a monthly credit. Participants must provide a 5-year termination notice to discontinue service under this program.

7. **Business Energy Evaluation:** Offers free standard level energy evaluations on-site and on-line. More detailed evaluations are available through this audit program with costs shared between FPL and the participating customer. Participation in FPL's other business DSM programs is promoted through this program. (Note that FPL does not count demand or energy savings from this program towards its DSM Goals.)

8. **Commercial/Industrial Load Control:** Reduces peak demand by controlling customer loads of 200 kW or greater during periods of extreme demand or capacity

shortages in exchange for monthly electric bill credits. (This program has been closed to new participants since the year 2000).

9. **Business Water Heating:** Encourages the installation of energy-efficient heat recovery units or heat pump water heaters.

10. **Business Refrigeration:** Encourages the installation of controls and equipment to reduce the usage of electric strip heat for defrosting purposes.

11. **Cogeneration and Small Power Production:** Facilitates FPL compliance with all regulatory requirements concerning qualifying facilities and small power producers. One role of the program is to assist customers in the evaluation of potential cogeneration projects, including self-generation. (Note that FPL does not count demand or energy savings from this program towards its DSM Goals.)

DSM Research and Development:

FPL's Conservation Research and Development (CRD) Program is an umbrella research project under which new DSM technologies are analyzed. Several FPL DSM programs have emerged from the CRD program including the business Building Envelope, Business On Call, and Residential New Construction programs. The program has also resulted in the addition of cost-effective measures to existing programs, such as the proposed inclusion of Energy Recovery Ventilators to the Business HVAC Program. FPL operates the CRD program based on DSM Plan approval, or for 6 years, whichever occurs first, with a spending cap as approved in the most current DSM Plan.

In summary regarding FPL's DSM efforts, FPL has sought out and implemented cost-effective DSM programs since 1978. These programs include both conservation initiatives and load management. FPL's DSM efforts through 2011 have resulted in a cumulative Summer peak reduction of approximately 4,513 MW (Summer) at the generator and an estimated cumulative energy saving of approximately 59,890 Gigawatt Hour (GWh) at the generator. After accounting for reserve margin requirements, FPL's DSM efforts through 2011 have eliminated the need to construct the equivalent of more than 13 new 400 MW generating units.

The FPSC in late 2009 imposed significantly higher DSM Goals for FPL for 2010 – 2019 than were deemed appropriate in prior DSM Goals dockets. The DSM Goals recently imposed by the FPSC have three components: Summer MW reductions, Winter MW reductions, and GWh reductions. The Summer MW component, and to a much lesser degree the Winter MW reduction component, impacts FPL's need for future resources such as those discussed in this document. The GWh reduction component has no impact on FPL's need for future resources.

In 2011, based on concerns over the projected higher electric rates that would occur if a new DSM Plan to meet the new DSM Goals were implemented, the FPSC determined in the DSM Plan docket that FPL should continue to implement the specific DSM programs, that FPL was implementing at that time (FPSC Order PSC-11-0590-FOF-EG). The projected demand reduction impact of these DSM programs from 2012 through 2019 (plus an assumed additional 100 MW per calendar year for 2020 and 2021) is presented below in Table III.D.1. (Subsequent analyses will ultimately determine the actual levels of DSM that should be added in these later years.)

Table III.D.1: FPL's Projected DSM Summer MW Reduction for 2012 - 2021

August MW values (at the Generator)

Year	Cumulative Summer MW DSM Goals for FPL (at Generator)
2012	136
2013	259
2014	422
2015	553
2016	685
2017	816
2018	947
2019	1079
2020	1188
2021	1288

FPL has consistently been among the leading utilities nationally in DSM achievement. For example, according to the U.S. Department of Energy's 2010 data (the last year for which the DOE data was available at the time this Site Plan is being developed), FPL ranked # 2 nationally in cumulative DSM demand reduction. And, importantly, FPL has achieved these significant DSM accomplishments while seeking to lessen the DSM-based impact on electric rates for all of its customers.

In regard to DSM, FPL's intent is to follow the FPSC's directions regarding DSM implementation and to continue its national leadership role in DSM consistent with efforts both to continue to lessen the DSM-based impact on electric rates for all of FPL's customers, and to ensure that FPL's system reliability does not become too dependent upon DSM resources.

III.E Transmission Plan

The transmission plan will allow for the reliable delivery of the required capacity and energy to FPL's retail and wholesale customers. The following table presents FPL's proposed future additions of 230 kV bulk transmission lines that must be certified under the Transmission Line Siting Act.

Table III.E.1: List of Proposed Power Lines

(1) Line Ownership	(2) Terminals (To)	(3) Terminals (From)	(4) Line Length CKT. Miles	(5) Commercial In-Service Date (Mo/Yr)	(6) Nominal Voltage (KV)	(7) Capacity (MVA)
FPL	St. Johns 1/	Pringle	25	Dec - 16	230	759
FPL	Manatee 2/	Bob White	30	Dec - 14	230	1195

1/ Final order certifying the corridor was issued on April 21, 2006. This project is to be completed in two phases. Phase I consisted of 4 miles of new 230 kV line (Pringle to Pellicer) and was completed in May-2009. Phase II consists of 21 miles of new 230 kV line (St. Johns to Pellicer) and is scheduled to be completed by Dec-2016.

2/ Final order certifying the corridor was issued on November 6, 2008. This project consists of 30 miles of new 230 kV line (Manatee to Bob White) and is scheduled to be completed by Dec-2014

In addition, there will be transmission facilities needed to connect several of FPL's projected generating capacity additions to the system transmission grid. These transmission facilities (described on the following pages) are for the capacity increases (uprates) at the existing St. Lucie and Turkey Point nuclear sites, and the generating capacity additions with the Cape Canaveral, Riviera Beach and Port Everglades modernizations.

In regard to the existing generating units that have been placed on Inactive Reserve status and/or which will be retired in late 2012, there are no projected impacts to FPL's transmission system from these units.

III.E.1 Transmission Facilities for St. Lucie Units 1 & 2 Capacity Uprates

The work required to address the St. Lucie Units 1 & 2 uprates in 2012 in regard to the FPL grid consists of the following:

I. Substation:

1. At Midway Substation, replace eleven 230 kV disconnect switches, and remove six wave traps. Also upgrade associated jumpers, bus work and equipment connections.
2. At St. Lucie Switchyard, replace eighteen 230 kV disconnect switches and remove six wave traps.
3. Uprate the Unit 1A and 1B main step-up transformers to 635 MVA. Unit 1B main step-up transformer is to be replaced by the uprated spare main step-up transformer. Existing Unit 1B main step-up transformer is to become the new station spare
4. Uprate the spare main step-up transformer to 635 MVA to replace Unit 2A main step-up transformer.
5. Replace the Unit 2A and Unit 2B main step-up transformer with a new one rated at 635 MVA.
6. Add fiber optic relays and other protective equipment.

II. Transmission:

1. Upgrade the three existing St. Lucie-Midway 230 kV lines with spacers between the conductors to achieve a normal (continuous) rating of 2790 Amperes.
2. Replace one existing overhead ground wire on each of the three existing St. Lucie Midway 230 kV line with fiber optic overhead ground wire for protective relay communication.

III.E.2 Transmission Facilities for Turkey Point Units 3 & 4 Capacity Uprates

The work required to address the Turkey Point Units 3 & 4 uprates in 2012 for Unit 3 and in 2012-2013 for Unit 4, in regard to the FPL grid consists of the following:

I. Substation:

1. At Turkey Point Switchyard, install two 5-Ohm series phase inductors combined with external shunt capacitors on the southeast and southwest 230 kV operating busses.
2. At Turkey Point Switchyard, replace twelve 230 kV disconnect switches. Also upgrade associated jumpers, bus work and equipment connections.
3. Uprate the Unit 3 and Unit 4 main step-up transformers to 970 MVA.
4. Replace spare main step-up transformer with 1028 MVA transformer.
5. Add relays and other protective equipment.
6. Replace breaker failure panels at Davis Substation.
7. Replace breaker failure panels at Flagami Substation.

II. Transmission:

1. Upgrade the existing string busses for both Units 3 & 4 between the main step-up transformers and the switchyard with spacers between the conductors.

III.E.3 Transmission Facilities for Cape Canaveral Next Generation Clean Energy Center (Modernization)

The work required to connect the Cape Canaveral Next Generation Clean Energy Center in 2013 to the FPL grid is projected to be as follows:

I. Substation:

1. Build new collector yard containing two collector busses with four breakers to connect the three combustion turbines (CT), and one steam turbine (ST).
2. Construct two string busses to connect the collector busses to Cape Canaveral 230 kV Substation.
3. Add four main step-up transformers (3-370 MVA, 1- 580 MVA), one for each CT, and one for the ST.
4. At Cape Canaveral Switchyard replace eight 230 kV disconnect switches. Also upgrade associated jumpers, bus work and equipment connections.
5. Expand switchyard relay vault and add relays and other protective equipment.

II. Transmission:

1. Relocate the Cape Canaveral-Grissom 115 kV line.

III.E.4 Transmission Facilities for Riviera Beach Next Generation Clean Energy Center (Modernization)

The work required to connect the Riviera Beach Next Generation Clean Energy Center in 2014 to the FPL grid is projected to be as follows:

I. Substation:

1. Expand the Riviera 230 kV Switchyard five breakers to accommodate terminals for one combustion turbine (CT), and one steam turbine (ST).
2. Construct a new 138 kV Riviera Switchyard - five bays, 14 breakers with terminals to connect two CT units and seven 138 kV lines.
3. Add four main step-up transformers (3-370 MVA, 1- 580 MVA), one for each CT, and one for the ST.
4. Add relays and other protective equipment.
5. At Ranch Substation, add a new 230 kV bay 5 and upgrade bay 4 to 3000 Amperes.
6. Breaker replacements:
   Ranch Substation – Replace one 230 kV breaker
   Broward Substation – Replace one 230 kV breaker

II. Transmission:

1. Break the Indiantown-Riviera 230 kV and extend each of the line segments south (approx. 4 miles) to connect to the Ranch 230 kV Substation forming Indiantown-Ranch and a Ranch-Riviera 230 kV circuits.
2. Remove Corbett-Ranch #2 230 kV line at Ranch and:
   a. extend to meet the Cedar-Lauderdale 230 kV line N/S corridor (approx. 10 miles).
3. Break Cedar-Corbett 230 kV (near Ranch Sub in Corbett-Jog section) and:
   a. Extend Cedar side to Riviera, (approx. 15 miles) creating new Cedar-Riviera 230 kV.
   b. Extend Corbett side to meet the Cedar-Lauderdale 230 kV N/S corridor (approx. 10 miles).
4. Break Cedar-Lauderdale 230 kV (near 230 corridor running N/S)
   a. Connect Cedar side to meet 3.b. to create a Cedar to Corbett 230 kV.
   b. Connect Lauderdale side to meet 2.a. to create a Corbett to Lauderdale 230 kV.
5. Upgrade the existing IBM-Yamato 138 kV line to 1200 Amperes.
6. New underground 138 kV tie line between new Riviera 138 kV Switchyard and 560 MVA, 230/138 kV autotransformer in the expanded Riviera 230 kV Substation.
7. Relocate six existing 138 kV lines from existing Riviera 138 kV Switchyard to new Riviera 138 kV Switchyard.

III.E.5 Transmission Facilities for Port Everglades Next Generation Clean Energy Center (Modernization)

The work required to connect the Port Everglades Next Generation Clean Energy Center in 2016 to the FPL grid is projected to be as follows:

I. Substation:

1. Construct two string busses to connect two combustion turbines (CT) to the Port Everglades 138 kV Substation.
2. Construct two string busses to connect one CT, and one steam turbine (ST) to the Port Everglades 230 kV Substation.
3. Add four main step-up transformers (3-450 MVA, 1- 580 MVA), one for each CT, and one for the ST.
4. Replace ten (10) 138 kV breakers
5. Replace eight (8) 230 kV breakers
6. At Port Everglades Switchyard replace twenty-two 138 kV disconnect switches. Also upgrade associated jumpers, bus work, and equipment connections.
7. Expand switchyard relay vault and add relays and other protective equipment.

II. Transmission:

1. Upgrade of existing transmission facilities:
   - An ampacity upgrade up to 1905 amps on the Port Everglades-Port Everglades Tap 138kV line section.
   - An ampacity upgrade up to 1905 amps on the Port Everglades Tap-Port Everglade Tap 2 138 kV line section.
   - An ampacity upgrade up to 1695 amps on the Port Everglades Tap 1-Dania 138 kV line section.
   - An ampacity upgrade up to 1695 amps on the Dania-Hollywood 138 kV line section.

III.F. Renewable Resources

FPL has been the leading Florida utility in examining ways to effectively utilize renewable energy technologies to serve its customers. FPL has been involved since 1976 in renewable energy research and development and in facilitating the implementation of various renewable energy technologies. For purposes of discussing FPL's renewable energy efforts in this document, those efforts will be placed into five categories.

Two of these categories are Supply-Side Efforts – Power Purchases and Supply-Side Efforts – FPL Facilities. In 2011, the energy (MWh) total output from these renewable energy sources was greater than the energy produced from oil-fired generation. This information is presented in Schedule 11.1 at the end of this chapter.

1) <u>Early Research & Development Efforts:</u>

FPL assisted the Florida Solar Energy Center (FSEC) in the late 1970s in demonstrating the first residential PV system east of the Mississippi. This PV installation at FSEC's Brevard County location was in operation for over 15 years and provided valuable information about PV performance capabilities in Florida on both a daily and annual basis. FPL later installed a second PV system at the FPL Flagami substation in Miami. This 10-kilowatt (kW) system was placed into operation in 1984. (The system was removed in 1990 to make room for substation expansion once PV testing had been completed.)

For a number of years, FPL maintained a thin-film PV test facility located at the FPL Martin Plant Site. This FPL PV test facility was used to test new thin-film PV technologies and to identify design, equipment, or procedure changes necessary to accommodate direct current electricity from PV facilities into the FPL system. Although this testing has ended, the site is now the home for PV capacity which was installed as a result of FPL's "green pricing" efforts.

2) <u>Demand Side & Customer Efforts:</u>

In terms of utilizing renewable energy sources to meet its customers' needs, FPL initiated the first utility-sponsored conservation program in Florida designed to facilitate the implementation of solar technologies by its customers. FPL's Conservation Water Heating Program, first implemented in 1982, offered incentive payments to customers who chose solar water heaters. Before the program ended (due to the fact that it was no longer cost-effective), FPL paid incentives to approximately 48,000 customers who installed solar water heaters.

In the mid-1980s, FPL introduced another renewable energy program, FPL's Passive Home Program. This program was created in order to broadly disseminate information about passive solar building design techniques which are most applicable in Florida's climate. As part of this program, three Florida architectural firms created complete construction blueprints for six passive home designs with the assistance of the FSEC and FPL. These designs and blueprints were available to customers at a low cost. During its existence, this program was popular and received a U.S. Department of Energy award for innovation. The program was eventually phased out due to a revision of the Florida Model Energy Building Code (Code). This revision was brought about in part by FPL's Passive Home Program. The revision incorporated into the Code was one of the most significant passive design techniques highlighted in the program: radiant barrier insulation.

In early 1991, FPL received approval from the FPSC to conduct a research project to evaluate the feasibility of using small PV systems to directly power residential swimming pool pumps. This research project was completed with mixed results. Some of the performance problems identified in the test were deemed to be solvable, particularly when new pools are constructed. However, the high cost of PV, the significant percentage of sites with unacceptable shading, and various customer satisfaction issues remain as significant barriers to wide acceptance and use of this particular solar application.

FPL has since continued to analyze and promote the utilization of PV. These efforts have included PV research, development, and education, as well as development and implementation of the FPL Next Generation Solar Station Program. As part of this program in 2011, FPL contributed 30 kW of PV to schools and educational non-profit organizations within its service area. This initiative also delivers teacher training and curriculum that is tied to the Sunshine Teacher Standards in Florida. Additionally, the program provides teacher grants to promote and fund projects in the classrooms.

In addition, FPL assists customers who are interested in installing PV equipment at their facilities. Consistent with Florida Administrative Code Rule 25-6.065, Interconnection and Net Metering of Customer-Owned Renewable Generation, FPL works with customers to interconnect these customer-owned PV systems. Through December 2011, approximately 1,580 customer systems (predominantly residential) have been interconnected.

As part of its 2009 DSM Goals decision, the FPSC imposed a requirement for Florida's investor-owned utilities to spend up to a set, not-to-exceed amount of money annually to facilitate demand side solar water heater and photovoltaic applications. FPL's not-to-exceed amount of money for these applications is approximately $15.5 million per year through 2014. In regard to this direction, FPL received approval from the FPSC in 2011 to initiate a solar pilot portfolio that consists of three PV-based programs and three solar water heating-based programs. These programs are currently projected to be offered through 2014. FPL is now evaluating the results from the first year of implementation of these programs.

FPL has also been investigating fuel cell technologies through monitoring of industry trends, discussions with manufacturers, and direct field trials. From 2002 through the end of 2005, FPL conducted field trials and demonstration projects of Proton Exchange Membrane (PEM) fuel cells with the objectives of serving customer end-uses while evaluating the technical performance, reliability, economics, and relative readiness of the PEM technology. The demonstration projects were conducted in partnership with customers and included five locations. The research projects were useful to FPL in identifying specific issues that can occur in field applications and the current commercial viability of this technology. FPL will continue to monitor the progress of these technologies and conduct additional field evaluations as significant developments in fuel cell technologies occur.

3) **Supply Side Efforts – Power Purchases:**

FPL has also facilitated renewable energy projects (facilities which burn bagasse, waste wood, municipal waste, etc.). Firm capacity and energy, and as-available energy, have been purchased by FPL from these types of facilities. (Please refer to Tables I.B.1, I.B.2, and I.C.1 in Chapter I).

Periodically, FPL invites renewable energy suppliers to provide proposals for renewable power and energy at or below avoided costs in response to FPL's Requests for Proposals (RFPs). FPL issued Renewable RFPs in 2007 and 2008 soliciting proposals to provide firm capacity and energy, and energy only, at or below avoided costs, from renewable generators. FPL also promptly responds to inquiries for information from prospective renewable energy suppliers either by e-mail or phone.

With regard to existing contracts that have recently ended, FPL and the Solid Waste Authority of Palm Beach (SWA) agreed to extend their contract that expired March 31, 2010 for a 20-year term beginning in April 1, 2012 through April 1, 2032. However, the SWA refurbished their generating unit ahead of schedule and, as of January 2012, this unit began delivering firm capacity to FPL. In 2011, the FPSC approved a contract for an additional 70 MW between FPL and SWA for a new unit to be constructed. Construction has now commenced. At the end of December 2011, the contract between FPL and Okeelanta (New Hope) expired. However, Okeelanta continues to deliver energy to FPL as an as-available, non-firm supplier of renewable energy.

4) **Supply Side Efforts – FPL Facilities:**

With regard to solar generating facilities, FPL has three such facilities: (i) a 75 MW steam generation solar thermal facility in Martin County (the Martin Next Generation Solar Energy Center); (ii) a 25 MW PV electric generation facility in DeSoto County (the DeSoto Next Generation Solar Energy Center); and (iii) a 10 MW PV electric generation facility in Brevard County at NASA's Kennedy Space Center (the Space Coast Next Generation Solar Energy Center). The DeSoto County project was completed in 2009 and the other two projects were completed in 2010. These three solar facilities were constructed in response to the Florida Legislature's House Bill 7135 which was signed into law by then-Governor Crist in June 2008. House Bill 7135 was enacted to enable the development of clean, zero greenhouse gas emitting renewable generation in the State of Florida. Specifically, the bill authorized cost recovery for the first 110 MW of eligible renewable projects that had the proper land, zoning, and transmission rights in place. FPL's three solar projects met the specified criteria, and were granted approval for cost recovery in 2008. Each of the three solar facilities is discussed below.

a. **The Martin Next Generation Solar Energy Center:**

This facility began commercial operation in 2010 and provides 75 MW of solar thermal capacity in an innovative way that directly displaces fossil fuel usage on the FPL system. This facility consists of solar thermal technology which generates steam that is integrated into the existing steam cycle for the Martin Unit 8 natural gas-fired CC plant. This project is the first "hybrid" solar plant in the world, the second largest solar facility in the world, and the largest solar plant of any kind in the U.S. outside of California.

b. **The DeSoto Next Generation Solar Energy Center:**

This PV facility began commercial operation in 2009 and provides 25 MW of non-firm capacity and energy, making it one of the largest PV facilities in the U.S. The facility utilizes a tracking PV array that is designed to follow the sun as it traverses across the sky.

c. **The Space Coast Next Generation Solar Energy Center:**

Located at the Kennedy Space Center, this facility is part of an innovative public/private partnership with NASA. This non-tracking PV facility began commercial operation in 2010 and provides 10 MW of non-firm capacity and energy.

Collectively, these Next Generation Solar Energy Centers are expected to produce a total of approximately 200,000 megawatt-hours (MWh) of electricity each year, and at peak production provide enough energy to serve the requirements of more than 14,380 homes at current levels of average residential use.

For resource planning purposes, FPL currently projects that the output from these renewable facilities will be "as available," non-firm energy only. This is due to several factors. First, the Martin solar thermal facility is a "fuel-substitute" facility, not a facility that provides additional capacity and energy. The solar thermal facility displaces the use of fossil fuel to produce steam on the FPL system when the solar thermal facility is operating. Second, in regard to the two PV facilities, the intermittent nature of the solar resource makes it difficult to accurately determine what contribution the PV facilities at these specific locations can consistently make at FPL's late Summer afternoon and early Winter morning peak load hours. Once site-specific operating data has been gathered for an appropriate amount of time, FPL will then re-evaluate the actual output from each PV facility to determine what portion, if any, of its output can be projected as firm capacity at the projected peak hours in FPL's resource planning work.

In addition to these three solar facilities, FPL is currently in the process of identifying other potential solar sites in the state in the event that a future Renewable Portfolio Standard (RPS), Clean Energy Portfolio Standard (CPS), or other energy legislation is enacted by the Florida legislature that enables FPL to construct and recover costs for additional renewable energy generation. FPL is evaluating existing FPL generation sites along with potential Greenfield sites within FPL's service territory. These potential FPL and Greenfield sites are discussed further in Chapter IV.

FPL remains hopeful of developing a wind generation project on South Hutchinson Island in St. Lucie County. This project is known as the St. Lucie Wind Project and it would consist of up to six wind turbine generators capable of generating up to approximately 13.8 MW. In 2007, FPL began the St. Lucie County land use approval process, and soon after applied for the necessary federal and state permitting. However, a decision by the state and federal agencies on the St. Lucie Wind Project's permitting cannot be finalized until the local land use approval process is completed. At the time this Site Plan document is being developed, the local land use approval process has not been completed. An in-service date for the project is dependent upon a successful outcome in the local approval and permitting process.

5) **Ongoing Research & Development Efforts:**

FPL has developed alliances with several Florida universities to promote development of emerging technologies. For example, an alliance has been established with the newly formed Southeast National Marine Renewable Energy Center (SNMREC) at Florida Atlantic University (FAU), which will focus on the commercialization of ocean current, ocean thermal (i.e., energy conversion as well as cold water air conditioning), and hydrogen technologies. FPL has been taking the lead in assisting FAU with the discussions being held with the U.S. Department of the Interior's Minerals Bureau of Ocean Energy Management Regulation and Enforcement (BOEMRE). BOEMRE is working to establish the permitting process for ocean energy development on the outer continental shelf.

FPL has also developed an alliance with the University of Florida to support its biomass-related studies to determine improved vegetative management techniques for use in minimizing maintenance costs at FPL's current and future solar sites and to perform wind studies within the state. In addition, FPL has partnered with the Florida Institute of Technology on fuel cell technology and with the Florida State Universities Center for Applied Power System in regard to grid integration of ocean energy and other renewables.

FPL has also developed a "Living Lab" to demonstrate FPL's solar energy commitment to employees and visitors at its Juno Beach office facility. To-date, FPL has installed five different PV arrays (different technologies) of rooftop PV totaling 24 kW at the Living Lab. In addition, construction of two PV-covered parking structures with a total of approximately 90 kW of PV is near completion at the FPL Juno office parking lot. Through these Living Lab projects, FPL is able to evaluate multiple solar technologies and applications for the purpose of developing a renewable business model resulting in the most cost-effective and reliable uses of solar energy for FPL's customers. FPL plans to continue to expand the Living Lab as new solar products come to market.

FPL has also been in discussions with several private companies on multiple emerging technology initiatives including ocean current, ocean thermal, hydrogen, fuel cell technology, biomass, biofuels, and energy storage.

III.G FPL's Fuel Mix and Fuel Price Forecasts

1. FPL's Fuel Mix

Until the mid-1980s, FPL relied primarily on a combination of fuel oil, natural gas, and nuclear energy to generate electricity with significant reliance on oil–fired generation. In the early 1980s, FPL began to purchase "coal-by-wire." In 1987, coal was first added to the fuel mix through FPL's partial ownership (20%) and additional purchases (30%) from the St. Johns River Power Park (SJRPP). This allowed FPL to meet its customers' energy needs with a more diversified mix of energy sources. Additional coal resources were added with the partial acquisition (76%) of Scherer Unit 4 which began serving FPL's customers in 1991. Starting in 1997, petroleum coke was added to the fuel mix as a blend stock with coal at SJRPP when economic.

The trend since the early 1990s has been a steady increase in the amount of natural gas that is used by FPL to provide electricity due, in part, to the introduction of highly efficient and cost-effective CC generating units and the ready availability of natural gas. This planning document reflects an evolution in that trend in recognition that, although efficient gas-fired generation continues to provide significant benefits to FPL's customers, adding natural gas-fired additions exclusively would, in the long term, create an unbalanced generation portfolio. In 2009, FPL placed into commercial operation two new gas-fired CC units at the West County Energy Center (WCEC) site. A third new CC unit was added to the WCEC site in 2011. In addition, FPL is currently modernizing its existing Cape Canaveral and Riviera plant sites by removing the steam generating units previously on the sites and replacing them with two highly efficient new CC units, one at each site. FPL has also recently received

FPSC approval to perform a similar modernization project at its Port Everglades site. These new CC units will provide highly efficient generation that will dramatically improve the efficiency of FPL's generation system in general, and, more specifically, the efficiency at which natural gas is utilized..

In addition, FPL is increasing its utilization of nuclear energy through capacity uprates of its four existing nuclear units. These uprates have begun and will add a total of approximately 490 MW of nuclear generation capacity by early 2013. 31 MW of the projected 490 MW total increase have already been added at FPL's St. Lucie Unit 2 and this increased nuclear capacity is already benefitting FPL's customers. (FPL is also pursuing plans to obtain licenses, permits, and approvals to construct and operate two new nuclear units at its existing Turkey Point site that, in total, would add approximately 2,200 MW of new nuclear generating capacity. The earliest dates by which those new nuclear units could practically be deployed continue to be outside of the ten-year reporting time frame of this document.)

In regard to utilizing renewable energy, FPL has added 110 MW of solar generating capacity through a 75 MW solar thermal steam generating facility at FPL's existing Martin site, a 25 MW PV facility in DeSoto County, and a 10 MW PV facility in Brevard County. The DeSoto facility was placed into commercial operation in 2009. The other two solar facilities were placed into commercial operation in 2010.

FPL's future resource planning work will continue to focus on identifying and evaluating alternatives that would most cost-effectively maintain and/or enhance FPL's long-term fuel diversity. These fuel diverse alternatives may include: the purchase of power from renewable energy facilities, additional FPL-owned renewable energy facilities, obtaining additional access to diversified sources of natural gas such as liquefied natural gas (LNG) and natural gas from the Mid-Continent unconventional reserves, preserving FPL's ability to utilize fuel oil at its existing units, and increased utilization of nuclear energy. (As previously discussed, new advanced technology coal generating units are not currently considered as viable options in Florida in the ten-year reporting period of this document due, in part, to current projections of relatively small differences in fuel costs between coal and natural gas, significantly higher capital costs for coal units compared to CC units, greater efficiencies of CC units, and concerns over non-greenhouse gas environmental regulations that would impact coal units more negatively than CC units.) The evaluation of the feasibility and cost-effectiveness of these, and other possible fuel diversity alternatives, will be part of on-going resource planning efforts.

FPL's current use of various fuels to supply energy to customers, plus a projection of this "fuel mix" through 2021 based on the resource plan presented in this document, is presented in Schedules 5, 6.1, and 6.2 later in this chapter.

2. FPL's Fossil Fuel Cost Forecasts

Fossil fuel price forecasts, and the resulting projected price differentials between fuels, are major drivers used in evaluating alternatives for meeting future resource needs. FPL's forecasts are generally consistent with other published contemporary forecasts.

Future oil and natural gas prices, and to a lesser extent, coal and petroleum coke prices, are inherently uncertain due to a significant number of unpredictable and uncontrollable drivers that influence the short- and long-term price of oil, natural gas, coal, and petroleum coke. These drivers include U.S. and worldwide demand, production capacity, economic growth, environmental legislation, and politics.

The inherent uncertainty and unpredictability in these factors today and tomorrow clearly underscores the need to develop a set of plausible oil, natural gas, and solid fuel (coal and petroleum coke) price scenarios that will bound a reasonable set of long-term price outcomes. In this light, FPL developed and utilized Low, Medium, and High price forecasts for fossil fuels in some of its 2011 and early 2012 resource planning work, particularly in regard to analyses conducted as part of the nuclear cost recovery filing work.

FPL's Medium price forecast methodology is consistent for oil and natural gas. For oil and natural gas commodity prices, FPL's Medium price forecast applies the following methodology:

a. For 2011 through 2013, the methodology used the November 14, 2011 forward curve for New York Harbor 1% sulfur heavy oil, U. S. Gulf Coast 1% sulfur heavy oil, ultra low sulfur diesel fuel oil, and Henry Hub natural gas commodity prices;

b. For the next two years (2014 and 2015), FPL used a 50/50 blend of the November 14, 2011 forward curve and the most current projections at the time from The PIRA Energy Group;

c. For the 2016 through 2025 period, FPL used the annual projections from The PIRA Energy Group; and,

d. For the period beyond 2025, FPL used the real rate of escalation from the Energy Information Administration (EIA). In addition to the development of oil and natural gas commodity prices, nominal price forecasts also were prepared for oil and natural gas transportation costs. The addition of commodity and transportation forecasts resulted in delivered price forecasts.

FPL's Medium price forecast methodology is also consistent for coal and petroleum coke prices. Coal and petroleum coke prices were based upon the following approach:

a. Delivered price forecasts for Central Appalachian (CAPP), Illinois Basin (IB), Powder River Basin (PRB), and South American coal and petroleum coke were provided by JD Energy; and,

b. The coal price forecast for SJRPP and Plant Scherer assume the continuation of the existing mine-mouth and transportation contracts until expiration, along with the purchase of spot coal, to meet generation requirements.

The development of FPL's Low and High price forecasts for oil, natural gas, coal, and petroleum coke prices were based on the historical volatility of the 12-month forward price, one year ahead. FPL developed these forecasts to account for the uncertainty which exists within each commodity as well as across commodities. These forecasts reflect a range of reasonable forecast outcomes.

3. Nuclear Fuel Cost Forecast

This section reviews the various steps needed to fabricate nuclear fuel for delivery to the nuclear power plants, the method used to forecast the price for each step, and other comments regarding FPL's nuclear fuel cost forecast.

a) Steps Required for Nuclear Fuel to be delivered to FPL's Plants

Four separate steps are required before nuclear fuel can be used in a commercial nuclear power reactor. These steps are summarized below.

(1) Mining: Uranium is produced in many countries such as Canada, Australia, Kazakhstan, and the United States. During the first step, uranium is mined from the ground using techniques such as open pit mining, underground mining, in-situ leaching operations, or production as a by-product from other mining operations, such as gold, copper, or phosphate rocks. The product from this first step is the raw uranium delivered as an oxide, U3O8 (sometimes referred to as yellowcake).

(2) Conversion: During the second step, the U3O8 is chemically converted into UF6 which, when heated, changes into a gaseous state. This second step further removes any chemical impurities and serves as preparation for the third step, which requires uranium to be in a gaseous state.

(3) Enrichment: The third step is called enrichment. Natural uranium contains 0.711% of uranium at an atomic mass of 235 (U-235) and 99.289% of uranium at an atomic mass of 238 (U-238). FPL's nuclear reactors use uranium with a higher percentage of up to five percent (5%) of U-235 atoms. Because natural uranium does not contain a sufficient amount of U-235, the third step increases the percentage amount of U-235 from 0.711% to a level specified when designing the reactor core (typically in a range from approximately 3% to as high as 5%). The output of this enrichment process is enriched uranium in the form of UF6.

(4) Fabrication: During the last step, fuel fabrication, the enriched UF6 is changed to a UO2 powder, pressed into pellets, and fed into tubes, which are sealed and bundled together into fuel assemblies. These fuel assemblies are then delivered to the plant site for insertion in a reactor.

Like other utilities, FPL has purchased raw uranium and the other components of the nuclear fuel cycle separately from numerous suppliers from different countries.

b) Price Forecasts for Each Step

(1) Mining: There is some volatility in the current uranium market. Current demand continues to be rather stable and outputs from production facilities have been increasing steadily. The following are the current major contributors that led to some volatility in the prices for uranium:

- In March 2011, an earthquake and tsunami struck the Fukushima nuclear complex in Japan. The immediate impact was a perceived reduction in worldwide nuclear fuel demand and thus prices have generally declined, with some small periodic increases through 2011.

- Hedge funds are currently in the market. This causes more speculative demand, not tied to market fundamentals, and causes the market price to move according to news potentially affecting potential future supply/demand balance, or news regarding current suppliers.

- The large inventory from the U.S. Department of Energy (DOE) is being withheld from the market due to political pressure from suppliers. Some of this uranium finds its way into the market periodically to fund cleanup of certain Department of Energy facilities.

- The U.S. Department of Commerce (DOC) has imposed restrictions on the import of nuclear fuel from France and Russia.

- Although a limited number of new nuclear units is scheduled to start production in the U.S. during the next 5 to 10 years, other countries, more specifically China, have announced a significant increase in construction of new units which has caused a short term increase in the uranium market price.

Over a 10-year horizon, FPL expects the market to be more consistent with market fundamentals The supply picture is more stable, with laws enacted to resolve the import of Russian-enriched uranium, by allowing some imports of Russian-enriched uranium to meet about 20-25% of needs for currently operating units, but with no restriction on the first core for new units and no restrictions after 2020. New and current facilities continue to add capacity to meet demands. Actual demand tends to grow over time because of the long lead time to build nuclear units. However, FPL cannot discount the possibility of future periodic sharp increase in prices, but believes such occurrences will likely be temporary in nature.

FPL's nuclear fuel price forecasts are the result of FPL's analysis based on inputs from various nuclear fuel market expert reports and studies.

(2) Conversion: FPL's price forecast considers the construction of new nuclear units. Just like for raw uranium, an increase in demand for conversion services would result from this need. Insufficient planned production is currently forecasted after 2013 to meet the higher demand scenario, but is sufficient to meet most reference case scenarios. As with additional raw uranium production, supply will expand beyond current level once more firm commitments are made including commitments to building new nuclear units.

(3) Enrichment: As a result of the Fukushima events in March 2011, the near-term price of enrichment services has declined. However, plans for several of the new facilities that were expected to come on-line in the next few years have been delayed. Also, some of the current high operating cost diffusion plants are indicating that they will shutdown in the next year or two. As with supply for the other steps of the nuclear fuel cycle, expansion of future capacity is feasible within the lead time for constructing new nuclear units and any other projected increase in demand. Meanwhile, world supply and demand will continue to be balanced such that FPL expects adequate supply of enrichment services. The tight supply/demand profile will most likely cause the price of enrichment services to remain stable or decline for the next few years before starting to increase.

(4) Fabrication: Because the nuclear fuel fabrication process is highly regulated by the Nuclear Regulatory Commission (NRC), not all production facilities can qualify as suppliers to nuclear reactors in the U.S. Although world supply and demand is expected to show significant excess capacity for the foreseeable future, the gap is not as wide for U.S. supply and demand. The supply for the U.S. market is expected to be sufficient to meet U.S. demand for the foreseeable future.

c) Other Comments Regarding FPL's Nuclear Fuel Cost Forecast

The calculations for the nuclear fuel cost forecasts used in FPL's 2011 and early 2012 resource planning work were performed consistent with the method then used for FPL's Fuel Clause filings, including the assumption of refueling outages every 18 months and plant operation at power uprate levels. The costs for each step to fabricate the nuclear fuels were added to come up with the total costs of the fresh fuel to be loaded at each refueling (acquisition costs). The acquisition cost for each group of fresh fuel assemblies were then amortized over the energy produced by each group of fuel assemblies. FPL also added 1 mill per kilowatt hour net to reflect payment to DOE for spent fuel disposal.

Col. (2) represents capacity additions and changes projected to be in-service by June 1st. These MW are generally considered to be available to meet Summer peak loads which are forecasted to occur during August of the year indicated.
Col. (6) = Col.(2) + Col.(3) - Col.(4) + Col.(5).
Col. (7) reflects the 2011 load forecast without incremental DSM or cumulative load management.
Col. (8) represents cumulative load management capability, plus incremental conservation, from 1/2012-on intended for use with the 2011 load forecast.
Col. (10) = Col. (6) - Col. (9)
Col. (11) = Col.(10) / Col.(9)
Col. (12) indicates the capacity of units projected to be out-of-service for planned maintenance during the Summer peak period. This value is comprised of:
(i) 745 MW (at St. Lucie Unit 2) of nuclear capacity that will be out-of-service during part of Summer in 2012 due to an extended planned outage as part of the capacity uprates project;
(ii) an additional 826 MW of fossil-fueled capacity that will be out-of-service in the Summer of 2013 (at Martin Unit 1) and in the Summer of 2014 (at Martin Unit 2) due to the installation of electrostatic precipitators.
Col. (13) = Col. (10) - Col. (12)
Col. (14) = Col.(13) / Col.(9)

(1) The Winter Total MW value consists of all generation additions and changes achieved by January. The Summer Total MW value consists of all generation additions and changes achieved by June. All MW additions/changes occurring later in the year will be picked up for reporting/planning purposes in the following year.
(2) The nuclear uprates will be performed during the extended outages for each unit.

(1) The Winter Total MW value consists of all generation additions and changes achieved by January. The Summer Total MW value consists of all generation additions and changes achieved by June. All MW additions/changes occuring later in the year will be picked up for reporting/planning purposes in the following year

(2) The nuclear uprates will be performed during the extended outages for each unit.

Schedule 9
Status Report and Specifications of Proposed Generating Facilities

(1) **Plant Name and Unit Number:** St. Lucie 1 Nuclear (Uprate)

(2) **Capacity**
a. Summer 129 MW (Incremental)
b. Winter 129 MW (Incremental)

(3) **Technology Type:** Nuclear

(4) **Anticipated Construction Timing**
a. Field construction start-date: During scheduled refueling outage
b. Commercial In-service date: 2012

(5) **Fuel**
a. Primary Fuel Uranium
b. Alternate Fuel ---

(6) **Air Pollution and Control Strategy:** No change from existing unit

(7) **Cooling Method:** No change from existing unit

(8) **Total Site Area:** No change from existing unit

(9) **Construction Status:** T (Regulatory approval received, but not under construction)

(10) **Certification Status:** T (Regulatory approval received, but not under construction)

(11) **Status with Federal Agencies:** T (Regulatory approval received, but not under construction)

(12) **Projected Unit Performance Data:**

Planned Outage Factor (POF):	No change from existing unit
Forced Outage Factor (FOF):	No change from existing unit
Equivalent Availability Factor (EAF):	No change from existing unit
Resulting Capacity Factor (%):	No change from existing unit
Average Net Operating Heat Rate (ANOHR):	No change from existing unit
Base Operation 75F,100%	No change from existing unit

(13) **Projected Unit Financial Data** *

Book Life (Years):	25	years (Matches the current operating license period.)
Total Installed Cost ($/kW): **	TBD	(See Note (1) for explanation.)
Direct Construction Cost:	TBD	(See Note (1) for explanation.)
AFUDC Amount ($/kW):		(See Note (2) for explanation.)
Escalation ($/kW):		(See Note (3) for explanation.)
Fixed O&M ($/kW -Yr.):	There is no additional O&M impact from this project.	
Variable O&M ($/MWH):	There is no additional O&M impact from this project.	
K Factor:		(See Note (2) for explanation.)

NOTE:
(1) The projected capital cost values for the capacity uprates at each of FPL's existing nuclear units is currently being reviewed in on-going analyses as this document is being prepared. The capital cost projections that will result from these analyses are expected to be presented in FPL's May 2012 Nuclear Cost Recovery filing.
(2) Not applicable due to early recovery of capital carrying costs.
(3) These costs are included in the Total Installed Cost value.

* $/kW values are based on incremental Summer capacity.
** $/incremental kW

Schedule 9
Status Report and Specifications of Proposed Generating Facilities

(1) **Plant Name and Unit Number:** Turkey Point 3 Nuclear (Uprate)

(2) **Capacity**
a. Summer 123 MW (Incremental)
b. Winter 123 MW (Incremental)

(3) **Technology Type:** Nuclear

(4) **Anticipated Construction Timing**
a. Field construction start-date: During scheduled refueling outage
b. Commercial In-service date: 2012

(5) **Fuel**
a. Primary Fuel Uranium
b. Alternate Fuel ---

(6) **Air Pollution and Control Strategy:** No change from existing unit

(7) **Cooling Method:** No change from existing unit

(8) **Total Site Area:** No change from existing unit

(9) **Construction Status:** T (Regulatory approval received, but not under construction)

(10) **Certification Status:** T (Regulatory approval received, but not under construction)

(11) **Status with Federal Agencies:** T (Regulatory approval received, but not under construction)

(12) **Projected Unit Performance Data:**

Planned Outage Factor (POF):	No change from existing unit
Forced Outage Factor (FOF):	No change from existing unit
Equivalent Availability Factor (EAF):	No change from existing unit
Resulting Capacity Factor (%):	No change from existing unit
Average Net Operating Heat Rate (ANOHR):	No change from existing unit
Base Operation 75F,100%	No change from existing unit

(13) **Projected Unit Financial Data ***

Book Life (Years):	21	years (Matches the current operating license period.)
Total Installed Cost ($/kW): **	TBD	(See Note (1) for explanation.)
Direct Construction Cost ($/kW):	TBD	(See Note (1) for explanation.)

Forced Outage Factor (FOF):	1.1%	
Equivalent Availability Factor (EAF):	95.4%	
Resulting Capacity Factor (%):	Approx. 90%	(First Full Year Base Operation)
Average Net Operating Heat Rate (ANOHR):	6,330	Btu/kWh
Base Operation 75F,100%		

(13) **Projected Unit Financial Data *,****

Book Life (Years):	30	years
Total Installed Cost (2016 $/kW):	928	
Direct Construction Cost ($/kW):		
AFUDC Amount ($/kW):	87	
Escalation ($/kW):		
Fixed O&M ($/kW-Yr): (2016 $)	30.00	
Variable O&M ($/MWH): (2016 $)	0.10	
K Factor:	1.51	

* $/kW values are based on Summer capacity.
** Fixed O&M cost includes capital replacement.

NOTE: Total installed cost includes gas expansion, transmission interconnection and integration, escalation, and AFUDC. Demolition costs of existing plant are not included.

Schedule 10
Status Report and Specifications of Proposed Transmission Lines

St. Lucie 1 Nuclear (Uprate)

The St. Lucie 1 Nuclear (Uprate) does not require any "new" transmission lines.

Schedule 10
Status Report and Specifications of Proposed Transmission Lines

Turkey Point 3 Nuclear (Uprate)

The Turkey Point 3 Nuclear (Uprate) does not require any "new" transmission lines.

Schedule 10
Status Report and Specifications of Proposed Transmission Lines

St. Lucie 2 Nuclear (Uprate)

The St. Lucie 2 Nuclear (Uprate) does not require any "new" transmission lines.

Schedule 10
Status Report and Specifications of Proposed Transmission Lines

Turkey Point 4 Nuclear (Uprate)

The Turkey Point 4 Nuclear (Uprate) does not require any "new" transmission lines.

Schedule 10
Status Report and Specifications of Proposed Transmission Lines

Cape Canaveral Next Generation Clean Energy Center (Modernization)

The Cape Canaveral Next Generation Clean Energy Center which will result from the modernization of the Cape Canaveral power plant site does not require any "new" transmission lines.

Schedule 10
Status Report and Specifications of Proposed Transmission Lines

Riviera Beach Next Generation Clean Energy Center (Modernization)

The Riviera Beach Energy Center which will result from the modernization of the Riviera Beach power plant site will require one new line and existing lines to be extended and reconfigured to accommodate the increased capacity.

(1)	Point of Origin and Termination:	Riviera – Cedar Substation
(2)	Number of Lines:	1
(3)	Right-of-way	Existing, FPL - Owned
(4)	Line Length:	15 miles
(5)	Voltage:	230 kV
(6)	Anticipated Construction Timing:	Start date: 2012 End date: 2014
(7)	Anticipated Capital Investment: (Trans. and Sub.)	$12,100,000
(8)	Substations:	Riviera Substation and Cedar Substation
(9)	Participation with Other Utilities:	None

Schedule 10
Status Report and Specifications of Proposed Transmission Lines

Port Everglades Next Generation Clean Energy Center

The Port Everglades Next Generation Clean Energy Center which will result from the modernization of the Port Everglades power plant site does not require any "new" transmission lines.

Schedule 11.1

Existing FIRM and NON-FIRM Capacity and Energy by Primary Fuel Type
Actuals for the Year 2011

	(1)	(2)	(3)	(4)	(5)	(6)	(7)
		Net (MW) Capability				NEL	Fuel Mix

(11)	***Purchases Other :***	***2,038.0***	8.3%	***2,074.0***	8.0%	***8,248***	7.3%
(12)	***Total :***	***24,637.0***	***100.0%***	***25,927.0***	***100.0%***	***112,454***	***100.0%***

Note.
(1) FPL Existing Units Total values on row (7), columns (2) and (4), match the System Firm Generating Capacity values found on Schedule 1 for Summer and Winter.
(2) Net Energy for Load GWh values on row (12), column (6), matches Schedule 6.1 value for 2011.

Schedule 11.2

Existing NON-FIRM Self-Service Renewable Generation Facilities
Actuals for the Year 2011

(1)	(2)	(3)	(4)	(5)	(6) = 3+4-5
Type of Facility	Installed Capacity DC (MW)	Renewable Projected Annual Output (MWh)	Annual Energy Purchased from FPL (MWh)	Annual Energy Sold to FPL (MWh)	Projected Annual Energy Used by Customers (GWh)
Customer-Owned PV (0 kW to 10 kW)	7.3	7,298.5	61,881.5	163.3	**69.0**
Customer-Owned PV (> 10 kW to 100 kW)	3.5	3,148.1	116,049.8	192.0	**119.0**
Customer-Owned PV (> 100 kW to 2 MW)	3.3	4,100.1	118,972.0	59.8	**123.0**
Total:	**14.1**	**14,546.7**	**296,903.3**	**415.1**	**311.0**

Notes:

(1) There were approximately 1,580 customer-owned renewable generation facilities interconnected with FPL on December 31, 2011.
(2) The Installed Capacity value is the sum of the nameplate ratings (DC MW) for all of the customer-owned renewable generation facilities connected as of Dec. 31,2011.
(3) The Projected Annual Output value is based on NREL's PV Watts 1 program and the installed capacity for each customer, adjusted for the days they were actively interconnected during 2011, and assuming each facility operated as planned.
(4) The Annual Energy Purchased from FPL is an actual value from FPL's metered data for 2011.
(5) The Annual Energy Sold to FPL is an actual number of kWH credited back to the customer from FPL's metered data for 2011.
(6) The Projected Annual Energy Used by Customers is a projected value that equals:
Renewable Projected Annual output + Annual Energy Purchased from FPL - Annual Energy Sold to FPL.

(This page is left intentionally blank.)

CHAPTER IV

Environmental and Land Use Information

(This page is left intentionally blank.)

IV. Environmental and Land Use Information

IV.A Protection of the Environment

FPL operates in a sensitive, temperate/sub-tropical environment containing a number of distinct ecosystems with many endangered or threatened plant and animal species. FPL competes for air, land, and water resources that are necessary to meet the demand for generation, transmission, and distribution of electricity. At the same time, residents and tourists want unspoiled natural amenities, and the general public has an expectation that large corporations such as FPL will conduct their business in an environmentally responsible manner.

FPL has been recognized for many years as one of the leaders among electric utilities for its commitment to the environment. For example, FPL has one of the lowest emissions profiles among U.S. utilities and its carbon dioxide (CO_2) emission rate is 36% lower (better) than the industry average. The environmental leadership of FPL and its parent company, NextEra Energy, Inc., has been heralded by many outside organizations as demonstrated by a few recent examples. In 2011, NextEra Energy, Inc. ranked in the top 10 among companies worldwide for social responsibility and, for a record sixth consecutive year, No. 1 in its industry, according to the 2011 "World's Most Admired Companies" report released by Fortune magazine. Being ranked first, for five consecutive years, is unprecedented in the industry and according to *Fortune*, America's Most Admired Companies is "the definitive report card on corporate reputations".

NextEra Energy, Inc. was named to the 2011 Dow Jones Sustainability Index (DJSI) of the leading companies in North America for corporate sustainability for the third consecutive year. The DJSI North America selects the top 20 percent of companies in sustainability performance from the 600 largest companies in North America. According to Sustainable Asset Management, the investment research firm that conducts the DJSI research, the evaluation is continuously adapted to capture the sustainability trends that are at the forefront of each industry sector and are likely to have an impact on the companies' competitive landscape.

FPL was recognized in 2010 by the Southeastern Electric Exchange (SEE) for outstanding performance in constructing the largest photovoltaic (PV) power plant at the time in the United States: the 25 MW DeSoto Next Generation Solar Energy Center. SEE gives its Chairman's Award annually to the project it deems "best of the best" among all entrants in its 11 award categories. Capable of powering approximately 3,000 homes with renewable energy, the DeSoto PV facility was completed months ahead of schedule and more than $22 million under budget.

In 2011, FPL's Martin Next Generation Solar Energy Center earned NextEra Energy recognition as a finalist in the competition for the Edison Award, presented annually by EEI. The award for "distinguished leadership, innovation and contribution to the advancement of the electric industry for the benefit of all" is EEI's most prestigious award. Also in 2011, the Martin Next Generation Solar Energy Center was named Project of the Year - Best Renewable Project by Power Engineering magazine, the leading power generation industry publication.

FPL was named a finalist in the Annual Sustainable Florida Best Practice Awards in both 2010 and 2011. In 2010, Sustainable Florida recognized the previously mentioned 25 MW DeSoto PV facility and in 2011 the organization recognized FPL's partnership with Palm Beach County to utilize reclaimed water at the West County Energy Center. The awards were presented by the Council for Sustainable Florida, the premier statewide organization committed to balancing the economic interests of the state with the need to be socially and environmentally responsible. The Sustainable Florida Award recognizes organizations for protecting and preserving Florida's environment for the future while building markets for Florida's businesses.

FPL's responsible tree care practices across its 35-county service area have been recognized for almost a decade. FPL has been the recipient of the Tree Line USA award annually from 2003 - 2011. This award is sponsored by the Arbor Day Foundation in cooperation with the National Association of State Foresters. The recognition is given to utilities that demonstrate quality tree care practices, annual worker training, and public education programs.

In October 2010, FPL won the 2010 Loggerhead Marinelife Center's "Blue Business of the Year" award. The awards were given to those who are leading the way in raising awareness about, and have made significant contributions to improve and protect South Florida's oceans, beaches, and wildlife. The award recognized FPL's protection and conservation of the endangered Florida manatee and fostering public and employee education and support.

IV.B FPL's Environmental Statement

To reaffirm its commitment to conduct business in an environmentally responsible manner, FPL developed an Environmental Statement in 1992 to clearly define its position, which it continues to stand by today. This statement reflects how FPL incorporates environmental values into all aspects of its activities and serves as a framework for new environmental initiatives throughout the company. FPL's Environmental Statement is:

> It is the Company's intent to continue to conduct its business in an environmentally responsible manner. Accordingly, Florida Power & Light Company will:
>
> - Comply with the spirit and intent, as well as the letter of, environmental laws, regulations, and standards.
> - Incorporate environmental protection and stewardship as an integral part of the design, construction, operation, and maintenance of our facilities.
> - Encourage the wise use of energy to minimize the impact on the environment.
> - Communicate effectively on environmental issues.
> - Conduct periodic self-evaluations and report performance.

IV.C Environmental Management

In order to implement the Environmental Statement, FPL established an Environmental Management System to direct and control the fulfillment of the organization's environmental responsibilities. A key component of the system is an Environmental Assurance Program that is discussed below. Other components include: executive management support and commitment, a dedicated environmental corporate governance program, written environmental policies and procedures, delineation of organizational responsibilities and individual accountabilities, allocation of appropriate resources for environmental compliance management (which includes reporting and corrective action when non-compliance occurs), environmental incident and/or emergency response, environmental risk assessment/management, environmental regulatory development and tracking, and environmental management information systems.

IV.D Environmental Assurance Program

FPL's Environmental Assurance Program consists of activities which are designed to evaluate environmental performance, verify compliance with corporate policy as well as legal and regulatory requirements, and communicate results to corporate management. The principal mechanism for pursuing environmental assurance is the environmental audit. An environmental audit may be defined as a management tool comprising a systematic, documented, periodic, and objective evaluation of the performance of the organization and of the specific management systems and equipment designed to protect the environment. The environmental audit's primary objectives are to facilitate management control of environmental practices and assess compliance with existing environmental regulatory requirements and FPL policies.

IV.E Environmental Communication and Facilitation

FPL is involved in many efforts to enhance environmental protection through the facilitation of environmental awareness and in public education. Some of FPL's 2011 environmental outreach activities are summarized below in Table IV.E.1.

Table IV.E.1: 2011 FPL Environmental Outreach Activities

Activity	# of Participants (Approx.)
Visitors to FPL's Energy Encounter at St. Lucie	12,000
Visitors to Manatee Park	146,814
Number of visits to FPL's Environmental Website	>500,000
Number of pieces of Environmental literature distributed	>20,000
Solar Schools Program (# of schools participating)	1 school and 2 non-profits
Visitors to Barley Barber Swamp	2,955
Number of visits to Manatee Cam Website	66,769

IV.F Preferred and Potential Sites

Based upon its projection of future resource needs, FPL has identified five (5) Preferred Sites and ten (10) Potential Sites for future generation additions. Preferred Sites are those locations where FPL has conducted significant reviews and has either taken action, or is currently committed to take action, to site new generation capacity. Potential Sites are those sites that have attributes that support the siting of generation and are under consideration as a location for future generation. Some of these sites are currently in use as existing generation sites and some are not. The identification of a Potential Site does not indicate that FPL has made a definitive decision to pursue generation (or generation expansion in the case of an existing generation site) at that location, nor does this designation indicate that the size or technology of a generator has been determined. The Preferred Sites and Potential Sites are discussed in separate sections below.

As has been described in previous FPL Site Plans, FPL also considers a number of other sites as possible sites for future generation additions. These include all of the remainder of FPL's existing generation sites and other Greenfield sites. FPL will continue to analyze the potential for modernizing existing power plant sites such as is now being done at the Cape Canaveral and Riviera sites, and which will occur by 2016 at the existing Port Everglades site. Analyses of any modernization candidates would include evaluation of numerous factors including: fuel delivery, transmission, permitting, etc.

IV.F.1 Preferred Sites

FPL identifies five Preferred Sites and all of them are existing plant sites: the St. Lucie plant site, the Turkey Point plant site, the Cape Canaveral plant site, the Riviera plant site and the Port Everglades plant site.

The St. Lucie site is the location for nuclear capacity uprates that FPL will complete work for in 2012. The Turkey Point site is the location for nuclear capacity uprates that FPL will complete work for in 2012 and 2013. (Turkey Point is also the site for two new nuclear units, Turkey Point Units 6 & 7, for which FPL is pursuing licensing and permit approvals. Current projections for in-service dates for these new nuclear units remain beyond the 2012 through 2021 reporting time frame of this document). The Cape Canaveral, Riviera, and Port Everglades sites are the locations for modernizations of existing power plant sites for capacity additions in 2013, 2014, and 2016, respectively.

The five Preferred Sites are discussed below in general chronological order in regard to when the capacity additions are projected to occur.

Preferred Site # 1: St. Lucie Plant, St. Lucie County

FPL's St. Lucie Plant is located in St. Lucie County on Hutchinson Island on an FPL-owned 1,130-acre site. The plant site is bordered by the Atlantic Ocean to the east and the Indian River Lagoon to the west. Located on the site are two nuclear-powered generating units, St. Lucie Units 1 & 2, which have been in operation since 1976 and 1983, respectively.

The generating capacity addition is an increase in the capacity of the two existing nuclear generating units that is used to serve FPL's customers of approximately 129 MW for St. Lucie Unit 1 and 115 MW for St. Lucie Unit 2. This capacity uprate is referred to as an Extended Power Uprate (EPU). The difference between the two values is due to FPL's 100% ownership share of St. Lucie Unit 1 and its 85% ownership share of St. Lucie Unit 2. This work involves changes to several existing main components within the existing facilities to increase their capability to produce steam for the generation of electricity. No new site facilities are required as part of this capacity "uprate." This capacity uprate, along with a similar capacity uprate of FPL's existing Turkey Point nuclear units, was approved by the FPSC in January 2008. A portion (31 MW) of the uprated capacity for St. Lucie Unit 2 has already been implemented and the remainder of the uprated capacity is projected to be in-service by the end of 2012.[6]

a. **U.S. Geological Survey (USGS) Map**

A USGS map of the FPL St. Lucie Nuclear site is found at the end of this chapter.

b. **Proposed Facilities Layout**

A map of the general layout of the proposed generating facilities at the site is found at the end of this chapter.

c. **Map of Site and Adjacent Areas**

An overview map of the site and adjacent areas is also found at the end of this chapter.

d. **Existing Land Uses of Site and Adjacent Areas**

St. Lucie Units 1 & 2 are pressurized water reactors, each having two steam generators. The prominent structures, enclosed facilities, and equipment associated

[6] FPL has also been pursuing the addition of six wind turbines at the St. Lucie plant site for a number of years. However, to-date FPL has been unable to obtain the necessary local land use approvals that would first be needed before state and federal approvals could be sought.

with St. Lucie Units 1 & 2 include the containment building, the turbine generator building, the auxiliary building, and the fuel handling building.

Prominent features beyond the power block area include the intake and discharge canals, switchyard, spent-fuel storage facilities, technical and administrative support facilities, and public education facilities (the Energy Encounter and the College of Turtle Knowledge). Significant features surrounding the St. Lucie Units 1 & 2 are predominately undeveloped land and water bodies including; Big Mud Creek, the Atlantic Ocean, Herman's Bay, and Indian River Lagoon.

In regard to the nuclear capacity uprates, the only changes will be modifications to the existing power generation facilities within the power block area, modifications to the switchyard facilities, and modifications to the transmission lines from St. Lucie to Midway substation. None of the other existing facilities at the plant will change as a result of the uprates.

e. General Environment Features On and In the Site Vicinity

1. Natural Environment

FPL's St. Lucie Plant is located in St. Lucie County on Hutchinson Island on an FPL-owned 1,130-acre site. The St. Lucie Plant includes the reactor buildings, turbine buildings, access/security building, auxiliary building, maintenance facilities, and miscellaneous warehouses and other buildings associated with the operation of Units 1 & 2. The site includes adjacent undeveloped mangrove areas. As a result of the capacity uprates, the site characteristics will not change.

2. Listed Species

The construction during the uprating of the units, and operation of the units after the capacity uprating is completed, are not expected to adversely affect any rare, endangered, or threatened species. Some listed species known to occur in the area of the plant location are Atlantic sturgeon (*Acipenser oxyrinchus*), smalltooth sawfish (*Pristis pectinate*), loggerhead sea turtle (*Caretta caretta*), green sea turtle (*Chelonia mydas)*, leatherback sea turtle (*Dermochelys coriacea*), hawksbill sea turtle (*Eretmochelys imbriccata*), gopher tortoise (*Gopherus polyphemus*), kemp's ridley sea turtle (*Lepidochelys kempi*), wood stork (*Mycteria americana*), black skimmer (*Rynchops niger*), and least tern (*Sterna antillarum*).

No changes in wildlife populations at the adjacent undeveloped areas are anticipated, including listed species. Noise and lighting impacts will not change and it is expected that wildlife will continue to use the undeveloped areas within the St. Lucie Plant boundary.

3. **Natural Resources of Regional Significance Status**

Significant features surrounding the St. Lucie Units 1 & 2 are predominately undeveloped land and water bodies including; Big Mud Creek, the Atlantic Ocean, Herman's Bay, and Indian River Lagoon.

4. **Other Significant Features**

FPL is not aware of any other significant features of the site.

f. **Design Features and Mitigation Options**

The source of cooling water for the St. Lucie Plant is the Atlantic Ocean. The cooling system for the two generating units is a once-through system. The effects of the discharge of cooling water via these discharge structures were evaluated and mixing zones were established to allow compliance with thermal water quality standards as a part of the Plant's NPDES (Permit No. FL0002208). In regard to the nuclear capacity uprates, the once-through cooling system will continue to be used for the nuclear units.

g. **Local Government Future Land Use Designations**

St. Lucie Units 1 & 2 are located in unincorporated St. Lucie County, Florida. The County has adopted a comprehensive plan, which is updated on a periodic basis. The County Comprehensive Plan incorporates a map that depicts the future land use categories of all property falling within the unincorporated portions of the County. The St. Lucie Plant has a Future Land Use category of Transportation/Utilities (T/U) according to the St. Lucie County Future Land Use Map. The T/U category is described in the St. Lucie County Comprehensive Plan Future Land Use Element Future Land Use.

h. **Site Selection Criteria Process**

The site has been selected as a Preferred Site for the nuclear capacity uprates because it is an existing nuclear plant site and, therefore, offers the opportunity for increased nuclear capacity.

i. **Water Resources**

The source of cooling water for the St. Lucie Plant is the Atlantic Ocean. The once-through cooling system flow will not change as a result of the nuclear uprates. Due to the existing nature of the St. Lucie Plant, surrounding surface waters will not be adversely affected by the generation capacity addition. Storm water will be handled by the existing facilities and no new areas will be impacted. Wetlands, groundwater, and nearby surface waters will not be impacted.

j. **Geological Features of Site and Adjacent Areas**

Beneath the land surface, there is a peat layer 4 to 6 feet thick. Below this layer is the Anastasia Formation, a sedimentary rock formation composed of clay lenses, sandy limestone, and silty fine to medium sand with fragmented shells. This highly permeable stratum extends 35 to 90 feet below mean sea level (msl). Underlying this stratum there is a semi-permeable zone, The Hawthorn Formation, consisting of slightly clayey and very fine silt which extends 600 feet below msl.

The original surficial deposits at the St. Lucie Plant were excavated to a depth of 60 feet and backfilled with Category I or II fill. The fill is underlain by the Anastasia formation, a sequence of partially cemented sand and sandy limestone, which extends to an average depth of about 145 feet. The Anastasia is underlain to a depth of about 600 to 700 feet by the partially cemented and indurated sands, clays, and sandy limestones of The Hawthorn Formation. Underlying these surface strata are about 13,000 feet of Jurassic through Tertiary Formations, primarily carbonate rocks. These formations have a relatively gentle slope to the southeast.

k. **Projected Water Quantities for Various Uses**

No change is expected in the quantity of industrial wastewaters generated by the facility. Therefore, no change in that compliance achievement status is expected. The capacity uprates will not cause any changes in hydrologic or water quality conditions due to diversion, interception, or additions to surface water flow. The St. Lucie Plant does not directly withdraw groundwater under its current operations and it will not withdraw groundwater after the capacity uprates work is completed. The use of water supplied by the City of Fort Pierce will remain unchanged and there will be no changes to the groundwater discharges. There will be no quality, quantity, or hydrological changes, either by withdrawal or discharge to a drinking water source. Therefore, there will be no impacts on drinking water.

l. **Water Supply Sources by Type**

The source of cooling water for the St. Lucie Plant is the Atlantic Ocean. General plant service water, fire protection water, process water, and potable water are obtained from City of Fort Pierce. Process water uses include demineralizer regeneration, steam cycle makeup, and general service water use for washdowns. The existing St. Lucie Plant water use is projected to be unchanged as a result of the nuclear capacity uprates.

m. **Water Conservation Strategies Under Consideration**

The existing water resources will not change as a result of the nuclear capacity uprates.

n. **Water Discharges and Pollution Control**

St. Lucie Units 1 & 2 use once-through cooling water from the Atlantic Ocean to remove heat from the main (turbine) condensers via the Circulating Water System (CWS), and to remove heat from other auxiliary equipment via the Auxiliary Equipment Cooling Water System (AECWS). The great majority of this cooling water is used for the CWS.

Under emergency conditions, water can be withdrawn from Big Mud Creek via the Emergency Intake Canal through two 54-inch pipe assemblies in the barrier wall that separates the Creek from the Canal. FPL does not use this intake during normal operations, but does test this system quarterly.

The facility employs a Best Management Practices (BMP) plan and Spill Prevention, Control, and Countermeasure (SPCC) plan to control the inadvertent release of pollutants.

o. **Fuel Delivery, Storage, Waste Disposal, and Pollution Control**

St. Lucie Units 1 & 2 are licensed for uranium-dioxide fuel that is slightly enriched uranium-235. The uranium-dioxide fuel is in the form of pellets contained in Zircaloy tubes with welded end plugs to confine radionuclides. The tubes are fabricated into assemblies designed for loading into the reactor core. Each reactor core includes 217 fuel assemblies.

FPL currently replaces approximately one-third of the fuel assemblies in each reactor at intervals of approximately 18 months. FPL operates the reactors such that the average fuel usage by the reactors is approximately 47,000 megawatt-days per metric ton uranium. In regard to the nuclear capacity uprates, more nuclear fuel will be used due to the increased capacity of each generating unit. Used fuel assemblies are stored in the onsite Nuclear Regulatory Commission (NRC)-approved spent fuel storage facilities. Following completion of the uprates, approximately 11 percent more nuclear fuel will be used to increase the capacity of each generating unit. No changes in the fuel-handling facilities are required.

Diesel fuel is used in a number of emergency generators that include four main plant generators, two building generators, and various general purpose diesel engines. The main plant emergency generators will not be changed as a result of the generation capacity additions. These emergency generators are for standby use only and are tested to assure reliability and for maintenance. Diesel fuel is delivered to the St. Lucie Plant by truck as needed, and stored in tanks with secondary containment.

p. **Air Emissions and Control Systems**

The St. Lucie Plant is classified as a minor source of air pollution, since FDEP has issued a Federally Enforceable State Operating Permit (FESOP) to keep emissions less than 100 tons per year for any air pollutant regulated under the Clean Air Act. The applicable units at the St. Lucie Plant consist of eight large main plant diesel engines, two smaller diesel engines, and various general-purpose diesel engines. The air emissions from these engines are limited by the use of 0.05-percent sulfur diesel fuel and good combustion practices. Best Available Control Technology (BACT) is not applicable to these existing emission units.

Nitrogen oxide (NO_x) emissions from the operation of the diesel engines comprise the limiting pollutant for these diesel units at the St Lucie Plant. The FDEP FESOP limits NO_x emissions to 99.4 tons, which includes fuel use limits on the large main plant emergency diesel engines of 97,000 gallons in any 12-month consecutive period and the smaller building and general purpose diesel engines of 190,000 gallons in any 12-month consecutive period. Also, the Plant may choose to combine the diesel units' fuel-tracking which then limits the NO_x totals for a 12-month consecutive period to a maximum of 80 tons. There will be no change in the operation or emissions of the diesel engines resulting from the nuclear capacity uprates.

In addition, the generation capacity additions will not result in an increase of CO_2 or other greenhouse gas emissions. In fact, the increases in emission-free nuclear generation capacity are projected to result in decreased FPL system-wide emissions of CO_2.

q. **Noise Emissions and Control Systems**

A field survey and impact assessment of noise expected to be caused by construction activities at the site was conducted. Predicted noise levels are not expected to result in adverse noise impacts in the vicinity of the site during construction or operation.

r. **Status of Applications**

A Site Certification Application (SCA) under the Florida Electrical Power Plant Siting Act was filed in December 2007 and a final order issued in September 2008. The FPSC voted to approve the need for the St. Lucie (and Turkey Point) nuclear capacity uprates and the final order approving the need for these capacity additions was issued in January 2008.

A License Amendment request for the EPU was submitted to the NRC in November 2010. There are two components to that application; one is the Environmental Assessment (EA) and the other is the Safety component. The St. Lucie Plant EA was published in the Federal Register in January 2012. The Application is still in process.

Preferred Site # 2: Turkey Point Plant, Miami-Dade County

The Turkey Point Plant site is located on the west side of Biscayne Bay, 25 miles south of Miami. The site is directly on the shoreline of Biscayne Bay and is geographically located approximately 9 miles east of Florida City on Palm Drive. Public access to the plant site is limited due to the nuclear units located there. The land surrounding the site is owned by FPL and acts as a buffer zone. The site is comprised of two nuclear units (Units 3 & 4), two natural gas/oil conventional steam units (Units 1 & 2 with Unit 2 currently serving in a synchronous condenser mode to provide voltage support), one CC natural gas unit (Unit 5), nine small diesel generators, the cooling canals, an FPL-maintained natural wildlife area, and wetlands that have been set aside as the Everglades Mitigation Bank (EMB).

Turkey Point Units 3 & 4 have been in operation since 1972 and 1973, respectively. The Turkey Point site has been selected as a Preferred Site for the increase in the capacity of its two existing nuclear generating units by approximately 123 MW each. This capacity uprate is referred to as an Extended Power Uprate (EPU). This work involves changes to several existing main components within the existing facilities to increase their capability to produce steam for the generation of electricity. No new or expanded facilities are required as part of this capacity "uprate." This capacity uprate, along with a similar capacity uprate of FPL's existing St. Lucie nuclear units, was approved by the FPSC in January 2008. The capacity uprates at Turkey Point are projected to be in-service, in part, during 2012 and completely in-service in 2013.

As previously mentioned, FPL is pursuing licensing for two new nuclear units at the Turkey Point site. Each of these two units would provide 1,100 MW of capacity. Current projections for the in-service dates of these two units, Turkey Point Units 6 & 7, remain beyond the 2012 through 2021 reporting time frame of this document.

a. **U.S. Geological Survey (USGS) Map**

A USGS map of the Turkey Point plant site is found at the end of this chapter.

b. **Proposed Facilities Layout**

A map of the general layout of the Turkey Point Units 3 and 4 generating facilities at the site is found at the end of this chapter.

c. **Map of Site and Adjacent Areas**

An overview map of the site and adjacent areas is also found at the end of this chapter.

d. **Existing Land Uses of Site and Adjacent Areas**

The Turkey Point Plant site is located on the west side of Biscayne Bay, 25 miles south of Miami. The site is directly on the shoreline of Biscayne Bay and is geographically located approximately 9 miles east of Florida City on Palm Drive.
The five existing generating units and support facilities occupy approximately 150 acres of the approximately 11,000-acre Turkey Point Plant site.

Prominent features beyond the power block area include the intake system, cooling canal system, switchyard, spent fuel storage facilities, and technical and administrative support facilities The cooling canal system occupies approximately 5,900 acres.

The two 400-megawatt (MW) (nominal) fossil fuel-fired steam electric generation units at the Turkey Point Plant have been in service since 1967 (Unit 1) and 1968 (Unit 2). These units have historically burned residual fuel oil and/or natural gas with a maximum equivalent sulfur content of 1 percent. Unit 2 is currently serving, not as a power generating unit, but as a synchronous condenser to provide voltage support to the southeastern end of FPL's transmission system. The two 700-MW (nominal) nuclear units have been in service since 1972 (Unit 3) and 1973 (Unit 4). Turkey Point Units 3 and 4 are pressurized water reactor (PWR) units. Turkey Point Unit 5 is a nominal 1,150-MW natural gas-fired combined cycle (CC) unit that began operation in 2007. Significant features in the vicinity of the site include Biscayne National Park, the Miami-Dade County Homestead Bayfront Park, and the Everglades National Park.

e. **General Environment Features On and In the Site Vicinity**

1. **Natural Environment**

   The Turkey Point Plant site is located on the west side of Biscayne Bay, 25 miles south of Miami. The site is directly on the shoreline of Biscayne Bay and is geographically located approximately 9 miles east of Florida City on Palm Drive. The Turkey Point Plant includes the reactor buildings, turbine buildings, access/security building, auxiliary building, maintenance facilities, and miscellaneous warehouses and other buildings associated with the operation of Units 3 & 4. As a result of the approved capacity uprates, the site characteristics will not change.

2. **Listed Species**

   The construction during the uprating of the units, and operation of the units after the capacity uprating is completed, are not expected to adversely affect any rare, endangered, or threatened species. Some listed species known to occur at the site and in the nearby Biscayne National Park that could potentially utilize the site include the peregrine falcon *(Falco peregrinus)*, wood stork *(Mycteria americana)*, American crocodile *(Crocodylus acutus)*, mangrove rivulus *(Rivulus marmoratus)*, roseate spoonbill (*Ajaja ajaja*), limpkin *(Aramus guarauna)*, little blue heron *(Egretta caerulea)*, snowy egret *(Egretta thula)*, American oystercatcher *(Haematopus palliates)*, least tern *(Sterna antillarum)*, the white ibis *(Eudocimus albus)*, and bald eagle *(Haliaeetus leucocephalus)*. No bald eagle nests are known to exist in the vicinity of the site. The federally listed, threatened American Crocodile thrives at the Turkey Point site, primarily in and around the southern end of the cooling canals which lie south of the project area. The entire site is considered crocodile habitat due to the mobility of the species and use of the site for foraging, traversing, and basking. FPL manages a program for the conservation and enhancement of the American Crocodile which is attributed with survival improvement and the downlisting of the American Crocodile from endangered to threatened.

3. **Natural Resources of Regional Significance Status**

Significant features in the vicinity of the site include Biscayne National Park, the Miami-Dade County Homestead Bayfront Park, and the Everglades National Park. The portion of Biscayne Bay adjacent to the site is included within the Biscayne National Park. Biscayne National Park contains 180,000 acres, approximately 95 percent of which is open water interspersed with more than 40 keys. The Biscayne National Park headquarters is located approximately 2 miles north of the Turkey Point Plant and is adjacent to the Miami-Dade County Homestead Bayfront Park which contains a marina and day-use recreational facilities.

4. **Other Significant Features**

FPL is not aware of any other significant features of the site.

f. **Design Features and Mitigation Options**

Turkey Point Units 3 & 4 uses cooling water from a closed-cycle cooling canal system to remove heat from the main (turbine) condensers, and to remove heat from other auxiliary equipment. The existing cooling canals will accommodate the increase in heat load that is associated with the increased capacity from the uprates. The maximum projected increase in water temperature entering the cooling canal system from the units resulting from the uprates is predicted to be about 2.5F, from 106.1F to 108.6F. The associated projected ma ximum increase in water temperature returning to the units is about 0.9F, from 91.9F to 92.8F.

g. **Local Government future Land Use Designations**

Local government future land use plan designates most of the site as IU-3 "(Industrial, Utilities, and Communications) Unlimited Manufacturing District." There are also areas designated GU – "Interim District." Designations for the surrounding area are primarily GU – "Interim District."

h. **Site Selection Criteria Process**

The site has been selected as a Preferred Site for the nuclear capacity uprates because it is an existing nuclear plant site and, therefore, offers the opportunity for increased nuclear capacity.

i. **Water Resources**

Unique to the Turkey Point Plant site is the self-contained cooling canal system that supplies water to condense steam used by the plant's turbine generators. The canal system consists of 36 interconnected canals. The cooling canals occupy an area approximately two miles wide by five miles long (5,900 acres), approximately four feet deep. The system performs the same function as a giant radiator. The water is circulated through the canals in a two-day journey, ending at the plant's intake pumps.

j. **Geological Features of Site and Adjacent Areas**

The Turkey Point Plant lies upon the Floridian Plateau, a partly-submerged peninsula of the continental shelf. The peninsula is underlain by approximately 4,000 to 15,000 feet of sedimentary rocks consisting of limestone and associated formations that range in age from Paleozoic to Recent. Little is known about the basement complex of Paleozoic igneous and metamorphic rocks due to their great depth.

Generally in Miami-Dade County, the surficial aquifer (Biscayne Aquifer) consists of a wedge-shaped system of porous clastic and carbonate sedimentary materials, primarily limestone and sand deposits of the Miocene to late Quaternary age. The Biscayne Aquifer is thickest along the eastern coast and varies in thickness from 80 to 200 feet thick. The surficial aquifer is typically composed of Pamlico Sand, Miami Limestone (Oolite), the Fort Thompson and Anastasia Formations (lateral equivalents), Caloosahatchee Marl, and the Tamiami formation. The lower confining layers below the surficial aquifer range in thickness from 350 to 600 feet and are composed of the Hawthorn Group. Beneath the Hawthorn Group, the Floridan Aquifer System ranges from 2,800 to 3,400 feet thick and consists of Suwannee Limestone, Avon Park Limestone, and the Oldsmar Formations.

k. **Projected Water Quantities for Various Uses**

The addition of nuclear generating capacity as a result of the uprates will not cause any changes in the quantity or characteristics of industrial wastewaters generated by the facility; therefore, no change in that compliance achievement status is expected. The uprates will not cause any changes in hydrologic or water quality conditions due to diversion, interception, or additions to surface water flow. The Turkey Point Nuclear Plant does not directly withdraw groundwater under its current operations and it will not do so after the capacity uprates. Locally, groundwater is present beneath the site in the surficial or Biscayne Aquifer and in deeper aquifer zones that are part of the Floridan Aquifer System. There will be no effects on those deeper aquifer zones from the capacity uprates.

l. **Water Supply Sources and Type**

The source of cooling water for Turkey Point Units 3 & 4 is the cooling canal system. There will be no increase in the amount of water withdrawn as a result of the capacity uprates. General plant service water, fire protection water, process water, and potable water are obtained from Miami-Dade County. Process water uses include demineralizer regeneration, steam cycle makeup, and general service water use for washdowns. The water use for the facility will not change as a result of the capacity uprates.

m. **Water Conservation Strategies**

The existing water resources will not change as a result of the nuclear capacity uprates.

n. **Water Discharges and Pollution Control**

Heated water discharges are dissipated using the existing closed cooling canal system.

The facility employs a Best Management Practices (BMP) plan and Spill Prevention, Control, and Countermeasure (SPCC) plan to prevent and control the inadvertent release of pollutants.

o. **Fuel Delivery, Storage, Waste Disposal, and Pollution Control**

Turkey Point Units 3 & 4 utilize uranium-dioxide fuel that is slightly enriched uranium-235. The uranium-dioxide fuel is in the form of pellets contained in Zircaloy tubes with welded end plugs to confine radionuclides. The tubes are fabricated into assemblies designed for loading into the reactor core. Used fuel assemblies are stored in the onsite NRC-approved spent fuel storage facilities.

FPL currently replaces approximately one-third of the fuel assemblies in each reactor at refueling intervals of approximately 18 months. FPL operates the reactors such that the average fuel usage by the reactors is approximately 45,000 megawatt-days per metric ton of uranium. Following completion of the uprates, more nuclear fuel will be used to increase the capacity of each unit. No changes in the fuel handling facilities are required. Following completion of the uprates, approximately 11 percent more nuclear fuel will be used to increase the capacity of each unit. No changes in the fuel-handling facilities are required.

Diesel fuel is used in a number of emergency generators that include four main emergency generators, five smaller emergency generators, and various general purpose diesel engines. The emergency generators will not be changed as a result of the capacity uprates. These emergency generators are for stand-by use only and only operated for testing purposes to assure reliability and for maintenance. Diesel fuel for the emergency generators is delivered to the Turkey Point Plant by truck as needed, and stored in tanks with secondary containment.

p. <u>Air Emissions and Control Systems</u>

The normal operation of Turkey Point Units 3 & 4 does not create fossil fuel-related air emissions. However, there are nine emergency generators associated with Units 3 & 4. Four of these nine emergency generators are main plant emergency generators which are rated at 2.5 MW each. The remaining five generators are smaller emergency generators which are associated with the security system. In addition, various general purpose diesels are used as needed for Units 3 & 4.

Turkey Point Plant Units 3 & 4's associated emergency generators and diesel engines, together with Units 1, 2, & 5, are classified as a major source of air pollution. FDEP has issued a separate Title V Air Operating Permit for the Turkey Point Nuclear Plant (Permit Number 0250003-004-AV). There are no operating limits for the emergency generators or diesel engines. Emergency diesel generators are limited to ultra-low sulfur distillate (0.0015% sulfur). NOx emissions are regulated under Reasonably Available Control Technology (RACT) requirements in Rule 62-296.570(4)(b)7 F.A.C., which limit NO_x emissions to 4.75 lb/MMBtu. The use of 0.05

percent sulfur diesel fuel and good combustion practices serve to keep NO_x emissions under this limit.

q. **Noise Emissions and Control Systems**

A field survey and impact assessment of noise expected to be caused by activities associated with the uprates was conducted. Predicted noise levels are not expected to result in adverse noise impacts in the vicinity of the site.

r. **Status of Applications**

A Site Certification Application (SCA) under the Florida Electrical Power Plant Siting Act was filed in January 2008 and a final order was issued in October 2008. The FPSC voted to approve the need for the Turkey Point (and St. Lucie) uprates and the final order approving the need for this additional nuclear capacity was issued in January 2008.

A License Amendment request for the EPU was submitted to the NRC in October 2010. There are two components to that application; one is the Environmental Assessment (EA) and the other is the Safety component. The Turkey Point Plant EA was published in the Federal Register in November 2011. The Application is still in process.

Preferred Site # 3: Cape Canaveral Plant, Brevard County

This site is located on the existing FPL Cape Canaveral Plant property in unincorporated Brevard County. The site is bound to the east by the Indian River Lagoon and on the west by a four lane highway (US. 1). The city of Port St. Johns is located less than a mile away. A rail line is located near the plant.

The site previously housed two steam generating units (Units 1 & 2) with 788 MW (Summer) of generating capacity. The units formerly occupied a portion of the 43 acres that are wholly owned by FPL. FPL is in the process of modernizing the existing Cape Canaveral Plant, to be renamed the Cape Canaveral Next Generation Clean Energy Center (CCEC), by replacing the previous two steam generating units with a single modern, highly efficient, lower-emission next-generation clean energy center using advanced combined cycle (CC) technology. The old units have been taken out of service. The demolition of the Cape Canaveral Plant began in mid-2010 and was completed during the first quarter of 2011. Construction for the new CC unit began in March 2011 and is expected to be completed by June 2013.

a. **Geological Survey (USGS) Map**

A USGS map of the CCEC site is found at the end of this chapter.

b. **Proposed Facilities Layout**

A map of the general layout of the CCEC generating facilities at the site is found at the end of this chapter.

c. **Map of Site and Adjacent Areas**

An overview map of the site and adjacent areas is also found at the end of this chapter.

d. **Existing Land Uses of Site and Adjacent Areas**

The existing and future land uses on the site are primarily dedicated to electrical generation; i.e., FPL's former Cape Canaveral Units 1 & 2 and the future CCEC unit. The existing land uses that are adjacent to the site consist of single- and multi-family residences to the south and southwest, commercial property to the northwest, utility systems to the west, and a private medical/office facility to the north.

e. **General Environment Features On and In the Site Vicinity**

1. **Natural Environment**

The natural environment surrounding the site includes the Indian River Lagoon to the east and upland scrub, pine and hardwoods to the north and south. Vegetation with the approximately 45-acre offsite construction laydown and parking area (located west of U.S. Highway 1) consists of open land, upland scrub, pine, hardwoods along with exotic plant species.

2. **Listed Species**

No adverse impacts to federally or state-listed terrestrial plants and animals are expected in association with construction at the site, due to the existing developed nature of the site and lack of suitable onsite habitat for listed species. Federal- or state-listed terrestrial plants and animals inhabiting the offsite construction laydown and parking area are limited to the state-listed gopher tortoise and the state- and federally-listed scrub jay. The warm water discharges from the plant attract manatees, an endangered species. FPL continues to work closely with state and federal wildlife agencies to ensure protection of the manatees during the modernization process. In 2010, FPL installed a temporary heating system to warm the water for the manatees as required during manatee season. FPL has complied, and will continue to comply, with several other manatee-related conditions of certification to ensure the protection of the manatees during the modernization work and during subsequent operation of the new generating facility.

3. **Natural Resources of Regional Significance Status**

The construction and operation of a natural gas-fired CC generating facility at this location is consistent with the existing use at the site and is not expected to have any adverse impacts on parks, recreation areas, or environmentally sensitive lands.

4. **Other Significant Features**

FPL is not aware of any other significant features of the site.

f. **Design Features and Mitigation Options**

The design option is to replace the previous steam generating units (Units 1 & 2) with one new 1,210 MW (approximate) CC unit consisting of three new combustion turbines (CT), three new heat recovery steam generators (HRSG), and a new steam turbine. The new CC unit is projected to be in-service in mid-2013. Natural gas delivered via pipeline is the primary fuel type for this unit with ULSD serving as a backup fuel.

g. **Local Government Future Land Use Designations**

Local government future land use designation for the site is "Public Utilities" and the area has been rezoned to GML-U. Designations for the surrounding area are primarily "Community Commercial" and "Residential". A land use map of the site and adjacent areas is also found at the end of this chapter.

h. **Site Selection Criteria Process**

The Cape Canaveral Plant site was selected for a site modernization due to consideration of various factors including system load and economics. Environmental issues were not a deciding factor since this site does not exhibit significant environmental sensitivity or other environmental issues. However, the significant reduction in cooling water withdrawal and thermal component of cooling water discharges are environmental benefits of replacing the previous steam units with a new CC unit including a significant reduction in system fuel use, a significant reduction in system air emissions, improved aesthetics at the site, and continued warm water discharge for the manatees as required during manatee season. Further, modernizing this existing facility reduces the impact on natural resources by not requiring new land, new water sources, or additional off-site transmission siting.

i. **<u>Water Resources</u>**

Condenser cooling for the steam cycle portion of the new plant and auxiliary cooling will come from the existing cooling water intake system. Process, potable, and reclaimed water for the new plant will come from the existing City of Cocoa's potable water supply.

j. **<u>Geological Features of Site and Adjacent Areas</u>**

The site is located on the Atlantic Coastal Ridge and is at an approximate elevation of 12 feet above mean sea level (msl). The land consists primarily of fine to medium sand that parallels the coast. There is a lack of shell as it was deposited during a time of transgression. The base of the sedimentary rocks is made up of a thick, primarily carbonate sequence deposited during the Jurassic age through the Pleistocene age. Starting in the Miocene age and continuing through the Holocene age, siliciclastic sedimentation became more predominant. The basement rocks in this area consist of low-grade metamorphic and igneous intrusives, which occur several thousand feet below land surface and are Precambrian, Paleozoic, and Mesozoic in age.

k. **<u>Projected Water Quantities for Various Uses</u>**

The estimated quantity of water required for processing is approximately 0.232 million gallons per day (mgd) for uses such as process water and service water. Approximately 619 mgd of cooling water would be cycled through the once-through cooling water system. Potable water demand is expected to average .001 mgd.

l. **<u>Water Supply Sources by Type</u>**

The modernized plant will continue to use the Indian River Lagoon water as the source of once-through cooling water. Such needs for cooling water will comply with the St. John's River Water Management District (SJRWMD) conditions of certification. Process and potable water for the new plant will come from the existing City of Cocoa's potable water supply. Reclaimed water will be used for irrigation.

m. **Water Conservation Strategies Under Consideration**

No additional water resources will be required as a result of the modernization project. Combined cycle technology uses less water by design than traditional steam generation units.

n. **Water Discharges and Pollution Control**

The modernized site will utilize portions of the existing once-through cooling water systems for heat dissipation. The heat recovery steam generator blowdown will be reused to the maximum extent practicable or mixed with the cooling water flow before discharge. Reverse osmosis (R/O) reject will be mixed with the plant's once-through cooling water system. Storm water runoff will be collected and routed to storm water ponds. The facility will employ a Best Management Practices (BMP) plan and Spill Prevention, Control, and Countermeasure (SPCC) plan to prevent and control the inadvertent release of pollutants.

o. **Fuel Delivery, Storage, Waste Disposal, and Pollution Control**

Natural gas for the new unit will be transported to the site via a pipeline. New off-site or on-site gas compressors will be installed to raise the gas pressure of the existing pipeline for the new unit. ULSD "light oil" will be received by truck or barge from Port Canaveral and stored in an above-ground storage tank.

p. **Air Emissions and Control Systems**

The emission rates of CCEC would decrease by over 90% from the former Cape Canaveral Plant, resulting in substantial annual emission reductions and increased air quality benefits per unit of energy produced. The use of natural gas, ULSD, and combustion controls would minimize air emissions from the unit and ensure compliance with applicable emission limiting standards. Using these fuels minimizes emissions of sulfur dioxide (SO_2), particulate matter, and other fuel-bound contaminates. Combustion controls similarly minimize the formation of nitrogen oxides (NO_x) and the combustor design will limit the formation of carbon monoxide and volatile organic compounds. When firing natural gas, NO_x emissions will be controlled using dry-low NO_x combustion technology and selective catalytic reduction

(SCR). Water injection and SCR will be used to reduce NO_x emissions during operations when using ULSD as backup fuel. These design alternatives are equivalent to the Best Available Control Technology for air emissions, and minimize such emissions while balancing economic, environmental, and energy impacts. In total, the design of the new CCEC plant will incorporate features that would make it among the most efficient and cleanest power plants in the State of Florida.

q. **Noise Emissions and Control Systems**

Noise from the operation of the new unit will be within allowable levels.

r. **Status of Applications**

The FPSC voted to approve the need for the modernization project and the need order was issued in September 2008. The project received final state certification on October 9, 2009, through the issuance of a final order signed by the Secretary of the Department of Environmental Protection (DEP).

Preferred Site # 4: Riviera Plant, Palm Beach County

This site is located on the former FPL Riviera Plant property primarily within Riviera Beach, Palm Beach County (with a small portion of the Site in West Palm Beach). The site is bound to the east by the Lake Worth Lagoon (Intracoastal Waterway) and on the west by a four lane highway (US. 1). The site has barge access via the Port of Palm Beach. A rail line is located near the plant.

The previous site generating capacity was made up of two 300 MW (approximate) steam generating units (Units 3 & 4) that have been taken out of service and dismantled in 2011. Units 1 & 2 were previously retired and dismantled and are no longer on the plant site.

FPL is in the process of modernizing the former Riviera Plant, to be renamed the Riviera Beach Next Generation Clean Energy Center (RBEC), by replacing the existing generating units with a modern, highly efficient, lower-emission next-generation clean energy center using advanced CC technology.

a. **U.S. Geological Survey (USGS) Map**

A USGS map of the RBEC site is found at the end of this chapter.

b. Proposed Facilities Layout

A general layout of the RBEC generating facilities is found at the end of this chapter.

c. Map of Site and Adjacent Areas

An overview map of the site and adjacent areas is also found at the end of this chapter.

d. Existing Land Uses of Site and Adjacent Areas

The previous Riviera Plant consisted of two 300 MW (approximate) units with conventional dual-fuel fired steam boilers and steam turbine units. The plant site includes minimal vegetation and a landscape buffer area south of the power plant. Adjacent land uses include port facilities and associated industrial activities, as well as light commercial and residential development.

e. General Environment Features On and In the Site Vicinity

1. Natural Environment

The majority of the site is comprised of facilities related to electric power generation. The site is located adjacent to the Intracoastal Waterway. The site provides warm water as required for manatees pursuant to the facility's Manatee Protection Plan.

2. Listed Species

No adverse impacts to federally or state-listed terrestrial plants and animals are expected in association with construction at the site, due to the existing developed nature of the site and lack of suitable onsite habitat for listed species. The warm water discharges from the plant attract manatees, an endangered species. FPL continues to work closely with state and federal wildlife agencies to ensure protection of the manatees during the modernization process. In 2009, FPL installed a temporary heating system to warm the water for the manatees as required pursuant to the facility's Manatee Protection Plan. FPL will also be complying with several other manatee-related conditions of certification to ensure the protection of the manatees during the modernization work and during operation of the RBEC.

3. Natural Resources of Regional Significance Status

The construction and operation of a natural gas-fired CC generating facility at this location is consistent with the existing use at the site and is not expected to have any adverse impacts on parks, recreation areas, or environmentally sensitive lands.

4. **Other Significant Features**

FPL is not aware of any other significant features of the site.

f. **Design Features and Mitigation Options**

The design option is to replace the previous steam generating units (Units 3 & 4) with one new 1,212 MW (approximate) CC unit consisting of three new combustion turbines (CT), three new heat recovery steam generators (HRSG), and a new steam turbine. The new CC unit is projected to be in service in mid-2014. Natural gas delivered via pipeline is the primary fuel type for the unit with ULSD serving as a backup fuel.

g. **Local Government Future Land Use Designations**

Local government future land use designation for the site is "Utility". The Port of Palm Beach is to the north of the site. Designation to the west of the site is "Commercial." To the south of the site is "Residential" and is in the City of West Palm Beach. A land use map of the site and adjacent areas is also found at the end of this chapter.

h. **Site Selection Criteria Process**

This site has been selected for site modernization due to consideration of various factors including system load and economics. Environmental issues were not a deciding factor since this site does not exhibit significant environmental sensitivity or other environmental issues. However, there are environmental benefits of replacing the existing steam units with a new CC unit including a significant reduction in system air emissions, improved aesthetics at the site, and continued warm water discharge for the manatees as required during manatee season. Further, modernizing this existing facility reduces the impact on natural resources by not requiring new land or new water resources.

i. **Water Resources**

Water from the Lake Worth Lagoon (Intracoastal Waterway) will be used for once-through cooling water. RBEC will utilize portions of the existing once-through cooling water intake and discharge structures. Water for cooling pump seals and irrigation will come from three onsite surficial aquifer wells. Process and potable water for the converted plant will come from the existing City of Riviera Beach potable water supply.

j. **Geological Features of Site and Adjacent Areas**

The site is underlain by the surficial aquifer system. The surficial aquifer system in eastern Palm Beach County is primarily composed of sand, sandstone, shell, silt, calcareous clay (marl), and limestone deposited during the Pleistocene and Pliocene Epochs. The sediments forming the aquifer system are the Pamlico Sand, Fort Thompson Formation (Pleistocene) and the Caloosahatchee Marl (Pleistocene and Pliocene). Permeable sediments in the upper part of the Tamiami Formation (Pliocene) are also part of the aquifer system.

The surficial aquifer is underlain by at least 600 feet the Hawthorn formation (confining unit). The Floridan Aquifer System underlies the Hawthorn formation.

k. **Projected Water Quantities for Various Uses**

The estimated quantity of water required for processing is approximately 0.232 million gallons per day (mgd) for uses such as process water and service water. Approximately 600 mgd of cooling water would be cycled through the once-through cooling water system. Potable water demand is expected to average .001 mgd.

l. **Water Supply Sources by Type**

The modernized plant will continue to use Lake Worth Lagoon water as the source of once-through cooling water. Water for cooling pump seals and irrigation will come from on-site surficial aquifer wells currently authorized under SFWMD conditions of certification. Process and potable water for the new plant will come from the existing City of Riviera Beach's potable water supply.

m. **Water Conservation Strategies Under Consideration**

No additional water resources will be required as a result of the modernization project. Combined cycle technology uses less water by design than traditional steam generation units.

n. **Water Discharges and Pollution Control**

The modernized plant will utilize portions of the existing once-through cooling water system for heat dissipation. The heat recovery steam generator blowdown will be mixed with the cooling water flow before discharge. Reverse osmosis (R/O) reject will be mixed with the plant's once-through cooling water system prior to discharge. Storm water runoff will be collected and routed to storm water ponds. The facility will employ a Best Management Practices (BMP) plan and Spill Prevention, Control, and Countermeasure (SPCC) plan to prevent and control the inadvertent release of pollutants.

o. Fuel Delivery, Storage, Waste Disposal, and Pollution Control

Natural gas for the new unit would be transported to the site via an approximately 6 mile FPL-owned pipeline, the RBEC Lateral. New gas compressors will be installed at the existing FPL 45th Street Terminal facility in Riviera Beach to raise the gas pressure of the pipeline to the appropriate level for the new unit. ULSD would be received by truck, pipeline, or barge and stored in a new above-ground storage tank.

p. Air Emissions and Control Systems

The regulated air emission rates at the new plant would be more than 90 percent lower than the previous Riviera Plant's emission rates, resulting in significant annual emissions reductions and air quality benefits per unit of energy produced. The use of natural gas and ULSD and combustion controls would minimize air emissions from the unit and ensure compliance with applicable emission limiting standards. Using these fuels minimizes emissions of sulfur dioxide (SO_2), particulate matter, and other fuel-bound contaminates. Combustion controls similarly minimize the formation of nitrogen oxides (NO_x) and the combustor design will limit the formation of carbon monoxide and volatile organic compounds. When firing natural gas, NO_x emissions will be controlled using dry-low NO_x combustion technology and selective catalytic reduction (SCR). Water injection and SCR will be used to reduce NO_x emissions during operations when using ULSD as backup fuel. These design alternatives are equivalent to the Best Available Control Technology for air emissions, and minimize such emissions while balancing economic, environmental, and energy impacts. Taken together, the design of RBEC would incorporate features that will make it among the most efficient and cleanest power plants in the State of Florida.

q. Noise Emissions and Control Systems

Noise expected to be caused by unit construction at the site is expected to be below current noise levels for the residents nearest the site.

r. Status of Applications

The FPSC voted to approve the need for the modernization project and the need order was issued in September 2008. The project received final state certification on November 24, 2009, through the issuance of a final order signed by the Secretary of the DEP. The project received final certification for the RBEC 6 mile pipeline lateral and compressor station on March 15, 2011.

Preferred Site # 5: Port Everglades, Broward County

This site is located on the existing FPL Port Everglades Plant property within the City of Hollywood, Broward County. The site is surrounded by the Port of Port Everglades. The site has barge access via the Port of Port Everglades. A rail line is located near the plant.

The previous site generating capacity was made up of two 200 MW (approximate) steam generating units (Units 1 & 2) and two 400 MW (approximate) steam generating units (Units 3 & 4). The four units are proposed to be taken out of service and dismantled in 2013 as part of the modernization of the plant site.

The Port Everglades Plant site has been listed as a Potential Site in previous FPL Site Plans for both CC and simple cycle combustion turbine (CT) generation options. On March 27, 2012, the FPSC voted to authorized the modernization of the existing Port Everglades Plant. As a result of the modernization of the site, the new generating unit - to be renamed the Port Everglades Next Generation Clean Energy Center (PEEC) – will replace the existing steam generating units with a modern, highly efficient, lower-emission next-generation clean energy center using advanced CC technology. The existing four steam units will first be removed from the site and will be replaced by a single new CC unit.

a. **U.S. Geological Survey (USGS) Map**
A USGS map of the PEEC site is found at the end of this chapter.

b. **Proposed Facilities Layout**
A general layout of the PEEC generating facilities is found at the end of this chapter.

c. **Map of Site and Adjacent Areas**
An overview map of the site and adjacent areas is also found at the end of this chapter.

d. **Existing Land Uses of Site and Adjacent Areas**

The existing Port Everglades Plant consists of two 200 MW (approximate) and two 400 MW (approximate) generating units with conventional dual-fuel fired steam boilers and steam turbine units. The plant site includes minimal vegetation. Adjacent land uses include port facilities and associated industrial activities, as well as light commercial and residential development.

e. **General Environment Features On and In the Site Vicinity**

1. **Natural Environment**

The majority of the site is comprised of facilities related to electric power generation for the existing Port Everglades Plant generating units. The site is located adjacent to the Intracoastal Waterway. The site provides warm water as required for manatees pursuant to the facility's Manatee Protection Plan.

2. **Listed Species**

No adverse impacts to federally or state-listed terrestrial plants and animals are expected in association with construction at the site, due to the existing developed nature of the site and lack of suitable onsite habitat for listed species. The warm water discharges from the plant attract manatees, an endangered species. FPL continues to work closely with state and federal wildlife agencies to ensure protection of the manatees during the modernization process and upon operation of the new plant. FPL plans to install a temporary heating system to provide warm water for manatees as required pursuant to the facility's Manatee Protection Plan. FPL also anticipates complying with other manatee-related conditions of certification to ensure the protection of the manatees during the modernization work and during future operations of PEEC.

3. **Natural Resources of Regional Significance Status**

The construction and operation of a natural gas-fired CC generating facility at this location is consistent with the existing use at the site and is not expected to have any adverse impacts on parks, recreation areas, or environmentally sensitive lands.

4. **Other Significant Features**

FPL is not aware of any other significant features of the site.

f. **Design Features and Mitigation Options**

The design option is to replace the existing units (Units 1 through 4) with one new 1,277 MW (approximate) unit consisting of three new combustion turbines (CT), three new heat recovery steam generators (HRSG), and a new steam turbine. The new CC unit is projected to be in service in mid-2016. Natural gas delivered via the existing pipeline is the primary fuel type for the unit with ULSD serving as a backup fuel.

g. **Local Government Future Land Use Designations**

Local government future land use designation for the site is a combination of "Electrical Generating Facility" and "Utilities Use". A land use map of the site and adjacent areas is also found at the end of this chapter.

h. **Site Selection Criteria Process**

The Port Everglades Plant has been selected for site modernization due to consideration of various factors including system load, ability to provide generation in the Miami-Dade/Broward region to help balance load and generation in the region, and economics. Environmental issues were not a deciding factor since this site does not exhibit significant environmental sensitivity or other environmental issues. However, there are environmental benefits of replacing the existing steam units with a new CC unit including a significant reduction in system air emissions, improved aesthetics at the site, and continued warm water discharge for the manatees as required pursuant to the facility's Manatee Protection Plan. Further, modernizing this existing facility reduces the impact on natural resources by not requiring new land or new water resources.

i. **Water Resources**

Water from the Intracoastal Waterway via the Port of Port Everglades Slip No. 3 is currently used for once-through cooling water supply. The new plant will utilize portions of the existing once-through cooling water intake and discharge structures. Process and potable water for the modernized plant will come from the existing City of Ft. Lauderdale potable water supply.

j. **Geological Features of Site and Adjacent Areas**

FPL's Port Everglades Plant site is underlain by the surficial aquifer system. The surficial aquifer system in eastern Broward County is primarily composed of sand, sandstone, shell, silt, calcareous clay (marl), and limestone deposited during the Pleistocene and Pliocene ages. The sediments forming the aquifer system are the

Pamlico Sand, Miami Oolite, Anastasia Formation, Key Largo Formation, and Fort Thompson Formation (Pleistocene) and the Tamiami Formation (Pliocene). The sediments in the eastern portion of the county are appreciably more permeable than in the west.

The surficial aquifer is underlain by at least 600 feet the Hawthorn formation (confining unit). The Floridan Aquifer System underlies the Hawthorn formation.

k. Projected Water Quantities for Various Uses

The estimated quantity of water required for processing is approximately 0.24 million gallons per day (mgd) for uses such as process water and service water. Approximately 635 mgd of cooling water would be cycled through the once-through cooling water system. Potable water demand is expected to average .001 mgd.

l. Water Supply Sources by Type

The modernized plant will continue to use the Intracoastal Waterway as the source of once-through cooling water. Process and potable water for the new plant will come from the existing City of Ft. Lauderdale potable water supply.

m. Water Conservation Strategies Under Consideration

No additional water resources will be required as a result of the modernization project. Combined cycle technology uses less water by design than traditional steam generation units.

n. Water Discharges and Pollution Control

The modernized plant will utilize portions of the existing once-through cooling water system for heat dissipation. The heat recovery steam generator blowdown will be reused to the maximum extent practicable or mixed with the cooling water flow before discharge. Reverse osmosis (R/O) reject will be mixed with the plant's once-through cooling water system prior to discharge. Stormwater runoff will be collected and routed to stormwater ponds. The facility will employ a Best Management Practices (BMP) plan and Spill Prevention, Control, and Countermeasure (SPCC) plan to prevent and control the inadvertent release of pollutants.

o. Fuel Delivery, Storage, Waste Disposal, and Pollution Control

Natural gas for the new unit would be transported to the site via an existing natural gas pipeline to the site. New gas compressors to raise the gas pressure of the pipeline to the appropriate level for the new unit will be installed either at the existing site or off-site. ULSD would be received by truck, pipeline, or barge and stored in a new above-ground storage tank.

p. **Air Emissions and Control Systems**

The regulated air emission rates at the new plant would be approximately 90 percent lower than the previous Port Everglades Plant's emission rates, resulting in significant annual emissions reductions and air quality benefits per unit of energy produced. The use of natural gas and ULSD and combustion controls would minimize air emissions from the unit and ensure compliance with applicable emission limiting standards. Using these fuels minimizes emissions of sulfur dioxide (SO_2), particulate matter, and other fuel-bound contaminates.

Combustion controls similarly minimize the formation of nitrogen oxides (NO_x) and the combustor design will limit the formation of carbon monoxide and volatile organic compounds. When firing natural gas, NO_x emissions will be controlled using dry-low NO_x combustion technology and selective catalytic reduction (SCR). Water injection and SCR will be used to reduce NO_x emissions during operations when using ULSD as backup fuel. These design alternatives are equivalent to the Best Available Control Technology for air emissions, and minimize such emissions while balancing economic, environmental, and energy impacts. Taken together, the design of PEEC would incorporate features that will make it among the most efficient and cleanest power plants in the State of Florida.

q. **Noise Emissions and Control Systems**

Noise expected to be caused by unit construction at the site is expected to be below current noise levels for the residents nearest the site.

r. **Status of Applications**

FPL filed a need determination with the FPSC on November 21, 2011. The FPSC authorized the need for the modernization of Port Everglades on March 27, 2012. The Site Certification Application (SCA) was submitted January 24, 2012. Concurrent with the SCA filing, FPL submitted applications for a Prevention of Significant Deterioration permit and an Industrial Wastewater Facility permit revision.

IV.F.2 Potential Sites for Generating Options

Ten (10) sites are currently identified as Potential Sites for near-term future generation additions to meet FPL's projected capacity and energy needs.[7] These sites have been identified as Potential Sites due to considerations of location to FPL load centers, space, infrastructure, and/or accessibility to fuel and transmission facilities. These sites are suitable for different capacity levels and technologies, including both renewable energy and non-renewable energy technologies for various sites.

Each of these Potential Sites offer a range of considerations relative to engineering and/or costs associated with the construction and operation of feasible technologies. In addition, each Potential Site has different characteristics that will require further definition and attention. Solely for the purpose of estimating water requirements for sites more suited for non-renewable energy technologies, it was assumed that either one dual-fuel (natural gas and light oil) simple cycle combustion turbine (CT), or a natural gas-fired CC unit, would be constructed at these Potential Sites unless otherwise noted.

A simple cycle CT would require approximately 50 gallons per minute (gpm) for both process and cooling water (assuming a cooling tower was utilized). A CC unit would require approximately up to 150 gpm for process water and up to 7.5 million gallons per day (mgd) per unit for cooling water (assuming a cooling tower is utilized). If an existing power plant site is ultimately selected for modernization (as is the case with FPL's CCEC, RBEC, and PEEC sites), the water requirements discussed above for a CC unit would be approximately correct for the modernized site. If a renewable energy generating technology is ultimately selected for one of these sites, the water requirements would be significantly less than those for CT or CC facilities.

Permits are presently considered to be obtainable for each of these sites. No significant environmental constraints are currently known for any of these sites. The Potential Sites briefly discussed below are presented in alphabetical order. At this time, FPL considers each site to be equally viable. As noted previously, FPL also considers a number of other sites as possible sites for future generation additions. These include all of the remainder of FPL's existing generation sites and other Greenfield sites.

[7] As has been described in previous FPL Site Plans, FPL also considers a number of other sites as possible sites for future generation additions. These include the remainder of FPL's existing generation sites and other Greenfield sites. Greenfield sites that FPL currently does not own, or for which FPL has not currently secured the necessary rights to, are not specifically identified as Potential Sites in order to protect the economic interests of FPL and its customers.

Potential Site # 1: Babcock Ranch , Charlotte County

This site is located within the proposed Babcock Ranch Community on the north side of Tuckers Grade, approximately 10.5 miles north of the intersection of SR-80 and SR-31 and 1.1 miles east of SR-31. The project is bordered on the north by the Babcock Ranch Preserve owned by the State of Florida. This site is a possibility for an FPL photovoltaic (PV) facility. FPL has received all permits necessary to construct a 75 MW PV facility at this location.

a. **U.S. Geological Survey (USGS) Map**

A map of this site is found at the end of this chapter.

b. **Land Uses**

Existing land use on the site is the Babcock Ranch Overlay District, and it is zoned as the Babcock Ranch Overlay Zoning District. This land use and zoning allows for solar facilities.

c. **Environmental Features**

FPL anticipates mitigating for unavoidable wildlife and/or wetland impacts as needed as a result of a PV project constructed at this site.

d. **Water Quantities**

Minimal amounts of water, if any, would be required for a PV facility.

e. **Supply Sources**

Minimal water would be required for a PV facility. A small amount may be needed to occasionally clean the solar panels in the absence of sufficient rainfall Any such water may be brought to the site by truck.

Potential Site # 2: DeSoto Solar Expansion, DeSoto County

The DeSoto site is located at 4051 Northeast Karson Street which is approximately 0.3 miles east of US 17 and immediately north of Bobay Road in Arcadia, Florida. The site is located in Sections 26, 27, & 35, Township 36 South, and Range 25 East. FPL owns an approximate 13,000 acre parcel in DeSoto County. FPL has designated approximately 5,177 acres for development of a photovoltaic (PV) facility.

The DeSoto site is home to a 25 MW PV facility that has been operational since 2009. Up to an additional 275 MW of PV generation could be constructed in phases on the remaining undeveloped land. FPL has initiated permitting for the additional PV facilities.

a. **U.S. Geological Survey (USGS) Map**

A map of this site is found at the end of this chapter.

b. **Land Uses**

Existing land use on the site is agricultural. The future land use is Electric Generating Facility.

c. **Environmental Features**

There are no significant environmental features on the site.

d. **Water Quantities**

Minimal amounts of water would be required for a future expansion of the existing PV facility.

e. **Supply Sources**

Minimal water would be required for an expanded PV facility. A small amount may be needed to occasionally clean the PV panels in the absence of sufficient rainfall. Potable water will be required in the administration building and maintenance building. FPL would propose to utilize existing wells onsite to accommodate water needs.

Potential Site # 3: Florida Heartland Solar, Glades County

This site is located within Glades County off SR 78. This site is a possibility for an FPL PV facility. FPL has initiated permitting for a PV facility of approximately 125 MW to be constructed at this location.

a. **U.S. Geological Survey (USGS) Map**

A map of this site is found at the end of this chapter.

b. **Land Uses**

The existing land use on the site is agriculture.

c. **Environmental Features**

FPL anticipates mitigating for unavoidable wildlife and/or wetland impacts as needed as a result of a PV project constructed at this site.

d. **Water Quantities**

Minimal amounts of water would be required for a PV facility.

e. **Supply Sources**

Minimal water would be required for a PV facility. A small amount may be needed to occasionally clean the PV panels in the absence of sufficient rainfall. Any such water may be brought to the site by truck.

Potential Site # 4: Hendry County

FPL has acquired a site in southeast Hendry County, off CR 833. This site is a possibility for a future PV facility and/or natural gas power generation. The site is approximately 3,127 acres.

a. **U.S. Geological Survey (USGS) Map**

A USGS map of the county has been included at the end of this chapter.

b. **Land Uses**

Hendry County has predominantly agricultural land use.

c. **Environmental Features**

FPL anticipates mitigating for unavoidable wildlife and/or wetland impacts as needed as a result of a power generation project constructed at this site.

d. **Water Quantities**

Minimal amounts of water would be required for a PV facility. Natural gas generation would require approximately up to 150 gallons per minute (gpm) for process water and up to 7.5 million gallons per day (mgd) per unit for cooling water (assuming a cooling tower is utilized).

e. **Supply Sources**

Minimal water would be required for a PV facility. A small amount may be needed to occasionally clean the solar panels in the absence of sufficient rainfall. Any such water may be brought to the site by truck. The supply of water for fossil generation would be dependent upon the capacity of the generating unit(s) and the generation technology to be implemented.

Potential Site # 5: Manatee Plant Site, Manatee County

The existing FPL Manatee Plant 9,500-acre site is located in unincorporated north-central Manatee County. The existing power generating facilities are located in all or portions of Sections 18 and 19 of Township 33S, Range 20-E. The plant site lies approximately 5 miles east of Parrish, Florida. It is approximately 5 miles east of U.S. 301 and 9.5 miles east of Interstate Highway 75 (I-75). The existing plant is approximately 2.5 miles south of the Hillsborough-Manatee County line; a portion of the north property boundary of the plant site abuts the county line. State Road 62 (SR 62) is about 0.7 mile south of the plant, with the plant entrance road going north from that highway. This site is a possible location for an FPL PV facility. FPL has received the federal and state permits required to construct approximately 40 MW of PV at this location.

a. **U.S. Geological Survey (USGS) Map**

A map of the site is found at the end of this chapter.

b. **Land Uses**

Existing land use on the site is agricultural. The property is zoned Planned Development / Public Interest (PD-PI), which will allow for electrical generation.

c. **Environmental Features**

FPL anticipates mitigating for unavoidable wildlife and/or wetland impacts as needed as a result of a PV project constructed at this site.

d. **Water Quantities**

Minimal amounts of water would be required for a PV facility.

e. **Supply Sources**

Minimal water would be required for a PV facility. A small amount may be needed to occasionally clean the PV panels in the absence of sufficient rainfall. Any such water may be brought to the site by truck.

Potential Site # 6: Martin County

FPL is currently evaluating potential sites in Martin County for a future PV facility. No specific locations have been selected at this time.

a. **U.S. Geological Survey (USGS) Map**
A USGS map of the county has been included at the end of this chapter.

b. **Land Uses**
This information is not available because a specific site has not been selected at this time.

c. **Environmental Features**
This information is not available because a specific site has not been selected at this time.

d. **Water Quantities**
Minimal amounts of water would be required for a PV facility.

e. **Supply Sources**
Minimal water would be required for a PV facility. A small amount may be needed to occasionally clean the PV panels in the absence of sufficient rainfall.

Potential Site # 7: Northeast Okeechobee County

FPL has purchased a 2,832 acre site in Northeast Okeechobee County for a future PV facility or natural gas generation.

a. **U.S. Geological Survey (USGS) Map**
A USGS map of the site has been included at the end of this chapter.

b. **Land Uses**
The site has predominantly agricultural land use.

c. **Environmental Features**

FPL anticipates mitigating for unavoidable wildlife and/or wetland impacts as needed as a result of a PV project constructed at this site.

d. **Water Quantities**

Water requirements for fossil generation would be up to 150 gallons per minute (gpm) for process water and up to 7.5 million gallons per day (mgd) per unit for cooling water (assuming a cooling tower would be utilized). Needed water quantities would be significantly less for a PV facility.

e. **Supply Sources**

Existing groundwater and/or regional water supply initiatives are potential water sources.

Potential Site # 8: Palatka Site, Putnam County

FPL is currently evaluating a site adjacent to the former FPL Putnam Plant site in Putnam County for future fossil-fueled generation. The approximately 170 acre site was the location of the former FPL Palatka Plant which was dismantled in the 1990s.

a. **U.S. Geological Survey (USGS) Map**

A map of the site is found at the end of this chapter.

b. **Land Uses**

The site has a land use designation of Industrial.

c. **Environmental Features**

The majority of site has been previously impacted by past power plant operations. No significant environmental features have been identified at this time.

d. **Water Quantities**

Water requirements would be up to 150 gallons per minute (gpm) for process water and up to 7.5 million gallons per day (mgd) per unit for cooling water (assuming a cooling tower).

e. **Supply Sources**

The St John's River, existing groundwater, and/or regional water supply initiatives are potential water sources.

Potential Site # 9: Putnam County

FPL is currently evaluating additional potential sites in Putnam County for a future PV facility or natural gas power generation. Sites currently under investigation are approximately 2,800 acres. No specific locations have been selected at this time.

a. **U.S. Geological Survey (USGS) Map**

A USGS map of the county has been included at the end of this chapter.

b. **Land Uses**

This information is not available because a specific site has not been selected at this time.

c. **Environmental Features**

This information is not available because a specific site has not been selected at this time.

d. **Water Quantities**

Minimal amounts of water would be required for a PV facility. Natural gas power generation would require approximately up to 150 gallons per minute (gpm) for process water and up to 7.5 million gallons per day (mgd) per unit for cooling water (assuming a cooling tower is utilized).

e. **Supply Sources**

Existing groundwater is a potential water source.

Potential Site # 10: Space Coast Solar Expansion, Brevard County

The Space Coast site is located at NASA's Kennedy Space Center property in Brevard County. This site currently houses a 10 MW PV facility which began operating in 2010, with the potential to expand the PV generating capacity by an additional 10 MW. FPL is also evaluating the potential for further expansion beyond the existing site, within the Space Center property.

a. **U.S. Geological Survey (USGS) Map**

A USGS map of the site has been included at the end of this chapter.

b. **Land Uses**

NASA, a federal agency, has approved use of the land at the site for PV generation.

c. **Environmental Features**

There are no significant environmental features on this site.

d. **Water Quantities**

Minimal amounts of water would be required for an expansion of the PV facility.

e. **Supply Sources**

Minimal water would be required for a PV facility. A small amount may be needed to occasionally clean the PV panels in the absence of sufficient rainfall.

Any such water would be brought to the site by truck or would come from existing onsite wells.

CHAPTER V

Other Planning Assumptions & Information

(This page is left intentionally blank.)

Introduction

The Florida Public Service Commission (FPSC), in Docket No. 960111-EU, specified certain information that was to be included in an electric utility's Ten Year Power Plant Site Plan filing. Among this specified information was a group of 12 items listed under a heading entitled "Other Planning Assumptions and Information." These 12 items basically concern specific aspects of a utility's resource planning work. The FPSC requested a discussion or a description of each of these items.

These 12 items are addressed individually below as separate "Discussion Items".

Discussion Item # 1: Describe how any transmission constraints were modeled and explain the impacts on the plan. Discuss any plans for alleviating any transmission constraints.

FPL's resource planning work considers two types of transmission limitations/constraints: external limitations and internal limitations. External limitations deal with FPL's ties to its neighboring systems. Internal limitations deal with the flow of electricity within the FPL system.

The external limitations are important since they affect the development of assumptions for the amount of external assistance that is available to the FPL system as well as the amount and price of economy energy purchases. Therefore, these external limitations are incorporated both in the reliability analysis and economic analysis aspects of resource planning. The amount of external assistance which is assumed to be available is based on the projected transfer capability to FPL from outside its system as well as historical levels of available assistance. In the loss of load probability (LOLP) portion of its reliability analyses, FPL models this amount of external assistance as an additional generator within FPL's system which provides capacity in all but the peak load months. The assumed amount and price of economy energy are based on historical values and projections from production costing models.

Internal transmission limitations are addressed by identifying potential geographic locations for potential new generating units that minimize adverse impacts to the flow of electricity within FPL's system. The internal transmission limitations are also addressed by developing the direct costs for siting new units at different locations, by evaluating the cost impacts created by the new unit/unit location combination on the operation of existing units in the FPL system, and/or by evaluating the costs of transmission additions that may be needed to address regional concerns regarding an imbalance between load and generation in a given region. Both of these site- and system-related transmission costs are developed for each different unit/unit location option or groups of options. In addition, transfer limits for capacity and energy that can be imported into the Southeastern (Miami-Dade and Broward Counties) region of FPL's system are also developed for use in FPL's production costing analyses. (A further discussion of the Southeastern Florida region, and the need to maintain a regional balance between generation and transmission contributions to meet regional load, is found in Chapter III.)

FPL's annual transmission planning work determines transmission additions needed to address limitations and to maintain/enhance system reliability. FPL's planned transmission facilities to interconnect and integrate FPL's resource plans and those that must be certified under the Transmission Line Siting Act are presented in Chapter III.

Discussion Item # 2: Discuss the extent to which the overall economics of the plan were analyzed. Discuss how the plan is determined to be cost-effective. Discuss any changes in the generation expansion plan as a result of sensitivity tests to the base case load forecast.

FPL typically performs economic analyses of competing resource plans using as an economic criterion FPL's levelized system average electric rates (i.e., a Rate Impact Measure or RIM approach). In addition, for analyses in which DSM levels are not changed, FPL uses the equivalent criterion of the cumulative present value of revenue requirements for the FPL system.[8]

The load forecast that is presented in FPL's 2012 Site Plan was developed in September 2011. The only load forecast sensitivities analyzed during 2011/early 2012 were high load forecast sensitivities developed solely to analyze the quality of FPL's future reserves and the projected frequency at which load control might be implemented. These analyses are on-going and the load forecast sensitivities have not been used to determine potential changes to the resource plan that is presented in this Site Plan document.

[8] FPL's basic approach in its resource planning work is to base decisions on a lowest electric rate basis. However, when DSM levels are considered a "given" in the analysis (i.e., when only new generating options are considered), the lowest electric rate basis approach and the lowest system cumulative present value of revenue requirements basis approach, yield identical results in terms of which resource options are more economic. In such cases FPL evaluates resource options on the simpler – to – calculate (but equivalent) lowest system revenue requirements basis.

Discussion Item # 3: Explain and discuss the assumptions used to derive the base case fuel forecast. Explain the extent to which the utility tested the sensitivity of the base case plan to high and low fuel price scenarios. If high and low fuel price sensitivities were performed, explain the changes made to the base case fuel price forecast to generate the sensitivities. If high and low fuel price scenarios were performed as part of the planning process, discuss the resulting changes, if any, in the generation expansion plan under the high and low fuel price scenario. If high and low fuel price sensitivities were not evaluated, describe how the base case plan is tested for sensitivity to varying fuel prices.

The basic assumptions FPL used in deriving its fuel price forecasts are discussed in Chapter III of this document. FPL used three fuel cost, and three environmental compliance cost, forecasts in analyses supporting its 2011 nuclear cost recovery filing. FPL also utilized one fuel cost forecast, and one environmental compliance cost forecast, in analyses supporting its 2011 Port Everglades modernization (PEEC) determination of need filing. In response to discovery requests in the PEEC need docket, sensitivity forecasts assuming low fuel costs, high fuel costs, and low environmental compliance costs were also analyzed for PEEC.

The high and low fuel cost forecasts are derived from a calculation of the historical volatility of the 12-month forward price for one year ahead. From this range of volatility, a reasonable value from the high end of the range is applied to the medium cost fuel cost forecast to develop a high cost fuel cost forecast. Similarly, a reasonable value from the low end of the range is applied to the medium cost fuel cost forecast to develop a low cost fuel cost forecast.

The resource plan presented in this Site Plan is based, in part, on those prior analyses. For that reason, this resource plan has not been further tested for different fuel cost forecasts.

Discussion Item # 4: Describe how the sensitivity of the plan was tested with respect to holding the differential between oil/gas and coal constant over the planning horizon.

As described above in the answer to Discussion Item # 3, FPL used up to three fuel cost forecasts in its 2011/early 2012 resource planning analyses. While these forecasts did not represent a constant cost differential between oil/gas and coal, a variety of fuel cost differentials were represented in these forecasts.

Discussion Item # 5: Describe how generating unit performance was modeled in the planning process.

The performance of existing generating units on FPL's system was modeled using current projections for scheduled outages, unplanned outages, capacity output ratings, and heat rate information. Schedule 1 in Chapter I and Schedule 8 in Chapter III present the current and projected capacity output ratings of FPL's existing units. The values used for outages and heat rates are generally consistent with the values FPL has used in planning studies in recent years.

In regard to new unit performance, FPL utilized current projections for the capital costs, fixed and variable operating & maintenance costs, capital replacement costs, construction schedules, heat rates, and capacity ratings for all construction options in its resource planning work. A summary of this information for the new capacity options FPL currently projects to add over the reporting horizon for this document is presented on the Schedule 9 forms in Chapter III.

Discussion Item # 6: Describe and discuss the financial assumptions used in the planning process. Discuss how the sensitivity of the plan was tested with respect to varying financial assumptions.

In its 2011 resource planning work, FPL's financial assumptions were: i) a capital structure of 40.88% debt and 59.12% equity; (ii) a 5.50% cost of debt; (iii) a 10.0% return on equity; and (iv) an after-tax discount rate of 7.29%. No sensitivities of these financial assumptions were used in FPL's 2011/early 2012 resource planning work.

Discussion Item # 7: Describe in detail the electric utility's Integrated Resource Planning process. Discuss whether the optimization was based on revenue requirements, rates, or total resource cost.

FPL's integrated resource planning (IRP) process is described in detail in Chapter III of this document.

The standard basis for comparing the economics of competing resource plans in FPL's basic IRP process is the impact of the plans on FPL's electricity rate levels with the objective generally being to minimize FPL's projected levelized system average electric rate (i.e., a Rate Impact Measure or RIM approach). As discussed in response to Discussion Item # 2, both the electricity rate perspective and the cumulative present value of system revenue requirement perspective are identical when DSM levels are unchanged between competing resource plans. Therefore, in planning work in which DSM levels were unchanged, the equivalent, but simpler to calculate, cumulative present value of revenue requirements perspective was utilized.

Discussion Item # 8: Define and discuss the electric utility's generation and transmission reliability criteria.

FPL currently uses two system reliability criteria in its resource planning work that addresses generation, purchase, and DSM options. One of these is a minimum 20% Summer and Winter reserve margin. The other reliability criterion is a maximum of 0.1 days per year loss-of-load-probability (LOLP). These reliability criteria are discussed in Chapter III of this document. As discussed briefly in the Executive Summary, and in more detail in Chapter III, FPL will be examining the extent to which its system reserves are projected to be dependent upon DSM resources and generation resources in its 2012 resource planning work. The results of this examination could result in a change to FPL's reliability criteria.

In regard to transmission reliability analysis work, FPL has adopted transmission planning criteria that are consistent with the planning criteria established by the Florida Reliability Coordinating Council (FRCC). The FRCC has adopted transmission planning criteria that are consistent with the Reliability Standards established by the North American Electric Reliability Council (NERC). The *NERC Reliability Standards* are available on the intemet site (http://www.nerc.com/).

In addition, FPL has developed a *Facility Connection Requirements* (FCR) document as well as a *Facility Rating Methodology* document that are also available on the internet under the FPL OATT Documents directory at https://www.oatioasis.com/FPL/index.html.

Generally, FPL limits its transmission facilities to 100% of the applicable thermal rating. The normal and contingency voltage criteria for FPL stations are provided below:

	Normal/Contingency	
Voltage Level (kV)	Vmin (p.u.)	Vmax (p.u.)
69, 115, 138	0.95/0.95	1.05/1.07
230	0.95/0.95	1.06/1.07
500	0.95/0.95	1.07/1.09
Turkey Point (*)	1.01/1.01	1.06/1.06
St. Lucie (*)	1.00/1.00	1.06/1.06

(*) Voltage range criteria for FPL's Nuclear Power Plants

There may be isolated cases for which FPL may have determined that it is acceptable to deviate from the general criteria stated above. There are several factors that could influence these criteria, such as the overall number of potential customers that may be impacted, the probability of an outage actually occurring, or transmission system performance, as well as others.

Discussion Item # 9: Discuss how the electric utility verifies the durability of energy savings for its DSM programs.

The projected impacts of FPL's DSM programs on demand and energy consumption are revised periodically. Engineering models, calibrated with current field-metered data, are updated at regular intervals. Participation trends are tracked for all of the FPL DSM programs in order to adjust impacts each year for changes in the mix of efficiency measures being installed by program participants. For its load management programs, FPL conducts periodic tests of the load control equipment to ensure that the equipment is functioning correctly. These tests, plus actual, non-test load management events, also allow FPL to gauge the MW reduction capabilities of its load management programs on an on-going basis.

Survey data is collected from non-participants in order to establish the baseline efficiency. Participant data is compared against non-participant data to establish the demand and energy saving benefits of the utility DSM program versus what would be installed in the absence of the program.

Discussion Item # 10: Discuss how strategic concerns are incorporated in the planning process.

The Executive Summary and Chapter III provide a discussion of a variety of system concerns/issues that influence FPL's resource planning process. Please see those chapters for a discussion of those concerns/issues.

In addition to these system concerns/issues, there are other strategic factors FPL typically considers when choosing between resource options. These include the following: (1) technology risk; (2) environmental risk, and (3) site feasibility. The consideration of these factors may include both economic and non-economic aspects.

Technology risk is an assessment of the relative maturity of competing technologies. For example, a prototype technology, which has not achieved general commercial acceptance, has a higher risk than a technology in wide use and, therefore, assuming all else equal, is less desirable.

Environmental risk is an assessment of the relative environmental acceptability of different generating technologies and their associated environmental impacts on the FPL system, including environmental compliance costs. Technologies regarded as more acceptable from an environmental perspective for FPL's resource plan are those which minimize environmental impacts for the FPL system as a whole through highly efficient fuel use, state of the art environmental controls, etc.

Site feasibility assesses a wide range of economic, regulatory, and environmental factors related to successfully developing and operating the specified technology at the site in question. Projects that are more acceptable have sites with few barriers to successful development.

All of these factors play a part in FPL's planning and decisions, including its decisions to construct capacity or to purchase power.

Discussion Item # 11: Describe the procurement process the electric utility intends to utilize to acquire the additional supply-side resources identified in the electric utility's ten-year site plan.

As shown in this 2012 Site Plan, beyond the capacity additions for which a need determination has already been approved (nuclear uprates and the modernizations at Cape Canaveral, Riviera, and Port Everglades), FPL currently projects no new capacity additions for the years 2017 through 2021 except for a one-year power purchase of approximately 250 MW for the year 2021. FPL anticipates that this short-term purchase would be acquired after discussions and negotiations with potential capacity suppliers at some point in the future.

In regard to the capacity additions that are underway for which a need determination has already been approved, the nuclear uprates (and the new nuclear units not addressed in the reporting period of this document), do not lend themselves to an RFP approach involving bids from third parties who would build new nuclear generation capacity. In addition, nuclear capacity additions are exempted from the Commission's Bid Rule by section 403.519 (4) (c). For these nuclear projects, FPL's procurement activities are conducted to ensure the best combination of quality and cost for the delivered products. Furthermore, the modernization projects at Cape Canaveral, Riviera, and Port Everglades received Commission waivers from the Bid Rule due to attributes specific to modernization projects (such as use of existing land, water, transmission, etc.) plus other economic benefits to FPL's customers. These waivers from the Bid Rule were granted in Order No. PSC-08-0591-FOF-EI for Cape Canaveral and Riviera and in Order No. PSC-11-0360-PAA-EI for Port Everglades.

If circumstances change and another large-scale capacity addition decision needs to be made during the reporting period of this document, FPL expects that its decision-making will be conducted in a manner consistent with the Commission's Bid Rule.

Identification of self-build options, beyond those units already approved by the FPSC and Governor and Siting Board or units for which FPL may be then seeking approval, in future FPL Site Plans will not be an indication that FPL has pre-judged any capacity solicitation it may conduct. The identification of future generating units is required of FPL in its Site Plan filings and represents those alternatives that appear to be FPL's best, most cost-effective self-build options at the time. FPL reserves the right to refine its planning analyses and to identify other self-build options. Such refined analyses have the potential to yield a variety of self-build options, some of which might not require an RFP. If an RFP is issued for Supply options, FPL reserves the right to choose the best alternative for its customers, even if that option is not an FPL self-build option.

Discussion Item # 12: Provide the transmission construction and upgrade plans for electric utility system lines that must be certified under the Transmission Line Siting Act (403.52 – 403.536, F. S.) during the planning horizon. Also, provide the rationale for any new or upgraded line.

(1) FPL has identified the need for a new 230 kV transmission line that required certification under the Transmission Line Siting Act which was issued in April 2006. The new line is to be completed in two phases connecting FPL's St. Johns Substation to FPL's Pringle Substation (also shown on Table III.E.1 in Chapter III). Phase 1 was completed in May 2009 and consisted of a new line connecting Pringle to a new Pellicer Substation. Phase 2 is planned to connect St. Johns to Pellicer and is scheduled to be completed by December 2016. The construction of this line is necessary to serve existing and future customers in the Flagler and St. Johns areas in a reliable and effective manner.

(2) FPL has identified the need for a new 230 kV transmission line (by December 2014) that required certification under the Transmission Line Siting Act which was issued on November 2008. The new line will connect FPL's Manatee Substation to FPL's proposed Bob White Substation (also shown on Table III.E.1 in Chapter III). The construction of this line, scheduled to be completed in 2014, is necessary to serve existing and future customers in the Manatee and Sarasota areas in a reliable and effective manner.

RE: Florida Power & Light Company's 2012 Ten Year Power Plant Site Plan

Dear Ms. Cole:

Please find enclosed for filing the original and twenty-five (25) copies of three pages from Florida Power & Light Company's 2012-2021 Ten Year Power Plant Site Plan, originally filed April 1, 2012, reflecting corrected information. Specifically, pages 15, 19, and 31 are being replaced. Corrections are included in red, bold print.

Please call me if there are any questions regarding this filing.

Sincerely,

Jessica Cano

I. Description of Existing Resources

FPL's service area contains approximately 27,650 square miles and has a population of approximately 8.8 million people. FPL served an average of 4,547,051 customer accounts in thirty-five counties during 2011. These customers were served by a variety of resources including: FPL-owned fossil-fueled, renewable, and nuclear generating units, non-utility owned generation, demand side management (DSM), and interchange/purchased power.

I.A. FPL-Owned Resources

The existing FPL generating resources are located at seventeen generating sites distributed geographically around its service territory including one site in Georgia (partial FPL ownership of one unit) and one site in Jacksonville, Florida (partial FPL ownership of two units). The current electrical generating facilities consist of four nuclear units, three coal units, fifteen combined cycle (CC) units, twelve fossil steam units, forty-eight combustion gas turbines, one simple cycle combustion turbine, and two photovoltaic facilities[1]. The locations of these eighty-five generating units are shown on Figure I.A.1 and in Table I.A.1. Table I.A.2 provides a "break down" of the capacity provided by the combustion turbine (CT) and steam turbine (ST) components of FPL's existing CC units.

FPL's bulk transmission system is comprised of **6,543** circuit miles of transmission lines. Integration of the generation, transmission, and distribution system is achieved through FPL's 587 substations in Florida.

The existing FPL system, including generating plants, major transmission stations, and transmission lines, is shown on Figure I.A.2. In addition, Figure I.A.3 shows FPL's interconnection ties with other utilities.

[1] FPL also has one 75 MW solar thermal facility at its Martin plant site. This facility does not generate electricity as the other units mentioned above do. Instead, it produces steam that reduces the use of fossil fuel to produce steam for electricity generation.

2008	21,060	181	20,879	0	966	1,042	760	706	19,334
2009	22,351	249	22,102	0	981	1,097	811	732	20,558
2010	22,256	419	21,837	0	990	1,181	815	758	**20,451**
2011	21,618	427	21,191	0	1,002	1,252	821	776	**19,795**

Historical Values (2002 - 2011):

Col. (2) - Col. (4) are actual values for historical Summer peaks. As such, they incorporate the effects of conservation (Col. 7 & Col. 9), and may incorporate the effects of load control if load control was operated on these peak days. Therefore, Col. (2) represents the actual Net Firm Demand.

Col. (5) - Col. (9) represent actual DSM capabilities starting from January 1988 and are annual (12-month) values except for 2011 values which are through August. Note that the values for FPL's former Interruptible Rate are incorporated into Col. (8), which also includes Business On Call (BOC), CILC, and Commercial /Industrial Demand Reduction (CDR).

Col. (10) represents a HYPOTHETICAL "Net Firm Demand" as if the load control values had definitely been exercised on the peak. Col. (10) is derived by the formula: Col. (10) = Col.(2) - Col.(6) - Col.(8).

Schedule 3.1
History and Forecast of Summer Peak Demand (MW)
(Projected)

(1) August of Year	(2) Total	(3) Wholesale	(4) Retail	(5) Interruptible	(6) Res. Load Management*	(7) Residential Conservation	(8) C/I Load Management*	(9) C/I Conservation	(10) Net Firm Demand
2012	21,623	432	21,191	0	1,036	64	865	26	19,632
2013	21,931	389	21,542	0	1,048	125	884	58	19,817
2014	23,243	1,187	22,056	0	1,075	190	922	90	20,966
2015	23,786	1,194	22,592	0	1,088	257	940	123	21,378
2016	24,315	1,201	23,114	0	1,101	324	959	155	21,775
2017	24,529	1,195	23,334	0	1,114	391	978	188	21,858
2018	24,674	1,202	23,472	0	1,127	458	996	221	21,871
2019	25,041	1,210	23,832	0	1,140	526	1,015	253	22,107
2020	25,499	1,217	24,282	0	1,156	579	1,028	280	22,456
2021	25,960	1,225	24,735	0	1,172	626	1,042	303	22,816

Projected Values (2012 - 2021):

Col. (2) - Col. (4) represent FPL's forecasted peak w/o incremental conservation, cumulative load management, or incremental load management.

Col. (5) - Col. (9) represent cumulative load management, and incremental conservation and load management. All values are projected August values. The projections for 2012 through 2019 are based on the FPSC's 2011 order in the DSM Plan docket. Projected DSM values for 2020 and 2021 assume 100 MW/year of incremental DSM.

Col. (8) represents FPL's Business On Call, CDR, CILC, and Curtailable programs/rates.

Col. (10) represents a 'Net Firm Demand" which accounts for all of the incremental conservation and assumes all of the load control is implemented on the peak. Col. (10) is derived by using the formula: Col. (10) = Col. (2) - Col. (5) - Col. (6) - Col. (7) - Col. (8) - Col. (9).

* Res. Load Management and C/I Load Management include MW values of load management from Lee County.

Overview of the Document

Chapter 186, Florida Statutes, requires that each electric utility in the State of Florida with a minimum existing generating capacity of 250 megawatts (MW) must annually submit a Ten Year Power Plant Site Plan. This plan should include an estimate of the utility's future electric power generating needs, a projection of how these estimated generating needs might be met, and disclosure of information pertaining to the utility's preferred and potential power plant sites. The information contained in this Site Plan is compiled and presented in accordance with rules 25-22.070, 25-22.071, and 25-22.072, Florida Administrative Code (F.A.C.).

This Ten Year Power Plant Site Plan (Site Plan) document is based on Florida Power & Light Company's (FPL) integrated resource planning (IRP) analyses that were carried out in 2012 and that were on-going in the first Quarter of 2013. The forecasted information presented in this plan addresses the years 2013 through 2022.

Site Plans are long-term planning documents and should be viewed in this context. A Site Plan contains uncertain forecasts and tentative planning information. Forecasts evolve, and all planning information is subject to change at the discretion of the utility. Much of the data submitted is preliminary in nature and is presented in a general manner. Specific and detailed data will be submitted as part of the Florida site certification process, or through other proceedings and filings, at the appropriate time.

This document is organized in the following manner:

Chapter I – Description of Existing Resources

This chapter provides an overview of FPL's current generating facilities. Also included is information on other FPL resources including purchased power, demand side management, and FPL's transmission system.

Chapter II – Forecast of Electric Power Demand

FPL's load forecasting methodology, and its forecast of seasonal peaks and annual energy usage, is presented in Chapter II.

Chapter III – Projection of Incremental Resource Additions

This chapter discusses FPL's integrated resource planning (IRP) process and outlines FPL's projected resource additions, especially new power plants, based on FPL's IRP work in 2012 and

early 2013. This chapter also discusses a number of issues that may change the resource plan presented in this Site Plan. Furthermore, this chapter discusses FPL's current DSM programs, renewable energy efforts, transmission planning additions, and fuel cost forecasts.

Chapter IV – Environmental and Land Use Information

This chapter discusses environmental information as well as Preferred and Potential site locations for additional electric generation facilities.

Chapter V – Other Planning Assumptions and Information

This chapter addresses twelve "discussion items" which pertain to additional information that is included in a Site Plan filing.

Executive Summary

Florida Power & Light Company's (FPL) 2013 Ten Year Power Plant Site Plan (Site Plan) presents FPL's current plans to augment and enhance its electric generation capability (owned or purchased) as part of its efforts to meet its projected incremental resource needs for the 2013 - 2022 time period. By design, the primary focus of this document is on supply side additions; i.e., electric generation capability and the sites for these additions. The supply side additions discussed in this document are resources projected to be needed after accounting for FPL's demand side management (DSM) resource additions previously approved by the Florida Public Service Commission (FPSC) and the significant energy efficiency contributions from the current federal appliance and lighting efficiency standards. The projected impacts of the federal and state appliance and lighting efficiency standards are accounted for in FPL's load forecast as discussed below and in Chapter II. The projected impacts of FPL's DSM efforts are addressed as projected reductions to the forecasted load in Chapters II and III. A discussion of FPL's current DSM programs is presented in Chapter III.

The resource plan that is presented in FPL's 2013 Site Plan contains three key similarities to the resource plan presented in FPL's 2012 Site Plan. However, there are several factors that have contributed to differences between the resource plan presented in the 2013 Site Plan and the resource plan that was previously presented in FPL's 2012 Site Plan. Additional factors will continue to influence FPL's on-going resource planning work and could result in changes in the resource plan presented in this document. A brief discussion of these similarities and factors is provided below. Additional information regarding these topics is presented in Chapter III.

I. Similarities Between the Current Resource Plan and the Resource Plan Previously Presented in FPL's 2012 Site Plan:

There are three key similarities between the current resource plan presented in this document and the resource plan presented in the 2012 Site Plan.

Similarity # 1: The modernizations of FPL's existing Cape Canaveral and Riviera Beach plant sites are underway and are projected to be completed on time in 2013 and 2014, respectively. In addition, the modernization of FPL's existing Port Everglades plant site has begun and it is projected to be completed in 2016.

FPL's 2012 Site Plan projected that the modernizations of two existing sites would be completed in 2013 (Cape Canaveral) and 2014 (Riviera Beach). FPL received need determination approval from the FPSC for both of these modernizations in September 2008 in Order No. PSC-08-0591-FOF-EI. Site Certification was received for Cape Canaveral in October 2009 in Order No. DEP 09-1015. Site Certification was received for Riviera Beach in November 2009 in Order No. DEP 09-1245. The work to complete these modernizations is underway and is proceeding as scheduled. These modernizations are again reflected in this Site Plan with no changes to the projected completion dates. In addition, work regarding a similar modernization at the existing Port Everglades site has begun and the project is projected to be completed in 2016. FPL received need determination approval from the FPSC for the Port Everglades modernization in April 2012 in Order No. PSC-12-0187-FOF-EI. The Site Certification order for the project, DOAH Case No. 12-0422EPP, was received for the Port Everglades project in October 2012.

Similarity # 2: FPL continues to pursue additional nuclear energy generation to significantly (i) reduce its use of fossil fuels, (ii) lower system fuel costs, (iii) lower system air emissions, and (iv) provide a valuable hedge against future increases in fuel costs and environmental compliance costs.

By the date this 2013 Site Plan is filed (April 1, 2013), FPL is projected to have completed essentially all of the work necessary to increase the generation capacity at the fourth of its four existing nuclear generating units, Turkey Point Unit 4. Similar work to increase the generation capacity at FPL's three other nuclear units, St. Lucie Units 1 & 2, and Turkey Point Unit 3 was completed in 2012 and FPL's customers are already benefitting from completion of that work. The total project, called the Extended Power Uprate (EPU) project, will have increased FPL's total nuclear generating capacity by over 500 MW, the equivalent of approximately one-half of a new nuclear unit. The addition of this nuclear generation capacity was accomplished in less than half the time that would be needed to license and construct a new nuclear unit.

In addition, FPL is continuing its work to obtain all of the licenses, permits, and approvals that will be necessary to construct and operate two new nuclear units at its Turkey Point site in the future. These licenses, permits, and approvals will provide FPL with the opportunity to construct these nuclear units at Turkey Point for a time expected to be up to 20 years from the time the licenses and permits are granted, and then to operate the units for at least 40 years thereafter. FPL received need determination approval from the FPSC for the two new nuclear units, Turkey Point Units 6 & 7, in April 2008 in Order No. PSC-08-0237-FOF-EI. The earliest practical deployment dates for these two new units are currently projected to be 2022 and 2023, respectively. Because 2022 is the last year of the 10-year reporting window for this Site Plan, Turkey Point Unit 6 is addressed in this document (while Turkey Point Unit 7, due to its projected in-service date of 2023, is not addressed in this document).

Similarity # 3: Five generating units were retired in 2012, two other generating units are scheduled to be retired in 2013, and two other generating units have been/will be switched to operate as synchronous condensers.

FPL's 2012 Site Plan discussed FPL's plans to retire specific generation units and to convert other generation units to synchronous condenser operation. Sanford Unit 3, Cutler Unit 5, Cutler Unit 6, and Port Everglades Units 1 & 2 were retired in the fourth quarter of 2012. Two other generating units, Port Everglades Units 3 & 4, are scheduled to be retired in 2013 as part of the Port Everglades Modernization project which will be completed in 2016. In addition, Turkey Point Unit 2 has been converted to operate in synchronous condenser mode to provide voltage support for the transmission system in Southeastern Florida. FPL also projects that Turkey Point Unit 1 will be similarly converted to run in synchronous condenser mode starting in 2016.

II. Factors Influencing FPL's Resource Planning Work Which Have Impacted, or Which Could Impact, FPL's Resource Plan:

There are a number of factors that influence FPL's resource planning work. Eight (8) of these are briefly discussed below and are discussed again in Chapter III.

Two of these factors are on-going system concerns that FPL has considered in its resource planning work for a number of years. These two on-going system concerns are: (1) maintaining/enhancing fuel diversity in the FPL system, and (2) maintaining a balance between load and generating capacity in Southeastern Florida, particularly in Miami-Dade and Broward Counties.

The third and fourth factors that will be discussed are factors that directly impacted the resource plan presented in this document because they affect FPL's forecast of its future load. The third factor is the projection that FPL will begin serving Vero Beach's electrical load beginning January 1, 2014. An agreement to this effect was reached between Vero Beach and FPL on February 19, 2013, and a referendum was held on March 12, 2013 that resulted in a majority of Vero Beach voters approving the agreement.

The fourth factor is an updated projection of the impact of mandated efficiency standards for appliances, lighting, and other electrical equipment. This updated projection of the impact of these efficiency standards has been incorporated into FPL's load forecast. The magnitude of efficiency that is being delivered to FPL's customers through these standards is significant. For example, by the year 2022, FPL's Summer peak is projected to be lower by approximately 2,900 MW compared to what the projected load would have been without the efficiency standards. This represents a decrease of approximately 10% in the forecasted Summer peak load for 2022. Likewise, FPL's forecasted net energy for load (NEL) in the year 2022 is projected to be approximately 11,850 GWh lower compared to what the projected NEL would have been without the efficiency standards. This represents a decrease of approximately 8% in the forecasted NEL for 2022. These significant reductions in FPL's peak load and NEL have been achieved solely through mandated efficiency standards and have been incremental to the reductions FPL has achieved through its DSM programs.

In addition to lowering FPL's forecast from what it otherwise would have been, and thus lowering FPL's projected resource needs, this projection of increased efficiency from the efficiency standards also affects FPL's resource planning in another way. The mandated higher efficiency standards lower the potential for future MW and GWh reductions from FPL's DSM programs that address the specific appliances and equipment covered by the standards.

The fifth factor is FPL's projected increasing dependence upon DSM resources to maintain system reliability. This factor has been previously discussed in FPL's 2011 and 2012 Site Plans, and it is discussed again in this 2013 Site Plan. In these previous Site Plans, FPL has discussed this projection of increasing dependence upon DSM resources using a new type of reserve margin projection as an indicator: a "generation-only reserve margin" (gen-only RM). In calculating the values for this indicator, all of FPL's projected incremental load management and energy efficiency program capabilities, and its existing load management capability, are removed from the reserve margin calculation. The resulting gen-only RM values indicate what FPL's reserve margin values are projected to be based solely on generation resources. The lower the gen-only RM values, the greater FPL's dependence is upon DSM resources.

The gen-only RM projections from the 2011, 2012, and 2013 Site Plans consistently show that these values are projected to significantly decrease throughout the 10-year reporting period of the Site Plans, and decline to single-digit values in the latter years of the reporting periods. These projections indicate a steadily growing dependence on DSM resources to maintain system reliability. Because of the various voluntary aspects associated with customer participation in DSM programs, FPL believes that system reliability risk increases as dependence on DSM resources increases.

There are additional factors that did not impact the resource plan presented in this document, but which could result in future in changes to this resource plan. For example, a sixth factor is the timing of when the Nuclear Regulatory Commission (NRC) will issue a new schedule for its review of FPL's application for a Combined Operating License (COL) for the Turkey Point Units 6 & 7 nuclear units and the potential impact that schedule may have on the overall project schedule. FPL must obtain a COL from the NRC before it could proceed with construction of the two new nuclear units planned for the Turkey Point site. During 2012, the NRC placed several review schedules "under review", including FPL's COL application. At the time this Site Plan is being finalized, the NRC has not identified a date by which it will issue a new schedule. Once the NRC's new review schedule is issued, FPL will conduct a project schedule review, integrating this information with other relevant information, to determine the earliest practicable in-service date for Turkey Point Unit 6 (and Unit 7).

The seventh factor is environmental regulation. As developments occur in regard to either new environmental regulations, and/or in how environmental regulations are interpreted and applied, the potential exists for such developments to affect FPL's resource plan that is presented in this document. For example, FPL has become aware of potential impacts to generating units of recent EPA changes to the National Ambient Air Quality Standards that include shorter duration 1-hour standards for nitrogen dioxide (NO_2) and sulfur dioxide (SO_2). FPL has begun the process of evaluating the impact of these standards on the fossil generating fleet, especially the higher emitting peaking gas turbines that have short emission stacks. The results of this analysis could potentially change FPL's resource plan information that is presented in this document.

The eighth factor that will be discussed is the possibility of the establishment of a Florida standard for renewable energy or clean energy. A Renewable Portfolio Standard (RPS) proposal was prepared by the FPSC, and then sent to the Florida Legislature for consideration, with a possible change to a Clean Portfolio Standard (CPS), during the 2009 legislative session. However, no RPS or CPS legislation was enacted in that session or in subsequent legislative sessions. Furthermore, during the 2012 legislative session, the legislature deleted a now obsolete directive to the FPSC that had instructed them to adopt RPS rules. RPS or CPS legislation, or other legislative initiatives regarding renewable or clean energy contributions, may still occur in the future at either the state or national level. If such legislation is enacted in later years, FPL would then determine what steps need to be taken to address the legislation. Such steps would then be discussed in FPL's Site Plan in the year following the enactment of such legislation.

Each of these factors will continue to be examined in FPL's on-going resource planning work during the rest of 2013 and in future years.

Table ES-1 presents a current projection of major changes to specific generating units and firm capacity purchases for 2013 – 2022 in terms of Summer MW. Table ES-2 then expands upon the information presented in Table ES-1 by adding projections of Winter MW impacts, Summer reserve margins, Winter reserve margins, etc. (Although neither table specifically identifies the impacts of projected DSM additions on FPL's resource needs and resource plan, FPL's projected DSM additions have been fully accounted for in the resource plan presented in this Site Plan.)

Table ES-1: Projected Capacity & Firm Purchase Power Changes

Year *	***Projected Capacity & Firm Purchase Power Changes***	***Summer MW***	***Date***
2013	Changes to existing purchases	(425)	December-12
	Port Everglades Units 3 & 4 retired for Modernization	(761)	January-13
	Turkey Point Unit 2 synchronous condenser	(392)	January-13
	Sanford Unit 5 CT Upgrade	9	February-13
	Turkey Point Unit 4 Uprate - completed	115	March-13
	Sanford Unit 4 CT Upgrade	16	April-13
	Martin Unit 1 ESP - Outage	(826)	June-13
	Cape Canaveral Next Generation Clean Energy Center	1,210	June-13
	Total of MW changes to Summer firm capacity:	**(1,054)**	
2014	Sanford Unit 5 CT Upgrade	10	September-13
	Changes to existing purchases	37	December-13
	Vero Beach Combined Cycle 1/	44	January-14
	Martin Unit 1 ESP - Outage	826	March-14
	Martin Unit 2 ESP - Outage	(826)	March-14
	Manatee Unit 3 CT Upgrade	19	May-14
	Turkey Point Unit 5 CT Upgrade	33	June-14
	Riviera Beach Next Generation Clean Energy Center	1,212	June-14
	Total of MW changes to Summer firm capacity:	**1,355**	
2015	Manatee Unit 3 CT Upgrade	20	September-14
	Martin Unit 2 ESP - Outage	826	December-14
	Palm Beach SWA - additional capacity	70	January-15
	Fort Myers Unit 2 CT Upgrades	51	May-15
	Total of MW changes to Summer firm capacity:	**967**	
2016	UPS Replacement	(928)	December-15
	Port Everglades Next Generation Clean Energy Center	1,277	June-16
	Total of MW changes to Summer firm capacity:	**349**	
2017	Vero Beach Combined Cycle 1/	(44)	January-17
	Changes to existing purchases	(37)	January-17
	Turkey Point Unit 1 synchronous condenser	(396)	October-16
	Total of MW changes to Summer firm capacity:	**(477)**	
2018	SJRPP suspension of energy	(381)	November-17
	Total of MW changes to Summer firm capacity:	**(381)**	
2019	---	---	
	Total of MW changes to Summer firm capacity:	**0**	
2020	---	---	
	Total of MW changes to Summer firm capacity:	**0**	
2021	Eco-Gen PPA	180	January-21
	Total of MW changes to Summer firm capacity:	**180**	
2022	Turkey Point Nuclear Unit 6	1,100	June-22
	Total of MW changes to Summer firm capacity:	**1,100**	

* Year shown reflects when the MW change begins to be accounted for in Summer reserve margin calculations. (Note that addition of MW values for each year will not yield a current cumulative value.)

1/ This unit will be added as part of the agreement that FPL will serve Vero Beach's electric load starting January, 2014. This unit is expected to be retired within 3 years.

Table ES-2: Projected Capacity Changes and Reserve Margins for FPL

Projected Capacity Changes and Reserve Margins for FPL (1)					
		Net Capacity Changes (MW)		Reserve Margin (%) After Maintenance	
Year	Projected Capacity Changes	Winter (2)	Summer (3)	Winter	Summer
2013	Changes to Existing Purchases (4)	(545)	(425)

2019	---	---	---	36.0%	22.7%
2020	---	---	---	34.9%	21.1%
2021	Changes to Existing Purchases (4)	180	180	34.5%	21.0%
2022	Turkey Point Nuclear Unit 6 (6)	---	1,100	34.4%	23.5%

(1) Additional information about these resulting reserve margins and capacity changes are found on Schedules 7 & 8 respectively.
(2) Winter values are forecasted values for January of the year shown.
(3) Summer values are forecasted values for August of the year shown.
(4) These are firm capacity and energy contracts with QF, utilities, and other entities. See Table I.B.1 and Table I.B.2 for more details.
(5) Outages for uprate work.
(6) All new unit additions are scheduled to be in-service in June of the year shown. All additions assumed to start in June are included in the Summer reserve margin calculation starting in that year and in the Winter reserve margin calculation starting with the next year.
(7) Outages for ESP work.
(8) This unit will be added as part of the agreement that FPL will serve Vero Beach's electric load starting January, 2014. This unit is expected to be retired within 3 years.

CHAPTER I

Description of Existing Resources

(This page is left intentionally blank.)

I. Description of Existing Resources

FPL's service area contains approximately 27,650 square miles and has a population of approximately 8.9 million people. FPL served an average of 4,576,449 customer accounts in thirty-five counties during 2012. These customers were served by a variety of resources including: FPL-owned fossil-fueled, renewable, and nuclear generating units, non-utility owned generation, demand side management (DSM), and interchange/purchased power.

I.A. FPL-Owned Resources

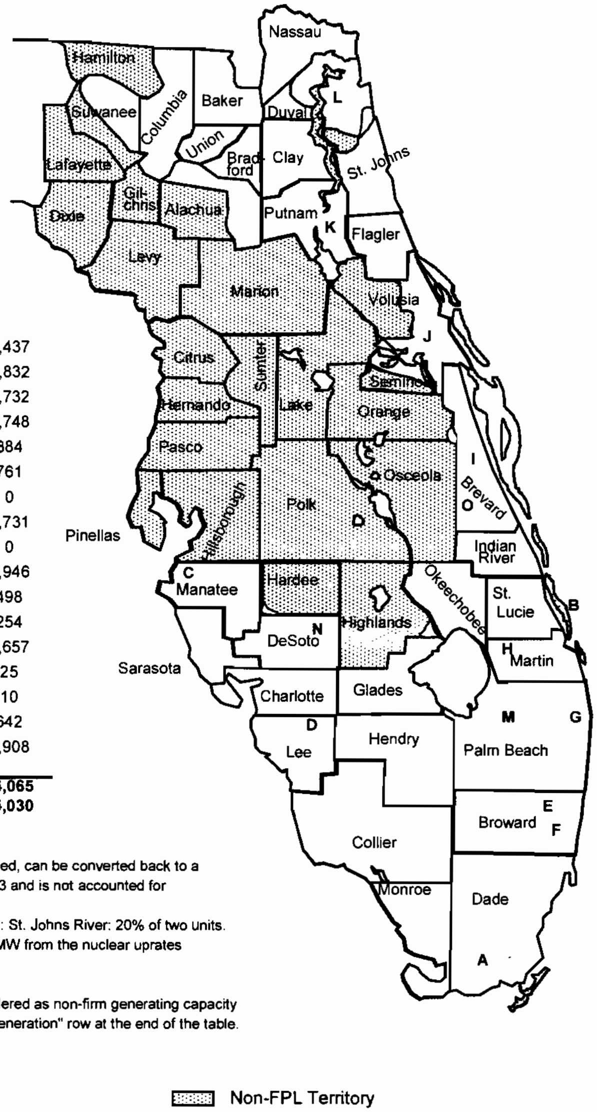
The existing FPL generating resources are located at fourteen generating sites distributed geographically around its service territory, plus one site in Georgia (partial FPL ownership of one unit) and one site in Jacksonville, Florida (partial FPL ownership of two units). The current electrical generating facilities consist of four nuclear units, three coal units, fifteen combined cycle (CC) units, eight fossil steam units, forty-eight combustion gas turbines, two simple cycle combustion turbines, and two photovoltaic facilities[1]. The locations of these eighty-two generating units are shown on Figure I.A.1 and in Table I.A.1. Table I.A.2 provides a further "break down" of the capacity provided by the combustion turbine (CT) and steam turbine (ST) components of FPL's existing CC units.

FPL's bulk transmission system is comprised of 6,558 circuit miles of transmission lines. Integration of the generation, transmission, and distribution system is achieved through FPL's 591 substations in Florida.

The existing FPL system, including generating plants, major transmission stations, and transmission lines, is shown on Figure I.A.2. In addition, Figure I.A.3 shows FPL's interconnection ties with other utilities.

1 FPL also has one 75 MW solar thermal facility at its Martin plant site. This facility does not generate electricity as the other units mentioned above do. Instead, it produces steam that reduces the use of fossil fuel to produce steam for electricity generation.

FPL Generating Resources by Location



A	Turkey Point [1/]	5	3,437
B	St. Lucie [2/]	2	1,832
C	Manatee	3	2,732
D	Fort Myers	3	1,748
E	Lauderdale	2	884
F	Port Everglades [3/]	2	761
G	Riviera [3/]	0	0
H	Martin	5	3,731

J	Sanford	2	1,946
K	Putnam	2	498
L	St. John's River Power Park [2/]	2	254
M	West County	3	3,657
N	DeSoto [4/]	1	25
O	Space Coast [4/]	1	10
	Scherer [5/]	1	642
	Gas Turbines	48	1,908
	Total System Generation =	**82**	**24,065**
	System Firm Generation =	**80**	**24,030**

1/ Turkey Point Unit 2 is currently operating as a synchronous condenser. If needed, can be converted back to a generating unit per the existing Title V operating permit through the end of 2013 and is not accounted for in Reserve Margin Calculation.
2/ Represents FPL's ownership share: St Lucie nuclear: 100% Unit 1, 85% Unit 2: St. Johns River: 20% of two units. The 1,832 MW value shown incorporates the latest projection for incremental MW from the nuclear uprates available at the time this document is being finalized.
3/ Will be site of new Modernization Plants.
4/ The 25 MW of PV at DeSoto and the 10 MW of PV at Space Coast are considered as non-firm generating capacity and the capacity from these units has been removed from the "System Firm Generation" row at the end of the table.
5/ The Scherer unit is located in Georgia and is not shown on this map.

Figure I.A.1: Capacity Resources by Location (as of December 31, 2012)

Table I.A.1: Capacity Resource by Unit Type (as of December 31, 2012)

Unit Type/ Plant Name	Location	Number of Units	Fuel	Summer MW
Nuclear				
St. Lucie 1/	Hutchinson Island, FL	2	Nuclear	1,832
Turkey Point	Florida City, FL	2	Nuclear	1,501

Total Gas Turbines/Diesels:		**48**		**1,908**
Combustion Turbines 3/				
Fort Myers	Fort Myers, FL	2	Gas/Oil	316
Total Combustion Turbines:		**2**		**316**
PV				
DeSoto 5/	DeSoto, FL	1	Solar Energy	25
Space Coast 5/	Brevard County, FL	1	Solar Energy	10
Total PV:		**2**		**35**
Total System Generation as of December 31, 2012 =		**82**		**24,065**
System Firm Generation as of December 31, 2012 =		**80**		**24,030**

1/ Total capability of St. Lucie 1 is 981/1,003 MW. FPL's share of St. Lucie 2 is 843/862. FPL's ownership share of St. Lucie Units 1 and 2 is 100% and 85%, respectively.

2/ Capabilities shown represent FPL's output share from each of the units (approx. 92.5% and exclude the Orlando Utilities Commission (OUC) and Florida Municipal Power Agency (FMPA) combined portion of approximately 7.44776% per unit. Represents FPL's ownership share: SJRPP coal: 20% of two units).

3/ The Combined Cycles and Combustion Turbines are broken down by components on Table 1.A.2.

4/ Turkey Point 2 is currently operating as a synchronous condenser. If needed, can be converted back to a generating unit per the existing Title V operating permit through the end of 2013 and is not accounted for in Reserve Margin Calculation.

5/ The 25 MW of PV at DeSoto and the 10 MW of PV at Space Coast are considered as non-firm generating capacity and the capacity from these units has been removed from the "System Firm Generation" row at the end of the table.

FPL Interconnection Diagram

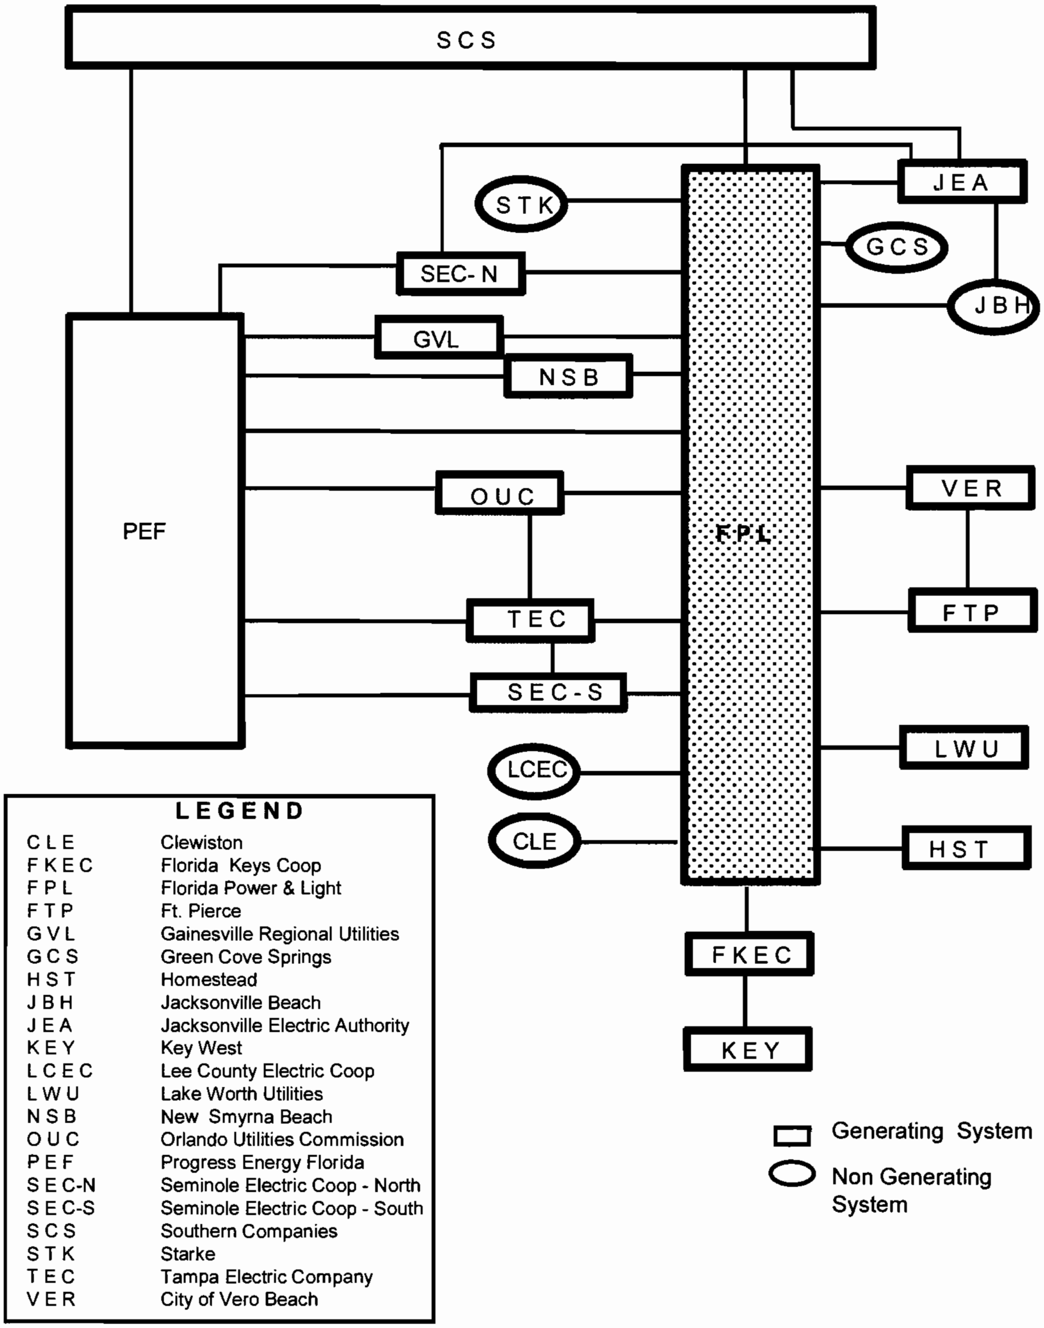

Figure I.A.3: FPL Interconnection Diagram

Description of Existing Resources

I.B Firm Capacity Power Purchases

Purchases from Qualifying Facilities (QF):

Firm capacity power purchases are an important part of FPL's resource mix. FPL currently has contracts with eight qualifying facilities; i.e., cogeneration/small power production facilities, to purchase firm capacity and energy during the 10-year reporting period of this Site Plan as shown in Table I.A.3, Table I.B.1, and Table I.B.2.

A cogeneration facility is one which simultaneously produces electrical and thermal energy, with the thermal energy (e.g., steam) being used for industrial, commercial, or cooling and heating purposes. A small power production facility is one which does not exceed 80 MW (unless it is exempted from this size limitation by the Solar, Wind, Waste, and Geothermal Power Production Incentives Act of 1990) and uses as its primary energy source solar, wind, waste, geothermal, or other renewable resources.

Purchases from Utilities:

FPL has a Unit Power Sales (UPS) contract to purchase 928 MW from the Southern Company (Southern) through the end of December 2015. This capacity is being supplied by Southern from a mix of gas-fired and coal-fired units.

In addition, FPL has contracts with the Jacksonville Electric Authority (JEA) for the purchase of 381 MW (Summer) and 388 MW (Winter) of coal-fired generation from the St. John's River Power Park (SJRPP) Units No. 1 and No. 2. However, due to Internal Revenue Service (IRS) regulations, the total amount of energy that FPL may receive from this purchase is limited. FPL currently assumes, for planning purposes, that this limit will be reached in November of 2017. Once this limit is reached, FPL will be unable to receive firm capacity and energy from these purchases. (However, FPL will continue to receive firm capacity and energy from its ownership portion of the SJRPP units.)

As part of the agreement that FPL will begin serving Vero Beach's electrical needs beginning in January 2014, FPL has acquired two existing power purchase agreements totaling approximately 37 MW of coal-fired capacity. These agreements will run through the end of 2016.

These purchases are shown in Table I.A.3, Table I.B.1, and Table I.B.2. FPL also has ownership interest in the SJRPP units. The ownership amount is reflected in FPL's installed capacity shown on Figure I.A.1, in Table I.A.1, and on Schedule 1.

Other Purchases:

FPL has two other firm capacity purchase contracts with non-QF, non-utility suppliers. These contracts with the Palm Beach Solid Waste Authority were previously listed as QFs; however, the addition of a second unit will cause both units to no longer meet the statutory definition of a QF. These contracts are therefore listed as "Other Purchases" after the current estimated in-service date of the new unit. Table I.B.1 and I.B.2 present the Summer and Winter MW, respectively, resulting from these contracts under the category heading of Other Purchases.

Table I.B.1: FPL's Firm Purchased Power Summer MW

Summary of FPL's Firm Capacity Purchases: Summer MW (for August of Year Shown)

I. Purchases from QF's:

Cogeneration Small Power Production Facilities	Contract Start Date	Contract End Date	2013	2014	2015	2016	2017	2018	2019	2020	2021	2022

4/ These units are part of the purchase of the Vero Beach Electric System.

I.C Non-Firm (As Available) Energy Purchases

FPL purchases non-firm (as-available) energy from several cogeneration and small power production facilities. Table I.C.1 shows the amount of energy purchased in 2012 from these facilities.

Table 1.C.1: As-Available Energy Purchases from Non-Utility Generators in 2012

Project	County	Fuel	In-Service Date	Energy (MWH) Delivered to 2012
Okeelanta (known as Florida Crystals and New Hope Power Partners) *	Palm Beach	Bagasse/Wood	11/95	141,594
Broward South *	Broward	Solid Waste	9/09	127,533
Broward North *	Broward	Solid Waste	1/12	119,168

First Solar	Miami	PV	4/11	67
Customer - Owned PV & Wind	Various	PV/Wind	Various	877
Palm Beach SWA	Palm Beach	Solid Waste	4/10	370,109
INEOS Bio *	Indian River	Wood	9/12	70

* These Non-Firm Energy Purchases are Renewable and are reflected on Schedule 11.1 row 9 column 6.

I.D Demand Side Management (DSM)

FPL has sought out and implemented cost-effective DSM programs since 1978. These programs include a number of conservation/energy efficiency and load management initiatives. FPL's DSM efforts through 2012 have resulted in a cumulative Summer peak reduction of approximately 4,652 MW at the generator and an estimated cumulative energy saving of approximately 62,653 Gigawatt-hour (GWh) at the generator. After accounting for reserve margin requirements, FPL's DSM efforts through 2012 have eliminated the need to construct the equivalent of approximately 14 new 400 MW generating units. DSM is discussed further in Chapter III.

											System Firm Generating Capacity as of December 31, 2012 [9/] =	**25,302**	**24,030**

1/ These ratings are peak capability.

2/ These ratings represent Florida Power & Light Company's share of Scherer Unit 4, adjusted for transmission losses.

3/ The capacity shown for the PV facility at Space Coast is considered as non-firm generating capacity due to the intermittent nature of the solar resource.

4/ The net capability ratings represent Florida Power & Light Company's share of St. Johns River Park Units 1 and 2, excluding the Jacksonville Electric Authority (JEA) share of 80%.

5/ Total capability of St. Lucie 1 is 987/1,009 MW. FPL's share of St. Lucie 2 is 845/864.FPL's ownership share of St. Lucie Units 1 and 2 is 100% and 85%, respectively, as shown above. FPL's share of the deliverable capacity from each unit is approx. 92.5% and exclude the Orlando Utilities Commission (OUC) and Florida Municipal Power Agency (FMPA) combined portion of approximately 7.44776% per unit.

6/ Currently operating as a synchronous condenser. If needed, it can be converted back to a generating unit per the existing Title V operating permit through the end of 2013 and is not accounted for in Reserve Margin Calculation.

7/ Values for the Nuclear Units are approximate due to the on going testing after the EPU work has been completed.

8/ The Total System Generating Capacity value shown includes FPL-owned firm and non-firm generating capacity.

9/ The System Firm Generating Capacity value shown includes only firm generating capacity.

CHAPTER II

Forecast of Electric Power Demand

(This page is left intentionally blank.)

II. Forecast of Electric Power Demand

II. A. Overview of the Load Forecasting Process

Long-term forecasts of sales, net energy for load (NEL), and peak loads are typically developed on an annual basis for resource planning work at FPL. New long-term forecasts were developed by FPL in early 2013 that replaced the previous long-term load forecasts that were used by FPL during 2012 in much of its resource planning work and which were presented in FPL's 2012 Site Plan. These new load forecasts are utilized throughout FPL's 2013 Site Plan. These forecasts are a key input to the models used to develop FPL's integrated resource plan.

The following pages describe how forecasts are developed for each component of the long-term forecast: sales, NEL, and peak loads. Consistent with past forecasts, the primary drivers to develop these forecasts include economic conditions and weather.

The projections for the national and Florida economies are obtained from the consulting firm IHS Global Insight. Population projections are obtained from the Florida Legislature's Office of Economic and Demographic Research (EDR). These projections are developed in conjunction with the Bureau of Economic and Business Research (BEBR) of the University of Florida. These inputs are quantified and qualified using statistical models in terms of their impact on the future demand for electricity.

Weather is always a key factor that affects FPL's energy sales and peak demand. Three sets of weather variables are developed and used in FPL's forecasting models:

1. Cooling degree-hours based on 72° F, winter heating degree-days based on 66° F, and heating degree-days based on 45° F are used to forecast energy sales.
2. The maximum temperature on the peak day, along with the build-up of cooling degree-hours prior to the peak, are used to forecast Summer peaks.
3. The minimum temperature on the peak day, along with the build-up of heating degree-hours based on 66° F on the day prior to the peak, are used to forecast Winter peaks.

The cooling degree-hours and winter heating degree-days are used to capture the changes in the electric usage of weather-sensitive appliances such as air conditioners and electric space heaters. Heating degree-days based on 45° F are used to capture heating load resulting from sustained periods of unusually cold weather not fully captured by heating degree-days based on 66° F. A composite hourly temperature profile is derived using hourly temperatures across FPL's service territory. Miami, Ft.Myers, Daytona Beach, and West Palm Beach are the locations from which temperatures are obtained. In developing the composite hourly profile, these regional temperatures are weighted by regional energy sales. The resulting composite temperature is used to derive projected cooling and heating degree-hours and heating degree-days. Similarly, composite temperature and hourly profiles of temperatures are used to calculate the weather variables used in the Summer and Winter peak models.

II. B. Comparison of FPL's Current and Previous Load Forecasts

While reflecting somewhat lower growth for a number of years, FPL's current load forecast is generally in line with the load forecast presented in its 2012 Site Plan. There are four primary factors that are driving the current load forecast: projected customer growth, a projection of gradual recovery following the economic recession in Florida, energy efficiency standards, and the additional load expected as a result of the acquisition of the City of Vero Beach electric utility.

In early 2013, FPL came to an agreement with the City of Vero Beach to purchase the City's electric system. This agreement was approved by the City voters on March 12' 2013. Beginning in January 2014, NEL, customers, and peaks for Vero Beach are included in FPL's forecasts and are reflected in FPL's 2013 Site Plan.

The customer forecast is based on recent population projections as well as the actual levels of customer growth experienced historically and the additional customers expected as a result of the acquisition of Vero Beach. Population projections are derived from the EDR's February 2013 Demographic Estimating Conference. This forecast is generally consistent with previous forecasts indicating a gradual rebound in Florida's population growth. Net migration into Florida fell to a record low in 2009 during the height of the recession. Florida has since experienced some rebound in net migration, but population growth rates have remained low by historical standards. Moderately higher rates of population growth are projected from 2013 until 2017 when the projected rate of population growth gradually begins to decelerate. Consistent with past population projections, the rates of population growth in the later years of the forecast are below the rates historically experienced in Florida.

Effective January 2014 FPL is expected to begin providing electric service to more than 34,000 customers formerly served by the City of Vero Beach. Reflecting this increase, the current forecast shows a significant increase in customer growth in 2014. Thereafter, customer growth is expected to mirror the overall level of population growth in the state. By 2019, the total number of customers served by FPL is expected to exceed five million. Between 2012 and 2022 the total number of customers is projected to increase at an annual rate of 1.4%, the same increase projected in the 2012 Site Plan.

The economic projections incorporated into FPL's load forecast are provided by IHS Global Insight, a leading economic forecasting firm. The economic projections from IHS Global Insight incorporated into the current load forecast indicate less robust growth than that assumed in the 2012 Site Plan forecast. Although IHS Global Insight remains cautiously optimistic on the Florida economy, their current projections for employment and income growth are lower than those incorporated into the 2012 Site Plan forecast.

Estimates of savings from energy efficiency standards are developed by ITRON, a leading expert in this area. Included in these estimates are savings from federal and state energy efficiency standards, including the 2005 National Energy Policy Act, the 2007 Energy Independence and Security Act, and the savings occurring from the use of compact fluorescent bulbs[2]. The impact of these savings began in 2005 and their cumulative impact on the Summer peak is expected to reach 2,898 MW by 2022. The cumulative impact from these savings on NEL is expected to reach 11,850 GWH over the same period while the cumulative impact on the Winter peak is expected to be 1,650 MW by 2022.

Consistent with the forecast presented in FPL's 2012 Site Plan, the total growth projected for the ten-year reporting period of this document is significant. The Summer peak is projected to increase to 26,105 MW by 2022, an increase of 4,665 MW over the 2012 actual Summer peak. Likewise, NEL is projected to reach 130,965 GWH in 2022, an increase of 20,099 GWH from the actual 2012 value.

II.C. Long-Term Sales Forecasts

Long-term forecasts of electricity sales were developed for the major revenue classes and are adjusted to match the NEL forecast. The results of these sales forecasts for the

[2] Note that in addition to the fact that these energy efficiency standards lower the forecasted load (as described later in this chapter), these standards also lower the potential for efficiency gains that would otherwise be available through utility DSM programs.

years 2013 - 2022 are presented in Schedules 2.1 - 2.3 which appear at the end of this chapter. Econometric models are developed for each revenue class using the statistical software package MetrixND. The methodologies used to develop energy sales forecasts for each jurisdictional revenue class and NEL forecast are outlined below.

1. Residential Sales

Residential electric usage per customer is estimated by using an econometric model. Residential sales are a function of the following variables: cooling degree-hours, winter heating degree-days, heating degree-days based on 45° F, lagged cooling degree-hours, lagged heating degree-days, retail gasoline prices, and Florida real per capita income weighted by the percent of the population employed. The impact of weather is captured by the cooling degree-hours, heating degree-days, and the one month lag of these variables. The impact energy prices have on electricity consumption is captured through retail gasoline prices. As energy prices rise, less disposable income is available for all goods and services, electricity included. To capture economic conditions, the model includes a composite variable based on Florida real per capita income and the percent of the state's population that is employed. Because of the relatively large percentage of Florida's population that was unemployed during the recession, real per capita income alone did not capture the full magnitude of the economic downturn. The composite variable more fully reflects economic conditions. Residential energy sales are forecasted by multiplying the forecasted residential use per customer by the number of residential customers forecasted.

2. Commercial Sales

The commercial sales forecast is also developed using an econometric model. Commercial sales are a function of the following variables: Florida real per capita income weighted by the percent of the population employed, cooling degree-hours, heating degree-hours, lagged cooling degree-hours, a variable designed to reflect the impact of empty homes, dummy variables for the month of December and for the specific months of January 2007 and November 2005, and an autoregressive term. Cooling degree-hours, heating degree-hours, and the one month lag of cooling degree-hours are used to capture weather-sensitive load in the commercial sector.

3. Industrial Sales

The industrial class is comprised of three distinct groups: very small accounts (those with less than 20 kW of demand), medium accounts (those with 21 kW to 499 kW of demand), and large accounts (those with demands of 500 kW or higher). As such, the forecast is developed using a separate econometric model for each group of industrial customers. The small industrial sales model utilizes the following variables: cooling degree-hours, heating degree-hours, dummy variables for the specific months of February 2009 and August 2004, and an autoregressive term. The medium industrial sales model utilizes the following variables: cooling degree-hours, Florida real per capita income, a dummy variable for the specific month of February 2006, two autoregressive terms, and a moving average term. The large industrial sales model utilizes the following variables: Florida real per capita income, the Consumer Price Index, and dummy variables for the specific months of October 2004, November 2004, and October 2005.

4. **Railroad and Railways Sales and Street and Highway Sales**

This class consists solely of Miami-Dade County's Metrorail system. The projections for railroad and railways sales are based on historical average use per customer which is multiplied by the forecasted number of customers. The number of customers is based on the planned addition of new Metrorail stations.

The forecast for street and highway sales is developed by first developing a trended use per customer value, then multiplying this value by the number of forecasted customers.

5. **Other Public Authority Sales**

This revenue class is closed to new customers. This class consists of sports fields and one government account. The forecast for this class is based on its historical usage characteristics.

6. **Total Sales to Ultimate Customer**

Sales forecasts by revenue class are summed to produce a total sales forecast.

7. **Sales for Resale**

Sales for resale (wholesale) customers are composed of municipalities and/or electric co-operatives. These customers differ from jurisdictional customers in that they are not the ultimate users of the electricity they buy. Instead, they resell this electricity to their own customers. Currently there are six customers in this class: the Florida Keys Electric Cooperative; City of Key West; Metro-Dade County; Lee County Electric

Cooperative; Wauchula; and Blountstown. In addition, FPL will begin making sales to Seminole Electric Cooperative in June 2014 under a long term agreement[3].

Beginning in May 2011, FPL began providing service to the Florida Keys Electric Cooperative under a long-term full requirements contract. Previously FPL was serving the Florida Keys under a partial requirements contract. The sales to Florida Keys Electric Cooperative are based on customer-supplied information and historical load factors.

FPL's sales to the City of Key West are expected to terminate in 2013. Forecasted sales to the City of Key West are based on assumptions regarding their contract demand and expected load factor.

Metro-Dade County sells 60 MW to Progress Energy Florida. Line losses are billed to Metro-Dade under a wholesale contract. This contract expires in 2013.

Lee County has contracted with FPL for FPL to supply a portion of their load through 2013, then to begin serving their entire load beginning in 2014. This contract began in January 2010. Lee County provides a forecast of their sales by delivery point which is used to derive their sales forecast.

FPL's sales to Wauchula began in October 2011 and will continue through December 2016.

Blountstown became an FPL wholesale customer in May 2012. FPL's contract with Blountstown expires in April 2017.

A new contract with Seminole Electric Cooperative is included in the forecast which includes delivery of 200 MW beginning in June 2014 and continuing through May 2021.

II.D. Net Energy for Load (NEL)

An econometric model is developed to produce a NEL per customer forecast. The inputs to the model include Florida real per capita income weighted by the percent of the

[3]FPL is currently evaluating the possibility of serving the electrical loads of several entities (including Lake Worth) at the time the 2013 Site Plan is being prepared. Because these possibilities are still being evaluated, the load forecast presented in this Site Plan does not include these potential loads.

population employed, and a proxy for energy prices. The model also includes three weather variables: cooling degree-hours, winter heating degree-days, and heating degree-days based on 45° F. In addition, the model also includes variables for energy efficiency standards and a variable designed to capture the impact of empty homes. Seasonal dummy variables are included for the months of February, April, June, September, and November and the specific months of March 2003, May 2004, and November 2005. There is also an autoregressive term in the model.

The energy efficiency variable is included to capture the impacts of the 2005 National Energy Policy Act, the 2007 Energy Independence and Security Act, and the savings occurring from the use of compact fluorescent bulbs. The impact of these savings began in 2005 and their cumulative impact on NEL is expected to reach 11,850 GWH by 2022. This reduction is inclusive of engineering estimates and any resulting behavioral changes. The cumulative 2022 reduction from these energy efficiency standards effectively reduces FPL's NEL for that year by 8.3%. On an incremental basis, net of the reduction already experienced through 2012, the reduction in 2022 is expected to reach 7,883 GWH.

The decline in the number of empty homes resulting from the current housing recovery has affected use per customer and is captured in a separate variable. The forecast was also adjusted for additional load estimated from hybrid vehicles, beginning in 2013, which resulted in an increase of approximately 1,408 GWH by the end of the ten-year reporting period. Other adjustments to the forecast include incremental load resulting from FPL's economic development riders which will impact the forecast beginning in 2013, and result in an increase, on average, of 418 GWH per year between 2013 and 2022, and incremental load from the acquisition of the Vero Beach electric system. The Vero Beach acquisition will add, on average, 824 GWH per year between 2014 and 2022.

The NEL forecast is developed by first multiplying the NEL per customer forecast by the total number of customers forecasted (excluding the customers formerly served by Vero Beach) and then adjusting the forecasted results for the expected incremental load resulting from hybrid vehicles, new wholesale contracts, the Vero Beach acquisition, and FPL's economic development riders. Once the NEL forecast is obtained, total billed sales are computed using a historical ratio of sales to NEL. The sales by class forecasts previously discussed are then adjusted to match the total billed sales. The forecasted NEL values for 2013 - 2022 are presented in Schedule 3.3 that appears at the end of this chapter.

II.E. System Peak Forecasts

The rate of absolute growth in FPL system peak load has been a function of the size of the customer base, varying weather conditions, projected economic conditions, changing patterns of customer behavior, and more efficient appliances and lighting. FPL developed the peak forecast models to capture these behavioral relationships. In addition, FPL's peak forecast also reflects changes in load expected a result of the acquisition of Vero Beach, changes in wholesale contracts, and the expected number of hybrid vehicles.

The savings from energy efficiency standards incorporated into the peak forecast include the impacts from the 2005 National Energy Policy Act, the 2007 Energy Independence and Security Act, and the use of compact fluorescent light bulbs. The impact from these energy efficiency standards began in 2005 and their cumulative impact on the Summer peak is expected to reach 2,898 MW by 2022. This reduction is inclusive of engineering estimates and any resulting behavioral changes. The cumulative 2022 impact from these energy efficiency standards effectively reduces FPL's Summer peak for that year by 10%. On an incremental basis, net of the reduction already experienced through 2012, the impact on the Summer peak from these energy efficiency standards is expected to reach 1,826 MW in 2022. By 2022, the Winter peak is expected to be reduced by 1,650 MW as result of the cumulative impact from these energy efficiency standards since 2005. On an incremental basis, net of the reduction already experienced through 2012, the impact on the Winter peak from these energy efficiency standards is expected to reach 1,126 MW in 2022.

The forecast was also adjusted for additional load estimated from hybrid vehicles which resulted in an increase of approximately 357 MW in the Summer and 151 MW in the Winter by the end of the ten-year reporting period and for the acquisition of the Vero Beach electric system. The Vero Beach acquisition will add 181 MW to the Summer peak, and 201 MW to the Winter peak, forecast by the end of the ten-year reporting period.

The forecasting methodology of Summer, Winter, and monthly system peaks is discussed below. The forecasted values for Summer and Winter peak loads for the years 2013 – 2022 are presented at the end of this chapter in Schedules 3.1 and 3.2, and in Chapter III in Schedules 7.1 through 7.4.

1. System Summer Peak

The Summer peak forecast is developed using an econometric model. The variables included in the model are the 3-month average CPI for Energy, Florida real per capita disposable income, cooling degree-hours in the day prior to the peak, the maximum temperature on the day of the peak, a dummy variables for the year 1994, a variable for energy efficiency standards, and a moving average term. The model is based on the Summer peak contribution per customer which is multiplied by total customers (excluding the customers that have been served by Vero Beach), and adjusted to account for incremental loads resulting from hybrid vehicles, new wholesale contracts, the Vero Beach acquisition, and FPL's economic development riders to derive FPL's system Summer peak.

2. System Winter Peak

Like the system Summer peak model, this model is also an econometric model. The model consists of two weather-related variables: the minimum temperature on the peak day and heating degree-hours for the prior day squared. The model also includes a dummy variable for Winter peaks occurring on weekends and a dummy variable for the year 2008. The forecasted results are adjusted for the impact of energy efficiency standards. The model is based on the Winter peak contribution per customer which is multiplied by total customers (excluding the customers that have been served by Vero Beach), and then adjusted for the expected incremental loads resulting from hybrid vehicles, new wholesale contracts, the Vero Beach acquisition, and FPL's economic development riders.

3. Monthly Peak Forecasts

The forecasting process for monthly peaks consists of the following actions:

a. Develop the historical seasonal factor for each month by using ratios of historical monthly peaks to the appropriate seasonal peak.

b. Apply the monthly ratios to their respective seasonal peak forecast to derive the peak forecast by month. This process assumes that the seasonal factors remain unchanged over the forecasting period.

II.F. The Hourly Load Forecast

Forecasted values for system hourly load for the period 2013 - 2022 are produced using a System Load Forecasting "shaper" program. This model uses years of historical FPL hourly system load data to develop load shapes for weekdays, weekend days, and holidays. The model generates a projection of hourly load values based on these load shapes and the forecast of monthly peaks and energy.

II.G. Uncertainty

In order to address uncertainty in the forecasts of aggregate peak demand and NEL, FPL first evaluates the assumptions underlying the forecasts. FPL takes a series of steps in evaluating the input variables, including comparing projections from different sources, identifying outliers in the series, and assessing the series' consistency with past forecasts. As needed, FPL reviews additional factors which may affect the input variables.

Uncertainty is also addressed in the modeling process. Generally, econometric models are used to forecast the aggregate peak demand and NEL. During the modeling process, the relevant statistics (goodness of fit, F-statistic, P-values, mean absolute deviation (MAD), mean absolute percentage error (MAPE), etc.) are scrutinized to ensure that the models adequately explain historical variation. Once a forecast is developed, it is compared with past forecasts. Deviations from past forecasts are examined in light of changes in input assumptions to ensure that the drivers underlying the forecast are well understood. Finally, forecasts of aggregate peak demand and NEL are compared with the actual values as these become available. An ongoing process of variance analyses is performed. To the extent that the variance analysis identifies large unexplained deviations between the forecast and actual values, revisions to the econometric model may be considered.

The inherent uncertainty in load forecasting is addressed in different ways in regard to FPL's overall resource planning and operational planning work. In regard to FPL's resource planning work, FPL's utilization of a 20% reserve margin criterion (approved by the FPSC) is designed, in part, to maintain reliable electric service to FPL's customers in light of forecasting uncertainty. In addition, banded forecasts of the projected Summer peak and net energy for load are produced based on an analysis of past forecasting errors. In regard to operational planning, a banded forecast for the projected Summer and Winter peak days is developed based on the historical weather variations. These bands are then used to develop similar bands for the monthly peaks.

II.H. DSM

The effects of FPL's DSM energy efficiency programs implementation through August 2012 are assumed to be imbedded in the actual usage data for forecasting purposes. The impacts of incremental energy efficiency that FPL plans to implement in the future, plus the cumulative and projected incremental impacts of FPL's load management programs, are accounted for as "line item reductions" to the forecasts as part of the IRP process as shown in Chapter III in Schedules 7.1 through 7.4. After making these adjustments to the load forecasts, the resulting "firm" load forecast is then used in FPL's IRP work.

2017	2,830	10,594	267,174	93	482	25	112,123
2018	2,775	10,703	259,320	93	488	25	113,378
2019	2,726	10,667	255,544	93	494	24	114,498
2020	2,665	10,596	251,510	93	500	24	115,970
2021	2,598	10,520	246,957	93	505	24	117,089
2022	2,540	10,573	240,208	93	510	24	118,674

Projected Values (2013 - 2022):

Col. (10) and Col.(15) represent forecasted energy sales that do not include the impact of incremental conservation. These values are at the meter.

Col. (11) represents the annual average of the twelve monthly values.

Col. (16) = Col. (4) + Col. (7) + Col. (10) + Col. (13) + Col. (14) + Col. (15).

Schedule 2.3
History of Energy Consumption
And Number of Customers by Customer Class

(1) Year	(17) Sales for Resale GWh	(18) Utility Use & Losses GWh	(19) Net Energy For Load GWh	(20) Average No. of Other Customers	(21) Total Average Number of Customers
2003	1,511	7,386	108,393	2,879	4,117,221
2004	1,531	7,467	108,093	3,029	4,224,509
2005	1,506	7,498	111,301	3,156	4,321,895
2006	1,569	7,909	113,137	3,218	4,409,563
2007	1,499	7,401	114,315	3,276	4,496,589
2008	993	7,092	111,004	3,348	4,509,730
2009	1,155	7,394	111,303	3,439	4,499,067
2010	2,049	7,870	114,475	3,523	4,520,328
2011	2,176	6,950	112,454	3,596	4,547,051
2012	2,237	6,403	110,866	3,645	4,576,449

Historical Values (2003 - 2012):

Col. (19) represents actual energy sales including the impacts of existing conservation.

Col. (19) = Col. (16) + Col. (17) + Col. (18). Historical NEL includes the impacts of existing conservation and agrees to Col. (5) on schedule 3.3. Historical GWH, prior to 2011, are based on a fiscal year beginning 12/29 and ending 12/28. The 2011 value is based on 12/29/10 to 12/31/11. The 2012 value is based on calendar year.

Col. (20) represents the annual average of the twelve monthly values.

Col. (21) = Col. (5) + Col. (8) + Col. (11) + Col. (20).

Schedule 2.3
Forecast of Energy Consumption
And Number of Customers by Customer Class

(1) Year	(17) Sales for Resale GWh	(18) Utility Use & Losses GWh	(19) Net Energy For Load GWh	(20) Average No. of Other Customers	(21) Total Average Number of Customers
2013	2,174	6,512	113,036	3,707	4,617,509
2014	4,924	6,806	118,718	3,763	4,705,879
2015	5,573	6,730	121,345	3,817	4,770,981
2016	5,620	6,817	123,453	3,867	4,841,466
2017	5,593	6,870	124,586	3,913	4,913,456
2018	5,636	6,944	125,957	3,958	4,985,069
2019	5,696	7,006	127,200	3,999	5,055,714
2020	5,763	7,095	128,829	4,039	5,124,207
2021	5,342	7,112	129,543	4,075	5,189,124
2022	5,059	7,231	130,965	4,110	5,254,304

Projected Values (2013 - 2022):

Col. (19) represents forecasted energy sales that do not include the impact of incremental conservation and agrees to Col. (2) on Schedule 3.3.

Col. (19) = Col. (16) + Col. (17) + Col. (18). These values are based on calendar year.

Col. (20) represents the annual average of the twelve monthly values.

Col. (21) = Col. (5) + Col. (8) + Col. (11) + Col. (20).

Schedule 3.1
History of Summer Peak Demand (MW)

(1)	(2)	(3)	(4)	(5)	(6)	(7)	(8)	(9)	(10)
Year	Total	Wholesale	Retail	Interruptible	Res. Load Management	Residential Conservation	C/I Load Management	C/I Conservation	Net Firm Demand
2003	19,668	253	19,415	0	892	798	577	554	18,200
2004	20,545	258	20,287	0	894	846	588	577	19,063
2005	22,361	264	22,097	0	902	895	600	611	20,858
2006	21,819	256	21,563	0	928	948	635	640	20,256
2007	21,962	261	21,701	0	952	982	716	683	20,295
2008	21,060	181	20,879	0	966	1,042	760	706	19,334
2009	22,351	249	22,102	0	981	1,097	811	732	20,558
2010	22,256	419	21,837	0	990	1,181	815	758	20,451
2011	21,619	427	21,192	0	1,000	1,281	821	781	19,798
2012	21,440	425	21,015	0	1,027	1,328	827	797	19,586

Historical Values (2003 - 2012):

Col. (2) - Col. (4) are actual values for historical Summer peaks. As such, they incorporate the effects of conservation (Col. 7 & Col. 9), and may incorporate the effects of load control if load control was operated on these peak days. Therefore, Col. (2) represents the actual Net Firm Demand.

Col. (5) - Col. (9) represent actual DSM capabilities starting from January 1988 and are annual (12-month) values except for 2012 values which are through August.

Col. (10) represents a HYPOTHETICAL "Net Firm Demand" as if the load control values had definitely been exercised on the peak. Col. (10) is derived by the formula: Col. (10) = Col.(2) - Col.(6) - Col.(8).

Schedule 3.1
Forecast of Summer Peak Demand (MW)

(1)	(2)	(3)	(4)	(5)	(6)	(7)	(8)	(9)	(10)
August of Year	Total	Wholesale	Retail	Interruptible	Res. Load Management*	Residential Conservation	C/I Load Management*	C/I Conservation	Net Firm Demand
2013	21,790	399	21,391	0	1,056	64	854	32	19,785
2014	22,928	1,184	21,744	0	1,072	128	889	64	20,775
2015	23,359	1,191	22,168	0	1,081	194	907	96	21,080
2016	23,733	1,197	22,536	0	1,090	261	925	128	21,329
2017	24,122	1,182	22,940	0	1,099	327	943	160	21,593
2018	24,493	1,189	23,304	0	1,109	393	961	192	21,839
2019	24,901	1,196	23,705	0	1,118	459	979	224	22,121
2020	25,302	1,203	24,099	0	1,127	506	996	250	22,422
2021	25,560	1,010	24,550	0	1,136	557	1,014	273	22,580
2022	26,105	1,017	25,088	0	1,145	608	1,032	295	23,025

Projected Values (2013 - 2022):

Col. (2) - Col. (4) represent FPL's forecasted peak and does not include incremental conservation, cumulative load management, or incremental load management.

Col. (5) - Col. (9) represent cumulative load management, and incremental conservation and load management. All values are projected August values.

Col. (8) represents FPL's Business On Call, CDR, CILC, and Curtailable programs/rates.

Col. (10) represents a 'Net Firm Demand" which accounts for all of the incremental conservation and assumes all of the load control is implemented on the peak. Col. (10) is derived by using the formula: Col. (10) = Col. (2) - Col. (5) - Col. (6) - Col. (7) - Col. (8) - Col. (9).

* Res. Load Management and C/I Load Management include MW values of load management from Lee County and FKEC.

Schedule 3.2
History of Winter Peak Demand:Base Case

(1)	(2)	(3)	(4)	(5)	(6)	(7)	(8)	(9)	(10)
Year	Total	Firm Wholesale	Retail	Interruptible	Res. Load Management	Residential Conservation	C/I Load Management	C/I Conservation	Net Firm Demand
2003	20,190	246	19,944	0	802	546	453	206	18,935
2004	14,752	211	14,541	0	813	567	534	227	13,405
2005	18,108	225	17,883	0	816	583	542	233	16,751
2006	19,683	225	19,458	0	823	600	550	240	18,311
2007	16,815	223	16,592	0	846	620	577	249	15,392
2008	18,055	163	17,892	0	868	644	636	279	16,551
2009	20,081	207	19,874	0	881	666	676	285	18,524
2010	24,346	500	23,846	0	895	687	721	291	22,730
2011	21,126	383	20,743	0	903	717	723	303	19,501
2012	17,934	382	17,552	0	856	755	722	314	16,356

Historical Values (2003 - 2012):

Col. (2) - Col. (4) are actual values for historical Winter peaks. As such, they incorporate the effects of conservation (Col. 7 & Col. 9), and may incorporate the effects of load control if load control was operated on these peak days. Therefore, Col. (2) represents the actual Net Firm Demand. For year 2011, the actual peaked occurred in December of 2010.

Col. (5) - Col. (9) for 2003 through 2012 represent actual DSM capabilities starting from January 1988 and are annual (12-month) values.

Col. (10) represents a HYPOTHETICAL "Net Firm Demand" as if the load control values had definitely been exercised on the peak. Col. (10) is derived by the formula: Col. (10) = Col.(2) - Col.(6) - Col.(8).

Schedule 3.2
Forecast of Winter Peak Demand:Base Case

(1)	(2)	(3)	(4)	(5)	(6)	(7)	(8)	(9)	(10)
January of Year	Total	Firm Wholesale	Retail	Interruptible	Res. Load Management*	Residential Conservation	C/I Load Management*	C/I Conservation	Net Firm Demand
2013	20,270	410	19,860	0	863	27	578	12	18,790
2014	21,593	941	20,652	0	880	66	603	23	20,022
2015	22,154	1,142	21,012	0	887	108	612	33	20,513
2016	22,430	1,143	21,287	0	895	151	621	44	20,719
2017	22,662	1,130	21,532	0	902	193	630	55	20,882
2018	22,898	1,123	21,775	0	910	235	638	66	21,049
2019	23,125	1,123	22,002	0	917	278	647	76	21,207
2020	23,356	1,124	22,233	0	924	311	656	85	21,380
2021	23,601	1,125	22,476	0	932	341	665	93	21,571
2022	23,670	925	22,745	0	939	371	673	100	21,587

Projected Values (2013 - 2022):

Col. (2) - Col. (4) represent FPL's forecasted peak and does not include incremental conservation, cumulative load management, or incremental load management.

Col. (5) - Col. (9) represent cumulative load management, and incremental conservation and load management. All values are projected January values.

Col. (8) represents FPL's Business On Call, CDR, CILC, and Curtailable programs/rates.

Col. (10) represents a 'Net Firm Demand" which accounts for all of the incremental conservation and assumes all of the load control is implemented on the peak. Col. (10) is derived by using the formula: Col. (10) = Col. (2) - Col. (5) - Col. (6) - Col. (7) - Col. (8) - Col. (9).

* Res. Load Management and C/I Load Management include MW values of load management from Lee County and FKEC.

Schedule 3.3
History of Annual Net Energy for Load (GWh)
(All values are "at the generator" values except for Col (8))

(1) Year	(2) Net Energy For Load without DSM GWh	(3) Residential Conservation GWh	(4) C/I Conservation GWh	(5) **Actual** Net Energy For Load GWh	(6) Sales for Resale GWh	(7) Utility Use & Losses GWh	(8) Total Billed Retail Energy Sales (GWh)	(9) Load Factor(%)
2003	111,784	1,773	1,619	108,393	1,511	7,386	99,496	62.9%
2004	111,659	1,872	1,693	108,093	1,531	7,467	99,095	60.1%
2005	115,065	1,970	1,793	111,301	1,506	7,498	102,296	56.8%
2006	117,116	2,078	1,901	113,137	1,569	7,909	103,659	59.2%
2007	118,518	2,138	2,066	114,315	1,499	7,401	105,415	59.4%
2008	115,379	2,249	2,126	111,004	993	7,092	102,919	60.2%
2009	115,844	2,345	2,196	111,303	1,155	7,394	102,755	56.8%
2010	119,220	2,487	2,259	114,475	2,049	7,870	104,557	58.7%
2011	117,460	2,683	2,324	112,454	2,176	6,950	103,327	59.4%
2012	116,083	2,823	2,394	110,866	2,237	6,403	102,226	59.0%

Historical Values (2003 - 2012):

Col. (2) represents derived "Total Net Energy For Load w/o DSM". The values are calculated using the formula: Col. (2) = Col. (3) + Col. (4) + Col. (5).

Col. (3) & Col. (4) are DSM values starting in January 1988 and are annual (12-month) values. Col. (3) and Col. (4) for 2012 are "estimated actuals" and are also annual (12-month) values. The values represent the total GWh reductions experienced each year .

Col. (5) is the actual Net Energy for Load (NEL) for years 2003 - 2012.

Col. (8) is the Total Retail Billed Sales. The values are calculated using the formula: Col. (8) = Col. (5) - Col. (6) - Col. (7). These values are at the meter.

Col. (9) is calculated using Col. (5) from this page and Col. (2), "Total", from Schedule 3.1 using the formula: Col. (9) = ((Col. (5)*1000) / ((Col. (2) * 8760)
Adjustments are made for leap years.

Schedule 3.3
Forecast of Annual Net Energy for Load (GWh)
(All values are "at the generator"values except for Col (8))

(1) Year	(2) **Forecasted** Net Energy For Load without DSM GWh	(3) Residential Conservation GWh	(4) C/I Conservation GWh	(5) Net Energy For Load Adjusted for DSM GWh	(6) Sales for Resale GWh	(7) Utility Use & Losses GWh	(8) **Forecasted** Total Billed Retail Energy Sales w/o DSM GWh	(9) Load Factor(%)
2013	113,036	48	26	112,962	2,174	6,512	104,350	59.2%
2014	118,718	147	78	118,493	4,924	6,806	106,988	59.1%
2015	121,345	248	131	120,966	5,573	6,730	109,042	59.3%
2016	123,453	348	186	122,919	5,620	6,817	111,016	59.2%
2017	124,586	449	241	123,896	5,593	6,870	112,123	59.0%
2018	125,957	549	296	125,112	5,636	6,944	113,378	58.7%
2019	127,200	650	351	126,199	5,696	7,006	114,498	58.3%
2020	128,829	730	406	127,692	5,763	7,095	115,970	58.0%
2021	129,543	801	450	128,292	5,342	7,112	117,089	57.9%
2022	130,965	871	488	129,605	5,059	7,231	118,674	57.3%

Projected Values (2013 - 2022):

Col. (2) represents Forecasted Net Energy for Load and does not include incremental DSM from 2013 - on. The Col. (2) values are extracted from Schedule 2.3, Col(19). The effects of conservation implemented prior to September 2012 are incorporated into the load forecast values in Col. (2).

Col. (3) & Col. (4) are forecasted values of the reduction on sales from incremental conservation from Jan 2013 - on and are mid-year (6-month) values reflecting DSM signups occurring evenly thoughout each year.

Col. (5) is the forecasted Net Energy for Load (NEL) after adjusting for impacts of incremental DSM for years 2013 - 2022 using the formula:
Col. (5) = Col. (2) - Col. (3) - Col. (4)

Col. (8) is the Total Retail Billed Sales. The values are calculated using the formula: Col. (8) = Col. (2) - Col. (6) - Col. (7).
These values are at the meter.

Col. (9) is calculated using Col. (2) from this page and Col. (2), "Total", from Schedule 3.1. Col. (9) = ((Col. (2)*1000) / ((Col. (2) * 8760)
Adjustments are made for leap years.

Schedule 4
Previous Year Actual and Two-Year Forecast of
Retail Peak Demand and Net Energy for Load (NEL) by Month

(1)	(2)	(3)	(4)	(5)	(6)	(7)
	2012 Actual		2013 FORECAST		2014 FORECAST	
Month	Total Peak Demand MW	NEL GWh	Total Peak Demand MW	NEL GWh	Total Peak Demand MW	NEL GWh
JAN	17,934	7,979	20,270	8,426	21,593	8,842
FEB	16,228	7,702	16,551	7,547	17,632	7,942
MAR	16,310	8,640	16,717	8,499	17,808	8,903
APR	18,108	8,509	17,342	8,649	18,247	9,030
MAY	19,981	9,895	19,375	9,962	20,386	10,378
JUN	20,351	10,243	20,696	10,378	21,776	10,873
JUL	21,343	11,226	21,277	11,228	22,387	11,748
AUG	21,440	11,203	21,790	11,266	22,928	11,792
SEP	19,711	10,234	20,993	10,471	22,089	11,005
OCT	19,337	9,654	19,654	9,812	20,680	10,351
NOV	14,282	7,423	18,105	8,309	18,576	8,829
DEC	16,025	8,157	18,008	8,489	18,476	9,026
Annual Values:		**110,866**		**113,036**		**118,718**

Col. (3) annual value shown is consistent with value shown in Col.(5) of Schedule 3.3.

Cols. (4) - (7) do not include the impacts of cumulative load management, incremental conservation, and incremental load management.

Cols. (5) and Col. (7) annual values shown are consistent with values shown in Col.(2) of Schedule 3.3.

CHAPTER III

Projection of Incremental Resource Additions

(This page is left intentionally blank.)

III. Projection of Incremental Resource Additions

III.A FPL's Resource Planning:

FPL utilizes its well established integrated resource planning (IRP) process in whole or in part as analysis needs are warranted, to determine when new resources are needed, what the magnitude of the needed resources are, and what type of resources should be added. The timing and type of new power plants, the primary subjects of this document, are determined as part of the IRP process work.

This section describes FPL's basic IRP process. Some of the key assumptions, in addition to a new load forecast, that were used in developing the resource plan presented in this Site Plan are also discussed.

Four Fundamental Steps of FPL's Resource Planning:

There are 4 fundamental steps to FPL's resource planning. These steps can be described as follows:

Step 1: Determine the magnitude and timing of FPL's new resource needs;

Step 2: Identify which resource options and resource plans can meet the determined magnitude and timing of FPL's resource needs (i.e., identify competing options and resource plans);

Step 3: Evaluate the competing options and resource plans in regard to system economics and non-economic factors; and,

Step 4: Select a resource plan and commit, as needed, to near-term options.

Figure III.A.1 graphically outlines the 4 steps.

Overview of FPL's IRP Process

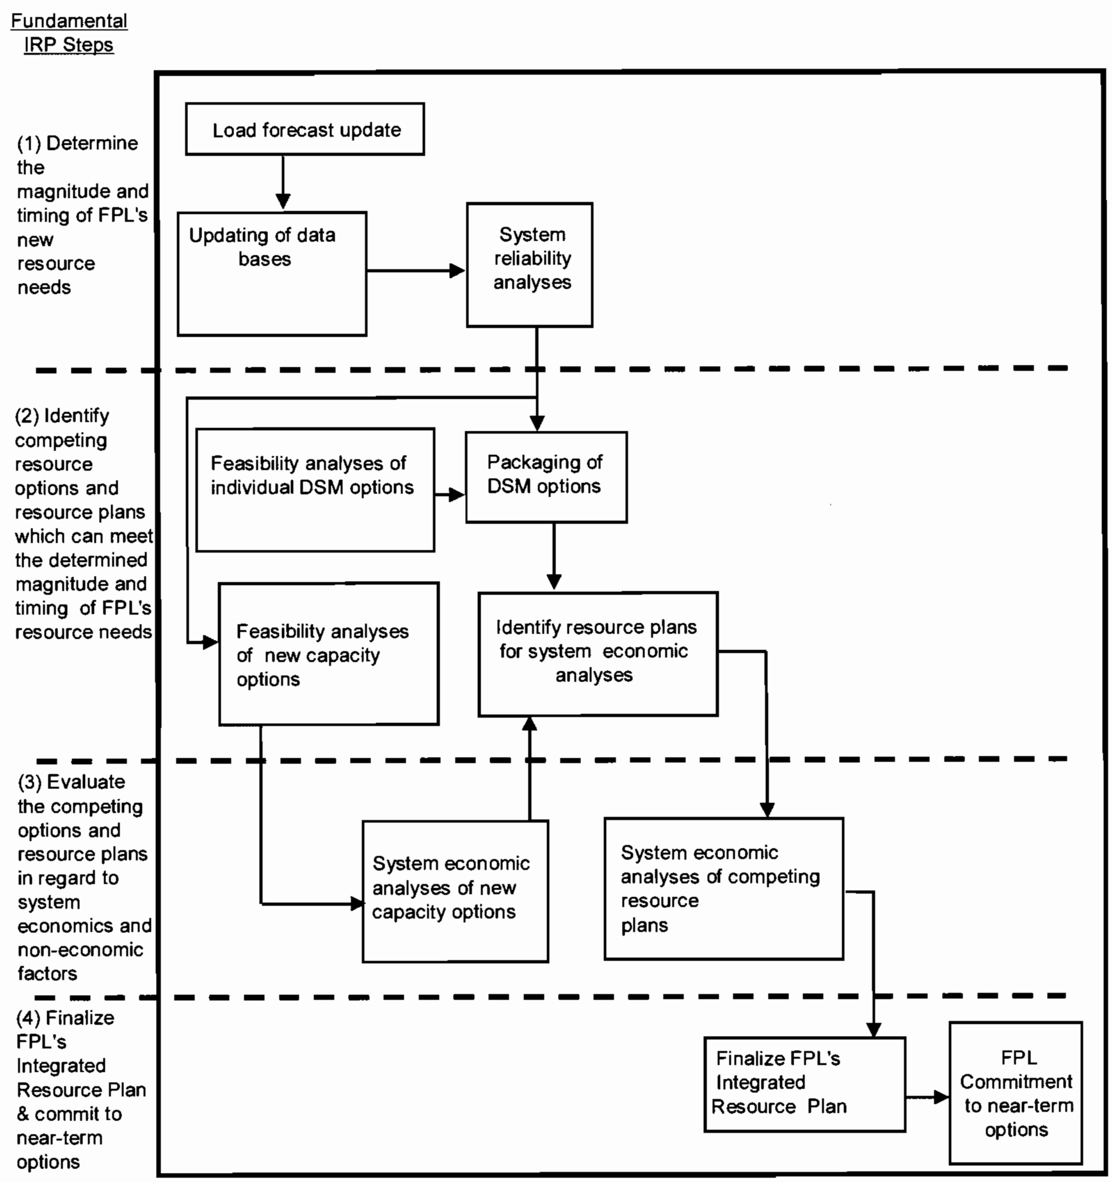

Figure III.A.1: Overview of FPL's IRP Process

Step 1: Determine the Magnitude and Timing of FPL's New Resource Needs:

The first of the four resource planning steps, determining the magnitude and timing of FPL's resource needs, is essentially a determination of the amount of capacity or megawatts (MW) of load reduction, new capacity additions, or a combination of both load reduction and new capacity additions that are needed to maintain system reliability. Also determined in this step is when the MW additions are needed to meet FPL's reliability criteria. This step is often referred to as a reliability assessment, or resource adequacy, analysis for the utility system.

Step 1 typically starts with an updated load forecast. Several databases are also updated in this first fundamental step, not only with the new information regarding forecasted loads, but also with other information that is used in many of the fundamental steps in resource planning. Examples of this new information include, but are not limited to: delivered fuel price projections, current financial and economic assumptions, and power plant capability and operating assumptions. FPL also includes key assumptions regarding three specific resource areas: (1) near-term construction capacity additions, (2) firm capacity power purchases, and (3) demand side management (DSM) implementation.

The first of these assumptions is based on new generating capacity additions that have been approved by the Florida Public Service Commission (FPSC) either through Determination of Need proceedings that evaluated both the need for, and the cost-effectiveness of, each of the new capacity additions or through other FPSC dockets. These generating capacity additions have also either received the necessary Site Certification approvals from either the Secretary of the Florida Department of Environmental Protection (FDEP) or the Governor and Cabinet (acting as the Siting Board), or these approvals have been applied for. There is also work in progress to obtain the necessary federal and state licenses, permits, and approvals for construction and operation of two new nuclear units. The earliest practical deployment date for the first of the two new nuclear units, Turkey Point Unit 6, is currently projected to be 2022, a date within the reporting period of this Site Plan.

These generating capacity additions include:

- The completion of the extended power uprates (EPU) project at FPL's existing Turkey Point Unit 4 nuclear unit. Similar EPU projects were completed during 2012 at FPL's three other existing nuclear power plants (St. Lucie Units 1 & 2 and Turkey Point Unit 3). The completion of the EPU project at Turkey Point Unit 4 is projected to add approximately 115 MW of incremental nuclear capacity and the total incremental nuclear capacity from the EPU project for all four nuclear plants is projected to be more than 500 MW. The FPSC approved the need for the EPU project in April 2008.

- Two existing generating plant sites, each featuring two older fossil fuel-fired steam generating units, are currently in the process of being modernized. The steam generating units originally at these sites have been removed and are in the process of being replaced with one new, highly efficient combined cycle (CC) unit at each site. The new CC plant at FPL's Cape Canaveral site is projected to be placed in-service in mid-2013. This new CC unit (called the Cape Canaveral Next Generation Clean Energy Center (CCEC)) is projected to have a peak Summer output of 1,210 MW. The new CC unit at FPL's Riviera Beach site (called the Riviera Beach Next Generation Clean Energy Center (RBEC)) is projected to be placed in-service in mid-2014 and it is expected to have a peak Summer output of 1,212 MW. These modernizations were approved by the FPSC in September 2008. The site certification application for Cape Canaveral was granted in October 2009. The site certification application for Riviera Beach was granted in November 2009.
- Similar to the two modernization projects mentioned above, the four existing steam units at the Port Everglades site are being removed and will be replaced with a new highly efficient CC unit. Two of these four existing steam units were removed in the fourth quarter of 2012 and the other two steam units are projected to be removed in the first half of 2013. The new generating unit, called the Port Everglades Next Generation Clean Energy Center (PEEC), is projected to be in-service in mid-2016 and is projected to have a peak Summer output of 1,277 MW. The FPSC provided the final need order for this modernization project on April 9th, 2012. The site certification application for Port Everglades was granted in October 2012.
- In the fourth quarter of 2011, FPL started upgrading the 7FA combustion turbines (CT) that are components at a number of its existing CC units. These upgrades will economically benefit FPL's customers by increasing the MW output of these CC units by approximately 228 MW (Summer peak value) in total. As reflected in Schedule 1 in Chapter I, 70 MW of the increased capacity from these CT upgrades is already in service. The work for the remaining upgrades is continuing and the project is projected to be completed in 2015.
- FPL is continuing its work to obtain all of the licenses, permits, and approvals that will be necessary to construct and operate two new nuclear units at its Turkey Point site. These licenses, permits, and approvals will provide FPL with the opportunity to

construct these nuclear units at Turkey Point for a time expected to be up to 20 years from the time the licenses and permits are granted, and then to operate the units for at least 40 years thereafter. FPL received need determination approval from the FPSC for the two nuclear units in April 2008 in Order No. PSC-08-0237-FOF-EI. The earliest practical deployment dates for the first of these two new units, Turkey Point Unit 6, is currently projected to be 2022. This new nuclear unit is projected to have a peak Summer output of 1,100 MW.

- As part of FPL's acquisition of Vero Beach's electric utility system, FPL will take ownership of Vero Beach's five existing generating units starting January 2014. The current plan is to immediately retire three of these older generating units and operate the remaining two, which supply approximately 44 MW (Summer) of combined cycle capacity, for a maximum of three years.

These new generating units and generating capacity additions were selected for a variety of reasons including cost-effectiveness, significant system fuel savings, fuel diversity, mitigation of regional generation/load imbalances, and significant system emission reductions, including greenhouse gas emission reductions.

The second of these assumptions involves firm capacity power purchases. FPL's current projection of firm capacity purchases has changed from the projection in the 2012 Site Plan. FPL's current projection includes an additional 70 MW from the Palm Beach Solid Waste Authority (SWA) starting in year 2015 which is a year earlier than projected in the 2012 Site Plan. Also, FPL now projects that its purchase agreement with Jacksonville Electric Authority (JEA) for St. Johns Regional Power Park (SJRPP)-based capacity and energy will allow FPL to continue to receive purchased capacity and energy until November 2017. At that time, FPL projects that Internal Revenue Service (IRS) regulations regarding the amount of energy that FPL can receive will result in the suspension of any further capacity and energy by FPL.[4] As part of the agreement that FPL will begin serving Vero Beach's electrical needs beginning in January 2014, FPL has acquired two existing power purchase agreements totaling approximately 37 MW of coal-fired capacity. These agreements will run through the end of 2016. In addition, FPL projects that it will begin receiving a total of 180 MW of firm capacity in 2021 from biomass-based power purchase agreements with EcoGen.

[4] FPL's projected suspension date for the SJRPP purchase is based on a system reliability perspective and represents the earliest projected date at which the suspension of capacity and energy could occur.

In total, the projected firm capacity purchases are from a combination of utility and independent power producers. Details, including the annual total capacity values for these purchases, are presented in Chapter I in Tables I.B.1 and I.B.2. These purchased capacity amounts were incorporated in FPL's resource planning work.

The third of these assumptions involves a projection of the amount of additional DSM that is anticipated to be implemented annually over the ten-year period. Since 1994, FPL's resource planning work has assumed that, at a minimum, the DSM MW called for in FPL's approved DSM Plan will be achieved. The resource plan presented in FPL's 2013 Site Plan fully accounts for the annual DSM implementation direction provided by the FPSC in 2011 that addresses the years through 2019. In addition, for planning purposes in this document, FPL also assumes an additional 100 MW per year of DSM for the remaining years addressed in this Site Plan, 2020 through 2022.

These key assumptions, plus the other updated information described above, are then applied in the first fundamental step: the determination of the magnitude and the timing of FPL's future resource needs. This determination is accomplished by system reliability analyses which for FPL have traditionally been based on dual planning criteria of a minimum peak period reserve margin of 20% (FPL applies this to both Summer and Winter peaks) and a maximum loss-of-load probability (LOLP) of 0.1 day per year. Both of these criteria are commonly used throughout the utility industry.

Historically, two types of methodologies, deterministic and probabilistic, have been utilized in system reliability analysis. The calculation of excess firm capacity at the annual system peaks (reserve margin) is the most common method, and this relatively simple deterministic calculation can be performed on a spreadsheet. It provides an indication of the adequacy of a generating system's capacity resources compared to its load during peak periods. However, deterministic methods do not take into account probabilistic-related elements such as the impact of individual unit failures. For example: two 50 MW units which can be counted on to run 90% of the time are more valuable in regard to utility system reliability than is one 100 MW unit which can also be counted on to run 90% of the time. Probabilistic methods also recognize the value of being part of an interconnected system with access to multiple capacity sources.

For this reason, probabilistic methodologies have been used to provide an additional perspective on the reliability of a generating system. There are a number of probabilistic methods that are being used to perform system reliability analyses. Among the most widely used is loss-of-load probability (LOLP) which FPL utilizes. Simply stated, LOLP is an index of how well a generating system may be able to meet its demand (i.e., a measure of how often load may exceed available resources). In contrast to reserve margin, the calculation of LOLP looks at the daily peak demands for each year, while taking into consideration such probabilistic events as the unavailability of individual generators due to scheduled maintenance or forced outages.

LOLP is expressed in units of the "number of times per year" that the system demand could not be served. The standard for LOLP accepted throughout the industry is a maximum of 0.1 day per year. This analysis requires a more complicated calculation methodology than does the reserve margin analysis. LOLP analyses are typically carried out using computer software models such as the Tie Line Assistance and Generation Reliability (TIGER) program used by FPL.

The result of the first fundamental step of resource planning is a projection of how many new MW of resources are needed to meet both reserve margin and LOLP criteria, and thus maintain system reliability, and when the MW are needed. Information regarding the timing and magnitude of these resource needs is then used in the second fundamental step: identifying resource options and resource plans that can meet the determined magnitude and timing of FPL's resource needs.

Step 2: Identify Resource Options and Plans That Can Meet the Determined Magnitude and Timing of FPL's Resource Needs:

The initial activities associated with this second fundamental step of resource planning generally proceed concurrently with the activities associated with Step 1. During Step 2, preliminary economic screening analyses of new capacity options that are identical, or virtually identical, in regard to certain key characteristics may be conducted to determine which new capacity options appear to be the most competitive on FPL's system. This preliminary analysis work can also help identify capacity size (MW) values, projected construction/permitting schedules, and operating parameters and costs. Similarly, preliminary economic screening analyses of new DSM options and/or continued growth in existing DSM options are often conducted.

FPL typically utilizes the P-MArea production cost model and a Fixed Cost Spreadsheet, and/or the Strategist model, as well as spreadsheet analyses, to perform the preliminary economic screening of generation resource options. For the preliminary economic screening analyses of DSM resource options, FPL typically uses its DSM cost-effectiveness model which is an FPL spreadsheet model utilizing the FPSC's approved methodology for performing preliminary cost-effectiveness screening of individual DSM measures and programs. FPL also utilizes its non-linear programming model for analyzing the potential for lowering system peak loads through additional load management/demand response capability. Then FPL typically utilizes its linear programming model to develop DSM portfolios that are subsequently used in developing resource plans for final system analyses of DSM-based resource plans.

The individual new resource options emerging from these preliminary economic screening analyses are then typically "packaged" into different resource plans which are designed to meet the system reliability criteria. In other words, resource plans are created by combining individual resource options so that the timing and magnitude of FPL's projected new resource needs are met. The creation of these competing resource plans is typically carried out using spreadsheet and/or dynamic programming techniques.

At the conclusion of the second fundamental resource planning step, a number of different combinations of new resource options (i.e., resource plans) of a magnitude and timing necessary to meet FPL's resource needs are identified.

Step 3: Evaluate the Competing Options and Resource Plans in Regard to System Economics and Non-Economic Factors:

At the completion of fundamental steps 1 & 2, the most viable new resource options have been identified, and these resource options have been combined into a number of resource plans which meet the magnitude and timing of FPL's resource needs. The stage is set for evaluating these resource options and resource plans in final, or system, economic analyses that attempt to account for all of the impacts to the FPL system from the competing resource options/resource plans. (A number of these system impacts are typically not accounted for in preliminary economic screening analyses.) In FPL's 2012 and early 2013 resource planning work, once the resource plans were developed, FPL utilized the P-MArea production cost model and a Fixed Cost Spreadsheet, and/or the Strategist model, to perform the system economic analyses.

The basic economic analyses of the competing resource plans focus on total system economics. The standard basis for comparing the economics of competing resource plans is their relative impact on FPL's electricity rate levels, with the objective generally being to minimize FPL's projected levelized system average electric rate (i.e., a Rate Impact Measure or RIM methodology). In cases in which the DSM contribution was assumed as a given and the only competing options were new generating units and/or purchase options, comparisons of competing resource plans' impacts on electricity rates and on system revenue requirements will yield identical outcomes in regard to the relative rankings of the resource options being evaluated. Consequently, the competing options and resource plans in such cases can be evaluated on a system cumulative present value revenue requirement (CPVRR) basis.

Other factors are also included in FPL's evaluation of resource options and resource plans. While these factors may have an economic component or impact, they are often discussed in quantitative, but non-economic, terms such as percentages, tons, etc. rather than in terms of dollars. These factors are often referred to by FPL as "system concerns" that include (but are not limited to) maintaining/enhancing fuel diversity in the FPL system, system emission levels, and maintaining a regional balance between load and generating capacity, particularly in the Southeastern Florida counties of Miami-Dade and Broward. In conducting the evaluations needed to determine which resource options and resource plans are best for FPL's system, the non-economic evaluations are conducted with an eye to whether the system concern is positively or negatively impacted by a given resource option or resource plan. These, and other, factors are discussed later in this chapter in section III.C.

Step 4: Finalizing FPL's Current Resource Plan

The results of the previous three fundamental steps are typically used to develop the current resource plan. This plan is presented in the following section.

III.B Projected Incremental Resource Additions/Changes

FPL's projected incremental generation capacity additions/changes for 2013 through 2022 are depicted in Table III.B.1. These capacity additions/changes result from a variety of actions that primarily consist of: (i) changes to existing units (which are frequently achieved as a result of plant component replacements during major overhauls and through other uprates to existing capacity), (ii) changes in the amounts of purchased power being delivered under existing contracts as per the contract schedules or by entering into new purchase contracts, (iii) the modernizations of FPL's existing Cape Canaveral, Riviera Beach, and Port Everglades sites by the removal of the steam generating units that were previously, or are currently, on the sites and the addition of one new, very fuel-efficient CC generating unit at each site, (iv) upgrades to the CTs at a number of existing combined cycle plants, (v) the switching of Turkey Point 1 and 2 from generation to synchronous condenser operation, and (vi) the addition of the new Turkey Point Unit 6 nuclear unit in 2022 (i.e., the year currently projected at the time this document is being finalized to be the earliest practical in-service date for this new nuclear unit).

Although the DSM additions that are consistent with the FPSC's directions regarding FPL's DSM program implementation are not explicitly presented in this table, these DSM additions have been fully accounted for in all of FPL's resource planning work reflected in this document. The FPSC's directions regarding FPL's DSM program implementation address the years through 2019. For planning purposes in this document, FPL currently projects an additional 100 MW (Summer) of DSM per year for the subsequent three years (2020 through 2022) addressed in this Site Plan. In addition, the projected MW reductions from these DSM additions are reflected in the projected reserve margin values shown in the table below and in Schedules 7.1 and 7.2 presented later in this chapter. (Subsequent analyses, particularly analyses that will be conducted in preparation for the 2014 DSM Goals docket, will ultimately determine the actual levels of DSM that FPL should implement in the 2015 through 2022 time frame.)

Table III.B.1: Projected Capacity Changes for FPL

Projected Capacity Changes for FPL (1)			
		Net Capacity Changes (MW)	
Year	**Projected Capacity Changes**	**Winter (2)**	**Summer (3)**
2013	Changes to Existing Purchases (4)	(545)	(425)
	Port Everglades Units 3 & 4 retired for Modernization	(765)	(761)
	Turkey Point Unit 2 operation changed to synchronous condenser	(394)	(392)
	Sanford Unit 5 CT Upgrade	---	9
	Turkey Point Unit 4 Uprate - Completed	---	115
	Turkey Point Unit 4 Uprate - Outage (5)	(717)	---
	Sanford Unit 4 CT Upgrade	---	16
	Manatee Unit 2	(3)	---
	Scherer Unit 4	(28)	---
	Cape Canaveral Next Generation Clean Energy Center (6)	---	1,210
	Manatee Unit 1 ESP - Outage (7)	(822)	---
	Martin Unit 1 ESP - Outage (7)	--	(826)
2014	Sanford Unit 5 CT Upgrade	19	10
	Cape Canaveral Next Generation Clean Energy Center (6)	1,355	---
	Changes to Existing Purchases (4)	22	37
	Manatee Unit 1 ESP - Outage (7)	822	---
	Sanford Unit 4 CT Upgrade	16	---
	Vero Beach Combined Cycle (8)	46	44
	Martin Unit 1 ESP - Outage (7)	(832)	826
	Martin Unit 2 ESP - Outage (7)	---	(826)
	Manatee Unit 3 CT Upgrade	---	19
	Turkey Point Unit 5 CT Upgrade	---	33
	Turkey Point Unit 4 Uprate - Completed (5)	115	---
	Riviera Beach Next Generation Clean Energy Center (6)	---	1,212
2015	Manatee Unit 3 CT Upgrade	39	20
	Martin Unit 1 ESP - Outage (7)	832	---
	Martin Unit 2 ESP - Outage (7)	---	826
	Turkey Point Unit 5 CT Upgrade	33	---
	Changes to Existing Purchases (4)	70	70
	Ft. Myers Unit 2 CT Upgrade	---	51
	Riviera Beach Next Generation Clean Energy Center (6)	1,344	---
2016	Changes to Existing Purchases (4)	(858)	(928)
	Ft. Myers Unit 2 CT Upgrade	51	---
	Port Everglades Next Generation Clean Energy Center (6)	---	1,277
2017	Turkey Point Unit 1 operation changed to synchronous condenser	(398)	(396)
	Changes to Existing Purchases (4)	(37)	(37)
	Vero Beach Combined Cycle (8)	(46)	(44)
	Port Everglades Next Generation Clean Energy Center (6)	1,429	---
2018	Changes to Existing Purchases (4)	(388)	(381)
2019	---	---	---
2020	---	---	---
2021	Changes to Existing Purchases (4)	180	180
2022	Turkey Point Nuclear Unit 6 (6)	---	1,100

(1) Additional information about these resulting reserve margins and capacity changes are found on Schedules 7 & 8 respectively.
(2) Winter values are forecasted values for January of the year shown.
(3) Summer values are forecasted values for August of the year shown.
(4) These are firm capacity and energy contracts with QF, utilities, and other entities. See Table I.B.1 and Table I.B.2 for more details.
(5) Outages for uprate work.
(6) All new unit additions are scheduled to be in-service in June of the year shown. All additions assumed to start in June are included in the Summer reserve margin calculation starting in that year and in the Winter reserve margin calculation starting with the next year.
(7) Outages for ESP work.
(8) This unit will be added as part of the agreement that FPL will serve Vero Beach's electric load starting January, 2014. This unit is expected to be retired within 3 years.

III.C Discussion of the Projected Resource Plan and Issues Impacting FPL's Resource Planning Work

As indicated in the Executive Summary, FPL's resource planning efforts in 2012 and early 2013 were influenced by a number of factors. These factors are expected to continue to influence FPL's resource planning work for the foreseeable future. In addition, other factors may also influence FPL's on-going resource planning work in the future and may result in changes to the resource plan discussed in this document. Eight (8) of these factors are discussed below (in no particular order of importance).

1) Maintaining/enhancing fuel diversity in the FPL system;
2) Maintaining a balance between load and generating capacity in Southeastern Florida, particularly in Miami-Dade and Broward Counties;
3) FPL will begin to provide electric service to Vero Beach;
4) The projected impacts of mandated energy efficiency standards;
5) FPL's growing dependence upon DSM resources to maintain system reliability;
6) The Nuclear Regulatory Commission's schedule for reviewing applications for Combined Operating Licenses for new nuclear units;
7) Environmental regulation and/or legislation; and,
8) Possible establishment of "Clean Energy Standards" or another mechanism to promote large scale utilization of renewable energy.

These 8 factors, and their various impacts on FPL's resource planning efforts including the current resource plan that is presented in this Site Plan, are briefly discussed below.

1. Maintaining/Enhancing System Fuel Diversity;

FPL is currently dependent upon using natural gas to generate approximately 2/3 of the total electricity it delivers to its customers. In the future, the percentage of FPL's electricity that is generated by natural gas is projected to increase. Therefore, FPL is continually seeking opportunities to maintain and enhance the fuel diversity of its system.

In 2007, following express direction by the Commission to do so, FPL sought approval from the FPSC to add two new advanced technology coal units to its system. These two new units would have been placed in-service in 2013 and 2014. However, in part due to concerns over potential greenhouse gas emission legislation/regulation, FPL was unable to obtain approval for these units. Several other factors are currently unfavorable to new coal units compared to new CC units. The first of these factors is a significant reduction in the fuel cost difference between coal and natural gas compared to the fuel cost difference projected in 2007 that favored coal; i.e., the projected cost advantage of coal versus natural gas has been significantly reduced. Second is the continuation of significantly higher capital costs for coal units compared to capital costs for CC units. Third is the increased fuel efficiency of new CC units compared to projected CC unit efficiencies in 2007. Fourth are the stricter environmental regulations, and the possibility of other environmental regulations that address greenhouse gas emissions, that are more unfavorable to new coal units than to new CC units. Consequently, FPL does not believe that new advanced technology coal units are currently economically, politically, or environmentally viable fuel diversity enhancement options in Florida.

Therefore, FPL has turned its attention to nuclear energy and renewable energy to enhance its fuel diversity and to using natural gas more efficiently. In regard to nuclear energy, in 2008 the FPSC approved the need to increase capacity at FPL's four existing nuclear units and authorized FPL to recover project-related expenditures that are approved as a result of annual nuclear cost recovery filings. In April of this year FPL will have completed this Extended Power Uprate (EPU) project and more than 500 MW of additional nuclear capacity will have been achieved to benefit FPL's customers.[5]

FPL is continuing its work to obtain all of the licenses, permits, and approvals that would be necessary to construct and operate two new nuclear units at its Turkey Point site in the future. These licenses, permits, and approvals will provide FPL with the opportunity to construct these nuclear units at Turkey Point for a time expected to be up to 20 years from the time the licenses and permits are granted, and then to operate the units for at least 40 years thereafter. At the time this document is being finalized, the earliest practical deployment date for the first of the two new nuclear units, Turkey Point Unit 6, is projected to be 2022.

FPL also has been involved in activities to investigate adding or maintaining renewable resources as a part of its generation supply. One of these activities is a

[5] The value for the increased capacity delivered by the EPU project will be known once the final testing at all of the four nuclear units is completed. At the time this document was being finalized, this testing had not yet been completed. However, for resource planning analysis purposes, a specific MW value is needed for calculations. For these analysis purposes, FPL is assuming the EPU project will have delivered a nominal 510 MW which equates to approximately 501 MW Summer and 516 MW Winter.

variety of discussions with the owners of existing facilities aimed at maintaining or extending current agreements that are scheduled to end during the ten-year reporting period of this document. As previously mentioned, FPL has recently signed power purchase agreements with EcoGen that will result in FPL receiving 180 MW of firm capacity from biomass facilities beginning in 2021.

FPL also sought and received approval from the FPSC in 2008 to add 110 MW through three new FPL-owned solar facilities: one solar thermal facility and two photovoltaic (PV) facilities. One 25 MW PV facility began commercial operation in 2009. The remaining two solar facilities, a 10 MW PV facility and a 75 MW solar thermal steam generating facility, began commercial operation in 2010. The addition of these renewable energy facilities was made possible due to enabling legislation from the Florida Legislature in 2008. FPL remains strongly supportive of Federal and/or State legislation that enables electric utilities to add renewable energy resources and authorize the utilities to recover appropriate costs for these resources.

In regard to using natural gas more efficiently, FPL received approvals in 2008 from the FPSC to modernize the existing Cape Canaveral and Riviera Beach plant sites with new, highly efficient CC units that replace the former steam generating units on each of those sites. The modernizations of Cape Canaveral and Riviera Beach are currently underway and are projected to go in-service on time in mid-2013 and mid-2014, respectively. On April 9th, 2012, FPL received FPSC approval to proceed with a similar modernization project at the Port Everglades site which is scheduled for completion in mid-2016. The modernization of Port Everglades will retain the capability of receiving water-borne delivery of oil as a backup fuel.

In regard to natural gas delivery, FPL issued a request for proposals (RFP) in December 2012 for new natural gas pipeline capacity into Florida and FPL's service territory. A third pipeline utilizing a new route would result in a more reliable, more economic, and more diverse natural gas supply for FPL's customers and the state of Florida. Proposals to this RFP are due in early April 2013.

In the future, FPL will continue to identify and evaluate alternatives that may maintain or enhance system fuel diversity. Moreover, FPL is also maintaining the ability to utilize fuel oil at existing units that have that capability. In this regard, FPL is in the process of installing electrostatic precipitators (ESPs) at its four 800 MW steam generating units at the Martin and Manatee sites which will enable FPL to retain the ability to burn oil, as needed, at these sites while retaining the flexibility to use natural gas when economically attractive.

2. Maintaining a Balance Between Load and Generation in Southeastern Florida:

In recent years, an imbalance was projected to develop between regionally installed generation and regional peak load in Southeastern Florida. With such an imbalance, a significant amount of energy required in the Southeastern Florida region during peak periods would need to be provided either by operating less efficient generating units located in Southeastern Florida out of economic dispatch, or by importing the energy through the transmission system from plants located outside the region. FPL's prior planning work concluded that either additional installed generating capacity in this region, or additional installed transmission capacity capable of delivering more electricity from outside the region, would be required to address this imbalance.

Partly because of the lower transmission-related costs resulting from their location, four recent capacity addition decisions (Turkey Point Unit 5 and WCEC Units 1, 2, & 3) were determined to be the most cost-effective options to meet FPL's capacity needs in the near-term. In addition, FPL has added increased capacity at FPL's existing two nuclear units at Turkey Point as part of the previously mentioned EPU project. The recently approved Port Everglades modernization project scheduled for completion in 2016 will also significantly aid in mitigating this imbalance. Adding the additional generation capacity through the projects mentioned above contributes to addressing the imbalance between generation and load in Southeastern Florida for approximately the remainder of this decade.

The planned addition of two new nuclear units at FPL's Turkey Point site, Turkey Point Unit 6 in 2022 and Turkey Point Unit 7 in 2023, will also address the imbalance issue for an additional period of time beginning in the next decade. Due to steadily increasing load in the Southeastern region, the Southeastern Florida imbalance issue will remain an important consideration in FPL's on-going resource planning work in future years.

3. FPL Will Begin to Provide Electric Service to Vero Beach:

FPL will begin serving Vero Beach's electrical load beginning January 1, 2014. An agreement to this effect was reached between Vero Beach and FPL on February 19, 2013, and a referendum was held on March 12, 2013 resulted in a majority of Vero Beach voters approving the agreement. The additional peak load that FPL will serve is projected to be 155 MW (Summer) in 2014 with additional growth in this peak load expected thereafter.

4. The Impacts of Mandated Energy Efficiency Standards:

Recent increases in the level of federal- and state-mandated energy efficiency standards for appliances, lighting, and other electric equipment began in 2005 with the passage of the National Energy Policy Act. These mandated efficiency standards have been periodically raised and extended since that time. FPL accounts for the impacts of these efficiency standards on projected peak load and annual energy usage in its load forecast.

The magnitude of efficiency that is being delivered to FPL's customers through these standards is significant. For example, by the year 2022, the cumulative impact of these standards since 2005 is expected to result in a reduction in FPL's Summer peak of approximately 2,900 MW compared to what the projected load would have been without the efficiency standards. This represents a decrease of approximately 10% in the forecasted Summer peak load for 2022. Likewise, FPL's forecasted net energy for load (NEL) in the year 2022 is projected to be approximately 11,850 GWh lower compared to what the projected NEL would have been without the efficiency standards. This represents a decrease of approximately 8% in the forecasted NEL for 2022.

In addition to lowering FPL's forecast from what it otherwise would have been, and thus lowering FPL's projected resource needs, this projection of increased efficiency from the efficiency standards also affects FPL's resource planning in another way. The mandated higher efficiency standards lower the potential for future MW and GWh reductions from FPL's demand side management (DSM) programs that address the specific appliances and equipment covered by the standards. FPL will take this fact into consideration in the aspects of its resource planning work that involve consideration of both the magnitude and type of DSM resources in its DSM portfolio.

5. FPL's Increasing Dependence On DSM Resources to Maintain System Reliability:

With its 2013 Site Plan, FPL continues to project that it will become increasingly dependent upon DSM resources to maintain system reliability. This projected trend has been previously discussed in FPL's 2011 and 2012 Site Plans. This trend is largely a result of two things: (1) high levels of DSM implementation by FPL required by the FPSC, and (2) relatively low growth in forecasted load.[6]

In regard to these two factors, in late 2009 the FPSC imposed significantly higher 10-year DSM Goals than had been deemed appropriate in previous DSM Goals dockets. For example, the 2009 Goals level was set at approximately 150 MW per year, almost double the previous 2004 Goals level of approximately 80 MW per year. The FPSC's 2011 DSM Plan decision subsequently lowered these required levels of DSM, but only by a relatively small amount to approximately 120-to-130 MW per year. As a consequence, FPL's resource planning is projecting DSM implementation of approximately 120-to-130 MW per year through the year 2019. During this time frame, FPL's projected load growth is considerably lower than the load growth projected when the 2004 Goals target of approximately 80 MW per year was set.

Consequently, DSM growth is projected to continue at a high level while FPL's projected load growth has slowed. As a result, the FPL system is becoming increasingly dependent upon DSM to maintain system reliability.

In its 2011 and 2012 Site Plans, FPL discussed this projected trend of increasing dependence upon DSM resources using a new type of reserve margin projection as an indicator: a "generation-only reserve margin" (gen-only RM). In calculating the values for this indicator, all of FPL's projected incremental load management and energy efficiency program capabilities, and its existing load management capability, are removed from the reserve margin calculation.

[6] Other contributing factors include the expiration of existing PPAs such as UPSR, the effective expiration of the SJRPP PPA, and the retirement of several older FPL generating units for economic reasons.

The resulting gen-only RM values indicate what FPL's reserve margin values are projected to be based solely on generation resources. The lower the gen-only RM values, the greater FPL's dependence is upon DSM resources.

The gen-only RM projections from the 2011 and 2012 Site Plans were presented in Schedules 7.3 and 7.4 in those Site Plans. These schedules consistently showed that FPL's gen-only RM values were projected to significantly decrease throughout the 10-year reporting period of those Site Plans, and to decline to single-digit values in the latter years of the reporting periods. These projections indicate a steadily growing dependence on DSM resources to maintain system reliability. Schedule 7.3 in this year's Site Plan, presented near the back of this chapter, shows a similar projection. FPL's gen-only RM is projected to be in the general range of 16.3% to 18.0% for the period of 2013 through 2016, then decrease steadily until 2021 when the projected gen-only RM value is 6.9%. In 2022, the projected gen-only RM value is 4.7% if potential delays (see discussion below) preclude FPL from bringing Turkey Point Unit 6 into service as currently planned in 2022. Schedule 7.4 presents the projection of FPL's gen-only RM after accounting for the planned addition of Turkey Point Unit 6 in 2022. This addition increases the projected gen-only RM value to 8.9%.

These consistent projections of increasing dependence on DSM resources to maintain system reliability are of concern to FPL because of the various voluntary aspects associated with customer participation in DSM programs, FPL believes that system reliability risk increases as dependence on DSM resources increases. Therefore, this issue will continue to be analyzed in FPL's on-going resource planning work.

6. The Nuclear Regulatory Commission's Schedule for Review of Applications for New Nuclear Units:

As the 2013 Site Plan is being finalized, it is unclear when the Nuclear Regulatory Commission (NRC) will issue a new schedule for its review of FPL's application for a Combined Operating License (COL) for the Turkey Point Units 6 & 7 nuclear units and the potential impact that revised schedule may have on the overall project schedule. FPL will require a Combined Operating License (COL) from the Nuclear Regulatory Commission (NRC) before construction of the two new nuclear units planned for the Turkey Point site. During 2012, the NRC placed several review schedules "under review", including FPL's COL application. At the time this Site Plan is being finalized, the NRC has not identified a date by which it will issue a new schedule. Once the NRC's new review schedule is issued, FPL will conduct a project schedule review, integrating this information with other relevant information, to determine earliest practicable in-service date for Turkey Point Unit 6.

7. Environmental Regulation and/or Legislation:

As developments occur in regard to new environmental regulations and/or laws, and in how current environmental regulations/laws are interpreted and applied, the potential exists for changes to occur in FPL's resource plan that is presented in this document. For example, FPL has become aware of potential impacts to generating units of recent EPA changes to the National Ambient Air Quality Standards that include shorter duration 1-hour standards for NO_2 and SO_2. FPL has begun the process of evaluating the impact of these standards on the fossil generating fleet, especially the higher emitting peaking gas turbines that have short emission stacks. The results of this analysis could potentially change FPL's resource plan information that is contained in this document.

8. Possible Establishment of "Clean Energy Standards":

Another factor that could influence FPL's resource planning, and could result in changes to the resource plan presented in this Site Plan, is the possibility of the establishment of a Florida standard for renewable energy or clean energy. A Renewable Portfolio Standard (RPS) proposal was prepared by the FPSC, and then sent to the Florida Legislature for consideration, with a possible change to a Clean Portfolio Standard (CPS), during the 2009 legislative session. However, no RPS or CPS legislation was enacted in that session or in subsequent legislative sessions. Furthermore, during the 2012 legislative session, the legislature deleted a now obsolete directive to the FPSC that had instructed them to adopt RPS rules. RPS or CPS legislation, or other legislative initiatives regarding renewable or clean energy contributions, may still occur in the future at either the state or national level. If such legislation is enacted in later years, FPL would then determine what steps need to be taken to address the legislation. Such steps would then be discussed in FPL's Site Plan in the year following the enactment of such legislation.

III.D Demand Side Management (DSM)

FPL has sought out and implemented cost-effective DSM programs since 1978. These programs include both conservation initiatives and load management. FPL's DSM efforts through 2012 have resulted in a cumulative Summer peak reduction of approximately 4,652 MW (Summer) at the generator and an estimated cumulative energy saving of approximately 62,653 Gigawatt Hour (GWh) at the generator. After accounting for reserve margin requirements, FPL's DSM efforts through 2012 have eliminated the need to construct the equivalent of approximately 14 new 400 MW generating units.

FPL has consistently been among the leading utilities nationally in DSM achievement. For example, according to the U.S. Department of Energy's 2011 data (the last year for which the DOE data was available at the time this Site Plan is being developed), FPL ranked # 2 nationally in cumulative DSM demand reduction. And, importantly, FPL has achieved these significant DSM accomplishments while seeking to lessen the DSM-based impact on electric rates for all of its customers.

During 2012 and early 2013, FPL offered the following DSM programs to its customers:

Residential DSM Programs

1. **Air-Conditioning:** This program is designed to reduce energy consumption and growth of coincident peak demand by encouraging customers to install high-efficiency central air-conditioning systems.

2. **Load Management (On Call):** This program is designed to reduce the Summer and Winter coincident peak demand and energy by turning off customers' appliances for varying durations. Load control equipment is installed at selected customer end-use equipment, allowing FPL to control these loads. Qualifying equipment includes central electric air conditioners, central electric heaters, conventional electric water heaters, and swimming pool pumps.

3. **Building Envelope:** This program is designed to reduce energy consumption and growth of coincident peak demand by encouraging customers to improve the thermal efficiency of the building structure.

4. **New Construction (BuildSmart®):** This program is designed to reduce energy consumption and growth of coincident peak demand through the design and

construction of energy-efficient homes. The program encourages builders and developers to achieve the ENERGY STAR®qualification.

5. **Duct System Testing and Repair:** This program is designed to reduce energy consumption and growth of coincident peak demand by encouraging customers to repair air leaks identified in air-conditioning duct systems.

6. **Low Income Weatherization:** This program is designed to reduce energy consumption and growth of coincident peak demand by partnering with government and non-profit agencies to assist eligible low income FPL residential customers to reduce the cost of heating and cooling their homes. The agencies include weatherization agency providers (WAPS), non-weatherization agency providers (non-WAPS), and other providers approved by FPL. The rebates are used by these providers to leverage their funds to increase the overall energy efficiency of the homes they are retrofitting.

7. **Home Energy Survey:** This program is designed to reduce energy consumption and growth of coincident peak demand by offering home energy surveys to customers. This objective is accomplished by educating customers on energy efficiency and encouraging customers to perform recommended practices and measures, even if they are not included in FPL's DSM Plan. The energy survey is also used to identify customers for other residential rebate programs dependent upon survey findings. (Note, FPL does not count demand and energy savings from this program towards achieving its DSM Goals.)

Business DSM Programs

1. **Heating, Ventilating, and Air Conditioning (HVAC):** This program is designed to reduce energy consumption and growth of coincident peak demand by encouraging customers to install high-efficiency HVAC systems. The current FPL program includes rebates for: 1) thermal storage; 2) chillers; 3) energy recovery ventilator units; 4) direct expansion (DX) units and efficient air conditioning room units; 5) demand control ventilation systems including kitchen hood control; and 6) electrically commutated motors for air conditioning systems.

2. **Commercial Industrial Demand Reduction (CDR):** This program is designed to reduce the growth of coincident peak demand by controlling customer loads of 200 kW or greater during periods of extreme demand, capacity shortages, or system emergencies.

3. **Commercial/Industrial Load Control (CILC):** This program is designed to reduce the growth of coincident peak demand by controlling customer loads of 200 kW or greater during periods of extreme demand, capacity shortages, or system emergencies. This program was closed to new participants as of December 31, 2000,

4. **Building Envelope:** This program is designed to reduce energy consumption and growth of coincident peak demand by encouraging customers to install eligible building envelope measures (e.g., roof/ceiling insulation, reflective roof coatings and window treatments).

5. **Business On Call:** This program is designed to reduce the summer coincident peak demand and energy by turning off customers' direct expansion central electric air-conditioning units.

6. **Efficient Lighting:** This program is designed to reduce energy consumption and growth of coincident peak demand by encouraging customers to install high-efficiency lighting systems.

7. **Business Custom Incentive:** This program is designed to reduce energy consumption and growth of coincident peak demand by encouraging customers to install unique high-efficiency systems not addressed by other FPL DSM programs.

8. **Water Heating:** This program is designed to reduce energy consumption and growth of coincident peak demand by encouraging customers to install high-efficiency water heating systems.

9. **Refrigeration:** This program is designed to reduce energy consumption and growth of coincident peak demand by encouraging customers to install high-efficiency refrigeration systems.

10. **Business Energy Evaluation (BEE):** This program is designed to reduce energy consumption and growth of coincident peak demand by offering energy audits to business customers. This objective is accomplished by educating customers on energy efficiency and encouraging customers to perform recommended practices and measures, even if these are not addressed by other FPL DSM programs. The BEE is also used to qualify customers for other FPL business rebate programs dependent upon audit findings. (Note, FPL does not count demand or energy savings from this program towards achieving its DSM Goals.)

11. **Cogeneration and Small Power Production:** Facilitates FPL compliance with all regulatory requirements concerning qualifying facilities and small power producers. Assists customers in the evaluation of potential cogeneration projects, including self-generation. (Note, FPL does not count demand or energy savings from this program towards achieving its DSM Goals)

Solar Pilot Programs

1. **Residential Photovoltaic (PV) Pilot:** This pilot is designed to reduce energy consumption and growth of coincident peak demand by encouraging customers to install PV systems in residential homes.

2. **Residential Solar Water Heating Pilot:** This pilot is designed to reduce energy consumption and growth of coincident peak demand by encouraging customers to install solar water heating systems in homes.

3. **Residential Solar Water Heating (Low Income New Construction) Pilot:** This pilot is designed to reduce energy consumption and growth of coincident peak demand, increase the efficiency of low income housing, and demonstrate the practical application of solar water heating in residential new construction by providing solar water heating systems to selected low income housing developments throughout FPL's service territory.

4. **Business Photovoltaic (PV) Pilot:** This pilot is designed to reduce energy consumption and growth of coincident peak demand by encouraging customers to install PV systems in businesses.

5. **Business Photovoltaic (PV) for Schools Pilot:** This pilot is designed to reduce energy consumption and growth of coincident peak demand and demonstrate and educate future generations on the practical applications of PV by providing PV systems and educational materials for selected schools in all public school districts throughout FPL's service territory.

6. **Business Solar Water Heating Pilot:** This pilot is designed to reduce energy consumption and growth of coincident peak demand by encouraging customers to install solar water heating systems in businesses.

DSM Research and Development:

Conservation Research and Development (CRD): CRD is an umbrella research project under which potential new DSM technologies are analyzed. Several FPL DSM programs have emerged from the CRD project including Business Building Envelope, Business On Call, and Residential New Construction (BuildSmart®) programs. This project has also resulted in the addition of cost-effective measures to existing programs, such as the inclusion of Energy Recovery Ventilators to the Business HVAC Program.

DSM Goals:

The FPSC in late 2009 imposed significantly higher DSM Goals for FPL for 2010 – 2019 than were deemed appropriate in prior DSM Goals dockets. The DSM Goals imposed by the FPSC have three components: Summer MW reductions, Winter MW reductions, and GWh reductions. The Summer MW component, and to a much lesser degree the Winter MW reduction component, impacts FPL's need for future resources such as those discussed in this document. The GWh reduction component has no impact on FPL's need for future resources.

In 2011, based on concerns over the projected higher electric rates that would result if a new DSM Plan to meet the new 2009 DSM Goals were implemented, the FPSC instructed FPL to continue executing its currently existing DSM programs (FPSC Order PSC-11-0590-FOF-EG). The projected demand reduction impact of these DSM programs from 2013 through 2019, plus an assumed additional 100 MW per calendar year for 2020 through 2022, is presented below in Table III.D.1. (Subsequent analyses will ultimately determine the actual levels of DSM that should be added in these later years.)

Table III.D.1: FPL's Projected DSM Summer MW Reduction for 2013 - 2022

August MW values (at the Generator)

Year	Cumulative Summer DSM MW for FPL (at Generator)
2013	124
2014	243
2015	369
2016	494
2017	619
2018	745
2019	870
2020	970
2021	1,070
2022	1,170

FPL's intent is to follow the FPSC's directions regarding DSM implementation and to continue its national leadership role in DSM. In doing so, FPL will maintain focus on lessening the DSM-based impact on electric rates for all of FPL's customers and ensuring that FPL's system reliability does not become too dependent upon DSM resources.

III.E Transmission Plan

The transmission plan will allow for the reliable delivery of the required capacity and energy to FPL's retail and wholesale customers. The following table presents FPL's proposed future additions of 230 kV bulk transmission lines that must be certified under the Transmission Line Siting Act.

Table III.E.1: List of Proposed Power Lines

(1) Line Ownership	(2) Terminals (To)	(3) Terminals (From)	(4) Line Length CKT. Miles	(5) Commercial In-Service Date (Mo/Yr)	(6) Nominal Voltage (KV)	(7) Capacity (MVA)
FPL	St. Johns 1/	Pringle	25	Dec – 17	230	759
FPL	Manatee 2/	Bob White	30	Dec – 14	230	1195

1/ Final order certifying the corridor was issued on April 21, 2006. This project is to be completed in two phases. Phase I consisted of 4 miles of new 230 kV line (Pringle to Pellicer) and was completed in May-2009. Phase II consists of 21 miles of new 230 kV line (St. Johns to Pellicer) and is scheduled to be completed by Dec-2017.

2/ Final order certifying the corridor was issued on November 6, 2008. This project consists of 30 miles of new 230 kV line (Manatee to Bob White) and is scheduled to be completed by Dec-2014

In addition, there will be transmission facilities needed to connect several of FPL's projected generating capacity additions to the system transmission grid. These transmission facilities (described on the following pages) are for the remaining capacity increase (uprate) at the existing Turkey Point Unit 4 nuclear generating unit, the generating capacity additions with the Cape Canaveral, Riviera Beach and Port Everglades modernizations, and the planned new nuclear capacity addition at the Turkey Point site from Turkey Point Unit 6.

III.E.1 Transmission Facilities for Turkey Point Unit 4 Capacity Uprate

The work that was required to address the remainder of the Turkey Point Unit 4 uprate in 2013 in regard to the FPL grid consisted of the following:

I. Substation:

1. At Turkey Point Switchyard, install two 5-Ohm series phase inductors combined with external shunt capacitors on the southeast and southwest 230 kV operating busses.
2. At Turkey Point Switchyard, replace twelve 230 kV disconnect switches. Also upgrade associated jumpers, bus work and equipment connections.
3. Uprate the Unit 4 main step-up transformer to 970 MVA.
4. Replace spare main step-up transformer with 1028 MVA transformer.
5. Add relays and other protective equipment.
6. Replace breaker failure panels at Davis Substation.
7. Replace breaker failure panels at Flagami Substation.

II. Transmission:

1. Upgrade the existing string busses for Unit 4 between the main step-up transformer and the switchyard with spacers between the conductors.

III.E.2 Transmission Facilities for Cape Canaveral Next Generation Clean Energy Center (Modernization)

The work required to connect the Cape Canaveral Next Generation Clean Energy Center in 2013 to the FPL grid is as follows:

I. Substation:

1. Build new collector yard containing two collector busses with four breakers to connect the three combustion turbines (CT), and one steam turbine (ST).
2. Construct two string busses to connect the collector busses to Cape Canaveral 230 kV Substation.
3. Add four main step-up transformers (3-370 MVA, 1- 580 MVA), one for each CT, and one for the ST.
4. At Cape Canaveral Switchyard replace eight 230 kV disconnect switches. Also upgrade associated jumpers, bus work and equipment connections.
5. Expand switchyard relay vault and add relays and other protective equipment.

II. Transmission:

1. Relocate the Cape Canaveral-Grissom 115 kV line.

III.E.3 Transmission Facilities for Riviera Beach Next Generation Clean Energy Center (Modernization)

The work required to connect the Riviera Beach Next Generation Clean Energy Center in 2014 to the FPL grid is as follows:

I. Substation:

1. Expand the Riviera Beach 230 kV Switchyard five breakers to accommodate terminals for one combustion turbine (CT), and one steam turbine (ST).
2. Construct a new 138 kV Riviera Beach Switchyard - five bays, 14 breakers with terminals to connect two CT units and seven 138 kV lines.
3. Add four main step-up transformers (3-370 MVA, 1- 580 MVA), one for each CT, and one for the ST.
4. Add relays and other protective equipment.
5. At Ranch Substation, add a new 230 kV bay 5 and upgrade bay 4 to 3000 Amperes.
6. At Sugar Substation, install one set of 2.5 Ohm phase inductors on the Corbett-Sugar 230 kV line.
7. Breaker replacements:
   Ranch Substation – Replace one 230 kV breaker
   Broward Substation – Replace one 230 kV breaker

II. Transmission:

1. Break the Indiantown-Riviera Beach 230 kV and extend each of the line segments south (approx. 4 miles) to connect to the Ranch 230 kV Substation forming Indiantown-Ranch and a Ranch-Riviera Beach 230 kV circuits.
2. Remove Corbett-Ranch #2 230 kV line at Ranch and:
   a. extend to meet the Cedar-Lauderdale 230 kV line N/S corridor (approx. 10 miles).
3. Break Cedar-Corbett 230 kV (near Ranch Sub in Corbett-Jog section) and:
   a. Extend Cedar side to Riviera Beach, (approx. 15 miles) creating new Cedar-Riviera Beach 230 kV.
   b. Extend Corbett side to meet the Cedar-Lauderdale 230 kV N/S corridor (approx. 10 miles).
4. Break Cedar-Lauderdale 230 kV (near 230 corridor running N/S)
   a. Connect Cedar side to meet 3.b. to create a Cedar to Corbett 230 kV.
   b. Connect Lauderdale side to meet 2.a. to create a Corbett to Lauderdale 230 kV.
5. Upgrade the existing IBM-Yamato 138 kV line to 1200 Amperes.

6. New underground 138 kV tie line between new Riviera Beach 138 kV Switchyard and 560 MVA, 230/138 kV autotransformer in the expanded Riviera Beach 230 kV Substation.
7. Relocate six existing 138 kV lines from existing Riviera Beach 138 kV Switchyard to new Riviera Beach 138 kV Switchyard.

III.E.4 Transmission Facilities for Port Everglades Next Generation Clean Energy Center (Modernization)

The work required to connect the Port Everglades Next Generation Clean Energy Center in 2016 to the FPL grid is projected to be:

I. Substation:

1. Construct two string busses to connect two combustion turbines (CT) to the Port Everglades 138 kV Substation.
2. Construct two string busses to connect one CT, and one steam turbine (ST) to the Port Everglades 230 kV Substation.
3. Add four main step-up transformers (3-450 MVA, 1- 580 MVA), one for each CT, and one for the ST.
4. Replace ten (10) 138 kV breakers
5. Replace eight (8) 230 kV breakers
6. At Port Everglades Switchyard replace twenty-two 138 kV disconnect switches. Also upgrade associated jumpers, bus work, and equipment connections.
7. Expand switchyard relay vault and add relays and other protective equipment.

II. Transmission:

1. Upgrade of existing transmission facilities:
   - An ampacity upgrade up to 1905 amps on the Port Everglades-Port Everglades Tap 138kV line section.
   - An ampacity upgrade up to 1905 amps on the Port Everglades Tap-Port Everglades Tap 2 138 kV line section.
   - An ampacity upgrade up to 1695 amps on the Port Everglades Tap 1-Dania 138 kV line section.
   - An ampacity upgrade up to 1695 amps on the Dania-Hollywood 138 kV line section.

III.E.5 Transmission Facilities for Turkey Point Nuclear Unit 6

The work required to connect the Turkey Point Nuclear Unit 6 by Summer 2022 to the FPL grid is projected to be:

I. Substation:

1. Build new Clear Sky 500/230kV Switchyard with six (6) bays on the 230 kV section for generator main step-up transformer connection, reserve auxiliary transformer connections, four (4) 230 kV line terminals, two (2) autotransformers and two (2) 500 kV line terminals.
2. At Turkey Point Switchyard add a new bay to accommodate the Turkey Point-Clear Sky 230 kV line terminal.
3. At Gratigny Substation install a second 230/138 kV autotransformer with one (1) 230 kV breaker and one (1) 138 kV breaker.
4. At Pennsuco Substation install a fourth line terminal to accommodate the Pennsuco-Clear Sky 230 kV line by converting the ring bus to a breaker and a half scheme and adding four (4) 230 kV breakers.
5. At Davis Substation construct two (2) new 230kV line terminals for the Clear Sky-Davis 230 kV line and the Davis-Miami 230 kV line with a switch-able inductor to be installed on the Davis-Miami 230 kV line
6. At Levee Substation expand 500 kV section to accommodate the two (2) Levee-Clear Sky 500 kV lines.
7. At Andytown Substation install two (2) 5-Ohm inductors combined with external shunt capacitors on the 230kV side of the 500/230 autotransformers (one per auto).
8. At Miami Substation expand the 230kV section to a double bus configuration and add a new 230kV line terminal for Davis line and replace one (1) autotransformer.
9. At Flagami Substation install a small inductor on one end of the Flagami-Miami 230kV #2 circuit.
10. Breaker replacements:
    Flagami Substation – Replace five (5) 230 kV breakers and three (3) 138 kV breakers
    Miami Substation – Replace one (1) 230 kV breaker and four (4) 138 kV breakers
    Davis Substation - Replace two (2) 230 kV breakers
    Dade Substation - Replace seven (7) 230 kV breakers
    Court Substation – Replace one (1) 138 kV breaker.

II. Transmission:

1. FPL will design and construct two (2) 500kV transmission lines from the new Clear Sky Substation to the existing FPL Levee 500kV Substation switchyard. The lines will be approximately 43 miles long.
2. Construct a new Clear Sky-Davis 230kV line (approximately 19 miles) with a rating of 2990 Amperes.
3. Construct a new Clear Sky-Pennsuco 230kV line (approximately 52 miles) with a rating of 2990 Amperes.
4. Construct a new Davis-Miami 230kV line (approximately 18 miles) with a rating of 2297 Amperes.
5. Construct a new Clear Sky-Turkey Point 230kV line (approximately 0.5 miles) with a rating of 2990 Amperes.

III.F. Renewable Resources

FPL has been the leading Florida utility in examining ways to effectively utilize renewable energy technologies to serve its customers. FPL has been involved since 1976 in renewable energy research and development and in facilitating the implementation of various renewable energy technologies. For purposes of discussing FPL's renewable energy efforts in this document, those efforts will be placed into five categories.

Two of these categories are Supply-Side Efforts – Power Purchases, and Supply-Side Efforts – FPL Facilities. Starting in 2011, the energy (MWh) total output from these renewable energy sources was greater than the energy produced from oil-fired generation. This was also true in 2012. The renewable energy information is presented in Schedule 11.1, and the oil-based energy information is presented in Schedule 6.1. Both of these schedules are presented at the end of this chapter.

1) <u>Early Research & Development Efforts:</u>

FPL assisted the Florida Solar Energy Center (FSEC) in the late 1970s in demonstrating the first residential PV system east of the Mississippi. This PV installation at FSEC's Brevard County location was in operation for over 15 years and provided valuable information about PV performance capabilities in Florida on both a daily and annual basis. FPL later installed a second PV system at the FPL Flagami substation in Miami. This 10-kilowatt (kW) system was placed into operation in 1984. (The system was removed in 1990 at the conclusion of the PV testing to make room for substation expansion.)

For a number of years, FPL maintained a thin-film PV test facility located at the FPL Martin Plant Site. This FPL PV test facility was used to test new thin-film PV technologies and to identify design, equipment, or procedure changes necessary to accommodate direct current electricity from PV facilities into the FPL system. Although this testing has ended, the site became the home for PV capacity which was installed as a result of FPL's earlier "green pricing" efforts.

2) **Demand Side & Customer Efforts:**

In terms of utilizing renewable energy sources to meet its customers' needs, FPL initiated the first utility-sponsored conservation program in Florida designed to facilitate the implementation of solar technologies by its customers. FPL's Conservation Water Heating Program, first implemented in 1982, offered incentive payments to customers who chose solar water heaters. Before the program ended (due to the fact that it was no longer projected to be cost-effective), FPL paid incentives to approximately 48,000 customers who installed solar water heaters.

In the mid-1980s, FPL introduced another renewable energy program, FPL's Passive Home Program. This program was created in order to broadly disseminate information about passive solar building design techniques which are most applicable in Florida's climate. As part of this program, three Florida architectural firms created complete construction blueprints for six passive home designs with the assistance of the FSEC and FPL. These designs and blueprints were available to customers at a low cost. During its existence, this program was popular and received a U.S. Department of Energy award for innovation. The program was eventually phased out due to a revision of the Florida Model Energy Building Code (Code). This revision was brought about in part by FPL's Passive Home Program. The revision incorporated into the Code was one of the most significant passive design techniques highlighted in the program: radiant barrier insulation.

In early 1991, FPL received approval from the FPSC to conduct a research project to evaluate the feasibility of using small PV systems to directly power residential swimming pool pumps. This research project was completed with mixed results. Some of the performance problems identified in the test were deemed to be solvable, particularly when new pools are constructed. However, the high initial cost of PV, the significant percentage of sites with unacceptable shading, and various customer satisfaction issues remain as significant barriers to wide acceptance and use of this particular solar application.

FPL has since continued to analyze and promote the utilization of PV. These efforts have included PV research, development, and education, as well as development and implementation of the FPL Next Generation Solar Station Program. This initiative also delivers teacher training and curriculum that is tied to the Sunshine Teacher Standards in Florida. Additionally, the program provides teacher grants to promote and fund projects in the classrooms.

In addition, FPL assists customers who are interested in installing PV equipment at their facilities. Consistent with Florida Administrative Code Rule 25-6.065, Interconnection and Net Metering of Customer-Owned Renewable Generation, FPL works with customers to interconnect these customer-owned PV systems. Through December 2012, approximately 2,117 customer systems (predominantly residential) have been interconnected.

As part of its 2009 DSM Goals decision, the FPSC imposed a requirement for Florida's investor-owned utilities to spend up to a set, not-to-exceed amount of money annually to facilitate demand side solar water heater and photovoltaic applications. FPL's not-to-exceed amount of money for these applications is approximately $15.5 million per year through 2014. In regard to this direction, FPL received approval from the FPSC in 2011 to initiate a solar pilot portfolio that consists of three PV-based programs and three solar water heating-based programs, plus Conservation Research and Development. These programs are currently projected to be offered through 2014. FPL is evaluating the results to-date from these programs.

FPL has also been investigating fuel cell technologies through monitoring of industry trends, discussions with manufacturers, and direct field trials. From 2002 through the end of 2005, FPL conducted field trials and demonstration projects of Proton Exchange Membrane (PEM) fuel cells with the objectives of serving customer end-uses while evaluating the technical performance, reliability, economics, and relative readiness of the PEM technology. The demonstration projects were conducted in partnership with customers and included five locations. The research projects were useful to FPL in identifying specific issues that can occur in field applications and the current commercial viability of this technology. FPL will continue to monitor the progress of these technologies and conduct additional field evaluations as significant developments in fuel cell technologies occur.

3) **Supply Side Efforts – Power Purchases:**

FPL has also facilitated renewable energy projects (facilities which burn bagasse, waste wood, municipal waste, etc.). Firm capacity and energy, and as-available energy, have been purchased by FPL from these types of facilities. (Please refer to Tables I.B.1, I.B.2, and I.C.1 in Chapter I).

Periodically, FPL invites renewable energy suppliers to provide proposals for renewable power and energy at or below avoided costs in response to FPL's Requests for Proposals (RFPs). FPL issued Renewable RFPs in 2007 and 2008 soliciting proposals to provide firm capacity and energy, and energy only, at or below avoided costs, from renewable generators. FPL also promptly responds to inquiries for information from prospective renewable energy suppliers either by e-mail or phone.

With regard to existing contracts that have recently ended, FPL and the Solid Waste Authority of Palm Beach (SWA) agreed to extend their contract that expired March 31, 2010 for a 20-year term beginning in April 1, 2012 through April 1, 2032. However, the SWA refurbished their generating unit ahead of schedule and, as of January 2012, this unit began delivering firm capacity to FPL. In 2011, the FPSC approved a contract for an additional 70 MW between FPL and SWA for a new unit to be constructed and to begin delivering firm capacity and energy beginning on January 1, 2015. At the end of December 2011, the contract between FPL and Okeelanta (New Hope) expired. However, Okeelanta continues to deliver energy to FPL as an as-available, non-firm supplier of renewable energy.

4) **Supply Side Efforts – FPL Facilities:**

With regard to solar generating facilities, FPL has three such facilities: (i) a 75 MW steam generation solar thermal facility in Martin County (the Martin Next Generation Solar Energy Center); (ii) a 25 MW PV electric generation facility in DeSoto County (the DeSoto Next Generation Solar Energy Center); and (iii) a 10 MW PV electric generation facility in Brevard County at NASA's Kennedy Space Center (the Space Coast Next Generation Solar Energy Center). The DeSoto County project was completed in 2009 and the other two projects were completed in 2010. These three solar facilities were constructed in response to the Florida Legislature's House Bill 7135 which was signed into law by the Governor in June 2008.

House Bill 7135 was enacted to enable the development of clean, zero greenhouse gas emitting renewable generation in the State of Florida. Specifically, the bill authorized cost recovery for the first 110 MW of eligible renewable projects that had the proper land, zoning, and transmission rights in place. FPL's three solar projects met the specified criteria, and were granted approval for cost recovery in 2008. Each of the three solar facilities is discussed below.

a. **The Martin Next Generation Solar Energy Center:**

This facility began commercial operation in 2010 and provides 75 MW of solar thermal capacity in an innovative way that directly displaces fossil fuel usage on the FPL system. This facility consists of solar thermal technology which generates steam that is integrated into the existing steam cycle for the Martin Unit 8 natural gas-fired CC plant. This project is the first "hybrid" solar plant in the world, and, at the time the facility came in-service, was the second largest solar facility in the world and the largest solar plant of any kind in the U.S. outside of California.

b. **The DeSoto Next Generation Solar Energy Center:**

This PV facility began commercial operation in 2009 and provides 25 MW of non-firm capacity and energy, making it one of the largest PV facilities in the U.S. The facility utilizes a tracking PV array that is designed to follow the sun as it traverses across the sky.

c. **The Space Coast Next Generation Solar Energy Center:**

Located at the Kennedy Space Center, this facility is part of an innovative public/private partnership with NASA. This non-tracking PV facility began commercial operation in 2010 and provides 10 MW of non-firm capacity and energy.

For resource planning purposes, FPL currently projects that the output from these renewable facilities will be "as available," non-firm energy only. This is due to several factors. First, the Martin solar thermal facility is a "fuel-substitute" facility, not a facility that provides additional capacity and energy. The solar thermal facility displaces the use of fossil fuel to produce steam on the FPL system when the solar thermal facility is operating. Second, in regard to the two PV facilities, the intermittent nature of the solar resource makes it difficult to accurately determine what contribution the PV facilities at these specific locations can consistently make at FPL's late Summer afternoon and early Winter morning peak load hours. Once site-specific operating data has been gathered for an appropriate amount of time, FPL will then re-evaluate the actual output from each PV facility to determine what portion, if any, of its output can be projected as firm capacity at the projected peak hours in FPL's resource planning work.

In addition to these three solar facilities, FPL is currently in the process of identifying other potential solar sites in the state. FPL is evaluating existing FPL generation sites along with potential Greenfield sites within FPL's service territory. These sites are discussed further in Chapter IV.

5) **Ongoing Research & Development Efforts:**

FPL has developed alliances with several Florida universities to promote development of emerging technologies. For example, an alliance has been established with the newly formed Southeast National Marine Renewable Energy Center (SNMREC) at Florida Atlantic University (FAU), which will focus on the commercialization of ocean current, ocean thermal (i.e., energy conversion as well as cold water air conditioning), and hydrogen technologies. FPL has been taking the lead in assisting FAU with the discussions being held with the U.S. Department of the Interior's Minerals Bureau of Ocean Energy Management Regulation and Enforcement (BOEMRE). BOEMRE is working to establish the permitting process for ocean energy development on the outer continental shelf.

FPL has also developed an alliance with the University of Florida to support its biomass-related studies to determine improved vegetative management techniques for use in minimizing maintenance costs at FPL's current and future solar sites and to perform wind studies within the state. In addition, FPL has partnered with the Florida Institute of Technology on fuel cell technology and with the Florida State Universities Center for Applied Power System in regard to grid integration of ocean energy and other renewables.

FPL has also developed a "Living Lab" to demonstrate FPL's solar energy commitment to employees and visitors at its Juno Beach office facility. To-date, FPL has installed five different PV arrays (different technologies) of rooftop PV totaling 24 kW at the Living Lab. In addition, two PV-covered parking structures with a total of approximately 90 kW of PV were constructed at the FPL Juno office parking lot. Through these Living Lab projects, FPL is able to evaluate multiple solar technologies and applications for the purpose of developing a renewable business model resulting in the most cost-effective and reliable uses of solar energy for FPL's customers. FPL plans to continue to expand the Living Lab as new solar products come to market.

FPL has also been in discussions with several private companies on multiple emerging technology initiatives including ocean current, ocean thermal, hydrogen, fuel cell technology, biomass, biofuels, and energy storage.

III.G FPL's Fuel Mix and Fuel Price Forecasts

1. FPL's Fuel Mix

Until the mid-1980s, FPL relied primarily on a combination of fuel oil, natural gas, and nuclear energy to generate electricity with significant reliance on oil–fired generation. In the early 1980s, FPL began to purchase "coal-by-wire." In 1987, coal was first added to the fuel mix through FPL's partial ownership (20%) and additional purchases (30%) from the St. Johns River Power Park (SJRPP). This allowed FPL to meet its customers' energy needs with a more diversified mix of energy sources. Additional coal resources were added with the partial acquisition (76%) of Scherer Unit 4 which began serving FPL's customers in 1991. Starting in 1997, petroleum coke was added to the fuel mix as a blend stock with coal at SJRPP when economic.

The trend since the early 1990s has been a steady increase in the amount of natural gas that is used by FPL to provide electricity due, in part, to the introduction of highly efficient and cost-effective CC generating units and the ready availability of natural gas. This planning document reflects an evolution in that trend in recognition that, although efficient gas-fired generation continues to provide significant benefits to FPL's customers, adding natural gas-fired additions exclusively would, in the long term, create an unbalanced generation portfolio. In 2009, FPL placed into commercial operation two new gas-fired CC units at the West County Energy Center (WCEC) site. A third new CC unit was added to the WCEC site in 2011. In addition, FPL is currently modernizing its existing Cape Canaveral, Riviera Beach, and Port Everglades plant sites by removing the steam generating units previously on the sites and replacing them with three highly efficient new CC units, one at each site. These new CC units will provide highly efficient generation that will dramatically improve the efficiency of FPL's generation system in general, and, more specifically, the efficiency at which natural gas is utilized.

In addition, FPL is increasing its utilization of nuclear energy through capacity uprates of its four existing nuclear units. The uprates have been completed at three of the four units, and the uprate work is projected to be completed at the fourth unit at approximately the time this Site Plan is completed. With these uprates, more than 500 MW of additional nuclear capacity have been added to the FPL system. FPL is also pursuing plans to obtain licenses, permits, and approvals to construct and operate two new nuclear units at its existing Turkey Point site that, in total, would add approximately 2,200 MW of new nuclear generating capacity. The earliest date by which the first of these two new nuclear units could practically be deployed is currently projected to be 2022.

In regard to utilizing renewable energy, FPL has added 110 MW of solar generating capacity through a 75 MW solar thermal steam generating facility at FPL's existing Martin site, a 25 MW PV facility in DeSoto County, and a 10 MW PV facility in Brevard County. The DeSoto facility was placed into commercial operation in 2009. The other two solar facilities were placed into commercial operation in 2010.

FPL's future resource planning work will continue to focus on identifying and evaluating alternatives that would most cost-effectively maintain and/or enhance FPL's long-term fuel diversity. These fuel diverse alternatives may include: the purchase of power from renewable energy facilities, additional FPL-owned renewable energy facilities, obtaining additional access to diversified sources of natural gas such as liquefied natural gas (LNG) and natural gas from the Mid-Continent unconventional reserves, preserving FPL's ability to utilize fuel oil at its existing units, and increased utilization of nuclear energy. (As previously discussed, new advanced technology coal generating units are not currently considered as viable options in Florida in the ten-year reporting period of this document due, in part, to current projections of relatively small differences in fuel costs between coal and natural gas, significantly higher capital costs for coal units compared to CC units, greater efficiencies of CC units, and concerns over non-greenhouse gas environmental regulations that would impact coal units more negatively than CC units.) The evaluation of the feasibility and cost-effectiveness of these, and other possible fuel diversity alternatives, will be part of FPL's on-going resource planning efforts.

FPL's current use of various fuels to supply energy to customers, plus a projection of this "fuel mix" through 2022 based on the resource plan presented in this document, is presented in Schedules 5, 6.1, and 6.2 later in this chapter.

FPL's Fossil Fuel Cost Forecasts

Fossil fuel price forecasts, and the resulting projected price differentials between fuels, are major drivers used in evaluating alternatives for meeting future resource needs. FPL's forecasts are generally consistent with other published contemporary forecasts.

Future oil and natural gas prices, and to a lesser extent, coal and petroleum coke prices, are inherently uncertain due to a significant number of unpredictable and uncontrollable drivers that influence the short- and long-term price of oil, natural gas, coal, and petroleum coke. These drivers include U.S. and worldwide demand, production capacity, economic growth, environmental legislation, and politics.

The inherent uncertainty and unpredictability in these factors today and tomorrow clearly underscores the need to develop a set of plausible oil, natural gas, and solid fuel (coal and petroleum coke) price scenarios that will bound a reasonable set of long-term price outcomes. In this light, FPL developed and utilized Low, Medium, and High price forecasts for fossil fuels in some of its 2012 and early 2013 resource planning work, particularly in regard to analyses conducted as part of the nuclear cost recovery filing work.

FPL's Medium price forecast methodology is consistent for oil and natural gas. For oil and natural gas commodity prices, FPL's Medium price forecast applies the following methodology:

a. For 2013 through 2015, the methodology used the February 4, 2013 forward curve for New York Harbor 1% sulfur heavy oil, U. S. Gulf Coast 1% sulfur heavy oil, ultra low sulfur diesel fuel oil, and Henry Hub natural gas commodity prices;

b. For the next two years (2016 and 2017), FPL used a 50/50 blend of the February 4, 2013 forward curve and the most current projections at the time from The PIRA Energy Group;

c. For the 2018 through 2030 period, FPL used the annual projections from The PIRA Energy Group; and,

d. For the period beyond 2030, FPL used the real rate of escalation from the Energy Information Administration (EIA). In addition to the development of oil and natural gas commodity prices, nominal price forecasts also were prepared for oil and natural gas transportation costs. The addition of commodity and transportation forecasts resulted in delivered price forecasts.

FPL's Medium price forecast methodology is also consistent for coal and petroleum coke prices. Coal and petroleum coke prices were based upon the following approach:

a. Delivered price forecasts for Central Appalachian (CAPP), Illinois Basin (IB), Powder River Basin (PRB), and South American coal and petroleum coke were provided by JD Energy; and,

b. The coal price forecast for SJRPP and Plant Scherer assume the continuation of the existing mine-mouth and transportation contracts until expiration, along with the purchase of spot coal, to meet generation requirements.

The development of FPL's Low and High price forecasts for oil, natural gas, coal, and petroleum coke prices were based on the historical volatility of the 12-month forward price, one year ahead. FPL developed these forecasts to account for the uncertainty which exists within each commodity as well as across commodities. These forecasts reflect a range of reasonable forecast outcomes.

3. Natural Gas Storage

FPL is under contract through March 2013 for 2 billion cubic feet (Bcf) of firm natural gas storage capacity in the Bay Gas storage facility located in Alabama. The Bay Gas storage facility is interconnected with the Florida Gas Transmission (FGT) pipeline. Starting on April 1, 2013, FPL will have entered into a new deal with Bay Gas Storage for one year for 2.5 billion cubic feet (Bcf) of firm natural gas storage capacity. FPL has predominately utilized natural gas storage to help mitigate gas supply problems caused by severe weather and/or infrastructure problems. Over the past several years, FPL has acquired upstream transportation capacity on several pipelines to help mitigate the risk of off-shore supply problems caused by severe weather in the Gulf of Mexico. While this transportation capacity has reduced FPL's off-shore exposure, a portion of FPL's supply portfolio remains tied to off-shore natural gas sources. Therefore, natural gas storage remains an important tool to help mitigate the risk of supply disruptions. For these reasons, FPL has typically maintained nearly full natural gas inventory during normal operations from June through November (hurricane season). From December through March, FPL typically maintains lower levels of natural gas inventory as compared to Summer peak months.

As FPL's reliance on natural gas has increased, its ability to manage the daily "swings" that can occur on its system due to weather and unit availability changes has become more challenging, particularly from oversupply situations. Natural gas storage is a valuable tool to help manage the daily balancing of supply and demand. From a balancing perspective, injection and withdrawal rights associated with storage have become an increasingly important part of the evaluation of overall storage requirements.

As FPL's system grows to meet customer needs, it must maintain adequate storage capacity to continue to help mitigate supply and/or infrastructure problems and to provide FPL the ability to manage its supply and demand on a daily basis. FPL will continue to evaluate its storage portfolio and enter into arrangements that will help increase reliability, provide the necessary flexibility to respond to demand changes, and diversify the overall portfolio.

4. Securing Additional Natural Gas:

The recent trend of increasing reliance upon natural gas to produce electricity for FPL's customers is projected to continue due to FPL's growing load. The addition of the highly fuel-efficient Cape Canaveral, Riviera Beach, and Port Everglades modernizations will serve to reduce the growth in natural gas use from what it otherwise might have been due to the high fuel-efficiency levels of these new CC units, but these efficiencies do not fully offset the effects of FPL's growing load. Therefore, FPL will need to secure more natural gas supply and more gas transportation capacity. The issue is how to secure these additional natural gas resources in a manner that is economical for FPL's customers and which maintains and/or enhances the reliability of natural gas supply and deliverability to FPL's generating units.

FPL has historically purchased the gas transportation capacity required for new natural gas supply from two existing natural gas pipeline companies. As more natural gas is delivered through these two pipelines, the impact of a supply disruption on either pipeline becomes more problematic. Therefore, FPL issued a Request for Proposals (RFP) in December 2012 for gas transportation capacity to meet FPL's system natural gas requirements beginning in 2017. The RFP encourages bidders to propose new gas transportation infrastructure to meet Florida's growing need for natural gas. A third pipeline would have benefits for FPL and its customers by increasing the diversity of FPL's fuel supply sources, increasing the physical reliability of the pipeline delivery system, and enhancing competition among pipelines. Responses to this RFP are due in early April 2013.

5. Nuclear Fuel Cost Forecast

This section reviews the various steps needed to fabricate nuclear fuel for delivery to the nuclear power plants, the method used to forecast the price for each step, and other comments regarding FPL's nuclear fuel cost forecast.

a) Steps Required for Nuclear Fuel to be delivered to FPL's Plants

Four separate steps are required before nuclear fuel can be used in a commercial nuclear power reactor. These steps are summarized below.

(1) Mining: Uranium is produced in many countries such as Canada, Australia, Kazakhstan, and the United States. During the first step, uranium is mined from the ground using techniques such as open pit mining, underground mining, in-situ leaching operations, or production as a by-product from other mining operations, such as gold, copper, or phosphate rocks. The product from this first step is the raw uranium delivered as an oxide, U3O8 (sometimes referred to as yellowcake).

(2) Conversion: During the second step, the U3O8 is chemically converted into UF6 which, when heated, changes into a gaseous state. This second step further removes any chemical impurities and serves as preparation for the third step, which requires uranium to be in a gaseous state.

(3) Enrichment: The third step is called enrichment. Natural uranium contains 0.711% of uranium at an atomic mass of 235 (U-235) and 99.289% of uranium at an atomic mass of 238 (U-238). FPL's nuclear reactors use uranium with a higher percentage of up to five percent (5%) of U-235 atoms. Because natural uranium does not contain a sufficient amount of U-235, the third step increases the percentage amount of U-235 from 0.711% to a level specified when designing the reactor core (typically in a range from approximately 3% to as high as 5%). The output of this enrichment process is enriched uranium in the form of UF6.

(4) Fabrication: During the last step, fuel fabrication, the enriched UF6 is changed to a UO2 powder, pressed into pellets, and fed into tubes, which are sealed and bundled together into fuel assemblies. These fuel assemblies are then delivered to the plant site for insertion in a reactor.

Like other utilities, FPL has purchased raw uranium and the other components of the nuclear fuel cycle separately from numerous suppliers from different countries.

b) Price Forecasts for Each Step

(1) Mining: The impact of the earthquake and tsunami that struck the Fukushima nuclear complex in Japan in March 2011 is still having a significant impact on the uranium market. Current demand has declined and several of the production facilities have announced delays. Factors of importance are:

- Hedge funds are still very active in the market. This causes more speculative demand that is not tied to market fundamentals and causes the market price to move up or down just based on news that might affect future demand.
- Some of the uranium inventory from the U.S. Department of Energy (DOE) is finding its way into the market periodically to fund cleanup of certain Department of Energy facilities.
- Although a limited number of new nuclear units are scheduled to start production in the U.S. during the next 5 to 10 years, other countries, more specifically China, have announced an increase in construction of new units which may cause uranium prices to trend up in the near future.

Over a 10-year horizon, FPL expects the market to be more consistent with market fundamentals. The supply picture is more stable, with laws enacted to resolve the import of Russian-enriched uranium, by allowing some imports of Russian-enriched uranium to meet about 20-25% of needs for currently operating units, but with no restriction on the first core for new units and no restrictions after 2020. New and current facilities continue to add capacity to meet demands. Actual demand tends to grow over time because of the long lead time to build nuclear units. However, FPL cannot discount the possibility of future periodic sharp increase in prices, but believes such occurrences will likely be temporary in nature.

FPL's nuclear fuel price forecasts are the result of FPL's analysis based on inputs from various nuclear fuel market expert reports and studies.

(2) Conversion: The conversion market is also in a state of flux due to the Fukushima events. Insufficient planned production is currently forecasted after 2013 to meet the higher demand scenario, but it is projected to be sufficient to meet most reference case scenarios. As with additional raw uranium production, supply will expand beyond current level once more firm commitments are made including commitments to building new nuclear units. FPL expects long term price stability for conversion services to support world demand.

(3) Enrichment: As a result of the Fukushima events in March 2011, the near-term price of enrichment services has been declining for the last two years. However, plans for several of the new facilities that were expected to come on-line in the next few years have been delayed. Also, some of the current high operating cost diffusion plants have shut down. As with supply for the other steps of the nuclear fuel cycle, expansion of future capacity is feasible within the lead time for constructing new nuclear units and any other projected increase in demand. Meanwhile, world supply and demand will continue to be balanced such that FPL expects adequate supply of enrichment services. The tight supply/demand profile will most likely result in the price of enrichment services remaining stable or declining for the next few years before starting to increase.

(4) Fabrication: Because the nuclear fuel fabrication process is highly regulated by the Nuclear Regulatory Commission (NRC), not all production facilities can qualify as suppliers to nuclear reactors in the U.S. Although world supply and demand is expected to show significant excess capacity for the foreseeable future, the gap is not as wide for U.S. supply and demand. The supply for the U.S. market is expected to be sufficient to meet U.S. demand for the foreseeable future.

c) Other Comments Regarding FPL's Nuclear Fuel Cost Forecast

The calculations for the nuclear fuel cost forecasts used in FPL's 2012 and early 2013 resource planning work were performed consistent with the method then used for FPL's Fuel Clause filings, including the assumption of refueling outages every 18 months and plant operation at power uprate levels. The costs for each step to fabricate the nuclear fuels were added to come up with the total costs of the fresh fuel to be loaded at each refueling (acquisition costs). The acquisition cost for each group of fresh fuel assemblies were then amortized over the energy produced by each group of fuel assemblies. FPL also added 1 mill per kilowatt hour net to reflect payment to DOE for spent fuel disposal.

1/ Source: A Schedules and Actual Data for Next Generation Solar Centers Report
2/ The projected figures are based on estimated energy purchases from SJRPP, the Southern Companies (UPS contract), and other utilities.
3/ Represents output from FPL's PV and solar thermal facilities.
4/ For 2011, the Martin 8 Solar Thermal GWh output is rolled into row (12) for reporting purposes. In 2012, the GWh output is presented in row (16). The projected GWh contributions for 2013-2022 are also provided on row (16).
5/ Represents a forecast of energy expected to be purchased from Qualifying Facilities, Independent Power Producers, net of Economy and other Power Sales.
6/ Net Energy For Load values for the years 2013 - 2022 are also shown in Col. (19) on Schedule 2.3.

Col. (2) represents capacity additions and changes projected to be in-service by June 1st. These MW are generally considered to be available to meet Summer peak loads which are forecasted to occur during August of the year indicated.
Col. (6) = Col.(2) + Col.(3) - Col.(4) + Col.(5).
Col. (7) reflects the 2013 load forecast without incremental DSM or cumulative load management.
Col. (8) represents cumulative load management capability, plus incremental conservation, from 1/2013-on intended for use with the 2013 load forecast.
Col. (10) = Col. (6) - Col. (9)
Col. (11) = Col.(10) / Col.(9)
Col. (12) indicates the capacity of units projected to be out-of-service for planned maintenance during the Summer peak period. This value is comprised of: an additional 826 MW of fossil-fueled capacity that will be out-of-service in the Summer of 2013 (at Martin Unit 1) and in the Summer of 2014 (at Martin Unit 2) due to the installation of electrostatic precipitators.
Col. (13) = Col. (10) - Col. (12)
Col. (14) = Col.(13) / Col.(9)

Schedule 7.2
Forecast of Capacity , Demand, and Scheduled Maintenance At Time of Winter Peak

Col. (2) represents capacity additions and changes projected to be in-service by January 1st. These MW are generally considered to be available to meet winter peak loads which are forecasted to occur during January of the year indicated.
Col. (6) = Col.(2) + Col.(3) - Col.(4) + Col.(5).
Col. (7) reflects the 2013 load forecast without incremental DSM or cumulative load management. 2013 load is an actual load value.
Col. (8) represents cumulative load management capability, plus incremental conservation, from 1/2013-on intended for use with the 2013 load forecast.
Col. (10) = Col. (6) - Col. (9)
Col. (11) = Col.(10) / Col.(9)
Col. (12) indicates the capacity of units projected to be out-of-service for planned maintenance during the Winter peak period. This value is comprised of: (i) 717 MW (at Turkey Point Unit 4) that will be out-of-service in Winter of 2013 due to an extended planned outage as part of the capacity uprates project; (ii) an additional 822 MW that will be out-of-service in the Winter of 2013 (at Manatee Unit 1) due to the installation of electrostatic precipitators; and (iii) an additional 832 MW (at Martin Unit 1) that will be out-of-service during the Winter of 2014 due to the installation of electrostatic precipitators.
Col. (13) = Col. (10) - Col. (12)
Col. (14) = Col.(13) / Col.(9)

Schedule 7.3
Projection of Generation - Only Reserves
At Time Of Summer Peak (Assuming no additions in 2022)

(1)	(2)	(3)	(4)	(5)	(6)	(7)	(8)	(9)	(10)	(11)	(12)	(13)	(14)
August of Year	Firm Installed Capacity MW	Firm Capacity Import MW	Firm Capacity Export MW	Firm QF MW	Total Firm Capacity Available MW	Total Peak Demand MW	DSM MW	Firm Summer Peak Demand MW	Reserve Margin Before Maintenance MW	Reserve Margin Before Maintenance % of Peak	Scheduled Maintenance MW	Reserve Margin After Maintenance MW	Reserve Margin After Maintenance % of Peak
2013	24,215	1,309	0	635	26,159	21,790	**0**	21,790	4,368	20.0	826	3,542	**16.3**
2014	25,533	1,346	0	635	27,513	22,928	**0**	22,928	4,585	20.0	826	3,759	**16.4**
2015	25,604	1,456	0	595	27,654	23,359	**0**	23,359	4,295	18.4	0	4,295	**18.4**

2019	26,441	110	0	595	27,146	24,901	**0**	24,901	2,244	9.0	0	2,244	**9.0**
2020	26,441	110	0	595	27,146	25,302	**0**	25,302	1,843	7.3	0	1,843	**7.3**
2021	26,441	110	0	775	27,326	25,560	**0**	25,560	1,765	6.9	0	1,765	**6.9**
2022	26,441	110	0	775	27,326	26,105	**0**	26,105	1,221	4.7	0	1,221	**4.7**

Col. (2) represents capacity additions and changes, **assuming no generation addition in 2022 in order to demonstrate FPL's gen-only RM trend.**
Col. (6) = Col.(2) + Col.(3) - Col.(4) + Col.(5).
Col. (7) reflects the load forecast without incremental DSM or cumulative load management.
Col. (8) shows zero contribution from DSM in order to calculate FPL's reserves that are supplied only by generation resources.
Col. (10) = Col. (6) - Col. (9)
Col. (11) = Col.(10) / Col.(9)
Col. (12) indicates the capacity of units projected to be out-of-service for planned maintenance during the Summer peak period. This value is comprised of 826 MW of fossil-fueled capacity that will be out-of-service in the Summer of 2013 (at Martin Unit 1) and in the Summer of 2014 (at Martin Unit 2) due to the installation of electrostatic precipitators.
Col. (13) = Col. (10) - Col. (12)
Col. (14) = Col.(13) / Col.(9)

Note that although there are no planned generating additions in this reserve margin calculation, the total firm capacity available in Col. (6) rises in 2021 due to the addition of 180MW of capacity from the EcoGen PPA.

Schedule 7.4
Projection of Generation - Only Reserves
At Time Of Summer Peak (Assuming TP6 is added in 2022)

											2015 Changes/Additions Total:	2,248	897	

(1) The Winter Total MW value consists of all generation additions and changes achieved by January. The Summer Total MW value consists of all generation additions and changes achieved by June. All MW additions/changes occuring after August each year will be picked up for reserve margin calculation purposes in the following year.
(2) This generating unit is currently serving as a synchronous condenser and is not included in reserve margin calculation.This unit can be brought back if needed in 2013 but for planning purposes it is not available for reserve margin calculations.
(3) Outages for ESP work.
(4) Turkey Point Nuclear Uprate will be performed during the extended outage.

Note: Schedule 8 shows only planned and prospective changes to generating facilities and does not reflect changes to existing purchases. Those changes are reflected on Tables ES-1, ES-2, I.B.1 and I.B.2.

Schedule 9
Status Report and Specifications of Proposed Generating Facilities

(1) **Plant Name and Unit Number:** Turkey Point 4 Nuclear (Uprate)

(2) **Capacity**

a. Summer	115	MW (Incremental)
b. Winter	115	MW (Incremental)

(3) **Technology Type:** Nuclear

(4) **Anticipated Construction Timing**

a. Field construction start-date:	During scheduled refueling outage
b. Commercial In-service date:	2013

(5) **Fuel**

a. Primary Fuel	Uranium
b. Alternate Fuel	---

(6)	**Air Pollution and Control Strategy:**		No change from existing unit
(7)	**Cooling Method:**		No change from existing unit
(8)	**Total Site Area:**		No change from existing unit
(9)	**Construction Status:**	V	(Under construction, more than 50% complete)
(10)	**Certification Status:**	V	(Under construction, more than 50% complete)
(11)	**Status with Federal Agencies:**	V	(Under construction, more than 50% complete)

(12) **Projected Unit Performance Data:**

Planned Outage Factor (POF):	No change from existing unit
Forced Outage Factor (FOF):	No change from existing unit
Equivalent Availability Factor (EAF):	No change from existing unit
Resulting Capacity Factor (%):	No change from existing unit
Average Net Operating Heat Rate (ANOHR):	No change from existing unit
Base Operation 75F,100%	No change from existing unit

(13) **Projected Unit Financial Data *,****

Book Life (Years):	21	years (Matches the current operating license period.)
Total Installed Cost ($/kW): **	TBD	(See Note (1) for explanation.)
Direct Construction Cost ($/kW):	TBD	(See Note (1) for explanation.)
AFUDC Amount ($/kW):		(See Note (2) for explanation.)
Escalation ($/kW):		(See Note (3) for explanation.)
Fixed O&M ($/kW -Yr.):	There is no additional O&M impact from this project.	
Variable O&M ($/MWH):	There is no additional O&M impact from this project.	
K Factor:		(See Note (2) for explanation.)

NOTE:

(1) The projected capital cost values for the capacity uprates at each of FPL's existing nuclear units is currently being reviewed in on-going analyses as this document is being prepared. The capital cost projections that will result from these analyses are expected to be presented in FPL's May 2013 Nuclear Cost Recovery filing.

(2) Not applicable due to early recovery of capital carrying costs.

(3) These costs are included in the Total Installed Cost value.

* $/kW values are based on incremental Summer capacity.

** $/incremental kW

Schedule 9
Status Report and Specifications of Proposed Generating Facilities

(1) **Plant Name and Unit Number:** Cape Canaveral Next Generation Clean Energy Center

(2) **Capacity**
a. Summer 1,210 MW
b. Winter 1,355 MW

(3) **Technology Type:** Combined Cycle

(4) **Anticipated Construction Timing**
a. Field construction start-date: 2011
b. Commercial In-service date: 2013

(5) **Fuel**
a. Primary Fuel: Natural Gas
b. Alternate Fuel: Ultra-low sulfur distillate

(6) **Air Pollution and Control Strategy:** Dry Low No_x Burners, SCR, Natural Gas, 0.0015% S. Distillate and Water Injection on Distillate

(7) **Cooling Method:** Once-through cooling water

(8) **Total Site Area:** 43 Acres

(9) **Construction Status:** V (Under construction, more than 50% complete)

(10) **Certification Status:** Permitted

(11) **Status with Federal Agencies:** Permitted

(12) **Projected Unit Performance Data:**

Planned Outage Factor (POF):	2.4%	
Forced Outage Factor (FOF):	1.1%	
Equivalent Availability Factor (EAF):	96.5%	
Resulting Capacity Factor (%):	Approx. 90 %	(First Full Year Base Operation)
Average Net Operating Heat Rate (ANOHR):	6,484	Btu/kWh
Base Operation 75F,100%		

(13) **Projected Unit Financial Data *,****

Book Life (Years):	30	years
Total Installed Cost (2013 $/kW):	921	
Direct Construction Cost ($/kW):		
AFUDC Amount ($/kW):	98	
Escalation ($/kW):		
Fixed O&M ($/kW-Yr): (2013 $)	13.29	
Variable O&M ($/MWH): (2013 $)	0.16	
K Factor:	1.484	

* $/kW values are based on Summer capacity for in service year.
** Fixed O&M cost includes capital replacement.

NOTE: Total installed cost includes gas expansion, transmission interconnection and integration, escalation, and AFUDC. Demolition costs of existing plant are not included.

Schedule 9
Status Report and Specifications of Proposed Generating Facilities

(1) **Plant Name and Unit Number:** Riviera Beach Next Generation Clean Energy Center

(2) **Capacity** *

a. Summer	1,212	MW
b. Winter	1,344	MW

(3) **Technology Type:** Combined Cycle

(4) **Anticipated Construction Timing**

a. Field construction start-date:	2012
b. Commercial In-service date:	2014

(5) **Fuel**

a. Primary Fuel	Natural Gas
b. Alternate Fuel	Ultra-low sulfur distillate

(6) **Air Pollution and Control Strategy:** Dry Low No_x Burners, SCR, Natural Gas, 0.0015% S. Distillate and Water Injection on Distillate

(7) **Cooling Method:** Once-through cooling water

(8) **Total Site Area:** 33 Acres

(9) **Construction Status:** U (Under construction, less than or equal to 50% complete)

(10) **Certification Status:** Permitted

(11) **Status with Federal Agencies:** Permitted

(12) **Projected Unit Performance Data:**

Planned Outage Factor (POF):	2.4%	
Forced Outage Factor (FOF):	1.1%	
Equivalent Availability Factor (EAF):	96.5%	
Resulting Capacity Factor (%):	Approx. 90%	(First Full Year Base Operation)
Average Net Operating Heat Rate (ANOHR):	6,480	Btu/kWh
Base Operation 75F,100%		

(13) **Projected Unit Financial Data** *,**

Book Life (Years):	30 years
Total Installed Cost (2014 $/kW):	1,053
Direct Construction Cost ($/kW):	
AFUDC Amount ($/kW):	121
Escalation ($/kW):	
Fixed O&M ($/kW-Yr): (2014 $)	13.67
Variable O&M ($/MWH): (2014 $)	0.13
K Factor:	1.509

* $/kW values are based on Summer capacity for in service year.
** Fixed O&M cost includes capital replacement.

NOTE: Total installed cost includes gas expansion, transmission interconnection and integration, escalation, and AFUDC.Demolition costs of existing plant are not included.

Schedule 9
Status Report and Specifications of Proposed Generating Facilities

(1) **Plant Name and Unit Number:** Vero Beach Combined Cycle Capacity

(2) **Capacity**
a. Summer 46 MW
b. Winter 44 MW

(3) **Technology Type:** Combined Cycle

(4) **Anticipated Construction Timing**
a. Field construction start-date: Not Applicable - See Note 1 below.
b. Commercial In-service date: 2014

(5) **Fuel**
a. Primary Fuel Gas
b. Alternate Fuel Oil

(6) **Air Pollution and Control Strategy:** N/A

(7) **Cooling Method:** Once-through cooling water

(8) **Total Site Area:** 16 Acres

(9) **Construction Status:** See note 1 below

(10) **Certification Status:** See note 1 below

(11) **Status with Federal Agencies:** See note 1 below

(12) **Projected Unit Performance Data:**

Planned Outage Factor (POF):	20.5%	
Forced Outage Factor (FOF):	0.0%	
Equivalent Availability Factor (EAF):	72.5%	
Resulting Capacity Factor (%):	3.88%	
Average Net Operating Heat Rate (ANOHR):	9,397	Btu/kWh
Base Operation 75F,100%		

(13) **Projected Unit Financial Data**

Book Life (Years):	TBD	years
Total Installed Cost ($/kW):	Not Applicable	
Direct Construction Cost ($/kW):	Not Applicable	
AFUDC Amount ($/kW):	Not Applicable	
Escalation ($/kW):	Not Applicable	
Fixed O&M ($/kW-Yr): ($)	Not Applicable	
Variable O&M ($/MWH): ($)	Not Applicable	
K Factor:	Not Applicable	

NOTE 1: The combined cycle capacity consists of two units. FPL is also taking ownership of three other steam units.The three units will be retired as soon as they aquired.

Schedule 9
Status Report and Specifications of Proposed Generating Facilities

(1) **Plant Name and Unit Number:**	Port Everglades Next Generation Clean Energy Center	
(2) **Capacity**		
a. Summer	1,277 MW	
b. Winter	1,429 MW	
(3) **Technology Type:**	Combined Cycle	
(4) **Anticipated Construction Timing**		
a. Field construction start-date:	2014	
b. Commercial In-service date:	2016	
(5) **Fuel**		
a. Primary Fuel		Natural Gas
b. Alternate Fuel		Ultra-low sulfur distillate
(6) **Air Pollution and Control Strategy:**		Dry Low No_x Burners, SCR, Natural Gas, 0.0015% S. Distillate and Water Injection on Distillate
(7) **Cooling Method:**		Once-through cooling water
(8) **Total Site Area:**	Existing Site	Acres
(9) **Construction Status:**	U	(Under construction, less than or equal to 50% complete)
(10) **Certification Status:**	---

NOTE: Total installed cost includes gas expansion, transmission interconnection and integration, escalation, and AFUDC. Demolition costs of existing plant are not included.

Schedule 10
Status Report and Specifications of Proposed Transmission Lines

Turkey Point 4 Nuclear (Uprate)

The Turkey Point 4 Nuclear (Uprate) does not require any "new" transmission lines.

Schedule 10
Status Report and Specifications of Proposed Transmission Lines

Cape Canaveral Next Generation Clean Energy Center (Modernization)

The Cape Canaveral Next Generation Clean Energy Center which will result from the modernization of the Cape Canaveral power plant site does not require any "new" transmission lines.

Schedule 10
Status Report and Specifications of Proposed Transmission Lines

Riviera Beach Next Generation Clean Energy Center (Modernization)

The Riviera Beach Energy Center which will result from the modernization of the Riviera Beach power plant site will require one new line and existing lines to be extended and reconfigured to accommodate the increased capacity.

(1)	Point of Origin and Termination:	Riviera Beach – Cedar Substation
(2)	Number of Lines:	1
(3)	Right-of-way	Existing, FPL - Owned
(4)	Line Length:	15 miles
(5)	Voltage:	230 kV
(6)	Anticipated Construction Timing:	Start date: 2012 End date: 2014
(7)	Anticipated Capital Investment: (Trans.and Sub.)	$12,100,000
(8)	Substations:	Riviera Beach Substation and Cedar Substation
(9)	Participation with Other Utilities:	None

Schedule 10
Status Report and Specifications of Proposed Transmission Lines

Vero Beach Existing Combined Cycle Capacity

The Vero Beach existing combined cycle capacity that FPL will take ownership of starting January 1, 2014 does not require any "new" transmission lines.

Schedule 10
Status Report and Specifications of Proposed Transmission Lines

Port Everglades Next Generation Clean Energy Center

The Port Everglades Next Generation Clean Energy Center which will result from the modernization of the Port Everglades power plant site does not require any "new" transmission lines.

Schedule 10
Status Report and Specifications of Proposed Transmission Lines

Turkey Point Nuclear Unit 6

The Turkey Point New Nuclear Project starting with the addition of Turkey Point Unit 6 will require a new substation and five new transmission lines terminating at existing substations.

(1)	Point of Origin and Termination:	New Clear Sky Substation – Levee Substation
(2)	Number of Lines:	2
(3)	Right-of-way	FPL Owned
(4)	Line Length:	43 miles
(5)	Voltage:	500 kV
(6)	Anticipated Construction Timing:	Start date: TBD End date: TBD
(7)	Anticipated Capital Investment: (Trans.and Sub.)	$ TBD
(8)	Substations:	New Clear Sky Substation and Levee Substation
(9)	Participation with Other Utilities:	None

(1)	Point of Origin and Termination:	New Clear Sky Substation – Pennsuco Substation
(2)	Number of Lines:	1
(3)	Right-of-way	FPL Owned
(4)	Line Length:	52 miles
(5)	Voltage:	230 kV
(6)	Anticipated Construction Timing:	Start date: TBD End date: TBD
(7)	Anticipated Capital Investment: (Trans.and Sub.)	$ TBD
(8)	Substations:	New Clear Sky Substation and Pennsuco Substation
(9)	Participation with Other Utilities:	None

Schedule 10
Status Report and Specifications of Proposed Transmission Lines

Turkey Point Nuclear Unit 6 (continued)

(1)	Point of Origin and Termination:	New Clear Sky Substation – Davis Substation
(2)	Number of Lines:	1
(3)	Right-of-way	FPL Owned
(4)	Line Length:	19 miles
(5)	Voltage:	230 kV
(6)	Anticipated Construction Timing:	Start date: TBD End date: TBD
(7)	Anticipated Capital Investment: (Trans.and Sub.)	$ TBD
(8)	Substations:	New Clear Sky Substation and Davis Substation
(9)	Participation with Other Utilities:	None

(1)	Point of Origin and Termination:	Davis Substation – Miami Substation
(2)	Number of Lines:	1
(3)	Right-of-way	FPL Owned
(4)	Line Length:	18 miles
(5)	Voltage:	230 kV
(6)	Anticipated Construction Timing:	Start date: TBD End date: TBD
(7)	Anticipated Capital Investment: (Trans.and Sub.)	$ TBD
(8)	Substations:	Davis Substation and Miami Substation
(9)	Participation with Other Utilities:	None

Schedule 10
Status Report and Specifications of Proposed Transmission Lines

Turkey Point Nuclear Unit 6 (continued)

(1)	Point of Origin and Termination:	New Clear Sky Substation – Turkey Point Substation
(2)	Number of Lines:	1
(3)	Right-of-way	FPL Owned
(4)	Line Length:	0.5 miles
(5)	Voltage:	230 kV
(6)	Anticipated Construction Timing:	Start date: TBD End date: TBD
(7)	Anticipated Capital Investment: (Trans.and Sub.)	$ TBD
(8)	Substations:	New Clear Sky Substation and Turkey Point Substation
(9)	Participation with Other Utilities:	None

Schedule 11.1

Existing FIRM and NON-FIRM Capacity and Energy by Primary Fuel Type
Actuals for the Year 2012

Note:

(1) FPL Existing Units Total values on row (7), columns (2) and (4), match the System Firm Generating Capacity values found on Schedule 1 for Summer and Winter.

(2) Net Energy for Load GWh values on row (12), column (6), matches Schedule 6.1 value for 2012.

Schedule 11.2

Existing NON-FIRM Self-Service Renewable Generation Facilities
Actuals for the Year 2012

1	2	3	4	5	6 = 3 + 4 - 5
Type of Facility	Installed Capacity DC (MW)	Renewable Projected Annual Output (MWh)	Annual Energy Purchased from FPL (MWh)	Annual Energy Sold to FPL (MWh)	Projected Annual Energy Used by Customers (MWH)
Customer-Owned Renewable Generation (0 kW to 10 kW)	9.9	11,601	103,518	408	114,710
Customer-Owned Renewable Generation (> 10 kW to 100 kW)	5.5	6,454	170,710	298	176,866
Customer-Owned Renewable Generation (> 100 kW - 2 MW)	3.6	4,647	111,472	180	115,938
Total	19	22,702	385,699	886	407,514

Notes:

(1) There were 2,117 customers with renewable generation facilities interconnected with FPL on December 31, 2012.

(2) The Installed Capacity value is the sum of the nameplate ratings (DC MW) for all of the customer-owned renewable generation facilities connected as of Dec. 31,2012.

(3) The Projected Annual Output value is based on NREL's PV Watts 1 program and the Installed Capacity value in column (2), adjusted for the date when each facility was installed and assuming each facility operated as planned.

(4) The Annual Energy Purchased from FPL is an actual value from FPL's metered data for 2012.

(5) The Annual Energy Sold to FPL is an actual value from FPL's metered data for 2012.

(6) The Projected Annual Energy Used by Customers is a projected value that equals: (Renewable Projected Annual output + Annual Energy Purchased from FPL) minus the Annual Energy Sold to FPL.

CHAPTER IV

Environmental and Land Use Information

(This page is left intentionally blank.)

IV. Environmental and Land Use Information

IV.A Protection of the Environment

Florida is a sensitive, temperate/sub-tropical environment containing a number of distinct ecosystems with many endangered or threatened plant and animal species. Florida's communities and ecology require the same air, land, and water resources that are necessary to meet the demand for the generation, transmission, and distribution of electricity. The general public has an expectation that large corporations such as FPL will conduct their business in an environmentally responsible manner that minimizes demands on the natural environment.

FPL has been recognized for many years as one of the leaders among electric utilities for its commitment to the environment. Being responsible stewards of the environment is ingrained in FPL's corporate culture. FPL has one of the lowest emissions profiles among U.S. utilities and in 2012 its carbon dioxide (CO_2) emission rate was 29% lower (better) than the industry average.

The environmental leadership of FPL and its parent company, NextEra Energy, Inc., has been heralded by many outside organizations as demonstrated by a few recent examples. NextEra Energy, Inc. was named to the 2012 Dow Jones Sustainability Index (DJSI) of the leading companies in North America for corporate sustainability for the fourth consecutive year. The DJSI North America selects the top 20 percent of companies in sustainability performance from the 600 largest companies in North America. According to Sustainable Asset Management, the investment research firm that conducts the DJSI research, the evaluation is continuously adapted to capture the sustainability trends that are at the forefront of each industry sector and are likely to have an impact on the companies' competitive landscape.

According to the 2013 "World's Most Admired Companies" report released by Fortune magazine, NextEra Energy, Inc. ranked, for a record seventh consecutive year, No. 1 in its industry. Being ranked first, for six consecutive years, is unprecedented in the industry and according to *Fortune*, America's Most Admired Companies is "the definitive report card on corporate reputations". In the same report, NextEra Energy, Inc. ranked in the top 10 among the most admired companies in the state of Florida.

FPL's responsible tree care practices across its 35-county service area have been recognized for almost a decade. FPL has been the recipient of the Tree Line USA award annually from 2003 - 2012. This award is sponsored by the Arbor Day Foundation in cooperation with the National Association of State Foresters. The recognition is given to utilities that demonstrate quality tree care practices, annual worker training, and public education programs.

In 2012, FPL continued to support the Loggerhead Marinelife Center with a $25,000 donation toward the acquisition of a larger tank to assist in sea turtle rehabilitation. In past years FPL has won the Loggerhead Marinelife Center's "Blue Business of the Year" award. This award is given to those who are leading the way in raising awareness about, and have made significant contributions to improve and protect, South Florida's oceans, beaches, and wildlife. The award recognized FPL's protection and conservation of the endangered Florida manatee and its fostering of public and employee education and support.

FPL employees serve as board members for many organizations that focus on environmental restoration, preservation, and stewardship. A partial list of these organizations includes: Audubon Florida, the Everglades Foundation, the Arthur R. Marshall Foundation, and the Palm Beach Zoo.

IV.B FPL's Environmental Statement

To reaffirm its commitment to conduct business in an environmentally responsible manner, FPL developed an Environmental Statement in 1992 to clearly define its position, and FPL continues to hold that position. This statement reflects how FPL incorporates environmental values into all aspects of its activities and serves as a framework for new environmental initiatives throughout the company.

FPL's Environmental Statement

It is the Company's intent to continue to conduct its business in an environmentally responsible manner. Accordingly, Florida Power & Light Company will:

- Comply with the spirit and intent, as well as the letter of, environmental laws, regulations, and standards;
- Incorporate environmental protection and stewardship as an integral part of the design, construction, operation, and maintenance of our facilities;

- Encourage the wise use of energy to minimize the impact on the environment;
- Communicate effectively on environmental issues; and
- Conduct periodic self-evaluations and report performance.

IV.C Environmental Management

In order to implement the Environmental Statement, FPL has an Environmental Management System to direct and control the fulfillment of the organization's environmental responsibilities. A key component of the system is an Environmental Assurance Program. Other components of the system include: executive management support and commitment, a dedicated environmental corporate governance program, written environmental policies and procedures, delineation of organizational responsibilities and individual accountabilities, allocation of appropriate resources for environmental compliance management (which includes reporting and corrective action when non-compliance occurs), environmental incident and/or emergency response, environmental risk assessment/management, environmental regulatory development and tracking, and environmental management information systems.

As part of its commitment to excellence and continuous improvement, FPL will begin to implement an enhanced environmental data management information system (EDMIS) in 2013. Environmental data management software systems are increasingly viewed as an industry best-management practice for environmental compliance needs. FPL's top goal is to improve the flow of environmental data between site operations and corporate services to ensure compliance and improve operating efficiencies. In addition, the EDMIS will help in standardizing data collection, reducing the time to generate state and federal agency reports, and improving external reporting to the public.

IV.D Environmental Assurance Program

FPL's Environmental Assurance Program consists of activities that are designed to evaluate environmental performance, verify compliance with corporate policy as well as legal and regulatory requirements, and communicate results to corporate management. The principal mechanism for pursuing environmental assurance is the environmental audit. An environmental audit may be defined as a management tool comprising a systematic, documented, periodic, and objective evaluation of the performance of the organization and of the specific management systems and equipment designed to protect the environment. The environmental audit's primary objectives are to facilitate management control of environmental practices and assess compliance with existing environmental regulatory requirements and FPL policies.

IV.E Environmental Communication and Facilitation

FPL is involved in many efforts to enhance environmental protection through the facilitation of environmental awareness and in public education. Some of FPL's 2012 environmental outreach activities are summarized below in Table IV.E.1.

Table IV.E.1: 2012 FPL Environmental Outreach Activities

Activity	# of Participants (Approx.)
Visitors to FPL's Energy Encounter at St. Lucie	15,000
Visitors to Manatee Park, Ft. Myers	198,000
Number of website visits to FPL's Environmental & Corporate Responsibility Websites	>200,000
Number of pieces of Environmental literature distributed	>20,000
Visitors to Barley Barber Swamp	>3000
Martin Energy Center Solar Tours	500
Solar Schools Program (# of schools participating)	1 school and 2 non-profits

IV.F Preferred and Potential Sites

Based upon its projection of future resource needs, FPL has identified seven (7) Preferred Sites and five (5) Potential Sites for future generation additions. Preferred Sites are those locations where FPL has conducted significant reviews and has either taken action, is currently committed to take action, or is likely to take action, to site new generating capacity. Potential Sites are those sites that have attributes that support the siting of generation and are under consideration as a location for future generation. Some of these sites are currently in use as existing generation sites and some are not. The identification of a Potential Site does not indicate that FPL has made a definitive decision to pursue generation (or generation expansion in the case of an existing generation site) at that location, nor does this designation indicate that the size or technology of a generator has been determined. The Preferred Sites and Potential Sites are discussed in separate sections below.

As has been described in previous FPL Site Plans, FPL also considers a number of other sites as possible sites for adding future power generation. These include the remainder of FPL's existing generation sites and other Greenfield sites. FPL is also analyzing the potential for modernizing additional existing power plant sites such as is now being done at the Cape Canaveral, Riviera Beach, and Port Everglades sites. Analyses of any modernization candidates would include evaluation of numerous factors including: fuel delivery, transmission, permitting, etc.

IV.F.1 Preferred Sites

FPL currently identifies seven (7) Preferred Sites. Four of these are existing sites: Turkey Point, Cape Canaveral, Riviera Beach, and Port Everglades; two are new plant sites: Hendry County and Northeast Okeechobee County; and one is the site of a former FPL generating unit: Palatka. The Turkey Point site is discussed in regard to two generation projects. The first Turkey Point project discussed is the Extended Power Uprate (EPU) project to increase capacity at the existing Turkey Point Unit 4. This project is expected to be completed at about the time this document is filed. The second Turkey Point project discussed is the first of two new nuclear units. Turkey Point Unit 6 is currently projected in the resource plan discussed in this Site Plan to come in-service in 2022. The 2022 date represents the current projection of the earliest practical in-service date for this unit.

The Cape Canaveral, Riviera Beach, and Port Everglades sites are locations where the modernization work to replace older steam generating units with new combined cycle (CC) technology is in progress. The modernization work at these three sites is scheduled to be completed in 2013, 2014, and 2016, respectively. The Hendry County, Okeechobee County, and Palatka sites are the likely next locations for new CC units after the modernization projects have been completed. In addition, the Hendry County and Okeechobee County sites are also likely sites for new photovoltaic (PV) facilities.

The first four Preferred Sites are discussed below in general chronological order with respect to when the capacity additions are projected to occur. The remaining three Preferred Sites are discussed in alphabetical order.

<u>Preferred Site # 1: Turkey Point Plant, Miami-Dade County</u>

The Turkey Point Plant (Turkey Point) is located on the west side of Biscayne Bay, 25 miles south of Miami. Turkey Point is directly on the shoreline of Biscayne Bay and is geographically located approximately 9 miles east of Florida City on Palm Drive. The land surrounding Turkey Point is owned by FPL and acts as a buffer zone. Turkey Point is comprised of two natural gas/oil conventional steam units (Units 1 & 2), two nuclear units (Units 3 & 4), one combined cycle natural gas unit (Unit 5), nine small diesel generators, and the cooling canals. The Everglades Mitigation Bank (EMB), an approximately 13,000 acre, FPL-maintained natural wildlife and wetlands area that has been set aside, is located to the south and west of the site.

As mentioned above, the Turkey Point Plant site is discussed in this document in regard to two generation projects: the EPU project for an existing nuclear unit (Turkey Point Unit 4), and a new nuclear unit (Turkey Point Unit 6).

Turkey Point Unit 4 has been in operation since 1973. An EPU project for Unit 4 is being completed at the time this document is being finalized. Similar EPU projects were completed during 2012 for three other existing FPL nuclear units: St. Lucie Unit 1, St. Lucie Unit 2, and Turkey Point Unit 3. The EPU work involves changes to several existing main components within the existing facilities to increase their capability to produce steam for the generation of electricity. This capacity uprate, along with similar capacity uprates of FPL's three other existing nuclear units, was included in a final order approved by the Secretary of the Florida Department of Environmental Protection in October 2008.

In regard to Turkey Point Unit 6, FPL is pursuing licensing for two new nuclear units at Turkey Point. Each of these two units would provide 1,100 MW of capacity. The current projections for the earliest practical in-service dates for the two new units are 2022 (for Turkey Point Unit 6) and 2023 (for Turkey Point Unit 7). Because the in-service date for Turkey Point Unit 7 is beyond the 2013 - 2022 reporting time frame of this document, only Turkey Point Unit 6 is discussed in this report. In addition to the two generating units, supporting buildings, facilities and equipment, will be located on the Turkey Point Units 6 & 7 site, along with a construction laydown area. Proposed associated facilities include: a nuclear administration building, a training building, a parking area; an FPL reclaimed water treatment facility and reclaimed water pipelines; radial collector wells and delivery pipelines; an equipment barge unloading area; transmission lines (and transmission system improvements elsewhere within Miami-Dade County), access roads and bridges, and potable water pipelines.

a. U.S. Geological Survey (USGS) Map

USGS maps of the Turkey Point area, with the location of Turkey Point Units 3, 4, 6 and 7 identified, are found at the end of this chapter.

b. Proposed Facilities Layout

Maps of the general layout of Turkey Point Unit 4 (which also includes Turkey Point Unit 3), and of Turkey Point Unit 6 (which also includes Turkey Point Unit 7), are found at the end of this chapter.

c. Map of Site and Adjacent Areas

Land Use / Land Cover overview maps of the Turkey Point Units 3 & 4 and Turkey Point Units 6 & 7 sites and adjacent areas are also found at the end of this chapter.

d. Existing Land Uses of Site and Adjacent Areas

Turkey Point Plant is currently home to five generating units and support facilities that occupy approximately 150 acres of the approximately 9,400-acre Turkey Point property. Prominent features beyond the power block area include the intake system, cooling canal system, switchyard, spent fuel storage facilities, and technical and administrative support facilities The cooling canal system occupies approximately 5,900 acres.

The two 400-megawatt (MW) (nominal) fossil fuel-fired steam electric generation units at Turkey Point have been in service since 1967 (Unit 1) and 1968 (Unit 2). These units have historically burned residual fuel oil and/or natural gas with a maximum equivalent sulfur content of one percent. Unit 2 is currently serving, not as a power generating unit, but as a synchronous condenser to provide voltage support to the southeastern end of FPL's transmission system. The two original 700-MW (nominal) nuclear units have been in service since 1972 (Unit 3) and 1973 (Unit 4). Turkey Point Units 3 and 4 are pressurized water reactor (PWR) units. Turkey Point Unit 5 is a nominal 1,150-MW natural gas-fired combined cycle unit that began operation in 2007. The site for the new Unit 6 (and Unit 7) is south of existing Units 3 and 4 and occupies approximately 300 acres within the existing cooling canal system.

Properties adjacent to Turkey Point property are almost exclusively undeveloped land. The FPL-owned EMB is adjacent to most of the western and southern boundaries of Turkey Point property. The South Florida Water Management District

(SFWMD) Canal L-31E is also situated to the west of Turkey Point property. The eastern portions of Turkey Point property are adjacent to Biscayne Bay, the Biscayne National Park (BNP), and Biscayne Bay Aquatic Preserve. The southeastern portion of Turkey Point property is bounded by state-owned land located on Card Sound. The Homestead Bayfront Park, owned and operated by Miami-Dade County, is situated to the north of the Turkey Point property.

e. General Environment Features On and In the Site Vicinity

1. Natural Environment

Turkey Point is located directly on the northwest, west, and southwest shoreline of Biscayne Bay and the Biscayne National Park, 25 miles south of Miami. Biscayne National Park was first established in 1968 as a National Monument and was expanded in 1980 to approximately 173,000 acres of water, coastal lands, and 42 keys. A portion of Biscayne Bay Aquatic Preserve, a state-owned preserve, is adjacent to the eastern boundary of the Turkey Point plant property. The Biscayne Bay Aquatic Preserve is a shallow, subtropical lagoon consisting of approximately 69,000 acres of submerged State land that has been designated as an Outstanding Florida Water.

The Turkey Point Unit 4 EPU project is located within the area of the existing Turkey Point Unit 4 site, which currently includes a nuclear generation unit and supporting facilities. The approximately 300-acre Turkey Point Units 6 & 7 site consists of the plant area and adjacent areas designated for laydown and ancillary facilities. The site includes hypersaline mud flats, man-made active cooling canals, man-made remnant canals, previously filled areas/roadways, mangrove heads associated with historical tidal channels, dwarf mangroves, open water /discharge canal associated with the cooling canals on the western portion of the site, wet spoil berms associated with remnant canals, and upland spoil areas.

2. Listed Species

Threatened, endangered, and/or animal species of special concern known to occur at the site, and in the nearby Biscayne National Park, include the peregrine falcon *(Falco peregrinus)*, wood stork *(Mycteria americana)*, American crocodile *(Crocodylus acutus)*, mangrove rivulus *(Rivulus marmoratus)*, roseate spoonbill (*Ajaja ajaja)*, little blue heron *(Egretta caerulea),* snowy egret *(Egretta thula),* American oystercatcher *(Haematopus palliates),* least tern *(Sterna antillarum)*, the white ibis *(Eudocimus albus)*, and bald eagle *(Haliaeetus leucocephalus)*. No bald eagle nests are known to exist in the vicinity of the site. The federally listed, threatened American crocodile thrives at Turkey Point, primarily in and around the southern end of the cooling canals which lie south of the Turkey Point Unit 4 and Turkey Point Unit 6 areas. The majority of Turkey Point is considered American crocodile habitat due to the mobility of the species and use of the site for foraging, traversing, and basking. FPL manages a program for the conservation and enhancement of the American Crocodile and the program is credited with survival improvement and contributing to the downlisting of the American Crocodile from endangered to threatened.

Some listed flora species likely to occur at the site or vicinity include golden leather fern (Acrostichum aureum), pinepink (Bletia purpurea), Florida brickell-bush (Brickellia mosieri), Florida lantana (Lantana depressa var. depressa), mullien nightshade (Solanum donianum), and lamarck's trema (Trema lamarckianum).

During the construction and operation after construction, neither the Turkey Point Unit 4 EPU project nor the new Turkey Point Unit 6 project are expected to adversely affect any rare, endangered, or threatened species.

3. <u>Natural Resources of Regional Significance Status</u>

Significant features within the vicinity of the site include Biscayne National Park, the Biscayne Bay Aquatic Preserve, Miami-Dade County Homestead Bayfront Park, and Everglades National Park. The portion of Biscayne Bay adjacent to the site is included within the Biscayne National Park. Biscayne National Park contains 180,000 acres, approximately 95 percent of which is open water interspersed with more than 40 keys. The Biscayne National Park headquarters is located approximately two miles north of Turkey Point and is adjacent to the Miami-Dade County Homestead Bayfront Park, which contains a marina and day-use recreational facilities.

4. <u>Other Significant Features</u>

FPL is not aware of any other significant features of the site.

f. <u>Design Features and Mitigation Options</u>

In regard to the EPU project for Turkey Point Unit 4, this unit uses cooling water from a closed-loop cooling canal system to remove heat from the main (turbine) condensers, and to remove heat from other auxiliary equipment. The existing cooling canals will accommodate the slight increase in heat load that is associated with the increased capacity from the uprate. The maximum projected increase in water temperature entering the cooling canal system resulting from the nuclear uprate project is predicted to be about 3°F, from 106°F to 109°F. The associated projected maximum increase in water temperature returning to the unit is about 1°F, from 92°F to 93°F.

For Turkey Point Unit 6, the technology proposed is the Westinghouse AP1000 pressurized water reactor (PWR).[7] This design is certified by the NRC under 10 CFR 52 and incorporates the latest technology and more advanced safety features than today's nuclear plants that have already achieved record safety levels. The Westinghouse AP1000 unit consists of the reactor, steam generators, pressurizer, and steam turbine/electric generator. Condenser cooling for the Unit 6 steam turbine will be accomplished using three circulating water cooling towers. The makeup water reservoir is the reinforced concrete structure beneath the circulating water system cooling towers that will contain reserve reclaimed water capacity to be used for the circulating water system. The structures for the Westinghouse AP1000 are the nuclear island (containment building, shield building, and auxiliary building), turbine building, annex building, diesel generator building, and radwaste building. The plant area will also contain the Clear Sky substation (switchyard) that will connect Unit 6 to FPL's transmission system.

g. <u>Local Government future Land Use Designations</u>

The Turkey Point Plant site is designated by the Miami-Dade County Comprehensive Development Management Plan as an IU-3 (Industrial, Utilities, and Communications) Unlimited Manufacturing District that carries a dual designation of MPA (Mangrove Protection Area) in portions of the property. There are also areas designated GU – "Interim District." Designations for the surrounding area are primarily GU – "Interim District."

[7] Unless otherwise noted, the information presented for Turkey Point Unit 6 will also apply for Turkey Point Unit 7 whose currently projected in-service date is outside of the 2013-2022 reporting period addressed in this document.

h. Site Selection Criteria Process

The site has been selected as a Preferred Site for the EPU project for existing Unit 4 because it is an existing nuclear plant site and, therefore, offers the opportunity for increased nuclear capacity. For Turkey Point Unit 6, FPL conducted an extensive site selection analysis leading to the selection of the Turkey Point site as the site that, on balance, provided the most favorable location for developing new nuclear generation to serve FPL's customers. The Site Selection Study employed the principles of the Electric Power Research Institute (EPRI) siting guidelines and is modeled upon applicable NRC site suitability and National Environmental Policy Act (NEPA) criteria regarding the consideration of alternative sites. The study convened a group of industry and FPL subject matter experts to develop and assign weighting factors to a broad range of site selection criteria. Twenty-three candidate sites were then ranked using the siting criteria. This review allowed the list of candidates to be reduced until the best site emerged. Key factors contributing to the selection of the Turkey Point site include the existing transmission and transportation infrastructure to support new generation, the large size and seclusion of the site while being relatively close to the load center, and the long-standing record of safe and secure operation of nuclear generation at the site since the early 1970s.

i. Water Resources

Unique to Turkey Point is the closed-loop cooling canal system that supplies water to condense steam used by the plant's turbine generators. The canal system consists of 36 interconnected canals. The cooling canals occupy an area approximately two miles wide by five miles long (5,900 acres) and are approximately four feet deep. The system performs the same function as a car radiator. The water is circulated through the canals in a two-day journey, ending at the plant's intake pumps. The cooling canal system is utilized for cooling by Turkey Point Units 3 and 4 nuclear units.

In regard to Turkey Point Unit 6, the primary source of cooling water makeup will be reclaimed water from the Miami-Dade County Water and Sewer Department (MDWASD), with potable water also from MDWASD. When reclaimed water is not available in sufficient quantity and quality of water needed for cooling, makeup water will be saltwater supplied by radial collector wells that are recharged from the marine environment of Biscayne Bay. Horizontal collector wells (radial collector wells) have become widely used for the purpose of inducing infiltration from surface water bodies into hydraulically-connected aquifer systems in order to develop moderate to high capacity water supplies.

Turkey Point Unit 6 wastewater will be discharged via on-site deep injection wells.

j. Geological Features of Site and Adjacent Areas

Turkey Point lies upon the Floridian Plateau, a partly-submerged peninsula of the continental shelf. The peninsula is underlain by approximately 4,000 to 15,000 feet of sedimentary rocks consisting of limestone and associated formations that range in age from Paleozoic to Recent. Little is known about the basement complex of Paleozoic igneous and metamorphic rocks due to their great depth.

Generally in Miami-Dade County, the surficial aquifer (Biscayne Aquifer) consists of a wedge-shaped system of porous clastic and carbonate sedimentary materials, primarily limestone and sand deposits of the Miocene to late Quaternary age. The Biscayne Aquifer is thickest along the eastern coast and varies in thickness from 80 to 200 feet thick. The surficial aquifer is typically composed of Pamlico Sand, Miami Limestone (Oolite), the Fort Thompson and Anastasia Formations (lateral equivalents), Caloosahatchee Marl, and the Tamiami formation. The lower confining layers below the surficial aquifer range in thickness from 350 to 600 feet and are composed of the Hawthorn Group. Beneath the Hawthorn Group, the Floridan Aquifer System ranges from 2,800 to 3,400 feet thick and consists of Suwannee Limestone, Avon Park Limestone, and the Oldsmar Formations.

k. Projected Water Quantities for Various Uses

There will be no increase in the amount of water required due to the additional capacity that will result from the EPU project for existing Turkey Point Unit 4.

The estimated quantity of water required for the new Turkey Point Unit 6 for industrial processing is approximately 468 gallons per minute (gpm) for uses such as process water and service water. Approximately 27.7 million gallons per day (mgd) of cooling water would be cycled through the cooling towers. Water quantities needed for other uses such as potable water are estimated to be approximately 25,200 gallons per day (gpd) for Unit 6.

l. Water Supply Sources and Type

The source of cooling water for Turkey Point Unit 4 is the cooling canal system. There will be no increase in the amount of water withdrawn as a result of the additional capacity that will result from the EPU project. General plant service water, fire protection water, process water, and potable water are obtained from Miami-

Dade County. Process water uses include demineralizer regeneration, steam cycle makeup, and general service water use for washdowns. The water use for the facility will not change as a result of the EPU project.

In regard to Turkey Point Unit 6, the water for the various plant water needs will be obtained from a reclaimed water supply, a saltwater supply, and a potable water supply. Reclaimed water will be used as makeup water to the cooling water system with saltwater from radial collector wells as a back-up water source to be used when reclaimed water is not available in sufficient quantity or quality.

Potable water will be used as makeup water for the service water system. The potable water supply will also provide water to the fire protection system, demineralized water treatment system, and other miscellaneous uses.

m. <u>Water Conservation Strategies</u>

The existing water resources will not change as a result of the EPU project at Turkey Point Unit 4. Regarding Turkey Point Unit 6, use of reclaimed water from MDWASD is a beneficial and cost-effective means of increasing the use of reclaimed water. This use of reclaimed water helps Miami-Dade County meet approximately half of its wastewater reuse goals and will provide environmental benefits by reducing the volume of wastewater discharged by the County. In the absence of reuse opportunities, this treated domestic wastewater would likely continue to be discharged to the ocean or into deep injection wells.

Miami-Dade County is required to eliminate ocean outfalls and increase the amount of water that is reclaimed for environmental benefit and other beneficial uses. Turkey Point Unit 6 will use reclaimed water 24 hrs per day, 365 days per year when operating and water is available in sufficient quantity and quality.

n. <u>Water Discharges and Pollution Control</u>

Heated water discharges from Turkey Point Unit 4 are dissipated using the existing closed-loop cooling canal system. The additional generating capacity as a result of the EPU project for Turkey Point Unit 4 will not cause any changes in the quantity or characteristics of industrial wastewaters generated by the facility. Nor will the increased generating capacity at Turkey Point Unit 4 cause any changes in hydrologic or water quality conditions due to diversion, interception, or additions to surface water flow. The existing units at Turkey Point do not directly withdraw groundwater under current operations and they will not do so after the EPU project is completed. Locally, groundwater is present beneath the site in the surficial or Biscayne Aquifer and in deeper aquifer zones that are part of the Floridan Aquifer System. There will be no effects on those deeper aquifer zones from the EPU project.

Turkey Point Unit 6 will dissipate heat from the power generation process using cooling towers. Blowdown water or discharge from the cooling towers, along with other wastestreams, will be injected into the boulder zone of the Floridan Aquifer. Non-point source discharges are not an issue since there will be none at this facility. Storm water runoff will be released to the closed-loop cooling canal system.

Turkey Point Unit 4 employs, and Turkey Point Unit 6 will employ, Best Management Practices (BMP) plans and Spill Prevention, Control, and Countermeasure (SPCC) plans to prevent and control the inadvertent release of pollutants.

o. <u>Fuel Delivery, Storage, Waste Disposal, and Pollution Control</u>

Turkey Point Unit 4 utilizes uranium-dioxide fuel that is slightly enriched uranium-235. The uranium-dioxide fuel is in the form of pellets contained in Zircaloy tubes with welded end plugs to confine radionuclides. The tubes are fabricated into assemblies designed for loading into the reactor core. Used fuel assemblies are stored in the onsite NRC-approved spent fuel storage facilities.

FPL currently replaces approximately one-third of the fuel assemblies in each reactor at refueling intervals of approximately 18 months. FPL operates each reactor such that the average fuel usage by a reactor is approximately 45,000 megawatt-days per metric ton of uranium. Following completion of the EPU project for Turkey Point Unit 4, more nuclear fuel will be used due to the increased generating capacity. No changes in the fuel handling facilities are required.

In regard to Turkey Point Unit 6, the reactor will contain enriched uranium fuel assemblies. A fuel assembly consists of 264 fuel rods in a 17-by-17 square array. The fuel rods consist of enriched uranium, in the form of cylindrical pellets of sintered uranium dioxide contained in ZIRLO™ tubing.

New fuel assemblies will be transported to Turkey Point for use in Unit 6 by truck from a fuel fabrication facility in accordance with U.S. Department of Transportation

(DOT) and NRC regulations. Spent fuel assemblies being discharged will remain in the spent fuel pool while short half-life isotopes decay.

After a sufficient decay period, the fuel would be transferred to an on-site independent spent fuel storage installation facility or an off-site disposal facility. Packaging of the fuel for off-site shipment will comply with the applicable DOT and NRC regulations for transportation of radioactive material.

The U.S. Department of Energy (DOE) is responsible for spent fuel transportation from reactor sites to a repository under the Nuclear Waste Policy Act of 1982, as amended. FPL has executed a standard spent nuclear fuel disposal contract with DOE for fuel used in Unit 6.

At Turkey Point Unit 4 diesel fuel is used in a number of emergency generators that include four main emergency generators, five smaller emergency generators, and various general purpose diesel engines. The emergency generators will not be changed as a result of the EPU project. These emergency generators are for stand-by use only and only operated for testing purposes to assure reliability and for maintenance. Diesel fuel for the emergency generators is delivered to Turkey Point by truck as needed, and stored in tanks with secondary containment.

p. **Air Emissions and Control Systems**

The normal operation of Turkey Point Unit 4 does not create fossil fuel-related air emissions. However, there are emergency generators associated with Unit 4. Four of these nine emergency generators are main plant emergency generators which are rated at 2.5 MW each. The remaining five generators are smaller emergency generators which are associated with the security system. In addition, various general purpose diesels are used as needed. No additional generators are required as part of the EPU project for Turkey Point Unit 4.

The Turkey Point Unit 4 associated emergency generators and diesel engines, together with Turkey Point Units 1, 2, and 5, are classified as a major source of air pollution. FDEP has issued a separate Title V Air Operating Permit for Turkey Point (Permit Number 0250003-004-AV). There are no operating limits for the emergency generators or diesel engines. Emergency diesel generators are limited to use ultra-low sulfur diesel fuel (0.0015% sulfur). NOx emissions are regulated under Reasonably Available Control Technology (RACT) requirements in Rule 62-296.570(4) (b) 7 F.A.C., which limit NO_x emissions to 4.75 lb/MMBtu. The use of 0.05

percent sulfur diesel fuel and good combustion practices serve to keep NO_x emissions under this limit.

Regarding Turkey Point Unit 6, the unit will also minimize FPL system air pollutant emissions by using nuclear fuel to generate electric power. This includes avoiding emissions of particulate matter (PM), sulfur dioxide (SO_2), nitrogen oxides (NOx), carbon monoxide (CO), carbon dioxide (CO_2), and volatile organic compounds (VOC). The circulating water cooling towers will be equipped with high-efficiency drift or mist eliminators to minimize emissions of PM to 0.0005 percent of the circulating water; this is over 99.99-percent control of potential drift emissions based on the circulating water flow.

The diesel engines necessary to support Turkey Point Unit 6 and fire pump engines will be purchased from manufacturers whose engines meet the EPA's NSPS Subpart IIII emission limits.

q. **Noise Emissions and Control Systems**

Field surveys and impact assessments of noise expected to be caused by activities associated with the Turkey Point Unit 4 EPU project and the Turkey Point Unit 6 project were conducted. Predicted noise levels associated with these projects are not expected to result in adverse noise impacts in the vicinity of the site.

r. **Status of Applications**

The Turkey Point Unit 4, EPU Site Certification Application (SCA), under the Florida Electrical Power Plant Siting Act, was filed in January 2008 and a final order was issued in October 2008. The FPSC voted to approve the need for additional generating capacity at Turkey Point and the final order approving the need for this additional nuclear capacity was issued in January 2008. In addition, a License Amendment request for the EPU was submitted to the NRC in October 2010. The License Amendment was approved in June 2012.

The Turkey Point Unit 6 Site Certification Application (SCA), under the Florida Electrical Power Plant Siting Act, was filed in June 2009 and a final order is currently expected in January 2014. The FPSC issued the final order approving the need for this additional nuclear capacity in April 2008.

A License Amendment request for Unit 6 was submitted to the NRC in June 2009. There are two components to that application; one is the Environmental Assessment (EA) and the other is the Safety component. The Application is still in process.

Besides the certification and the license amendment, additional permits have been issued for Turkey Point Units 6 & 7 including Miami-Dade County Unusual Use approvals that were issued in 2007 and 2013 and the Prevention of Significant Deterioration (Air permit) that was issued in 2009. In addition, a permit to construct an exploratory well and a dual zone monitoring well, under the Underground Injection Control Program, was issued in 2010. Permits from the FAA for the containment structure were originally issued in 2009 and renewed in 2012.

Preferred Site # 2: Cape Canaveral Plant, Brevard County

This site is located on the existing FPL Cape Canaveral Plant property in unincorporated Brevard County. The site is bound to the east by the Indian River Lagoon and on the west by a four-lane highway (U.S. Highway 1). The city of Port St. Johns is located less than a mile away. A rail line is located near the plant.

The site previously housed two steam generating units (Units 1 & 2) with 788 MW (Summer) of generating capacity. The units formerly occupied a portion of the 43 acres that are wholly owned by FPL. FPL is in the process of modernizing the existing Cape Canaveral Plant, to be renamed the Cape Canaveral Next Generation Clean Energy Center (CCEC), by replacing the previous two steam generating units with a single modern, highly efficient, lower-emission next-generation clean energy center using advanced CC technology. The old units have been taken out of service and dismantled. The demolition of the Cape Canaveral Plant began in mid-2010 and was completed during the first quarter of 2011. Construction for the new CC unit began in March 2011 and is expected to be completed by June 2013.

a. Geological Survey (USGS) Map

A USGS map of the CCEC site is found at the end of this chapter.

b. Proposed Facilities Layout

A map of the general layout of the CCEC generating facilities at the site is found at the end of this chapter.

c. **Map of Site and Adjacent Areas**

An overview map of the site and adjacent areas is also found at the end of this chapter.

d. **Existing Land Uses of Site and Adjacent Areas**

The existing and future land uses on the site are primarily dedicated to electrical generation; i.e., FPL's former Cape Canaveral Units 1 & 2 and the future CCEC unit. The existing land uses that are adjacent to the site consist of single- and multi-family residences to the south and southwest, commercial property to the northwest, utility systems to the west, and a private medical/office facility to the north.

e. **General Environment Features On and In the Site Vicinity**

1. **Natural Environment**

The natural environment surrounding the site includes the Indian River Lagoon to the east and upland scrub, pine and hardwoods to the north and south. Vegetation within the approximately 45-acre offsite construction laydown and parking area (located west of U.S. Highway 1) consists of open land, upland scrub, pine, hardwoods along with exotic plant species.

2. **Listed Species**

No adverse impacts to federally or state-listed terrestrial plants and animals are expected in association with construction of the CCEC at the site, due to the existing developed nature of the site and lack of suitable habitat for listed species. Federal- or state-listed terrestrial plants and animals inhabiting the offsite construction laydown and parking area are limited to the state-listed gopher tortoise and the state- and federally-listed scrub jay. The warm water discharges from the plant attract manatees, an endangered species. FPL continues to work closely with state and federal wildlife agencies to ensure protection of the manatees during the modernization process. In 2010, FPL installed a temporary heating system to warm the water for the manatees as required during manatee season. FPL has complied, and will continue to comply, with several other manatee-related conditions of certification to ensure the protection of the manatees during the modernization work and during subsequent operation of the new generating facility.

3. Natural Resources of Regional Significance Status

The construction and operation of the CCEC at this location is consistent with the existing use at the site and is not expected to have any adverse impacts on parks, recreation areas, or environmentally sensitive lands.

4. Other Significant Features

FPL is not aware of any other significant features of the site.

f. Design Features and Mitigation Options

The design option is to replace the previous steam generating units (Units 1 & 2) with one new 1,210 MW (Summer) CC unit consisting of three new combustion turbines (CTs), three new heat recovery steam generators (HRSG), and a new steam turbine. The new CC unit is projected to be in-service in mid-2013. Natural gas delivered via pipeline is the primary fuel type for this unit with ultra-low sulfur light fuel oil serving as a backup fuel.

g. Local Government Future Land Use Designations

Local government future land use designation for the site is "Public Utilities" and the area has been rezoned to GML-U. Designations for the surrounding area are primarily "Community Commercial" and "Residential". A land use map of the site and adjacent areas is also found at the end of this chapter.

h. Site Selection Criteria Process

The Cape Canaveral Plant site was selected for a site modernization due to consideration of various factors including system load and economics. Environmental issues were not a significant factor since this site was the site of a previous power plant and does not exhibit significant environmental sensitivity or other environmental issues. However, the significant reduction in cooling water withdrawal and thermal component of cooling water discharges are environmental benefits of replacing the previous steam units with a new CC unit. Other environmental benefits include a significant reduction in system fuel use, a significant reduction in system air emissions, improved aesthetics at the site, and continued warm water discharge for the manatees as required during manatee season. Further, modernizing this existing facility reduces the impact on natural resources by not requiring new land, new water sources, or additional off-site transmission siting.

i. Water Resources

Condenser cooling for the steam cycle portion of the new plant and auxiliary cooling will come from the existing cooling water intake system. Process, potable, and reclaimed water for the new plant will come from the existing City of Cocoa's potable water supply.

j. Geological Features of Site and Adjacent Areas

The site is located on the Atlantic Coastal Ridge and is at an approximate elevation of 12 feet above mean sea level (msl). The land consists primarily of fine to medium sand that parallels the coast. There is a lack of shell as it was deposited during a time of transgression. The base of the sedimentary rocks is made up of a thick, primarily carbonate sequence deposited during the Jurassic age through the Pleistocene age. Starting in the Miocene age and continuing through the Holocene age, siliciclastic sedimentation became more predominant. The basement rocks in this area consist of low-grade metamorphic and igneous intrusives, which occur several thousand feet below land surface and are Precambrian, Paleozoic, and Mesozoic in age.

k. Projected Water Quantities for Various Uses

The estimated quantity of water required for processing is approximately 0.232 million gallons per day (mgd) for uses such as process water and service water. Potable water demand is expected to average .001 mgd. Approximately 600 mgd of cooling water would be cycled through the once-through cooling water system.

l. Water Supply Sources by Type

The modernized plant will continue to use the Indian River Lagoon water as the source of once-through cooling water. Such needs for cooling water will comply with the St. John's River Water Management District (SJRWMD) conditions in the site certification. Process and potable water for the new plant will come from the existing City of Cocoa's potable water supply. Reclaimed water may be used for irrigation.

m. Water Conservation Strategies Under Consideration

No additional water resources will be required as a result of the modernization project. CC technology uses less water by design than traditional steam generation units.

n. Water Discharges and Pollution Control

The modernized site will utilize portions of the existing once-through cooling water systems for heat dissipation. The heat recovery steam generator blowdown (wastewater discharge required to maintain process water quality) will be reused to the maximum extent practicable or mixed with the cooling water flow before discharge. Reverse osmosis (R/O) reject will be mixed with the plant's once-through cooling water system. Storm water runoff will be collected and routed to storm water ponds. The facility will employ a Best Management Practices (BMP) plan and Spill Prevention, Control, and Countermeasure (SPCC) plan to prevent and control the inadvertent release of pollutants.

o. Fuel Delivery, Storage, Waste Disposal, and Pollution Control

Natural gas for the new unit will be transported to the site via a pipeline. New off-site gas compressors will be used to raise the gas pressure of the existing pipeline for the new unit. Ultra-low sulfur light fuel oil will be received by truck or barge from Port Canaveral and stored in an above-ground storage tank.

p. Air Emissions and Control Systems

The emission rates of CCEC would decrease by over 90% from the former Cape Canaveral Plant, resulting in substantial annual emission reductions and increased air quality benefits per unit of energy produced. The use of natural gas, ultra-low sulfur light fuel oil, and combustion controls would minimize air emissions from the CC unit and ensure compliance with applicable emission limiting standards. Using these clean fuels minimizes emissions of sulfur dioxide (SO_2), particulate matter, and other fuel-bound contaminates. Combustion controls similarly minimize the formation of nitrogen oxides (NO_x) and the combustor design will limit the formation of carbon monoxide and volatile organic compounds. When firing natural gas, NO_x emissions will be controlled using dry-low NO_x combustion technology and selective catalytic reduction (SCR). Water injection and SCR will be used to reduce NO_x emissions during operations when using ultra-low sulfur light fuel oil as backup fuel. These design alternatives are equivalent to the Best Available Control Technology for air emissions, and minimize such emissions while balancing economic, environmental, and energy impacts. CC facility emissions of greenhouse gases (GHGs) from combustion of natural gas achieve an emission rate substantially lower than the EPA proposed new source performance standards for GHGs. In total, the design of the new CCEC plant will incorporate features that would make it among the most efficient and cleanest power plants in the State of Florida.

q. **Noise Emissions and Control Systems**

Noise expected to be caused by unit construction at the site is expected to be below current noise levels for the residents nearest the site. Noise from the operation of the new unit will be within allowable levels.

r. **Status of Applications**

The FPSC voted to approve the need for the modernization project and the need order was issued in September 2008. The project received final state certification on October 9, 2009, through the issuance of a final order signed by the Secretary of the Department of Environmental Protection (DEP).

Preferred Site # 3: Riviera Beach Plant, Palm Beach County

This site is located on the former FPL Riviera Beach Plant property primarily within Riviera Beach, Palm Beach County (with a small portion of the Site in West Palm Beach). The site is bound to the east by the Lake Worth Lagoon (Intracoastal Waterway) and on the west by a four-lane highway (U.S. Highway 1). The site has barge access via the Port of Palm Beach. A rail line is located near the plant.

The previous site generating capacity was made up of two 300 MW (approximate) steam generating units (Units 3 & 4) that were taken out of service and dismantled in 2011. Units 1 & 2 were previously retired and dismantled and are no longer on the plant site.

FPL is in the process of modernizing the former Riviera Beach Plant, to be renamed the Riviera Beach Next Generation Clean Energy Center (RBEC), by replacing the existing generating units with a modern, highly efficient, lower-emission next-generation clean energy center using advanced CC technology.

a. **U.S. Geological Survey (USGS) Map**

A USGS map of the RBEC site is found at the end of this chapter.

b. **Proposed Facilities Layout**

A general layout of the RBEC generating facilities is found at the end of this chapter.

c. **Map of Site and Adjacent Areas**

An overview map of the site and adjacent areas is also found at the end of this chapter.

d. Existing Land Uses of Site and Adjacent Areas

The previous Riviera Beach Plant consisted of two 300 MW (approximate) units with conventional dual-fuel fired steam boilers and steam turbine units. The plant site includes minimal vegetation and a landscape buffer area south of the power plant. Adjacent land uses include port facilities and associated industrial activities, as well as light commercial and residential development.

e. General Environment Features On and In the Site Vicinity

1. Natural Environment

The existing FPL Riviera Beach Plant property is located on approximately 46 acres of flat, sandy soils on the west side of the Intracoastal Waterway. The majority of the site is comprised of seven acres containing transmission lines and facilities on the west side of U.S. Highway 1, and 39 acres comprised of facilities related to electric power generation on the east side of U.S. Highway 1. The site provides warm water as required for manatees pursuant to the facility's Manatee Protection Plan.

.

2. Listed Species

No adverse impacts to federally or state-listed terrestrial plants and animals are expected in association with construction at the site, due to the existing developed nature of the site and lack of suitable onsite habitat for listed species. The warm water discharges from the plant attract manatees, an endangered species. FPL continues to work closely with state and federal wildlife agencies to ensure protection of the manatees during the modernization process. In 2009, FPL installed a temporary heating system to warm the water for the manatees as required pursuant to the facility's Manatee Protection Plan. FPL will also be complying with several other manatee-related conditions of certification to ensure the protection of the manatees during the modernization work and during operation of the RBEC.

3. Natural Resources of Regional Significance Status

The construction and operation of a natural gas-fired CC generating facility at this location is consistent with the existing use at the site and is not expected to have any adverse impacts on parks, recreation areas, or environmentally sensitive lands.

4. Other Significant Features

FPL is not aware of any other significant features of the site.

f. Design Features and Mitigation Options

The design option is to replace the previous steam generating units (Units 3 & 4) with one new 1,212 MW (Summer) CC unit consisting of three new CTs, three new heat recovery steam generators (HRSG), and a new steam turbine. The new CC unit is projected to be in service in mid-2014. Natural gas delivered via pipeline is the primary fuel type for the unit with ultra-low sulfur light fuel oil serving as a backup fuel.

g. Local Government Future Land Use Designations

Local government future land use designation for the site is "Utility". The Port of Palm Beach is to the north of the site. Designation to the west of the site is "Commercial." To the south of the site is "Residential" and is in the City of West Palm Beach. A land use map of the site and adjacent areas is also found at the end of this chapter.

h. Site Selection Criteria Process

This site has been selected for site modernization due to consideration of various factors including system load and economics. Environmental issues were not a deciding factor since this site does not exhibit significant environmental sensitivity or other environmental issues. However, there are environmental benefits of replacing the existing steam units with a new CC unit including a significant reduction in system air emissions, improved aesthetics at the site, and continued warm water discharge for the manatees as required during manatee season. Further, modernizing this existing facility reduces the impact on natural resources by not requiring new land or new water resources.

i. Water Resources

Water from the Lake Worth Lagoon (Intracoastal Waterway) will be used for once-through cooling water. RBEC will utilize portions of the existing once-through cooling water intake and discharge structures. Water for cooling pump seals and irrigation will come from three onsite surficial aquifer wells. Process and potable water for the converted plant will come from the existing City of Riviera Beach potable water supply.

j. Geological Features of Site and Adjacent Areas

The site is underlain by the surficial aquifer system. The surficial aquifer system in eastern Palm Beach County is primarily composed of sand, sandstone, shell, silt, calcareous clay (marl), and limestone deposited during the Pleistocene and Pliocene Epochs. The sediments forming the aquifer system are the Pamlico Sand, Fort Thompson Formation (Pleistocene) and the Caloosahatchee Marl (Pleistocene and Pliocene). Permeable sediments in the upper part of the Tamiami Formation (Pliocene) are also part of the aquifer system.

The surficial aquifer is underlain by at least 600 feet of the Hawthorn formation (confining unit). The Floridan Aquifer System underlies the Hawthorn formation.

k. Projected Water Quantities for Various Uses

The estimated quantity of water required for processing is approximately 0.232 million gallons per day (mgd) for uses such as process water and service water. Approximately 600 mgd of cooling water would be cycled through the once-through cooling water system. Potable water demand is expected to average .001 mgd.

l. Water Supply Sources by Type

The modernized plant will continue to use Lake Worth Lagoon water as the source of once-through cooling water. Water for cooling pump seals and irrigation will come from on-site surficial aquifer wells currently authorized under SFWMD conditions of certification. Process and potable water for the new plant will come from the existing City of Riviera Beach's potable water supply.

m. Water Conservation Strategies Under Consideration

No additional water resources will be required as a result of the modernization project. CC technology uses less water by design than traditional steam generation units.

n. Water Discharges and Pollution Control

The modernized plant will utilize portions of the existing once-through cooling water system for heat dissipation. The heat recovery steam generator blowdown will be mixed with the cooling water flow before discharge. Reverse osmosis (R/O) reject will be mixed with the plant's once-through cooling water system prior to discharge. Storm water runoff will be collected and routed to storm water ponds. The facility will employ a Best Management Practices (BMP) plan and Spill Prevention, Control, and

Countermeasure (SPCC) plan to prevent and control the inadvertent release of pollutants.

o. Fuel Delivery, Storage, Waste Disposal, and Pollution Control

Natural gas for the new unit would be transported to the site via an approximately six mile FPL-owned pipeline and a 32 mile pipeline from the Martin Plant. Together, the two pipelines are known as the RBEC Lateral. New gas compressors will be installed at the existing FPL 45th Street Terminal facility in Riviera Beach to raise the gas pressure of the pipeline to the appropriate level for the new unit. Ultra-low sulfur light fuel oil would be received by truck, pipeline, or barge and stored in a new above-ground storage tank.

p. Air Emissions and Control Systems

The regulated air emission rates at the new plant would be more than 90 percent lower than the previous Riviera Beach Plant's emission rates, resulting in significant annual emissions reductions and air quality benefits per unit of energy produced. The use of natural gas, ultra-low sulfur light fuel oil, and combustion controls would minimize air emissions from the unit and ensure compliance with applicable emission limiting standards. Using these fuels minimizes emissions of sulfur dioxide (SO_2), particulate matter, and other fuel-bound contaminates. Combustion controls similarly minimize the formation of nitrogen oxides (NO_x) and the combustor design will limit the formation of carbon monoxide and volatile organic compounds. When firing natural gas, NO_x emissions will be controlled using dry-low NO_x combustion technology and selective catalytic reduction (SCR). Water injection and SCR will be used to reduce NO_x emissions during operations when using ultra-low sulfur light fuel oil as backup fuel. These design alternatives are equivalent to the Best Available Control Technology for air emissions, and minimize such emissions while balancing economic, environmental, and energy impacts. CC facility emissions of GHGs from combustion of natural gas achieve an emission rate substantially lower than the EPA proposed new source performance standards for GHGs. Taken together, the design of RBEC would incorporate features that will make it among the most efficient and cleanest power plants in the State of Florida.

q. Noise Emissions and Control Systems

Noise expected to be caused by unit construction at the site is expected to be below current noise levels for the residents nearest the site. Noise from the operation of the new unit will be within allowable levels.

r. Status of Applications

The FPSC voted to approve the need for the modernization project and the need order was issued in September 2008. The project received final state certification on November 24, 2009, through the issuance of a final order signed by the Secretary of the DEP. The project received final certification for the RBEC Lateral and compressor station on March 15, 2011.

Preferred Site # 4: Port Everglades Plant, Broward County

This site is located on the existing FPL Port Everglades Plant property within the City of Hollywood, Broward County. The site is surrounded by the Port of Port Everglades. The site has barge access via the Port of Port Everglades. A rail line is located near the plant.

The previous site generating capacity was made up of two 200 MW (approximate) steam generating units (Units 1 & 2) and two 400 MW (approximate) steam generating units (Units 3 & 4). The four units will be taken out of service and dismantled by mid-2013 as part of the modernization of the plant site.

The Port Everglades Plant site has been listed as a Potential Site in previous FPL Site Plans for both CC and CT generation options. On April 9, 2012, the FPSC issued the final need order for the modernization of the existing Port Everglades Plant. As a result of the modernization of the site, the new generating unit - to be renamed the Port Everglades Next Generation Clean Energy Center (PEEC) – will replace the existing steam generating units with a modern, highly efficient, lower-emission next-generation clean energy center using advanced CC technology. The existing four steam units will first be removed from the site and will be replaced by a single new CC unit.

a. U.S. Geological Survey (USGS) Map

A USGS map of the PEEC site is found at the end of this chapter.

b. Proposed Facilities Layout

A general layout of the PEEC generating facilities is found at the end of this chapter.

c. Map of Site and Adjacent Areas

An overview map of the site and adjacent areas is also found at the end of this chapter.

d. Existing Land Uses of Site and Adjacent Areas

The existing Port Everglades Plant consists of two 200 MW (approximate) and two 400 MW (approximate) generating units with conventional dual-fuel fired steam boilers and steam turbine units. The plant site includes minimal vegetation. Adjacent land uses include port facilities and associated industrial activities, as well as light commercial and residential development.

e. General Environment Features On and In the Site Vicinity

1. Natural Environment

The majority of the site is comprised of facilities related to electric power generation for the existing Port Everglades Plant generating units. The site is located adjacent to the Intracoastal Waterway. The site provides warm water as required for manatees pursuant to the facility's Manatee Protection Plan.

2. Listed Species

No adverse impacts to federally or state-listed terrestrial plants and animals are expected in association with construction at the site, due to the existing developed nature of the site and lack of suitable onsite habitat for listed species. The warm water discharges from the plant attract manatees, an endangered species. FPL continues to work closely with state and federal wildlife agencies to ensure protection of the manatees during the modernization process and upon operation of the new plant. FPL plans to install a temporary heating system to provide warm water for manatees as required pursuant to the facility's Manatee Protection Plan. FPL also anticipates complying with other manatee-related conditions of certification to ensure the protection of the manatees during the modernization work and during future operations of PEEC.

3. Natural Resources of Regional Significance Status

The construction and operation of a natural gas-fired CC generating facility at this location is consistent with the existing use at the site and is not expected to have any adverse impacts on parks, recreation areas, or environmentally sensitive lands.

4. Other Significant Features

FPL is not aware of any other significant features of the site.

f. Design Features and Mitigation Options

The design option is to replace the existing units (Units 1 through 4) with one new 1,277 MW (Summer) unit consisting of three new CTs, three new heat recovery steam generators (HRSG), and a new steam turbine. The new CC unit is projected to be in service in mid-2016. Natural gas delivered via the existing pipeline is the primary fuel type for the unit with ultra-low sulfur light fuel oil serving as a backup fuel.

g. Local Government Future Land Use Designations

Local government future land use designation for the site is a combination of "Electrical Generating Facility" and "Utilities Use". A land use map of the site and adjacent areas is also found at the end of this chapter.

h. Site Selection Criteria Process

The Port Everglades Plant has been selected for site modernization due to consideration of various factors including system load, ability to provide generation in the Miami-Dade/Broward region to help balance load and generation in the region, and economics. Environmental issues were not a deciding factor since this site does not exhibit significant environmental sensitivity or other environmental issues. However, there are environmental benefits of replacing the existing steam units with a new CC unit including a significant reduction in system air emissions, improved aesthetics at the site, and continued warm water discharge for the manatees as required pursuant to the facility's Manatee Protection Plan. Further, modernizing this existing facility reduces the impact on natural resources by not requiring new land or new water resources.

i. Water Resources

Water from the Intracoastal Waterway via the Port of Port Everglades Slip No. 3 is currently used for once-through cooling water supply. The new plant will utilize portions of the existing once-through cooling water intake and discharge structures. Process and potable water for the modernized plant will come from the existing City of Ft. Lauderdale potable water supply.

j. Geological Features of Site and Adjacent Areas

FPL's Port Everglades Plant site is underlain by the surficial aquifer system. The surficial aquifer system in eastern Broward County is primarily composed of sand, sandstone, shell, silt, calcareous clay (marl), and limestone deposited during the

Pleistocene and Pliocene ages. The sediments forming the aquifer system are the Pamlico Sand, Miami Oolite, Anastasia Formation, Key Largo Formation, and Fort Thompson Formation (Pleistocene) and the Tamiami Formation (Pliocene). The sediments in the eastern portion of the county are appreciably more permeable than in the west.

The surficial aquifer is underlain by at least 600 feet of the Hawthorn formation (confining unit). The Floridan Aquifer System underlies the Hawthorn formation.

k. Projected Water Quantities for Various Uses

The estimated quantity of water required for processing is approximately 0.24 million gallons per day (mgd) for uses such as process water and service water. Approximately 600 mgd of cooling water would be cycled through the once-through cooling water system which is a reduction of more than 51% from the previous fossil steam unit's capability. Potable water demand is expected to average .001 mgd.

l. Water Supply Sources by Type

The modernized plant will continue to use the Intracoastal Waterway as the source of once-through cooling water. Process and potable water for the new plant will come from the existing City of Ft. Lauderdale potable water supply.

m. Water Conservation Strategies Under Consideration

No additional water resources will be required as a result of the modernization project. CC technology uses less water by design than traditional steam generation units.

n. Water Discharges and Pollution Control

The modernized plant will utilize portions of the existing once-through cooling water system for heat dissipation. The heat recovery steam generator blowdown will be reused to the maximum extent practicable or mixed with the cooling water flow before discharge. Reverse osmosis (R/O) reject will be mixed with the plant's once-through cooling water system prior to discharge. Stormwater runoff will be collected and routed to stormwater ponds. The facility will employ a Best Management Practices (BMP) plan and Spill Prevention, Control, and Countermeasure (SPCC) plan to prevent and control the inadvertent release of pollutants.

o. Fuel Delivery, Storage, Waste Disposal, and Pollution Control

Natural gas for the new unit would be transported to the site via an existing natural gas pipeline to the site. New gas compressors to raise the gas pressure of the pipeline to the appropriate level for the new unit will be installed either at the existing site or off-site. Ultra-low sulfur light fuel oil would be received by truck, pipeline, or barge and stored in a new above-ground storage tank.

p. Air Emissions and Control Systems

The regulated air emission rates at the new plant would be approximately 90 percent lower than the previous Port Everglades Plant's emission rates, resulting in significant annual emissions reductions and air quality benefits per unit of energy produced. The use of natural gas, ultra-low sulfur light fuel oil, and combustion controls would minimize air emissions from the unit and ensure compliance with applicable emission limiting standards. Using these fuels minimizes emissions of sulfur dioxide (SO_2), particulate matter, and other fuel-bound contaminates. Combustion controls similarly minimize the formation of nitrogen oxides (NO_x) and the combustor design will limit the formation of carbon monoxide and volatile organic compounds. When firing natural gas, NO_x emissions will be controlled using dry-low NO_x combustion technology and selective catalytic reduction (SCR). Water injection and SCR will be used to reduce NO_x emissions during operations when using ultra-low sulfur light fuel oil as backup fuel. CC facility emissions of GHGs from combustion of natural gas achieve an emission rate substantially lower than the EPA proposed new source performance standards for GHGs. These design alternatives are equivalent to the Best Available Control Technology for air emissions, and minimize such emissions while balancing economic, environmental, and energy impacts. Taken together, the design of PEEC would incorporate features that will make it among the most efficient and cleanest power plants in the State of Florida.

q. Noise Emissions and Control Systems

Noise expected to be caused by unit construction at the site is expected to be below current noise levels for the residents nearest the site.

r. Status of Applications

FPL filed a need determination with the FPSC on November 21, 2011. The FPSC's final need order was issued on April 9, 2012. The Site Certification Application (SCA) was submitted January 24, 2012 resulting in the issuance of Final Order PA 12-57 on

October 9, 2012. Concurrent with the SCA filing, FPL submitted applications for a Greenhouse Gas permit, a Prevention of Significant Deterioration permit and an Industrial Wastewater Facility permit revision. The revised Industrial Wastewater Facility permit was issued December 16, 2012.

Preferred Site # 5: Hendry County, Hendry County

FPL has acquired an approximately 3,120-acre site in southeast Hendry County, off CR 833. The Hendry County site has been listed as a Potential Site in previous FPL Site Plans as a possibility for a future PV facility and/or natural gas-fired CC generation. FPL currently views the Hendry site as one of the most likely sites to be used for large-scale generation additions at some future date after the last of the three modernization projects are completed in 2016.

a. Geological Survey (USGS) Map

A USGS map of the site is found at the end of this chapter.

b. Proposed Facilities Layout

A map of the property owned by FPL is found at the end of this chapter.

c. Map of Site and Adjacent Areas

An overview map of the site and adjacent areas is also found at the end of this chapter.

d. Existing Land Uses of Site and Adjacent Areas

The existing and future land uses on the site are zoned Utility. The existing land uses that are adjacent to the site are predominately agricultural. The property to the south is the Seminole Big Cypress Reservation.

e. General Environment Features On and In the Site Vicinity

1. Natural Environment

The natural environment adjacent to the north, east, and west of the site are used predominately for agricultural activities such as improved, unimproved, and woodland pasture. The majority of the pasture lands includes upland scrub, pine, and hardwoods. The Seminole Big Cypress Reservation lies to the south.

2. **Listed Species**

FPL strives to have no adverse impacts on federal- or state-listed terrestrial plants and animals. Much of southwest Florida is considered habitat for the endangered Florida Panther. Although few or no impacts are expected in association with future construction at the site, FPL anticipates minimizing or mitigating for unavoidable wildlife or wetland impacts.

3. **Natural Resources of Regional Significance Status**

Future construction and operation of a solar and/or a natural gas-fired CC generating facility at this location is not expected to have any adverse impacts on parks, recreation areas, or environmentally sensitive lands.

4. **Other Significant Features**

FPL is not aware of any other significant features of the site.

f. **Design Features and Mitigation Options**

Options include construction of CC and/or solar power generation technologies. Mitigation for unavoidable impacts may occur through a combination of on- and off-site mitigation.

g. **Local Government Future Land Use Designations**

Local government future land use designation for the site is Utility. A land use map of the site and adjacent areas is also found at the end of this chapter.

h. **Site Selection Criteria Process**

The Hendry County site has been selected as "Preferred" due to consideration of various factors including system load, transmission interconnection, and economics.

i. **Water Resources**

Groundwater is anticipated to supply water to the Hendry County site.

j. **Geological Features of Site and Adjacent Areas**

The site is at an approximate elevation of 10 to 12 feet above mean sea level (msl) and is located on the Immokalee Rise and the Big Cypress Spur considered terraces created by high sea level events. The terraces are composed of fine quartz sands that lie discontinuously upon the surficial aquifer system whose sediments are the Fort Thompson (Pleistocene), Caloosahatchee Marl (Pleistocene and Pliocene), and

Tamiami Formations (Pliocene). Other soil types in the area include limestone rock, calcareous muds, sands, organic materials, and mixed solids.

The surficial aquifer is underlain by the Hawthorn formation (confining unit). The Floridan Aquifer System underlies the Hawthorn formation.

k. Projected Water Quantities for Various Uses

The estimated quantity of water required for processing at a CC unit is approximately 0.24 million gallons per day (mgd) for uses such as process water and service water. Potable water demand is expected to average .001 mgd. Minimal amounts of water would be required for a PV facility. Approximately 7.5 mgd of cooling water would be used in cooling towers for one CC unit.

l. Water Supply Sources by Type

Potential water supply source is groundwater. Additional evaluations are necessary to determine the exact source.

m. Water Conservation Strategies Under Consideration

CC and cooling tower technologies withdraw less water by design than traditional steam generation units. Some solar technologies do not require water for process or cooling purposes. Specific water conservation strategies will be evaluated and selected during the detailed design phase of any development project.

n. Water Discharges and Pollution Control

A CC unit at the site will utilize a closed cycle cooling (towers) system for heat dissipation. The heat recovery steam generator blowdown will be reused to the maximum extent practicable or mixed with the cooling water flow before discharge. Reverse osmosis (R/O) reject will be mixed with the plant's cooling water flow prior to discharge. Wastewater disposal is anticipated via discharge to an Underground Injection Control well system. Stormwater runoff would be collected and routed to stormwater ponds. The facility will employ a Best Management Practices (BMP) plan and Spill Prevention, Control, and Countermeasure (SPCC) plan to prevent and control the inadvertent release of pollutants.

o. Fuel Delivery, Storage, Waste Disposal, and Pollution Control

Natural gas for a new CC unit will be transported to the site via a new natural gas pipeline lateral to the site. New gas compressors to raise the gas pressure of the pipeline to the appropriate level for the new unit may be necessary Ultra-low sulfur light fuel oil will be received by truck or pipeline and stored in an above-ground storage tank.

p. Air Emissions and Control Systems

The use of natural gas, ultra-low sulfur light fuel oil, and combustion controls would minimize regulated air emissions from a CC unit and ensure compliance with applicable emission limiting standards. Using these clean fuels minimizes emissions of SO_2, PM, and other fuel-bound contaminates. Combustion controls similarly minimize the formation of NO_x and the combustor design will limit the formation of CO and VOCs. When firing natural gas, NO_x emissions will be controlled using dry-low NO_x combustion technology and selective catalytic reduction (SCR). Water injection and SCR will be used to reduce NO_x emissions during operations when using ultra low sulfur fuel oil as backup fuel. CC facility emissions of GHGs from combustion of natural gas achieve an emission rate substantially lower than the EPA proposed new source performance standards for GHGs. These design alternatives are equivalent to the Best Available Control Technology for air emissions, and minimize such emissions while balancing economic, environmental, and energy impacts. Taken together, the design of a CC unit would incorporate features that will make it among the most efficient and cleanest power plants in the State of Florida. PV generation does not produce air emissions.

q. Noise Emissions and Control Systems

Noise anticipated to be caused by unit construction at the site is expected to be minimal.

r. Status of Applications

FPL has not submitted any application associated with the Hendry County site.

Preferred Site # 6: NE Okeechobee County, Okeechobee County

FPL has purchased a site of approximately 2,800 acres in Northeast Okeechobee County. The site is in an unincorporated, rural area and is predominantly used for agricultural production. FPL's transmission lines intersect the property. The Northeast Okeechobee County site has been listed as a Potential Site in previous FPL Site Plans as a possibility for a future PV facility or natural gas-fired CC generation. FPL currently views the Okeechobee site as one of the most likely sites to be used for large-scale generation additions at some future date after the last of the three modernization projects are completed in 2016.

a) **U.S. Geological Survey (USGS) Map**

A USGS map of the Northeast Okeechobee site is found at the end of this chapter.

b) **Proposed Facilities Layout**

A map of the property owned by FPL is found at the end of this chapter.

c) **Map of Site and Adjacent Areas**

An overview map of the site and adjacent areas is also found at the end of this chapter.

d) **Existing Land Uses of Site and Adjacent Areas**

The Northeast Okeechobee County site is predominantly used for agricultural production (cattle and citrus). Adjacent land uses include primarily agriculture and conservation.

e) **General Environment Features On and In the Site Vicinity**

1. **Natural Environment**

The majority of the site is comprised of lands dedicated to agricultural production.

2. **Listed Species**

Minimal impacts to federal- or state-listed terrestrial plants and animals are expected in association with construction at the site, due to the existing developed nature of the site and lack of suitable onsite habitat for listed species.

3. **Natural Resources of Regional Significance Status**

The construction and operation of a power generating facility at this location is not expected to have any adverse impacts on parks, recreation areas, or environmentally sensitive lands.

4. **Other Significant Features**

FPL is not aware of any other significant features of the site.

f) **Design Features and Mitigation Options**

Options include construction of PV or CC technologies. Mitigation for unavoidable impacts may occur through a combination of on- and off-site mitigation.

g) **Local Government Future Land Use Designations**

Local government future land use designation for the site is predominantly unimproved pasture. A land use map of the site and adjacent areas is also found at the end of this chapter.

h) **Site Selection Criteria Process**

The Northeast Okeechobee County site has been selected as a Preferred Site due to consideration of various factors including system load, transmission interconnection, and economics. Environmental issues were not a deciding factor since this site does not exhibit significant environmental sensitivity.

i) **Water Resources**

Groundwater and/or surface water resources are anticipated to supply water to the Northeast Okeechobee County site.

j) **Geological Features of Site and Adjacent Areas**

The hydrostratigraphy of the Northeast Okeechobee County site is similar to that of most of South Florida. In general, the groundwater system underlying Okeechobee County consists of the Surficial Aquifer System (SAS), the Intermediate Confining Unit (ICU), and the Floridan Aquifer System (FAS). The SAS consists of approximately 100 to 250 feet of undifferentiated deposits of sand, shell, clay and silt. The ICU consists of approximately 200 feet of carbonate rocks interbedded with sandy and silty clay. The multiple layers of the FAS extend thousands of feet below the ICU.

k) **Projected Water Quantities for Various Uses**

Potable water demand is expected to average .001 mgd. The estimated quantity of water required for processing at a CC unit is approximately 0.24 million gallons per day (mgd) for uses such as process water and service water. Approximately 7.5 mgd of cooling water would be used in cooling towers for a CC unit. Minimal amounts of water would be required for a PV facility.

l) Water Supply Sources by Type

Potential water supply sources are groundwater and surface water. Additional evaluations are necessary to determine which source(s) may be used.

m) Water Conservation Strategies Under Consideration

CC technology withdraws less water by design than traditional steam generation units. PV facilities have minimal water demands. Specific water conservation strategies will be evaluated and selected during the detailed design phase of any development project.

n) Water Discharges and Pollution Control

A CC plant is anticipated to utilize a closed cycle cooling (towers) system for heat dissipation. The heat recovery steam generator blowdown will be reused to the maximum extent practicable or mixed with the cooling water flow before discharge. Reverse osmosis (R/O) reject will be mixed with the plant's cooling water flow prior to discharge. Wastewater disposal is anticipated via discharge to an Underground Injection Control well system. Stormwater runoff would be collected and routed to stormwater ponds. The facility will employ Best Management Practices (BMP) and Spill Prevention, Control, and Countermeasure (SPCC) plans to prevent and control the inadvertent release of pollutants.

o) Fuel Delivery, Storage, Waste Disposal, and Pollution Control

Natural gas for a new CC unit will be transported to the site via a new natural gas pipeline lateral. New gas compressors to raise the gas pressure of the pipeline to the appropriate level for the new unit may be necessary. Back-up fuel supplies of ultra-low sulfur light fuel oil will be received by truck or pipeline and stored in an above-ground storage tank to ensure reliability of operations.

p) Air Emissions and Control Systems

The use of natural gas, ultra-low sulfur light fuel oil, and combustion controls would minimize regulated air emissions from a CC unit and ensure compliance with applicable emission limiting standards. Using these clean fuels minimizes emissions of SO_2, PM, and other fuel-bound contaminates. Combustion controls similarly minimize the formation of NO_x and the combustor design will limit the formation of CO and VOCs. When firing natural gas, NO_x emissions will be controlled using dry-low NO_x combustion technology and selective catalytic reduction (SCR). Water injection and SCR will be used to reduce NO_x emissions during operations when using ultra- low sulfur light fuel oil as backup fuel. CC facility emissions of GHGs from combustion of natural gas achieve an emission rate substantially lower than the EPA proposed new source performance standards for GHGs. These design alternatives are equivalent to the Best Available Control Technology for air emissions, and minimize such emissions while balancing economic, environmental, and energy impacts. Taken together, the design of a CC unit would incorporate features that will make it among the most efficient and cleanest power plants in the State of Florida. PV generation does not produce air emissions.

q) Noise Emissions and Control Systems

Noise anticipated to be caused by unit construction at the site is expected to be minimal.

r) Status of Applications

FPL has not filed any applications associated with the Northeast Okeechobee County site.

Preferred Site # 7: Palatka Site, Putnam County

FPL is currently evaluating the former FPL Palatka Plant site, which was dismantled in the 1990s, for future natural gas-fired generation. This 170 acre site is located on the west side of Highway 100 opposite the FPL Putnam Plant in East Palatka. The Palatka site has been listed as a Potential Site in previous FPL Site Plans as a possibility for future natural gas-fired CC generation. FPL currently views the Palatka site as one of the most likely sites to be used for large-scale generation additions at some future date after the last of the three modernization projects are completed in 2016.

a) U.S. Geological Survey (USGS) Map

A USGS map of the Palatka site is found at the end of this chapter.

b) Proposed Facilities Layout

A map of the property owned by FPL is found at the end of this chapter.

c) Map of Site and Adjacent Areas

An overview map of the site and adjacent areas is also found at the end of this chapter.

d) Existing Land Uses of Site and Adjacent Areas

The Palatka site is designated as Industrial land use. Adjacent land uses include power generation and associated facilities (the existing FPL Putnam Plant) as well as Mixed Wetland Hardwoods, Residential and Hardwood-Coniferous Mixed.

e) General Environment Features On and In the Site Vicinity

1. Natural Environment

The majority of site has been previously impacted by past power plant operations. No significant environmental features have been identified at this time.

2. Listed Species

Minimal impacts to federal- or state-listed terrestrial plants and animals are expected in association with construction at the site, due to the existing developed nature of the site and lack of suitable onsite habitat for listed species.

3. Natural Resources of Regional Significance Status

The construction and operation of a power generating facility at this location is not expected to have any adverse impacts on parks, recreation areas, or environmentally sensitive lands.

4. Other Significant Features

FPL is not aware of any other significant features of the site.

f) Design Features and Mitigation Options

Options include construction of CC technologies. Mitigation for unavoidable impacts may occur through a combination of on- and off-site mitigation.

g) Local Government Future Land Use Designations

Local government future land use designation for the site is Industrial. A land use map of the site and adjacent areas is also found at the end of this chapter.

h) Site Selection Criteria Process

The Palatka site has been selected as a Preferred Site due to consideration of various factors including system load, transmission interconnection, and economics.

i) Water Resources

The St John's River, ground water, and/or regional water supply initiatives are potential water sources.

j) Geological Features of Site and Adjacent Areas

The hydrostratigraphy of the Palatka site is similar to that of most of North Florida. In general, the groundwater system underlying Palatka consists of the Surficial Aquifer System (SAS), and the Floridan Aquifer System (FAS).

k) Projected Water Quantities for Various Uses

Potable water demand is expected to average .001 mgd. The estimated quantity of water required at a CC unit is approximately 0.24 million gallons per day (mgd) for uses such as process water and service water. Approximately 7.5 mgd of cooling water would be used in cooling towers for a CC unit.

l) Water Supply Sources by Type

Potential water supply sources are surface and ground water. Additional evaluations are necessary to determine which source(s) may be used.

m) Water Conservation Strategies Under Consideration

CC and cooling tower technologies withdraw less water by design than traditional steam generation units. Specific water conservation strategies will be evaluated and selected during the detailed design phase of the project development.

n) Water Discharges and Pollution Control

A CC plant is anticipated to utilize a closed cycle cooling (towers) system for heat dissipation. The heat recovery steam generator blowdown will be reused to the maximum extent practicable or mixed with the cooling water flow before discharge. Reverse osmosis (R/O) reject will be mixed with the plant's cooling water flow prior to discharge. Wastewater disposal is anticipated via discharge to surface and/or ground water as with the existing Putnam Plant. Stormwater runoff would be collected and routed to stormwater ponds. The facility will employ Best Management Practices (BMP) and Spill Prevention, Control, and Countermeasure (SPCC) plans to prevent and control the inadvertent release of pollutants.

o) Fuel Delivery, Storage, Waste Disposal, and Pollution Control

Natural gas for a new CC unit will be transported to the site via a new natural gas pipeline lateral. New gas compressors to raise the gas pressure of the pipeline to the appropriate level for the new unit may be necessary. Back-up fuel supplies of ultra-low sulfur light fuel oil will be received by water-borne delivery, truck or pipeline and stored in an above-ground storage tank to ensure reliability of operations.

p) Air Emissions and Control Systems

The use of natural gas, ultra-low sulfur light fuel oil, and combustion controls would minimize regulated air emissions from a CC unit and ensure compliance with applicable emission limiting standards. Using these clean fuels minimizes emissions of SO_2, PM, and other fuel-bound contaminates. Combustion controls similarly minimize the formation of NO_x and the combustor design will limit the formation of CO and VOCs. When firing natural gas, NO_x emissions will be controlled using dry-low NO_x combustion technology and selective catalytic reduction (SCR). Water injection and SCR will be used to reduce NO_x emissions during operations when using ultra- low sulfur light fuel oil as backup fuel. CC facility emissions of GHGs from combustion of natural gas achieve an emission rate substantially lower than the EPA proposed new source performance standards for GHGs. These design alternatives are equivalent to the Best Available Control Technology for air emissions, and minimize such emissions while balancing economic, environmental, and energy impacts. Taken together, the design of a CC unit would incorporate features that will make it among the most efficient and cleanest power plants in the State of Florida.

q) Noise Emissions and Control Systems

Noise anticipated to be caused by unit construction at the site is expected to be minimal.

r) Status of Applications

FPL has not submitted any applications associated with the Palatka site.

IV.F.2 Potential Sites for Generating Options

Five (5) sites are currently identified as Potential Sites for future generation additions to meet FPL's projected capacity and energy needs.[8] These sites have been identified as Potential Sites due to considerations of location to FPL load centers, space, infrastructure, and/or accessibility to fuel and transmission facilities. These sites are suitable for different capacity levels and technologies, including both renewable energy and non-renewable energy technologies for various sites.

Each of these Potential Sites offer a range of considerations relative to engineering and/or costs associated with the construction and operation of feasible technologies. In addition, each Potential Site has different characteristics that will require further definition and attention. Solely for the purpose of estimating water requirements for sites more suited for non-renewable energy technologies, it was assumed that either one dual-fuel (natural gas and light oil) simple cycle CT, or a natural gas-fired CC unit, would be constructed at these Potential Sites unless otherwise noted.

A simple cycle CT would require approximately 50 gallons per minute (gpm) for both process and cooling water (assuming a cooling tower was utilized). A CC unit would require approximately up to 150 gpm for process water and up to 7.5 million gallons per day (mgd) per unit for cooling water (assuming a cooling tower is utilized). If an existing power plant site is ultimately selected for modernization (as is the case with FPL's CCEC, RBEC, and PEEC sites), the water requirements discussed above for a CC unit would be approximately correct for the modernized site. If a renewable energy generating technology is ultimately selected for one of these sites, the water requirements would be significantly less than those for simple cycle CT or CC facilities.

Permits are presently considered to be obtainable for each of these sites. No significant environmental constraints are currently known for any of these sites. The Potential Sites briefly discussed below are presented in alphabetical order. At this time, FPL considers each site to be equally viable.

[8] As has been described in previous FPL Site Plans, FPL also considers a number of other sites as possible sites for future generation additions. These include the remainder of FPL's existing generation sites and other Greenfield sites. Greenfield sites that FPL currently does not own, or for which FPL has not currently secured the necessary rights to, are not specifically identified as Potential Sites in order to protect the economic interests of FPL and its customers.

Potential Site # 1: Babcock Ranch, Charlotte County

This site is located within the proposed Babcock Ranch Community on the north side of Tuckers Grade, approximately 10.5 miles north of the intersection of SR-80 and SR-31 and 1.1 miles east of SR-31. The project is bordered on the north by the Babcock Ranch Preserve owned by the State of Florida. This site is a possibility for an FPL PV facility. FPL has received all permits necessary to construct a 74 MW PV facility at this location.

a. U.S. Geological Survey (USGS) Map

A map of this site is found at the end of this chapter.

b. Land Uses

Existing land use on the site is the Babcock Ranch Overlay District, and it is zoned as the Babcock Ranch Overlay Zoning District. This land use and zoning allows for solar facilities.

c. Environmental Features

FPL anticipates mitigating for unavoidable wildlife and/or wetland impacts as needed as a result of a PV project constructed at this site.

d. Water Quantities

Minimal amounts of water, if any, would be required for a PV facility.

e. Supply Sources

Minimal water would be required for a PV facility. A small amount may be needed to occasionally clean the solar panels in the absence of sufficient rainfall. Any such water may be brought to the site by truck.

Potential Site # 2: DeSoto Solar Expansion, DeSoto County

The DeSoto site is located at 4051 Northeast Karson Street which is approximately 0.3 miles east of U.S. Highway 17 and immediately north of Bobay Road in Arcadia, Florida. The site is located in Sections 26, 27, & 35, Township 36 South, and Range 25 East. FPL owns an approximate 13,000 acre parcel in DeSoto County. FPL has designated approximately 5,177 acres for development of a PV facility.

The DeSoto site is home to a 25 MW PV facility that has been operational since 2009. Up to an additional 275 MW of PV generation could be constructed in phases on the remaining undeveloped land. FPL has initiated permitting for the additional PV facilities.

a. **U.S. Geological Survey (USGS) Map**

A map of this site is found at the end of this chapter.

b. **Land Uses**

Existing land use on the site is agricultural. The future land use is Electric Generating Facility.

c. **Environmental Features**

There are no significant environmental features on the site.

d. **Water Quantities**

Minimal amounts of water would be required for a future expansion of the existing PV facility.

e. **Supply Sources**

Minimal water would be required for an expanded PV facility. A small amount may be needed to occasionally clean the PV panels in the absence of sufficient rainfall. Potable water will be required in the administration building and maintenance building. FPL would propose to utilize existing wells onsite to accommodate water needs.

Potential Site # 3: Manatee Plant Site, Manatee County

The existing FPL Manatee Plant 9,500-acre site is located in unincorporated north-central Manatee County. The existing power generating facilities are located in all or portions of Sections 18 and 19 of Township 33S, Range 20-E. The plant site lies approximately 5 miles east of Parrish, Florida. It is approximately 5 miles east of U.S. Highway 301 and 9.5 miles east of Interstate Highway 75 (I-75). The existing plant is approximately 2.5 miles south of the Hillsborough-Manatee County line; a portion of the north property boundary of the plant site abuts the county line. State Road 62 (SR 62) is about 0.7 mile south of the plant, with the plant entrance road going north from that highway. This site is a possible location for an FPL PV facility. FPL has received the federal and state permits required to construct approximately 50 MW of PV at this location.

a. **U.S. Geological Survey (USGS) Map**

A map of the site is found at the end of this chapter.

b. **Land Uses**

Existing land use on the site is agricultural. The property is zoned Planned Development / Public Interest (PD-PI), which will allow for electrical generation.

c. **Environmental Features**

FPL anticipates mitigating for unavoidable wildlife and/or wetland impacts as needed as a result of a PV project constructed at this site.

d. **Water Quantities**

Minimal amounts of water would be required for a PV facility.

e. **Supply Sources**

Minimal water would be required for a PV facility. A small amount may be needed to occasionally clean the PV panels in the absence of sufficient rainfall. Panel cleaning water source may be existing potable water or water tank trucked to the site.

Potential Site # 4: Martin County, Martin County

FPL is currently evaluating potential sites in Martin County for a future PV facility. No specific locations have been selected at this time.

a. **U.S. Geological Survey (USGS) Map**

A USGS map of the county has been included at the end of this chapter.

b. **Land Uses**

This information is not available because a specific site has not been selected at this time.

c. **Environmental Features**

This information is not available because a specific site has not been selected at this time.

d. **Water Quantities**

Minimal amounts of water would be required for a PV facility.

e. **Supply Sources**

Minimal water would be required for a PV facility. A small amount may be needed to occasionally clean the PV panels in the absence of sufficient rainfall.

Potential Site # 5: Putnam County

FPL is currently evaluating potential sites in Putnam County for a future PV facility or natural gas power generation. Sites currently under investigation are approximately 2,800 acres. No specific locations have been selected at this time.

a. **U.S. Geological Survey (USGS) Map**

A USGS map of the county has been included at the end of this chapter.

b. **Land Uses**

This information is not available because a specific site has not been selected at this time.

c. **Environmental Features**

This information is not available because a specific site has not been selected at this time.

d. **Water Quantities**

Minimal amounts of water would be required for a PV facility. Natural gas power generation would require approximately up to 150 gallons per minute (gpm) for process water and up to 7.5 million gallons per day (mgd) per unit for cooling water (assuming a cooling tower is utilized).

e. **Supply Sources**

The St John's River, existing groundwater, and/or regional water supply initiatives are potential water sources.

CHAPTER V

Other Planning Assumptions & Information

(This page is left intentionally blank.)

Introduction

The Florida Public Service Commission (FPSC), in Docket No. 960111-EU, specified certain information that was to be included in an electric utility's Ten Year Power Plant Site Plan filing. Among this specified information was a group of 12 items listed under a heading entitled "Other Planning Assumptions and Information." These 12 items basically concern specific aspects of a utility's resource planning work. The FPSC requested a discussion or a description of each of these items.

These 12 items are addressed individually below as separate "Discussion Items".

Discussion Item # 1: Describe how any transmission constraints were modeled and explain the impacts on the plan. Discuss any plans for alleviating any transmission constraints.

FPL's resource planning work considers two types of transmission limitations/constraints: external limitations and internal limitations. External limitations deal with FPL's ties to its neighboring systems. Internal limitations deal with the flow of electricity within the FPL system.

The external limitations are important since they affect the development of assumptions for the amount of external assistance that is available to the FPL system as well as the amount and price of economy energy purchases. Therefore, these external limitations are incorporated both in the reliability analysis and economic analysis aspects of resource planning. The amount of external assistance which is assumed to be available is based on the projected transfer capability to FPL from outside its system as well as historical levels of available assistance. In the loss of load probability (LOLP) portion of its reliability analyses, FPL models this amount of external assistance as an additional generator within FPL's system which provides capacity in all but the peak load months. The assumed amount and price of economy energy are based on historical values and projections from production costing models.

Internal transmission limitations are addressed by identifying potential geographic locations for potential new generating units that minimize adverse impacts to the flow of electricity within FPL's system. The internal transmission limitations are also addressed by developing the direct costs for siting new units at different locations, by evaluating the cost impacts created by the new unit/unit location combination on the operation of existing units in the FPL system, and/or by evaluating the costs of transmission additions that may be needed to address regional concerns regarding an imbalance between load and generation in a given region. Both of these site- and system-related transmission costs are developed for each different unit/unit location option or groups of options. In addition, transfer limits for capacity and energy that can be imported into the Southeastern Florida region (Miami-Dade and Broward Counties) of FPL's system are also developed for use in FPL's production costing analyses. (A further discussion of the Southeastern Florida region of FPL's system, and the need to maintain a regional balance between generation and transmission contributions to meet regional load, is found in Chapter III.)

FPL's annual transmission planning work determines transmission additions needed to address limitations and to maintain/enhance system reliability. FPL's planned transmission facilities to interconnect and integrate generating units in FPL's resource plans, including those transmission facilities that must be certified under the Transmission Line Siting Act, are presented in Chapter III.

Discussion Item # 2: Discuss the extent to which the overall economics of the plan were analyzed. Discuss how the plan is determined to be cost-effective. Discuss any changes in the generation expansion plan as a result of sensitivity tests to the base case load forecast.

FPL typically performs economic analyses of competing resource plans using as an economic criterion FPL's levelized system average electric rates (i.e., a Rate Impact Measure or RIM approach). In addition, for analyses in which DSM levels are not changed, FPL uses the equivalent criterion of the cumulative present value of revenue requirements for the FPL system.[9]

The load forecast that is presented in FPL's 2013 Site Plan was developed in February 2013. The only load forecast sensitivities analyzed during 2012/early 2013 were high load forecast sensitivities developed solely to analyze the quality of FPL's future reserves and the projected frequency at which load control might be implemented. These analyses are on-going.

[9] FPL's basic approach in its resource planning work is to base decisions on a lowest electric rate basis. However, when DSM levels are considered a "given" in the analysis (i.e., when only new generating options are considered), the lowest electric rate basis approach and the lowest system cumulative present value of revenue requirements basis approach, yield identical results in terms of which resource options are more economic. In such cases FPL evaluates resource options on the simpler-to-calculate (but equivalent) lowest cumulative present value system revenue requirements basis.

Discussion Item # 3: Explain and discuss the assumptions used to derive the base case fuel forecast. Explain the extent to which the utility tested the sensitivity of the base case plan to high and low fuel price scenarios. If high and low fuel price sensitivities were performed, explain the changes made to the base case fuel price forecast to generate the sensitivities. If high and low fuel price scenarios were performed as part of the planning process, discuss the resulting changes, if any, in the generation expansion plan under the high and low fuel price scenario. If high and low fuel price sensitivities were not evaluated, describe how the base case plan is tested for sensitivity to varying fuel prices.

The basic assumptions FPL used in deriving its fuel price forecasts are discussed in Chapter III of this document. FPL used three fuel cost, and three environmental compliance cost, forecasts in analyses supporting its 2012 nuclear cost recovery filing.

The high and low fuel cost forecasts are derived from a calculation of the historical volatility of the 12-month forward price for one year ahead. From this range of volatility, a reasonable value from the high end of the range is applied to the medium fuel cost forecast to develop a high fuel cost forecast. Similarly, a reasonable value from the low end of the range is applied to the medium fuel cost forecast to develop a low fuel cost forecast.

The resource plan presented in this Site Plan is based, in part, on those prior analyses. For that reason, this resource plan has not been further tested for different fuel cost forecasts.

Discussion Item # 4: Describe how the sensitivity of the plan was tested with respect to holding the differential between oil/gas and coal constant over the planning horizon.

As described above in the answer to Discussion Item # 3, FPL used up to three fuel cost forecasts in its 2012/early 2013 resource planning analyses. While these forecasts did not represent a constant cost differential between oil/gas and coal, a variety of fuel cost differentials were represented in these forecasts.

Discussion Item # 5: Describe how generating unit performance was modeled in the planning process.

The performance of existing generating units on FPL's system was modeled using current projections for scheduled outages, unplanned outages, capacity output ratings, and heat rate information. Schedule 1 in Chapter I and Schedule 8 in Chapter III present the current and projected capacity output ratings of FPL's existing units. The values used for outages and heat rates are generally consistent with the values FPL has used in planning studies in recent years.

In regard to new unit performance, FPL utilized current projections for the capital costs, fixed and variable operating & maintenance costs, capital replacement costs, construction schedules, heat rates, and capacity ratings for all construction options in its resource planning work. A summary of this information for the new capacity options FPL currently projects to add over the reporting horizon for this document is presented on the Schedule 9 forms in Chapter III.

Discussion Item # 6: Describe and discuss the financial assumptions used in the planning process. Discuss how the sensitivity of the plan was tested with respect to varying financial assumptions.

During much of its 2012 resource planning work, FPL's financial assumptions were: i) a capital structure of 40.88% debt and 59.12% equity; (ii) a 5.50% cost of debt; (iii) a 10.0% return on equity; and (iv) an after-tax discount rate of 7.29%. Starting in late 2012, and continuing in 2013, FPL's financial assumptions have been based on the outcome of FPL's most recent base rate case and include: i) a capital structure of 40.38% debt and 59.62% equity; (ii) a 4.79% cost of debt; (iii) a 10.5% return on equity; and (iv) an after-tax discount rate of 7.45%. No sensitivities of these financial assumptions were used in FPL's 2012/early 2013 resource planning work.

Discussion Item # 7: Describe in detail the electric utility's Integrated Resource Planning process. Discuss whether the optimization was based on revenue requirements, rates, or total resource cost.

FPL's integrated resource planning (IRP) process is described in detail in Chapter III of this document.

The standard basis for comparing the economics of competing resource plans in FPL's basic IRP process is the impact of the plans on FPL's electricity rate levels with the objective generally being to minimize FPL's projected levelized system average electric rate (i.e., a Rate Impact Measure or RIM approach). As discussed in response to Discussion Item # 2, both the electricity rate perspective and the cumulative present value of system revenue requirement perspective are identical yield identical results in terms of which resource options are more economic when DSM levels are unchanged between competing resource plans. Therefore, in planning work in which DSM levels were unchanged, the equivalent, but simpler-to-calculate, cumulative present value of revenue requirements perspective was utilized.

Discussion Item # 8: Define and discuss the electric utility's generation and transmission reliability criteria.

FPL uses two system reliability criteria in its resource planning work that addresses generation, purchase, and DSM options. One of these is a minimum 20% Summer and Winter reserve margin. The other reliability criterion is a maximum of 0.1 days per year loss-of-load-probability (LOLP). These two reliability criteria are discussed in Chapter III of this document.

In regard to transmission reliability analysis work, FPL has adopted transmission planning criteria that are consistent with the planning criteria established by the Florida Reliability Coordinating Council (FRCC). The FRCC has adopted transmission planning criteria that are consistent with the Reliability Standards established by the North American Electric Reliability Council (NERC). The *NERC Reliability Standards* are available on the internet site (http://www.nerc.com/).

In addition, FPL has developed a *Facility Connection Requirements* (FCR) document as well as a *Facility Rating Methodology* document that are also available on the internet under the FPL OATT Documents directory at https://www.oatioasis.com/FPL/index.html.

Generally, FPL limits its transmission facilities to 100% of the applicable thermal rating. The normal and contingency voltage criteria for FPL stations are provided below:

	Normal/Contingency	
Voltage Level (kV)	**Vmin (p.u.)**	**Vmax (p.u.)**
69, 115, 138	0.95/0.95	1.05/1.07
230	0.95/0.95	1.06/1.07
500	0.95/0.95	1.07/1.09
Turkey Point (*)	1.01/1.01	1.06/1.06
St. Lucie (*)	1.00/1.00	1.06/1.06

(*) Voltage range criteria for FPL's Nuclear Power Plants

There may be isolated cases for which FPL may have determined that it is acceptable to deviate from the general criteria stated above. There are several factors that could influence these criteria, such as the overall number of potential customers that may be impacted, the probability of an outage actually occurring, or transmission system performance, as well as others.

Discussion Item # 9: Discuss how the electric utility verifies the durability of energy savings for its DSM programs.

The projected impacts of FPL's DSM programs on demand and energy consumption are revised periodically. Engineering models, calibrated with current field-metered data, are updated at regular intervals. Participation trends are tracked for all of FPL's DSM programs in order to adjust impacts each year for changes in the mix of efficiency measures being installed by program participants. For its load management programs, FPL conducts periodic tests of the load control equipment to ensure that the equipment is functioning correctly. These tests, plus actual, non-test load management events, also allows FPL to gauge the MW reduction capabilities of its load management programs on an on-going basis.

Discussion Item # 10: Discuss how strategic concerns are incorporated in the planning process.

The Executive Summary and Chapter III provide a discussion of a variety of system concerns/issues that influence FPL's resource planning process. Please see those chapters for a discussion of those concerns/issues.

In addition to these system concerns/issues, there are other strategic factors FPL typically considers when choosing between resource options. These include the following: (1) technology risk; (2) environmental risk, and (3) site feasibility. The consideration of these factors may include both economic and non-economic aspects.

Technology risk is an assessment of the relative maturity of competing technologies. For example, a prototype technology, which has not achieved general commercial acceptance, has a higher risk than a technology in wide use and, therefore, assuming all else equal, is less desirable.

Environmental risk is an assessment of the relative environmental acceptability of different generating technologies and their associated environmental impacts on the FPL system, including environmental compliance costs. Technologies regarded as more acceptable from an environmental perspective for FPL's resource plan are those which minimize environmental impacts for the FPL system as a whole through highly efficient fuel use, state of the art environmental controls, generating technologies that do not utilize fossil fuels (such as nuclear and photovoltaics), etc.

Site feasibility assesses a wide range of economic, regulatory, and environmental factors related to successfully developing and operating the specified technology at the site in question. Projects that are more acceptable have sites with few barriers to successful development.

All of these factors play a part in FPL's planning and decision-making, including its decisions to construct capacity or to purchase power.

Discussion Item # 11: Describe the procurement process the electric utility intends to utilize to acquire the additional supply-side resources identified in the electric utility's ten-year site plan.

As shown in this 2013 Site Plan, FPL's resource plan currently projects the following major supply-side resource additions: the completion of the nuclear uprates project, the modernizations at Cape Canaveral, Riviera, and Port Everglades, the upgrading of CTs in numerous CCs throughout FPL's system, the EcoGen PPA, and Turkey Point Unit 6.

In regard to these capacity additions for which a need determination has already been approved, the nuclear uprates and Turkey Point Unit 6, do not lend themselves to a request for proposal (RFP) approach involving bids from third parties who would build new nuclear generation capacity. In addition, nuclear capacity additions are exempted from the Commission's Bid Rule by section 403.519 (4) (c). For these nuclear projects, FPL's procurement activities are conducted to ensure the best combination of quality and cost for the delivered products. Furthermore, the modernization projects at Cape Canaveral, Riviera, and Port Everglades received Commission waivers from the Bid Rule due to attributes specific to modernization projects (such as use of existing land, water, transmission, etc.) plus other economic benefits to FPL's customers. These waivers from the Bid Rule were granted in Order No. PSC-08-0591-FOF-EI for Cape Canaveral and Riviera and in Order No. PSC-11-0360-PAA-EI for Port Everglades.

CT upgrades are currently taking place at various CC units throughout the FPL system. FPL was approached by the original equipment manufacturer (OEM) of the CTs regarding the possibility of upgrading these units. Following negotiations with the OEM, and economic analyses that showed that upgrading was cost-effective for FPL's customers, the decision was made to proceed with the CT upgrades. That process is underway and is scheduled to be completed in 2015.

The EcoGen PPA was the result of negotiations between EcoGen and FPL.

Identification of self-build options, beyond those units already approved by the FPSC and Governor and Siting Board or units for which FPL may be then seeking approval, in future FPL Site Plans will not be an indication that FPL has pre-judged any capacity solicitation it may conduct. The identification of future generating units is required of FPL in its Site Plan filings and represents those alternatives that appear to be FPL's best, most cost-effective self-build options at the time. FPL reserves the right to refine its planning analyses and to identify other self-build options. Such refined analyses have the potential to yield a variety of self-build options, some of which might not require an RFP. If an RFP is issued for Supply options, FPL reserves the right to choose the best alternative for its customers, even if that option is not an FPL self-build option.

Discussion Item # 12: Provide the transmission construction and upgrade plans for electric utility system lines that must be certified under the Transmission Line Siting Act (403.52 – 403.536, F. S.) during the planning horizon. Also, provide the rationale for any new or upgraded line.

---

(1) FPL has identified the need for a new 230 kV transmission line that required certification under the Transmission Line Siting Act which was issued in April 2006. The new line is to be completed in two phases connecting FPL's St. Johns Substation to FPL's Pringle Substation (shown on Table III.E.1 in Chapter III). Phase 1 was completed in May 2009 and consisted of a new line connecting Pringle to a new Pellicer Substation. Phase 2 is planned to connect St. Johns to Pellicer and is scheduled to be completed by December 2017. The construction of this line is necessary to serve existing and future customers in the Flagler and St. Johns areas in a reliable and effective manner.

(2) FPL has identified the need for a new 230 kV transmission line (by December 2014) that required certification under the Transmission Line Siting Act which was issued on November 2008. The new line will connect FPL's Manatee Substation to FPL's proposed Bob White Substation (also shown on Table III.E.1 in Chapter III). The construction of this

line, scheduled to be completed in 2014, is necessary to serve existing and future customers in the Manatee and Sarasota areas in a reliable and effective manner.

Overview of the Document

Chapter 186, Florida Statutes, requires that each electric utility in the State of Florida with a minimum existing generating capacity of 250 megawatts (MW) must annually submit a Ten Year Power Plant Site Plan (Site Plan). This Site Plan should include an estimate of the utility's future electric power generating needs, a projection of how these estimated generating needs could be met, and disclosure of information pertaining to the utility's preferred and potential power plant sites. The information contained in this Site Plan is compiled and presented in accordance with rules 25-22.070, 25-22.071, and 25-22.072, Florida Administrative Code (F.A.C.).

Site Plans are long-term planning documents and should be viewed in this context. A Site Plan contains uncertain forecasts and tentative planning information. Forecasts evolve, and all planning information is subject to change at the discretion of the utility. Much of the data submitted is preliminary in nature and is presented in a general manner. Specific and detailed data will be submitted as part of the Florida site certification process, or through other proceedings and filings, at the appropriate time.

This Site Plan document is based on Florida Power & Light Company's (FPL) integrated resource planning (IRP) analyses that were carried out in 2013 and that were on-going in the first Quarter of 2014. The forecasted information presented in this plan addresses the years 2014 through 2023.
This document is organized in the following manner:

Chapter I – Description of Existing Resources

This chapter provides an overview of FPL's current generating facilities. Also included is information on other FPL resources including purchased power, demand side management, and FPL's transmission system.

Chapter II – Forecast of Electric Power Demand

FPL's load forecasting methodology, and its forecast of seasonal peaks and annual energy usage, is presented in Chapter II.

Chapter III – Projection of Incremental Resource Additions

This chapter discusses FPL's integrated resource planning (IRP) process and outlines FPL's projected resource additions, especially new power plants, based on FPL's IRP work in 2013 and early 2014. This chapter also discusses a number of issues that may change the resource plan presented in this Site Plan. Furthermore, this chapter briefly discusses the status of FPL's DSM planning efforts, as well as FPL's, renewable energy efforts, transmission planning additions, and fuel cost forecasts.

Chapter IV – Environmental and Land Use Information

This chapter discusses environmental information as well as Preferred and Potential site locations for additional electric generation facilities.

Chapter V – Other Planning Assumptions and Information

This chapter addresses twelve "discussion items" which pertain to additional information that is included in a Site Plan filing.

Executive Summary

Florida Power & Light Company's (FPL) 2014 Ten Year Power Plant Site Plan (Site Plan) presents FPL's current plans to augment and enhance its electric generation capability (owned or purchased) as part of its efforts to meet its projected incremental resource needs for the 2014 - 2023 time period. By design, the primary focus of this document is on supply side additions; i.e., electric generation capability and the sites for these additions. The supply side additions discussed in this document are resources projected to be needed, based on FPL's load forecast, after accounting for FPL's demand side management (DSM) resource additions. In 2014, new DSM Goals for FPL for the time period 2015 through 2024 will be set by the Florida Public Service Commission (FPSC). At almost the same time FPL is filing this 2014 Site Plan, FPL will also be filing its proposed DSM Goals with the FPSC. Consequently, the level of DSM additions reflected in the 2014 Site Plan is consistent with FPL's proposed DSM Goals. The proposed level of DSM is discussed further below and in Chapter III.

FPL's load forecast accounts for a significant amount of efficiency that results from federal and state energy efficiency codes and standards. The projected impacts of these codes and standards are directly accounted for in FPL's load forecast as discussed below and in Chapter II.

The resource plan that is presented in FPL's 2014 Site Plan contains four key similarities to the resource plan presented in FPL's 2013 Site Plan. However, there are several factors that have contributed to differences between the resource plan presented in the 2014 Site Plan and the resource plan that was previously presented in FPL's 2013 Site Plan. Additional factors will continue to influence FPL's on-going resource planning work and could result in changes in the resource plan presented in this document. A brief discussion of these similarities and factors is provided below. Additional information regarding these topics is presented in Chapter III.

I. Similarities Between the Current Resource Plan and the Resource Plan Previously Presented in FPL's 2013 Site Plan:

There are four key similarities between the current resource plan presented in this document and the resource plan presented in the 2013 Site Plan.

Similarity # 1: Modernizations of Existing Power Plant Sites.

The modernization of FPL's Cape Canaveral plant site was completed on time in 2013 and the modernization of FPL's existing Riviera Beach plant site is scheduled to be completed on/near the April 1, 2014 date this 2014 Site Plan is to be filed. In addition, the modernization of FPL's existing Port Everglades plant site is underway and is projected to be completed in 2016.

Similarity # 2: FPL continues to pursue additional nuclear energy generation to significantly (i) reduce its use of fossil fuels, (ii) lower system fuel costs, (iii) lower system air emissions, and (iv) provide a valuable hedge against future increases in fuel costs and environmental compliance costs.

In 2013 FPL successfully completed its capacity uprate projects at its four existing nuclear units ; Turkey Point Units 3 & 4 and St. Lucie Units 1 & 2. The nuclear uprate project added about 520 MW of additional nuclear capacity to FPL's system which was about 30% more additional nuclear capacity than was originally projected when the project began. FPL's customers are already benefiting from lower fuel costs and reduced system air emissions provided by this additional nuclear capacity.

FPL is also continuing its work to obtain all of the licenses, permits, and approvals that will be necessary to construct and operate two new nuclear units at its Turkey Point site in the future. The earliest deployment dates for these two new units remain 2022 and 2023, respectively, and this Site Plan projects the two new nuclear units going in-service in those years.

Similarity #3: FPL is projected to serve Vero Beach's electrical load.

An agreement to this effect was reached between Vero Beach and FPL on February 19, 2013, and a referendum was held on March 12, 2013 that resulted in a majority of Vero Beach voters approving the agreement. FPL's current load forecast projects that FPL will begin serving Vero Beach's load in January 2015.

Similarity #4: Specific generating units are projected to be retired and/or converted to synchronous condenser operation.

In the last two years, FPL has retired a number of older, less efficient generating units including: Sanford Unit 3, Cutler Units 5 & 6, Cape Canaveral Units 1 & 2, Riviera Beach Units 3 & 4, and Port Everglades Units 1 – 4. In addition, Turkey Point Unit 2 has been converted to operate in synchronous condenser mode to provide voltage support for the transmission system in Southeastern Florida.

This trend is projected to continue. Putnam Units 1 & 2 are now projected to be retired by the end of 2014. And, similar to the earlier conversion of Turkey Point Unit 2, FPL projects that Turkey Point Unit 1 will be converted to run in synchronous condenser mode starting in 2016. In addition, for planning purposes, FPL is projecting that all of its existing gas turbines (GTs) at its two Broward County sites will be retired by the end of 2018 and that 5 new combustion turbines (CTs) will be installed at FPL's Lauderdale plant site also by the end of 2018. This projection is further discussed later in this executive summary and in Chapter III.

II. Factors Influencing FPL's Resource Planning Work Which Have Impacted, or Which Could Impact, FPL's Resource Plan:

There are a number of factors that influence FPL's resource planning work. Eight (8) of these are briefly discussed below and are discussed again in Chapters II and/or III.

Two of these factors are on-going system concerns that FPL has considered in its resource planning work for a number of years. These two on-going system concerns are: (1) maintaining/enhancing fuel diversity in the FPL system, and (2) maintaining a balance between load and generating capacity in Southeastern Florida, particularly in Miami-Dade and Broward Counties.

The third and fourth factors that will be discussed are factors that directly impacted the resource plan presented in this document because they affect FPL's forecast of its future load and its future firm load. The third factor is the impact of federal and state energy efficiency codes and standards on FPL's future loads. The impact of these codes and standards has been incorporated into FPL's current load forecast. The magnitude of efficiency that is being delivered to FPL's customers through these codes and standards is significant. For example, by the year 2023 (the last year addressed in this Site Plan), FPL's Summer peak is projected to be lower by approximately 3,477 MW compared to what the projected load would have been without the codes and standards based on cumulative savings beginning in 2005. This represents a decrease of approximately 12% in what the forecasted Summer peak load for 2023 would have been without the codes and standards. Likewise, FPL's forecasted net energy for load (NEL) in the year 2023 is projected to be approximately 9,991 GWh lower compared to what the projected NEL would have been without the efficiency codes and standards based on cumulative savings beginning in 2005. This represents a decrease of approximately 7% from what the forecasted NEL for 2023 would have been without the codes and standards.

There are two significant impacts from these codes and standards. The first impact is to substantially lower FPL's forecasted peak load and NEL. The second impact is that the codes and standards lower the potential for future MW and GWh reductions from FPL's DSM programs that address the specific appliances and equipment impacted by the codes and standards. Thus, significant energy efficiency regarding this equipment will be delivered to FPL's customers through codes and standards, thus precluding the potential for FPL to pursue these same efficiency gains through utility DSM programs.

The fourth factor is a projected decline in the cost-effectiveness of a number of utility DSM measures due to reasons that are beneficial overall for FPL's customers. Compared to 2009 (when DSM Goals were last set): (i) forecasted fuel costs have dropped by 50%, thus lowering the potential benefits from DSM kwh reductions; (ii) projected compliance costs for carbon dioxide (CO_2), have not only been significantly lowered, but their forecasted start date has been delayed by almost a decade, thus again lowering the potential benefits from DSM kwh reductions; and, (iii) FPL's generating system, due to the retirement of older, less efficient generators and replacement with highly efficient generators, plus additional nuclear capacity, has gotten more fuel-efficient, thus lowering fuel-related costs that would otherwise represent potential benefits for DSM kwh reductions. These factors are benefitting FPL's customers through lower electric rates, but they also lower the potential economic benefits that otherwise could be offered by DSM. When combined with the previously discussed fact that codes and standards have reduced the potential for efficiency gains in regard to appliance and equipment addressed by these codes and standards, the result is that FPL is logically projecting a lower contribution from utility DSM in the near-term. That lower contribution is accounted for in the 2014 Site Plan. These factors are discussed in detail in the filing FPL is making in its DSM Goals proceeding.

The fifth factor is the need to take measures to limit FPL's projected increasing dependence upon DSM resources to maintain system reliability. This factor has been previously discussed in FPL's 2011, 2012, and 2013 Site Plans. In these previous Site Plans, FPL has discussed this projection of increasing dependence upon DSM resources using a new type of reserve margin projection as an indicator: a "generation-only reserve margin" or "GRM".

The GRM projections from the 2011, 2012, and 2013 Site Plans consistently showed that these values were projected to significantly decrease over the 10-year reporting period of the Site Plans, declining to single-digit values in the latter years of the reporting periods. These projections indicated a steadily growing dependence on DSM resources to maintain system reliability. FPL's analyses show that system reliability risk increases, particularly from a system operations perspective, as dependence on DSM resources increases to a point where DSM resources account for more than half of FPL's 20% total reserve margin criterion value. Therefore, FPL is implementing a new reliability criterion of a 10% GRM in its resource planning work to complement its other two reliability criteria: a 20% total reserve margin criterion for Summer and Winter, and an annual 0.1 day/year loss-of-load-probability (LOLP) criterion. FPL is implementing the GRM criterion so that FPL's resource plans will begin to meet this criterion in the year 2019. A further discussion of the GRM criterion is presented in Chapter III.

There are additional factors that did not impact FPL's resource plan presented in this document, but which could result in future changes to this resource plan. For example, a sixth factor is the project schedule for the Turkey Point Units 6 & 7 nuclear units. At the time the 2014 Site Plan is being finalized, the Nuclear Regulatory Commission (NRC) has not provided a schedule for its review of FPL's Combined Operating License Application (COLA). Once the NRC's COLA review schedule is available, FPL will review the overall schedule for the Turkey Point Units 6 & 7 project. FPL's review will also consider the impacts of the recently amended nuclear cost recovery clause (NCRC) statute and the ongoing feasibility analyses that are part of Florida Nuclear Cost Recovery process.

The seventh factor is environmental regulation. As developments occur in regard to either new environmental regulations, and/or in how environmental regulations are interpreted and applied, the potential exists for such developments to affect FPL's resource plan that is presented in this document. For example, FPL is aware of potential impacts to generating units of recent EPA changes to the National Ambient Air Quality Standards that include shorter duration 1-hour standards for nitrogen dioxide (NO_2) and sulfur dioxide (SO_2). As a consequence, FPL filed in mid-2013 for FPSC approval to recover costs through the environmental cost recovery clause for removing all of its existing gas turbines (GTs) and partially replacing that peaking unit capacity with new combustion turbines (CTs). Although FPL withdrew its filing in December 2013 pending further analyses including on-site monitoring, FPL believes that the results of the monitoring and analyses will require that the Broward GTs be replaced. Therefore, FPL is currently projecting the retirement of all GTs in Broward County; i.e., at its existing Lauderdale and Port Everglades plant sites (a decrease in generating capacity of 1,260 MW Summer), and the installation of 5 new 201 MW CTs at its existing Lauderdale plant site (an increase of 1,005 MW Summer).

The eighth factor that will be discussed is the possibility of the establishment of a Florida standard for renewable energy or clean energy. Although no such legislation has been enacted to-date, Renewable Portfolio Standards, or Clean Energy Portfolio Standards legislation, or other legislative initiatives regarding renewable or clean energy contributions, may occur in the future at either the state or national level. If such legislation is enacted, FPL would then determine what steps need to be taken to address the legislation.

Each of these factors will continue to be examined in FPL's on-going resource planning work during the rest of 2014 and in future years.

Table ES-1 presents a current projection of major changes to specific generating units and firm capacity purchases for 2014 – 2023. (Although this table does not specifically identify the impacts of projected DSM additions on FPL's resource needs and resource plan, FPL's projected DSM additions have been fully accounted for in the resource plan presented in this Site Plan.)

Table ES-1: Projected Capacity & Firm Purchase Power Changes

Year *	Projected Capacity & Firm Purchase Power Changes	Summer MW	Date	Summer Reserve Margin **
2014	Martin Unit 1 ESP - Return from ESP outage	823	March-14	
	Martin Unit 2 ESP - Temporary Outage to install ESPs	(826)	March-14	
	Turkey Point Unit 5 CT Upgrade	30	March-14	
	Sanford 5 CT Upgrade	9	September-13	
	Riviera Beach Next Generation Clean Energy Center	1,212	April-14	
	Total of MW changes to Summer firm capacity:	**1,247**		**28.0%**
2015	Manatee Unit 3 CT Upgrade	32	October-14	
	Martin Unit 2 ESP - Returned from ESP Outage	823	December-14	
	Putnam 1&2 Retirement	(498)	December-14	
	OUC - Stanton PPAs	37	January-15	
	Vero Beach Combined Cycle 1/	46	January-15	
	Palm Beach SWA - additional capacity	70	January-15	
	Fort Myers Unit 2 CT Upgrades	18	June-15	
	Fort Myers Unit 2 CT Upgrades	18	March-15	
	Fort Myers Unit 2 CT Upgrades	18	May-15	
	Total of MW changes to Summer firm capacity:	**563**		**27.5%**
2016	UPS Replacement	(928)	December-15	
	Port Everglades Next Generation Clean Energy Center	1,237	June-16	
	Total of MW changes to Summer firm capacity:	**309**		**28.6%**
2017	Turkey Point Unit 1 synchronous condenser	(396)	October-16	
	Total of MW changes to Summer firm capacity:	**(396)**		**22.6%**
2018	OUC - Stanton PPAs	(37)	December-17	
	Vero Beach Combined Cycle 1/	(46)	January-18	
	Total of MW changes to Summer firm capacity:	**(83)**		**20.5%**
2019	Port Everglades GT retirement	(420)	December-18	
	Lauderdale GT retirement	(840)	December-18	
	Lauderdale CT	1,005	January-19	
	SJRPP suspension of energy	(381)	April-19	
	Unsited CC	1,269	June-19	
	Total of MW changes to Summer firm capacity:	**633**		**21.6%**
2020	Unspecified Purchase	129	June-20	
	Total of MW changes to Summer firm capacity:	**129**		**20.5%**
2021	Eco-Gen PPA	180	January-21	
	Unspecified Purchase	168	June-21	
	Total of MW changes to Summer firm capacity:	**348**		**20.8%**
2022	Cape Next Generation Clean Energy Center	87	June-22	
	Turkey Point Nuclear Unit 6	1,100	June-22	
	Total of MW changes to Summer firm capacity:	**1,187**		**22.6%**
2023	Riviera Beach Next Generation Clean Energy Center	55	June-23	
	Turkey Point Nuclear Unit 7	1,100	June-23	
	Total of MW changes to Summer firm capacity:	**1,155**		**24.4%**

* Year shown reflects when the MW change begins to be accounted for in Summer reserve margin calculations. (Note that addition of MW values for each year will not yield a current cumulative value.)

** Winter Reserve Margins are typically high than Summer Reserve Margin. Winter Reserve Margin are shown on Schedule 7.2 in Chapter III.

1/ This unit will be added as part of the agreement that FPL will serve Vero Beach's electric load starting January, 2015. This unit is expected to be retired within 3 years.

CHAPTER I

Description of Existing Resources

(This page is left intentionally blank.)

I. Description of Existing Resources

FPL's service area contains approximately 27,650 square miles and has a population of approximately 9.0 million people. FPL served an average of 4,626,934 customer accounts in thirty-five counties during 2013. These customers were served by a variety of resources including: FPL-owned fossil-fueled, renewable, and nuclear generating units, non-utility owned generation, demand side management (DSM), and interchange/purchased power.

I.A. FPL-Owned Resources

The existing FPL generating resources are located at fourteen generating sites distributed geographically around its service territory, plus one site in Georgia (partial FPL ownership of one unit) and one site in Jacksonville, Florida (partial FPL ownership of two units). The current electrical generating facilities consist of four nuclear units, three coal units, sixteen combined cycle (CC) units, five fossil steam units, forty-eight combustion gas turbines, two simple cycle combustion turbines, and two photovoltaic facilities[1]. The locations of these eighty generating units are shown on Figure I.A.1 and in Table I.A.1.

FPL's bulk transmission system is comprised of 6,734 circuit miles of transmission lines. Integration of the generation, transmission, and distribution system is achieved through FPL's 589 substations in Florida.

The existing FPL system, including generating plants, major transmission stations, and transmission lines, is shown on Figure I.A.2.

1 FPL also has one 75 MW solar thermal facility at its Martin plant site. This facility does not generate electricity as the other units mentioned above do. Instead, it produces steam that reduces the use of fossil fuel to produce steam for electricity generation.

FPL Generating Resources by Location

Location/ Map Key	Plant Name	Number of Units	Summer MW
A	Turkey Point	4	3,176
B	St. Lucie [1/]	2	1,821
C	Manatee	3	2,729
D	Fort Myers	3	1,748

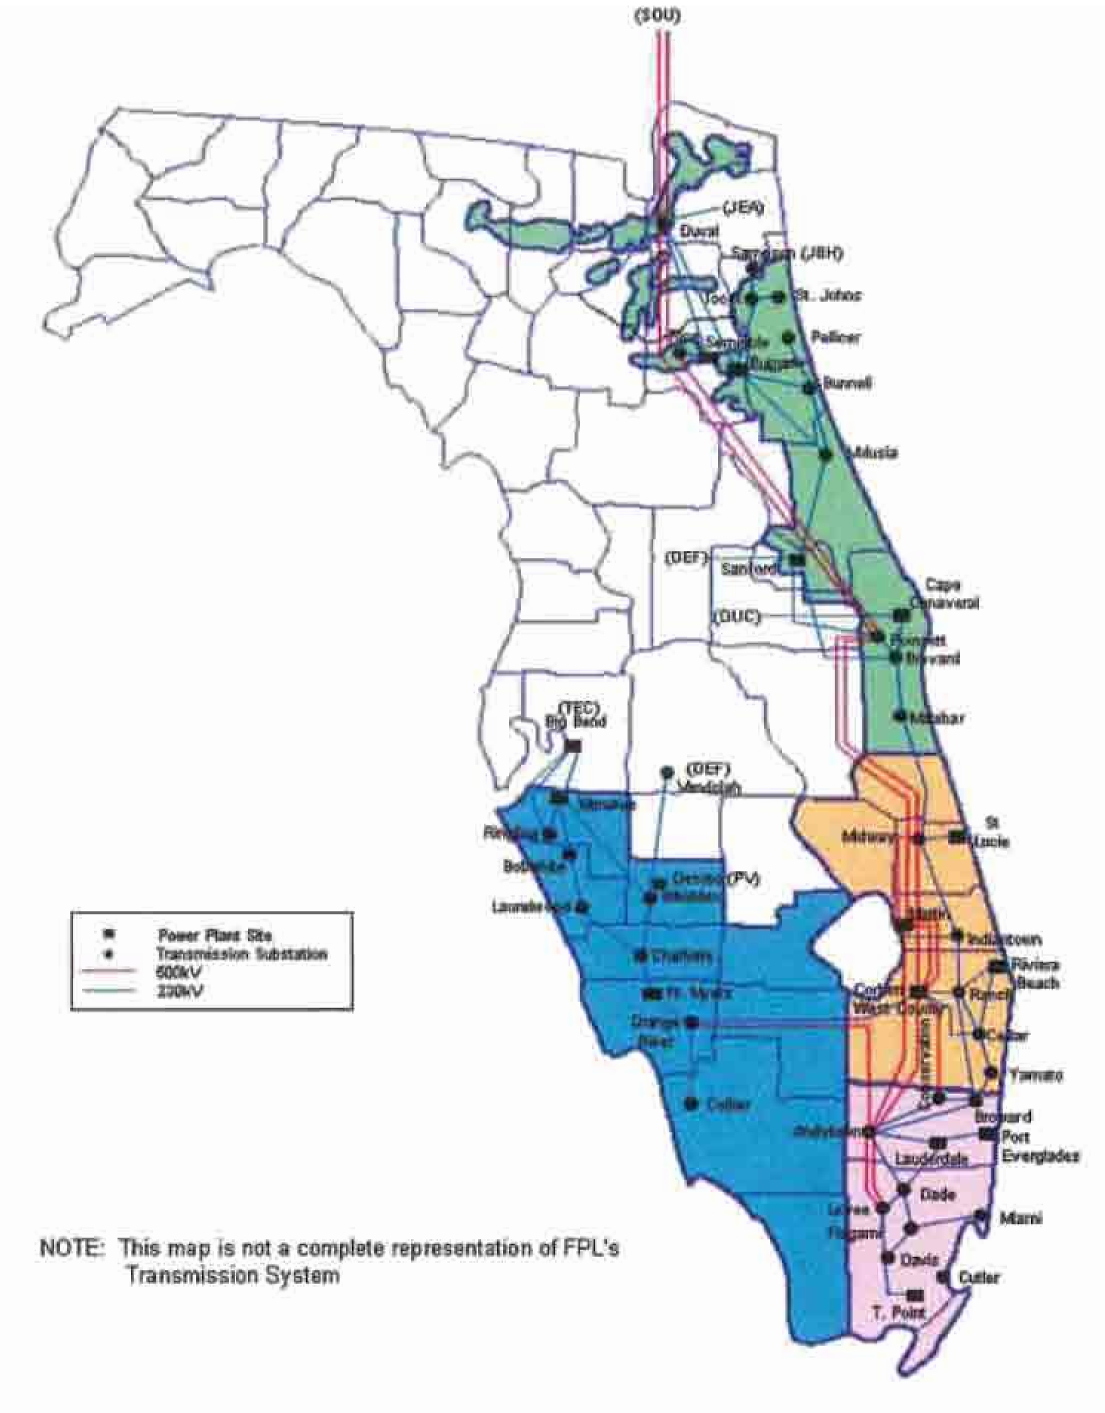
Total Combustion Turbines:		**2**		**316**
PV				
DeSoto 3/	DeSoto, FL	1	Solar Energy	25
Space Coast 3/	Brevard County, FL	1	Solar Energy	10
Total PV:		**2**		**35**
Total System Generation as of December 31, 2013 =		**80**		**24,274**
System Firm Generation as of December 31, 2013 =		**78**		**24,239**

1/ Total capability of St. Lucie 1 is 981/1,003 MW. FPL's share of St. Lucie 2 is 840/860. FPL's ownership share of St. Lucie Units 1 and 2 is 100% and 85%, respectively.

2/ Capabilities shown represent FPL's output share from each of the units (approx. 92.5% and exclude the Orlando Utilities Commission (OUC) and Florida Municipal Power Agency (FMPA) combined portion of approximately 7.44776% per unit. Represents FPL's ownership share: SJRPP coal: 20% of two units).

3/ The 25 MW of PV at DeSoto and the 10 MW of PV at Space Coast are considered as non-firm generating capacity and the capacity from these units has been removed from the "System Firm Generation" row at the end of the table.



NOTE: This map is not a complete representation of FPL's Transmission System

Figure I.A.2: FPL Substation and Transmission System Configuration

Description of Existing Resources

I.B Capacity and Energy Power Purchases

Firm Capacity Purchases from Qualifying Facilities (QF)

Firm capacity power purchases are an important part of FPL's resource mix. FPL currently has contracts with eight qualifying facilities; i.e., cogeneration/small power production facilities, to purchase firm capacity and energy during the 10-year reporting period of this Site Plan as shown in Table I.A.3, Table I.B.1, and Table I.B.2.

A cogeneration facility is one which simultaneously produces electrical and thermal energy, with the thermal energy (e.g., steam) being used for industrial, commercial, or cooling and heating purposes. A small power production facility is one which does not exceed 80 MW (unless it is exempted from this size limitation by the Solar, Wind, Waste, and Geothermal Power Production Incentives Act of 1990) and uses as its primary energy source solar, wind, waste, geothermal, or other renewable resources.

Firm Capacity Purchases from Utilities

FPL has a Unit Power Sales (UPS) contract to purchase 928 MW from the Southern Company (Southern) through the end of December 2015. This capacity is being supplied by Southern from a mix of gas-fired and coal-fired units.

In addition, FPL has contracts with the Jacksonville Electric Authority (JEA) for the purchase of 375 MW (Summer) and 383 MW (Winter) of coal-fired generation from the St. John's River Power Park (SJRPP) Units No. 1 and No. 2. However, due to Internal Revenue Service (IRS) regulations, the total amount of energy that FPL may receive from this purchase is limited. FPL currently assumes, for planning purposes, that this limit will be reached in April 2019. Once this limit is reached, FPL will be unable to receive firm capacity and energy from these purchases. (However, FPL will continue to receive firm capacity and energy from its ownership portion of the SJRPP units.)

As part of the agreement that FPL will begin serving Vero Beach's electrical needs beginning in January 2015, FPL has acquired two existing power purchase agreements totaling approximately 37 MW of coal-fired capacity. These agreements will run through the end of 2017.

These purchases are shown in Table I.A.3, Table I.B.1, and Table I.B.2. FPL also has ownership interest in the SJRPP units. The ownership amount is reflected in FPL's installed capacity shown on Figure I.A.1, in Table I.A.1, and on Schedule 1.

Firm Capacity Other Purchases

FPL has two other firm capacity purchase contracts with non-QF, non-utility suppliers. These contracts with the Palm Beach Solid Waste Authority were previously listed as QFs. However, the addition of a second unit will cause both units to no longer meet the statutory definition of a QF. These contracts are therefore listed as "Other Purchases" after the current estimated in-service date of the new unit. Table I.B.1 and I.B.2 present the Summer and Winter MW, respectively, resulting from these contracts under the category heading of Other Purchases.

Non-Firm (As Available) Energy Purchases

FPL purchases non-firm (as-available) energy from several cogeneration and small power production facilities. Table I.A.3 shows the amount of energy purchased in 2013 from these facilities.

Table 1.A.3: Purchase Power Resources by Contract (as of December 31, 2013)

Firm Capacity Purchases (MW)	Location (City or County)	Fuel	Summer MW
I. Purchases from QF's: Cogeneration/Small Power Production Facilities			
Cedar Bay Generating Co.	Duval	Coal (Cogen)	250
Indiantown Cogen., LP	Martin	Coal (Cogen)	330
Broward South	Broward	Solid Waste	4
Broward North	Broward	Solid Waste	11

1/ When the second unit comes into service at the Palm Beach SWA, neither unit will meet the standards to be a small power producers, and both units then will be accounted for under "Other Purchases".

2/ The EcoGen units will enter service in 2016, and initially provide non-firm energy. Firm capacity delivery will commence in 2021.

3/ Contract End Date shown for the SJRPP purchase does not represent the actual contract end date. Instead, this date represents a projection of the earliest date at which FPL's ability to receive further capacity and energy from this purchase could be suspended due to IRS regulations.

4/ These units are part of the purchase of the Vero Beach Electric System.

5/ These unspecified purchases are short-term purchases that are included for resource planning purposes. No decision regarding such purchases is needed at this time.

I.C Demand Side Management (DSM)

FPL has sought out and implemented cost-effective DSM programs since 1978. These programs include a number of conservation/energy efficiency and load management initiatives. FPL's DSM efforts through 2013 have resulted in a cumulative Summer peak reduction of approximately 4,753 MW at the generator and an estimated cumulative energy saving of approximately 66,782 Gigawatt-hour (GWh) at the generator. After accounting for reserve margin requirements, FPL's DSM efforts through 2013 have eliminated the need to construct the equivalent of approximately 14 new 400 MW generating units. New DSM Goals for FPL for the 2015 through 2024 time period will be set by the FPSC in the second half of 2014. DSM is discussed further in Chapter III.

Total System Generating Capacity as of December 31, 2013 [6] =												25,691	24,274
System Firm Generating Capacity as of December 31, 2013 [7] =												25,656	24,229

1/ These ratings are peak capability.
2/ These ratings represent Florida Power & Light Company's share of Scherer Unit 4, adjusted for transmission losses.
3/ The capacity shown for the PV facility at Space Coast is considered as non-firm generating capacity due to the intermittent nature of the solar resource.
4/ The net capability ratings represent Florida Power & Light Company's share of St. Johns River Park Units 1 and 2, excluding the Jacksonville Electric Authority (JEA) share of 80%.
5/ Total capability of St. Lucie 1 is 981/1,003 MW. FPL's share of St. Lucie 2 is 840/880 FPL's ownership share of St. Lucie Units 1 and 2 is 100% and 85%, respectively, as shown above. FPL's share of the deliverable capacity from each unit is approx. 92.5% and exclude the Orlando Utilities Commission (OUC) and Florida Municipal Power Agency (FMPA) combined portion of approximately 7.44776% per unit.
6/ The Total System Generating Capacity value shown includes FPL-owned firm and non-firm generating capacity.
7/ The System Firm Generating Capacity value shown includes only firm generating capacity.

CHAPTER II

Forecast of Electric Power Demand

(This page is left intentionally blank.)

II. Forecast of Electric Power Demand

II. A. Overview of the Load Forecasting Process

Long-term forecasts of sales, net energy for load (NEL), and peak loads are typically developed on an annual basis for resource planning work at FPL. New long-term forecasts were developed by FPL in late 2013 that replaced the previous long-term load forecasts that were used by FPL during 2013 in much of its resource planning work and which were presented in FPL's 2013 Site Plan. These new load forecasts are utilized throughout FPL's 2014 Site Plan. These forecasts are a key input to the models used to develop FPL's integrated resource plan.

The following pages describe how forecasts are developed for each component of the long-term forecast: sales, NEL, and peak loads. Consistent with past forecasts, the primary drivers to develop these forecasts include economic conditions and weather.

The projections for the national and Florida economies are obtained from the consulting firm IHS Global Insight. Population projections are obtained from the Florida Legislature's Office of Economic and Demographic Research (EDR). These projections are developed in conjunction with the Bureau of Economic and Business Research (BEBR) of the University of Florida. These inputs are quantified and qualified using statistical models in terms of their impact on the future demand for electricity.

Weather is always a key factor that affects FPL's energy sales and peak demand. Three sets of weather variables are developed and used in FPL's forecasting models:

1. Cooling degree-hours based on 72° F, winter heating degree-days based on 66° F, and heating degree-days based on 45° F are used to forecast energy sales.
2. The maximum temperature on the peak day, along with the build-up of cooling degree-hours prior to the peak, is used to forecast Summer peaks.
3. The minimum and average temperatures on the peak day, along with the build-up of heating degree-hours based on 66° F, one and two days prior to the peak, are used to forecast Winter peaks.

The cooling degree-hours and winter heating degree-days are used to capture the changes in the electric usage of weather-sensitive appliances such as air conditioners and electric space heaters. Heating degree-days based on 45° F are used to capture heating load resulting from sustained periods of unusually cold weather not fully captured by heating degree-days based on 66° F. A composite hourly temperature profile is derived using hourly temperatures across FPL's service territory. Miami, Ft. Myers, Daytona Beach, and West Palm Beach are the locations from which temperatures are obtained. In developing the composite hourly profile, these regional temperatures are weighted by regional energy sales. The resulting composite temperature is used to derive projected cooling and heating degree-hours and heating degree-days. Similarly, composite temperature and hourly profiles of temperatures are used to calculate the weather variables used in the Summer and Winter peak models.

II. B. Comparison of FPL's Current and Previous Load Forecasts

While reflecting some fluctuations by year, FPL's current load forecast is generally in line with the load forecast presented in its 2013 Site Plan. There are four primary factors that are driving the current load forecast: projected population growth, the continued recovery of the Florida economy, energy efficiency codes and standards, and the additional load expected as a result of the acquisition of the City of Vero Beach electric utility.

In early 2013, FPL came to an agreement with the City of Vero Beach to purchase the City's electric system. This agreement was approved by the City voters on March 12, 2013. Beginning in January 2015, NEL, customers, and peaks for Vero Beach are included in FPL's forecasts and are reflected in FPL's 2014 Site Plan.

The customer forecast is based on recent population projections as well as the actual levels of customer growth experienced historically and the additional customers expected as a result of the acquisition of Vero Beach. Population projections are derived from the EDR's July 2013 Demographic Estimating Conference. This forecast is generally consistent with previous forecasts indicating a gradual rebound in Florida's population growth. Net migration into Florida fell to a record low in 2009 during the height of the recession. Florida has since experienced an improvement in net migration which now accounts for a majority of the population growth. However, population growth rates have remained modest by historical standards. Moderately higher rates of population growth are projected from 2014 until 2018 when the projected rate of population growth gradually begins to decelerate. Consistent with past population projections, the rates of population growth in the later years of the forecast are below the rates historically experienced in Florida.

Effective January 2015, FPL is expected to begin providing electric service to more than 34,000 customers formerly served by the City of Vero Beach. Reflecting this increase, the current forecast shows an increase in customer growth in 2015. Thereafter, customer growth is expected to mirror the overall level of population growth in the state. By 2019, the total number of customers served by FPL is expected to exceed five million. Between 2013 and 2023 the total number of customers is projected to increase at an annual rate of 1.4%, the same increase projected in the 2013 Site Plan.

The economic projections incorporated into FPL's load forecast are provided by IHS Global Insight, a leading economic forecasting firm. IHS Global Insight projects a continued recovery in the Florida economy with relatively healthy increases in employment and income levels between 2014 and 2020. Particularly robust growth is projected for the tourism and healthcare industries. Consistent with past projections, economic growth in the later years of the forecast is expected to moderate slightly.

Estimates of savings from energy efficiency codes and standards are developed by ITRON, a leading expert in this area. Included in these estimates are savings from federal and state energy efficiency codes and standards, including the 2005 National Energy Policy Act, the 2007 Energy Independence and Security Act, and the savings occurring from the use of compact fluorescent bulbs[2]. The impact of these savings began in 2005 and their cumulative impact on the Summer peak is expected to reach 3,477 MW by 2023, the equivalent of approximately a 12% reduction in what the forecasted Summer peak load for 2023 would have been without these codes and standards. The cumulative impact from these savings on NEL is expected to reach 9,991 GWH over the same period while the cumulative impact on the Winter peak is expected to be 1,689 MW by 2023. This represents a decrease of approximately 7% in the forecasted NEL for 2023 and a 4% reduction in forecasted Winter peak load for 2023.

Consistent with the forecast presented in FPL's 2013 Site Plan, the total growth projected for the ten-year reporting period of this document is significant. The Summer peak is projected to increase to 26,528 MW by 2023, an increase of 4,952 MW over the 2013 actual Summer peak. Likewise, NEL is projected to reach 132,357 GWH in 2023, an increase of 20,702 GWH from the actual 2013 value.

II.C. Long-Term Sales Forecasts

Long-term forecasts of electricity sales were developed for the major revenue classes and are adjusted to match the NEL forecast. The results of these sales forecasts for the years 2014 - 2023 are presented in Schedules 2.1 - 2.3 which appear at the end of this chapter. Econometric models are developed for each revenue class using the statistical software package MetrixND. The methodologies used to develop energy sales forecasts for each jurisdictional revenue class and NEL forecast are outlined below.

[2] Note that in addition to the fact that these energy efficiency codes and standards lower the forecasted load (as described later in this chapter), these standards also lower the potential for efficiency gains that would otherwise be available through utility DSM programs.

1. Residential Sales

Residential electric usage per customer is estimated by using an econometric model. Residential sales are a function of the following variables: cooling degree-hours, winter heating degree-days, lagged cooling degree-hours, lagged winter heating degree-days, retail gasoline prices, and Florida real per capita income weighted by the percent of the population employed. The impact of weather is captured by the cooling degree-hours, heating degree-days, and the one month lag of these variables. The impact energy prices have on electricity consumption is captured through retail gasoline prices. As energy prices rise, less disposable income is available for all goods and services, electricity included. To capture economic conditions, the model includes a composite variable based on Florida real per capita income and the percent of the state's population that is employed. Residential energy sales are forecasted by multiplying the forecasted residential use per customer by the number of residential customers forecasted.

2. Commercial Sales

The commercial sales forecast is also developed using an econometric model. Commercial sales are a function of the following variables: Florida real per capita income weighted by the percent of the population employed, cooling degree-hours, heating degree-hours, lagged cooling degree-hours, a variable designed to reflect the impact of empty homes, dummy variables for the month of December and for the specific months of January 2007, November 2005, and March 2013, and an autoregressive term. Cooling degree-hours, heating degree-hours, and the one month lag of cooling degree-hours are used to capture weather-sensitive load in the commercial sector.

3. Industrial Sales

The industrial class is comprised of three distinct groups: very small accounts (those with less than 20 kW of demand), medium accounts (those with 21 kW to 499 kW of demand), and large accounts (those with demands of 500 kW or higher). As such, the forecast is developed using a separate econometric model for each group of industrial customers. The small industrial sales model utilizes the following variables: cooling degree-hours, heating degree-hours, dummy variables for the specific months of November 2005 and August 2004, and two autoregressive terms. The medium industrial sales model utilizes the following variables: cooling degree-hours, Florida real per capita income weighted by the percent of the population employed, dummy variables for the specific months of February 2005 and 2006 and November 2005, and three autoregressive terms,. The large industrial sales model utilizes the following variables: cooling degree-hours, Florida real per capita income weighted by the percent of the population employed, the Consumer Price Index, and dummy variables for the specific months of October 2004 and 2005, November 2004, and September 2005.

4. **Railroad and Railways Sales and Street and Highway Sales**

This class consists solely of Miami-Dade County's Metrorail system. The projections for railroad and railways sales are based on a historical moving average.

The forecast for street and highway sales is developed by first developing a trended use per customer value, then multiplying this value by the number of forecasted customers.

5. **Other Public Authority Sales**

This class consists of a sports field rate schedule, which is closed to new customers, and one government account. The forecast for this class is based on its historical usage characteristics.

6. **Total Sales to Ultimate Customer**

Sales forecasts by revenue class are summed to produce a total sales forecast.

7. **Sales for Resale**

Sales for resale (wholesale) customers are composed of municipalities and/or electric co-operatives. These customers differ from jurisdictional customers in that they are not the ultimate users of the electricity they buy. Instead, they resell this electricity to their own customers. Currently there are five customers in this class: the Florida Keys Electric Cooperative; Lee County Electric Cooperative; Wauchula; Winter Park; and Blountstown. In addition, FPL will begin making sales to Seminole Electric Cooperative in June 2014 under a long term agreement[3].

Beginning in May 2011, FPL began providing service to the Florida Keys Electric Cooperative under a long-term full requirements contract. Previously FPL was serving the Florida Keys under a partial requirements contract. The sales to Florida Keys Electric Cooperative are based on customer-supplied information and historical coincidence factors.

Lee County has contracted with FPL for FPL to supply a portion of their load through 2013, then to begin serving their entire load beginning in 2014. This contract began in January 2010. Lee County provides a forecast of their sales by delivery point which is used to derive their sales forecast.

FPL's sales to Wauchula began in October 2011 and will continue through December 2016.

[3] FPL continues to evaluate the possibility of serving the electrical loads of other entities at the time the 2014 Site Plan is being prepared. Because these possibilities are still being evaluated, the load forecast presented in this Site Plan does not include these potential loads.

Sales to Winter Park began in January 2014 and will continue through December 2016.

Blountstown became an FPL wholesale customer in May 2012. FPL's contract with Blountstown expires in April 2017.

A new contract with Seminole Electric Cooperative is included in the forecast which includes delivery of 200 MW beginning in June 2014 and continuing through May 2021.

II.D. Net Energy for Load (NEL)

An econometric model is developed to produce a NEL per customer forecast. The inputs to the model include Florida real per capita income weighted by the percent of the population employed, and a proxy for energy prices. The model also includes several weather variables including cooling degree-hours and heating degree-days by calendar month, and heating degree-days based on 45° F. In addition, the model also includes variables for energy efficiency codes and standards and a variable designed to capture the impact of empty homes. Dummy variables are included for the specific months of May 2004, and November 2005. There is also an autoregressive term in the model.

The energy efficiency variable is included to capture the impacts from major codes and standards, including those associated with the 2005 National Energy Policy Act, the 2007 Energy Independence and Security Act, and the savings occurring from the use of compact fluorescent bulbs. The estimated impact from these codes and standards is inclusive of engineering estimates and any resulting behavioral changes. The impact of these savings began in 2005 and their cumulative impact on NEL is expected to reach 9,991 GWH by 2023. This represents a 7.0% reduction in what the forecasted NEL for 2023 would have been absence these codes and standards. On an incremental basis, net of the reduction already experienced through 2013, the reduction in 2023 is expected to reach 6,075 GWH.

The decline in the number of empty homes resulting from the current housing recovery has affected use per customer and is captured in a separate variable. The forecast was also adjusted for additional load estimated from hybrid vehicles, beginning in 2013, which resulted in an increase of approximately 1,587 GWH by the end of the ten-year reporting period. The forecast was also adjusted for the incremental load resulting from FPL's economic development riders which began in 2013, and this incremental load is projected to grow to 537 GWH before leveling off in 2018. An additional adjustment to the NEL forecast was made to reflect the acquisition of the Vero Beach electric system. The Vero Beach acquisition is projected to add 793 GWH by 2023.

The NEL forecast is developed by first multiplying the NEL per customer forecast by the total number of customers forecasted (excluding the customers formerly served by Vero Beach) and then adjusting the forecasted results for the expected incremental load resulting from hybrid vehicles, new wholesale contracts, the Vero Beach acquisition, and FPL's economic development riders. Once the NEL forecast is obtained, total billed sales are computed using a historical ratio of sales to NEL. The sales by class forecasts previously discussed are then adjusted to match the total billed sales. The forecasted NEL values for 2014 - 2023 are presented in Schedule 3.3 that appears at the end of this chapter.

II.E. System Peak Forecasts

The rate of absolute growth in FPL system peak load has been a function of the size of the customer base, varying weather conditions, projected economic conditions, changing patterns of customer behavior, and more efficient appliances and lighting. FPL developed the peak forecast models to capture these behavioral relationships. In addition, FPL's peak forecast also reflects changes in load expected as a result of the acquisition of Vero Beach, changes in wholesale contracts, and the expected number of hybrid vehicles.

The savings from energy efficiency codes and standards incorporated into the peak forecast include the impacts from the 2005 National Energy Policy Act, the 2007 Energy Independence and Security Act, and the use of compact fluorescent light bulbs. The impact from these energy efficiency standards began in 2005 and their cumulative impact on the Summer peak is expected to reach 3,477 MW by 2023. This reduction is inclusive of engineering estimates and any resulting behavioral changes. The cumulative 2023 impact from these energy efficiency codes and standards effectively reduces FPL's Summer peak for that year by 11.6%. On an incremental basis, net of the reduction already experienced through 2013, the impact on the Summer peak from these energy efficiency codes and standards is expected to reach 1,997 MW in 2023. By 2023, the Winter peak is expected to be reduced by 1,689 MW as result of the cumulative impact from these energy efficiency standards since 2005. On an incremental basis, net of the reduction already experienced through 2013, the impact on the Winter peak from these energy efficiency standards is expected to reach 1,065 MW in 2023.

The forecast was also adjusted for additional load estimated from hybrid vehicles which results in an expected increase of approximately 443 MW in the Summer and 221 MW in the Winter by the end of the ten-year reporting period and for the acquisition of the Vero Beach electric system. The Vero Beach acquisition will add 169 MW to the Summer peak, and 179 MW to the Winter peak, forecast by the end of the ten-year reporting period.

The forecasting methodology of Summer, Winter, and monthly system peaks is discussed below. The forecasted values for Summer and Winter peak loads for the years 2014 – 2023 are presented at the end of this chapter in Schedules 3.1 and 3.2, and in Chapter III in Schedules 7.1 and 7.2.

1. **System Summer Peak**

   The Summer peak forecast is developed using an econometric model. The variables included in the model are the price of gasoline, lagged one month, Florida real household disposable income, cooling degree-hours two days prior to the peak day, the maximum temperature on the day of the peak, a variable for energy efficiency standards, and a moving average term. The model is based on the Summer peak contribution per customer which is multiplied by total customers (excluding the customers that have been served by Vero Beach), and adjusted to account for incremental loads resulting from hybrid vehicles, new wholesale contracts, the Vero Beach acquisition, and FPL's economic development riders to derive FPL's system Summer peak.

2. **System Winter Peak**

   Like the system Summer peak model, this model is also an econometric model. The model consists of three weather-related variables: the average temperature on the peak day, heating degree-hours for the prior day squared, and heating degree-hours two days prior to the peak day. The model also includes two dummy variables; one for Winter peaks occurring on weekends and one for winter peaks with minimum temperature below 40.5 degrees. Also included in the model are a variable for housing starts per capita, and an autoregressive term. The forecasted results are adjusted for the impact of energy efficiency standards. The model is based on the Winter peak contribution per customer which is multiplied by total customers (excluding the customers that have been served by Vero Beach), and then adjusted for the expected incremental loads resulting from hybrid vehicles, new wholesale contracts, the Vero Beach acquisition, and FPL's economic development riders.

3. **Monthly Peak Forecasts**

   The forecasting process for monthly peaks consists of the following steps:

   a. The forecasted annual summer peak is assumed to occur in the month of August. The month of August has historically accounted for more annual summer peaks than any other month.

b. The forecasted annual winter peak is assumed to occur in the month of January. The month of January has historically accounted for more annual winter peaks than any other month.

c. The remaining monthly peaks are forecasted based on the historical relationship between the monthly peaks and the annual summer peak.

II.F. The Hourly Load Forecast

Forecasted values for system hourly load for the period 2014 - 2023 are produced using a System Load Forecasting "shaper" program. This model uses years of historical FPL hourly system load data to develop load shapes for weekdays, weekend days, and holidays. The model generates a projection of hourly load values based on these load shapes and the forecast of monthly peaks and energy.

II.G. Uncertainty

In order to address uncertainty in the forecasts of aggregate peak demand and NEL, FPL first evaluates the assumptions underlying the forecasts. FPL takes a series of steps in evaluating the input variables, including comparing projections from different sources, identifying outliers in the series, and assessing the series' consistency with past forecasts. As needed, FPL reviews additional factors which may affect the input variables.

Uncertainty is also addressed in the modeling process. Generally, econometric models are used to forecast the aggregate peak demand and NEL. During the modeling process, the relevant statistics (goodness of fit, F-statistic, P-values, mean absolute deviation (MAD), mean absolute percentage error (MAPE), etc.) are scrutinized to ensure that the models adequately explain historical variation. Once a forecast is developed, it is compared with past forecasts. Deviations from past forecasts are examined in light of changes in input assumptions to ensure that the drivers underlying the forecast are well understood. Finally, forecasts of aggregate peak demand and NEL are compared with the actual values as these become available. An ongoing process of variance analyses is performed. To the extent that the variance analysis identifies large unexplained deviations between the forecast and actual values, revisions to the econometric model may be considered.

The inherent uncertainty in load forecasting is addressed in different ways in regard to FPL's overall resource planning and operational planning work. In regard to FPL's resource planning work, FPL's utilization of a 20% total reserve margin criterion, and a 10% generation-only reserve margin criterion, are designed to maintain reliable electric service to FPL's customers in light of forecasting (and other) uncertainty. In addition, banded forecasts of the projected Summer peak and net energy for load are produced based on an analysis of past forecasting variances. In regard to operational planning, a banded forecast for the projected Summer and Winter peak days is developed based on the historical weather variations. These bands are then used to develop similar bands for the monthly peaks.

II.H. DSM

The effects of FPL's DSM energy efficiency programs implementation through August 2013 are assumed to be imbedded in the actual usage data for forecasting purposes. The impacts of incremental energy efficiency that FPL plans to implement in the future, plus the cumulative and projected incremental impacts of FPL's load management programs, are accounted for as "line item reductions" to the forecasts as part of the IRP process as shown in Chapter III in Schedules 7.1 and 7.2. After making these adjustments to the load forecasts, the resulting "firm" load forecast is then used in FPL's IRP work.

Schedule 2.1
History of Energy Consumption
And Number of Customers by Customer Class

(1)	(2)	(3)	(4)	(5)	(6)	(7)	(8)	(9)

2017	5,418	6,811	124,914	4,437	4,922,918
2018	5,440	6,896	126,399	4,491	4,991,659
2019	5,496	6,959	127,673	4,543	5,058,945
2020	5,559	7,035	129,187	4,592	5,123,909
2021	5,133	7,018	129,454	4,638	5,185,333
2022	4,846	7,124	130,517	4,681	5,247,054
2023	4,906	7,239	132,357	4,724	5,309,376

Projected Values (2014 - 2023):

Col. (19) represents forecasted energy sales that do not include the impact of incremental conservation and agrees to Col. (2) on Schedule 3.3.

Col. (19) = Col. (16) + Col. (17) + Col. (18). These values are based on calendar year.

Col. (20) represents the annual average of the twelve monthly values.

Col. (21) = Col. (5) + Col. (8) + Col. (11) + Col. (20).

Schedule 3.1
History of Summer Peak Demand (MW)

(1)	(2)	(3)	(4)	(5)	(6)	(7)	(8)	(9)	(10)
Year	Total	Wholesale	Retail	Interruptible	Res. Load Management	Residential Conservation	C/I Load Management	C/I Conservation	Net Firm Demand
2004	20,545	258	20,287	0	894	840	588	577	19,063
2005	22,361	264	22,097	0	902	895	600	611	20,858
2006	21,819	256	21,563	0	928	948	635	640	20,256
2007	21,962	261	21,701	0	952	982	716	683	20,295
2008	21,060	181	20,879	0	966	1,042	760	706	19,334
2009	22,351	249	22,102	0	981	1,097	811	732	20,558
2010	22,256	419	21,837	0	990	1,181	815	758	20,451
2011	21,619	427	21,192	0	1,000	1,281	821	781	19,798
2012	21,440	431	21,009	0	1,013	1,351	833	810	19,594
2013	21,576	396	21,180	0	1,025	1,394	833	827	19,718

Historical Values (2004 - 2013):

Col. (2) - Col. (4) are actual values for historical Summer peaks. As such, they incorporate the effects of conservation (Col. 7 & Col. 9), and may incorporate the effects of load control if load control was operated on those peak days. Therefore, Col. (2) represents the actual Net Firm Demand.

Col. (5) - Col. (9) represent actual DSM capabilities starting from January 1988 and are annual (12-month) values except for 2013 values which are through August.

Col. (10) represents a HYPOTHETICAL "Net Firm Demand" as if the load control values had definitely been exercised on the peak. Col. (10) is derived by the formula: Col. (10) = Col.(2) - Col.(6) - Col.(8).

Schedule 3.1
Forecast of Summer Peak Demand (MW)

(1)	(2)	(3)	(4)	(5)	(6)	(7)	(8)	(9)	(10)
August of Year	Total	Wholesale	Retail	Interruptible	Res. Load Management*	Residential Conservation	C/I Load Management*	C/I Conservation	Net Firm Demand
2014	22,768	1,173	21,595	0	1,077	65	816	33	20,777
2015	23,356	1,206	22,149	0	1,093	88	830	46	21,298
2016	23,778	1,212	22,565	0	1,103	89	841	49	21,695
2017	24,190	1,159	23,031	0	1,113	91	853	52	22,081
2018	24,544	1,166	23,378	0	1,124	92	865	56	22,407
2019	24,895	1,172	23,723	0	1,134	94	877	62	22,729
2020	25,239	1,179	24,061	0	1,144	97	889	67	23,042
2021	25,439	985	24,454	0	1,154	100	901	73	23,211
2022	25,908	992	24,916	0	1,165	104	912	79	23,648
2023	26,528	998	25,530	0	1,175	109	924	85	24,235

Projected Values (2014 - 2023):

Col. (2) - Col. (4) represent FPL's forecasted peak and does not include incremental conservation, cumulative load management, or incremental load management.

Col. (5) - Col. (9) represent cumulative load management, and incremental conservation and load management. All values are projected August values.

Col. (8) represents FPL's Business On Call, CDR, CILC, and Curtailable programs/rates.

Col. (10) represents a "Net Firm Demand" which accounts for all of the incremental conservation and assumes all of the load control is implemented on the peak. Col. (10) is derived by using the formula: Col. (10) = Col. (2) - Col. (5) - Col. (6) - Col. (7) - Col. (8) - Col. (9).

* Res. Load Management and C/I Load Management include MW values of load management from Lee County and FKEC.

Schedule 3.2
History of Winter Peak Demand:Base Case

(1)	(2)	(3)	(4)	(5)	(6)	(7)	(8)	(9)	(10)
Year	Total	Firm Wholesale	Retail	Interruptible	Res. Load Management	Residential Conservation	C/I Load Management	C/I Conservation	Net Firm Demand
2004	14,752	211	14,541	0	813	567	534	227	13,405
2005	18,108	225	17,883	0	816	583	542	233	16,751
2006	19,683	225	19,458	0	823	600	550	240	18,311
2007	16,815	223	16,592	0	846	620	577	249	15,392
2008	18,055	163	17,892	0	868	644	636	279	16,551
2009	20,061	207	19,874	0	881	666	676	285	18,524
2010	24,346	500	23,846	0	895	687	721	291	22,730
2011	21,126	383	20,743	0	903	717	723	303	19,501
2012	17,934	382	17,552	0	856	755	722	314	16,356
2013	15,031	348	15,583	0	843	781	567	326	14,521

Historical Values (2004 - 2013):

Col. (2) - Col. (4) are actual values for historical Winter peaks. As such, they incorporate the effects of conservation (Col. 7 & Col. 9), and may incorporate the effects of load control if load control was operated on these peak days. Therefore, Col. (2) represents the actual Net Firm Demand. For year 2011, the actual peaked occurred in December of 2010.

Col. (5) - Col. (9) for 2003 through 2012 represent actual DSM capabilities starting from January 1988 and are annual (12-month) values.

Col. (10) represents a HYPOTHETICAL "Net Firm Demand" as if the load control values had definitely been exercised on the peak. Col. (10) is derived by the formula: Col. (10) = Col.(2) - Col.(6) - Col.(8).

Schedule 3.2
Forecast of Winter Peak Demand:Base Case

2006	117,116	2,078	1,901	113,137	1,569	7,909	103,659	59.2%
2007	118,518	2,136	2,068	114,315	1,499	7,401	105,415	59.4%
2008	115,379	2,249	2,126	111,004	993	7,092	102,919	60.0%
2009	115,844	2,345	2,196	111,303	1,155	7,394	102,755	56.5%
2010	119,220	2,487	2,259	114,475	2,049	7,870	104,557	58.7%
2011	117,460	2,683	2,324	112,454	2,176	6,950	103,327	59.4%
2012	116,083	2,823	2,394	110,866	2,237	6,403	102,226	58.9%
2013	117,087	2,962	2,469	111,655	2,158	6,713	102,784	59.1%

Historical Values (2004 - 2013):

Col. (2) represents derived "Total Net Energy For Load w/o DSM". The values are calculated using the formula: Col. (2) = Col. (3) + Col. (4) + Col. (5).

Col. (3) & Col. (4) are DSM values starting in January 1988 and are annual (12-month) values. Col. (3) and Col. (4) for 2013 are "estimated actuals" and are also annual (12-month) values. The values represent the total GWh reductions experienced each year.

Col. (5) is the actual Net Energy for Load (NEL) for years 2003 - 2013.

Col. (8) is the Total Retail Billed Sales. The values are calculated using the formula: Col. (8) = Col. (5) - Col. (6) - Col. (7). These values are at the meter.

Col. (9) is calculated using Col. (5) from this page and Col. (2), "Total", from Schedule 3.1 using the formula: Col. (9) = ((Col. (5)*1000) / ((Col. (2) * 8760) Adjustments are made for leap years.

Schedule 3.3
Forecast of Annual Net Energy for Load (GWh)
(All values are "at the generator" values except for Col (8))

(1) Year	(2) Forecasted Net Energy For Load without DSM GWh	(3) Residential Conservation GWh	(4) C/I Conservation GWh	(5) Net Energy For Load Adjusted for DSM GWh	(6) Sales for Resale GWh	(7) Utility Use & Losses GWh	(8) Forecasted Total Billed Retail Energy Sales w/o DSM GWh	(9) Load Factor(%)
2014	118,001	91	53	117,856	4,907	6,662	106,432	59.2%
2015	121,606	142	80	121,383	5,854	6,703	109,248	59.4%
2016	123,943	144	81	123,718	5,708	6,775	111,463	59.3%
2017	124,914	147	81	124,686	5,419	6,811	112,684	58.9%
2018	126,399	150	81	126,168	5,440	6,896	114,063	58.8%
2019	127,673	155	80	127,438	5,496	6,959	115,218	58.5%
2020	129,187	159	81	128,948	5,559	7,035	116,593	58.3%
2021	129,454	164	82	129,208	5,133	7,018	117,303	58.1%
2022	130,517	170	82	130,264	4,846	7,124	118,548	57.5%
2023	132,357	179	83	132,095	4,908	7,239	120,210	57.0%

Projected Values (2014 - 2023):

Col. (2) represents Forecasted Net Energy for Load and does not include incremental DSM from 2013 - on. The Col. (2) values are extracted from Schedule 2.3, Col(19). The effects of conservation implemented prior to September 2012 are incorporated into the load forecast values in Col. (2).

Col. (3) & Col. (4) are forecasted values of the reduction on sales from incremental conservation from Jan 2014 - on and are mid-year (6-month) values reflecting DSM signups occurring evenly thoughout each year.

Col. (5) is the forecasted Net Energy for Load (NEL) after adjusting for impacts of incremental DSM for years 2014 - 2023 using the formula: Col. (5) = Col. (2) - Col. (3) - Col. (4)

Col. (8) is the Total Retail Billed Sales. The values are calculated using the formula: Col. (8) = Col. (2) - Col. (6) - Col. (7). These values are at the meter.

Col. (9) is calculated using Col. (2) from this page and Col. (2), "Total", from Schedule 3.1. Col. (9) = ((Col. (2)*1000) / ((Col. (2) * 8760) Adjustments are made for leap years.

Schedule 4
Previous Year Actual and Two-Year Forecast of Retail Peak Demand and Net Energy for Load (NEL) by Month

(1)	(2)	(3)	(4)	(5)	(6)	(7)
	2013 Actual		2014 FORECAST		2015 FORECAST	
Month	Total Peak Demand MW	NEL GWh	Total Peak Demand MW	NEL GWh	Total Peak Demand MW	NEL GWh
JAN	15,135	8,089	19,875	8,719	20,971	9,093
FEB	15,627	7,468	17,441	7,781	18,050	8,126
MAR	15,931	7,936	17,273	8,753	17,875	9,103
APR	18,419	8,967	18,149	9,047	18,782	9,386

CHAPTER III

Projection of Incremental Resource Additions

(This page is left intentionally blank.)

III. Projection of Incremental Resource Additions

III.A FPL's Resource Planning:

FPL utilizes its well established integrated resource planning (IRP) process in whole or in part as analysis needs are warranted, to determine when new resources are needed, what the magnitude of the needed resources are, and what type of resources should be added. The timing and type of new power plants, the primary subjects of this document, are determined as part of the IRP process work.

This section describes FPL's basic IRP process. Some of the key assumptions, in addition to a new load forecast, that were used in developing the resource plan presented in this Site Plan are also discussed.

Four Fundamental Steps of FPL's Resource Planning:

There are 4 fundamental steps to FPL's resource planning. These steps can be generally described as follows:

Step 1: Determine the magnitude and timing of FPL's new resource needs;

Step 2: Identify which resource options and resource plans can meet the determined magnitude and timing of FPL's resource needs (i.e., identify competing options and resource plans);

Step 3: Evaluate the competing options and resource plans in regard to system economics and non-economic factors; and,

Step 4: Select a resource plan and commit, as needed, to near-term options.

Figure III.A.1 graphically outlines the 4 steps.

Overview of FPL's IRP Process

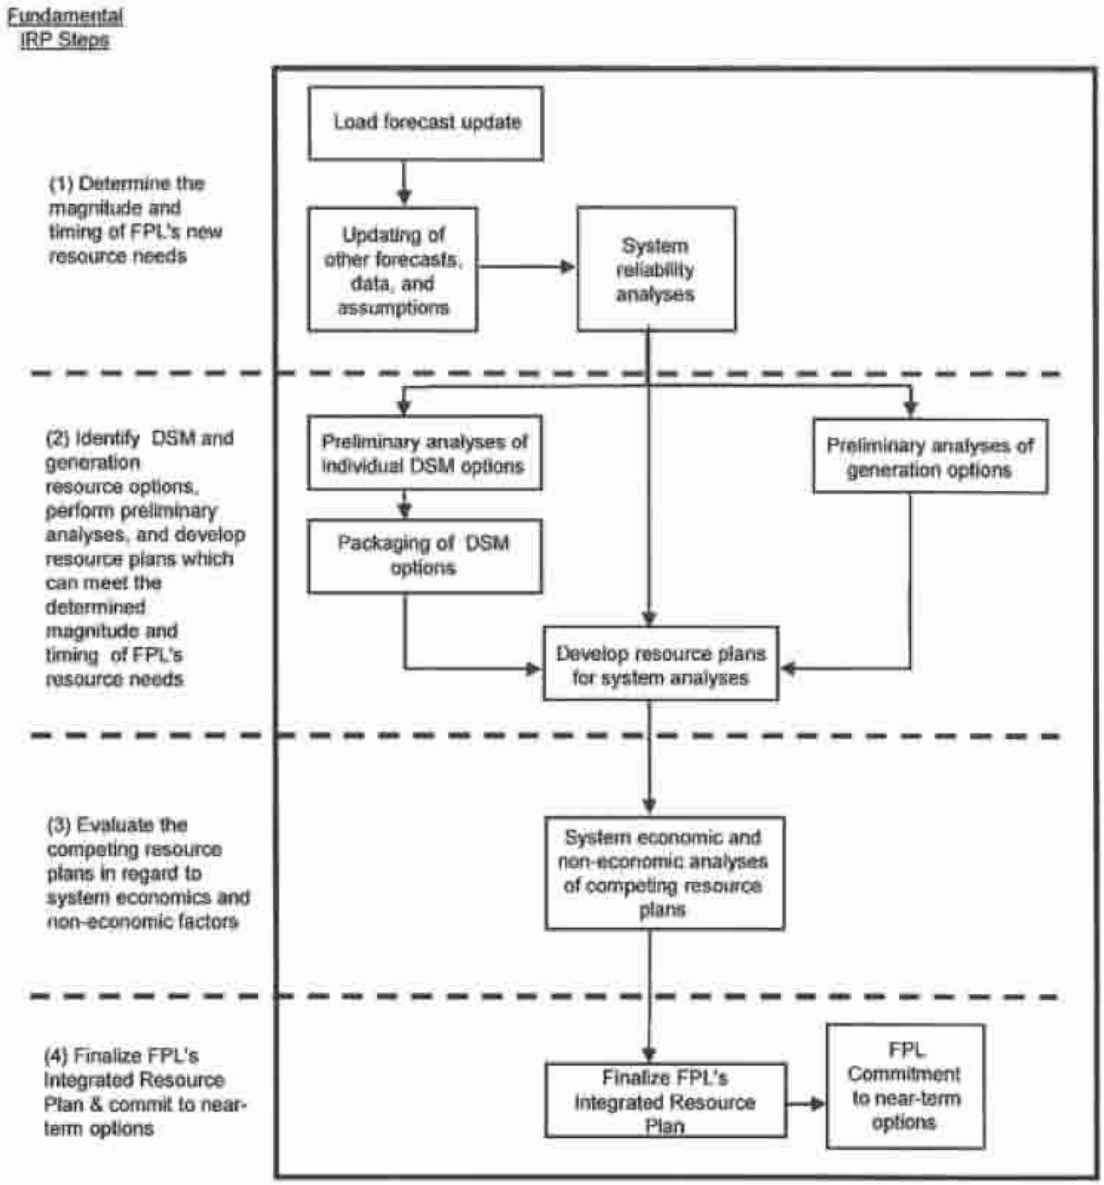

Figure III.A.1: Overview of FPL's IRP Process

Step 1: Determine the Magnitude and Timing of FPL's New Resource Needs:

The first of the four resource planning steps, determining the magnitude and timing of FPL's resource needs, is essentially a determination of the amount of capacity or megawatts (MW) of load reduction, new capacity additions, or a combination of both load reduction and new capacity additions that are needed to maintain system reliability. Also determined in this step is when the MW additions are needed to meet FPL's reliability criteria. This step is often referred to as a reliability assessment, or resource adequacy, analysis for the utility system.

Step 1 typically starts with an updated load forecast. Several databases are also updated in this first fundamental step, not only with the new information regarding forecasted loads, but also with other information that is used in many of the fundamental steps in resource planning. Examples of this new information include, but are not limited to: delivered fuel price projections, current financial and economic assumptions, and power plant capability and operating assumptions. FPL also includes key sets of assumptions regarding three specific types of resources: (1) FPL unit capacity changes, (2) firm capacity power purchases, and (3) demand side management (DSM) implementation.

<u>Key Assumptions Regarding the Three Types of Resources:</u>

The first set of assumptions, FPL unit capacity changes, is based on the current projection of new generating capacity additions and planned retirements of existing generating units. In FPL's 2014 Site Plan, there are five such projected capacity changes. These are listed below in chronological order:

1) <u>Planned retirement of existing Putnam Units 1 & 2:</u>

   Analyses conducted during 2013 and early 2014 showed that it would be cost-effective to retire the two existing units, Putnam Units 1 & 2, and replace the capacity with new combined cycle (CC) capacity at a later date and at a site to be determined. The new CC capacity would have a significantly better heat rate, thus reducing FPL's system fuel usage and system emissions. Consequently, FPL currently projects that the two existing units will be retired by the end of 2014.

2) <u>CT upgrades at existing CC plant sites:</u>

   In the fourth quarter of 2011, FPL started upgrading the 7FA combustion turbines (CT) that are components at a number of its existing CC units. These upgrades will economically benefit FPL's customers by increasing the MW output of these CC units by approximately 209 MW (Summer peak value) in total. As reflected in Schedule 1 in Chapter I, 133 MW of the increased capacity from these CT upgrades is already in service. The work for the remaining upgrades is continuing and the project is projected to be completed in 2015.

3) Modernization of the Port Everglades plant site:
The work to modernize the existing Port Everglades site by adding new combined cycle (CC) capacity continues. The new generating unit, called the Port Everglades Next Generation Clean Energy Center (PEEC), is projected to be in-service in mid-2016 and is projected to have a peak Summer output of 1,237 MW. The FPSC issued the final need order for this modernization project in April 2012 in Order No. PSC-12-0187-FOF-EI. The site certification order for the project, DOAH Case No. 12-0422EPP, was received for the Port Everglades project in October 2012. (Note that a similar modernization of the FPL's existing Riviera Beach plant site is scheduled to be completed on/near the April 1, 2014 filing date of this 2014 Site Plan.)

4) Retirement of existing gas turbines (GTs) in Broward County and partial capacity replacement with new combustion turbines (CTs) at FPL's Lauderdale plant site:
Due to new nitrogen dioxide (NO_2) environmental regulations, FPL filed in June 2013 for FPSC approval to recover costs for removing all of its existing GTs and replacing a portion of the GT capacity with new CTs. In December 2013, FPL withdrew this request pending additional environmental monitoring and analyses. Computer modeling of the emissions from the GTs projected that the GTs would exceed the new NO_2 limit. FPL believes this monitoring and analyses will confirm that the operation of its existing GTs in Broward County will not comply with the new NO_2 regulations. Therefore, for planning purposes, FPL has assumed that all of its existing Broward County GTs will be removed (a loss of 1,260 MW Summer) and that this capacity will be partially replaced by 5 new CTs that would be sited in Broward County (an increase of 1,005 MW Summer). This GT removal and CT partial replacement is assumed to occur by the end of 2018.

5) Turkey Point Nuclear Units 6 & 7:
FPL is continuing its work to obtain all of the licenses, permits, and approvals that will be necessary to construct and operate two new nuclear units at its Turkey Point site. These licenses, permits, and approvals will provide FPL with the opportunity to construct these nuclear units at Turkey Point for a time expected to be up to 20 years from the time the licenses and permits are granted, and then to operate the units for at least 40 years thereafter. FPL received need determination approval from the FPSC for the two nuclear units in April 2008 in Order No. PSC-08-0237-FOF-EI. The earliest deployment dates for these two new units, Turkey Point Units 6 & 7, remain 2022 and 2023, respectively. Each new nuclear unit is projected to have a peak Summer output of 1,100 MW.

Also in regard to FPL unit capacity changes, as part of FPL's planned acquisition of Vero Beach's electric utility system, FPL is projected to take ownership of Vero Beach's five existing generating units starting January 2015. The current plan, based on the units' poor economics, is to immediately retire three of these older generating units and operate the remaining two, which supply approximately 46 MW (Summer) of combined cycle capacity, for a maximum of three years.

The second set of assumptions involves firm capacity power purchases. FPL's current projection of firm capacity purchases has changed from the projection in the 2013 Site Plan in regard to only two purchases. As part of the projected agreement that FPL will begin serving Vero Beach's electrical needs beginning in January 2015, FPL has acquired two existing power purchase agreements totaling approximately 37 MW of coal-fired capacity. These agreements are now projected to run through the end of 2017 instead of 2016 as projected in FPL's 2013 Site Plan. In addition, FPL now projects that Internal Revenue Service (IRS) regulations regarding the amount of energy that FPL can receive under its purchase agreement with Jacksonville Electric Authority (JEA) for St. Johns Regional Power Park (SJRPP)-based capacity and energy will not result in the suspension of the delivery of capacity and energy receipts to FPL until April 2019. [4]

None of the other purchase projections has changed from those in the 2013 Site Plan. FPL's current projection includes an additional 70 MW from the Palm Beach Solid Waste Authority (SWA) starting in year 2015. In addition, FPL projects that it will begin receiving a total of 180 MW of firm capacity in 2021 from biomass-based power purchase agreements with EcoGen.

In total, the projected firm capacity purchases are from a combination of utility and independent power producers. Details, including the annual total capacity values for these purchases, are presented in Chapter I in Tables I.B.1 and I.B.2. These purchased capacity amounts were incorporated in FPL's resource planning work.

The third set of assumptions involves a projection of the amount of additional DSM that is anticipated to be implemented annually over the ten-year period. A key aspect of FPL's IRP process is the evaluation of DSM resources. Since 1994, FPL's resource planning work has assumed that, at a minimum, the DSM MW called for in FPL's FPSC-approved DSM Plan will be achieved. In 2014, FPL is required to propose new DSM Goals for the 2015 through 2024 time period. Those proposed goals will be filed with the FPSC on April 2, 2014; i.e., one day after this 2014 Site Plan is filed with the FPSC. FPL's filing to support its proposed DSM goals provides extensive detail regarding how DSM resources were evaluated in FPL's most current IRP planning

[4] FPL's projected suspension date for the SJRPP purchase is based on a system reliability perspective and represents the earliest projected date at which the suspension of capacity and energy could occur.

analyses. The DSM assumptions presented in this 2014 Site Plan, and which are assumed in the analyses whose results are reflected in the Site Plan, are consistent with FPL's proposed goals. The FPSC is expected to make a decision regarding FPL's 2015 – 2024 DSM Goals later in 2014.

The Three Reliability Criteria Used to Determine FPL's Projected Resource Needs:

These key assumptions, plus the other updated information described above, are then applied in the first fundamental step: the determination of the magnitude and the timing of FPL's future resource needs. This determination is accomplished by system reliability analyses which for FPL have traditionally been based on dual planning criteria of a minimum peak period reserve margin of 20% (FPL applies this to both Summer and Winter peaks) and a maximum loss-of-load probability (LOLP) of 0.1 day per year. Both of these criteria are commonly used throughout the utility industry. Beginning this year, FPL is also using a third reliability criterion: a 10% generation-only reserve margin (GRM) criterion.

Historically, two types of methodologies, deterministic and probabilistic, have been utilized in system reliability analysis. The calculation of excess firm capacity at the annual system peaks (reserve margin) is the most common method, and this relatively simple deterministic calculation can be performed on a spreadsheet. It provides an indication of the adequacy of a generating system's capacity resources compared to its load during peak periods. However, deterministic methods do not take into account probabilistic-related elements such as the impact of individual unit failures. For example: two 50 MW units which can be counted on to run 90% of the time are more valuable in regard to utility system reliability than is one 100 MW unit which can also be counted on to run 90% of the time. Probabilistic methods also recognize the value of being part of an interconnected system with access to multiple capacity sources.

For this reason, probabilistic methodologies have been used to provide an additional perspective on the reliability of a generating system. There are a number of probabilistic methods that are being used to perform system reliability analyses. Among the most widely used is loss-of-load probability (LOLP) which FPL utilizes. Simply stated, LOLP is an index of how well a generating system may be able to meet its firm demand (i.e., a measure of how often load may exceed available resources). In contrast to reserve margin, the calculation of LOLP looks at the daily peak demands for each year, while taking into consideration such probabilistic events as the unavailability of individual generators due to scheduled maintenance or forced outages.

LOLP is expressed in terms of the projected probability that a utility will be unable to meet its entire firm load at some point during a year. The probability of not being able to meet the entire firm load is calculated for each day of the year using the daily peak hourly load. These daily probabilities are then summed to develop an annual probability value. This annual probability value is commonly expressed as "the number of days per year" that the entire system firm load could not be met. FPL's standard for LOLP, commonly accepted throughout the industry, is a maximum of 0.1 day per year. This analysis requires a more complicated calculation methodology than does the reserve margin analysis. LOLP analyses are typically carried out using computer software models such as the Tie Line Assistance and Generation Reliability (TIGER) program used by FPL.

FPL's recent integrated resource planning work has resulted in FPL's resource plans showing a significant shift in the mix of generation and DSM resources over the next 10 years in regard to the relative contribution of these resources to system reliability. In order to gauge the extent of this shift and its potential implications for FPL's system reliability, FPL developed a new metric: a generation-only reserve margin (GRM). This GRM metric reflects reserves that would be provided only by actual generating resources. The GRM value is calculated by setting to zero all incremental energy efficiency (EE) and load management (LM), plus all existing LM, in a reserve margin calculation. The resulting GRM value provides an indication of how large a role generation is projected to play in each year as FPL maintains its 20% Summer and Winter "total" reserve margins (which account for both generation and DSM resources).

FPL has been reporting the GRM metric in its Site Plans since 2011 when it presented projections of its Summer GRM for the years 2011-2020. The 2011 projection showed a steady decrease in GRM values from a "balanced" 11.5% in 2011 to much reduced 7.2% by 2020. In its 2012 Site Plan, FPL's projected GRM values steadily decreased over the 10-year period from 16.2% in 2012 to 5.5% in 2021. The projected pattern in the 2013 Site Plan was similar: a steady decrease from 16.3% in 2013 to 6.9% in 2021. (The projected GRM value for 2022 presented in the 2013 Site Plan increased to 8.9% due to the planned addition of the new Turkey Point 6 nuclear unit in 2022.) Thus FPL's resource planning projections over the last 3 years have each shown a general downwards trend in projected GRM in the latter portion of this decade. This indicates increasing reliance on DSM resources, particularly EE resource additions, and decreasing reliance on generation resources, to maintain system reliability. As a result, FPL has analyzed what impact(s) this trend could have on system reliability. Two types of evaluations were conducted. One of these evaluations is from the perspective of FPL's system operators who are responsible for operating the bulk electric system. The other evaluation is from a resource planning perspective.

The first evaluation examined what impact an increasing reliance on EE resource additions was projected to have on the amount and type of reserves that operators would have at their disposal to meet load on a system peak hour. FPL first used a "looking back" perspective at a recent actual peak load day of January 11, 2010 to see how the system actually operated. Then, assuming a "what if" situation in which the system was assumed to have been designed to have an identical total reserve margin, but higher and lower GRM respectively, FPL analyzed what the impact would have been on FPL's ability to serve its customers on that peak day with these alternative assumed systems.

FPL also performed analyses taking a "looking forward" perspective at the projected year of 2021. Three scenarios were analyzed: (i) the system with its projected GRM and total reserve margin values consistent with the 2013 Site Plan; (ii) a system with an identical total reserve margin, but a higher GRM; and (iii) a system with an identical total reserve margin, but a lower GRM. Recognizing that the impacts from EE resource additions will already have been accounted for in the peak load that system operators must react to on an actual peak day, the analyses assumed an adverse peak day situation which consisted of significantly higher load and significantly less available generation than projected. The results from both the "looking back" and "looking forward" analyses were similar. For resource plans with identical total reserve margins, but different GRM levels, system operators were projected to have significantly higher levels (MW) of reserves, either generation and/or load management reserves, available on the peak days with a resource plan that had a higher GRM level than with a resource plan that had a lower GRM level. Thus a resource plan with a higher GRM, compared with a lower GRM, results in better system reliability for customers due to a greater likelihood of meeting customers' firm demand on peak load days, despite unexpected conditions or events. Better system reliability to customers translates to a reduced risk of shedding firm load.

The second evaluation was from the resource planning perspective of loss-of-load-probability (LOLP). For this evaluation, FPL also analyzed resource plans with identical total reserve margins, but higher and lower GRM levels. The results of these analyses for the FPL system showed that a resource plan with a higher GRM resulted in a projection of lower LOLP values than a resource plan with a lower GRM.

Based on these operational and resource planning evaluations, FPL has concluded that resource plans for its system with identical total reserve margins, but different GRM values, are not equal in regard to system reliability. A resource plan with a higher GRM value is projected to result in more MW being available to system operators on adverse peak load days, and in lower LOLP values, than a resource plan with a lower GRM value, even though both resource plans have an identical total reserve margin. Therefore, FPL has applied a minimum GRM criterion as a third reliability criterion in its resource planning process.

Based on the expertise and experience of FPL's system operators regarding the amount of generation MW needed for reliable operations, the GRM criterion is set at a minimum of 10% for Summer and Winter. From an operational perspective, FPL believes it is necessary to have approximately 2,650 MW of generation reserves. These reserves will allow FPL to address a variety of operational considerations including: (i) unplanned generation unavailability; (ii) the deployment of real-time operating reserves to meet its 15-minute obligations as part of the Florida Reserve Sharing Group; (iii) the requirement pursuant to NERC Reliability Standards to replace with other resources within 30 minutes following the unplanned loss of a large generation unit; and (iv) higher-than-forecasted loads. The sum of the operational reserves to cover for these requirements and considerations is approximately 2,650 MW. This MW value is consistent with a 10% GRM for the foreseeable future. FPL is planning its system so that the minimum 10% GRM criterion is met beginning in the Summer of 2019.

The 10% minimum Summer and Winter GRM criterion augments the two existing reliability criteria used by FPL: a 20% total reserve margin criterion for Summer and Winter, and a 0.1 day/year LOLP criterion. The total reserve margin and LOLP criteria continue to identify the timing and magnitude of FPL's future resource needs. The GRM criterion provides direction regarding the mix of generation and DSM resources that should be added to maintain and enhance FPL's system reliability.

Step 2: Identify Resource Options and Plans That Can Meet the Determined Magnitude and Timing of FPL's Resource Needs:

The initial activities associated with this second fundamental step of resource planning generally proceed concurrently with the activities associated with Step 1. During Step 2, preliminary economic screening analyses of new capacity options that are identical, or virtually identical, in regard to certain key characteristics may be conducted to determine which new capacity options appear to be the most competitive on FPL's system. This preliminary analysis work can also help identify capacity size (MW) values, projected construction/permitting schedules, and operating parameters and costs. Similarly, preliminary economic screening analyses of new DSM options and/or evaluation of existing DSM options are often conducted in this second fundamental IRP step.

FPL typically utilizes the P-MArea production cost model and a Fixed Cost Spreadsheet, and/or an optimization models and spreadsheet analyses, to perform the preliminary economic screening of generation resource options. For the preliminary economic screening analyses of DSM resource options, FPL typically uses its DSM CPF model which is an FPL spreadsheet model utilizing the FPSC's approved methodology for performing preliminary economic screening of individual DSM measures and programs. In addition, a years-to-payback screening test based on a two-year criterion is also used in the preliminary economic screening of individual DSM measures and programs. Then, as the focus of DSM analyses progresses from analysis of individual DSM measures to the development of DSM portfolios, FPL uses two additional models. One of these models is FPL's non-linear programming model that is used for analyzing the potential for lowering system peak loads through additional load management/demand response capability. The other model that FPL typically utilizes is its linear programming model with which FPL develops DSM portfolios.

The individual new resource options, both Supply options and DSM portfolios, emerging from these preliminary economic screening analyses are then typically "packaged" into different resource plans which are designed to meet the system reliability criteria. In other words, resource plans are created by combining individual resource options so that the timing and magnitude of FPL's projected new resource needs are met. The creation of these competing resource plans is typically carried out using spreadsheet and/or dynamic programming techniques.

At the conclusion of the second fundamental resource planning step, a number of different combinations of new resource options (i.e., resource plans) of a magnitude and timing necessary to meet FPL's resource needs are identified.

Step 3: Evaluate the Competing Options and Resource Plans in Regard to System Economics and Non-Economic Factors:

At the completion of fundamental steps 1 & 2, the most viable new resource options have been identified, and these resource options have been combined into a number of resource plans which meet the magnitude and timing of FPL's resource needs. The stage is set for evaluating these resource options and resource plans in system economic analyses that aim to account for all of the impacts to the FPL system from the competing resource options/resource plans. In FPL's 2013 and early 2014 resource planning work, once the resource plans were developed, FPL utilized the P-MArea production cost model and a Fixed Cost Spreadsheet, and/or the Strategist model, to perform the system economic analyses. Other spreadsheet models may also be used to further analyze the resource plans.

The basic economic analyses of the competing resource plans focus on total system economics. The standard basis for comparing the economics of competing resource plans is their relative impact on FPL's electricity rate levels, with the objective generally being to minimize FPL's projected levelized system average electric rate (i.e., a Rate Impact Measure or RIM methodology). In analyses in which the DSM contribution has already been determined through the same IRP process and FPSC approval, and therefore the only competing options were new generating units and/or purchase options, comparisons of competing resource plans' impacts on electricity rates and on system revenue requirements will yield identical outcomes in regard to the relative rankings of the resource options being evaluated. Consequently, the competing options and resource plans in such cases can be evaluated on a system cumulative present value revenue requirement (CPVRR) basis.

Other factors are also included in FPL's evaluation of resource options and resource plans. While these factors may have an economic component or impact, they are often discussed in quantitative, but non-economic, terms such as percentages, tons, etc. rather than in terms of dollars. These factors are often referred to by FPL as "system concerns" that include (but are not limited to) maintaining/enhancing fuel diversity in the FPL system, system emission levels, and maintaining a regional balance between load and generating capacity, particularly in the Southeastern Florida counties of Miami-Dade and Broward. In conducting the evaluations needed to determine which resource options and resource plans are best for FPL's system, the non-economic evaluations are conducted with an eye to whether the system concern is positively or negatively impacted by a given resource option or resource plan. These, and other, factors are discussed later in this chapter in section III.C.

Step 4: Finalizing FPL's Current Resource Plan

The results of the previous three fundamental steps are typically used to develop FPL's current resource plan. The current resource plan is presented in the following section.

III.B Projected Incremental Resource Additions/Changes in the Resource Plan

FPL's projected incremental generation capacity additions/changes for 2014 through 2023 are depicted in Table III.B.1. These capacity additions/changes include the 5 generation additions/changes previously discussed. The table shows three more generation changes: a CC unit being added in 2019, a short-term PPA of 129 MW being added in 2020, and a short-term PPA of 168 MW being added in 2021. The CC unit is added in 2019 to meet the Summer total reserve margin criterion and the two PPAs are added in 2020 and 2021 to meet the GRM criterion.

Although FPL's projected DSM additions that are developed in the IRP process are not explicitly presented in this table, these DSM additions have been fully accounted for in all of FPL's resource planning work reflected in this document. The projected MW reductions from these DSM additions are also reflected in the projected total reserve margin values shown in the table below and in Schedules 7.1 and 7.2 presented later in this chapter. DSM is further addressed later in this chapter in section III.D.

III.C Discussion of the Projected Resource Plan and Issues Impacting FPL's Resource Planning Work

As indicated in the Executive Summary, FPL's resource planning efforts in 2013 and early 2014 were influenced by a number of factors. These factors are expected to continue to influence FPL's resource planning work for the foreseeable future. In addition, other factors may also influence FPL's on-going resource planning work in the future and may result in changes to the resource plan discussed in this document. Eight (8) of these factors are discussed below (in no particular order of importance).

1) Maintaining/enhancing fuel diversity in the FPL system;
2) Maintaining a balance between load and generating capacity in Southeastern Florida, particularly in Miami-Dade and Broward Counties;
3) Updated projections of Federal and state energy efficiency codes and standards;
4) Decline in the projected cost-effectiveness of utility DSM measures and programs;
5) FPL's growing dependence upon DSM resources to maintain system reliability;
6) The schedule for the new Turkey Point Nuclear Units 6 & 7;
7) Environmental regulation and/or legislation; and,
8) Possible establishment of a Florida standard for renewable energy or clean energy.

These 8 factors, and their various impacts on FPL's resource planning efforts including the current resource plan that is presented in this Site Plan, are briefly discussed below.

1. Maintaining/Enhancing System Fuel Diversity:

FPL currently uses natural gas to generate approximately 2/3 of the total electricity it delivers to its customers. In the future, the percentage of FPL's electricity that is generated by natural gas is projected to remain at a high level. For this reason, and due to evolving environmental regulations, FPL is continually seeking opportunities to economically maintain and enhance the fuel diversity of its system.

In 2007, following express direction by the FPSC to do so, FPL sought approval from the FPSC to add two new advanced technology coal units to its system. These two new units would have been placed in-service in 2013 and 2014. However, in part due to concerns over potential greenhouse gas emission legislation/regulation, FPL was unable to obtain approval for these units. Several other factors are currently unfavorable to new coal units compared to new CC units. The first of these factors is a significant reduction in the fuel cost difference between coal and natural gas compared to the fuel cost difference projected in 2007 that favored coal; i.e., the projected fuel cost advantage of coal versus natural gas has been significantly reduced. Second is the continuation of significantly higher capital costs for coal units compared to capital costs for CC units. Third is the increased fuel efficiency of new CC units compared to projected CC unit efficiencies in 2007. Fourth are existing and proposed environmental regulations, including those that address greenhouse gas emissions, that are unfavorable to new coal units when compared to new CC units. Consequently, FPL does not believe that new advanced technology coal units are currently economically, politically, or environmentally viable fuel diversity enhancement options in Florida.

Therefore, FPL has turned its attention to nuclear energy and renewable energy to enhance its fuel diversity, to diversifying the sources of natural gas, to diversifying the gas transportation paths used to deliver natural gas to FPL's generating units, and to using natural gas more efficiently. In regard to nuclear energy, in 2008 the FPSC approved the need to increase capacity at FPL's four existing nuclear units and authorized FPL to recover project-related expenditures that are approved as a result of annual nuclear cost recovery filings. FPL has now successfully completed the nuclear capacity uprate project. Approximately 520 MW of additional nuclear capacity were delivered by the project which represents an increase of approximately 30% more capacity than was originally forecasted when the project began. FPL's customers are already benefitting from lower fuel costs and reduced system emissions provided by this additional nuclear capacity.

FPL is continuing its work to obtain all of the licenses, permits, and approvals that would be necessary to construct and operate two new nuclear units at its Turkey Point site in the future. These licenses, permits, and approvals will provide FPL with the opportunity to construct these nuclear units at Turkey Point for a time expected to be up to 20 years from the time the licenses and permits are granted, and then to operate the units for at least 40 years thereafter. The earliest deployment dates for the two new nuclear units, Turkey Point Units 6 & 7, remain 2022 and 2023, respectively.

FPL also has been involved in activities to investigate adding or maintaining renewable resources as a part of its generation supply. One of these activities is a variety of discussions with the owners of existing facilities aimed at maintaining or extending current agreements. In addition, FPL considers new cost-effective renewable energy projects such as the power purchase agreements with EcoGen that will result in FPL receiving 180 MW of firm capacity from biomass facilities beginning in 2021.

FPL also sought and received approval from the FPSC in 2008 to add 110 MW through three new FPL-owned solar facilities: one solar thermal facility and two photovoltaic (PV) facilities.

One 25 MW PV facility began commercial operation in 2009. The remaining two solar facilities, a 10 MW PV facility and a 75 MW solar thermal steam generating facility, began commercial operation in 2010. The addition of these renewable energy facilities was made possible due to enabling legislation from the Florida Legislature in 2008. FPL remains strongly supportive of federal and/or state legislation that enables electric utilities to add renewable energy resources and authorize the utilities to recover appropriate costs for these resources. FPL is planning to introduce two new PV-based solar programs in 2014. These are discussed further in section III.F.4 of this chapter.

In regard to using natural gas more efficiently, FPL received approvals in 2008 from the FPSC to modernize the existing Cape Canaveral and Riviera Beach plant sites with new, highly efficient CC units that replace the former steam generating units on each of those sites. The Cape Canaveral modernization was commissioned on April 24, 2013 and the Riviera Beach modernization is projected to go in-service on/near the April 1, 2014 date this 2014 Site Plan is filed with the FPSC. On April 9th, 2012, FPL received FPSC approval to proceed with a similar modernization project at the Port Everglades site which is scheduled for completion in mid-2016. The modernization of the Port Everglades site will retain the capability of receiving water-borne delivery of oil as a backup fuel.

In regard to diversity in natural gas sourcing and delivery, in 2013 FPL was granted approval from the FPSC to build a new 3rd natural gas pipeline into Florida and FPL's service territory. The process to obtain approval for the new pipeline from the Federal Energy Regulatory Commission (FERC) is underway. The new pipeline will utilize a new route that will result in a more reliable, more economic, and more diverse natural gas supply for FPL's customers and the state of Florida.

In the future, FPL will continue to identify and evaluate alternatives that may maintain or enhance system fuel diversity. In this regard, FPL is maintaining the ability to utilize fuel oil at existing units that have that capability. For this purpose, FPL has installed electrostatic precipitators (ESPs) at its two 800 MW steam generating units at the Manatee site and at one of its two 800 MW steam generating units at the Martin site. FPL is in the process of installing ESPs on its remaining 800 MW steam generating unit at the Martin site. These installations will enable FPL to retain the ability to burn oil, as needed, at these sites while retaining the flexibility to use natural gas when economically attractive.

2. Maintaining a Balance Between Load and Generation in Southeastern Florida:

An imbalance has existed between regionally installed generation and regional peak load in Southeastern Florida. As a result of that imbalance, a significant amount of energy required in the Southeastern Florida region during peak periods is provided by operating less efficient generating units located in Southeastern Florida out of economic dispatch, by importing the energy through the transmission system from plants located outside the region, or by a combination of the two. FPL's prior planning work concluded that, as load inside the region grows, either additional installed generating capacity in this region, or additional installed transmission capacity capable of delivering more electricity from outside the region, would be required to address this imbalance.

Partly because of the lower transmission-related costs resulting from their location, four recent capacity addition decisions (Turkey Point Unit 5 and WCEC Units 1, 2, & 3) were determined to be the most cost-effective options to meet FPL's capacity needs in the near-term. In addition, FPL has added increased capacity at FPL's existing two nuclear units at Turkey Point as part of the previously mentioned nuclear capacity uprates project. The Port Everglades modernization project scheduled for completion in 2016 will also assist in addressing this imbalance. Adding the additional generation capacity through the projects mentioned above contributes to addressing the imbalance between generation, transmission capacity, and load in Southeastern Florida for approximately the remainder of this decade.

The planned addition of two new nuclear units at FPL's Turkey Point site, Turkey Point Unit 6 in 2022 and Turkey Point Unit 7 in 2023, will also address the imbalance issue for an additional period of time beginning in the next decade. Due to forecasted steadily increasing load in the Southeastern region, the Southeastern Florida imbalance issue will remain an important consideration in FPL's on-going resource planning work in future years.

3. Projections of Federal and State Energy Efficiency Codes and Standards:

As discussed in Chapter II, FPL's load forecast includes projected impacts from federal and state energy efficiency codes and standards. The magnitude of energy efficiency that is now projected to be delivered to FPL's customers through these codes and standards is significant.

In FPL's 2013 Site Plan, the projected cumulative Summer peak impact for the year 2022 from the codes and standards since 2005 was 2,898 MW compared to what the projected load would have been without the codes and standards. The current projection of cumulative Summer peak impact for the year 2023 from the codes and standards since 2005 is 3,477 MW.

In addition to lowering FPL's load forecast from what it otherwise would have been, and thus serving to lower FPL's projected resource needs, this projection of efficiency from the codes and standards also affects FPL's resource planning in another way. The projected impacts from the efficiency codes and standards lower the potential for utility DSM programs to deliver energy efficiency for the appliances and equipment that are directly addressed by the codes and standards. This effect is taken into account in FPL's proposed DSM Goals for the 2015 – 2024 time period and it is one reason why FPL's resource plan shows a diminished role for utility DSM for the years addressed by this 2014 Site Plan.

4. **Decline in the Projected Cost-Effectiveness of Utility DSM Measures and Programs:** There is another important reason why FPL's resource plan currently shows a diminished role for utility DSM: a decline in the projected cost-effectiveness of utility DSM measures and programs. The supporting testimony that FPL is filing in the DSM Goals proceeding discusses in detail the reasons for the declining cost-effectiveness of DSM. One portion of that discussion is summarized here for illustrative purposes.

The cost-effectiveness of DSM is driven in large part by the potential benefits that the kw (demand) reduction and kwh (energy) reduction characteristics of DSM programs are projected to provide. This discussion focuses solely on the current projection of potential benefits that DSM's kwh reductions can provide. At least three factors are each resulting in projections of lower kwh reduction-based benefits and thus projections of lower DSM cost-effectiveness.

The first factor is lower fuel costs. For example, comparing current fuel cost forecasts with those forecasted in 2009 – the year when FPL's DSM Goals were last set by the FPSC – shows that current forecasted fuel costs are now much lower than those forecasted in 2009, particularly in the near-term. This can be seen by comparing the 2009 and current forecasted costs ($/mmBTU) for natural gas for two specific years addressed in this Site Plan and which were addressed in the 2009 DSM goals-setting: 2015 and 2019:

Year	2009 Forecast	Current Forecast
2015	$9.64	$4.26
2019	$12.63	$6.15

As shown from these values, natural gas prices are currently forecast to be less than 50% of what they were forecast to be in 2009 when DSM goals were last set. Although lower forecasted natural gas costs are a very good thing for FPL's customers, lower fuel costs also result in lower potential fuel savings benefits from the kWh reductions of DSM measures. These lowered benefit values result in DSM being less cost-effective.

A second factor contributing to the decline in the cost-effectiveness of utility DSM is the steadily increasing efficiency with which FPL generates electricity. FPL's generating system has steadily gotten more efficient in regard to its ability to generate electricity using less fossil fuel. For example, FPL used 20% less fossil fuel to generate the same number of kwh in 2012 than it did in 2001. This is a very good thing for FPL's customers because it helps to significantly lower fuel costs.

The improvements in generating system efficiency affect DSM cost-effectiveness in much the same way that lower forecasted fuel costs do: both lower the fuel costs of energy delivered to FPL's customers. Therefore, the improvements in generating system efficiency further reduce the potential fuel savings benefits from the kWh reduction impacts of DSM, thus lowering potential DSM benefits and DSM cost-effectiveness.

A third factor for declining cost-effectiveness of utility DSM is due to significant changes in projected carbon dioxide (CO_2) compliance costs. For example, comparing CO_2 compliance forecasts with those forecasted in 2009 – the year when FPL's DSM Goals were last set by the FPSC – shows that current forecasted compliance costs are much lower than those forecasted in 2009, particularly in the near-term. This can be seen by comparing the 2009 and current forecasted costs ($/ton) for two specific years addressed in this Site Plan and which were addressed in the 2009 DSM goals-setting: 2015 and 2019:

Year	2009 Forecast	Current Forecast
2015	$17.00	$0.00
2019	$25.00	$0.00

(FPL's current forecast does not project non-zero CO_2 compliance costs until the year 2023.) While lower forecasted CO_2 compliance costs are again a good thing for FPL's customers, lower compliance costs also result in lower compliance cost savings benefits from the kWh reductions of DSM measures. These lower potential DSM benefits again result in lowering DSM cost-effectiveness.

Each of these three factors discussed above – lower forecasted fuel costs, greater efficiency in FPL's electricity generation, and lower forecasted CO_2 compliance costs – are good for FPL's customers because they will result in lower electric rates. Although good for FPL's customers, these factors also contribute to lowering the cost-effectiveness of utility DSM programs. Therefore, these factors (and other factors not discussed above), plus the growing impacts of energy efficiency codes and standards, lead to FPL's resource plan showing a diminished role for utility DSM.

5. **FPL's Increasing Dependence On DSM Resources to Maintain System Reliability:**

As discussed earlier in section III.A of this chapter, FPL's 2011, 2012, and 2013 Site Plans each projected that FPL's system was becoming increasingly dependent upon DSM resources to maintain system reliability. FPL's analyses of this projected trend showed that, from an operational perspective, there can be significant differences between resources plans on the peak day even though the resource plans have identical total reserve margins. For this reason, FPL has begun using a 10% minimum generation-only reserve margin (GRM) in its resource planning work to complement its existing 20% total reserve margin and 0.1 day/year LOLP reliability criteria. FPL will begin applying the GRM criterion in the year 2019.

6. **The Schedule for the New Turkey Point Nuclear Units 6 & 7:**

At the time the 2014 Site Plan is being finalized, the schedule for the project is under review. Several items will be considered that potentially influence the project schedule, including the Nuclear Regulatory Commission's (NRC's) schedule for reviewing the Combined Operating License Application (COLA), the impacts of the recently amended nuclear cost recovery clause (NCRC) statute, and the ongoing feasibility analyses that are part of the NCRC process.

7. **Environmental Regulation and/or Legislation:**

The seventh factor is environmental regulation. As developments occur in regard to either new environmental regulations, and/or in how environmental regulations are interpreted and applied, the potential exists for such developments to affect FPL's resource plan that is presented in this document. For example, FPL is aware of potential impacts to generating units of recent EPA changes to the National Ambient Air Quality Standards that include shorter duration 1-hour standards for nitrogen dioxide (NO_2) and sulfur dioxide (SO_2). As a consequence, FPL filed in mid-2013 for FPSC approval to recover costs through the environmental cost recovery clause for removing all of its existing gas turbines (GTs) and partially replacing that peaking unit capacity with new combustion turbines (CTs). Although FPL withdrew its filing in December 2014 pending further analyses including on-site monitoring, FPL believes that the results of the monitoring and analyses will require that the Broward GTs be replaced. Therefore, FPL is currently projecting the retirement of all GTs in Broward County; i.e., at its existing Lauderdale and Port Everglades plant sites (a decrease in generating capacity of 1,260 MW Summer), and the installation of 5 new 201 MW CTs at its existing Lauderdale plant site (an increase of 1,005 MW Summer), both by the end of 2018.

8. **Possible establishment of a Florida standard for renewable energy or clean energy:** Although no such legislation has been enacted to-date, Renewable Portfolio Standards (RPS) or Clean Energy Portfolio Standard (CPS) legislation, or other legislative initiatives regarding renewable or clean energy contributions, may occur in the future at either the state or national level. If such legislation is enacted, FPL would then determine what steps need to be taken to address the legislation.

Each of these 8 factors will continue to be examined in FPL's on-going resource planning work during the rest of 2014 and in future years.

III.D Demand Side Management (DSM)

FPL has sought out and implemented cost-effective DSM programs since 1978 and DSM has been a key focus of FPL's IRP process for decades. During that time FPL's DSM programs have included numerous energy efficiency and load management initiatives. FPL's DSM efforts through 2013 have resulted in a cumulative Summer peak reduction of approximately 4,753 MW (Summer) at the generator and an estimated cumulative energy saving of approximately 66,782 Gigawatt Hour (GWh) at the generator. After accounting for the 20% total reserve margin requirement, FPL's DSM efforts through 2013 have eliminated the need to construct the equivalent of approximately 14 new 400 MW power plants.

FPL has consistently been among the leading utilities nationally in DSM achievement. For example, according to the U.S. Department of Energy's 2012 data (the last year for which the DOE data was available at the time this Site Plan is being developed), FPL ranked # 2 nationally in cumulative DSM demand reduction. And, importantly, FPL has achieved these significant DSM accomplishments while minimizing the DSM-based impact on electric rates for all of its customers.

In 2014, new DSM Goals for the years 2015 through 2024 will be set for FPL by the FPSC. As part of this goals-setting process, FPL must propose new DSM Goals for this time period based on its most recent resource planning analyses. The results of those analyses are reflected in this 2014 Site Plan and FPL is filing its proposed new DSM Goals on April 2, 2014 (i.e., one day after the 2014 Site Plan is filed). As discussed in the previous section of this chapter, two factors have influenced the analyses that led to the amount of DSM that FPL is proposing as its new DSM Goals: (i) increased energy efficiency that will be delivered to FPL's customers through Federal and state energy efficiency codes and standards; and (ii) a decline in the projected cost-effectiveness of DSM measures.

Based on these factors and FPL's most recent resource planning analyses, FPL is proposing that its DSM Goals be set at 337 MW of Summer MW reduction. After accounting for the 20% total reserve margin requirements, this represents the elimination of the need to construct the equivalent of another 400 MW power plant. The resource plan presented in this 2014 Site Plan accounts for the proposed amount of annual DSM implementation through the year 2023 and the DSM contribution is shown in Schedules 7.1 and 7.2 that appear later in this chapter. The FPSC is expected to make its decision regarding what FPL's DSM Goals will be for 2015 through 2024 later this year.

III.E Transmission Plan

The transmission plan will allow for the reliable delivery of the required capacity and energy to FPL's retail and wholesale customers. The following table presents FPL's proposed future additions of 230 kV bulk transmission lines that must be certified under the Transmission Line Siting Act.

Table III.E.1: List of Proposed Power Lines

(1) Line Ownership	(2) Terminals (To)	(3) Terminals (From)	(4) Line Length CKT. Miles	(5) Commercial In-Service Date (Mo/Yr)	(6) Nominal Voltage (KV)	(7) Capacity (MVA)
FPL	St. Johns [1/]	Pringle	25	Dec – 18	230	759
FPL	Manatee [2/]	Bob White	30	Dec – 14	230	1195

1/ Final order certifying the corridor was issued on April 21, 2006. This project is to be completed in two phases. Phase I consisted of 4 miles of new 230 kV line (Pringle to Pellicer) and was completed in May-2009. Phase II consists of 21 miles of new 230 kV line (St. Johns to Pellicer) and is scheduled to be completed by Dec-2018.

2/ Final order certifying the corridor was issued on November 6, 2008. This project consists of 30 miles of new 230 kV line (Manatee to Bob White) and is scheduled to be completed by Dec-2014

In addition, there will be transmission facilities needed to connect several of FPL's projected generating capacity additions to the system transmission grid. These transmission facilities (described on the following pages) are for the Port Everglades modernization, the planned Lauderdale gas turbine replacements, and the planned new nuclear capacity addition at the Turkey Point site from Turkey Point Units 6 & 7.[5] Please see discussion in the Turkey Point Preferred Site section, subsection r, of the possibility of a transmission corridor/land swap between FPL and the National Park Service. At the time the 2014 Site Plan is being prepared, no

[5] Please see discussion in the Turkey Point Preferred Site section, subsection r of the possibility of a transmission corridor/land sway between FPL and National Park Service.

site has been selected for the planned addition of a CC unit in 2019. Therefore, no transmission information for this new unit is presented.

II.E.1 Transmission Facilities for Port Everglades Next Generation Clean Energy Center (Modernization)

The work required to connect the Port Everglades Next Generation Clean Energy Center in 2016 to the FPL grid is projected to be:

I. Substation:

1. Construct two string busses to connect two combustion turbines (CT) to the Port Everglades 138 kV Substation.
2. Construct two string busses to connect one CT, and one steam turbine (ST) to the Port Everglades 230 kV Substation.
3. Add four main step-up transformers (3-450 MVA, 1- 580 MVA), one for each CT, and one for the ST.
4. Replace ten (10) 138 kV breakers.
5. Replace eight (8) 230 kV breakers.
6. At Port Everglades Switchyard replace twenty-two 138 kV disconnect switches. Also upgrade associated jumpers, bus work, and equipment connections.
7. Expand switchyard relay vault and add relays and other protective equipment.

II. Transmission:

1. Upgrade of existing transmission facilities:
   - An ampacity upgrade up to 1905 amps on the Port Everglades-Port Everglades Tap 138kV line section.
   - An ampacity upgrade up to 1905 amps on the Port Everglades Tap-Port Everglades Tap 2 138 kV line section.
   - An ampacity upgrade up to 1695 amps on the Port Everglades Tap 1-Dania 138 kV line section.
   - An ampacity upgrade up to 1695 amps on the Dania-Hollywood 138 kV line section.

III.E.2 Transmission Facilities for the Lauderdale GT Replacement Project

The work required to connect the five Lauderdale combustion turbines (CT) in 2018 to the FPL grid is projected to be:

I. Substation:

1. Construct a collector switchyard for the five (5) CTs at Lauderdale Plant.
2. Install five (5) main step-up transformers (5 - 320 MVA), one for each CT.
3. Construct one 230 kV collector buss to connect two (2) CT step-up transformers to collector switchyard.
4. Construct one 138 kV collector buss to connect two (2) CT step-up transformers to collector switchyard.
5. Construct Cable Termination Structures (CTS) in the collector switchyard and the Lauderdale 138 kV Substation to connect the 138 kV collector buss for the two CTs to the Lauderdale 138 kV Substation Outside Bus.
6. Construct CTS in the collector switchyard and the Lauderdale 138 kV Substation to connect the fifth CT to the Lauderdale 138 kV Substation Inside Bus.
7. Add relays and other protective equipment.

II. Transmission:

1. Construct overhead 230 kV string bus to connect the 230 kV collector buss to the Lauderdale 230 kV Substation Inside Bus.
2. Construct two (2) underground 138 kV cables connecting the collector switchyard to the Lauderdale Substation Inside and Outside Busses.

III.E.3 Transmission Facilities for Turkey Point Nuclear Unit 6

The work required to connect the Turkey Point Nuclear Unit 6 by Summer 2022 to the FPL grid is projected to be:

I. Substation:

1. Build new Clear Sky 500/230kV Switchyard with six (6) bays on the 230 kV section for generator main step-up transformer connection, reserve auxiliary transformer connections, four (4) 230 kV line terminals, two (2) autotransformers and two (2) 500 kV line terminals.
2. At Turkey Point Switchyard add a new bay to accommodate the Turkey Point-Clear Sky 230 kV line terminal.
3. At Pennsuco Substation install a fourth line terminal to accommodate the Pennsuco-Clear Sky 230 kV line by converting the ring bus to a breaker and a half scheme and adding four (4) 230 kV breakers.
4. At Davis Substation construct two (2) new 230kV line terminals for the Clear Sky-Davis 230 kV line and the Davis-Miami 230 kV line.
5. At Levee Substation expand 500 kV section to accommodate the two (2) Levee-Clear Sky 500 kV lines.
6. At Andytown Substation install two (2) 5-Ohm inductors combined with external shunt capacitors on the 230kV side of the 500/230 autotransformers (one per auto).
7. At Miami Substation expand the 230kV section to a double bus configuration and add a new 230kV line terminal for Davis line and replace one (1) autotransformer.
8. Breaker replacements:
   Flagami Substation – Replace five (5) 230 kV breakers and three (3) 138 kV breakers
   Miami Substation – Replace one (1) 230 kV breaker and four (4) 138 kV breakers
   Davis Substation - Replace two (2) 230 kV breakers

II. Transmission:

1. FPL will design and construct two (2) 500kV transmission lines from the new Clear Sky Substation to the existing FPL Levee 500kV Substation switchyard. The lines will be approximately 43 miles long.
2. Construct a new Clear Sky-Davis 230kV line (approximately 19 miles) with a rating of 2990 Amperes.
3. Construct a new Clear Sky-Pennsuco 230kV line (approximately 52 miles) with a rating of 2990 Amperes.
4. Construct a new Davis-Miami 230kV line (approximately 18 miles) with a rating of 2297 Amperes.
5. Construct a new Clear Sky-Turkey Point 230kV line (approximately 0.5 miles) with a rating of 2990 Amperes.

III.E.4 Transmission Facilities for Turkey Point Nuclear Unit 7

The work required to connect the Turkey Point Nuclear Unit 7 by Summer 2023 to the FPL grid is projected to be:

I. Substation:

1. At Gratigny Substation install a second 230/138 kV autotransformer with one (1) 230 kV breaker and one (1) 138 kV breaker.
2. At Davis Substation construct a switch-able inductor to be installed on the Davis-Miami 230 kV line.
3. At Flagami Substation install a small inductor on one end of the Flagami-Miami 230kV #2 circuit.
4. Breaker replacements:
   Dade Substation - Replace seven (7) 230 kV breakers
   Court Substation – Replace one (1) 138 kV breaker.

II. Transmission:

1. The transmission line facilities required for Turkey Point Unit 7 will be constructed with the transmission line facilities needed for Turkey Point Unit 6, as described above in section III. E.3.

III.F. Renewable Resources

FPL has been the leading Florida utility in examining ways to effectively utilize renewable energy technologies to serve its customers. FPL has been involved since 1976 in renewable energy research and development and in facilitating the implementation of various renewable energy technologies. For purposes of discussing FPL's renewable energy efforts in this document, those efforts will be placed into five categories.

Two of these categories are Supply-Side Efforts – Power Purchases, and Supply-Side Efforts – FPL Facilities. Since 2011, the energy (MWh) total output from these renewable energy sources has been greater than the energy produced from oil-fired generation. The renewable energy information is presented in Schedule 11.1, and the oil-based energy information is presented in Schedule 6.1 and in Schedule 11.1. Both of these schedules are presented at the end of this chapter.

1) <u>Early Research & Development Efforts:</u>

FPL assisted the Florida Solar Energy Center (FSEC) in the late 1970s in demonstrating the first residential photovoltaic (PV) system east of the Mississippi. This PV installation at FSEC's Brevard County location was in operation for over 15 years and provided valuable information about PV performance capabilities in Florida on both a daily and annual basis. FPL later installed a second PV system at the FPL Flagami substation in Miami. This 10-kilowatt (kW) system was placed into operation in 1984. (The system was removed in 1990 at the conclusion of the PV testing to make room for substation expansion.)

For a number of years, FPL maintained a thin-film PV test facility located at the FPL Martin Plant Site. This FPL PV test facility was used to test new thin-film PV technologies and to identify design, equipment, or procedure changes necessary to accommodate direct current electricity from PV facilities into the FPL system. Although this testing has ended, the site became the home for PV capacity which was installed as a result of other FPL renewable energy initiatives.

2) <u>Demand Side & Customer Efforts:</u>

In terms of utilizing renewable energy sources to meet its customers' needs, FPL initiated the first utility-sponsored conservation program in Florida designed to facilitate the implementation of solar technologies by its customers. FPL's Conservation Water Heating Program, first implemented in 1982, offered incentive payments to customers who chose solar water heaters. Before the program ended (due to the fact that it was no longer projected to be cost-effective), FPL paid incentives to approximately 48,000 customers who installed solar water heaters.

In the mid-1980s, FPL introduced another renewable energy program, FPL's Passive Home Program. This program was created in order to broadly disseminate information about passive solar building design techniques which are most applicable in Florida's climate. As part of this program, three Florida architectural firms created complete construction blueprints for six passive home designs with the assistance of the FSEC and FPL. These designs and blueprints were available to customers at a low cost. During its existence, this program was popular and received a U.S. Department of Energy award for innovation. The program was eventually phased out due to a revision of the Florida Model Energy Building Code (Code). This revision was brought about in part by FPL's Passive Home Program. The revision incorporated into the Code was one of the most significant passive design techniques highlighted in the program: radiant barrier insulation.

In early 1991, FPL received approval from the FPSC to conduct a research project to evaluate the feasibility of using small PV systems to directly power residential swimming pool pumps. This research project was completed with mixed results. Some of the performance problems identified in the test were deemed to be solvable, particularly when new pools are constructed. However, challenges included the significant percentage of sites with unacceptable shading and various customer satisfaction issues.

FPL has since continued to analyze and promote the utilization of PV. These efforts have included PV research, development, and education, as well as development and implementation of the FPL Next Generation Solar Station Program. This initiative also delivers teacher training and curriculum that is tied to the Sunshine Teacher Standards in Florida. The program provides teacher grants to promote and fund projects in the classrooms.

In addition, FPL assists customers who are interested in installing PV equipment at their facilities. Consistent with Florida Administrative Code Rule 25-6.065, Interconnection and Net Metering of Customer-Owned Renewable Generation, FPL works with customers to interconnect these customer-owned PV systems. Through December 2013, approximately 2,565 customer systems (predominantly residential) have been interconnected.

As part of its 2009 DSM Goals decision, the FPSC imposed a requirement for Florida's investor-owned utilities to spend up to a set, not-to-exceed amount of money annually to facilitate demand side solar water heater and PV applications. FPL's not-to-exceed amount of money for these applications is approximately $15.5 million per year through 2014. In regard to this direction, FPL received approval from the FPSC in 2011 to initiate a solar pilot portfolio that consists of three PV-based programs and three solar water heating-based programs, plus Conservation Research and Development. These programs are currently projected to be offered through 2014. FPL's analyses of the results to-date from these programs shows that none of these programs are projected to be cost-effective using any of the three cost-effectiveness screening tests used by the State of Florida. The fate of these solar programs, including their potential replacement with new solar initiatives, will be determined later in 2014 as part of the FPSC's 2014 DSM Goals docket.

FPL has also been investigating fuel cell technologies through monitoring of industry trends, discussions with manufacturers, and direct field trials. From 2002 through the end of 2005, FPL conducted field trials and demonstration projects of Proton Exchange Membrane (PEM) fuel cells with the objectives of serving customer end-uses while evaluating the technical performance, reliability, economics, and relative readiness of the PEM technology. The demonstration projects were conducted in partnership with customers and included five locations. The research projects were useful to FPL in identifying specific issues that can occur in field applications and the current commercial viability of this technology. FPL will continue to monitor the progress of these technologies and conduct additional field evaluations as significant developments in fuel cell technologies occur.

3) <u>Supply Side Efforts – Power Purchases:</u>

FPL has also facilitated renewable energy projects (facilities which burn bagasse, waste wood, municipal waste, etc.). Firm capacity and energy, and as-available energy, have been purchased by FPL from these types of facilities. (Please refer to Tables I.B.1, I.B.2, and I.C.1 in Chapter I).

FPL issued Renewable Requests for Proposals (RFPs) in 2007 and 2008 soliciting proposals to provide firm capacity and energy, and energy only, at or below avoided costs, from renewable generators. FPL also promptly responds to inquiries for information from prospective renewable energy suppliers either by e-mail or phone.

On April 22, 2013 in Order No. PSC-13-1064-PAA-EQ, the FPSC approved three 60 MW power purchase agreements with affiliates of U.S. EcoGen for biomass-fired renewable energy facilities. These facilities are expected to begin service in 2019, and to begin providing firm renewable energy and capacity to FPL's customers in 2021.

With regard to existing contracts that have recently ended, FPL and the Solid Waste Authority of Palm Beach (SWA) agreed to extend their contract that expired March 31, 2010 for a 20-

year term beginning in April 1, 2012 through April 1, 2032. However, the SWA refurbished their generating unit ahead of schedule and, as of January 2012, this unit began delivering firm capacity to FPL. In 2011, the FPSC approved a contract for an additional 70 MW between FPL and SWA for a new unit to be constructed and to begin delivering firm capacity and energy beginning on January 1, 2015. At the end of December 2011, the contract between FPL and Okeelanta (New Hope) expired. However, Okeelanta continues to deliver energy to FPL as an as-available, non-firm supplier of renewable energy.

4) **Supply Side Efforts – FPL Facilities:**

With regard to solar generating facilities, FPL has three such facilities: (i) a 75 MW steam generation solar thermal facility in Martin County (the Martin Next Generation Solar Energy Center); (ii) a 25 MW PV electric generation facility in DeSoto County (the DeSoto Next Generation Solar Energy Center); and (iii) a 10 MW PV electric generation facility in Brevard County at NASA's Kennedy Space Center (the Space Coast Next Generation Solar Energy Center). The DeSoto County project was completed in 2009 and the other two projects were completed in 2010. These three solar facilities were constructed in response to the Florida Legislature's House Bill 7135 which was signed into law by the Governor in June 2008.

House Bill 7135 was enacted to enable the development of clean, zero greenhouse gas emitting renewable generation in the State of Florida. Specifically, the bill authorized cost recovery for the first 110 MW of eligible renewable projects that had the proper land, zoning, and transmission rights in place. FPL's three solar projects met the specified criteria, and were granted approval for cost recovery in 2008. Each of the three solar facilities is discussed below.

a. **The Martin Next Generation Solar Energy Center:**

This facility began commercial operation in 2010 and provides 75 MW of solar thermal capacity in an innovative way that directly displaces fossil fuel usage on the FPL system. This facility consists of solar thermal technology which generates steam that is integrated into the existing steam cycle for the Martin Unit 8 natural gas-fired CC plant. This project is the first "hybrid" solar plant in the world, and, at the time the facility came in-service, was the second largest solar facility in the world and the largest solar plant of any kind in the U.S. outside of California.

b. **The DeSoto Next Generation Solar Energy Center:**

This PV facility began commercial operation in 2009 and provides 25 MW of non-firm capacity and energy, making it one of the largest PV facilities in the U.S. The facility utilizes a tracking PV array that is designed to follow the sun as it traverses across the sky.

c. **The Space Coast Next Generation Solar Energy Center:**

Located at the Kennedy Space Center, this facility is part of an innovative public/private partnership with NASA. This non-tracking PV facility began commercial operation in 2010 and provides 10 MW of non-firm capacity and energy.

At the time the 2014 Site Plan is being prepared, FPL considers the output from these renewable facilities to be "as available," non-firm energy only. This is due to several factors. First, the Martin solar thermal facility is a "fuel-substitute" facility, not a facility that provides additional capacity and energy. The solar thermal facility displaces the use of fossil fuel to produce steam on the FPL system when the solar thermal facility is operating. Second, in regard to the two PV facilities, the intermittent nature of the solar resource has made it difficult to-date to accurately determine what contribution the PV facilities at these specific locations can consistently make at FPL's late Summer afternoon and early Winter morning peak load hours. This is, in part, due to the fact that at least several years worth of Summer and Winter peak load periods are needed to accurately gauge the actual output of these PV facilities during system peak hours. FPL is now evaluating what portion, if any, of the PV facilities' output can be projected as firm capacity at the projected peak hours in FPL's resource planning work.

In addition to these three solar facilities, FPL is currently in the process of identifying other potential sites in the state for central station PV facilities. FPL is evaluating existing FPL generation sites along with potential Greenfield sites within FPL's service territory. These sites are discussed further in Chapter IV.

In regard to PV distributed generation (DG), FPL is planning to implement two PV DG solar programs in 2014. The first program is a voluntary customer participation program that will be pursued on a pilot basis. FPL will file for FPSC approval of this program near the April filing date of the 2014 Site Plan. The second program is designed to research the effects of increasing PV DG on the FPL system. This program will be introduced later in 2014. A brief description of the two programs follows.

d. **Voluntary, Community-based Solar Partnership Pilot Program**

FPL will be filing for FPSC approval of a tariff that provides customers an opportunity to make voluntary contributions toward the construction of PV facilities on a local level throughout FPL's service territory. The pilot program will provide all customers the opportunity to support the use of solar energy at a community scale, and is designed to be especially attractive for customers who do not wish, or are not able, to place solar equipment on their roof.

d. **C&I Solar Partnership Program:**

This is also a PV-focused research program that will be conducted in partnership with interested commercial and industrial (C&I) customers. Limited investments will be made in rooftop PV facilities in selected geographic areas in order to examine the effect of PV DG on FPL's distribution system. FPL will attempt to site these PV facilities in areas where PV DG already exists to better study feeder loading impacts. The PV facilities will be located on C&I customer property near the targeted feeders. The objective of the program is to gather data that will result in a better understanding of the effects of high PV DG penetrations on FPL's system.

5) **Ongoing Research & Development Efforts:**

FPL has developed alliances with several Florida universities to promote development of emerging technologies. For example, FPL has an alliance has been established with the newly formed Southeast National Marine Renewable Energy Center (SNMREC) at Florida Atlantic University (FAU), which will focus on the commercialization of ocean current, ocean thermal (i.e., energy conversion as well as cold water air conditioning), and hydrogen technologies. FPL has been supporting FAU with the discussions being held with the U.S. Department of the Interior's Minerals Bureau of Ocean Energy Management Regulation and Enforcement (BOEMRE). BOEMRE is working to establish the permitting process for ocean energy development on the outer continental shelf.

FPL has also developed a "Living Lab" to demonstrate FPL's solar energy commitment to employees and visitors at its Juno Beach office facility. To-date, FPL has installed five different PV arrays (different technologies) of rooftop PV totaling 24 kW at the Living Lab. In addition, two PV-covered parking structures with a total of approximately 90 kW of PV are in use at the FPL Juno office parking lot. Through these Living Lab projects, FPL is able to evaluate multiple solar technologies and applications for the purpose of developing a renewable business model resulting in the most cost-effective and reliable uses of solar energy for FPL's customers. FPL plans to continue to expand the Living Lab as new solar products come to market.

FPL has also been in discussions with several private companies on multiple emerging technology initiatives including ocean current, ocean thermal, hydrogen, fuel cell technology, biomass, biofuels, and energy storage

III.G FPL's Fuel Mix and Fuel Price Forecasts

1. FPL's Fuel Mix

Until the mid-1980s, FPL relied primarily on a combination of fuel oil, natural gas, and nuclear energy to generate electricity with significant reliance on oil–fired generation. In the early 1980s, FPL began to purchase "coal-by-wire." In 1987, coal was first added to the fuel mix through FPL's partial ownership (20%) and additional purchases (30%) from the St. Johns River Power Park (SJRPP). This allowed FPL to meet its customers' energy needs with a more diversified mix of energy sources. Additional coal resources were added with the partial acquisition (76%) of Scherer Unit 4 which began serving FPL's customers in 1991.

The trend since the early 1990s has been a steady increase in the amount of natural gas that is used by FPL to provide electricity due, in part, to the introduction of highly efficient and cost-effective CC generating units and the ready availability of natural gas. Most recently, FPL placed into commercial operation two new gas-fired CC units at the West County Energy Center (WCEC) site in 2009. A third new CC unit was added to the WCEC site in 2011. In addition, FPL finished modernization of its Cape Canaveral and Riviera Beach plant sites and is currently modernizing its existing Port Everglades plant site by removing the steam generating units previously on the site and replacing them with one highly efficient new CC unit. The new CC units at each of these three sites will provide highly efficient generation that will dramatically improve the efficiency of FPL's generation system in general and, more specifically, the efficiency at which natural gas is utilized.

In addition, FPL increased its utilization of nuclear energy through capacity uprates of its four existing nuclear units. With these uprates, more than 520 MW of additional nuclear capacity have been added to the FPL system. FPL is also pursuing plans to obtain licenses, permits, and approvals to construct and operate two new nuclear units at its existing Turkey Point site that, in total, would add approximately 2,200 MW of new nuclear generating capacity. The earliest dates by which these two new nuclear units could practically be deployed remain 2022 and 2023, respectively.

In regard to utilizing renewable energy, FPL has a 110 MW of solar generating capacity through a 75 MW solar thermal steam generating facility at FPL's existing Martin site, a 25 MW PV facility in DeSoto County, and a 10 MW PV facility in Brevard County. The DeSoto facility was placed into commercial operation in 2009. The other two solar facilities were placed into commercial operation in 2010.

FPL's future resource planning work will continue to focus on identifying and evaluating alternatives that would most cost-effectively maintain and/or enhance FPL's long-term fuel diversity. These fuel diverse alternatives may include: the purchase of power from renewable energy facilities, additional FPL-owned renewable energy facilities, obtaining additional access to diversified sources of natural gas such as liquefied natural gas (LNG) and natural gas from the Mid-Continent unconventional reserves, preserving FPL's ability to utilize fuel oil at its existing units, and increased utilization of nuclear energy. (As previously discussed, new advanced technology coal generating units are not currently considered as viable options in Florida in the ten-year reporting period of this document due, in part, to current projections of relatively small differences in fuel costs between coal and natural gas, significantly higher capital costs for coal units compared to CC units, greater efficiencies of CC units, and concerns over environmental regulations that would impact coal units more negatively than CC units.) The evaluation of the feasibility and cost-effectiveness of these, and other possible fuel diversity alternatives, will be part of FPL's on-going resource planning efforts.

FPL's current use of various fuels to supply energy to customers, plus a projection of this "fuel mix" through 2023 based on the resource plan presented in this document, is presented in Schedules 5, 6.1, and 6.2 later in this chapter.

FPL's Fossil Fuel Cost Forecasts

Fossil fuel price forecasts, and the resulting projected price differentials between fuels, are major drivers used in evaluating alternatives for meeting future resource needs. FPL's forecasts are generally consistent with other published contemporary forecasts. An October 2013 fuel cost forecast was used in the analyses whose results led to the resource plan presented in this 2014 Site Plan.

Future oil and natural gas prices, and to a lesser extent, coal and petroleum coke prices, are inherently uncertain due to a significant number of unpredictable and uncontrollable drivers that influence the short- and long-term price of oil, natural gas, coal, and petroleum coke. These drivers include U.S. and worldwide demand, production capacity, economic growth, environmental legislation, and politics.

The inherent uncertainty and unpredictability in these factors today and tomorrow clearly underscores the need to develop a set of plausible oil, natural gas, and solid fuel (coal and petroleum coke) price scenarios that will bound a reasonable set of long-term price outcomes. In this light, FPL developed and utilized Low, Medium, and High price forecasts for fossil fuels in some of its 2013 and early 2014 resource planning work, particularly in regard to analyses conducted as part of the nuclear cost recovery filing work.

FPL's Medium price forecast methodology is consistent for oil and natural gas. For oil and natural gas commodity prices, FPL's Medium price forecast applies the following methodology:

a. For 2014 through 2015, the methodology used the October 7, 2013 forward curve for New York Harbor 1% sulfur heavy oil, U. S. Gulf Coast 1% sulfur heavy oil, ultra low sulfur diesel fuel oil, and Henry Hub natural gas commodity prices;

b. For the next two years (2016 and 2017), FPL used a 50/50 blend of the October 7, 2013 forward curve and the most current projections at the time from The PIRA Energy Group;

c. For the 2018 through 2030 period, FPL used the annual projections from The PIRA Energy Group; and,

d. For the period beyond 2030, FPL used the real rate of escalation from the Energy Information Administration (EIA). In addition to the development of oil and natural gas commodity prices, nominal price forecasts also were prepared for oil and natural gas transportation costs. The addition of commodity and transportation forecasts resulted in delivered price forecasts.

FPL's Medium price forecast methodology is also consistent for coal and petroleum coke prices. Coal and petroleum coke prices were based upon the following approach:

a. Delivered price forecasts for Central Appalachian (CAPP), Illinois Basin (IB), Powder River Basin (PRB), and South American coal and petroleum coke were provided by JD Energy; and,

b. The coal price forecast for SJRPP and Plant Scherer assume the continuation of the existing mine-mouth and transportation contracts until expiration, along with the purchase of spot coal, to meet generation requirements.

The development of FPL's Low and High price forecasts for oil, natural gas, coal, and petroleum coke prices were based on the historical volatility of the 12-month forward price, one year ahead. FPL developed these forecasts to account for the uncertainty which exists within each commodity as well as across commodities. These forecasts reflect a range of reasonable forecast outcomes.

3. Natural Gas Storage

FPL was under contract through March 2013 for 2 billion cubic feet (Bcf) of firm natural gas storage capacity in the Bay Gas storage facility located in Alabama. The Bay Gas storage facility is interconnected with the Florida Gas Transmission (FGT) pipeline. Starting on April 1, 2013, FPL entered into a new deal with Bay Gas Storage for one year for 2.5 billion cubic feet (Bcf) of firm natural gas storage capacity. In December 2013, FPL elected to extend this transaction for an additional three years which resulted in a lower annual cost for Bay Gas. FPL has predominately utilized natural gas storage to help mitigate gas supply problems caused by severe weather and/or infrastructure problems. Over the past several years, FPL has acquired upstream transportation capacity on several pipelines to help mitigate the risk of off-shore supply problems caused by severe weather in the Gulf of Mexico. While this transportation capacity has reduced FPL's off-shore exposure, a portion of FPL's supply portfolio remains tied to off-shore natural gas sources. Therefore, natural gas storage remains an important tool to help mitigate the risk of supply disruptions. For these reasons, FPL has typically maintained nearly full natural gas inventory during normal operations from June through November (hurricane season). From December through March, FPL typically maintains lower levels of natural gas inventory compared to Summer peak months.

As FPL's reliance on natural gas has increased, its ability to manage the daily "swings" that can occur on its system due to weather and unit availability changes has become more challenging, particularly from oversupply situations. Natural gas storage is a valuable tool to help manage the daily balancing of supply and demand. From a balancing perspective, injection and withdrawal rights associated with gas storage have become an increasingly important part of the evaluation of overall gas storage requirements.

As FPL's system grows to meet customer needs, it must maintain adequate gas storage capacity to continue to help mitigate supply and/or infrastructure problems and to provide FPL the ability to manage its supply and demand on a daily basis. FPL continues to evaluate its gas storage portfolio and is likely to subscribe for additional gas storage capacity to help increase reliability, provide the necessary flexibility to respond to demand changes, and diversify the overall portfolio.

4. **Securing Additional Natural Gas:**

The recent trend of increasing reliance upon natural gas to produce electricity for FPL's customers is projected to continue due to FPL's growing load. The addition of highly fuel-efficient CC units at Cape Canaveral and Riviera Beach due to completed modernization projects, and the on-going Port Everglades modernization project, will serve to reduce the growth in natural gas use from what it otherwise might have been due to the high fuel-efficiency levels of these new CC units. However, these efficiency gains do not fully offset the effects of FPL's growing load. Therefore, FPL will need to secure more natural gas supply and more firm gas transportation capacity in the future as fuel requirements dictate. The issue is how to secure these additional natural gas resources in a manner that is economical for FPL's customers and which maintains and/or enhances the reliability of natural gas supply and deliverability to FPL's generating units.

FPL has historically purchased the gas transportation capacity required for new natural gas supply from two existing natural gas pipeline companies. As more natural gas is delivered through these two pipelines, the impact of a supply disruption on either pipeline becomes more problematic. Therefore, FPL issued a Request for Proposals (RFP) in December 2012 for gas transportation capacity to meet FPL's system natural gas requirements beginning in 2017. The RFP encouraged bidders to propose new gas transportation infrastructure to meet Florida's growing need for natural gas. A third pipeline would have benefits for FPL and its customers by increasing the diversity of FPL's fuel supply sources, increasing the physical reliability of the pipeline delivery system, and enhancing competition among pipelines. The RFP process was completed in June 2013 and the winning bidders, Sabal Trail Transmission, LLC (Sabal Trail) and Florida Southeast Connection, LLC (FSC), have begun the Federal Energy Regulatory Commission approval process with a planned in-service date of May 2017. The contracts with Sabal Trail and FSC were reviewed by the FPSC and were approved for cost recovery in late 2013. The order approving this cost recovery became final in January 2014.

5. Nuclear Fuel Cost Forecast

This section reviews the various steps needed to fabricate nuclear fuel for delivery to the nuclear power plants, the method used to forecast the price for each step, and other comments regarding FPL's nuclear fuel cost forecast.

a) Steps Required for Nuclear Fuel to be delivered to FPL's Plants

Four separate steps are required before nuclear fuel can be used in a commercial nuclear power reactor. These steps are summarized below.

(1) Mining: Uranium is produced in many countries such as Canada, Australia, Kazakhstan, and the United States. During the first step, uranium is mined from the ground using techniques such as open pit mining, underground mining, in-situ leaching operations, or production as a by-product from other mining operations, such as gold, copper, or phosphate rocks. The product from this first step is the raw uranium delivered as an oxide, U3O8 (sometimes referred to as yellowcake).

(2) Conversion: During the second step, the U3O8 is chemically converted into UF6 which, when heated, changes into a gaseous state. This second step further removes any chemical impurities and serves as preparation for the third step, which requires uranium to be in a gaseous state.

(3) Enrichment: The third step is called enrichment. Natural uranium contains 0.711% of uranium at an atomic mass of 235 (U-235) and 99.289% of uranium at an atomic mass of 238 (U-238). FPL's nuclear reactors use uranium with a higher percentage of up to almost five percent (5%) of U-235 atoms. Because natural uranium does not contain a sufficient amount of U-235, the third step increases the percentage amount of U-235 from 0.711% to a level specified when designing the reactor core (typically in a range from approximately 2.2% to as high as 4.95%). The output of this enrichment process is enriched uranium in the form of UF6.

(4) Fabrication: During the last step, fuel fabrication, the enriched UF6 is changed to a UO2 powder, pressed into pellets, and fed into tubes, which are sealed and bundled together into fuel assemblies. These fuel assemblies are then delivered to the plant site for insertion in a reactor.

Like other utilities, FPL has purchased raw uranium and the other components of the nuclear fuel cycle separately from numerous suppliers from different countries.

b) Price Forecasts for Each Step

(1) Mining: The impact of the earthquake and tsunami that struck the Fukushima nuclear complex in Japan in March 2011 is still being felt in the uranium market. Current demand has declined and several of the production facilities have announced delays. Factors of importance are:

- Hedge funds are still very active in the market. This causes more speculative demand that is not tied to market fundamentals and causes the market price to move up or down just based on news that might affect future demand.
- Some of the uranium inventory from the U.S. Department of Energy (DOE) is finding its way into the market periodically to fund cleanup of certain Department of Energy facilities.
- Although a limited number of new nuclear units are scheduled to start production in the U.S. during the next 5 to 10 years, other countries, more specifically China, have announced an increase in construction of new units which may cause uranium prices to trend up in the near future.

Over a 10-year horizon, FPL expects the market to be more consistent with market fundamentals. The supply picture is more stable, with laws enacted to resolve the import of Russian-enriched uranium, by allowing some imports of Russian-enriched uranium to meet about 20-25% of needs for currently operating units, but with no restriction on the first core for new units and no restrictions after 2020. New and current uranium production facilities continue to add capacity to meet demands. Actual demand tends to grow over time because of the long lead time to build nuclear units. However, FPL cannot discount the possibility of future periodic sharp increase in prices, but believes such occurrences will likely be temporary in nature.

(2) Conversion: The conversion market is also in a state of flux due to the Fukushima events. Planned production after 2016 is currently forecasted to be insufficient to meet the higher demand scenario, but it is projected to be sufficient to meet most reference case scenarios. As with additional raw uranium production, supply will expand beyond current level once more firm commitments are made including commitments to build new nuclear units. FPL expects long term price stability for conversion services to support world demand.

(3) Enrichment: As a result of the Fukushima events in March 2011, the near-term price of enrichment services has been declining for the last three years. However, plans for construction of several new facilities that were expected to come on-line in the next few years have been delayed. Also, some of the existing high operating cost diffusion plants have shut down. As with supply for the other steps of the nuclear fuel cycle, expansion of future capacity is feasible within the lead time for constructing new nuclear units and any other projected increase in demand. Meanwhile, world supply and demand will continue to be balanced such that FPL expects adequate supply of enrichment services. The current supply/demand profile will most likely result in the price of enrichment services remaining stable or declining for the next few years before starting to increase.

(4) Fabrication: Because the nuclear fuel fabrication process is highly regulated by the Nuclear Regulatory Commission (NRC), not all production facilities can qualify as suppliers to nuclear reactors in the U.S. Although world supply and demand is expected to show significant excess capacity for the foreseeable future, the gap is not as wide for U.S. supply and demand. The supply for the U.S. market is expected to be sufficient to meet U.S. demand for the foreseeable future.

c) Other Comments Regarding FPL's Nuclear Fuel Cost Forecast

FPL's nuclear fuel price forecasts are the result of FPL's analysis based on inputs from various nuclear fuel market expert reports and studies. The calculations for the nuclear fuel cost forecasts used in FPL's 2013 and early 2014 resource planning work were performed consistent with the method then used for FPL's Fuel Clause filings, including the assumption of refueling outages every 18 months and plant operation at power uprate levels. The costs for each step to fabricate the nuclear fuels were added to come up with the total costs of the fresh fuel to be loaded at each refueling (acquisition costs). The acquisition cost for each group of fresh fuel assemblies were then amortized over the energy produced by each group of fuel assemblies. FPL also added 1 mill per kilowatt hour net to reflect payment to DOE for spent fuel disposal.

Col. (2) represents capacity additions and changes projected to be in-service by June 1st. These MW are generally considered to be available to meet Summer peak loads which are forecasted to occur during August of the year indicated.
Col. (6) = Col.(2) + Col.(3) - Col (4) + Col.(5).
Col. (7) reflects the 2013 load forecast without incremental DSM or cumulative load management.
Col. (8) represents cumulative load management capability, plus incremental conservation,and load management, from 9/2013-on intended for use with the 2013 load forecast.
Col. (10) = Col. (6) - Col. (9)
Col. (11) = Col.(10) / Col.(9)
Col. (12) indicates the capacity of units projected to be out-of-service for planned maintenance during the Summer peak period; i.e., Martin Unit 2's planned outage in Summer 2014 for the installation of electrostatic precipitators.
Col. (13) = Col. (10) - Col. (12)
Col. (14) = Col.(13) / Col.(9)
Col. (15) =Col. (6) - Col. (7)
Col. (16) = Col.(15) / Col.(7)

(1) Schedule 8 shows only planned and prospective changes to generating facilities and does not reflect changes to existing purchases. These changes are reflected on Tables ES-1, I.B.1 and I.B.2.
The Winter Total MW value consists of all generation additions and changes achieved by January. The Summer Total MW value consists of all generation additions and changes achieved by June. All MW additions/changes occurring after August each year will be picked up for reserve margin calculation purposes in the following year.
(2) This generating unit is currently serving as a synchronous condenser and is not included in reserve margin calculation.
(3) Outages for ESP work.

Schedule 9
Status Report and Specifications of Proposed Generating Facilities

(1) **Plant Name and Unit Number:** Vero Beach Combined Cycle Capacity

(2) **Capacity**
a. Summer 46 MW
b. Winter 44 MW

(3) **Technology Type:** Combined Cycle

(4) **Anticipated Construction Timing**
a. Field construction start-date: Not Applicable - See Note 1 below.
b. Commercial In-service date: 2015

(5) **Fuel**
a. Primary Fuel Gas
b. Alternate Fuel Oil

(6) **Air Pollution and Control Strategy:** N/A

(7) **Cooling Method:** Once-through cooling water

(8) **Total Site Area:** 16 Acres

(9) **Construction Status:** See note 1 below

(10) **Certification Status:** See note 1 below

(11) **Status with Federal Agencies:** See note 1 below

(12) **Projected Unit Performance Data:**

Planned Outage Factor (POF):	20.5%	
Forced Outage Factor (FOF):	0.0%	
Equivalent Availability Factor (EAF):	72.5%	
Resulting Capacity Factor (%):	3.88%	
Average Net Operating Heat Rate (ANOHR):	9,397	Btu/kWh
Base Operation 75F,100%		

(13) **Projected Unit Financial Data**

Book Life (Years):	TBD	years
Total Installed Cost ($/kW):	Not Applicable	
Direct Construction Cost ($/kW):	Not Applicable	
AFUDC Amount ($/kW):	Not Applicable	
Escalation ($/kW):	Not Applicable	
Fixed O&M ($/kW-Yr): ($)	Not Applicable	
Variable O&M ($/MWH):($)	Not Applicable	
K Factor:	Not Applicable	

NOTE 1: The combined cycle capacity consists of two existing units. This existing unit is being acquired by FPL as part of the arrangement for FPL to serve Vero Beach's load beginning in January 2015. FPL is also taking ownership of three steam units.The three steam units will be retired as soon as they aquired. FPL plans to retire the CC unit at the end of 2017.

Schedule 9
Status Report and Specifications of Proposed Generating Facilities

(1) **Plant Name and Unit Number:** Port Everglades Next Generation Clean Energy Center

(2) **Capacity**
a. Summer 1,237 MW
b. Winter 1,429 MW

(3) **Technology Type:** Combined Cycle

(4) **Anticipated Construction Timing**
a. Field construction start-date: 2014
b. Commercial In-service date: 2016

(5) **Fuel**
a. Primary Fuel: Natural Gas
b. Alternate Fuel: Ultra-low sulfur distillate

(6) **Air Pollution and Control Strategy:** Dry Low No_x Burners, SCR, Natural Gas, 0.0015% S. Distillate and Water Injection on Distillate

(7) **Cooling Method:** Once-through cooling water

(8) **Total Site Area:** Existing Site Acres

(9) **Construction Status:** U (Under construction, less than or equal to 50% complete)

(10) **Certification Status:** ---

(11) **Status with Federal Agencies:** ---

(12) **Projected Unit Performance Data:**
Planned Outage Factor (POF): 3.5%
Forced Outage Factor (FOF): 1.1%
Equivalent Availability Factor (EAF): 95.4%
Resulting Capacity Factor (%): Approx. 90% (First Full Year Base Operation)
Average Net Operating Heat Rate (ANOHR): 6,330 Btu/kWh
Base Operation 75F,100%

(13) **Projected Unit Financial Data *,****
Book Life (Years): 30 years
Total Installed Cost (2016 $/kW): 928
Direct Construction Cost ($/kW):
AFUDC Amount ($/kW): 87
Escalation ($/kW):
Fixed O&M ($/kW-Yr): (2016 $) 30.00
Variable O&M ($/MWH): (2016 $) 0.10
K Factor: 1.51

* $/kW values are based on Summer capacity.
** Fixed O&M cost includes capital replacement.

NOTE: Total installed cost includes gas expansion, transmission interconnection and integration, escalation, and AFUDC. Demolition costs of existing plant are not included.

Schedule 9
Status Report and Specifications of Proposed Generating Facilities

(1) **Plant Name and Unit Number:** Lauderdale CT's (5 CTs will be added)

(2) **Capacity (for each CT)**
a. Summer 201 MW
b. Winter 223 MW

(3) **Technology Type:** Combustion Turbine

(4) **Anticipated Construction Timing**
a. Field construction start-date: 2017
b. Commercial In-service date: 2018

(5) **Fuel**
a. Primary Fuel: Natural Gas
b. Alternate Fuel: Ultra-low sulfur distillate

(6) **Air Pollution and Control Strategy:** Dry Low NO_x Burners, SCR, Natural Gas, 0.0015% S. Distillate and Water Injection on Distillate

(7) **Cooling Method:** Water to Air Heat Exchangers

(8) **Total Site Area:** Existing Site Acres

(9) **Construction Status:** P (Planned Unit)

(10) **Certification Status:** ---

(11) **Status with Federal Agencies:** ---

(12) **Projected Unit Performance Data:**

Planned Outage Factor (POF):	1.6%
Forced Outage Factor (FOF):	1.0%
Equivalent Availability Factor (EAF):	97.4%
Resulting Capacity Factor (%):	3% (First Full Year Base Operation)
Average Net Operating Heat Rate (ANOHR):	10,057 Btu/kWh
Base Operation 75F,100%	

(13) **Projected Unit Financial Data *,****

Book Life (Years):	30 years
Total Installed Cost (2018 $/kW):	547
Direct Construction Cost ($/kW):	
AFUDC Amount ($/kW):	56
Escalation ($/kW):	
Fixed O&M ($/kW-Yr): (2018 $)	17.63
Variable O&M ($/MWH): (2018 $)	0.07
K Factor:	1.59

* $/kW values are based on Summer capacity.
** Fixed O&M cost includes capital replacement.

NOTE: Total installed cost includes transmission interconnection and integration, escalation, and AFUDC. Demolition costs of existing GTs are not included.

Schedule 9
Status Report and Specifications of Proposed Generating Facilities

(1) **Plant Name and Unit Number:** Unsited 3x1 CC

(2) **Capacity**

a. Summer	1,269	MW
b. Winter	1,429	MW

(3) **Technology Type:** Combined Cycle

(4) **Anticipated Construction Timing**

a. Field construction start-date:	2017
b. Commercial In-service date:	2019

(5) **Fuel**

a. Primary Fuel	Natural Gas
b. Alternate Fuel	Ultra-low sulfur distillate

(6) **Air Pollution and Control Strategy:**		Dry Low NO_x Burners, SCR, Natural Gas, 0.0015% S. Distillate and Water Injection on Distillate
(7) **Cooling Method:**		Once-through cooling water
(8) **Total Site Area:**	TBD	Acres
(9) **Construction Status:**	P	(Planned Unit)
(10) **Certification Status:**	—	
(11) **Status with Federal Agencies:**	—	

(12) **Projected Unit Performance Data:**

Planned Outage Factor (POF):	3.5%
Forced Outage Factor (FOF):	1.1%
Equivalent Availability Factor (EAF):	95.4%
Resulting Capacity Factor (%):	Approx. 90% (First Full Year Base Operation)
Average Net Operating Heat Rate (ANOHR): Base Operation 75F,100%	6,334 Btu/kWh

(13) **Projected Unit Financial Data *,****

Book Life (Years):	30 years
Total Installed Cost (2019 $/kW):	968
Direct Construction Cost ($/kW):	
AFUDC Amount ($/kW):	95
Escalation ($/kW):	872.79
Fixed O&M ($/kW-Yr): (2019 $)	22.25
Variable O&M ($/MWH): (2019 $)	0.72
K Factor:	1.51

* $/kW values are based on Summer capacity.
** Fixed O&M cost includes capital replacement.

NOTE: Total installed cost includes gas lateral, transmission interconnection and integration, escalation, and AFUDC.

Schedule 9
Status Report and Specifications of Proposed Generating Facilities

(1) **Plant Name and Unit Number:** Turkey Point Nuclear Unit 6

(2) **Capacity**
a. Summer 1,100 MW
b. Winter 1,100 MW

(3) **Technology Type:** Nuclear

(4) **Anticipated Construction Timing**
a. Field construction start-date: 2015
b. Commercial In-service date: 2022

(5) **Fuel**
a. Primary Fuel: Uranium Dioxide
b. Alternate Fuel: N/A

(6) **Air Pollution and Control Strategy:** N/A

(7) **Cooling Method:** Mechanical Draft Cooling Towers

(8) **Total Site Area:** 211 Acres

(9) **Construction Status:** L (Regulatory approval pending.Not under construction)

(10) **Certification Status:** L (Regulatory approval pending.Not under construction)

(11) **Status with Federal Agencies:** L (Regulatory approval pending.Not under construction)

Schedule 9

Status Report and Specifications of Proposed Generating Facilities

(1) **Plant Name and Unit Number:** Turkey Point Nuclear Unit 7

(2) **Capacity**
a. Summer 1,100 MW
b. Winter 1,100 MW

(3) **Technology Type:** Nuclear

(4) **Anticipated Construction Timing**
a. Field construction start-date: 2015
b. Commercial In-service date: 2023

(5) **Fuel**
a. Primary Fuel: Uranium Dioxide
b. Alternate Fuel: N/A

(6) **Air Pollution and Control Strategy:** N/A

(7) **Cooling Method:** Mechanical Draft Cooling Towers

(8) **Total Site Area:** 211 Acres

(9) **Construction Status:** L (Regulatory approval pending. Not under construction)

(10) **Certification Status:** L (Regulatory approval pending. Not under construction)

(11) **Status with Federal Agencies:** L (Regulatory approval pending. Not under construction)

(12) **Projected Unit Performance Data:**

Planned Outage Factor (POF):	TBD	
Forced Outage Factor (FOF):	TBD	
Equivalent Availability Factor (EAF):	TBD	
Resulting Capacity Factor (%):	Approx. 90%	(First Full Year Base Operation)
Average Net Operating Heat Rate (ANOHR):	TBD	Btu/kWh
Base Operation 75F,100%		

(13) **Projected Unit Financial Data *,****

Book Life (Years):	TBD	years
Total Installed Cost ($/kW):	TBD	
Direct Construction Cost ($/kW):	TBD	
AFUDC Amount ($/kW):	TBD	
Escalation ($/kW):	TBD	
Fixed O&M ($/kW-Yr): ($)	TBD	
Variable O&M ($/MWH):($)	TBD	
K Factor:	TBD	

* $/kW values are based on Summer capacity.
** Fixed O&M cost includes capital replacement.

Schedule 10
Status Report and Specifications of Proposed Transmission Lines

Vero Beach Existing Combined Cycle Capacity

The Vero Beach existing combined cycle capacity that FPL is projected to take ownership of starting January 1, 2015 does not require any "new" transmission lines.

Schedule 10
Status Report and Specifications of Proposed Transmission Lines

Port Everglades Next Generation Clean Energy Center

The Port Everglades Next Generation Clean Energy Center which will result from the modernization of the Port Everglades power plant site does not require any "new" transmission lines.

Schedule 10
Status Report and Specifications of Proposed Transmission Lines

Lauderdale Combustion Turbine Project

The Lauderdale Combustion Turbine (CT) project, which will result in the retirement of 36 aero-derivative combustion gas turbines at the Lauderdale and Port Everglades plant sites, and their replacement with 5 simple-cycle combustion turbines at the Lauderdale site, does not require any "new" transmission lines.

Schedule 10
Status Report and Specifications of Proposed Transmission Lines

Unsited Combined Cycle in 2019

No projection of a new transmission line(s) can be made until a site is selected for this unit.

Schedule 10
Status Report and Specifications of Proposed Transmission Lines

Turkey Point Nuclear Unit 6

The Turkey Point New Nuclear Project starting with the addition of Turkey Point Unit 6 will require a new substation and five new transmission lines terminating at existing substations.

(1)	Point of Origin and Termination:	New Clear Sky Substation – Levee Substation
(2)	Number of Lines:	2
(3)	Right-of-way	FPL Owned
(4)	Line Length:	43 miles
(5)	Voltage:	500 kV
(6)	Anticipated Construction Timing:	Start date: TBD End date: TBD
(7)	Anticipated Capital Investment: (Trans.and Sub.)	$ TBD
(8)	Substations:	New Clear Sky Substation and Levee Substation
(9)	Participation with Other Utilities:	None

(1)	Point of Origin and Termination:	New Clear Sky Substation – Pennsuco Substation
(2)	Number of Lines:	1
(3)	Right-of-way	FPL Owned
(4)	Line Length:	52 miles
(5)	Voltage:	230 kV
(6)	Anticipated Construction Timing:	Start date: TBD End date: TBD
(7)	Anticipated Capital Investment: (Trans.and Sub.)	$ TBD
(8)	Substations:	New Clear Sky Substation and Pennsuco Substation
(9)	Participation with Other Utilities:	None

Schedule 10
Status Report and Specifications of Proposed Transmission Lines

Turkey Point Nuclear Unit 6 (continued)

(1)	Point of Origin and Termination:	New Clear Sky Substation – Davis Substation
(2)	Number of Lines:	1
(3)	Right-of-way	FPL Owned
(4)	Line Length:	19 miles
(5)	Voltage:	230 kV
(6)	Anticipated Construction Timing:	Start date: TBD End date: TBD
(7)	Anticipated Capital Investment: (Trans.and Sub.)	$ TBD
(8)	Substations:	New Clear Sky Substation and Davis Substation
(9)	Participation with Other Utilities:	None

(1)	Point of Origin and Termination:	Davis Substation – Miami Substation
(2)	Number of Lines:	1
(3)	Right-of-way	FPL Owned
(4)	Line Length:	18 miles
(5)	Voltage:	230 kV
(6)	Anticipated Construction Timing:	Start date: TBD End date: TBD
(7)	Anticipated Capital Investment: (Trans.and Sub.)	$ TBD
(8)	Substations:	Davis Substation and Miami Substation
(9)	Participation with Other Utilities:	None

Schedule 10
Status Report and Specifications of Proposed Transmission Lines

Turkey Point Nuclear Unit 6 (continued)

(1)	Point of Origin and Termination:	New Clear Sky Substation – Turkey Point Substation
(2)	Number of Lines:	1
(3)	Right-of-way	FPL Owned
(4)	Line Length:	0.5 miles
(5)	Voltage:	230 kV
(6)	Anticipated Construction Timing:	Start date: TBD End date: TBD
(7)	Anticipated Capital Investment: (Trans.and Sub.)	$ TBD
(8)	Substations:	New Clear Sky Substation and Turkey Point Substation
(9)	Participation with Other Utilities:	None

Schedule 10
Status Report and Specifications of Proposed Transmission Lines

Turkey Point Nuclear Unit 7

The transmission lines required for Turkey Point Unit 7 will be constructed with Turkey Point Unit 6 and are listed in the Schedule 10 for Turkey Point Nuclear Unit 6.

Schedule 11.1

Existing FIRM and NON-FIRM Capacity and Energy by Primary Fuel Type
Actuals for the Year 2013

	(1)	(2)	(3)	(4)	(5)	(6)	(7)
		Net (MW) Capability				NEL	Fuel Mix
	Generation by Primary Fuel	Summer (MW)	Summer (%)	Winter (MW)	Winter (%)	GWh (2)	%
(1)	Coal	897	3.4%	911	3.3%	5,981	5.4%
(2)	Nuclear	3,453	13.2%	3,550	12.8%	25,243	22.6%
(3)	Residual	3,666	14.0%	3,700	13.4%	75	0.1%
(4)	Distillate	648	2.5%	710	2.6%	120	0.1%
(5)	Natural Gas	15,575	59.4%	16,785	60.6%	75,208	67.4%
(6)	Solar (Non-Firm)	35	0.1%	35	0.1%	155	0.1%
(7)	***FPL Existing Units Total (1):***	***24,274***	***92.6%***	***25,691***	***92.8%***	***106,782***	***95.6%***
(8)	Renewables (Purchases)- Firm	61.0	0.2%	112.0	0.4%	43	0.0%
(9)	Renewables (Purchases)- Non-Firm	Not Applicable	---	Not Applicable	---	362	0.3%
(10)	***Renewable Total:***	61.0	0.2%	112.0	0.4%	405	0.36%
(11)	***Purchases Other :***	1,683.0	7.2%	1,891.0	6.8%	4,468	4.0%
(12)	***Total :***	*26,218.0*	*100.0%*	*27,694.0*	*100.0%*	*111,655*	*100.0%*

Note:

(1) FPL Existing Units Total values on row (7), columns (2) and (4), match the System Firm Generating Capacity values found on Schedule 1 for Summer and Winter.

(2) Net Energy for Load GWh values on row (12), column (6), matches Schedule 6.1 value for 2013.

Schedule 11.2

Existing NON-FIRM Self-Service Renewable Generation Facilities
Actuals for the Year 2013

(1)	(2)	(3)	(4)	(5)	(6) = (3)+(4)-(5)
Type of Facility	Installed Capacity DC (MW)	Renewable Projected Annual Output (MWh)	Annual Energy Purchased from FPL (MWh)	Annual Energy Sold to FPL (MWh)	Projected Annual Energy Used by Customers
Customer-Owned Renewable Generation (0 kW to 10 kW)	12.86	16,142	111,831	465	127,508
Customer-Owned Renewable Generation (> 10 kW to 100 kW)	6.69	8,758	197,171	376	205,553
Customer-Owned Renewable Generation (> 100 kW - 2 MW)	7.94	10,475	62,050	177	72,348
	27.49	35,375	371,052	1,018	405,409

Notes:

(1) There were 2,565 customers with renewable generation facilities interconnected with FPL on December 31, 2013.

(2) The Installed Capacity value is the sum of the nameplate ratings (DC MW) for all of the customer-owned renewable generation facilities connected as of Dec. 31,2013. One system does not have a DC rating. The AC valued of 0.75 MW was included in the (> 100 - 2 MW) row.

(3) The Projected Annual Output value is based on NREL's PV Watts 1 program and the Installed Capacity value in column (2), adjusted for the date when each facility was installed and assuming each facility operated as planned.

(4) The Annual Energy Purchased from FPL is an actual value from FPL's metered data for 2013.

(5) The Annual Energy Sold to FPL is an actual value from FPL's metered data for 2013.

(6) The Projected Annual Energy Used by Customers is a projected value that equals: (Renewable Projected Annual output + Annual Energy Purchased) minus the Annual Energy Sold to FPL.

CHAPTER IV

Environmental and Land Use Information

(This page is left intentionally blank.)

IV. Environmental and Land Use Information

IV.A Protection of the Environment

Florida is a sensitive, temperate/sub-tropical environment containing a number of distinct ecosystems with many endangered or threatened plant and animal species. Florida's residents, wildlife, and ecosystems require the same air, land, and water resources that are necessary to meet the demand for the generation, transmission, and distribution of electricity. The general public has an expectation that a large corporation, such as FPL, will conduct their business in an environmentally responsible manner that minimizes impacts to the natural environment.

FPL has been recognized for many years as one of the leaders among electric utilities for its commitment to the environment. Being responsible stewards of the environment is ingrained in FPL's corporate culture. FPL has one of the lowest emissions profiles among U.S. utilities and in 2013 its carbon dioxide (CO_2) emission rate was 35% lower (better) than the industry average.

FPL's environmental leadership and that of its parent company, NextEra Energy, Inc., has been heralded by many outside organizations as demonstrated by a few recent examples.

FPL's responsible tree care practices across its 35-county service area have been recognized for almost a decade. FPL has been the recipient of the Tree Line USA award annually from 2003 - 2013. This award is sponsored by the Arbor Day Foundation in cooperation with the National Association of State Foresters. The recognition is given to utilities that demonstrate quality tree care practices, annual worker training, and public education programs.

In 2013, FPL continued to support the Loggerhead Marinelife Center with a $21,500 donation toward the acquisition of a larger tank to assist in sea turtle rehabilitation. Two FPL employees serve as members of the Loggerhead Marinelife Center and are committed to its success. In addition, through a "Power to Care" charity event an additional $500 was collected by FPL staff and given to the Center. In past years, FPL has won the Loggerhead Marinelife Center's "Blue Business of the Year" award, which is given to those who are leading the way in raising awareness about, and have made significant contributions to improve and protect, South Florida's oceans, beaches, and wildlife. The award recognized FPL's protection and conservation of the endangered Florida manatee and the fostering of public and employee education and support.

FPL employees serve as board members for many organizations that focus on environmental restoration, preservation, and stewardship. A partial list of these organizations includes: Audubon Florida, the Everglades Foundation, the Arthur R. Marshall Foundation, The Nature Conservancy, and the Palm Beach Zoo.

IV.B FPL's Environmental Statement

At FPL and its parent company, NextEra Energy, Inc., we are committed to being an industry leader in environmental protection and stewardship, not only because it makes business sense, but because it is the right thing to do. Our commitment to compliance, conservation, communication, and continuous improvement fosters a culture of environmental excellence and drives the sustainable management of our business planning, operations, and daily work.

In accordance with our commitments to environmental protection and stewardship, FPL and NextEra Energy, Inc. endeavor to:

Comply

- Comply with all applicable environmental laws, regulations, and permits
- Proactively identify environmental risks and take action to mitigate those risks
- Pursue opportunities to exceed environmental standards
- Participate in the legislative and regulatory process to develop environmental laws, regulations, and policies that are technically sound and economically feasible
- Design, construct, operate, and maintain our facilities in an environmentally sound and responsible manner

Conserve

- Prevent pollution, minimize waste, and conserve natural resources
- Avoid, minimize, and/or mitigate impacts to habitat and wildlife
- Promote the efficient use of energy, both within our company and in our communities

Communicate

- Communicate this policy to all employees and publish it on the corporate website
- Invest in environmental training and awareness to achieve a corporate culture of environmental excellence
- Maintain an open dialogue with stakeholders on environmental matters and performance

Continuously Improve

- Establish, monitor, and report progress toward environmental targets
- Review and update this policy on a regular basis
- Drive continuous improvement through ongoing evaluations of our environmental management system to incorporate lessons learned and best practices.

This statement was updated in 2013 by FPL's parent company, NextEra Energy, Inc. to reflect changing expectations and ensure that employees are doing the utmost to protect the environment. FPL complies with all environmental laws, regulations, and permit requirements. FPL designs, constructs, and operates its facilities in an environmentally sound and responsible manner. It also responds immediately and effectively to any known environmental hazards or non-compliance situations. FPL's commitment to the environment does not end there. It proactively pursue opportunities to exceed current environmental standards, including reducing waste and emission of pollutants, recycling materials, and conserving natural resources throughout its operations and day-to-day work activities. FPL also encourages the efficient use of energy, both within the Company and in communities served by FPL. These actions are just a few examples of how FPL is committed to the environment.

To ensure that FPL is adhering to its environmental commitment, it has developed rigorous environmental governance procedures and programs. These include its Environmental Assurance Program and Corporate Environmental Governance Council. Through these programs, FPL conducts periodic environmental self-evaluations to verify that its operations are in compliance with environmental laws, regulations, and permit requirements. Regular evaluations also help identify best practices and opportunities for improvement.

IV.C Environmental Management

In order to successfully implement the Environmental Statement, FPL has developed a robust Environmental Management System program to direct and control the fulfillment of the organization's environmental responsibilities. A key component of the system is an Environmental Assurance Program. Other components of the system include: executive management support and commitment, a dedicated environmental corporate governance program, written environmental policies and procedures, delineation of organizational responsibilities and individual accountabilities, allocation of appropriate resources for environmental compliance management (which includes reporting and corrective action when non-compliance occurs), environmental incident and/or emergency response, environmental risk assessment/management, environmental regulatory development and tracking, and environmental management information systems.

As part of its commitment to excellence and continuous improvement, FPL began implementing an enhanced environmental data management information system (EDMIS) in 2013. Environmental data management software systems are increasingly viewed as an industry best-management practice to ensure environmental compliance. FPL's top goals for this project are to: 1) improve the flow of environmental data between site operations and corporate services to ensure compliance, and 2) improve operating efficiencies. In addition, the EDMIS will help standardize environmental data collection, thus improving external reporting to the public.

IV.D Environmental Assurance Program

FPL's Environmental Assurance Program consists of activities that are designed to evaluate environmental performance, verify compliance with corporate policy as well as legal and regulatory requirements, and communicate results to corporate management. The principal mechanism for pursuing environmental assurance is the environmental audit. An environmental audit may be defined as a management tool comprising a systematic, documented, periodic, and objective evaluation of the performance of the organization and of the specific management systems and equipment designed to protect the environment. The environmental audit's primary objectives are to facilitate management control of environmental practices and assess compliance with existing environmental regulatory requirements and FPL policies. In addition to FPL facility audits, the Environmental Assurance Program performs audits of third-party vendors used for recycling and/or disposal of waste generated by FPL operations. Vendor audits provide information used for selecting candidates or incumbent vendors for disposal and recycling needs.

FPL has also implemented a Corporate Environmental Governance System, in which quarterly reviews are performed by each business unit deemed to have significant environmental exposures. Quarterly reviews evaluate operations for potential environmental risks and consistency with the company's Environmental Policy. Items tracked during the quarterly reviews include processes for the identification and management of environmental risks, metrics, and indicators and progress / changes since the most recent review.

IV.E Environmental Communication and Facilitation

FPL is involved in many efforts to enhance environmental protection through the facilitation of environmental awareness and in public education. Some of FPL's 2013 environmental outreach activities are summarized in Table IV.E.1.

Table IV.E.1: 2013 FPL Environmental Outreach Activities

Activity	Count (#)
Visitors to FPL's Energy Encounter at St. Lucie	2,900
Visitors to Manatee Park, Ft. Myers	>210,000
Number of website visits to FPL's Environmental & Corporate Responsibility Websites	245,630
Visitors to Barley Barber Swamp (Treasured Lands Partnership)	1,492
Martin Energy Center Solar Tours	~850
Solar Schools Program (# of schools actively generating)	24 schools 5 demo sites An additional 67 schools will come online by the end of 2014

IV.F Preferred and Potential Sites

Based upon its projection of future resource needs, FPL has identified six (6) Preferred Sites and four (4) Potential Sites for future generation additions. Preferred Sites are those locations where FPL has conducted significant reviews and has either taken action, is currently committed to take action, or is likely to take action, to site new generating capacity. Potential Sites are those sites that have attributes that support the siting of generation and are under consideration as a location for future generation. Some of these sites are currently in use as existing generation sites and some are not. The identification of a Potential Site does not indicate that FPL has made a definitive decision to pursue generation (or generation expansion or modernization in the case of an existing generation site) at that location, nor does this designation indicate that the size or technology of a generator has been determined. Analyses of any modernization candidates would include evaluation of numerous factors including: fuel delivery, transmission, permitting, etc. The Preferred Sites and Potential Sites are discussed in separate sections below.

IV.F.1 Preferred Sites

The modernization of FPL's Riviera Beach site was scheduled to be completed on/near April 1, 2014 (the filing date for this 2014 Site Plan). Therefore, the Riviera Beach modernization is not discussed further in this chapter. FPL currently has identified six (6) Preferred Sites. Four of these are existing plant sites: Port Everglades, Lauderdale, Putnam and Turkey Point; two of these would be new plant sites: Hendry County and Northeast (NE) Okeechobee County.

The Port Everglades site is a location where modernization work, to replace the former steam generating units with new combined cycle (CC) technology, is in progress. The modernization work is scheduled to be completed in mid-2016. The existing gas turbines (GTs) at the Port Everglades and the Lauderdale sites are projected to be removed by the end of 2018. Five new combustion turbines (CTs) are projected to be added at the Lauderdale site by the end of 2018 to partially replace the capacity from existing GTs at Port Everglades and at the Lauderdale sites. These actions will aid in addressing compliance with new air emissions standards. The Hendry County, NE Okeechobee County, and Putnam sites are the likely next locations for new CC units after the Port Everglades and Lauderdale projects mentioned above have been completed. In addition, the Hendry County and Okeechobee County sites are also likely sites for new photovoltaic (PV) facilities.

In regard to the Turkey Point site, the nuclear capacity uprate project was successfully completed in 2013. The new Turkey Point nuclear Units 6 & 7 are currently projected to come in-service in 2022 and 2023, respectively.

The first two Preferred Sites discussed below are in general chronological order with respect to when the capacity additions are projected to occur. The remaining four Preferred Sites are discussed in alphabetical order.

Preferred Site # 1: Port Everglades Plant, Broward County

This site is located on the existing FPL Port Everglades Plant property within the City of Hollywood, Broward County. The site is surrounded by the Port of Port Everglades. The site has barge access via the Port of Port Everglades. A rail line is located near the plant.

The previous site generating capacity was made up of two 200 MW (approximate) steam generating units (Units 1 & 2) and two 400 MW (approximate) steam generating units (Units 3 & 4). The four units have been taken out of service and dismantled as part of the modernization of the plant site.

The Port Everglades Plant site has been listed as a Preferred or Potential Site in previous FPL Site Plans for both CC and CT generation options. On April 9, 2012, the FPSC issued the final need order for the modernization of the existing Port Everglades Plant. As a result of the modernization of the site, the new generating unit - to be renamed the Port Everglades Next Generation Clean Energy Center (PEEC) – will replace the existing steam generating units with modern, highly efficient, lower-emission next-generation advanced CC technology. The existing four steam units have been removed from the site and will be replaced by a single new CC unit.

a. U.S. Geological Survey (USGS) Map

A USGS map of the PEEC site is found at the end of this chapter.

b. Proposed Facilities Layout

A general layout of the PEEC generating facilities is found at the end of this chapter.

c. Map of Site and Adjacent Areas

An overview map of the site and adjacent areas is also found at the end of this chapter.

d. Existing Land Uses of Site and Adjacent Areas

The existing Port Everglades Plant formerly consisted of two 200 MW (approximate) and two 400 MW (approximate) generating units with conventional dual-fuel fired steam boilers and steam turbine units. These generating units have now been removed as part of the modernization project. The plant site includes minimal vegetation. Adjacent land uses include port facilities and associated industrial activities, as well as light commercial and residential development.

e. General Environment Features On and In the Site Vicinity

1. Natural Environment

The majority of the site is comprised of facilities related to electric power generation for the former Port Everglades Plant generating units. The site is located adjacent to the Intracoastal Waterway. The site provides warm water as required for manatees pursuant to the facility's Manatee Protection Plan.

2. Listed Species

No adverse impacts to federally or state-listed terrestrial plants and animals are expected in association with construction at the site, due to the existing developed nature of the site and lack of suitable onsite habitat for listed species. The warm water discharges from the plant attract manatees, an endangered species. FPL continues to work closely with state and federal wildlife agencies to ensure protection of the manatees during the modernization process and upon operation of the new plant. FPL plans to install a temporary heating system to provide warm water for manatees as required pursuant to the facility's Manatee Protection Plan. FPL also anticipates complying with other manatee-related conditions of certification to ensure the protection of the manatees during the modernization work and during future operations of PEEC.

3. Natural Resources of Regional Significance Status

The construction and operation of a natural gas-fired CC generating facility at this location is consistent with the existing use at the site and is not expected to have any adverse impacts on parks, recreation areas, or environmentally sensitive lands.

4. **Other Significant Features**

FPL is not aware of any other significant features of the site.

f. **Design Features and Mitigation Options**

The design option is to replace the former units (Units 1 through 4) with one new approximately 1,237 MW (Summer) unit consisting of three new CTs, three new heat recovery steam generators (HRSG), and a new steam turbine. The new CC unit is projected to be in service in mid-2016. Natural gas delivered via an existing pipeline is the primary fuel type for the unit with ultra-low sulfur light fuel oil serving as a backup fuel.

In addition, all of the existing GTs at the Port Everglades site are projected to be removed by the end of 2018.

g. **Local Government Future Land Use Designations**

Local government future land use designation for the site is a combination of "Electrical Generating Facility" and "Utilities Use". A land use map of the site and adjacent areas is also found at the end of this chapter.

h. **Site Selection Criteria Process**

The Port Everglades site has been selected for modernization due to consideration of various factors including system load, ability to provide generation in the Miami-Dade/Broward region to help balance load and generation in the region, and economics. Environmental issues were not a deciding factor since this site does not exhibit significant environmental sensitivity or other environmental issues. However, there are environmental benefits of replacing the former steam units with a new CC unit including a significant reduction in system air emissions, improved aesthetics at the site, and continued warm water discharge for the manatees as required pursuant to the facility's Manatee Protection Plan. Further, modernizing this existing facility reduces the impact on natural resources by not requiring new land or new water resources.

i. **Water Resources**

Water from the Intracoastal Waterway via the Port of Port Everglades Slip No. 3 is currently used for once-through cooling water supply. The new plant will utilize portions of the existing once-through cooling water intake and discharge structures. Process and potable water for the modernized plant will come from the existing City of Ft. Lauderdale potable water supply.

j. **Geological Features of Site and Adjacent Areas**

FPL's Port Everglades Plant site is underlain by the surficial aquifer system. The surficial aquifer system in eastern Broward County is primarily composed of sand, sandstone, shell, silt, calcareous clay (marl), and limestone deposited during the Pleistocene and Pliocene ages. The sediments forming the aquifer system are the Pamlico Sand, Miami Oolite, Anastasia Formation, Key Largo Formation, and Fort Thompson Formation (Pleistocene) and the Tamiami Formation (Pliocene). The sediments in the eastern portion of the county are appreciably more permeable than in the west.

The surficial aquifer is underlain by at least 600 feet of the Hawthorn formation (confining unit). The Floridan Aquifer System underlies the Hawthorn formation.

k. **Projected Water Quantities for Various Uses**

The estimated quantity of water required for processing is approximately 0.24 million gallons per day (mgd) for uses such as process water and service water. Approximately 600 mgd of cooling water would be cycled through the once-through cooling water system which is a reduction of more than 51% from the previous fossil steam unit's capability. Potable water demand is expected to average .001 mgd.

l. **Water Supply Sources by Type**

The modernized plant will continue to use the Intracoastal Waterway as the source of once-through cooling water. Process and potable water for the new plant will come from the existing City of Ft. Lauderdale potable water supply.

m. **Water Conservation Strategies Under Consideration**

No additional water resources will be required as a result of the modernization project. CC technology uses less water by design than traditional steam generation units.

n. **Water Discharges and Pollution Control**

The modernized plant will utilize portions of the existing once-through cooling water system for heat dissipation. The heat recovery steam generator blowdown will be reused to the maximum extent practicable or mixed with the cooling water flow before discharge. Reverse osmosis (R/O) reject will be mixed with the plant's once-through cooling water system prior to discharge. Stormwater runoff will be collected and routed to stormwater ponds. The facility will employ a Best Management Practices (BMP) plan and Spill Prevention, Control, and Countermeasure (SPCC) plan to prevent and control the inadvertent release of pollutants.

o. Fuel Delivery, Storage, Waste Disposal, and Pollution Control

Natural gas for the new unit would be transported to the site via an existing natural gas pipeline to the site. New gas compressors to raise the gas pressure of the pipeline to the appropriate level for the new unit will be installed either at the existing site or off-site. Ultra-low sulfur light fuel oil would be received by truck, pipeline, or barge and stored in a new above-ground storage tank.

p. Air Emissions and Control Systems

The regulated air emission rates at the new plant would be approximately 90 percent lower than the previous Port Everglades Plant's emission rates, resulting in significant annual emissions reductions and air quality benefits per unit of energy produced. The use of natural gas, ultra-low sulfur light fuel oil, and combustion controls would minimize air emissions from the unit and ensure compliance with applicable emission limiting standards. Using these fuels minimizes emissions of sulfur dioxide (SO_2), particulate matter, and other fuel-bound contaminates. Combustion controls similarly minimize the formation of nitrogen oxides (NO_x) and the combustor design will limit the formation of carbon monoxide and volatile organic compounds. When firing natural gas, NO_x emissions will be controlled using dry-low NO_x combustion technology and selective catalytic reduction (SCR). Water injection and SCR will be used to reduce NO_x emissions during operations when using ultra-low sulfur light fuel oil as backup fuel. CC facility emissions of greenhouse gas emissions (GHGs) from combustion of natural gas achieve an emission rate substantially lower than the EPA proposed new source performance standards for GHGs. These design alternatives are equivalent to the Best Available Control Technology for air emissions, and minimize such emissions while balancing economic, environmental, and energy impacts. Taken together, the design of PEEC would incorporate features that will make it among the most efficient and cleanest power plants in the State of Florida.

q. Noise Emissions and Control Systems

Noise expected to be caused by unit construction at the site is expected to be below current noise levels for the residents nearest the site.

r. Status of Applications

FPL filed a need determination with the FPSC on November 21, 2011. The FPSC's final need order was issued on April 9, 2012. The Site Certification Application (SCA) was submitted January 24, 2012 resulting in the issuance of Final Order PA 12-57 on October 9, 2012. Concurrent with the SCA filing, FPL submitted applications for a Greenhouse Gas (GHG) permit, a Prevention of Significant Deterioration (PSD) permit, and an Industrial Wastewater Facility permit revision. The revised Industrial Wastewater Facility permit was issued

December 16, 2012. The GHG permit was issued December 26, 2013 and the PSD permit was issued May 1, 2012.

Preferred Site # 2: Lauderdale Plant, Broward County

This site is located at and situated within the existing FPL Lauderdale Plant property, approximately 392 acres, within the Cities of Dania Beach and Hollywood in Broward County, Florida. The jurisdiction for the City of Hollywood is a small area south of SW 42nd Street in the eastern portion of the property. The remainder of the Plant property is located in the City of Dania Beach. The Plant property is located east of U.S. Highway 441, north of Griffin Road, west of SW 30th Avenue, and south of Interstate 595. The existing accesses to the Plant are from SW 24th Avenue and SW 42nd Street. The adjacent properties include residential properties to the south, the South Broward County Resource Recovery Facility to the west, Pond Apple Slough to the north and commercial properties to the east.

The Lauderdale Plant includes two banks of 12 simple cycle gas turbines (GTs) that began operation in the early 1970s. These GTs are first generation GTs that are used to serve peak and emergency demands in a quick-start manner. Each bank of GTs has a net capacity of 420 (Summer) megawatts (MWs), and are authorized to operate on natural gas and distillate oil. Due to new nitrogen dioxide (NO_2) environmental regulations, FPL filed in June 2013 for FPSC approval to recover costs for removing all of its existing GTs and replacing a portion of the GT capacity with new CTs. In December 2013, FPL withdrew this request pending additional environmental monitoring and analyses. Computer modeling of the emissions from the GTs projected that the GTs would exceed the new NO_2 limit. FPL believes this monitoring and analyses will confirm that the operation of its existing GTs in Broward County will not comply with the new NO_2 regulations. Therefore, for planning purposes, FPL has assumed that all of its existing Broward County GTs will be removed (a loss of 1,260 MW Summer) and that this capacity will be partially replaced by 5 new CTs that would be sited in Broward County (an increase of 1,005 MW Summer). This GT removal and CT partial replacement is assumed to occur by the end of 2018.

a. **U.S. Geological Survey (USGS) Map**

A USGS map of the Lauderdale site is found at the end of this chapter.

b. **Proposed Facilities Layout**

A general layout of the Lauderdale generating facilities is found at the end of this chapter.

c. **Map of Site and Adjacent Areas**

An overview map of the site and adjacent areas is also found at the end of this chapter.

d. Existing Land Uses of Site and Adjacent Areas

The existing Lauderdale Plant includes two combined cycle units (Units 4 and 5) and two banks of 12 simple cycle gas turbines (GT1 through GT12 and GT13 through GT24). Units 4 and 5 have net capacity of 442 (Summer) MW each. Each bank of GTs has a net capacity of 420 (Summer) MW. The northern portion of the property is comprised of a forested wetland area adjacent to the Pond Apple Slough.

The adjacent properties to the Lauderdale Site include residential properties to the south, the South Broward County Resource Recovery Facility to the west, Pond Apple Slough to the north and commercial properties to the east. The Dania Cut-off Canal is located along the southern boundary and the South New River Canal is located along the western and northern boundaries.

e. General Environment Features On and In the Site Vicinity

1. Natural Environment

FPL Lauderdale Plant property consists of approximately 392 acres, within the Cities of Dania Beach and Hollywood in Broward County, Florida. The Project area comprises approximately 20 acres in the northern portion of the existing Plant site, and includes the approximately 6-acre north gas turbine site containing 12 gas turbines as well as approximately 14 acres of surrounding forested wetlands and upland spoil piles.

2. Listed Species

No negative impacts to threatened or endangered species are anticipated as a result of the CT Project.

Based upon the field assessment conducted in 2013, review of United States Fish and Wildlife (USFWS) and Florida Fish and Wildlife Conservation Commission (FWC) literature and databases, the Florida Natural Areas Inventory (FNAI) database of documented listed species occurrences, and the lack of suitable habitat, federally listed species are not anticipated to utilize the CT Project area. The potential occurrence of listed flora and fauna within the CT Project area is limited due to the surrounding land uses (industrial, commercial, and residential areas, as well as Ft. Lauderdale-Hollywood International Airport), and lack of suitable habitat within and surrounding the CT Project area to support partial or full life-cycle requirements of federally listed species known to occur within Broward County.

3. **Natural Resources of Regional Significance Status**

The construction and operation of the CT Project at this location is consistent with the existing use at the site and is not expected to have any adverse impacts on parks, recreation areas, or environmentally sensitive lands. No named wetlands, named surface waters, Outstanding Florida Waters, or Aquatic Preserves would be impacted by the proposed Project.

4. **Other Significant Features**

FPL is not aware of any other significant features of the site.

f. **Design Features and Mitigation Options**

In the event monitoring confirms that emissions from operation of the existing GTs would not comply with the NO_2 regulations, the design option is to remove 24 gas turbines (GTs) at the existing Lauderdale Plant, and an additional 12 simple cycle GTs at their nearby Port Everglades Plant, and replace them with five new highly efficient simple cycle combustion turbines (CTs). The CTs operate in simple cycle mode with associated stacks and produce electrical energy by direct connection to an electric generator. The CTs will operate using natural gas and ultra-low sulfur distillate (ULSD) oil as fuel.

g. **Local Government Future Land Use Designations**

The site is zoned General Industrial by the City of Dania Beach, a designation intended to provide for light and medium intensity industrial, research, and assembly fabrication uses. Electrical power plants are permitted within a General Industrial zoning designation as a special exception use only.

A land use map of the site and adjacent areas is also found at the end of this chapter.

h. **Site Selection Criteria Process**

The Lauderdale Plant site has been selected as a "Preferred" for the location of peaking unit facilities due to consideration of various factors including maximizing opportunities to utilize existing utility infrastructure, system load, transmission interconnection, and economics.

i. **Water Resources**

The Project will require a marginal increase in demineralized water that will be obtained from the existing Lauderdale Plant's water treatment system.

j. **Geological Features of Site and Adjacent Areas**

According to the Natural Resource Conservation Service (NRCS) Soil Survey of Broward County, the Project area is dominated by Okeelanta muck, with Udorthents, shaped as a minor association.

The Okeelanta series consists of very deep, very poorly drained, rapidly permeable soils in large fresh water marshes and small depressional areas. They formed in decomposed hydrophytic non-woody organic material overlying sand. Slopes range from zero to two percent. In un-drained areas the water table is at depths of less than ten inches below the surface or the soil is covered by water 6 to 12 months during most years. Areas of Okeelanta muck within the Project area support a mixed native and exotic hardwood wetland community.

k. **Projected Water Quantities for Various Uses**

The CT Project consists of CTs that are operated in simple cycle mode and do not require a heat dissipation system. As a result, there are no associated cooling water uses, cooling water discharges, or other heat dissipation impacts.

l. **Water Supply Sources by Type**

The CT Project would continue to acquire water from existing water contracts with Broward County. Therefore, the Project will have no adverse impact to groundwater. The CT Project would not use onsite groundwater or a new groundwater source for any purpose. The CT Project would have no adverse impact to surface water.

The CT Project would continue to use municipal potable water from the City of Hollywood to provide drinking water for employees. There is no projected increase in employment at the Lauderdale Plant as a result of the CT Project and no associated potable water use increase for that purpose. Therefore, there would be no impact to drinking water sources from the CT Project.

m. **Water Conservation Strategies Under Consideration**

No additional water resources would be required as a result of the CTs project.

n. **Water Discharges and Pollution Control**

There would be no surface water discharges required for the operation of the CT Project, other than storm water discharges from non-contact areas. Operation of the CT Project would not generate leachate and the stormwater management system has been designed to prevent direct discharge to surface waters. Therefore, there would be no adverse impact to water supplies due to runoff or leachate from the CT Project.

The facility will employ a Best Management Practices (BMP) plan and Spill Prevention, Control, and Countermeasure (SPCC) plan to prevent and control the inadvertent release of pollutants.

o. <u>Fuel Delivery, Storage, Waste Disposal, and Pollution Control</u>

The fuel to be used in the CTs is natural gas and ULSD oil. Natural gas will be transported to the facility via existing pipeline. No onsite storage is provided for natural gas. ULSD oil would be trucked or piped to the facility and stored in double walled ULSD oil tanks.

p. <u>Air Emissions and Control Systems</u>

Air emission rates for NOx with the CT Project would be approximately 90 percent lower than the existing GT emission rates, resulting in significantly lower air quality impacts. In addition to lower air emissions, the maximum total air quality impacts for the CT Project are predicted to be well below and in compliance with the National Ambient Air Quality Standards (NAAQS). For pollutants such as NO_2, the CT Project's total air quality impacts are predicted to be significantly reduced by 40 percent or more compared to the existing GTs.

The use of clean fuels (natural gas and ULSD oil) and combustion controls would minimize air emissions of SO_2, sulfuric acid mist (SAM), particulates (PM/PM10/PM2.5), and other fuel-bound contaminants and ensure compliance with applicable emission-limiting standards. Combustion controls will minimize the formation of NOx and the formation of CO and VOCs by combustor design. Further NOx reduction will be achieved by water injection during oil firing.

q. <u>Noise Emissions and Control Systems</u>

It is not expected that noise from the CT Project would exceed the maximum permissible sound levels in Section 17-86 of the City of Dania Beach noise ordinance. The operation of the CTs is not expected to exceed the City of Dania Beach maximum permissible sound levels in residential areas.

The design of the CT Project includes components that mitigate noise from being emitted to the surrounding environment. The majority of the noise sources, such as the CTs, are located within enclosures that mitigate sounds emitted by equipment.

Noise expected to be caused by unit construction at the site is expected to be below current noise levels for the residents nearest the site.

r. **Status of Applications**

No licenses or permits have been issued for the CT Project. FPL has submitted applications to: the Florida Department of Environmental Protection (FDEP) for the Prevention of Significant Deterioration (PSD) air permit; U.S. Environmental Protection Agency (EPA) for the Greenhouse Gas air permit; and to the U. S. Army Corps of Engineers (USACE) for the 404 dredge and fill permit. These applications are currently in review with the respective agencies.

Preferred Site # 3: Hendry County, Hendry County

FPL has acquired an approximately 3,120-acre site in southeast Hendry County, off CR 833. The Hendry County site has been listed as a Preferred or Potential Site in previous FPL Site Plans as a possibility for a future PV facility and/or natural gas-fired CC generation. FPL currently views the Hendry site as one of the most likely sites to be used for future large-scale generation.

a. **Geological Survey (USGS) Map**

A USGS map of the site is found at the end of this chapter.

b. **Proposed Facilities Layout**

A map of the property owned by FPL is found at the end of this chapter.

c. **Map of Site and Adjacent Areas**

An overview map of the site and adjacent areas is also found at the end of this chapter.

d. **Existing Land Uses of Site and Adjacent Areas**

The existing and future land uses on the site are zoned Planned Unit Development (PUD). The PUD is currently being challenged. The existing land uses that are adjacent to the site are predominately agricultural. The property to the south is the Seminole Big Cypress Reservation.

e. **General Environment Features On and In the Site Vicinity**

1. **Natural Environment**

The natural environment adjacent to the north, east, and west of the site are used predominately for agricultural activities such as improved, unimproved, and woodland pasture. The majority of the pasture lands includes upland scrub, pine, and hardwoods. The Seminole Big Cypress Reservation lies to the south.

2. **Listed Species**

FPL strives to have no adverse impacts on federal- or state-listed terrestrial plants and animals. Much of southwest Florida is considered habitat for the endangered Florida

Panther. Although few or no impacts are expected in association with future construction at the site, FPL anticipates minimizing or mitigating for unavoidable wildlife or wetland impacts.

3. **Natural Resources of Regional Significance Status**

Future construction and operation of a solar and/or a natural gas-fired CC generating facility at this location is not expected to have any adverse impacts on parks, recreation areas, or environmentally sensitive lands.

4. **Other Significant Features**

FPL is not aware of any other significant features of the site.

f. **Design Features and Mitigation Options**

Options include construction of CC and/or solar power generation technologies. Mitigation for unavoidable impacts may occur through a combination of on- and off-site mitigation.

g. **Local Government Future Land Use Designations**

Local government future land use designation for the site is Utility. A land use map of the site and adjacent areas is also found at the end of this chapter.

h. **Site Selection Criteria Process**

The Hendry County site has been selected as "Preferred" due to consideration of various factors including system load, transmission interconnection, and economics.

i. **Water Resources**

Groundwater is anticipated to supply water to the Hendry County site.

j. **Geological Features of Site and Adjacent Areas**

The site is at an approximate elevation of 10 to 12 feet above mean sea level (msl) and is located on the Immokalee Rise and the Big Cypress Spur considered terraces created by high sea level events. The terraces are composed of fine quartz sands that lie discontinuously upon the surficial aquifer system whose sediments are the Fort Thompson (Pleistocene), Caloosahatchee Marl (Pleistocene and Pliocene), and Tamiami Formations (Pliocene). Other soil types in the area include limestone rock, calcareous muds, sands, organic materials, and mixed solids.

The surficial aquifer is underlain by the Hawthorn formation (confining unit). The Floridan Aquifer System underlies the Hawthorn formation.

k. **Projected Water Quantities for Various Uses**

The estimated quantity of water required for processing at a CC unit is approximately 0.24 million gallons per day (mgd) for uses such as process water and service water. Potable water demand is expected to average .001 mgd. Minimal amounts of water would be required for a PV facility. Approximately 7.5 mgd of cooling water would be used in cooling towers for one CC unit.

l. **Water Supply Sources by Type**

Potential water supply source is groundwater. Additional evaluations are necessary to determine the exact source. Process and potable water for the new plant will come from the existing potable water supply.

m. **Water Conservation Strategies Under Consideration**

CC and cooling tower technologies utilize less water by design than traditional steam generation units. PV facilities have minimal water demands. Specific water conservation strategies will be evaluated and selected during the detailed design phase of any development project.

n. **Water Discharges and Pollution Control**

A CC unit at the site would utilize a closed cycle cooling (towers) system for heat dissipation. The heat recovery steam generator blowdown will be reused to the maximum extent practicable or mixed with the cooling water flow before discharge. Reverse osmosis (R/O) reject will be mixed with the plant's cooling water flow prior to discharge. Wastewater disposal is anticipated via discharge to an Underground Injection Control well system. Stormwater runoff would be collected and routed to stormwater ponds. The facility will employ a Best Management Practices (BMP) plan and Spill Prevention, Control, and Countermeasure (SPCC) plan to prevent and control the inadvertent release of pollutants.

o. **Fuel Delivery, Storage, Waste Disposal, and Pollution Control**

Natural gas for a new CC unit will be transported to the site via a new natural gas pipeline lateral to the site. New gas compressors to raise the gas pressure of the pipeline to the appropriate level for the new unit may be necessary Ultra-low sulfur light fuel oil will be received by truck or pipeline and stored in an above-ground storage tank.

p. **Air Emissions and Control Systems**

The use of natural gas, ultra-low sulfur light fuel oil, and combustion controls would minimize regulated air emissions from a CC unit and ensure compliance with applicable emission limiting standards. Using these clean fuels minimizes emissions of SO_2, PM, and other fuel-bound contaminates. Combustion controls similarly minimize the formation of NO_x and the combustor design will limit the formation of CO and VOCs. When firing natural gas, NO_x emissions will be controlled using dry-low NO_x combustion technology and selective catalytic reduction (SCR). Water injection and SCR will be used to reduce NO_x emissions during operations when using ultra low sulfur fuel oil as backup fuel. CC facility emissions of GHGs from combustion of natural gas achieve an emission rate substantially lower than the EPA's proposed new source performance standards for GHGs. These design alternatives are equivalent to the Best Available Control Technology for air emissions, and minimize such emissions while balancing economic, environmental, and energy impacts. Taken together, the design of a CC unit would incorporate features that would make it among the most efficient and cleanest power plants in the State of Florida. PV generation does not produce air emissions.

q. <u>Noise Emissions and Control Systems</u>

Noise anticipated to be caused by unit construction at the site is expected to be minimal.

r. <u>Status of Applications</u>

FPL has not submitted any application associated with the Hendry County site.

<u>Preferred Site # 4: NE Okeechobee County, Okeechobee County</u>

FPL has purchased a site of approximately 2,800 acres in Northeast Okeechobee County. The site is in an unincorporated, rural area and is predominantly used for agricultural production. FPL's transmission lines intersect the property. The Northeast Okeechobee County site has been listed as a Preferred or Potential Site in previous FPL Site Plans as a possibility for a natural gas-fired CC generation and/or future PV facility. Natural gas-fired CC generation will be made possible by the May,2017 projected commercial operating date of the Florida Southeast Connection (FSC) natural gas pipeline. FSC is within 3 miles of the NE Okeechobee County site. FPL currently views the Okeechobee site as one of the most likely sites to be used for future large-scale generation.

a. <u>U.S. Geological Survey (USGS) Map</u>

A USGS map of the Northeast Okeechobee site is found at the end of this chapter.

b. <u>Proposed Facilities Layout</u>

A map of the property owned by FPL is found at the end of this chapter.

c. Map of Site and Adjacent Areas

An overview map of the site and adjacent areas is also found at the end of this chapter.

d. Existing Land Uses of Site and Adjacent Areas

The Northeast Okeechobee County site is predominantly used for agricultural production (cattle and citrus). Adjacent land uses include primarily agriculture and conservation.

e. General Environment Features On and In the Site Vicinity

1. Natural Environment

The majority of the site is comprised of lands dedicated to agricultural production.

2. Listed Species

Minimal impacts to federal- or state-listed terrestrial plants and animals are expected in association with construction at the site, due to the existing developed nature of the site and lack of suitable onsite habitat for listed species.

3. Natural Resources of Regional Significance Status

The construction and operation of a power generating facility at this location is not expected to have any adverse impacts on parks, recreation areas, or environmentally sensitive lands.

4. Other Significant Features

FPL is not aware of any other significant features of the site.

f. Design Features and Mitigation Options

Options include construction of PV or CC technologies. Mitigation for unavoidable impacts may occur through a combination of on- and off-site mitigation.

g. Local Government Future Land Use Designations

Local government future land use designation for the site is predominantly unimproved pasture. A land use map of the site and adjacent areas is also found at the end of this chapter.

h. Site Selection Criteria Process

The Northeast Okeechobee County site has been selected as a Preferred Site due to consideration of various factors including system load, transmission interconnection, the proximity of the proposed FSC natural gas pipeline, and economics. Environmental issues were not a deciding factor since this site does not exhibit significant environmental sensitivity.

i. **Water Resources**

Groundwater is anticipated to supply water to the Northeast Okeechobee County site.

j. **Geological Features of Site and Adjacent Areas**

The hydrostratigraphy of the Northeast Okeechobee County site is similar to that of most of South Florida. In general, the groundwater system underlying Okeechobee County consists of the Surficial Aquifer System (SAS), the Intermediate Confining Unit (ICU), and the Floridan Aquifer System (FAS). The SAS consists of approximately 100 to 250 feet of undifferentiated deposits of sand, shell, clay and silt. The ICU consists of approximately 200 feet of carbonate rocks interbedded with sandy and silty clay. The multiple layers of the FAS extend thousands of feet below the ICU.

k. **Projected Water Quantities for Various Uses**

Potable water demand is expected to average .001 mgd. The estimated quantity of water required for processing at a CC unit is approximately 0.24 million gallons per day (mgd) for uses such as process water and service water. Approximately 7.5 mgd of cooling water would be used in cooling towers for a CC unit. Minimal amounts of water would be required for a PV facility.

l. **Water Supply Sources by Type**

Potential water supply source is groundwater. Additional evaluations are necessary to determine the exact source. Process and potable water for the new plant will come from the existing a potable water supply.

m. **Water Conservation Strategies Under Consideration**

CC technology utilizes less water by design than traditional steam generation units. PV facilities have minimal water demands. Specific water conservation strategies will be evaluated and selected during the detailed design phase of any development project.

n. **Water Discharges and Pollution Control**

A CC plant is anticipated to utilize a closed cycle cooling (towers) system for heat dissipation. The heat recovery steam generator blowdown will be reused to the maximum extent practicable or mixed with the cooling water flow before discharge. Reverse osmosis (R/O) reject will be mixed with the plant's cooling water flow prior to discharge. Wastewater disposal is anticipated via discharge to an Underground Injection Control well system. Stormwater runoff would be collected and routed to stormwater ponds. The facility will employ Best

Management Practices (BMP) and Spill Prevention, Control, and Countermeasure (SPCC) plans to prevent and control the inadvertent release of pollutants.

o. **Fuel Delivery, Storage, Waste Disposal, and Pollution Control**

Natural gas for a new CC unit will be transported to the site via a new natural gas pipeline lateral. New gas compressors to raise the gas pressure of the pipeline to the appropriate level for the new unit may be necessary. Back-up fuel supplies of ultra-low sulfur light fuel oil will be received by truck or pipeline and stored in an above-ground storage tank to ensure reliability of operations.

p. **Air Emissions and Control Systems**

The use of natural gas, ultra-low sulfur light fuel oil, and combustion controls would minimize regulated air emissions from a CC unit and ensure compliance with applicable emission limiting standards. Using these clean fuels minimizes emissions of SO_2, PM, and other fuel-bound contaminates. Combustion controls similarly minimize the formation of NO_x and the combustor design will limit the formation of CO and VOCs. When firing natural gas, NO_x emissions will be controlled using dry-low NO_x combustion technology and selective catalytic reduction (SCR). Water injection and SCR will be used to reduce NO_x emissions during operations when using ultra-low sulfur light fuel oil as backup fuel. CC facility emissions of GHGs from combustion of natural gas achieve an emission rate substantially lower than the EPA's proposed new source performance standards for GHGs. These design alternatives are equivalent to the Best Available Control Technology for air emissions, and minimize such emissions while balancing economic, environmental, and energy impacts. Taken together, the design of a CC unit would incorporate features that would make it among the most efficient and cleanest power plants in the State of Florida. PV generation does not produce air emissions.

q. **Noise Emissions and Control Systems**

Noise anticipated to be caused by unit construction at the site is expected to be minimal.

r. **Status of Applications**

FPL has not filed any applications associated with the Northeast Okeechobee County site.

Preferred Site # 5: Putnam Site, Putnam County

FPL is currently evaluating the existing Putnam Plant site for future natural gas-fired generation as part of a potential modernization project. This 66 acre site is located on the east side of Highway 100 opposite the former FPL Palatka Plant in East Palatka. The Putnam site has been listed as a Potential Site in previous FPL Site Plans as a possibility for future natural gas-fired CC generation.

FPL currently views the Putnam site as one of the most likely sites to be used for future large-scale generation.

a. **U.S. Geological Survey (USGS) Map**

A USGS map of the Putnam site is found at the end of this chapter.

b. **Proposed Facilities Layout**

A map of the property owned by FPL is found at the end of this chapter.

c. **Map of Site and Adjacent Areas**

An overview map of the site and adjacent areas is also found at the end of this chapter.

d. **Existing Land Uses of Site and Adjacent Areas**

The Putnam site is designated as Industrial land use. Adjacent land uses include power generation and associated facilities (the former Palatka Plant) as well as Mixed Wetland Hardwoods, Residential, and Hardwood-Coniferous Mixed.

e. **General Environment Features On and In the Site Vicinity**

1. **Natural Environment**

The majority of the site is developed and has facilities necessary for power plant operations. No significant environmental features have been identified at this time.

2. **Listed Species**

Minimal impacts to federal- or state-listed terrestrial plants and animals are expected in association with construction at the site, due to the existing developed nature of the site and lack of suitable onsite habitat for listed species.

3. **Natural Resources of Regional Significance Status**

The construction and operation of a power generating facility at this location is not expected to have any adverse impacts on parks, recreation areas, or environmentally sensitive lands.

4. **Other Significant Features**

FPL is not aware of any other significant features of the site.

f. **Design Features and Mitigation Options**

Options include construction of CC technology. Mitigation for unavoidable impacts may occur through a combination of on- and off-site mitigation.

g. **Local Government Future Land Use Designations**

Local government future land use designation for the site is Industrial. A land use map of the site and adjacent areas is also found at the end of this chapter.

h. **Site Selection Criteria Process**

The Putnam site has been selected as a Preferred Site due to consideration of various factors including system load, transmission interconnection, and economics.

i. **Water Resources**

The St John's River and/or regional water supply initiatives are potential water sources.

j. **Geological Features of Site and Adjacent Areas**

The hydrostratigraphy of the Putnam site is similar to that of most of North Florida. In general, the groundwater system underlying Putnam consists of the Surficial Aquifer System (SAS), and the Floridan Aquifer System (FAS).

k. **Projected Water Quantities for Various Uses**

Potable water demand is expected to average .001 million gallons per day (mgd). The estimated quantity of water required at a CC unit is approximately 0.24 mgd for uses such as process water and service water. Approximately 7.5 mgd of cooling water would be used in cooling towers for a CC unit.

l. **Water Supply Sources by Type**

Potential water supply source is the St. John's River. Additional evaluations are necessary to determine the exact source. Process and potable water for the new plant will come from the existing a potable water supply.

m. **Water Conservation Strategies Under Consideration**

CC and cooling tower technologies utilize less water by design than traditional steam generation units. Specific water conservation strategies will be evaluated and selected during the detailed design phase of the project development.

n. **Water Discharges and Pollution Control**

A CC plant is anticipated to utilize a closed cycle cooling (towers) system for heat dissipation. The heat recovery steam generator blowdown will be reused to the maximum extent practicable or mixed with the cooling water flow before discharge. Reverse osmosis (R/O) reject will be mixed with the plant's cooling water flow prior to discharge. Wastewater disposal is anticipated via discharge to surface and/or ground water as is the case with the existing Putnam Plant. Stormwater runoff would be collected and routed to stormwater ponds. The facility will employ Best Management Practices (BMP) and Spill Prevention, Control, and Countermeasure (SPCC) plans to prevent and control the inadvertent release of pollutants.

o. **Fuel Delivery, Storage, Waste Disposal, and Pollution Control**

Natural gas for a new CC unit will be transported to the site via a new natural gas pipeline lateral. New gas compressors to raise the gas pressure of the pipeline to the appropriate level for the new unit may be necessary. Back-up fuel supplies of ultra-low sulfur light fuel oil will be received by water-borne delivery, truck, or pipeline and stored in an above-ground storage tank to ensure reliability of operations.

p. **Air Emissions and Control Systems**

The use of natural gas, ultra-low sulfur light fuel oil, and combustion controls would minimize regulated air emissions from a CC unit and ensure compliance with applicable emission limiting standards. Using these clean fuels minimizes emissions of SO_2, PM, and other fuel-bound contaminates. Combustion controls similarly minimize the formation of NO_x and the combustor design will limit the formation of CO and VOCs. When firing natural gas, NO_x emissions will be controlled using dry-low NO_x combustion technology and selective catalytic reduction (SCR). Water injection and SCR will be used to reduce NO_x emissions during operations when using ultra- low sulfur light fuel oil as backup fuel. CC facility emissions of GHGs from combustion of natural gas achieve an emission rate substantially lower than the EPA's proposed new source performance standards for GHGs. These design alternatives are equivalent to the Best Available Control Technology for air emissions and minimize such emissions while balancing economic, environmental, and energy impacts. Taken together, the design of a CC unit would incorporate features that would make it among the most efficient and cleanest power plants in the State of Florida.

q. **Noise Emissions and Control Systems**

Noise anticipated to be caused by unit construction at the site is expected to be minimal.

r. **Status of Applications**

FPL has not submitted any applications associated with the Putnam site.

Preferred Site # 6: Turkey Point Plant, Miami-Dade County

The Turkey Point Plant (Turkey Point) is located on the west side of Biscayne Bay, 25 miles south of Miami. Turkey Point is directly on the shoreline of Biscayne Bay and is geographically located approximately 9 miles east of Florida City on Palm Drive. The land surrounding Turkey Point is owned by FPL and acts as a buffer zone. Turkey Point is comprised of two natural gas/oil conventional steam units (Units 1 & 2), two nuclear units (Units 3 & 4), one combined cycle natural gas unit (Unit 5), nine small diesel generators, and the cooling canals. A capacity uprate project for the two nuclear units was successfully completed in 2013. The Everglades Mitigation Bank (EMB), an approximately 13,000 acre, FPL-maintained natural wildlife and wetlands area that has been set aside, is located to the south and west of the site.

In regard to Turkey Point Units 6 & 7, FPL is pursuing licensing for two new nuclear units at Turkey Point. Each of these two units would provide 1,100 MW of capacity. The current projections for the earliest in-service dates for the two new units remain 2022 (for Turkey Point Unit 6) and 2023 (for Turkey Point Unit 7). In addition to the two generating units, supporting buildings, facilities, and equipment will be located on the Turkey Point Units 6 & 7 site, along with a construction laydown area. Proposed associated facilities include: a nuclear administration building, a training building, a parking area, an FPL reclaimed water treatment facility and reclaimed water pipelines, radial collector wells and delivery pipelines, an equipment barge unloading area, transmission lines (and transmission system improvements elsewhere within Miami-Dade County), access roads and bridges, and potable water pipelines.

a. <u>U.S. Geological Survey (USGS) Map</u>

USGS maps of the Turkey Point area, with the proposed location of Turkey Point Units 6 & 7 identified, are found at the end of this chapter.

b. <u>Proposed Facilities Layout</u>

Maps of the general layout of Turkey Point Units 6 &7 are found at the end of this chapter.

c. <u>Map of Site and Adjacent Areas</u>

Land Use / Land Cover overview maps of the Turkey Point Units 6 & 7 site and adjacent areas are also found at the end of this chapter.

d. <u>Existing Land Uses of Site and Adjacent Areas</u>

Turkey Point Plant is currently home to five generating units and support facilities that occupy approximately 150 acres of the approximately 9,400-acre Turkey Point property. Prominent features beyond the power block area include the intake system, cooling canal system, switchyard, spent fuel storage facilities, and technical and administrative support facilities The cooling canal system occupies approximately 5,900 acres.

The two 400-megawatt (MW) (nominal) fossil fuel-fired steam electric generation units at Turkey Point have been in service since 1967 (Unit 1) and 1968 (Unit 2). These units have historically burned residual fuel oil and/or natural gas with a maximum equivalent sulfur content of one percent. Unit 2 is currently serving, not as a power generating unit, but as a synchronous condenser to provide voltage support to the southeastern end of FPL's transmission system. The two original 700-MW (nominal) nuclear units have been in service since 1972 (Unit 3) and 1973 (Unit 4) and were uprated to a total of approximately 1,632 (Summer) MW's in 2013. Turkey Point Units 3 and 4 are pressurized water reactor (PWR) units. Turkey Point Unit 5 is a net 1,148 (Summer) MW natural gas-fired combined cycle unit that began operation in 2007. The site for the new Units 6 & 7 is south of existing Units 3 and 4 and occupies approximately 300 acres within the existing cooling canal system.

Properties adjacent to Turkey Point property are almost exclusively undeveloped land. The FPL-owned EMB is adjacent to most of the western and southern boundaries of Turkey Point property. The South Florida Water Management District (SFWMD) Canal L-31E is also situated to the west of Turkey Point property. The eastern portions of Turkey Point property are adjacent to Biscayne Bay, the Biscayne National Park (BNP), and Biscayne Bay Aquatic Preserve. The southeastern portion of Turkey Point property is bounded by state-owned land located on Card Sound. The Homestead Bayfront Park, owned and operated by Miami-Dade County, is situated to the north of the Turkey Point property.

e. <u>General Environment Features On and In the Site Vicinity</u>

1. <u>Natural Environment</u>

Turkey Point is located directly on the northwest, west, and southwest shoreline of Biscayne Bay and the Biscayne National Park, 25 miles south of Miami. Biscayne National Park was first established in 1968 as a National Monument and was expanded in 1980 to approximately 173,000 acres of water, coastal lands, and 42 keys. A portion of Biscayne Bay Aquatic Preserve, a state-owned preserve, is adjacent to the eastern boundary of the Turkey Point plant property. The Biscayne Bay Aquatic Preserve is a shallow, subtropical lagoon consisting of approximately 69,000 acres of submerged State land that has been designated as an Outstanding Florida Water.

The approximately 300-acre Turkey Point Units 6 & 7 site consists of the plant area and adjacent areas designated for laydown and ancillary facilities. The site includes hypersaline mud flats, man-made active cooling canals, man-made remnant canals, previously filled areas/roadways, mangrove heads associated with historical tidal channels, dwarf mangroves, open water /discharge canal associated with the cooling canals on the western portion of the site, wet spoil berms associated with remnant canals, and upland spoil areas.

2. **Listed Species**

Threatened, endangered, and/or animal species of special concern known to occur at the site, transmission line corridors, or in the nearby Biscayne National Park, include the peregrine falcon *(Falco peregrinus)*, wood stork *(Mycteria americana)*, American crocodile *(Crocodylus acutus)*, roseate spoonbill (*Ajaja ajaja)*, little blue heron *(Egretta caerulea)*, snowy egret *(Egretta thula)*, American oystercatcher *(Haematopus palliates)*, least tern *(Sterna antillarum)*, the white ibis *(Eudocimus albus)*, Florida manatee (Trichechus manatus latirostris), eastern indigo snake (Drymarchon couperi), snail kite (Rostrhamus sociabilis plumbeus), white-crowned pigeon (Patagioenas leucocephala), and bald eagle *(Haliaeetus leucocephalus)*. No bald eagle nests are known to exist in the vicinity of the site. The federally listed, threatened American crocodile thrives at Turkey Point, primarily in and around the southern end of the cooling canals which lie south of the Turkey Point Unit 6 & 7 area. The majority of Turkey Point is considered American crocodile habitat due to the mobility of the species and use of the site for foraging, traversing, and basking. FPL manages a program for the conservation and enhancement of the American Crocodile and the program is credited with survival improvement and contributing to the downlisting of the American Crocodile from endangered to threatened.

Some listed flora species likely to occur at the site or vicinity include pinepink (Bletia purpurea), Florida brickell-bush (Brickellia mosieri), Florida lantana (Lantana depressa var. depressa), mullien nightshade (Solanum donianum), and lamarck's trema (Trema lamarckianum).

The construction, and operation after construction, of Turkey Point Unit 6 & 7 project is not expected to adversely affect any rare, endangered, or threatened species.

3. **Natural Resources of Regional Significance Status**

Significant features within the vicinity of the site include Biscayne National Park, the Biscayne Bay Aquatic Preserve, Miami-Dade County Homestead Bayfront Park, and Everglades National Park. The portion of Biscayne Bay adjacent to the site is included within the Biscayne National Park. Biscayne National Park contains 180,000 acres, approximately 95 percent of which is open water interspersed with more than 40 keys. The Biscayne National Park headquarters is located approximately two miles north of Turkey Point and is adjacent to the Miami-Dade County Homestead Bayfront Park, which contains a marina and day-use recreational facilities.

4. **Other Significant Features**

FPL is not aware of any other significant features of the site.

f. **Design Features and Mitigation Options**

For Turkey Point Units 6 & 7, the technology proposed is the Westinghouse AP1000 pressurized water reactor (PWR). This design is certified by the Nuclear Regulatory Commission (NRC) under 10 CFR 52 and incorporates the latest technology and more advanced safety features than today's nuclear plants that have already achieved record safety levels. The Westinghouse AP1000 unit consists of the reactor, steam generators, pressurizer, and steam turbine/electric generator. Condenser cooling for the Units 6 & 7 steam turbines will be accomplished using six circulating water cooling towers. The makeup water reservoir is the reinforced concrete structure beneath the circulating water system cooling towers that will contain reserve reclaimed water capacity to be used for the circulating water system. The structures for the Westinghouse AP1000 are the nuclear island (containment building, shield building, and auxiliary building), turbine building, annex building, diesel generator building, and radwaste building. The plant area will also contain the Clear Sky substation (switchyard) that will connect Units 6 & 7 to FPL's transmission system.

g. **Local Government future Land Use Designations**

The Turkey Point Plant site is designated by the Miami-Dade County Comprehensive Development Management Plan as an IU-3 (Industrial, Utilities, and Communications) Unlimited Manufacturing District that carries a dual designation of MPA (Mangrove Protection Area) in portions of the property. There are also areas designated GU – "Interim District." Designations for the surrounding area are primarily GU – "Interim District."

h. **Site Selection Criteria Process**

For Turkey Point Units 6 & 7, FPL conducted an extensive site selection analysis leading to the selection of the Turkey Point site as the site that, on balance, provided the most favorable location for developing new nuclear generation to serve FPL's customers. The Site Selection Study employed the principles of the Electric Power Research Institute (EPRI) siting guidelines and is modeled upon applicable NRC site suitability and National Environmental Policy Act (NEPA) criteria regarding the consideration of alternative sites. The study convened a group of industry and FPL subject matter experts to develop and assign weighting factors to a broad range of site selection criteria. Twenty-three candidate sites were then ranked using the siting criteria. This review allowed the list of candidates to be reduced until the best site emerged. Key factors contributing to the selection of the Turkey Point site include the existing transmission and transportation infrastructure to support new generation, the large size and seclusion of the site while being relatively close to the load center, and the long-standing record of safe and secure operation of nuclear generation at the site since the early 1970s.

i. **Water Resources**

In regard to Turkey Point Units 6 & 7, the primary source of cooling water makeup will be reclaimed water from the Miami-Dade County Water and Sewer Department (MDWASD), with potable water also from MDWASD. When reclaimed water is not available in sufficient quantity and quality of water needed for cooling, makeup water will be saltwater supplied by radial collector wells that are recharged from the marine environment of Biscayne Bay. Horizontal collector wells (radial collector wells) have become widely used for the purpose of inducing infiltration from surface water bodies into hydraulically-connected aquifer systems in order to develop moderate to high capacity water supplies. Turkey Point Units 6 & 7 wastewater will be discharged via on-site deep injection wells.

j. **Geological Features of Site and Adjacent Areas**

Turkey Point lies upon the Floridian Plateau, a partly-submerged peninsula of the continental shelf. The peninsula is underlain by approximately 4,000 to 15,000 feet of sedimentary rocks consisting of limestone and associated formations that range in age from Paleozoic to Recent. Little is known about the basement complex of Paleozoic igneous and metamorphic rocks due to their great depth.

Generally in Miami-Dade County, the surficial aquifer (Biscayne Aquifer) consists of a wedge-shaped system of porous clastic and carbonate sedimentary materials, primarily limestone and sand deposits of the Miocene to late Quaternary age. The Biscayne Aquifer is thickest along the eastern coast and varies in thickness from 80 to 200 feet thick. The surficial aquifer is typically composed of Pamlico Sand, Miami Limestone (Oolite), the Fort Thompson and Anastasia Formations (lateral equivalents), Caloosahatchee Marl, and the Tamiami formation. The lower confining layers below the surficial aquifer range in thickness from 350 to 600 feet and are composed of the Hawthorn Group. Beneath the Hawthorn Group, the Floridan Aquifer System ranges from 2,800 to 3,400 feet thick and consists of Suwannee Limestone, Avon Park Limestone, and the Oldsmar Formations.

k. **Projected Water Quantities for Various Uses**

The estimated quantity of water required for the new Turkey Point Units 6 & 7 for industrial processing is approximately 936 gallons per minute (gpm) for uses such as process water and service water. Approximately 55.3 million gallons per day (mgd) of cooling water would be cycled through the cooling towers. Water quantities needed for other uses such as potable water are estimated to be approximately 50,400 gallons per day (gpd) for Units 6 & 7.

l. **Water Supply Sources and Type**

The water for the various water needs of Turkey Point 6 & 7 will be obtained from a reclaimed water supply, a saltwater supply, and a potable water supply. Reclaimed water will be used as makeup water to the cooling water system with saltwater from radial collector wells as a back-up water source to be used when reclaimed water is not available in sufficient quantity or quality.

Potable water will be used as makeup water for the service water system. The potable water supply will also provide water to the fire protection system, demineralized water treatment system, and other miscellaneous uses.

m. **Water Conservation Strategies**

Use of reclaimed water from MDWASD Turkey Point Units 6 & 7 is a beneficial and cost-effective means of increasing the use of reclaimed water. This use of reclaimed water helps Miami-Dade County meet approximately half of its wastewater reuse goals and will provide environmental benefits by reducing the volume of wastewater discharged by the County. In the absence of reuse opportunities, this treated domestic wastewater would likely continue to be discharged to the ocean or into deep injection wells.

Miami-Dade County is required to eliminate ocean outfalls and increase the amount of water that is reclaimed for environmental benefit and other beneficial uses. Turkey Point Units 6 & 7 will use reclaimed water 24 hours per day, 365 days per year when operating and when the reclaimed water is available in sufficient quantity and quality.

n. **Water Discharges and Pollution Control**

Turkey Point Units 6 & 7 will dissipate heat from the power generation process using cooling towers. Blowdown water or discharge from the cooling towers, along with other wastestreams, will be injected into the boulder zone of the Floridan Aquifer. Non-point source discharges are not an issue since there will be none at this facility. Storm water runoff will be released to the closed-loop cooling canal system.

Turkey Point Units 6 & 7 will employ Best Management Practices (BMP) plans and Spill Prevention, Control, and Countermeasure (SPCC) plans to prevent and control the inadvertent release of pollutants.

o. **Fuel Delivery, Storage, Waste Disposal, and Pollution Control**

The Turkey Point Units 6 & 7, reactors will contain enriched uranium fuel assemblies. A fuel assembly consists of 264 fuel rods, 24 guide thimbles, and 1 instrumentation tube in a 17-by-

17 square array. The fuel rods consist of enriched uranium, in the form of cylindrical pellets of sintered uranium dioxide contained in ZIRLO™ tubing.

New fuel assemblies will be transported to Turkey Point for use in Units 6 & 7 by truck from a fuel fabrication facility in accordance with U.S. Department of Transportation (DOT) and NRC regulations. Spent fuel assemblies being discharged will remain in the spent fuel pool while short half-life isotopes decay.

After a sufficient decay period, the fuel would be transferred to an on-site independent spent fuel storage installation facility or an off-site disposal facility. Packaging of the fuel for off-site shipment will comply with the applicable DOT and NRC regulations for transportation of radioactive material.

The U.S. Department of Energy (DOE) is responsible for spent fuel transportation from reactor sites to a repository under the Nuclear Waste Policy Act of 1982, as amended. FPL has executed a standard spent nuclear fuel disposal contract with DOE for fuel used in Units 6 & 7.

p. <u>Air Emissions and Control Systems</u>

Turkey Point Units 1, 2, and 5, and the emergency diesel generators associated with Units 3 and 4, are classified as a major source of air pollution. FDEP has issued a separate Title V Air Operating Permit for the fossil units at Turkey Point and for the emergency diesel generators associated with the nuclear units. There are no operating limits for the emergency generators or diesel engines. Emergency diesel generators are limited to use ultra-low sulfur diesel fuel (0.0015% sulfur). NO_x emissions are regulated under Reasonably Available Control Technology (RACT) requirements in Rule 62-296.570(4) (b) 7 F.A.C., which limit NO_x emissions to 4.75 lb/MMBtu. The use of 0.05 percent sulfur diesel fuel and good combustion practices serve to keep NO_x emissions under this limit.

Regarding Turkey Point Units 6 & 7, the units will also minimize FPL system air pollutant emissions by using nuclear fuel to generate electric power. This includes avoiding emissions of particulate matter (PM), sulfur dioxide (SO_2), nitrogen oxides (NO_x), carbon monoxide (CO), carbon dioxide (CO_2), and volatile organic compounds (VOC). The circulating water cooling towers will be equipped with high-efficiency drift or mist eliminators to minimize emissions of PM to 0.0005 percent of the circulating water, which represents 99.99-percent control of potential drift emissions based on the circulating water flow.

The diesel engines necessary to support Turkey Point Units 6 & 7 and fire pump engines will be purchased from manufacturers whose engines meet the EPA's New Source Performance Standards (NSPS) Subpart IIII emission limits.

q. **Noise Emissions and Control Systems**

Field surveys and impact assessments of noise expected to be caused by activities associated with the Turkey Point Units 6 & 7 project were conducted. Predicted noise levels associated with these projects are not expected to result in adverse noise impacts in the vicinity of the site.

r. **Status of Applications**

The Turkey Point Units 6 & 7 Site Certification Application (SCA), under the Florida Electrical Power Plant Siting Act, was filed in June 2009 and a final order is anticipated in mid-2014. The FPSC issued the final order approving the need for this additional nuclear capacity in April 2008.

A Combined License Application for Units 6 & 7 was submitted to the NRC in June 2009. There are two components to that application; one is the Environmental Assessment (EA) and the other is the Safety component. The Application is still in process.

Besides the certification and the license, additional approvals have been issued for Turkey Point Units 6 & 7 including Miami-Dade County Unusual Use approvals that were issued in 2007 and 2013 and a Land Use Consistency Determination that was issued in 2013. The Prevention of Significant Deterioration (Air permit) was issued in 2009. In addition, a permit to construct an exploratory well and a dual zone monitoring well, under the Underground Injection Control Program, was issued in 2010, and a permit to convert the exploratory well, to an injection well and to operationally test the system, was issued in 2013. Permits from the Federal Aviation Administration (FAA) for the containment structure were originally issued in 2009 and renewed in 2012.

The western transmission lines associated with Units 6 & 7 (2 500 kV New Clear Sky Substation – Levee Substation and 1 230 kV New Clear Sky Substation – Pennsuco Substation) will utilize the existing approximately 40-mile-long transmission line right-of-way acquired by FPL in the 1960s and early 1970s between the Turkey Point plant property and Levee Substation. A 7.4 mile long segment of that existing right-of-way became surrounded by the Everglades National Park in 1989 when the East Everglades Expansion Area south of Tamiami Trail (US-41) was added to the Park. The National Park Service and several other federal, state and local agencies entered into contingent agreements in 2008 to exchange

FPL's fee-owned property within the Park for an alternative right-of-way along the Park's eastern boundary (the Exchange Right-of-Way). That land exchanges was authorized by the U.S. Congress in the 2009 Omnibus Public Lands Management Act, and the National Park Service is currently engaged in a National Environmental Policy Act (NEPA) review of the proposed exchange. The Recommended Order to be considered by the Siting Board in 2014 recommends for approval FPL's West Preferred Corridor, which includes the Exchange Right-of-Way, as a back-up western transmission line corridor to another corridor. The primary western corridor recommended for approval is the West Consensus Corridor (comprising an alternate corridor proposed by the Miami-Dade Limestone Products Association and a portion of FPL's West Preferred Corridor). Both of those western transmission line corridors recommended for certification use the Exchange Right-of-Way. In the event the pending land exchange with the National Park Service and other agencies is not consummated on a timely basis, FPL will need to evaluate other potential western corridors for the western transmission lines associated with Units 6 & 7, including its existing fee-owned right-of-way in the Park, and seek necessary approvals for construction of the required transmission facilities.

IV.F.2 Potential Sites for Generating Options

Four (4) sites are currently identified as Potential Sites for future generation additions to meet FPL's projected capacity and energy needs.[6] These sites have been identified as Potential Sites due to considerations of location to FPL load centers, space, infrastructure, and/or accessibility to fuel and transmission facilities. These sites are suitable for different capacity levels and technologies, including both renewable energy and non-renewable energy technologies for various sites.

Each of these Potential Sites offer a range of considerations relative to engineering and/or costs associated with the construction and operation of feasible technologies. In addition, each Potential Site has different characteristics that will require further definition and attention.

Permits are presently considered to be obtainable for each of these sites. No significant environmental constraints are currently known for any of these sites. The Potential Sites briefly discussed below are presented in alphabetical order. At this time, FPL considers each site to be equally viable.

[6] As has been described in previous FPL Site Plans, FPL also considers a number of other sites as possible sites for future generation additions. These include the remainder of FPL's existing generation sites and other Greenfield sites. Greenfield sites that FPL currently does not own, or for which FPL has not currently secured the necessary rights to, are not specifically identified as Potential Sites in order to protect the economic interests of FPL and its customers.

Potential Site # 1: Babcock Ranch, Charlotte County

This site is located within the proposed Babcock Ranch Community on the north side of Tuckers Grade, approximately 10.5 miles north of the intersection of SR-80 and SR-31 and 1.1 miles east of SR-31. The project is bordered on the north by the Babcock Ranch Preserve owned by the State of Florida. This site is a possibility for an FPL PV facility. FPL has received all permits necessary to construct a 74 MW PV facility at this location.

a. **U.S. Geological Survey (USGS) Map**

A map of this site is found at the end of this chapter.

b. **Land Uses**

Existing land use on the site is the Babcock Ranch Overlay District, and it is zoned as the Babcock Ranch Overlay Zoning District. This land use and zoning allows for solar facilities.

c. **Environmental Features**

FPL anticipates mitigating for unavoidable wildlife and/or wetland impacts as needed as a result of a PV project constructed at this site.

d. **Water Quantities**

Minimal amounts of water, if any, would be required for a PV facility.

e. **Supply Sources**

Minimal water would be required for a PV facility. A small amount may be needed to occasionally clean the solar panels in the absence of sufficient rainfall. Any such water may be brought to the site by truck.

Potential Site # 2: DeSoto Solar Expansion, DeSoto County

The DeSoto site is located at 4051 Northeast Karson Street which is approximately 0.3 miles east of U.S. Highway 17 and immediately north of Bobay Road in Arcadia, Florida. The site is located in Sections 26, 27, & 35, Township 36 South, and Range 25 East. FPL owns an approximate 13,000 acre parcel in DeSoto County. FPL has designated approximately 5,177 acres for development of a PV facility.

The DeSoto site is home to a 25 MW PV facility that has been operational since 2009. Up to an additional 275 MW of PV generation could be constructed in phases on the remaining undeveloped land. FPL has initiated permitting for the additional PV facilities.

a. U.S. Geological Survey (USGS) Map

A map of this site is found at the end of this chapter.

b. Land Uses

Existing land use on the site is agricultural. The future land use is Electric Generating Facility.

c. Environmental Features

There are no significant environmental features on the site.

d. Water Quantities

Minimal amounts of water would be required for a future expansion of the existing PV facility.

e. Supply Sources

Minimal water would be required for an expanded PV facility. A small amount may be needed to occasionally clean the PV panels in the absence of sufficient rainfall. Potable water will be required in the administration building and maintenance building. FPL would propose to utilize existing wells onsite to accommodate water needs.

Potential Site # 3: Manatee Plant Site, Manatee County

The existing FPL Manatee Plant 9,500-acre site is located in unincorporated north-central Manatee County. The existing power generating facilities are located in all or portions of Sections 18 and 19 of Township 33S, Range 20-E. The plant site lies approximately 5 miles east of Parrish, Florida. It is approximately 5 miles east of U.S. Highway 301 and 9.5 miles east of Interstate Highway 75 (I-75). The existing plant is approximately 2.5 miles south of the Hillsborough-Manatee County line. A portion of the north property boundary of the plant site abuts the county line. State Road 62 (SR 62) is about 0.7 mile south of the plant, with the plant entrance road going north from that highway. This site is a possible location for an FPL PV facility. FPL has received the federal and state permits required to construct approximately 50 MW of PV at this location.

a. U.S. Geological Survey (USGS) Map

A map of the site is found at the end of this chapter.

b. Land Uses

Existing land use on the site is agricultural. The property is zoned Planned Development / Public Interest (PD-PI), which will allow for electrical generation.

c. Environmental Features

FPL anticipates mitigating for unavoidable wildlife and/or wetland impacts as needed as a result of a PV project constructed at this site.

d. Water Quantities

Minimal amounts of water would be required for a PV facility.

e. Supply Sources

Minimal water would be required for a PV facility. A small amount may be needed to occasionally clean the PV panels in the absence of sufficient rainfall. Panel cleaning water source may be existing potable water or water tank trucked to the site.

Potential Site # 4: Martin County, Martin County

FPL is currently evaluating potential sites in Martin County for a future PV facility. No specific locations have been selected at this time.

a. U.S. Geological Survey (USGS) Map

A USGS map of the county has been included at the end of this chapter.

b. Land Uses

This information is not available because a specific site has not been selected at this time.

c. Environmental Features

This information is not available because a specific site has not been selected at this time.

d. Water Quantities

Minimal amounts of water would be required for a PV facility.

e. Supply Sources

Minimal water would be required for a PV facility. A small amount may be needed to occasionally clean the PV panels in the absence of sufficient rainfall.

CHAPTER V

Other Planning Assumptions & Information

(This page is left intentionally blank.)

Introduction

The Florida Public Service Commission (FPSC), in Docket No. 960111-EU, specified certain information that was to be included in an electric utility's Ten Year Power Plant Site Plan filing. Among this specified information was a group of 12 items listed under a heading entitled "Other Planning Assumptions and Information." These 12 items basically concern specific aspects of a utility's resource planning work. The FPSC requested a discussion or a description of each of these items.

These 12 items are addressed individually below as separate "Discussion Items".

Discussion Item # 1: Describe how any transmission constraints were modeled and explain the impacts on the plan. Discuss any plans for alleviating any transmission constraints.

FPL's resource planning work considers two types of transmission limitations/constraints: external limitations and internal limitations. External limitations deal with FPL's ties to its neighboring systems. Internal limitations deal with the flow of electricity within the FPL system.

The external limitations are important since they affect the development of assumptions for the amount of external assistance that is available to the FPL system as well as the amount and price of economy energy purchases. Therefore, these external limitations are incorporated both in the reliability analysis and economic analysis aspects of resource planning. The amount of external assistance which is assumed to be available is based on the projected transfer capability to FPL from outside its system as well as historical levels of available assistance. In the loss of load probability (LOLP) portion of its reliability analyses, FPL models this amount of external assistance as an additional generator within FPL's system which provides capacity in all but the peak load months. The assumed amount and price of economy energy are based on historical values and projections from production costing models.

Internal transmission limitations are addressed by identifying potential geographic locations for potential new generating units that minimize adverse impacts to the flow of electricity within FPL's system. The internal transmission limitations are also addressed by developing the direct costs for siting new units at different locations, by evaluating the cost impacts created by the new unit/unit location combination on the operation of existing units in the FPL system, and/or by evaluating the costs of transmission additions that may be needed to address regional concerns regarding an imbalance between load and generation in a given region. Both of these site- and system-related transmission costs are developed for each different unit/unit location option or groups of options. When analyzing DSM portfolios, such as in a DSM Goals docket, FPL also examines the potential of utility DSM energy efficiency programs to avoid/defer regional transmission expenditures that would otherwise be needed to import power into that region by lowering electrical load in Southeastern Florida. In addition, transfer limits for capacity and energy that can be

imported into the Southeastern Florida region (Miami-Dade and Broward Counties) of FPL's system are also developed for use in FPL's production costing analyses. (A further discussion of the Southeastern Florida region of FPL's system, and the need to maintain a regional balance between generation and transmission contributions to meet regional load, is found in Chapter III.)

FPL's annual transmission planning work determines transmission additions needed to address limitations and to maintain/enhance system reliability. FPL's planned transmission facilities to interconnect and integrate generating units in FPL's resource plans, including those transmission facilities that must be certified under the Transmission Line Siting Act, are presented in Chapter III.

Discussion Item # 2: Discuss the extent to which the overall economics of the plan were analyzed. Discuss how the plan is determined to be cost-effective. Discuss any changes in the generation expansion plan as a result of sensitivity tests to the base case load forecast.

FPL typically performs economic analyses of competing resource plans using as an economic criterion FPL's levelized system average electric rates (i.e., a Rate Impact Measure or RIM approach). In addition, for analyses in which DSM levels are not changed, FPL uses the equivalent criterion of the cumulative present value of revenue requirements for the FPL system.[7]

The load forecast that is presented in FPL's 2014 Site Plan was developed in October 2014. The only load forecast sensitivities analyzed during 2013/early 2014 were high load forecast sensitivities developed to analyze FPL's potential future natural gas needs and to analyze the quality of FPL's future reserves.

[7] FPL's basic approach in its resource planning work is to base decisions on a lowest electric rate basis. However, when DSM levels are considered a "given" in the analysis (i.e., when only new generating options are considered), the lowest electric rate basis approach and the lowest system cumulative present value of revenue requirements basis approach yield identical results in terms of which resource options are more economic. In such cases FPL evaluates resource options on the simpler-to-calculate (but equivalent) lowest cumulative present value system revenue requirements basis.

Discussion Item # 3: Explain and discuss the assumptions used to derive the base case fuel forecast. Explain the extent to which the utility tested the sensitivity of the base case plan to high and low fuel price scenarios. If high and low fuel price sensitivities were performed, explain the changes made to the base case fuel price forecast to generate the sensitivities. If high and low fuel price scenarios were performed as part of the planning process, discuss the resulting changes, if any, in the generation expansion plan under the high and low fuel price scenario. If high and low fuel price sensitivities were not evaluated, describe how the base case plan is tested for sensitivity to varying fuel prices.

The basic assumptions FPL used in deriving its fuel price forecasts are discussed in Chapter III of this document. FPL used three fuel cost, and three environmental compliance cost, forecasts in analyses supporting its 2013 nuclear cost recovery filing. Also, in response to a request from the FPSC Staff, FPL used three fuel cost forecasts in sensitivity case analyses for the 2014 DSM Goals docket.

A Medium fuel cost forecast is developed first. Then the Medium fuel cost forecast is adjusted upwards (for the High fuel cost forecast), or downwards (for the Low fuel cost forecast), by multiplying the annual cost values from the Medium fuel cost forecast by a factor of (1 + the historical volatility in the 12-month forward price, one year ahead) for the High fuel cost forecast, or by a factor of (1 – the historical volatility of the 12-month forward price, one year ahead) for the Low fuel cost forecast.

The resource plan presented in this Site Plan is based, in part, on those prior analyses. For that reason, this resource plan has not been further tested for different fuel cost forecasts.

Discussion Item # 4: Describe how the sensitivity of the plan was tested with respect to holding the differential between oil/gas and coal constant over the planning horizon.

As described above in the answer to Discussion Item # 3, FPL used up to three fuel cost forecasts in its 2013/early 2014 resource planning analyses. While these forecasts did not represent a constant cost differential between oil/gas and coal, a variety of fuel cost differentials were represented in these forecasts.

Discussion Item # 5: Describe how generating unit performance was modeled in the planning process.

The performance of existing generating units on FPL's system was modeled using current projections for scheduled outages, unplanned outages, capacity output ratings, and heat rate information. Schedule 1 in Chapter I and Schedule 8 in Chapter III present the current and projected capacity output ratings of FPL's existing units. The values used for outages and heat rates are generally consistent with the values FPL has used in planning studies in recent years.

In regard to new unit performance, FPL utilized current projections for the capital costs, fixed and variable operating & maintenance costs, capital replacement costs, construction schedules, heat rates, and capacity ratings for all construction options in its resource planning work. A summary of this information for the new capacity options FPL currently projects to add over the reporting horizon for this document is presented on the Schedule 9 forms in Chapter III.

Discussion Item # 6: Describe and discuss the financial assumptions used in the planning process. Discuss how the sensitivity of the plan was tested with respect to varying financial assumptions.

During 2013, FPL used the following financial assumptions: i) a capital structure of 40.38% debt and 59.62% equity; (ii) a 4.79% cost of debt; (iii) a 10.5% return on equity; and (iv) an after-tax discount rate of 7.45%. In early 2014, the cost of debt and the after-tax discount rate changed slightly to 5.14% and 7.54%, respectively. The other assumptions did not change. No sensitivities of these financial assumptions were used in FPL's 2013/early 2014 resource planning work.

Discussion Item # 7: Describe in detail the electric utility's Integrated Resource Planning process. Discuss whether the optimization was based on revenue requirements, rates, or total resource cost.

FPL's integrated resource planning (IRP) process is described in detail in Chapter III of this document.

The standard basis for comparing the economics of competing resource plans in FPL's basic IRP process is the impact of the plans on FPL's electricity rate levels with the objective generally being to minimize FPL's projected levelized system average electric rate (i.e., a Rate Impact Measure or RIM approach). As discussed in response to Discussion Item # 2, both the electricity rate perspective and the cumulative present value of system revenue requirement perspective yield identical results in terms of which resource options are more economic when DSM levels are unchanged between competing resource plans. Therefore, in planning work in which DSM levels were unchanged, the equivalent, but simpler-to-calculate, cumulative present value of revenue requirements perspective was utilized.

Discussion Item # 8: Define and discuss the electric utility's generation and transmission reliability criteria.

FPL uses three system reliability criteria in its resource planning work that addresses generation, purchase, and DSM options. One criterion is a minimum 20% Summer and Winter reserve margin. Another reliability criterion is a maximum of 0.1 days per year loss-of-load-probability (LOLP). The third criterion is a minimum 10% generation-only reserve margin (GRM) criterion. These three reliability criteria are discussed in Chapter III of this document.

In regard to transmission reliability analysis work, FPL has adopted transmission planning criteria that are consistent with the planning criteria established by the Florida Reliability Coordinating Council (FRCC). The FRCC has adopted transmission planning criteria that are consistent with the Reliability Standards established by the North American Electric Reliability Council (NERC). The *NERC Reliability Standards* are available on the internet site (http://www.nerc.com/).

In addition, FPL has developed a *Facility Connection Requirements* (FCR) document as well as a *Facility Rating Methodology* document that are also available on the internet under the Interconnection Request Information, and FPL Facility Ratings Methodologies, directories respectively
at https://www.oatioasis.com/FPL/index.html.

Generally, FPL limits its transmission facilities to 100% of the applicable thermal rating. The normal and contingency voltage criteria for FPL stations are provided below:

	Normal/Contingency	
Voltage Level (kV)	Vmin (p.u.)	Vmax (p.u.)
69, 115, 138	0.95/0.95	1.05/1.07
230	0.95/0.95	1.06/1.07
500	0.95/0.95	1.07/1.09
Turkey Point (*)	1.01/1.01	1.06/1.06
St. Lucie (*)	1.00/1.00	1.06/1.06

(*) Voltage range criteria for FPL's Nuclear Power Plants

There may be isolated cases for which FPL may have determined that it is acceptable to deviate from the general criteria stated above. There are several factors that could influence these criteria, such as the overall number of potential customers that may be impacted, the probability of an outage actually occurring, or transmission system performance, as well as others.

Discussion Item # 9: Discuss how the electric utility verifies the durability of energy savings for its DSM programs.

The projected impacts of FPL's DSM programs on demand and energy consumption are revised periodically. Engineering models, calibrated with current field-metered data, are updated at regular intervals. Participation trends are tracked for all of FPL's DSM programs in order to adjust impacts each year for changes in the mix of efficiency measures being installed by program participants. For its load management programs, FPL conducts periodic tests of the load control equipment to ensure that the equipment is functioning correctly. These tests, plus actual, non-test load management events, also allows FPL to gauge the MW reduction capabilities of its load management programs on an on-going basis.

Discussion Item # 10: Discuss how strategic concerns are incorporated in the planning process.

The Executive Summary and Chapter III provide a discussion of a variety of system concerns/issues that influence FPL's resource planning process. Please see those chapters for a discussion of those concerns/issues.

In addition to these system concerns/issues, there are other strategic factors FPL typically considers when choosing between resource options. These include the following: (1) technology risk; (2) environmental risk, and (3) site feasibility. The consideration of these factors may include both economic and non-economic aspects.

Technology risk is an assessment of the relative maturity of competing technologies. For example, a prototype technology, which has not achieved general commercial acceptance, has a higher risk than a technology in wide use and, therefore, assuming all else equal, is less desirable.

Environmental risk is an assessment of the relative environmental acceptability of different generating technologies and their associated environmental impacts on the FPL system, including environmental compliance costs. Technologies regarded as more acceptable from an environmental perspective for FPL's resource plan are those which minimize environmental impacts for the FPL system as a whole through highly efficient fuel use, state of the art environmental controls, generating technologies that do not utilize fossil fuels (such as nuclear and solar), etc.

Site feasibility assesses a wide range of economic, regulatory, and environmental factors related to successfully developing and operating the specified technology at the site in question. Projects that are more acceptable have sites with few barriers to successful development.

All of these factors play a part in FPL's planning and decision-making, including its decisions to construct capacity or to purchase power.

Discussion Item # 11: Describe the procurement process the electric utility intends to utilize to acquire the additional supply-side resources identified in the electric utility's ten-year site plan.

As shown in this 2014 Site Plan, FPL's resource plan currently reflects the following major supply-side resource additions: the on-going modernization at Port Everglades, on-going upgrading of CTs in several CCs throughout FPL's system, the projected addition of CTs at FPL's Lauderdale plant site, the implementation of the previously executed EcoGen PPA, a projected new CC unit (at a site that has not yet been selected), and the projected Turkey Point Units 6 & 7.

In regard to the above capacity additions for which a need determination has already been granted, Turkey Point Units 6 & 7, did not lend themselves to a request for proposal (RFP) approach involving bids from third parties who would build new nuclear generation capacity. In addition, nuclear capacity additions are exempted from the Commission's Bid Rule by section 403.519 (4) (c). For nuclear projects, FPL's procurement activities are conducted to ensure the best combination of quality and cost for the delivered products. In regard to the modernization project at Port Everglades, the project received a Commission waiver from the Bid Rule due to attributes specific to the Port Everglades site and to modernization projects in general (such as use of existing land, water, transmission, etc.) plus other economic benefits to FPL's customers. This waiver from the Bid Rule was granted in Order No. PSC-11-0360-PAA-EI for Port Everglades.

CT upgrades are currently taking place at several CC units throughout the FPL system. FPL was approached by the original equipment manufacturer (OEM) of the CTs regarding the possibility of upgrading these units. Following negotiations with the OEM, and economic analyses that showed that upgrading was cost-effective for FPL's customers, the decision was made to proceed with the CT upgrades. That process is underway and is scheduled to be completed in 2015.

In regard to the addition of five new CTs at FPL's Lauderdale plant site, FPL anticipates selecting the CTs through negotiations with, and/or competitive solicitation of, CT manufacturers. The EcoGen PPA, which was approved by the Commission in Order No. PSC-13-0205-CO-EQ dated 5/21/13, was the result of negotiations between EcoGen and FPL.

Identification of projected self-build options, beyond those units already approved by the FPSC and Governor and Siting Board or units, such as the 2019 CC unit presented in this Site Plan, is required of FPL in its Site Plan filings and represents FPL's current view of alternatives that appear to be FPL's best, most cost-effective self-build options at present. FPL reserves the right to refine its planning analyses and to identify and evaluate other options before making decisions regarding future capacity additions. Such refined analyses have the potential to yield a variety of self-build options, some of which might not require an RFP. If an RFP is issued for Supply options, FPL reserves the right to choose the best alternative for its customers, even if that option is not an FPL self-build option.

Discussion Item # 12: Provide the transmission construction and upgrade plans for electric utility system lines that must be certified under the Transmission Line Siting Act (403.52 – 403.536, F. S.) during the planning horizon. Also, provide the rationale for any new or upgraded line.

(1) FPL has identified the need for a new 230 kV transmission line that required certification under the Transmission Line Siting Act which was issued in April 2006. The new line is to be completed in two phases connecting FPL's St. Johns Substation to FPL's Pringle Substation (shown on Table III.E.1 in Chapter III). Phase 1 was completed in May 2009 and consisted of a new line connecting Pringle to a new Pellicer Substation. Phase 2 is planned to connect St. Johns to Pellicer and is scheduled to be completed by December 2018. The construction of this line is necessary to serve existing and future customers in the Flagler and St. Johns areas in a reliable and effective manner.

(2) FPL has identified the need for a new 230 kV transmission line (by December 2014) that required certification under the Transmission Line Siting Act which was issued on November 2008. The new line will connect FPL's Manatee Substation to FPL's proposed Bob White Substation (also shown on Table III.E.1 in Chapter III). The construction of this line, scheduled to be completed in 2014, is necessary to serve existing and future customers in the Manatee and Sarasota areas in a reliable and effective manner.

Ten Year Power Plant Site Plan

2015-2024

Overview of the Document

Chapter 186, Florida Statutes, requires that each electric utility in the State of Florida with a minimum existing generating capacity of 250 megawatts (MW) must annually submit a Ten Year Power Plant Site Plan (Site Plan). This Site Plan should include an estimate of the utility's future electric power generating needs, a projection of how these estimated generating needs could be met, and disclosure of information pertaining to the utility's preferred and potential power plant sites. The information contained in this Site Plan is compiled and presented in accordance with Rules 25-22.070, 25-22.071, and 25-22.072, Florida Administrative Code (F.A.C.).

Site Plans are long-term planning documents and should be viewed in this context. A Site Plan contains uncertain forecasts and tentative planning information. Forecasts evolve, and all planning information is subject to change, at the discretion of the utility. Much of the data submitted is preliminary in nature and is presented in a general manner. Specific and detailed data will be submitted as part of the Florida site certification process, or through other proceedings and filings, at the appropriate time.

This Site Plan document is based on Florida Power & Light Company's (FPL's) integrated resource planning (IRP) analyses that were carried out in 2014 and that were on-going in the first Quarter of 2015. The forecasted information presented in this plan addresses the years 2015 through 2024.

This document is organized in the following manner:

Chapter I – Description of Existing Resources

This chapter provides an overview of FPL's current generating facilities. Also included is information on other FPL resources including purchased power, demand side management, and FPL's transmission system.

Chapter II – Forecast of Electric Power Demand

FPL's load forecasting methodology, and the resulting forecast of seasonal peaks and annual energy usage, is presented in Chapter II. Included in this discussion is the projected significant impact of federal and state energy efficiency codes and standards.

Chapter III – Projection of Incremental Resource Additions

This chapter discusses FPL's integrated resource planning (IRP) process and outlines FPL's projected resource additions, especially new power plants, based on FPL's IRP work in 2014 and early 2015. This chapter also discusses a number of factors or issues that either have changed, or may change, the resource plan presented in this Site Plan. Furthermore, this chapter discusses FPL's previous and planned demand side management (DSM) efforts, the projected significant impact of the combined effects of FPL's DSM plans and state/federal energy efficiency codes and standards, FPL's previous and planned renewable energy efforts, projected transmission planning additions, and FPL's fuel cost forecasting processes.

Chapter IV – Environmental and Land Use Information

This chapter discusses environmental information as well as Preferred and Potential site locations for additional electric generation facilities.

Chapter V – Other Planning Assumptions and Information

This chapter addresses twelve "discussion items" which pertain to additional information that is included in a Site Plan filing.

FPL
List of Abbreviations
Used in FPL Forms

Reference	***Abbreviation***	***Definition***
Unit Type	CC	Combined Cycle
	CT	Combustion Turbine
	GT	Gas Turbine
	ST	Steam Unit (Fossil or Nuclear)
	PV	Photovoltaic
Fuel Type	NUC	Uranium
	BIT	Bituminous Coal
	FO2	#1, #2 or Kerosene Oil (Distillate)
	FO6	#4,#5,#6 Oil (Heavy)
	NG	Natural Gas
	No	None
	Solar	Solar Energy
	SUB	Sub Bituminous Coal
	Pet	Petroleum Coke
Fuel Transportation	No	None
	PL	Pipeline
	RR	Railroad
	TK	Truck
	WA	Water
Unit/Site Status	OT	Other
	L	Regulatory approval pending. Not under construction
	P	Planned Unit
	T	Regulatory approval received but not under construction
	U	Under construction, less than or equal to 50% Complete
	V	Under construction, more than 50% Complete
Other	ESP	Electrostatic Precipitators

Executive Summary

Florida Power & Light Company's (FPL's) 2015 Ten Year Power Plant Site Plan (Site Plan) presents FPL's current plans to augment and enhance its electric generation capability (owned or purchased) as part of its efforts to meet FPL's projected incremental resource needs for the 2015 - 2024 time period. By design, the primary focus of this document is on projected supply side additions; *i.e.*, electric generation capability and the sites for these additions. The supply side additions discussed in this document are resources projected to be needed, based on FPL's load forecast, after accounting for FPL's demand side management (DSM) resource additions. New DSM Goals for FPL for the time period 2015 through 2024 were set in November 2014 by the Florida Public Service Commission (FPSC). Consequently, the level of DSM additions reflected in the 2015 Site Plan is consistent with these newly approved DSM Goals. DSM is discussed later in this summary and in Chapters II and III.

In addition, FPL's load forecast accounts for a significant amount of efficiency that results from federal and state energy efficiency codes and standards. The projected impacts of these codes and standards are directly accounted for in FPL's load forecast and are discussed in Chapter II.

The resource plan presented in FPL's 2015 Site Plan contains both similarities and differences when compared to the resource plan presented in FPL's 2014 Site Plan. There are a number of factors that have either contributed to the differences between the resource plan presented in this Site Plan and the resource plan that was previously presented in FPL's 2014 Site Plan, or which may influence FPL's on-going resource planning efforts. These factors could result in future changes to the resource plan presented in this document. A brief discussion of these similarities, differences, and factors is provided below. Additional information regarding these topics is presented in Chapters II and III.

I. Similarities Between the Current Resource Plan and the Resource Plan Previously Presented in FPL's 2014 Site Plan:

There are three key similarities between the current resource plan presented in this document and the resource plan that was discussed in the 2014 Site Plan.

Similarity # 1: Modernizations of Existing Power Plant Sites.

As discussed in previous Site Plans, FPL has been in the process of modernizing several existing power plant sites during the last few years. These modernizations consist of replacing old existing steam generating units with modern, highly efficient combined cycle (CC) generating units. The modernizations of FPL's existing Cape Canaveral and Riviera Beach plant sites were completed in 2013 and 2014, respectively. The last of the previously approved modernization projects, the modernization of FPL's existing Port Everglades plant site, is underway and projected to be completed in 2016.

Similarity # 2: Specific generating units are projected to be retired and/or converted to synchronous condenser operation.

In the last several years, FPL has retired a number of older, less efficient generating units including: Sanford Unit 3, Cutler Units 5 & 6, Cape Canaveral Units 1 & 2, Riviera Beach Units 3 & 4, and Port Everglades Units 1 – 4. In addition, Turkey Point Unit 2 has been converted to operate in synchronous condenser mode to provide voltage support for the transmission system in Southeastern Florida.

This trend is projected to continue. As discussed in FPL's 2014 Site Plan, Putnam Units 1 & 2 were retired at the end of 2014. In addition, similar to the earlier conversion of Turkey Point Unit 2, FPL projects that Turkey Point Unit 1 will be converted to run in synchronous condenser mode starting in 2016.

Similarity # 3: A number of older gas turbine peaking units are projected to be retired and replaced with modern combustion turbine peaking units.

In FPL's 2014 Site Plan, FPL projected that it would retire all of its existing gas turbine (GT) units in Broward County at its Lauderdale and Port Everglades sites (a decrease in peaking generating capacity of 1,260 MW) and partially replace this peaking capacity with the installation of 5 new combustion turbine (CT) units at the Lauderdale site (an increase of 1,005 MW). These changes were projected to be completed in 2019. These changes to FPL's generating system were based on concerns regarding whether the older, existing GTs would allow FPL to be able to meet the new EPA 1-hour standards for nitrogen dioxide and sulfur dioxide. Economic analyses now indicate that it is cost-effective to retire and replace a number of the existing GTs at an earlier date. Based on these analyses, FPL currently projects the retirement of a number of its existing GTs, including: 22 of 24 GTs at the Lauderdale site, all 12 GTs at the Port Everglades site, and 10 of 12 GTs at the Fort Myers plant site. Two of the existing GTs at the Lauderdale site, and two of the existing GTs at the Ft. Myers site, will be retained for black start capability. In conjunction with the retirement of these peaking units, FPL is adding a number of new, larger, and more efficient CTs: 5 at the Lauderdale site and 2 at the Fort Myers site. Also, the two existing CTs at the Fort Myers site will undergo capacity upgrades. In total, the net effect of the GT retirements, plus new/upgraded CTs, is a net reduction of approximately 40 MW in net peaking capability. All of these changes are projected to be completed by the end of 2016.

II. Differences Between the Current Resource Plan and the Resource Plan Previously Presented in FPL's 2014 Site Plan:

There are four key differences between the current resource plan presented in this document and the resource plan previously presented in the 2014 Site Plan. These differences are discussed below in chronological order as they pertain to FPL's current resource plan.

Difference # 1: FPL no longer projects that it will serve Vero Beach's electrical load.

Difficulties in the negotiations among the parties involved have led FPL to no longer project that it will serve Vero Beach's electrical load as had been assumed in FPL's most recent Site Plans and load forecasts. This factor results in a reduction of FPL's forecasted load. To the extent circumstances change and a consummation of the sale once again seems likely, FPL will reincorporate this load into its forecast.

Difference # 2: FPL's power purchase agreement with Cedar Bay will be terminated in 2015.

FPL anticipates terminating its existing power purchase agreement for 250 MW of coal-fired capacity from the Cedar Bay generating facility at the end of August 2015 as a result of a Purchase and Sale Agreement between FPL and Cedar Bay Generating Company, L.P. FPL would then own the unit starting on September 1, 2015. FPL currently anticipates that it will not need the unit for economic purposes after 2016 and, if that proves to be the case, would retire the unit at that time. FPL filed for FPSC approval of the Purchase and Sale Agreement in the first quarter of 2015.

Difference # 3: FPL will approximately triple its solar generating capacity by the end of 2016.

FPL will be adding three new photovoltaic (PV) facilities by the end of 2016. Each of the PV facilities will be approximately 74.5 MW (nameplate rating, AC). As a result, FPL's solar generation capacity will increase from its current 110 MW to approximately 333 MW. The new PV installations are projected to be sited in Manatee, Charlotte, and DeSoto counties. The economics of these specific PV projects are aided by the fact that the sites are located close to existing electric infrastructure, including tranmission lines and electric substations, and by the fact that bringing these solar facilities into service prior to the end of 2016 will allow the facilities to take advantage of the current 30% investment tax credit that is scheduled to be reduced to 10% beginning in 2017.

Difference # 4: The projected in-service dates of FPL's planned two new nuclear units, Turkey Point 6 & 7, have now been moved outside of the 10-year reporting period of this document.

In recent Site Plans, the earliest practical deployment dates for the new Turkey Point 6 & 7 nuclear unit were identified as 2022 and 2023, and these two dates were used as the projected in-service dates for these units. However, in the second half of 2014, the Nuclear Regulatory Commission (NRC) issued a new schedule for completing its review of FPL's Combined Operating License Application (COLA) for Turkey Point 6 & 7. The NRC's new schedule now projects that its review will not be completed until late 2016. As a consequence of the NRC delay, and the impacts of the recently amended Florida nuclear cost recovery (NCR) statute, FPL now projects that the earliest practical deployment dates for Turkey Point 6 & 7 will fall outside of the 10-year time period of 2015 through 2024 that is addressed in this Site Plan document. However, emissions-free, baseload capacity and energy from nuclear power remains an important part of FPL's resource plans. For that reason, Chapter IV provides detailed information regarding the Turkey Point site for these two new nuclear units.

III. Factors Which Have Impacted, or Which Could Impact, FPL's Resource Plan:

In addition to these key similarities and differences, there are a number of factors which have impacted, or which may impact, FPL's resource plan. Six (6) such factors are summarized in the text below and these are presented in no particular order. These factors, and/or their corresponding impacts on FPL's resource plan, are further discussed in Chapters II and III.

The first and second of these factors are on-going system concerns that FPL has considered in its resource planning work for a number of years. The first factor is the objective to maintain/enhance fuel diversity in the FPL system. Diversity is sought both in terms of the types of fuel utilized by FPL and how these fuels are supplied to FPL. (Related to the fuel diversity objective, FPL also seeks to enhance the efficiency with which it uses fuel to generate electricity.) The second factor is the need to maintain a balance between load and generating capacity in Southeastern Florida, particularly in Miami-Dade and Broward counties. This balance has both reliability and economic implications for FPL's system.

The third factor is also a system concern that FPL has considered in its resource planning for several years. This factor addresses system reliability and focuses upon the desirability of maintaining an appropriate balance of DSM and supply resources from a system reliability perspective. FPL addresses this through the use of a 10% generation-only reserve margin (GRM) reliability criterion in its resource planning work to complement its other two reliability criteria: a 20% total reserve margin criterion for Summer and Winter, and an annual 0.1 day/year loss-of-load-probability (LOLP) criterion. Together, these three criteria allow FPL to address this specific concern regarding system reliability in a comprehensive manner.

The fourth factor is the significant and increasing impact that federal and state energy efficiency codes and standards are having on FPL's projected demand and energy load forecasts. The incremental impacts of these energy efficiency codes and standards during the 2015 through 2024 time period are projected to reduce FPL's forecasted Summer peak load by more than 2,000 MW, and reduce annual energy consumption by more than 6,800 GWh, by 2024. In addition, this mandated energy efficiency significantly reduces the potential for cost-effective energy efficiency that might otherwise have been obtained through FPL's DSM programs.

The fifth factor is the increasing cost competitiveness of utility-scale PV facilities due to the continued decline of the cost of PV modules. Utility-scale PV facilities are the most economical way to utilize PV technology and the declining costs of PV modules have resulted, for the first time, in utility scale PV now being competitive on FPL's system at specific, highly advantaged sites. As a result, FPL's current resource plan presented in this year's Site Plan includes approximately 223 MW (nameplate, AC) of new PV facilities at three specific sites that offer particular cost advantages. The projected new PV facilities are also presented in Table ES – 1 at the end of this executive summary.

The sixth factor is environmental regulation, particularly the U.S. Environmental Protection Agency's (EPA) proposed Clean Power Plan issued in June 2014. The intent of the Clean Power Plan is to set carbon dioxide (CO_2) emission limits for each state. The EPA is scheduled to issue final rules and emission limits in June 2015 (several months after this Site Plan is filed). The current draft rules call for each state to submit its compliance plan by June 2016 (although a delay of at least one year is possible). FPL's resource planning work will account for the CO_2 limits as they are finalized and FPL expects to be actively engaged in the development of Florida's statewide compliance plan.

Each of these factors will continue to be examined in FPL's on-going resource planning work during the rest of 2015 and in future years.

Table ES-1 presents a current projection of major changes to specific generating units and firm capacity purchases for 2015 – 2024. Although this table does not specifically identify the impacts of projected DSM additions on FPL's resource needs and resource plan, FPL's projected DSM additions that are consistent with its new DSM Goals have been fully accounted for in the resource plan presented in this Site Plan.

In addition, this table shows the addition of an FPL CC unit in 2019. This potential new unit represents FPL's most economic self-build generation option for 2019 and it appears in this table and this Site Plan as a placeholder for that year. In March 2015, FPL issued a capacity request for proposals (RFP) that solicited proposals from interested parties for generation that could supply firm, dispatchable capacity starting in mid-2019. Proposals are due in May 2015. At that time, FPL and an independent evaluator will conduct separate reviews of proposals received in response to the RFP and of FPL's potential self-build

CC unit. At the conclusion of the analyses, FPL will file for a determination of need, or approval of cost recovery, from the Florida Public Service Commission for the generation option(s) that was determined in these analyses to be the best selection for FPL's customers beginning in 2019.

Table ES-1: Projected Capacity & Firm Purchase Power Changes

Year *	Projected Capacity & Firm Purchase Power Changes	Summer MW	Date	Summer Reserve Margin **
2015	Turkey Point	(22)	January-15

	Total of MW changes to Summer firm capacity:	**0**		**22.2%**

* Year shown reflects when the MW change begins to be accounted for in Summer reserve margin calculations.

** Winter Reserve Margins are typically high than Summer Reserve Margin. Winter Reserve Margin are shown on Schedule 7.2 in Chapter III.

*** MW values shown represent the firm capacity assumption for each 74.5 MW nameplate (AC) PV facility.

**** The Okeechobee generating is FPL's best self-build option for 2019. During 2015 it will be evaluated versus

(This page is left intentionally blank.)

CHAPTER I

Description of Existing Resources

(This page is left intentionally blank.)

I. Description of Existing Resources

FPL's service area contains approximately 27,650 square miles and has a population of approximately 9.1 million people. FPL served an average of 4,708,829 customer accounts in 35 counties during 2014. These customers were served by a variety of resources including: FPL-owned fossil-fuel, renewable, and nuclear generating units, non-utility owned generation, demand side management (DSM), and interchange/purchased power.

I.A. FPL-Owned Resources

The existing FPL generating resources are located at 14 generating sites distributed geographically around its service territory, plus one site in Georgia (partial FPL ownership of one unit) and one site in Jacksonville, Florida (partial FPL ownership of two units). As of December 31, 2014, FPL's electrical generating facilities consisted of: four nuclear units, three coal units, 15 combined cycle (CC) units, five fossil steam units, 48 combustion gas turbines, two simple cycle combustion turbines, and two photovoltaic facilities[1]. The locations of these 79 generating units are shown on Figure I.A.1 and in Table I.A.1.

FPL's bulk transmission system, including both overhead and underground lines, is comprised of 6,888 circuit miles of transmission lines. Integration of the generation, transmission, and distribution system is achieved through FPL's 596 substations in Florida.

The existing FPL system, including generating plants, major transmission stations, and transmission lines, is shown on Figure I.A.2.

1 FPL also has one 75 MW solar thermal facility at its Martin plant site. This facility does not generate electricity as the other units mentioned above do. Instead, it produces steam that reduces the use of fossil fuel to produce steam for electricity generation.

FPL Generating Resources by Location

Location/ Map Key	Plant Name	Number of Units	Summer MW
A	Turkey Point	4	3,220
B	St. Lucie [1/]	2	1,821

System Firm Generation as of December 31, 2013 =				**25,072**

1/ Total capability of St. Lucie 1 is 981/1,003 MW. FPL's share of St. Lucie 2 is 840/860. FPL's ownership share of St. Lucie Units 1 and 2 is 100% and 85%, respectively.

2/ Capabilities shown represent FPL's output share from each of the units (approx. 92.5% and exclude the Orlando Utilities Commission (OUC) and Florida Municipal Power Agency (FMPA) combined portion of approximately 7.44776% per unit. Represents FPL's ownership share: SJRPP coal: 20% of two units).

3/ Approximately 46% of the 25 MW of PV at DeSoto, and 32% of the 10 MW of PV at Space Coast, are considered as firm generating capacity for Summer reserve margin purposes.

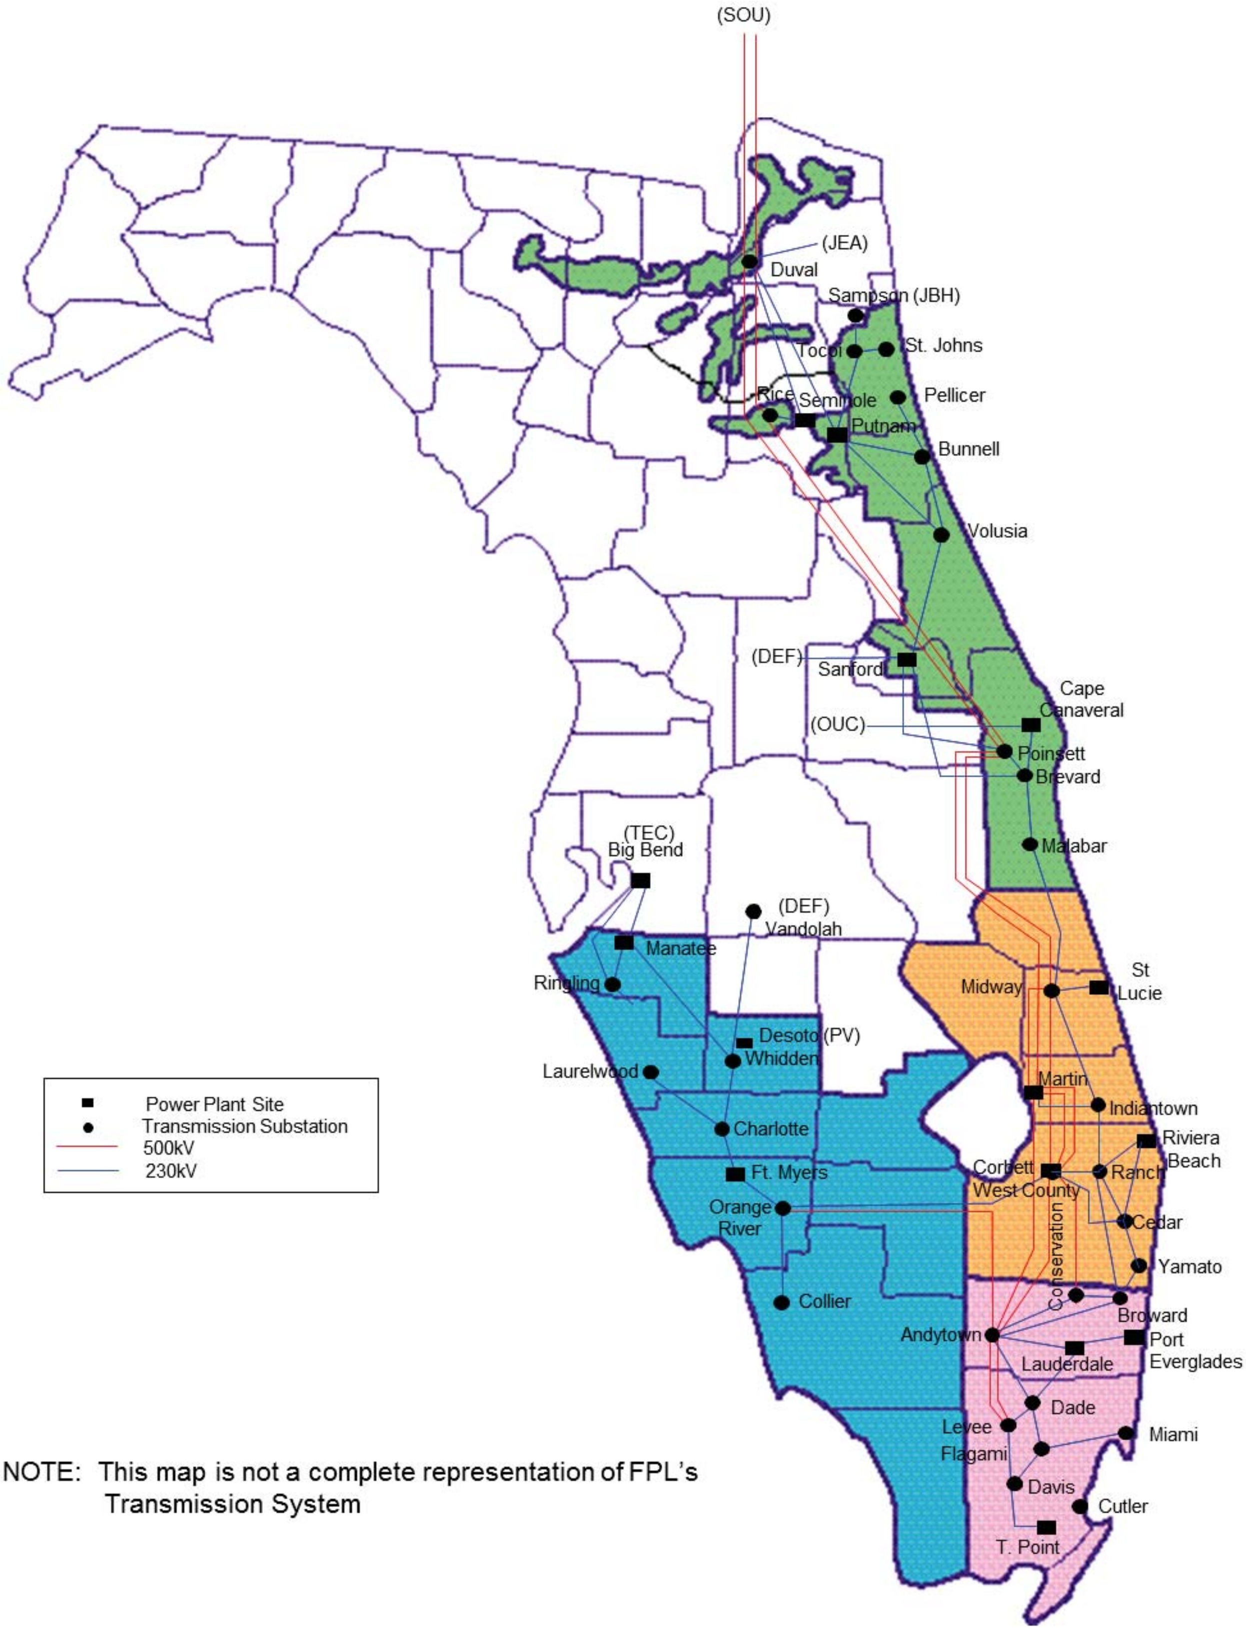

Figure I.A.2: FPL Substation and Transmission System Configuration

Description of Existing Resources

I.B Capacity and Energy Power Purchases

Firm Capacity: Purchases from Qualifying Facilities (QF)

Firm capacity power purchases are an important part of FPL's resource mix. FPL currently has contracts with seven qualifying facilities; i.e., cogeneration/small power production facilities, to purchase firm capacity and energy during the 10-year reporting period of this Site Plan. This is shown in Table I.A.3, Table I.B.1, and Table I.B.2.

A cogeneration facility is one that simultaneously produces electrical and thermal energy, with the thermal energy (e.g., steam) used for industrial, commercial, or cooling and heating purposes. A small power production facility is one that does not exceed 80 MW (unless it is exempted from this size limitation by the Solar, Wind, Waste, and Geothermal Power Production Incentives Act of 1990) and uses solar, wind, waste, geothermal, or other renewable resources as its primary energy source.

Firm Capacity: Purchases from Utilities

FPL has a Unit Power Sales (UPS) contract to purchase 928 MW from the Southern Company (Southern) through the end of December 2015. This capacity is being supplied by Southern from a mix of gas- and coal-fired units.

In addition, FPL has contracts with the Jacksonville Electric Authority (JEA) for the purchase of 382 MW (Summer) and 389 MW (Winter) of coal-fired generation from the St. John's River Power Park (SJRPP) Units No. 1 and No. 2. However, due to Internal Revenue Service (IRS) regulations, the total amount of energy that FPL may receive from this purchase is limited. FPL currently assumes, for planning purposes, that this limit will be reached in the second quarter of 2019. Once this limit is reached, FPL will be unable to receive firm capacity and energy from these purchases. (However, FPL will continue to receive firm capacity and energy from its ownership portion of the SJRPP units.)

These purchases are shown in Table I.A.3, Table I.B.1, and Table I.B.2. FPL's ownership interest in the SJRPP units is reflected in FPL's installed capacity shown on Figure I.A.1, in Table I.A.1, and on Schedule 1.

Firm Capacity: Other Purchases

FPL has two other firm capacity purchase contracts with non-QF, non-utility suppliers. These contracts with the Palm Beach Solid Waste Authority were previously listed as QFs. However, the addition of a second unit in 2015 will cause both units to no longer meet the statutory definition of a QF. Therefore, these contracts are listed as “Other Purchases” following the estimated in-service date of the new unit. Table I.B.1 and I.B.2 present the Summer and Winter MW, respectively, resulting from these contracts under the category heading of Other Purchases.

Non-Firm (As Available) Energy Purchases

FPL purchases non-firm (as-available) energy from several cogeneration and small power production facilities. Table I.A.3 shows the amount of energy purchased in 2014 from these facilities.

Table 1.A.3: Purchase Power Resources by Contract (as of December 31, 2014)

Firm Capacity Purchases (MW)	Location (City or County)	Fuel	Summer MW
I. Purchase from QF's: Cogeneration/Small Power Production Facilities			
Cedar Bay Generating Company	Duval	Coal (Cogen)	250
Indiantown Cogen LP	Martin	Coal (Cogen)	330
Broward South	Broward	Solid Waste	4
Broward North	Broward	Solid Waste	11
Palm Beach SWA - extension	Palm Beach	Solid Waste	40
		Total:	635
II. Purchases from Utilities			
UPS from Southern Company	Various Georgia	Coal/Gas	928
SJRPP	Jacksonville	Coal	382
		Total:	1,310
	Total Net Firm Generating Capability:		1,945

Non-Firm Energy Purchases (MWH)

Project	County	Fuel	Energy (MWH) Delivered to FPL in 2014
Okeelanta (known as Florida Crystals and New Hope	Palm Beach	Bagasse/Wood	87,690
Broward South*	Broward	Solid Waste	93,548
Broward North*	Broward	Solid Waste	57,806
Waste Management Renewable Energy*	Broward	Landfill Gas	34,265
Waste Management - Collier County Landfill*	Broward	Landfill Gas	24,928
Tropicana	Manatee	Natural Gas	7,172
Georgia Pacific	Putnam	Paper by-product	8,606
Rothenbach Park (known as MMA Bee Ridge)*	Sarasota	PV	286
First Solar*	Dade	PV	409
Customer Owned PV & Wind	Various	PV/Wind	1,505
INEOS Bio*	Indian River	Wood	325
Miami Dade Resource Recovery*	Dade	Solid Waste	146,417

*These Non-Firm Energy Purchases are renewable and are reflected on Schedule 11.1, rows 8 and 9, column 6.

I.C Demand Side Management (DSM)

FPL has sought out and implemented cost-effective DSM programs since 1978. These programs include a number of conservation/energy efficiency and load management initiatives. FPL's DSM efforts through 2014 have resulted in a cumulative Summer peak reduction of approximately 4,793 MW at the generator and an estimated cumulative energy saving of approximately 70,997 Gigawatt-hour (GWh) at the generator. After accounting for reserve margin requirements, FPL's DSM efforts through 2014 have eliminated the need to construct the equivalent of approximately 14 new 400 MW generating units. New DSM Goals for FPL for the 2015 through 2024 time period were set by the FPSC in November 2014. The new DSM Goals are discussed in Chapter III.

Schedule 1

Total System Generating Capacity as of December 31, 2014 6/ =												**26,668**	**25,092**
System Firm Generating Capacity as of December 31, 2014 7/ =												**26,633**	**25,072**

1/ These ratings are peak capability.

2/ These ratings relate to FPL's 76.36% share of Plant Scherer Unit 4 operated by Georgia Power, and represent FPL's 73.923% owernership share available at point of interchange.

3/ Approximately 32% of the 10 MW (Nameplate, AC) PV facility at Space Coast is considered as firm generating capacity for Summer reserve margin purposes and 0% is considered as firm capacity for Winter reserve margin purposes.

4/ The net capability ratings represent Florida Power & Light Company's share of St. Johns River Park Units 1 and 2, excluding the Jacksonville Electric Authority (JEA) share of 80%.

5/ Total capability of St. Lucie 1 is 981/1,003 MW. FPL's share of St. Lucie 2 is 840/860.FPL's ownership share of St. Lucie Units 1 and 2 is 100% and 85%, respectively, as shown above. FPL's share of the deliverable capacity from each unit is approx. 92.5% and exclude the Orlando Utilities Commission (OUC) and Florida Municipal Power Agency (FMPA) combined portion of approximately 7.448% per unit.

6/ The Total System Generating Capacity value shown includes FPL-owned firm and non-firm generating capacity.

7/ The System Firm Generating Capacity value shown includes only firm generating capacity.

CHAPTER II

Forecast of Electric Power Demand

(This page is left intentionally blank.)

II. Forecast of Electric Power Demand

II. A. Overview of the Load Forecasting Process

At FPL, long-term forecasts of sales, net energy for load (NEL), and peak loads typically are developed on an annual basis for resource planning work. FPL developed new long-term forecasts in late 2014 that replaced the previous long-term load forecasts used by FPL during 2014 in much of its resource planning work and which were presented in FPL's 2014 Site Plan. These new load forecasts are utilized throughout FPL's 2015 Site Plan and are a key input to the models used to develop FPL's integrated resource plan.

The following pages describe how forecasts are developed for each component of the long-term forecast including: sales, NEL, and peak loads. Consistent with past forecasts, the primary drivers to develop these forecasts include economic conditions and weather.

The projections for the national and Florida economies are obtained from IHS Global Insight, a leading economic forecasting firm. Population projections are obtained from the Florida Legislature's Office of Economic and Demographic Research (EDR). These projections are developed in conjunction with the Bureau of Economic and Business Research (BEBR) of the University of Florida. These inputs are quantified and qualified using statistical models in terms of their impact on the future demand for electricity.

Weather is always a key factor that affects FPL's energy sales and peak demand. Three sets of weather variables are developed and used in FPL's forecasting models::

1. Cooling degree-hours based on 72^{o} F, winter heating degree-days based on 66^{o} F, and heating degree-days based on 45^{o} F are used to forecast energy sales.
2. The maximum temperature on the peak day and the build-up of cooling degree-hours prior to the peak are used to forecast Summer peaks.
3. The minimum temperature on the peak day and the build-up of heating degree-hours based on 66^{o} F on the morning of the peak are used to forecast Winter peaks.

The cooling degree-hours and winter heating degree-days are used to capture the changes in the electric usage of weather-sensitive appliances such as air conditioners and electric space heaters. Heating degree-days based on 45^{o} F are used to capture heating load resulting from sustained periods of unusually cold weather that are not fully captured by heating degree-days based on 66^{o} F. A composite hourly temperature profile is derived using hourly temperatures across FPL's service territory. Miami, Ft. Myers, Daytona Beach, and West Palm Beach are the locations where temperatures are obtained. In developing the composite hourly profile, these regional temperatures are weighted by regional energy sales. The resulting composite temperature is used to derive projected cooling and heating degree-hours and heating degree-days. Similarly, composite temperature and hourly profiles of temperatures are used to calculate the weather variables used in the Summer and Winter peak models.

II. B. Comparison of FPL's Current and Previous Load Forecasts

While reflecting some fluctuations by year, FPL's current load forecast is generally in line with the load forecast previously presented in its 2014 Site Plan. Three primary factors drive the current load forecast: projected population growth, the performance of Florida's economy, and energy efficiency codes and standards. An additional fourth factor, which represents a change in assumptions from the 2014 Site Plan, pertains to FPL's previously planned acquisition of the City of Vero Beach's electric system.

In early 2013, FPL came to an agreement with the City of Vero Beach to purchase the City's electric system. This agreement was approved by the City's voters on March 12, 2013. FPL projected in its 2014 Site Plan that it would begin serving Vero Beach's electric load in January 2015. Accordingly, NEL, customers, and peaks for Vero Beach from 2015 through 2023 were included in FPL's load forecasts in its 2014 Site Plan. However, lack of progress among negotiating parties has resulted in uncertainty regarding whether FPL will provide, or when it can begin providing, Vero Beach's electric load. As a result, FPL's current load forecast does not include electric service to Vero Beach.

The customer forecast is based on recent population projections as well as the actual levels of customer growth experienced historically. Population projections are derived from the EDR's July 2014 Demographic Estimating Conference. This forecast is generally consistent with previous forecasts indicating steady growth in Florida's population. On a percentage basis, the projected rates of population growth are expected to be somewhat below the state's long-term historical averages. However, the absolute increases in population are projected to be significant. The state's population is expected to reach 20 million by 2016 and exceed 22 million by 2023. Overall, the state's population is expected to increase by approximately three million between 2014 and 2024.

FPL customer growth is expected to mirror the overall level of population growth in the state. From 2014 through 2024 the total number of customers is projected to increase at an annual rate of 1.3% resulting in a cumulative increase of more than 670,000 customers. By 2019, the total number of customers served by FPL is expected to exceed five million. By 2024, the total number of FPL customers is expected to reach approximately 5.4 million.

The economic projections incorporated into FPL's load forecast are provided by IHS Global Insight. IHS Global Insight projects solid growth in the Florida economy with relatively healthy increases in employment and income levels from 2015 through 2019. This firm projects particularly robust growth for the professional and business services, trade, tourism, and healthcare industries. Consistent with past projections, economic growth in the later years of the forecast is expected to moderate slightly.

Estimates of savings from energy efficiency codes and standards are developed by ITRON, a leading expert in this field. These estimates include savings from federal and state energy efficiency codes and standards, including the 2005 National Energy Policy Act, the 2007 Energy Independence and Security Act, and the savings resulting from the use of compact fluorescent bulbs and light-emitting diodes (LEDs)[2]. The impact of these savings began in 2005 and their cumulative impact on the Summer peak is expected to reach 3,568 MW by 2024, the equivalent of an approximately 12% reduction in what the forecasted Summer peak load for 2024 would have been without these codes and standards. The cumulative impact on NEL from these savings is expected to reach 11,405 GWH over the same period while the cumulative impact on the Winter peak is expected to be 2,022 MW by 2024. This represents a decrease of approximately 8% in the forecasted NEL for 2024 and an 8% reduction in forecasted Winter peak load for 2024.

Consistent with the forecast presented in FPL's 2014 Site Plan, the total growth projected for the ten-year reporting period of this document is significant. The Summer peak is projected to increase to 26,771 MW by 2024, an increase of 3,836 MW over the 2014 actual Summer peak. Likewise, NEL is projected to reach 133,276 GWH in 2024, an increase of 17,308 GWH from the actual 2014 value.

II.C. Long-Term Sales Forecasts

Long-term forecasts of electricity sales were developed for the major revenue classes and are adjusted to match the NEL forecast. The results of these sales forecasts for the years 2015 through 2024 are presented in Schedules 2.1 - 2.3 that appear at the end of this chapter. Econometric models are developed for each revenue class using the statistical software package MetrixND. The methodologies used to develop energy sales forecasts for each jurisdictional revenue class and NEL forecast are outlined below.

[2] Note that in addition to the fact that these energy efficiency codes and standards lower the forecasted load, these standards also lower the potential for efficiency gains that would otherwise be available through utility DSM programs.

1. Residential Sales

Residential electric usage per customer is estimated by using an econometric model. Residential sales are a function of the following variables: cooling degree-hours, winter heating degree-days, twelve-month average Consumer Price Index for Energy, and Florida real per capita income weighted by the percent of the population that is employed. The impact of weather is captured by the cooling degree-hours and winter heating degree-days. The impact energy prices have on electricity consumption is captured through the Consumer Price Index for Energy variable. As energy prices rise, less disposable income is available for all goods and services, including electricity. To capture economic conditions, the model includes a composite variable based on Florida real per capita income and the percent of the state's population that is employed. Residential energy sales are forecasted by multiplying the projected residential use per customer by the projected number of residential customers.

2. Commercial Sales

The commercial sales forecast is also developed using econometric models. The commercial class is forecast using three separate models, based on customer size, including: small accounts (less than 20 kW of demand), medium accounts (21 kW to 499 kW of demand), and large accounts (demand of 500 kW or higher). Commercial sales are driven by economic and weather variables. Specifically, the small commercial sales model utilizes the following variables: Florida real per capita income weighted by the percent of the population that is employed, cooling degree-hours, heating degree-hours, lagged cooling degree-hours, the Consumer Price Index, dummy variables for the month of December and for the specific months of January 2007 and November 2005, and an autoregressive term. The medium commercial sales model utilizes the same variables as the small commercial model with the exception of a January heating degree-day term rather than the heating degree-hours term. The large commercial sales model utilizes the following variables: Florida real per capita income, cooling degree-hours, heating degree-hours, lagged cooling degree-hours, dummy variables for the month of December and for the specific months of January 2007 and November 2005, and an autoregressive term. Cooling degree-hours, heating degree-hours, and the one-month lag of cooling degree-hours are used to capture weather-sensitive load in the commercial sector.

3. Industrial Sales

Like the commercial class, the industrial class is forecast using three separate models, based on customer size. The industrial class is comprised of three distinct groups: small accounts (less than 20 kW of demand), medium accounts (21 kW to 499 kW of demand), and large accounts (demands of 500 kW or higher). The small industrial sales model utilizes the following variables: Florida real household disposable income, cooling degree-hours, heating degree-hours, and autoregressive terms. The medium industrial sales model utilizes the following variables: Florida real Gross State Product, the Consumer Price Index, cooling degree-hours, January heating degree-days, dummy variables for the specific months of February 2005 and November 2005, and autoregressive terms. The large industrial sales model utilizes the following variables: cooling degree-hours, Florida Gross State Product for manufacturing, the Consumer Price Index, the employee to population ratio, and dummy variables for the specific months of October 2004 and November 2004.

4. Railroad and Railways Sales and Street and Highway Sales

This class consists solely of Miami-Dade County's Metrorail system. The projections for railroad and railways sales are based on a historical moving average.

The forecast for street and highway sales is developed by first developing a trended use per customer value, then multiplying this value by the number of forecasted customers.

5. Other Public Authority Sales

This class consists of a sports field rate schedule, which is closed to new customers, and one government account. The forecast for this class is based on its historical usage characteristics.

6. Total Sales to Ultimate Customer

Sales forecasts by revenue class are summed to produce a total sales forecast.

7. Sales for Resale

Sales for resale (wholesale) customers are composed of municipalities and/or electric co-operatives. These customers differ from jurisdictional customers in that they are not the ultimate users of the electricity they buy. Instead, they resell this electricity to their own customers. There are currently seven customers in this class: Florida Keys Electric Cooperative, Lee County Electric Cooperative, New Smyrna Beach, Wauchula, Winter Park, Blountstown, and Seminole Electric Cooperative[3].

Beginning in May 2011, FPL began providing service to the Florida Keys Electric Cooperative under a long-term full requirements contract. FPL previously served the Florida Keys under a

[3] FPL continues to evaluate the possibility of serving the electrical loads of other entities at the time this Site Plan is being prepared. Because these possibilities are still being evaluated, the load forecast presented in this Site Plan does not include these potential loads.

partial requirements contract. The sales to Florida Keys Electric Cooperative are based on customer-supplied information and historical coincidence factors.

Lee County contracted with FPL for FPL to supply a portion of the Lee County load through 2013, then to serve the entire Lee County load beginning in 2014. This contract began in January 2010. Forecasted NEL for Lee County is based on an econometric model utilizing the following variables: cooling and heating degree-hours, January heating degree-days, real disposable household income, and autoregressive terms.

FPL sales to New Smyrna Beach began in February 2014 and will continue through December 2017.

FPL's sales to Wauchula began in October 2011 and will continue through December 2016.

Sales to Winter Park began in January 2014 and will continue through December 2016.

Blountstown became an FPL wholesale customer in May 2012 under a contract that expires in April 2017.

FPL sales to Seminole Electric Cooperative are based on delivery of 200 MW that began in June 2014 and continues through May 2021.

II.D. Net Energy for Load (NEL)

An econometric model is developed to produce a NEL per customer forecast. The inputs to the model include Florida real per capita income weighted by the percent of the population that is employed, and a proxy for energy prices. The model also includes several weather variables including cooling degree-hours and heating degree-days by calendar month, and heating degree-days based on 45o F. In addition, the model also includes a variable for energy efficiency codes and standards. A dummy variable is included for the specific month of November 2005. There are also two autoregressive terms in the model.

The energy efficiency variable is included to capture the impacts from major codes and standards, including those associated with the 2005 National Energy Policy Act, the 2007 Energy Independence and Security Act, and savings resulting from the use of compact fluorescent bulbs and LEDs. The estimated impact from these codes and standards includes engineering estimates and any resulting behavioral changes. The impact of these savings began in 2005 and their cumulative impact on NEL is expected to reach 11,405 GWH by 2024. This represents an approximately 8% reduction in what the forecasted NEL for 2024 would have been absence these codes and standards. From the end of 2014, the incremental reduction through 2024 is expected to be 6,808 GWH. An additional adjustment is made due to the impact of incremental distributed generation not otherwise included in the forecast. The adjustment to the forecast due to distributed generation begins in 2014 and is expected to reduce the NEL forecast by 444 GWH by 2024.

The forecast was also adjusted for the additional load estimated from hybrid vehicles, beginning in 2014, which resulted in an increase of approximately 616 GWH by the end of the ten-year reporting period. The forecast was further adjusted for the incremental load resulting from FPL's economic development riders which began in 2014 and this incremental load is projected to grow to 242 GWH before leveling off in 2020

The NEL forecast is developed by first multiplying the NEL per customer forecast by the projected total number of customers and then adjusting the forecasted results for the expected changes in load resulting from hybrid vehicles, new wholesale contracts, distributed generation, and FPL's economic development riders. Once the NEL forecast is determined, total billed sales are computed using a historical ratio of sales to NEL. The sales by class forecasts discussed previously are then adjusted to match the total billed sales. The forecasted NEL values for 2015 through 2024 are presented in Schedule 3.3 which appears at the end of this chapter.

II.E. System Peak Forecasts

The rate of absolute growth in FPL system peak load has been a function of the size of the customer base, varying weather conditions, projected economic conditions, changing patterns of customer behavior, and more efficient appliances and lighting. FPL developed the peak forecast models to capture these behavioral relationships. In addition, FPL's peak forecast also reflects changes in load expected as a result of changes in wholesale contracts, distributed generation, and the expected number of hybrid vehicles.

The savings from energy efficiency codes and standards incorporated into the peak forecast include the impacts from the 2005 National Energy Policy Act, the 2007 Energy Independence and Security Act, and the use of compact fluorescent light bulbs and LEDs. The impact from these energy efficiency standards began in 2005 and their cumulative impact on the Summer peak is expected to reach 3,568 MW by 2024. This reduction includes engineering estimates and any resulting behavioral changes. This reduction also represents significant energy efficiency that is not funded by FPL's customers through the Energy Conservation Cost Recovery Clause.

The cumulative 2024 impact from these energy efficiency codes and standards effectively reduces FPL's Summer peak for that year by approximately 12%. From the end of 2014, the projected incremental impact on the Summer peak from these energy efficiency codes and standards is projected to be a reduction of 2,035 MW through 2024. By 2024, the Winter peak is expected to be reduced by 2,022 MW as result of the cumulative impact from these energy efficiency standards since 2005. On an incremental basis, net of the reduction already experienced through 2014, the impact on the Winter peak from these energy efficiency standards is expected to reach 1,321 MW in 2024.

The forecast also was adjusted for additional load estimated from hybrid vehicles which is projected to be an increase of approximately 173 MW in the Summer and 86 MW in the Winter by the end of the ten-year reporting period. The incremental impact of distributed generation results in an expected decrease of approximately 105 MW in the Summer and a negligible reduction in the Winter by the end of the ten-year reporting period. The incremental impact from distributed generation is based on forecasted increases in rooftop photovoltaic (PV) installations not otherwise reflected in the load forecast. The ratio of the expected Summer Peak MW reduction relative to the installed nameplate MW (DC) capacity is appropriately 34% for residential PV installations and appropriately 37% for commercial PV installations. The ratio of the expected Winter Peak MW reduction to installed nameplate MW (DC) capacity is close to 0% for both residential and commercial PV installations.

The forecasting methodology of Summer, Winter, and monthly system peaks is discussed below. The forecasted values for Summer and Winter peak loads for the years 2015 through 2024 are presented at the end of this chapter in Schedules 3.1 and 3.2, and in Chapter III in Schedules 7.1 and 7.2.

1. System Summer Peak

The Summer peak forecast is developed using an econometric model. The variables included in the model are the price of gasoline (lagged one month), Florida real household disposable income, cooling degree-hours two days prior to the peak day, the maximum temperature on the day of the peak, a variable for energy efficiency standards, and a dummy variable for the year 1990. The model is based on the Summer peak contribution per customer which is multiplied by total customers. This product is then adjusted to account for the expected changes in loads resulting from hybrid vehicles, new wholesale contracts, distributed generation, and FPL's economic development riders to derive FPL's system Summer peak.

2. System Winter Peak

Like the system Summer peak model, this model also is an econometric model. The model consists of two weather-related variables: the minimum temperature on the peak day and heating degree-hours for the prior day squared. The model also includes two dummy variables; one for Winter peaks occurring on weekends and one for the year 1994. Also included in the model are a variable for housing starts per capita, and an autoregressive term. The forecasted results are adjusted for the impact of energy efficiency standards. The model is based on the Winter peak contribution per customer which is multiplied by the total number of customers. This product then is adjusted for the expected changes in loads resulting from hybrid vehicles, new wholesale contracts, distributed generation, and FPL's economic development riders.

3. Monthly Peak Forecasts

The forecasting process for monthly peaks consists of the following steps:

a. The forecasted annual summer peak is assumed to occur in the month of August which historically has accounted for more annual summer peaks than any other month.

b. The forecasted annual winter peak is assumed to occur in the month of January which historically has accounted for more annual winter peaks than any other month.

c. The remaining monthly peaks are forecasted based on the historical relationship between the monthly peaks and the annual summer peak.

II.F. Hourly Load Forecast

Forecasted values for system hourly load for the period 2015 through 2024 are produced using a System Load Forecasting "shaper" program. This model uses years of historical FPL hourly system load data to develop load shapes for weekdays, weekend days, and holidays. The model generates a projection of hourly load values based on these load shapes and the forecast of monthly peaks and energy.

II.G. Uncertainty

Uncertainty is inherent in the load forecasting process. This uncertainty can result from a number of factors, including unexpected changes in consumer behavior, structural shifts in the economy, and fluctuating weather conditions. Large weather fluctuations, in particular, can result in significant deviations between actual and forecasted peak demands. The load forecast is based on average expected or normal weather conditions; i.e. a 50% probability (or P50) forecast. An extreme P90 cold weather event, however, can add an additional 3,000 MW to the Winter Peak and an extreme P90 hot weather event can add an additional 800 MW to the Summer Peak.

In order to address uncertainty in the forecasts of aggregate peak demand and NEL, FPL first evaluates the assumptions underlying the forecasts. FPL takes a series of steps in evaluating the input variables, including comparing projections from different sources, identifying outliers in the series, and assessing the series' consistency with past forecasts. As needed, FPL reviews additional factors that may affect the input variables.

Uncertainty is also addressed in the modeling process. Econometric models generally are used to forecast the aggregate peak demand and NEL. During the modeling process, the relevant statistics (goodness of fit, F-statistic, P-values, mean absolute deviation (MAD), mean absolute percentage error (MAPE), etc.) are scrutinized to ensure the models adequately explain historical variation. Once a forecast is developed, it is compared with past forecasts. Deviations from past forecasts are examined in light of changes in input assumptions to ensure that the drivers underlying the forecast are well understood. Finally, forecasts of aggregate peak demand and NEL are compared with the actual values as these become available. An ongoing process of variance analyses is performed. To the extent that the variance analyses identify large unexplained deviations between the forecast and actual values, revisions to the econometric model may be considered.

The inherent uncertainty in load forecasting is addressed in different ways in regard to FPL's overall resource planning and operational planning work. In regard to FPL's resource planning work, FPL's utilization of a 20% total reserve margin criterion, a Loss-of-Load-Probability (LOLP) criterion of 0.1, and a 10% generation-only reserve margin criterion, are designed to maintain reliable electric service for FPL's customers in light of forecasting (and other) uncertainty. In addition, banded forecasts of the projected Summer peak and net energy for load are produced based on an analysis of past forecasting variances. In regard to operational planning, a banded forecast for the projected Summer and Winter peak days is developed based on historical weather variations. These bands are then used to develop similar bands for the monthly peaks.

II.H. DSM

The effects of FPL's DSM energy efficiency programs implementation through August 2014 are assumed to be embedded in the actual usage data for forecasting purposes. The following are accounted for as "line item reductions" to the forecasts as part of the IRP process: the impacts of incremental energy efficiency that FPL has implemented in the September 2014 through December 2014 time period, incremental energy efficiency that FPL plans to implement in the future based on the new DSM Goals set for FPL by the FPSC in November 2014, and the cumulative and projected incremental impacts of FPL's load management programs. After making these adjustments to the load forecasts, the resulting "firm" load forecast is then used in FPL's IRP work as shown in Chapter III in Schedules 7.1 and 7.2.

Schedule 2.1
History of Energy Consumption
And Number of Customers by Customer Class

(1)	(2)	(3)	(4)	(5)	(6)	(7)	(8)	(9)
			Rural & Residential			**Commercial**

Historical Values (2005 - 2014):

Col. (2) represents population only in the area served by FPL.

Col. (4) and Col. (7) represent actual energy sales including the impacts of existing conservation.
These values are at the meter.

Col. (5) and Col. (8) represent the annual average of the twelve monthly values.

Schedule 2.1
Forecast of Energy Consumption

2020	5,700	7,036	128,851	4,058	5,124,436
2021	5,256	7,011	129,237	4,090	5,190,185
2022	4,955	7,097	130,077	4,118	5,254,820
2023	5,013	7,176	131,495	4,145	5,318,608
2024	5,073	7,271	133,276	4,170	5,381,815

Projected Values (2015 - 2024):

Col. (19) represents forecasted energy sales that do not include the impact of incremental conservation and agrees to Col. (2) on Schedule 3.3.

Col. (19) = Col. (16) + Col. (17) + Col. (18). These values are based on calendar year.

Col. (20) represents the annual average of the twelve monthly values.

Col. (21) = Col. (5) + Col. (8) + Col. (11) + Col. (20).

Schedule 3.1
History of Summer Peak Demand (MW)

(1)	(2)	(3)	(4)	(5)	(6)	(7)	(8)	(9)	(10)
Year	Total	Wholesale	Retail	Interruptible	Res. Load Management	Residential Conservation	C/I Load Management	C/I Conservation	Net Firm Demand
2005	22,361	264	22,097	0	902	895	600	611	20,858
2006	21,819	256	21,563	0	928	948	635	640	20,256
2007	21,962	261	21,701	0	952	982	716	683	20,295
2008	21,060	181	20,879	0	966	1,042	760	706	19,334
2009	22,351	249	22,102	0	981	1,097	811	732	20,558
2010	22,256	419	21,837	0	990	1,181	815	758	20,451
2011	21,619	427	21,192	0	1,000	1,281	821	781	19,798
2012	21,440	431	21,009	0	1,013	1,351	833	810	19,594
2013	21,576	396	21,180	0	1,025	1,394	833	827	19,718
2014	22,935	955	21,980	0	1,010	1,444	843	840	21,082

Historical Values (2005 - 2014):

Col. (2) - Col. (4) are actual values for historical Summer peaks. As such, they incorporate the effects of conservation (Col. 7 & Col. 9), and may incorporate the effects of load control if load control was operated on these peak days. Therefore, Col. (2) represents the actual Net Firm Demand.

Col. (5) - Col. (9) represent actual DSM capabilities starting from January 1988 and are annual (12-month) values except for 2014 values which are through August.

Col. (10) represents a HYPOTHETICAL "Net Firm Demand" as if the load control values had definitely been exercised on the peak. Col. (10) is derived by the formula: Col. (10) = Col.(2) - Col.(6) - Col.(8).

Schedule 3.1
Forecast of Summer Peak Demand (MW)

(1)	(2)	(3)	(4)	(5)	(6)	(7)	(8)	(9)	(10)
August of Year	Total	Wholesale	Retail	Interruptible	Res. Load Management*	Residential Conservation	C/I Load Management*	C/I Conservation	Net Firm Demand
2015	23,286	1,231	22,054	0	1,020	46	862	25	21,334
2016	23,778	1,240	22,538	0	1,030	60	873	37	21,778
2017	24,252	1,186	23,066	0	1,040	71	885	50	22,206
2018	24,648	1,145	23,502	0	1,051	82	897	63	22,555
2019	25,045	1,149	23,896	0	1,061	94	909	77	22,904
2020	25,369	1,150	24,219	0	1,071	106	920	91	23,181
2021	25,497	953	24,544	0	1,082	118	932	106	23,260
2022	25,833	957	24,875	0	1,092	131	944	121	23,545
2023	26,286	965	25,321	0	1,102	144	956	136	23,948
2024	26,771	972	25,798	0	1,113	157	968	152	24,381

Projected Values (2015 - 2024):

Col. (2) - Col. (4) represent FPL's forecasted peak and does not include incremental conservation, cumulative load management, or incremental load management.

Col. (5) - Col. (9) represent cumulative load management, and incremental conservation and load management. All values are projected August values.

Col. (8) represents FPL's Business On Call, CDR, CILC, and Curtailable programs/rates.

Col. (10) represents a 'Net Firm Demand" which accounts for all of the incremental conservation and assumes all of the load control is implemented on the peak. Col. (10) is derived by using the formula: Col. (10) = Col. (2) - Col. (5) - Col. (6) - Col. (7) - Col. (8) - Col. (9).

* Res. Load Management and C/I Load Management include MW values of load management from Lee County and FKEC.

Schedule 3.2
History of Winter Peak Demand (MW)

(1)	(2)	(3)	(4)	(5)	(6)	(7)	(8)	(9)	(10)
Year	Total	Firm Wholesale	Retail	Interruptible	Res. Load Management	Residential Conservation	C/I Load Management	C/I Conservation	Net Firm Demand
2005	18,108	225	17,883	0	816	583	542	233	16,751
2006	19,683	225	19,458	0	823	600	550	240	18,311
2007	16,815	223	16,592	0	846	620	577	249	15,392
2008	18,055	163	17,892	0	868	644	636	279	16,551
2009	20,081	207	19,874	0	881	666	676	285	18,524
2010	24,346	500	23,846	0	895	687	721	291	22,730
2011	21,126	383	20,743	0	903	717	723	303	19,501
2012	17,934	382	17,552	0	856	755	722	314	16,356
2013	15,931	348	15,583	0	843	781	567	326	14,521
2014	17,500	890	16,610	0	768	805	590	337	16,142

Historical Values (2005 - 2014):

Col. (2) - Col. (4) are actual values for historical Winter peaks. As such, they incorporate the effects of conservation (Col. 7 & Col. 9), and may incorporate the effects of load control if load control was operated on these peak days. Therefore, Col. (2) represents the actual Net Firm Demand. For year 2011, the actual peaked occurred in December of 2010.

Col. (5) - Col. (9) for 2005 through 2014 represent actual DSM capabilities starting from January 1988 and are annual (12-month) values.

Col. (10) represents a HYPOTHETICAL "Net Firm Demand" as if the load control values had definitely been exercised on the peak. Col. (10) is derived by the formula: Col. (10) = Col.(2) - Col.(6) - Col.(8).

Schedule 3.2
Forecast of Winter Peak Demand (MW)

Projected Values (2015 - 2024):

Col. (2) - Col. (4) represent FPL's forecasted peak and does not include incremental conservation, cumulative load management, or incremental load management.

Col. (5) - Col. (9) represent cumulative load management, and incremental conservation and load management. All values are projected January values.

Col. (8) represents FPL's Business On Call, CDR, CILC, and Curtailable programs/rates.

Col. (10) represents a 'Net Firm Demand" which accounts for all of the incremental conservation and assumes all of the load control is implemented on the peak. Col. (10) is derived by using the formula: Col. (10) = Col. (2) - Col. (5) - Col. (6) - Col. (7) - Col. (8) - Col. (9).

* Res. Load Management and C/I Load Management include MW values of load management from Lee County and FKEC.

Schedule 3.3
History of Annual Net Energy for Load (GWh)
(All values are "at the generator" values except for Col (8))

CHAPTER III

Projection of Incremental Resource Additions

(This page is left intentionally blank.)

III. Projection of Incremental Resource Additions

III.A FPL's Resource Planning:

FPL utilizes its well established integrated resource planning (IRP) process, in whole or in part as dictated by analysis needs, to determine: when new resources are needed, what the magnitude of the needed resources are, and what type of resources should be added. The timing and type of new power plants, the primary subjects of this document, are determined as part of the IRP process work.

This section describes FPL's basic IRP process. It also discusses some of the key assumptions, in addition to a new load forecast discussed in the previous chapter, that were used in developing the resource plan presented in this Site Plan.

Four Fundamental Steps of FPL's Resource Planning:

There are 4 fundamental steps to FPL's resource planning. These steps can be generally described as follows:

Step 1: Determine the magnitude and timing of FPL's new resource needs;

Step 2: Identify which resource options and resource plans can meet the determined magnitude and timing of FPL's resource needs (i.e., identify competing options and resource plans);

Step 3: Evaluate the competing options and resource plans in regard to system economics and non-economic factors; and,

Step 4: Select a resource plan and commit, as needed, to near-term options.

Figure III.A.1 graphically outlines the 4 steps.

Overview of FPL's IRP Process

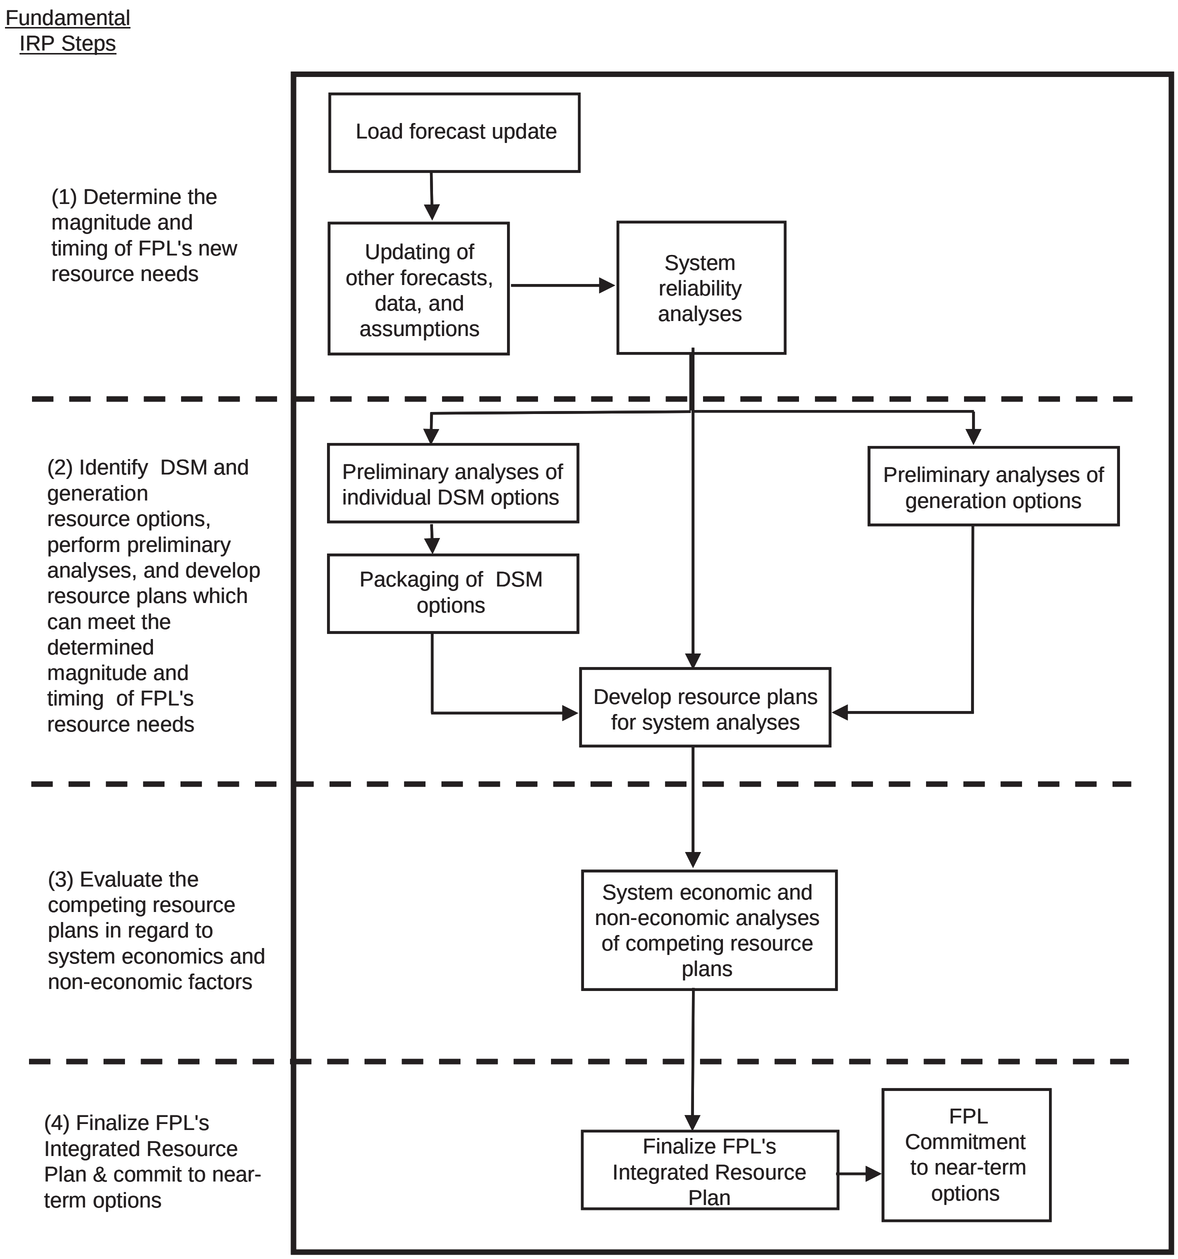

Figure III.A.1: Overview of FPL's IRP Process

Step 1: Determine the Magnitude and Timing of FPL's New Resource Needs:

The first of the four resource planning steps, determining the magnitude and timing of FPL's resource needs, is essentially a determination of the amount of capacity or megawatts (MW) of load reduction, new capacity additions, or a combination of both load reduction and new capacity additions that are needed to maintain system reliability. Also determined in this step is when the MW additions are needed to meet FPL's reliability criteria. This step is often referred to as a reliability assessment, or resource adequacy, analysis for the utility system.

Step 1 typically starts with an updated load forecast. Several databases are also updated in this first fundamental step, not only with the new information regarding forecasted loads, but also with other information that is used in many of the fundamental steps in resource planning. Examples of this new information include, but are not limited to: delivered fuel price projections, current financial and economic assumptions, current power plant capability and operating assumptions, and current demand side management (DSM) demand and energy reduction assumptions. FPL also includes key sets of projections regarding three specific types of resources: (1) FPL unit capacity changes, (2) firm capacity power purchases, and (3) DSM implementation.

Key Assumptions Regarding the Three Types of Resources:

The first set of assumptions, FPL unit capacity changes, is based on the current projection of new generating capacity additions and planned retirements of existing generating units. In FPL's 2015 Site Plan, there are six (6) such projected capacity changes through the 10-year reporting time frame of this document. These changes are listed below in general chronological order:

1) Retirement of existing Putnam Units 1 & 2:

   As explained in FPL's 2014 Site Plan, analyses conducted during 2013 and early 2014 showed that it would be cost-effective to retire two existing units, Putnam Units 1 & 2, and replace the capacity with new combined cycle (CC) capacity at a later date and at a site to be determined. The new CC capacity would have a significantly better heat rate, thus reducing FPL's system fuel usage and system emissions. As a result, these two units were retired at the end of 2014.

2) CT upgrades at existing CC plant sites:

   In the fourth quarter of 2011, FPL started upgrading the 7FA combustion turbines (CT) that are components at a number of its existing CC units. These upgrades will economically benefit FPL's customers by increasing the MW output of these CC units. 221 MW of the increased capacity from these CT upgrades is already in service. The work for the remaining upgrades is continuing and the project is projected to be completed in early 2016.

3) Modernization of the Port Everglades plant site:
The work to modernize the existing Port Everglades site by adding new combined cycle (CC) capacity continues. The new generating unit, called the Port Everglades Next Generation Clean Energy Center (PEEC), is projected to be in-service in mid-2016 and is projected to have a peak Summer output of 1,237 MW. The FPSC issued the final need order for this modernization project in April 2012 in Order No. PSC-12-0187-FOF-EI. The site certification order for the project, DOAH Case No. 12-0422EPP, was received for the Port Everglades project in October 2012.

4) New Solar Facilities:
FPL currently projects that it will add new photovoltaic (PV) facilities by the end of 2016 at three sites. These sites are FPL's existing Manatee plant site in Manatee County, the Citrus site in DeSoto County, and the Babcock Ranch site in Charlotte County. Each of the PV facilities is projected to have a nameplate rating of approximately 74.5 MW (AC). Therefore, the three PV facilities will have a combined total nameplate (AC) rating of approximately 223 MW. FPL's analyses of these three specific projects have led to a conclusion that approximately 52% of their nameplate (AC) rating can be accounted for as firm Summer capacity, and 0% for firm Winter capacity, in FPL's reliability analyses.

5) GT Replacement:
FPL plans, for economic reasons, to retire a number of its older gas turbine (GT) peaking units at its three GT sites (Lauderdale, Port Everglades, and Fort Myers) and partially replace this peaking capacity with new combustion turbine (CT) capacity at the Lauderdale and Fort Myers sites. In addition, the two existing CTs at the Fort Myers site will be upgraded, which will increase their capacity. These changes are projected to be completed by the end of 2016. The MW impact of these changes to FPL's peaking capacity is a net decrease of approximately 40 MW.

6) New Combined Cycle Capacity:
FPL currently projects a need for a significant capacity addition in 2019. FPL's best self-build option to meet this need is a new combined cycle (CC) unit that would be built in Okeechobee County. In order to ensure that the best generation option for FPL's customers is chosen to meet this need, and in keeping with the FPSC's Bid Rule, FPL issued a Request for Proposals (RFP) in March 2015 that invited generation proposals from outside parties. These proposals are scheduled to be received in May 2015. Once

these proposals and FPL's self-build CC unit have been thoroughly evaluated by both FPL and an independent evaluator, FPL expects to file in mid-2015 for an FPSC determination of need approval, and/or for FPSC approval for cost recovery, for the best option(s).

In addition, FPL's current resource plan presented in this Site Plan also shows potential new CC capacity being added in 2023. No decision on this potential addition is yet needed and FPL expects to make a decision on this capacity addition at an appropriate time in a manner similar to how the decision for the 2019 need will be reached.

The second set of assumptions involves firm capacity power purchases. There are two significant changes in firm capacity power purchases from those shown in FPL's 2014 Site Plan. The first of those is due to the fact that FPL no longer is projecting that it will serve Vero Beach's electrical load (as discussed in Chapter II). Thus FPL is no longer projecting that it will acquire the Vero Beach combined cycle unit (46 MW), or that it will acquire two of Vero Beach's existing power purchase agreements which total approximately 37 MW of coal-fired capacity that were projected to run through the end of 2017. The second change is that FPL anticipates terminating its existing power purchase agreement for 250 MW of coal-fired capacity from the Cedar Bay generating facility at the end of August 2015 as a result of a Purchase and Sale Agreement between FPL and Cedar Bay Generating Company, L.P. FPL would then own the unit starting on September 1, 2015. FPL currently anticipates that it will not need the unit for economic purposes after 2016 and, if that proves to be the case, would retire the unit at that time. FPL filed for FPSC approval of the Purchase and Sale Agreement in the first quarter of 2015.

None of the other purchase projections has changed from those in the 2014 Site Plan. FPL's current projection includes an additional 70 MW of waste-to-energy capacity from the Palm Beach Solid Waste Authority (SWA) starting in mid-2015. In addition, FPL continues to project that Internal Revenue Service (IRS) regulations regarding the amount of energy that FPL can receive under its purchase agreement with Jacksonville Electric Authority (JEA) for St. Johns Regional Power Park (SJRPP) will result in the suspension of the delivery of capacity and energy to FPL in the second quarter of 2019.[4] In addition, FPL projects that it will begin receiving a total of 180 MW of firm capacity in 2021 from biomass-based power purchase agreements with affiliates of U.S. EcoGen.

In total, the projected firm capacity purchases are from a combination of utility and independent power producers. Details, including the annual total capacity values for these purchases, are presented in Chapter I in Tables I.B.1 and I.B.2. These purchased capacity amounts were incorporated in FPL's resource planning work.

[4] FPL's projected suspension date for the SJRPP purchase is based on a system reliability perspective and represents the earliest projected date at which the suspension of capacity and energy could occur.

The third set of assumptions involves a projection of the amount of additional DSM that FPL anticipates it will implement annually over the ten-year period of 2015 through 2024. A key aspect of FPL's IRP process is the evaluation of DSM resources. Since 1994, FPL's resource planning work has assumed that, at a minimum, the DSM MW called for in FPL's FPSC-approved DSM Plan will be achieved. In November 2014, the FPSC established new DSM Goals for FPL that address the years 2015 through 2024, a time period that matches the reporting period of this Site Plan. The FPSC's DSM Goals Order No. PSC-14-0696-FOF-EU recognized that two key market forces currently were affecting the feasibility and cost-effectiveness of utility DSM programs. The first of these is the growing impact of federal and state energy efficiency codes and standards. As discussed in Chapter II, the projected incremental impacts of these energy efficiency codes and standards during the 2015 through 2024 time period are: a Summer peak reduction of approximately 2,035 MW, a Winter peak reduction of approximately 1,321 MW, and approximately 6,808 GWh of energy reduction. As a result, these energy efficiency codes and standards significantly reduce the potential for cost-effective utility DSM programs.

The second market force was lower generating costs with which DSM must compete. This is particularly noticeable in regard to current and projected fuel costs compared to those when Florida previously established DSM Goals in 2009. As an example, natural gas cost projections are 50% lower than natural gas costs projections were in 2009. Although lower generating costs, such as lower fuel costs, are very beneficial for FPL's customers, they also negatively impact the economics of utility DSM programs. Therefore, fewer DSM programs are now cost-effective. In addition, for some DSM programs to remain cost-effective, incentive payments to participating customers have to be lowered, thus reducing the attractiveness of these programs to potential participants.

The FPSC recognized the impact these market forces have on utility DSM programs and set the new DSM Goals accordingly. Although the new DSM Goals are lower than the previous goals, the new goals will help ensure that the electric rate impacts to all of FPL's customers from pursuing DSM are minimized. In March 2015, FPL filed for FPSC approval of its DSM Plan that presents specific DSM programs designed to achieve the new DSM Goals. A decision regarding FPL's DSM Plan is expected by mid-2015. In this Site Plan, the resource plan that is presented assumes that the new DSM Goals will be met in each year of the reporting period. FPL's DSM efforts are further discussed later in this chapter in section III.D.

The Three Reliability Criteria Used to Determine FPL's Projected Resource Needs:

These key assumptions, plus the other updated information described above, are then applied in the first fundamental step: determining the magnitude and timing of FPL's future resource needs. This determination is accomplished by system reliability analyses which for FPL have traditionally been based on dual planning criteria of a minimum peak period total reserve margin of 20% (FPL applies this to both Summer and Winter peaks) and a maximum loss-of-load probability (LOLP) of 0.1 day per year. Both of these criteria are commonly used throughout the utility industry. Beginning in 2014, FPL also implemented a third reliability criterion: a 10% generation-only reserve margin (GRM).

Historically, two types of methodologies, deterministic and probabilistic, have been utilized in system reliability analysis. The calculation of excess firm capacity at the annual system peaks (reserve margin) is the most common method, and this relatively simple deterministic calculation can be performed on a spreadsheet. It provides an indication of the adequacy of a generating system's capacity resources compared to its load during peak periods. However, deterministic methods do not take into account probabilistic-related elements such as the impact of individual unit failures. For example: two 50 MW units that can be counted on to run 90% of the time are more valuable in regard to utility system reliability than is one 100 MW unit that can also be counted on to run 90% of the time. Probabilistic methods also recognize the value of being part of an interconnected system with access to multiple capacity sources.

For this reason, probabilistic methodologies have been used to provide an additional perspective on the reliability of a generating system. There are a number of probabilistic methods that are in use for performing system reliability analyses. Among the most widely used is loss-of-load probability (LOLP) which FPL utilizes. Simply stated, LOLP is an index of how well a generating system may be able to meet its firm demand (i.e., a measure of how often load may exceed available resources). In contrast to reserve margin, the calculation of LOLP looks at the daily peak demands for each year, while taking into consideration such probabilistic events as the unavailability of individual generators due to scheduled maintenance or forced outages.

LOLP is expressed in terms of the projected probability that a utility will be unable to meet its entire firm load at some point during a year. The probability of not being able to meet the entire firm load is calculated for each day of the year using the daily peak hourly load. These daily probabilities are then summed to develop an annual probability value. This annual probability value is commonly expressed as "the number of days per year" that the entire system firm load could not be met. FPL's standard for LOLP, commonly accepted throughout the industry, is a maximum of 0.1 day per year. This analysis requires a more complicated calculation methodology than does the reserve margin analysis. LOLP analyses are typically carried out using computer software models such as the Tie Line Assistance and Generation Reliability (TIGER) program used by FPL.

FPL's integrated resource planning work over the last several years examined a projected fundamental change in FPL's resource plans. This change was a significant shift in the mix of generation and DSM resources in which FPL was becoming increasingly reliant on DSM resources to maintain system reliability. As discussed in detail in FPL's 2014 Site Plan, extensive analyses examined this shift from a system reliability perspective.

In these analyses, FPL developed a new metric: a generation-only reserve margin (GRM). This GRM metric reflects reserves that would be provided only by actual generating resources. The GRM value is calculated by setting to zero all incremental energy efficiency (EE) and load management (LM), plus all existing LM, in another version of a reserve margin calculation. The resulting GRM value provides an indication of how large a role generation is projected to play each year as FPL maintains its 20% Summer and Winter "total" reserve margins (which account for both generation and DSM resources).

These analyses examined the two types of resources, DSM and Supply options, from both an operational and a resource planning perspective. Based on these analyses, FPL concluded that resource plans for its system with identical total reserve margins, but different GRM values, are not equal in regard to system reliability. A resource plan with a higher GRM value is projected to result in more MW being available to system operators on adverse peak load days, and in lower LOLP values, than a resource plan with a lower GRM value, even though both resource plans have an identical total reserve margin. Therefore, in 2014 FPL implemented a minimum GRM criterion of 10% as a third reliability criterion in its resource planning process.

The 10% minimum Summer and Winter GRM criterion augments the other two reliability criteria used by FPL: a 20% total reserve margin criterion for Summer and Winter, and a 0.1 day/year LOLP criterion. All three reliability criteria are potentially useful in terms of identifying the timing of the resource need. In terms of identifying the magnitude of the resource need on FPL's system, the total reserve margin and GRM criteria are more useful although the projected magnitudes under each of these criteria may differ. In addition, the GRM criterion provides direction regarding the mix of generation and DSM resources that should be added to maintain and enhance FPL's system reliability.

Step 2: Identify Resource Options and Plans That Can Meet the Determined Magnitude and Timing of FPL's Resource Needs:

The initial activities associated with this second fundamental step of resource planning generally proceed concurrently with the activities associated with Step 1. During Step 2, preliminary economic screening analyses of new capacity options that are identical, or virtually identical, in regard to certain key characteristics may be conducted to determine which new capacity options appear to be the most competitive on FPL's system. These preliminary analyses can also help identify capacity size (MW) values, projected construction/permitting schedules, and operating parameters and costs. Similarly, preliminary economic screening analyses of new DSM options and/or evaluation of existing DSM options are often conducted in this second fundamental IRP step.

FPL typically utilizes a production cost model and a Fixed Cost Spreadsheet, and/or an optimization model and spreadsheet analyses, to perform the preliminary economic screening of generation resource options. For the preliminary economic screening analyses of DSM resource options, FPL typically uses its DSM CPF model which is an FPL spreadsheet model utilizing the FPSC's approved methodology for performing preliminary economic screening of individual DSM measures and programs. In addition, a years-to-payback screening test based on a two-year criterion is also used in the preliminary economic screening of individual DSM measures and programs. Then, as the focus of DSM analyses progresses from analysis of individual DSM measures to the development of DSM portfolios, FPL uses two additional models. One of these models is FPL's non-linear programming model that is used for analyzing the potential for lowering system peak loads through additional load management/demand response capability. The other model that FPL typically utilizes is its linear programming model, which FPL uses to develop DSM portfolios.

The individual new resource options, both Supply options and DSM portfolios, emerging from these preliminary economic screening analyses are then typically "packaged" into different resource plans which are designed to meet the system reliability criteria. In other words, resource plans are created by combining individual resource options so that the timing and magnitude of FPL's projected new resource needs are met. The creation of these competing resource plans is typically carried out using spreadsheet and/or dynamic programming techniques.

At the conclusion of the second fundamental resource planning step, a number of different combinations of new resource options (i.e., resource plans) of a magnitude and timing necessary to meet FPL's resource needs are identified.

Step 3: Evaluate the Competing Options and Resource Plans in Regard to System Economics and Non-Economic Factors:

At the completion of fundamental steps 1 & 2, the most viable new resource options have been identified and these resource options have been combined into a number of resource plans that each meet the magnitude and timing of FPL's resource needs. The stage is set for evaluating these resource options and resource plans in system economic analyses that aim to account for all of the impacts to the FPL system from the competing resource options/resource plans. In FPL's 2014 and early 2015 resource planning work, once the resource plans were developed, FPL utilized the UPLAN production cost model and a Fixed Cost Spreadsheet, and/or the EGEAS optimization model, to perform the system economic analyses of the resource plans. Other spreadsheet models may also be used to further analyze the resource plans.

The basic economic analyses of the competing resource plans focus on total system economics. The standard basis for comparing the economics of competing resource plans is their relative impact on FPL's electricity rate levels, with the objective generally being to minimize FPL's projected levelized system average electric rate (i.e., a Rate Impact Measure or RIM methodology). In analyses in which the DSM contribution has already been determined through the same IRP process and/or FPSC approval, and therefore the only competing options are new generating units and/or purchase options, comparisons of competing resource plans' impacts on electricity rates and on system revenue requirements will yield identical outcomes in regard to the relative rankings of the resource options being evaluated. Consequently, the competing options and resource plans in such cases can be evaluated on a system cumulative present value revenue requirement (CPVRR) basis.

Other factors are also included in FPL's evaluation of resource options and resource plans. Although these factors may have an economic component or impact, they are often discussed in quantitative, but non-economic, terms such as percentages, tons, etc. rather than in terms of dollars. These factors are often referred to by FPL as "system concerns" that include (but are not limited to) maintaining/enhancing fuel diversity in the FPL system, system emission levels, and maintaining a regional balance between load and generating capacity, particularly in the Southeastern Florida counties of Miami-Dade and Broward. In conducting the evaluations needed to determine which resource options and resource plans are best for FPL's system, the non-economic evaluations are conducted with an eye to whether the system concern is positively or negatively impacted by a given resource option or resource plan. These, and other, factors are discussed later in this chapter in section III.C.

Step 4: Finalizing FPL's Current Resource Plan

The results of the previous three fundamental steps are typically used to develop FPL's current resource plan. The current resource plan is presented in the following section.

III.B Projected Incremental Resource Additions/Changes in the Resource Plan

FPL's projected incremental generation capacity additions/changes for 2015 through 2024 are depicted in Table ES-1 which was previously presented in the Executive Summary chapter. These capacity additions/changes include the 6 generation additions/changes previously discussed in this chapter.

Although FPL's projected DSM additions that are developed in the IRP process are not explicitly presented in this table, these DSM additions have been fully accounted for in all of FPL's resource planning work reflected in this document. The projected MW reductions from these DSM additions are also reflected in the projected total reserve margin values shown in Table ES-1 and in Schedules 7.1 and 7.2 presented later in this chapter. DSM is further addressed later in this chapter in section III.D.

III.C Discussion of the Projected Resource Plan and Issues Impacting FPL's Resource Planning Work

As indicated in the Executive Summary, FPL's resource planning efforts in 2014 and early 2015 resulted in a resource plan that has four (4) key differences compared to the resource plan presented in FPL's 2014 Site Plan. These 4 key differences are discussed below in chronological order.

1. **FPL No Longer Projects That It Will Serve Vero Beach's Electrical Load:**
   Difficulties in the negotiations between the parties involved have led FPL to no longer project that it will serve Vero Beach's electrical load which was assumed in FPL's most recent Site Plans and load forecasts. This factor results in a lowering of FPL's forecasted load and projected resource needs. To the extent circumstances change and a consummation of the sale once again seems likely, FPL will reincorporate this load into its forecast.

2. **FPL's Power Purchase Agreement with Cedar Bay Will Be Terminated in 2015:**
   FPL anticipates terminating its existing power purchase agreement for 250 MW of coal-fired capacity from the Cedar Bay generating facility at the end of August 2015 as a result of a Purchase and Sale Agreement between FPL and Cedar Bay Generating Company, L.P. FPL would then assume ownership of the facility starting on September 1, 2015. FPL currently anticipates that it will not need the unit for economic purposes after 2016 and, if that proves to be the case, would retire the unit at that time. FPL filed for FPSC approval of the Purchase and Sale Agreement in the first quarter of 2015.

3. FPL Will Approximately Triple Its Solar Generation Capacity by the End of 2016:

FPL will be adding three new photovoltaic (PV) facilities by the end of 2016. Each of the PV facilities will be approximately 74.5 MW (nameplate rating, AC). As a result, FPL's solar generation capacity will increase from its current 110 MW to approximately 333 MW. The new PV installations are projected to be sited in Manatee, Charlotte, and DeSoto counties. The economics of these specific PV projects are aided by the fact that the sites are located close to existing electric infrastructure, including tranmission lines and electric substations, and by the fact that bringing these solar facilities into service prior to the end of 2016 will allow the facilities to take advantage of the current 30% investment tax credit that is scheduled to be reduced to 10% beginning in 2017.

4. Turkey Point 6 & 7 Projected In-Service Dates Have Been Moved Outside of the 10-year Reporting Period of This Document.

In recent Site Plans, the earliest practical deployment dates for the new Turkey Point 6 & 7 nuclear units were identified as 2022 and 2023 and these two dates were used as the in-service dates for these units. However, in the second half of 2014, the Nuclear Regulatory Commission (NRC) issued a new schedule for completing its review of FPL's Combined Operating License Application (COLA) for Turkey Point 6 & 7. The NRC's new schedule now projects that its review will not be completed until late 2016 which is a significant delay from the NRC's previous projection of a 2014 completion of its COLA review. As a consequence of the NRC delay, and the impacts of the recently amended Florida nuclear cost recovery (NCR) statute, FPL now projects that the earliest practical deployment dates for Turkey Point 6 & 7 will fall outside of the 10-year time period of 2015 through 2024 that is addressed in this Site Plan document. However, emissions-free, baseload capacity and energy from nuclear power remains an important part of FPL's resource plans. For that reason, Chapter IV provides detailed information regarding the Turkey Point site for these two new nuclear units.

In addition, there are six (6) significant factors that either influenced the current resource plan presented in this document or which may result in changes in this resource plan in the future. These 6 factors are discussed below (in no particular order of importance).

1. Maintaining/Enhancing System Fuel Diversity:

FPL currently uses natural gas to generate approximately two-thirds of the total electricity it delivers to its customers. In the future, the percentage of FPL's electricity that is generated by natural gas is projected to remain at a high level. For this reason, and due to evolving environmental regulations, FPL is continually seeking opportunities to economically maintain and enhance the fuel diversity of its system.

In 2007, following express direction by the FPSC to do so, FPL sought approval from the FPSC to add two new advanced technology coal units to its system. These two new units would have been placed in-service in 2013 and 2014. However, in part due to concerns over potential greenhouse gas emission legislation/regulation, FPL was unable to obtain approval for these units. Several other factors are currently unfavorable to new coal units compared to new natural gas-fired combined cycle (CC) units. The first of these factors is a significant reduction in the fuel cost difference between coal and natural gas when compared to the fuel cost difference projected in 2007 which favored coal; i.e., the projected fuel cost advantage of coal versus natural gas has been significantly reduced. Second is the continuation of significantly higher capital costs for coal units compared to capital costs for CC units. Third is the increased fuel efficiency of new CC units compared to projected CC unit efficiencies in 2007. Fourth are existing and proposed environmental regulations, including those that address greenhouse gas emissions, which are unfavorable to new coal units when compared to new CC units. Consequently, FPL does not believe that new advanced technology coal units are currently economically, politically, or environmentally viable fuel diversity enhancement options in Florida.

Therefore, FPL has turned its attention to: nuclear energy and renewable energy to enhance its fuel diversity, diversifying the sources of natural gas, diversifying the gas transportation paths used to deliver natural gas to FPL's generating units, and using natural gas more efficiently. In regard to nuclear energy, in 2008 the FPSC approved the need to increase capacity at FPL's four existing nuclear units and authorized FPL to recover project-related expenditures that are approved as a result of annual nuclear cost recovery filings. FPL successfully completed the nuclear capacity uprate project. Approximately 520 MW of additional nuclear capacity were delivered by the project which represents an increase of approximately 30% more incremental capacity than was originally forecasted when the project began. FPL's customers are already benefitting from lower fuel costs and reduced system emissions provided by this additional nuclear capacity.

FPL is continuing its work to obtain all of the licenses, permits, and approvals that are necessary to construct and operate two new nuclear units at its Turkey Point site in the future. These licenses, permits, and approvals will provide FPL with the opportunity to construct these nuclear units at Turkey Point for a time expected to be up to 20 years from the time the licenses and permits are granted, and then to operate the units for at least 40 years thereafter. However, as discussed below, a several year delay in the Nuclear Regulatory Commission's (NRC) schedule for completing its review of FPL's Combined Operating License Application (COLA) have resulted in the earliest deployment dates for the two new nuclear units, Turkey Point Units 6 & 7, moving beyond the 2015 through 2024 reporting time period of this Site

Plan. The projected new in-service dates for Turkey Point Units 6 & 7 are June 2027 and June 2028, respectively.

FPL also has been involved in activities to investigate adding and/or maintaining renewable resources as a part of its generation supply. One of these activities is a variety of discussions with the owners of existing facilities aimed at maintaining or extending current agreements. In addition, FPL considers new cost-effective renewable energy projects such as the power purchase agreements with U.S. EcoGen which will result in FPL receiving 180 MW of firm capacity from biomass facilities beginning in 2021.

FPL also sought and received approval from the FPSC in 2008 to add 110 MW of then new renewable facilities through three FPL-owned solar facilities: one solar thermal facility and two photovoltaic (PV) facilities. One 25 MW PV facility began commercial operation in 2009. The remaining two solar facilities, a 10 MW PV facility and a 75 MW solar thermal steam generating facility, began commercial operation in 2010. The addition of these renewable energy facilities was made possible by enabling legislation enacted by the Florida Legislature in 2008. FPL remains strongly supportive of federal and/or state legislation that enables electric utilities to add renewable energy resources and authorize the utilities to recover appropriate costs for these resources.

The capital costs for PV modules have steadily declined. In addition, FPL's on-going analyses of its existing PV facilities have led FPL to develop a methodology with which to determine appropriate firm capacity values for PV facilities for use in reserve margin calculations. This methodology has concluded, in general, that it is possible on FPL's system to develop a utility-scale PV project-specific non-zero firm capacity value for the Summer peak hour, but not for FPL's Winter morning peak hour. Partly as a result of developing this methodology, FPL's current resource plan that is presented in this Site Plan shows that FPL plans to add approximately 223 MW (nameplate, AC) of new PV generation by the end of 2016. These 3 specific PV projects are projected to contribute a total of approximately 116 MW (or 52% of the nameplate AC value for each project) of firm Summer capacity, but no MW of firm Winter capacity. Significant cost advantages that exist at the 3 specific sites selected for the new PV facilities greatly assisted in being able to bring the PV facilities in-service in 2016. In addition, the fact that bringing these solar facilities into service prior to the end of 2016 allows the facilities to take advantage of the current 30% investment tax credit that is scheduled to be reduced to 10% beginning in 2017, also assisted in this regard. The PV facilities are further discussed later in section III.F of this chapter.

In regard to diversity in natural gas sourcing and delivery, in 2013 the FPSC approved FPL's contracts to bring more natural gas into FPL's service territory through a 3rd natural gas pipeline system into Florida. The process by the pipeline companies to obtain approval for the new pipeline system from the Federal Energy Regulatory Commission (FERC) is currently underway. The new pipeline system will utilize an independent route that will result in a more reliable, more economic, and more diverse natural gas supply for FPL's customers and the State of Florida.

In regard to using natural gas more efficiently, FPL received approvals in 2008 from the FPSC to modernize the existing Cape Canaveral and Riviera Beach plant sites with new, highly efficient CC units to replace the former steam generating units on each of those sites. The Cape Canaveral modernization was commissioned on April 24, 2013 and the Riviera Beach modernization was commissioned on April 1, 2014. On April 9, 2012, FPL received FPSC approval to proceed with a similar modernization project at the Port Everglades site. The project is scheduled for completion in mid-2016. All three of these modernized sites will retain the capability of receiving water-borne delivery of ultra-low sulfur diesel (ULSD) oil as a backup fuel.

In the future, FPL will continue to identify and evaluate alternatives that may maintain or enhance system fuel diversity. In this regard, FPL is also maintaining the ability to utilize heavy oil and/or ULSD oil at existing units that have that capability. For this purpose, FPL has completed the installation of electrostatic precipitators (ESPs) at the two 800 MW steam generating units at its Manatee site and at the two 800 MW steam generating units at its Martin site. These installations will enable FPL to retain the ability to burn heavy oil, as needed, at these sites while retaining the flexibility to use natural gas when economically attractive. In addition, the new CTs that FPL plans to install at its existing Lauderdale and Fort Myers sites, which will replace older GT units that are being retired, will have the capability to burn either natural gas or ULSD oil.

2. Maintaining a Balance Between Load and Generation in Southeastern Florida:

An imbalance has existed between regionally installed generation and regional peak load in Southeastern Florida. As a result of that imbalance, a significant amount of energy required in the Southeastern Florida region during peak periods is provided by: importing energy through the transmission system from generating units located outside the region, operating less efficient generating units located in Southeastern Florida out of economic dispatch, or a combination of the two. FPL's prior planning work concluded that, as load inside the region grows, either additional installed generating capacity in this region, or additional installed transmission capacity capable of delivering more electricity from outside the region, would be required to address this imbalance.

Partly because of the lower transmission-related costs resulting from their location in Southeastern Florida, four recent capacity addition decisions (Turkey Point Unit 5 and WCEC Units 1, 2, & 3) were determined to be the most cost-effective options to meet FPL's capacity needs in the near-term. In addition, FPL has added increased capacity at its existing two nuclear units at Turkey Point as part of the previously mentioned nuclear capacity uprates project. The Port Everglades modernization project scheduled for completion in 2016 will also assist in addressing this imbalance. Implementing the additional generation capacity through the projects mentioned above has contributed to addressing the imbalance between generation, transmission capacity, and load in Southeastern Florida for much, if not all, of the 2015 through 2024 reporting time frame of this Site Plan. However, due to forecasted steadily increasing load in the Southeastern Florida region, the Southeastern Florida imbalance issue will remain an important consideration in FPL's on-going resource planning work in future years.

3. **Maintaining a Balance Between Generation and DSM Resources in Regard to System Reliability:**

There is another system concern that FPL has considered in its resource planning for several years. This concern surfaced beginning in 2010 when FPL's system was projected to become increasingly dependent upon DSM resources for system reliability in later years. FPL discussed this concern previously in its Site Plans from 2011 through 2014. As a result of this concern, FPL conducted extensive analyses of its system from both a resource planning perspective and a system operations perspective. Those analyses showed that system reliability risk increases, particularly from a system operations perspective, as dependence on DSM resources increases to a point where DSM resources account for more than half of FPL's 20% total reserve margin criterion value. As a result, in 2014 FPL implemented a new reliability criterion of a minimum 10% generation-only reserve margin (GRM) in its resource planning work to complement its other two reliability criteria: a 20% total reserve margin criterion for Summer and Winter, and an annual 0.1 day/year loss-of-load-probability (LOLP) criterion. Together, these three criteria allow FPL to address this specific concern regarding system reliability in a comprehensive manner.

4. **The Significant Impacts of Federal and State Energy Efficiency Codes and Standards:**

As discussed in Chapter II, FPL's load forecast includes projected impacts from federal and state energy efficiency codes and standards. The magnitude of energy efficiency that is now projected to be delivered to FPL's customers through these codes and standards is significant.

FPL currently projects a cumulative Summer peak reduction impact of 3,568 MW from these codes and standards beginning in 2005 (the year the National Energy Policy Act was enacted) and extending through the year 2024 (i.e., the last year in the 2015 through 2024 reporting time period for this Site Plan) compared to what the projected load would have been without the codes and standards. The projected incremental Summer MW impact from these codes and standards during the 2015 through 2024 reporting period of this Site Plan; i.e., from year-end 2014 through 2024, is 2,035 MW compared to what the projected load would have been without the codes and standards. Both of these projections show the significant impact of these energy efficiency codes and standards.

In addition to lowering FPL's load forecast from what it otherwise would have been, and thus serving to lower FPL's projected load and resource needs, this projection of efficiency from the codes and standards also affects FPL's resource planning in another way. The projected impacts from the efficiency codes and standards lower the potential for utility DSM programs to cost-effectively deliver energy efficiency for the appliances and equipment that are directly addressed by the codes and standards. This effect was taken into account by the FPSC in the new DSM Goals for the 2015 – 2024 time period set by the FPSC in November 2014.

5. **The Economic Competitiveness of Utility-Scale Photovoltaics (PV)**:

A factor that is now significantly influencing FPL's resource planning is the increasing attractiveness of utility-scale photovoltaic (PV) facilities. This is due largely to the continued decline of the cost of PV modules. Because utility-scale PV facilities are at least twice as economical on an installed $/kw basis than distributed PV, the declining costs of PV modules has resulted, for the first time, in utility-scale PV in specific locations now being cost competitive on FPL's system. In addition, FPL's analyses of the output from its existing PV facilities in DeSoto and Brevard counties have resulted in FPL establishing a methodology for determining Summer and Winter firm capacity values for utility-scale PV facilities.

Therefore, FPL's current resource plan that is presented in this Site Plan shows that FPL plans to add approximately 223 MW (nameplate AC) of new PV generation by the end of 2016. Details regarding the projected new PV facilities are discussed further in this chapter in section III.F.

6. **Environmental Regulation in General and Specifically, the EPA's Proposed Clean Power Plan:**

Another important factor is environmental regulation in general and, specifically, the U.S. Environmental Protection Agency's (EPA's) proposed Clean Power Plan issued in June 2014. The intent of the Clean Power Plan is to establish carbon dioxide (CO_2) emission limits for each state. The process for finalizing all aspects of the proposed CO_2 regulations will encompass several years at least. The EPA is scheduled to issue final rules and emission limits in the Summer of 2015 (i.e., several months after this Site Plan is filed). The current draft rules then call for each state to submit its state compliance plan by June 2016 (although a delay of at least one year is possible). Legal challenges to the proposed Clean Power Plan are expected and such challenges have the potential to delay the proposed timetable.

FPL's resource planning work will account for the CO_2 limits as they are finalized. In addition, FPL expects to be actively engaged in the development of Florida's statewide compliance plan.

Each of these 6 factors will continue to be examined in FPL's on-going resource planning work during the remainder of 2015 and in future years.

III.D Demand Side Management (DSM)

FPL has sought and implemented cost-effective DSM programs since 1978 and DSM has been a key focus of FPL's IRP process for decades. During that time FPL's DSM programs have included many energy efficiency and load management programs and initiatives. FPL's DSM efforts through 2014 have resulted in a cumulative Summer peak reduction of approximately 4,793 MW (Summer) at the generator and an estimated cumulative energy saving of approximately 70,997 Gigawatt Hour (GWh) at the generator. After accounting for the 20% total reserve margin requirement, FPL's DSM efforts through 2014 have eliminated the need to construct the equivalent of approximately 14 new 400 MW power plants.

FPL consistently has been among the leading utilities nationally in DSM achievement. For example, according to the U.S. Department of Energy's 2013 data (the last year for which the DOE ranking data was available at the time this Site Plan was developed), FPL ranked # 2 nationally in cumulative DSM demand reduction. And, importantly, FPL has achieved these significant DSM accomplishments while minimizing the DSM-based impact on electric rates for all of its customers.

In November 2014, new DSM Goals for FPL for the years 2015 through 2024 were set by the FPSC. These DSM Goals were lower than the previous DSM Goals for FPL due to two factors. The first factor is the significant impact of federal and state energy efficiency codes and standards. The projected impact of these codes and standards has significantly lowered FPL's projected load and resource needs. In addition, these codes and standards have removed a significant amount of potential energy efficiency that otherwise might have been addressed by utility DSM programs. The projected impacts from these codes and standards are discussed in Chapter II.

The second factor why FPL's resource plan currently shows a diminished role for utility DSM is the decline in the projected cost-effectiveness of utility DSM measures and programs. The cost-effectiveness of DSM is driven in large part by the potential benefits that the kW (demand) reduction and kWh (energy) reduction characteristics of DSM programs are projected to provide. The diminished cost-effectiveness of utility DSM programs can be illustrated by looking only at potential benefits that DSM's kWh reductions can provide. There are at least two reasons for projections of lower kWh reduction-based benefits and thus projections of lower DSM cost-effectiveness.

The first reason is lower fuel costs. For example, comparing the current fuel cost forecast (at the time this Site Plan was prepared) with the fuel forecast used in 2009 – the year when FPL's DSM Goals were previously set by the FPSC – shows that current forecasts of fuel costs are now much lower than those forecasted in 2009. This can be seen by comparing the 2009 and current forecasted costs ($/mmBTU) for natural gas for two specific years addressed in this Site Plan and that were addressed in the 2009 DSM goals-setting: 2015 and 2019:

Year	2009 Forecast	Current Forecast
2015	$9.64	$4.02
2019	$12.63	$4.70

As shown from these values, natural gas prices are forecast to be less than 50% of what they were forecast to be in 2009 when DSM goals were previously set. Lower forecasted natural gas costs are very beneficial for FPL's customers because they result in lower fuel costs and lower electric rates. At the same time, lower fuel costs also result in lower potential fuel savings benefits from the kWh reductions of DSM measures. These lowered benefit values result in DSM being less cost-effective.

A second reason for the decline in the cost-effectiveness of utility DSM on the FPL system is the steadily increasing efficiency with which FPL generates electricity. FPL's generating system has steadily become more efficient in regard to its ability to generate electricity using less fossil fuel. For example, FPL used 20% less fossil fuel to generate the same number of MWh in 2012 than it did in 2001. This is a very good thing for FPL's customers because it helps to significantly lower fuel costs and electric rates.

However, the improvements in generating system efficiency affect DSM cost-effectiveness in much the same way that lower forecasted fuel costs do: both lower the fuel costs of energy delivered to FPL's customers. Therefore, the improvements in generating system efficiency further reduce the potential fuel savings benefits from the kWh reduction impacts of DSM, thus further lowering potential DSM benefits and DSM cost-effectiveness.

The two reasons discussed above – lower forecasted fuel costs and greater efficiency in FPL's electricity generation – are good for FPL's customers because they will result in lower electric rates. Although beneficial for FPL's customers, these factors also contribute to lowering the cost-effectiveness of utility DSM programs. Therefore, the reduction in DSM cost-effectiveness, plus the growing impacts of energy efficiency codes and standards, led to the FPSC setting lower DSM Goals for FPL.

Although the new DSM Goals are appropriately lower due to these market forces, the projected cumulative effect of FPL's DSM programs from their inception through 2024 is truly significant. FPL's Summer MW Goals for the 2015 – 2024 time period were set at 526 MW. After accounting for the 20% total reserve margin requirements, the combination of this new Summer MW reduction value, and the Summer MW reductions from FPL's DSM programs from their inception through 2014, represent the equivalent of avoiding the need to build approximately sixteen (16) 400 MW power plants. The resource plan presented in this 2015 Site Plan accounts for the DSM MW and GWh reductions set forth in FPL's new DSM Goals. The reductions from the new DSM Goals are accounted for in Schedules 7.1 and 7.2 which appear later in this chapter.

In the March 2015, FPL filed for FPSC approval of a DSM Plan that consists of numerous DSM programs to meet the new DSM Goals. A decision by the FPSC on these new DSM programs is expected in mid-2015.

III.E Transmission Plan

The transmission plan will allow for the reliable delivery of the required capacity and energy to FPL's retail and wholesale customers. The following table presents FPL's proposed future additions of 230 kV bulk transmission lines that must be certified under the Transmission Line Siting Act.

Table III.E.1: List of Proposed Power Lines

(1) Line Ownership	(2) Terminals (To)	(3) Terminals (From)	(4) Line Length CKT. Miles	(5) Commercial In-Service Date (Mo/Yr)	(6) Nominal Voltage (KV)	(7) Capacity (MVA)
FPL	St. Johns [1/]	Pringle	25	Dec – 18	230	759
FPL	Levee [2/]	Midway	150	Jun – 23	500	2598
FPL	Raven [3/]	Duval	45	Dec – 19	230	759

1/ Final order certifying the corridor was issued on April 21, 2006. This project is to be completed in two phases. Phase I consisted of 4 miles of new 230 kV line (Pringle to Pellicer) and was completed in May-2009. Phase II consists of 21 miles of new 230 kV line (St. Johns to Pellicer) and is scheduled to be completed by Dec-2018.

2/ Final order certifying the corridor was issued in April 1990. Construction of 114 miles is complete and in-service. Remaining 36 miles are scheduled to be completed by Jun-2023.

3/ TLSA is being initiated in 2015 for the Raven to Duval project.

In addition, there will be transmission facilities needed to connect several of FPL's projected generating capacity additions to the system transmission grid. These transmission facilities (described on the following pages) are for the Port Everglades modernization that will be completed in mid-2016, the PV additions in late 2016, and the potential new CC unit in 2019 at the Okeechobee site. At the time the 2015 Site Plan was prepared, no site had been selected for the 2023 combined cycle addition in the resource plan presented in this Site Plan. Therefore, no transmission information for this addition is presented.

II.E.1 Transmission Facilities for Port Everglades Next Generation Clean Energy Center (Modernization)

The work required to connect the Port Everglades Next Generation Clean Energy Center to the FPL grid in 2016 is projected to be:

I. Substation:

1. Construct two string busses to connect two combustion turbines (CT) to the Port Everglades 138 kV Substation.
2. Construct two string busses to connect one CT, and one steam turbine (ST) to the Port Everglades 230 kV Substation.
3. Add four main step-up transformers (3-450 MVA, 1- 580 MVA), one for each CT, and one for the ST.
4. Replace ten (10) 138 kV breakers.
5. Replace eight (8) 230 kV breakers.
6. At Port Everglades Switchyard replace twenty-two 138 kV disconnect switches. Also upgrade associated jumpers, bus work, and equipment connections.
7. Expand switchyard relay vault and add relays and other protective equipment.

II. Transmission:

1. Upgrade of existing transmission facilities:
    - An ampacity upgrade up to 1905 amps on the Port Everglades-Port Everglades Tap 138kV line section.
    - An ampacity upgrade up to 1905 amps on the Port Everglades Tap-Port Everglades Tap 2 138 kV line section.
    - An ampacity upgrade up to 1695 amps on the Port Everglades Tap 1-Dania 138 kV line section.
    - An ampacity upgrade up to 1695 amps on the Dania-Hollywood 138 kV line section.

III.E.2 Transmission Facilities for the PV Project at the Existing Manatee Plant Site

The work required to connect the approximate 74.5 MW (nameplate, AC) facility at the existing Manatee site is projected to be:

I. Substation:

1. Build a new 230 kV substation approximately 0.4 miles west of the existing FPL Manatee 230 kV substation.
2. Add one main step-up transformer (80 MVA) to connect solar PV inverter array
3. Construct a new 230 kV breaker bay at the Manatee switchyard.
4. Add relays and other protective equipment.
5. Breaker replacements: None

II. Transmission:

1. Construct 0.4 mile 230 kV line from new substation to Manatee switchyard.
2. No upgrades are expected to be necessary at this time.

III.E.3 Transmission Facilities for the Citrus PV Project in DeSoto County

The work required to connect the approximate 74.5 MW (nameplate, AC) Citrus PV facility in DeSoto County is projected to be:

I. Substation:

1. Construct a new 4-breaker 230 kV ring bus at Sunshine substation.
2. Add one main step-up transformer (80 MVA) to connect solar PV inverter array
3. Construct a string buss to connect the PV array to Sunshine 230 kV Substation
4. Add relays and other protective equipment.
5. Breaker replacements: None

II. Transmission:

1. No upgrades are expected to be necessary at this time.

III.E.3 Transmission Facilities for the Babcock Ranch PV Project in Charlotte County

The work required to connect the approximate 74.5 MW (nameplate, AC) Babcock Ranch PV facility in Citrus County is projected to be:

I. Substation:

1. Build a new 230 kV Tuckers substation approximately 5 miles north of the planned FPL Hercules 230 kV substation.
2. Add one main step-up transformer (80 MVA) to connect solar PV inverter array
3. Add one (1) mid-breaker to complete bay 2 at Hercules
4. Add relays and other protective equipment.
5. Breaker replacements: None

II. Transmission:

1. Construct 5 miles of 230 kV line from new Tuckers substation to Hercules substation.
2. No upgrades are expected to be necessary at this time.

III.E.4 Transmission Facilities for the Potential New Combined Cycle (CC) Unit in Okeechobee County

The work required to connect the potential new CC unit in Okeechobee County by Summer 2019 is projected to be:

I. Substation:

1. Build a new six breaker 500kV Okeechobee Substation switchyard on the Okeechobee generation site with a relay vault for the two generator string buses and the Martin and Poinsett line terminals.
2. Build new collector yard containing two collector busses with 4 breakers to connect the three CTs, and one ST.
3. Construct two string busses to connect the collector busses and main switchyard to Okeechobee 500kV Substation.
4. Add five main step-up transformers (5-450 MVA) one for each CT, and two for the ST.
5. Add relays and other protective equipment.
6. Breaker replacements:
   Poinsett Sub – Replace three (3) 230 kV breakers.

II. Transmission:

1. No upgrades are expected to be necessary at this time.

III.F. Renewable Resources

FPL's Renewable Energy Efforts Through 2014:

FPL has been the leading Florida utility in examining ways to effectively utilize renewable energy technologies to serve its customers. FPL has been involved since 1976 in renewable energy research and development and in facilitating the implementation of various renewable energy technologies. For purposes of discussing FPL's renewable energy efforts through 2014, those efforts will be placed into five categories. FPL's plans for new renewable energy facilities during the 2015 through 2024 time period are then discussed in a separate section.

Two of these categories are Supply-Side Efforts – Power Purchases, and Supply-Side Efforts – FPL Facilities. Since 2011, the combined total energy output (MWh) from these renewable energy sources has been greater than that produced from oil-fired generation. The comparable values for energy delivered by renewable and oil-fired sources for the year 2014 are presented in Schedule 11.1 at the end of this chapter.

1) Early Research & Development Efforts:

In the late 1970s, FPL assisted the Florida Solar Energy Center (FSEC) in demonstrating the first residential PV system east of the Mississippi River. This PV installation at FSEC's Brevard County location was in operation for more than 15 years and provided valuable information about PV performance capabilities in Florida on both a daily and annual basis. In 1984, FPL installed a second PV system at its Flagami substation in Miami. This 10-kilowatt (kW) system operated for a number of years before it was removed to make room for substation expansion. In addition, FPL maintained a thin-film PV test facility at the FPL Martin Plant Site for a number of years to test new thin-film PV technologies.

2) Demand Side & Customer Efforts:

In terms of utilizing renewable energy sources to meet its customers' needs, FPL initiated the first utility-sponsored conservation program in Florida designed to facilitate the implementation of solar technologies by its customers. FPL's Conservation Water Heating Program, first implemented in 1982, offered incentive payments to customers who chose solar water heaters. Before the program ended (because it was no longer cost-effective), FPL paid incentives to approximately 48,000 customers who installed solar water heaters.

In the mid-1980s, FPL introduced another renewable energy program, FPL's Passive Home Program. This program was created in order to broadly disseminate information about passive solar building design techniques that are most applicable in Florida's climate. As part of this program, three Florida architectural firms created complete construction blueprints for six passive home designs with the assistance of the FSEC and FPL. These designs and blueprints were available to customers at a low cost. During its existence, the program received a U.S. Department of Energy award for innovation and also led to a revision of the Florida Model Energy Building Code (Code). The Code was revised to incorporate one of the most significant passive design techniques highlighted in the program: radiant barrier insulation.

FPL has continued to analyze and promote the utilization of PV. These efforts have included PV research such as the 1991 research project to evaluate the feasibility of using small PV systems to directly power residential swimming pool pumps. FPL's PV efforts also included educational efforts such as FPL's Next Generation Solar Station Program. This initiative delivered teacher training and curriculum that is tied to the Sunshine Teacher Standards in Florida. The program provided teacher grants to promote and fund projects in the classrooms. In addition, FPL assists customers who are interested in installing PV equipment at their facilities. Consistent with Florida Administrative Code Rule 25-6.065, Interconnection and Net Metering of Customer-Owned Renewable Generation, FPL works with customers to interconnect these customer-owned PV systems. Through December 2014, approximately 3,241 customer systems (predominantly residential) have been interconnected.

As part of its 2009 DSM Goals decision, the FPSC imposed a requirement for Florida's investor-owned utilities to spend up to a not-to-exceed amount of money annually to facilitate demand side solar water heater and PV applications. FPL's not-to-exceed amount of money for these applications was approximately $15.5 million per year for five years. In response to this direction, FPL received approval from the FPSC in 2011 to initiate a solar pilot portfolio consisting of three PV-based programs and three solar water heating-based programs, plus Renewable Research and Demonstration projects. FPL's analyses of the results from these programs since their inception have consistently shown that none of these pilot programs is cost-effective using any of the three cost-effectiveness screening tests used by the State of Florida. As a result, consistent with the FPSC's November 2014 DSM Goals Order No. PSC-14-0696-FOF-EU, these pilot programs will expire on December 31, 2015.

FPL also has been investigating fuel cell technologies through monitoring of industry trends, discussions with manufacturers, and direct field trials. From 2002 through the end of 2005, FPL conducted field trials and demonstration projects of Proton Exchange Membrane (PEM) fuel cells with the objectives of serving customer end-uses while evaluating the technical performance, reliability, economics, and relative readiness of the PEM technology. The demonstration projects were conducted in partnership with customers and included five locations. The research projects were useful to FPL in identifying specific issues that can occur in field applications and the current commercial viability of this technology. FPL will continue to monitor the progress of these technologies and conduct additional field evaluations as significant developments in fuel cell technologies occur.

3) <u>Supply Side Efforts – Power Purchases:</u>

FPL also has facilitated a number of renewable energy projects (facilities which burn bagasse, waste wood, municipal waste, etc.). Firm capacity and energy, and as-available energy, have been purchased by FPL from these types of facilities. (Please refer to Tables I.A.3, I.B.1, and I.B.2 in Chapter I).

FPL issued Renewable Requests for Proposals (RFPs) in 2007 and 2008 which solicited proposals to provide firm capacity and energy, and energy only, at or below avoided costs, from renewable generators. FPL also promptly responds to inquiries for information from prospective renewable energy suppliers either by e-mail or phone.

On April 22, 2013, in Order No. PSC-13-1064-PAA-EQ, the FPSC approved three 60 MW power purchase agreements with affiliates of U.S. EcoGen for biomass-fired renewable energy facilities. These facilities are expected to provide non-firm energy service beginning in 2019 and to provide firm energy and capacity to FPL's customers beginning in 2021.

In regard to existing contracts that have recently ended, FPL and the Solid Waste Authority of Palm Beach (SWA) agreed to extend their contract that expired March 31, 2010 for a 20-year term beginning in April 1, 2012 through April 1, 2032. However, the SWA refurbished their generating unit ahead of schedule and, as of January 2012, this unit began delivering firm capacity to FPL. In 2011, the FPSC approved a contract for an additional 70 MW between FPL and SWA for a new unit. The new unit is now delivering test energy and will begin delivering firm capacity and energy to FPL beginning in June 2015. At the end of December 2011, the contract between FPL and Okeelanta (New Hope) expired. However, Okeelanta continues to deliver energy to FPL as an as-available, non-firm supplier of renewable energy.

4) <u>Supply Side Efforts – FPL Facilities:</u>

With regard to solar generating facilities, FPL currently has three such facilities: (i) a 75 MW steam generation solar thermal facility in Martin County (the Martin Next Generation Solar Energy Center); (ii) a 25 MW PV electric generation facility in DeSoto County (the DeSoto Next Generation Solar Energy Center); and (iii) a 10 MW PV electric generation facility in Brevard County at NASA's Kennedy Space Center (the Space Coast Next Generation Solar

Energy Center). The DeSoto County project was completed in 2009 and the other two projects were completed in 2010.

These three solar facilities were constructed in response to the Florida Legislature's House Bill 7135 which was signed into law by the Governor in June 2008. House Bill 7135 was enacted to enable the development of clean, zero greenhouse gas emitting renewable generation in the State of Florida. Specifically, the bill authorized cost recovery for the first 110 MW of eligible renewable projects that had the proper land, zoning, and transmission rights in place. FPL's three solar projects met the specified criteria and were granted approval for cost recovery in 2008. Each of the three solar facilities is discussed below.

a. <u>The Martin Next Generation Solar Energy Center:</u>

This facility began commercial operation in 2010 and provides 75 MW of solar thermal capacity in an innovative way that directly displaces fossil fuel usage on the FPL system. This facility consists of solar thermal technology which generates steam that is integrated into the existing steam cycle for the Martin Unit 8 natural gas-fired CC plant. This project is the first "hybrid" solar plant in the world and, at the time the facility came in-service, was the second largest solar facility in the world and the largest solar plant of any kind in the U.S. outside of California.

b. <u>The DeSoto Next Generation Solar Energy Center:</u>

This 25 MW (nameplate, AC) PV facility began commercial operation in 2009 which made it one of the largest PV facilities in the U.S. at that time. The facility utilizes a tracking PV array that is designed to follow the sun as it traverses across the sky.

c. <u>The Space Coast Next Generation Solar Energy Center:</u>

Located at the Kennedy Space Center, this facility is part of an innovative public/private partnership with NASA. This non-tracking, 10 MW (nameplate, AC) PV facility began commercial operation in 2010.

During 2014, FPL conducted analyses designed to develop a methodology with which to determine what firm capacity value at FPL's Summer and Winter peak hours would be appropriate to apply to these existing, and potential future, utility-scale PV facilities. (Note that the Martin solar thermal facility is a "fuel-substitute" facility, not a facility that provides additional capacity and energy. The solar thermal facility displaces the use of fossil fuel to produce steam on the FPL system when the solar thermal facility is operating.) Based on the results of these analyses, FPL has concluded that its two existing utility-scale PV facilities can be counted on to contribute certain percentages of their nameplate (AC) ratings (approximately 46% for DeSoto and 32% for Space Coast) as firm capacity at FPL's Summer peak hour (that typically occurs in the 4 p.m. to 5 p.m. hour), but contribute no firm capacity during FPL's Winter peak hour (that typically occurs in the 7 a.m. to 8 a.m. hour). Future FPL utility-scale PV facilities will be evaluated for potential firm capacity contribution on a case-by-case basis using this methodology. Their potential capacity contribution will be dependent upon a number of factors including (but not necessarily limited to) site location, technology, and design. For example, the three new PV facilities that are planned to be added by the end of 2016 are each projected to provide approximately 52% of their nameplate (AC) rating as firm capacity at FPL's Summer peak hour, but provide no firm capacity during FPL's Winter peak hour.

5) <u>Ongoing Research & Development Efforts:</u>

FPL has developed alliances with several Florida universities to promote the development of emerging technologies. For example, FPL supports the newly formed Southeast National Marine Renewable Energy Center (SNMREC) at Florida Atlantic University (FAU), which will focus on the commercialization of ocean current, ocean thermal energy conversion, cold water air conditioning, and hydrogen technologies. FPL has supported FAU in discussions with the U.S. Department of the Interior's Minerals Bureau of Ocean Energy Management Regulation and Enforcement (BOEMRE). BOEMRE is working to establish the permitting process for ocean energy development on the outer continental shelf.

FPL has also developed a "Living Lab" to demonstrate FPL's solar energy commitment to employees and visitors at its Juno Beach office facility. FPL has installed five different PV arrays (using different technologies) of rooftop PV totaling 24 kW at the Living Lab. In addition, two PV-covered parking structures with a total of approximately 90 kW of PV are in use at the FPL Juno office parking lot. Through these Living Lab projects, FPL is able to evaluate multiple solar technologies and applications for the purpose of developing a renewable business model resulting in the most cost-effective and reliable uses of solar energy for FPL's customers. FPL plans to continue to expand the Living Lab as new solar products come to market.

FPL has also been in discussions with several private companies on multiple emerging technology initiatives, including ocean current, ocean thermal, hydrogen, fuel cell technology, biomass, biofuels, and energy storage.

FPL's Planned Renewable Energy Efforts for 2015 Through 2024:

FPL has concluded from its implementation and analyses of utility-scale PV and PV demand side pilot programs that utility-scale PV applications are the most economical way to utilize solar energy. In fact, FPL's analysis suggests that utility-scale PV is at least twice as economical on an installed $/kw basis compared to distributed PV systems. This conclusion is supported by FPL's recent analyses discussed above regarding the ability to assign firm capacity value at FPL's Summer peak hour to utility-scale PV. Due to the fact that the price of PV modules has declined in recent years, utility-scale PV has become more cost competitive. However, only the most cost-advantaged sites for utility-scale PV are projected to be cost-effective on FPL's system at this time. Other sites may become cost-effective in later years if PV costs continue to decline as expected. Consequently, the resource plan FPL is presenting in this Site Plan includes three utility-scale PV facilities at specific, cost-advantaged sites which also are able to take advantage of the current 30% investment tax credit (which is scheduled to be reduced to 10% in 2017). If/when utility-scale PV projects at other sites are projected to be cost-effective, additional PV generation sources will be discussed in future Site Plans.

1) FPL Utility-Scale PV Facilities:

In the resource plan presented in this Site Plan, FPL projects the addition of three separate utility-scale PV facilities by the end of 2016. Each PV facility is projected to be approximately 74.5 MW (nameplate, AC). The sites of these three proposed PV additions are: FPL's existing Manatee plant site, a site in DeSoto County, and a site in Charlotte County. These locations are expected to have cost advantages to support early development, including:

- Current ownership of land or low cost land purchase agreement in place;
- Proximity to existing transmission lines with sufficient injection capacity;
- Proximity to existing electric substations;
- Previously performed site development and permitting work;
- Proximity to existing FPL generating facilities which allows for lower operating expenses;
- Support from the associated counties and land developers, with the potential for further cost abatements;

As previously mentioned, bringing these three PV facilities in service before the end of 2016 will also allow the facilities to capture the full benefit of the currently available 30% investment tax credit for such PV facilities. The investment tax credit is scheduled to revert back to a 10% credit for PV projects that are placed in service after 2016.

2) FPL Distributed Generation (DG) PV Pilot Programs:

In regard to distributed generation (DG) PV, FPL is planning to implement two DG PV pilot programs in 2015. The first is a voluntary, community-based, solar partnership pilot to install new solar-powered generating facilities. The program will be at least partially funded by contributions from customers who volunteer to participate in the pilot and will not rely on subsidies from non-participating customers. The second program will implement approximately 6 MW of combined DG PV and battery storage at large commercial customer sites. The objective of this program is to collect grid integration data for DG PV and develop operational best practices for addressing potential problems that may be identified. A brief description of the two pilot programs follows:

a) Voluntary, Community-Based Solar Partnership Pilot Program:

FPL is introducing a Voluntary Solar Pilot Program to provide FPL customers with an additional and flexible opportunity to support development of solar power in Florida. The Commission approved FPL's request for this three-year pilot program in Order No. PSC-14-0468-TRF-EI on August 29, 2014. This pilot program will provide all customers the opportunity to support the use of solar energy at a community scale and is designed to be especially attractive for customers who do not wish, or are not able, to place solar equipment on their roof. Customers can participate in the program through voluntary contributions of $9/month starting in mid-2015.

In this respect, these DG-scale projects differ from FPL's three new utility-scale PV projects proposed for 2016, which are not projected to introduce a net cost to customers over the life of these projects and, therefore, do not require additional contributions from FPL's customers. In contrast, smaller DG-scale projects have a higher cost to construct, operate, and maintain. The cost per MW to construct DG-scale facilities (whether utility-owned and operated or otherwise) is approximately double that of the more cost-efficient utility-scale PV projects. Furthermore, the operations and maintenance costs of DG-scale projects are projected to be three times as much as for utility-scale PV due to the distributed nature of the installations. Thus a voluntary contribution is necessary for this DG-based pilot program so that net costs, and electric rates, do not increase for non-participants.

The first 200 kW of DG-scale PV projects will be built by FPL in the first half of 2015 at locations in the city of West Palm Beach and in Broward County. The first installation is scheduled to be at the Young at Arts Museum in Broward County. Additional PV facilities under this pilot program will be built when the projected voluntary contributions are sufficient to cover on-going program costs without increasing electric rates for all customers, including non-participating customers. The locations of these additional PV facilities will be determined at a later date. While the ultimate amount of PV that will be installed under this voluntary program cannot be known at this time, it is estimated that the project could result in approximately 2 MW (nameplate, DC) of community-located PV installations supported by over 10,000 customer participants by the end of the three-year pilot.

b) <u>C&I Solar Partnership Pilot Program:</u>

This is a research program that will be conducted in partnership with interested commercial and industrial (C&I) customers over an approximate five year period. Limited investments will be made in PV facilities located at customer sites in selected geographic areas of FPL's service territory. The objective of this portion of the pilot program is to examine the effect of high DG PV penetration on FPL's distribution system and to determine how best to address any problems that may be identified. FPL will site approximately 5 MW (nameplate, DC) of PV facilities in areas where DG PV already exists to better study feeder loading impacts. PV installations at Daytona International Speedway, and FIU's Engineering Center campus in West Miami-Dade County have been selected based largely on their interconnection with targeted circuits. In addition, this pilot program will also install a battery storage facility of approximately 1 MW capacity. This facility will be used to investigate the interoperability, and optimization, of multiple DG technologies. A multi-year research partnership agreement has been executed with FIU for the university to assist FPL in the battery storage research and development plan, and in the analyses that will subsequently be conducted.

III.G FPL's Fuel Mix and Fuel Price Forecasts

1. FPL's Fuel Mix

Until the mid-1980s, FPL relied primarily on a combination of fuel oil, natural gas, and nuclear energy to generate electricity with significant reliance on oil–fired generation. In the early 1980s, FPL began to purchase "coal-by-wire." In 1987, coal was first added to the fuel mix through FPL's partial ownership (20%) and additional purchases (30%) from the St. Johns River Power Park (SJRPP). This allowed FPL to meet its customers' energy needs with a more diversified mix of energy sources. Additional coal resources were added with the partial acquisition (76%) of Scherer Unit 4 which began serving FPL's customers in 1991.

The trend since the early 1990s has been a steady increase in the amount of natural gas that FPL uses to produce electricity due, in part, to the introduction of highly efficient and cost-effective CC generating units and the ready availability of natural gas. FPL placed into commercial operation two new gas-fired CC units at the West County Energy Center (WCEC) site in 2009. A third new CC unit was added to the WCEC site in 2011. In addition, FPL has completed the modernization of its Cape Canaveral and Riviera Beach plant sites and is currently modernizing its existing Port Everglades plant site by removing the steam generating units that previously operated at the site and replacing them with one highly efficient new CC unit. The new CC units at each of these three sites will provide highly efficient generation that will dramatically improve the efficiency of FPL's generation system in general and, more specifically, the efficiency with which natural gas is utilized.

In addition, FPL increased its utilization of nuclear energy through capacity uprates of its four existing nuclear units. With these uprates, more than 520 MW of additional nuclear capacity have been added to the FPL system. FPL is also pursuing plans to obtain licenses, permits, and approvals to construct and operate two new nuclear units at its existing Turkey Point site that, in total, would add approximately 2,200 MW of new nuclear generating capacity.

In regard to utilizing renewable energy, FPL has 110 MW of solar generating capacity consisting of: a 75 MW solar thermal steam generating facility at FPL's existing Martin site, a 25 MW PV facility in DeSoto County, and a 10 MW PV facility in Brevard County. The DeSoto facility was placed into commercial operation in 2009. The other two solar facilities were placed into commercial operation in 2010. As discussed in the preceding section, FPL is planning to add three new approximately 74.5 MW (nameplate, AC) PV facilities by the end of 2016.

FPL's future resource planning work will continue to focus on identifying and evaluating alternatives that would most cost-effectively maintain and/or enhance FPL's long-term fuel diversity. These fuel diverse alternatives may include: the purchase of power from renewable energy facilities, additional FPL-owned renewable energy facilities, obtaining additional access to diversified sources of natural gas such as liquefied natural gas (LNG) and natural gas from the Mid-Continent unconventional reserves, securing gas reserves, preserving FPL's ability to utilize fuel oil at its existing units, and increased utilization of nuclear energy. (As previously discussed, new advanced technology coal-fired generating units are not currently considered as viable options in Florida in the ten-year reporting period of this document due, in part, to current projections of relatively small differences in fuel costs between coal and natural gas, significantly higher capital costs for coal units compared to CC units, greater efficiencies of CC units, and concerns over environmental regulations that would impact coal units more negatively than CC units.) The evaluation of the feasibility and cost-effectiveness of these, and other possible fuel diversity alternatives, will be part of FPL's on-going resource planning efforts.

FPL's current use of various fuels to supply energy to customers, plus a projection of this "fuel mix" through 2024 based on the resource plan presented in this document, is presented in Schedules 5, 6.1, and 6.2 later in this chapter.

2) FPL's Fossil Fuel Cost Forecasts

Fossil fuel price forecasts, and the resulting projected price differentials between fuels, are major drivers used in evaluating alternatives for meeting future resource needs. FPL's forecasts are generally consistent with other published contemporary forecasts. A November 2014 fuel cost forecast was used in the analyses whose results led to the resource plan presented in this 2015 Site Plan.

Future oil and natural gas prices, and to a lesser extent, coal prices, are inherently uncertain due to a significant number of unpredictable and uncontrollable drivers that influence the short- and long-term price of oil, natural gas, and coal. These drivers include U.S. and worldwide demand, production capacity, economic growth, environmental requirements, and politics.

The inherent uncertainty and unpredictability of these factors today and in the future clearly underscores the need to develop a set of plausible oil, natural gas, and solid fuel (coal) price scenarios that will bound a reasonable set of long-term price outcomes. In this light, FPL developed and utilized Low, Medium, and High price forecasts for fossil fuels in some of its 2014 and early 2015 resource planning work, particularly in regard to analyses conducted as part of the nuclear cost recovery filing work.

FPL's Medium price forecast methodology is consistent for oil and natural gas. For oil and natural gas commodity prices, FPL's Medium price forecast applies the following methodology:

a. For 2015 through 2016, the methodology used the November 3, 2014 forward curve for New York Harbor 0.7% sulfur heavy oil, ultra-low sulfur diesel (ULSD) fuel oil, and Henry Hub natural gas commodity prices;

b. For the next two years (2017 and 2018), FPL used a 50/50 blend of the November 3, 2014 forward curve and the most current projections at the time from The PIRA Energy Group;

c. For the 2019 through 2035 period, FPL used the annual projections from The PIRA Energy Group; and,

d. For the period beyond 2035, FPL used the real rate of escalation from the Energy Information Administration (EIA). In addition to the development of oil and natural gas commodity prices, nominal price forecasts also were prepared for oil and natural gas transportation costs. The addition of commodity and transportation forecasts resulted in delivered price forecasts.

FPL's Medium price forecast methodology is also consistent for coal prices. Coal prices were based upon the following approach:

a. Delivered price forecasts for Central Appalachian (CAPP), Illinois Basin (IB), Powder River Basin (PRB), and South American coal were provided by JD Energy; and,

b. The coal price forecast for SJRPP and Plant Scherer assumes the continuation of the existing mine-mouth and transportation contracts until expiration, along with the purchase of spot coal, to meet generation requirements.

The development of FPL's Low and High price forecasts for oil, natural gas, and coal prices were based on the historical volatility of the 12-month forward price, one year ahead. FPL developed these forecasts to account for the uncertainty that exists within each commodity as well as across commodities. These forecasts reflect a range of reasonable forecast outcomes.

3. Natural Gas Storage

FPL was under contract through August 2014 for 2.5 billion cubic feet (Bcf) of firm natural gas storage capacity in the Bay Gas storage facility located in Alabama. The Bay Gas storage facility is interconnected with the Florida Gas Transmission (FGT) pipeline. FPL amended the transaction with Bay Gas on September 1, 2014 to increase the capacity to 4.0 Bcf of firm natural gas storage capacity. FPL has predominately utilized natural gas storage to help mitigate gas supply problems caused by severe weather and/or infrastructure problems.

Over the past several years, FPL has acquired upstream transportation capacity on several pipelines to help mitigate the risk of off-shore supply problems caused by severe weather in the Gulf of Mexico. While this transportation capacity has reduced FPL's off-shore exposure, a portion of FPL's supply portfolio remains tied to off-shore natural gas sources. Therefore, natural gas storage remains an important tool to help mitigate the risk of supply disruptions.

As FPL's reliance on natural gas has increased, its ability to manage the daily "swings" that can occur on its system due to weather and unit availability changes has become more challenging, particularly from oversupply situations. Natural gas storage is a valuable tool to help manage the daily balancing of supply and demand. From a balancing perspective, injection and withdrawal rights associated with gas storage have become an increasingly important part of the evaluation of overall gas storage requirements.

As FPL's system grows to meet customer needs, it must maintain adequate gas storage capacity to continue to help mitigate supply and/or infrastructure problems and to provide FPL the ability to manage its supply and demand on a daily basis. FPL continues to evaluate its gas storage portfolio and is likely to subscribe for additional gas storage capacity to help increase reliability, provide the necessary flexibility to respond to demand changes, and diversify the overall portfolio.

4. Securing Additional Natural Gas:

The recent trend of increasing reliance upon natural gas to produce electricity for FPL's customers is projected to continue due to FPL's growing load. The addition of highly fuel-efficient CC units at Cape Canaveral and Riviera Beach due to completed modernization projects, the on-going Port Everglades modernization project, plus the potential for additional CC capacity, will reduce the growth in natural gas use from what it otherwise might have been due to the high fuel-efficiency levels of these new CC units. In addition, FPL plans to add a significant amount of new PV facilities that utilize no fossil fuel. However, these efficiency gains do not fully offset the effects of FPL's growing load. Therefore, FPL will need to secure more natural gas supply, more firm gas transportation capacity, and secure gas reserves in the future as fuel requirements dictate. The issue is how to secure these additional natural gas resources in a manner that is economical for FPL's customers and which maintains and/or enhances the reliability of natural gas supply and deliverability to FPL's generating units.

FPL has historically purchased the gas transportation capacity required for new natural gas supply from two existing natural gas pipeline companies. As more natural gas is delivered through these two pipelines, the impact of a supply disruption on either pipeline becomes more problematic. Therefore, FPL issued a Request for Proposals (RFP) in December 2012 for gas transportation capacity to meet FPL's system natural gas requirements beginning in 2017. The RFP encouraged bidders to propose new gas transportation infrastructure to meet Florida's growing need for natural gas. A third pipeline would benefit FPL and its customers by increasing the diversity of FPL's fuel supply sources, increasing the physical reliability of the pipeline delivery system, and enhancing competition among pipelines.

The RFP process was completed in June 2013, and the winning bidders were Sabal Trail Transmission, LLC (Sabal Trail) and Florida Southeast Connection, LLC (FSC). The contracts with Sabal Trail and FSC were reviewed by the FPSC and approved for cost recovery in late 2013. The order approving this cost recovery became final in January 2014. Sabal Trail and FSC are currently in the process of obtaining Federal Energy Regulatory Commission approval for the new pipelines. The planned in-service date for the pipelines is May 2017.

5. Nuclear Fuel Cost Forecast

This section reviews the various steps needed to fabricate nuclear fuel for delivery to the nuclear power plants, the method used to forecast the price for each step, and other comments regarding FPL's nuclear fuel cost forecast.

a) Steps Required for Nuclear Fuel to be delivered to FPL's Plants

Four separate steps are required before nuclear fuel can be used in a commercial nuclear power reactor. These steps are summarized below.

(1) Mining: Uranium is produced in many countries such as Canada, Australia, Kazakhstan, and the United States. During the first step, uranium is mined from the ground using techniques such as open pit mining, underground mining, in-situ leaching operations, or production as a by-product from other mining operations, such as gold, copper, or phosphate rocks. The product from this first step is the raw uranium delivered as an oxide, U3O8 (sometimes referred to as yellowcake).

(2) Conversion: During the second step, the U3O8 is chemically converted into UF6 which, when heated, changes into a gaseous state. This second step further removes any chemical impurities and serves as preparation for the third step, which requires uranium to be in a gaseous state.

(3) Enrichment: The third step is called enrichment. Natural uranium contains 0.711% of uranium at an atomic mass of 235 (U-235) and 99.289% of uranium at an atomic mass of 238 (U-238). FPL's nuclear reactors use uranium with a higher percentage of up to almost five percent (5%) of U-235 atoms. Because natural uranium does not contain a sufficient amount of U-235, the third step increases the percentage amount of U-235 from 0.711% to a level specified when designing the reactor core (typically in a range from approximately 2.2% to as high as 4.95%). The output of this enrichment process is enriched uranium in the form of UF6.

(4) Fabrication: During the last step, fuel fabrication, the enriched UF6 is changed to a UO2 powder, pressed into pellets, and fed into tubes, which are sealed and bundled together into fuel assemblies. These fuel assemblies are then delivered to the plant site for insertion in a reactor.

Like other utilities, FPL has purchased raw uranium and the other components of the nuclear fuel cycle separately from numerous suppliers from different countries.

b) Price Forecasts for Each Step

(1) Mining: The impact of the earthquake and tsunami that struck the Fukushima nuclear complex in Japan in March 2011 is still being felt in the uranium market. Current demand has declined and several of the production facilities have announced delays. Factors of importance are:

- Hedge funds are still very active in the market. This causes more speculative demand that is not tied to market fundamentals and causes the market price to move up or down just based on news that might affect future demand.

- Some of the uranium inventory from the U.S. Department of Energy (DOE) is finding its way into the market periodically to fund cleanup of certain Department of Energy facilities.

- Although a limited number of new nuclear units are scheduled to start production in the U.S. during the next 5 to 10 years, other countries, more specifically China, have announced an increase in construction of new units which may cause uranium prices to trend up in the near future.

Over a 10-year horizon, FPL expects the market to be more consistent with market fundamentals. The supply picture is more stable, with laws enacted to resolve the import of Russian-enriched uranium, by allowing some imports of Russian-enriched uranium to meet about 20-25% of needs for currently operating units, but with no restriction on the first core for new units and no restrictions after 2020. New and current uranium production facilities continue to add capacity to meet demands. Actual demand tends to grow over time because of the long lead time to build nuclear units. However, FPL cannot discount the possibility of future periodic sharp increase in prices, but believes such occurrences will likely be temporary in nature.

(2) Conversion: The conversion market is also in a state of flux due to the Fukushima events. Planned production after 2018 is currently forecasted to be insufficient to meet the higher demand scenario, but it is projected to be sufficient to meet most reference case scenarios. As with additional raw uranium production, supply will expand beyond current level once more firm commitments are made including commitments to build new nuclear units. FPL expects long term price stability for conversion services to support world demand.

(3) Enrichment: As a result of the Fukushima events in March 2011, the near-term price of enrichment services has been declining for the last three years. However, plans for construction of several new facilities that were expected to come on-line in the next few years have been delayed. Also, some of the existing high operating cost diffusion plants have shut down. As with supply for the other steps of the nuclear fuel cycle, expansion of future capacity is feasible within the lead time for constructing new nuclear units and any other projected increase in demand. Meanwhile, world supply and demand will continue to be balanced such that FPL expects adequate supply of enrichment services. The current supply/demand profile will most likely result in the price of enrichment services remaining stable for the next few years before starting to increase.

(4) Fabrication: Because the nuclear fuel fabrication process is highly regulated by the Nuclear Regulatory Commission (NRC), not all production facilities can qualify as suppliers to nuclear reactors in the U.S. Although world supply and demand is expected to show significant excess capacity for the foreseeable future, the gap is not as wide for U.S. supply and demand. The supply for the U.S. market is expected to be sufficient to meet U.S. demand for the foreseeable future.

c) Other Comments Regarding FPL's Nuclear Fuel Cost Forecast

FPL's nuclear fuel price forecasts are the result of FPL's analysis based on inputs from various nuclear fuel market expert reports and studies. The calculations for the nuclear fuel cost forecasts used in FPL's 2014 and early 2015 resource planning work were performed consistent with the method then used for FPL's Fuel Clause filings, including the assumption of refueling outages every 18 months and plant operation at current (i.e., power uprated) levels. The costs for each step to fabricate the nuclear fuel were added to come up with the total costs of the fresh fuel to be loaded at each refueling (acquisition costs). The acquisition cost for each group of fresh fuel assemblies were then amortized over the energy produced by each group of fuel assemblies. DOE notified FPL that, effective May 2014, all high level waste payments would be suspended until further notice. Therefore, FPL is no longer including in its nuclear fuel cost forecast a 1 mill per kilowatt hour net to reflect payment to DOE for spent fuel disposal.

(1) Schedule 8 shows only planned and prospective changes to generating facilities and does not reflect changes to existing purchases. Those changes are reflected on Tables ES-1, I.B.1 and I.B.2.

(2) The Winter Total MW value consists of all generation additions and changes achieved by January. The Summer Total MW value consists of all generation additions and changes achieved by June. All MW additions/changes occurring after August each year will be picked up for reserve margin calculation purposes in the following year.

(3) This generating unit will serve as a synchronous condenser and will not be included in reserve margin calculation.

All MW additions/changes occurring after August each year will be picked up for reserve margin calculation purposes in the following year.

Schedule 9
Status Report and Specifications of Proposed Generating Facilities

(1) **Plant Name and Unit Number:** Port Everglades Next Generation Clean Energy Center

(2) **Capacity**
a. Summer 1,237 MW
b. Winter 1,429 MW

(3) **Technology Type:** Combined Cycle

(4) **Anticipated Construction Timing**
a. Field construction start-date: 2014
b. Commercial In-service date: 2016

(5) **Fuel**
a. Primary Fuel: Natural Gas
b. Alternate Fuel: Ultra-low sulfur distillate

(6) **Air Pollution and Control Strategy:** Dry Low No_x Burners, SCR, Natural Gas, 0.0015% S. Distillate and Water Injection on Distillate

(7) **Cooling Method:** Once-through cooling water

(8) **Total Site Area:** Existing Site Acres

(9) **Construction Status:** U (Under construction, less than or equal to 50% complete)

(10) **Certification Status:** ---

(11) **Status with Federal Agencies:** ---

(12) **Projected Unit Performance Data:**

Planned Outage Factor (POF):	3.5%	
Forced Outage Factor (FOF):	1.1%	
Equivalent Availability Factor (EAF):	95.4%	
Resulting Capacity Factor (%):	Approx. 90%	(First Full Year Base Operation)
Average Net Operating Heat Rate (ANOHR):	6,330	Btu/kWh
Base Operation 75F,100%		

(13) **Projected Unit Financial Data *,****

Book Life (Years):	30	years
Total Installed Cost (2016 $/kW):	928	
Direct Construction Cost ($/kW):	841	
AFUDC Amount ($/kW):	87	
Escalation ($/kW):	Accounted for in Direct Construction Cost	
Fixed O&M ($/kW-Yr): (2016 $)	30.00	
Variable O&M ($/MWH): (2016 $)	0.10	
K Factor:	1.51	

* $/kW values are based on Summer capacity.
** Fixed O&M cost includes capital replacement.

Note: Total installed cost includes gas expansion, transmission interconnection and integration, escalation, and AFUDC. Demolition costs of existing plant are not included.

Schedule 9
Status Report and Specifications of Proposed Generating Facilities

(1) **Plant Name and Unit Number:** Fort Myers CT (2 CTs will be added)

(2) **Capacity (for each CT)**
a. Summer 211 MW plus 20 MW of peaking capacity
b. Winter 223 MW

(3) **Technology Type:** Combustion Turbine

(4) **Anticipated Construction Timing**
a. Field construction start-date: 2015
b. Commercial In-service date: 2016

(5) **Fuel**
a. Primary Fuel: Natural Gas
b. Alternate Fuel: Ultra-low sulfur distillate

(6) **Air Pollution and Control Strategy:** Dry Low NO_x Burners, SCR, Natural Gas, 0.0015% S. Distillate and Water Injection on Distillate

(7) **Cooling Method:** Water to Air Heat Exchangers

(8) **Total Site Area:** Existing Site Acres

(9) **Construction Status:** P (Planned Unit)

(10) **Certification Status:** ---

(11) **Status with Federal Agencies:** ---

(12) **Projected Unit Performance Data:**

Planned Outage Factor (POF):	3.0%	
Forced Outage Factor (FOF):	1.0%	
Equivalent Availability Factor (EAF):	96.0%	
Resulting Capacity Factor (%):	Approx. 3%	(First Full Year Base Operation)
Average Net Operating Heat Rate (ANOHR): Base Operation 75F,100%	10,075	Btu/kWh
Average Net Incremental Heat Rate (ANIHR): Peak Operation 75F,100%	7,644	Btu/kWh

(13) **Projected Unit Financial Data *,****

Book Life (Years):	30	years
Total Installed Cost (2016 $/kW):	441	
Direct Construction Cost ($/kW):	422	
AFUDC Amount (2016 $/kW):	19	
Escalation ($/kW):	Accounted for in Direct Construction Cost	
Fixed O&M ($/kW-Yr):	2.63	
Variable O&M (2016 $/MWH):	0.00	
K Factor:	1.38	

* $/kW values are based on Summer capacity.
** Levelized value includes Fixed O&M and Capital Replacement

Note: Total installed cost includes transmission interconnection and integration, escalation, and AFUDC. Demolition costs of existing GTs are not included.

Schedule 9

Status Report and Specifications of Proposed Generating Facilities

(1) **Plant Name and Unit Number:** Lauderdale CT (5 CTs will be added)

(2) **Capacity (for each CT)**
a. Summer 211 MW plus 20 MW of peaking capacity
b. Winter 223 MW

(3) **Technology Type:** Combustion Turbine

(4) **Anticipated Construction Timing**
a. Field construction start-date: 2015
b. Commercial In-service date: 2016

(5) **Fuel**
a. Primary Fuel: Natural Gas
b. Alternate Fuel: Ultra-low sulfur distillate

* $/kW values are based on Summer capacity.
** Levelized value includes Fixed O&M and Capital Replacement

Note: Total installed cost includes transmission interconnection and integration, and AFUDC. Actual transmission and interconnection costs are unknown for an unsited unit. The transmission interconnection and integration costs for the unsited unit are based on the costs for the Okeechobee Clean Energy Center

Schedule 10
Status Report and Specifications of Proposed Transmission Lines

Port Everglades Next Generation Clean Energy Center

The Port Everglades Next Generation Clean Energy Center which will result from the modernization of the Port Everglades power plant site does not require any “new” transmission lines.

Schedule 10
Status Report and Specifications of Proposed Transmission Lines

Fort Myers Plant Gas Turbine Replacement and CT Upgrade

The Fort Myers Plant gas turbine replacement and CT upgrade projects do not require any “new” transmission lines.

Schedule 10
Status Report and Specifications of Proposed Transmission Lines

Lauderdale Plant Gas Turbine Replacement

The Lauderdale Plant Gas Turbine Replacement project does not require any “new” transmission lines.

Schedule 10
Status Report and Specifications of Proposed Transmission Lines

Citrus Solar Energy Center (DeSoto)

The Citrus Solar Energy Center (DeSoto) will require one new line to connect the PV inverter array to the expanded Sunshine Substation.

(1)	Point of Origin and Termination:	Skylight – Sunshine Substation
(2)	Number of Lines:	1
(3)	Right-of-way	FPL – Owned
(4)	Line Length:	1.5 miles
(5)	Voltage:	230 kV
(6)	Anticipated Construction Timing:	Start date: 2015 End date: 2016
(7)	Anticipated Capital Investment: (Trans. and Sub.)	Included in total installed cost on schedule 9
(8)	Substations:	Skylight Substation and Sunshine Substation
(9)	Participation with Other Utilities:	None

Schedule 10
Status Report and Specifications of Proposed Transmission Lines

Manatee Solar Energy Center (Manatee)

The Manatee Solar Energy Center will require one new line to connect the PV inverter array to the expanded Manatee Switchyard.

(1)	Point of Origin and Termination:	Helios – Manatee Switchyard
(2)	Number of Lines:	1
(3)	Right-of-way	FPL – Owned
(4)	Line Length:	1.5 miles
(5)	Voltage:	230 kV
(6)	Anticipated Construction Timing:	Start date: 2015 End date: 2016
(7)	Anticipated Capital Investment: (Trans. and Sub.)	Included in total installed cost on schedule 9
(8)	Substations:	Helios Substation and Manatee Switchyard
(9)	Participation with Other Utilities:	None

Schedule 10
Status Report and Specifications of Proposed Transmission Lines

Babcock Solar Energy Center (Charlotte)

The Babcock Solar Energy Center (Charlotte) will require one new line to connect the PV inverter array to the planned Freeland Substation.

(1)	Point of Origin and Termination:	Webb – Freeland Substation
(2)	Number of Lines:	1
(3)	Right-of-way	FPL – Owned
(4)	Line Length:	5 miles
(5)	Voltage:	230 kV
(6)	Anticipated Construction Timing:	Start date: 2015 End date: 2016
(7)	Anticipated Capital Investment: (Trans. and Sub.)	Included in total installed cost on schedule 9
(8)	Substations:	Webb Substation and Freeland Substation
(9)	Participation with Other Utilities:	None

Schedule 10
Status Report and Specifications of Proposed Transmission Lines

Okeechobee Next Generation Clean Energy Center

The Okeechobee Next Generation Clean Energy Center does not require any "new" transmission lines.

Schedule 10
Status Report and Specifications of Proposed Transmission Lines

Unsited 3x1 CC

No site has been determined, therefore no transmission analysis is possible.

Schedule 11.1

Existing FIRM and NON-FIRM Capacity and Energy by Primary Fuel Type
Actuals for the Year 2014

	(1)	(2)	(3)	(4)	(5)	(6)	(7)
		Net (MW) Capability				NEL	Fuel Mix

(11)	***Purchases Other :***	1,890.0	7.0%	1,890.0	6.6%	4,117	3.6%
(12)	***Total :***	*27,037.0*	*100.0%*	*28,613.0*	*100.0%*	*115,968*	*100.0%*

Note:

(1) FPL Existing Units Total values on row (7), columns (2) and (4), match the System Firm Generating Capacity values found on Schedule 1 for Summer and Winter.

(2) Net Energy for Load GWh values on row (12), column (6), matches Schedule 6.1 value for 2014.

Schedule 11.2

Existing NON-FIRM Self-Service Renewable Generation Facilities
Actuals for the Year 2014

(1)	(2)	(3)	(4)	(5)	(6) = (3)+(4)-(5)
Type of Facility	Installed Capacity DC (MW)	Renewable Projected Annual Output (MWh)	Annual Energy Purchased from FPL (MWh)	Annual Energy Sold to FPL (MWh)	Projected Annual Energy Used by Customers
Customer-Owned Renewable Generation (0 kW to 10 kW)	17.25	21,548	191,676	634	212,590
Customer-Owned Renewable Generation (> 10 kW to 100 kW)	8.77	11,087	217,985	661	228,411
Customer-Owned Renewable Generation (> 100 kW - 2 MW)	12.76	36,645	91,007	210	127,442
Totals	39	69,279	500,668	1,505	568,443

Notes:

(1) There were 3241 customers with renewable generation facilities interconnected with FPL on December 31, 2014.

(2) The Installed Capacity value is the sum of the nameplate ratings (DC MW) for all of the customer-owned renewable generation facilities connected as of December 31, 2014. Three systems do not have a DC rating. These are 3 non-solar facilities:

Tropicana - Landfill gas reciprocating generator: 1600 kW AC
Manatee Landfill gas: 1600 kW AC
Bio Mass - Palm Beach County: 750 kW AC

These AC values are included in the (> 100 kW < 2 MW) row.

(3) The Projected Annual Output value is based on NREL's PV Watts 1 program and the Installed Capacity value in column (2), adjusted for the date when each facility was installed and assuming each facility operated as planned.

(4) The Annual Energy Purchased from FPL is an actual value from FPL's metered data for 2014.

(5) The Annual Energy Sold to FPL is an actual value from FPL's metered data for 2014.

(6) The Projected Annual Energy Used by Customers is a projected value that equals: (Renewable Projected Annual output + Annual Energy Purchased) minus the Annual Energy Sold to FPL.

(This page is left intentionally blank.)

CHAPTER IV

Environmental and Land Use Information

(This page is left intentionally blank.)

IV. Environmental and Land Use Information

IV.A Protection of the Environment

Florida's climate can be described as a combination of humid subtropical and tropical savanna supporting an environment which includes a diverse number of distinct ecosystems with many endangered or threatened plant and animal species. These distinct ecosystems, the residents, and industries of Florida compete for the same resources that are necessary for the generation, transmission, and distribution of electricity. FPL is a corporation which practices strong environmental stewardship evidenced by the creation and management of the Everglades Mitigation Bank and the preservation of the Barley Barber Swamp. FPL desires to meet public expectations of such stewardship and conducts their business in a responsible manner by minimizing impacts to Florida's natural environment.

FPL and its parent company, NextEra Energy, Inc. have continuously been recognized as leaders among electric utilities for their commitment to the environment. That commitment is ingrained in FPL's corporate culture. FPL has one of the lowest emissions profiles among U.S. utilities and in 2014 its carbon dioxide (CO_2) emission rate was 38% lower (better) than the industry national average.

On March 3, 2014 NextEra Energy was named No. 1 in its sector on Fortune Magazine's "Most Admired Companies" list for the eighth year in a row. In determining the industry rankings, approximately 15,000 senior executives, outside directors, and industry analysts are surveyed and companies are rated on the following nine attributes:

1.) Ability to attract and retain talented people
2.) Quality of management
3.) Social responsibility to the community and the environment
4.) Innovativeness
5.) Quality of products or services
6.) Wise use of corporate assets
7.) Financial soundness
8.) Long-term investment value
9.) Effectiveness in doing business globally

Fortune recognized that "*in 2013, the output from NextEra Energy's power plants resulted in emissions rates of sulfur dioxide, nitrogen oxide and carbon dioxide that were 97 percent, 80 percent and 53 percent lower, respectively, than the U.S. electric industry's average. In addition, the company provides grants to teachers of science, technology, engineering and math (STEM)* *classes, partners with community colleges on wind technology training, and protects threatened and endangered species where it has operations, including the Florida manatee, American crocodile, and osprey and desert tortoise."*

In March 2014, FPL received the 2014 Florida House Conservation Award in recognition of its extraordinary commitment to the environment. In presenting the award, Bart Hudson, president of the Florida House, declared *"From preserving wildlife and natural resources to bringing the public and private sectors together to support long-term restoration efforts in the Everglades, the southeast Florida marshes and Biscayne Bay, conservation is at the core of FPL's mission"*.

Other conservation efforts noted by the Florida House include FPL's focus on reducing greenhouse gas emissions while helping to keep customer bills low through the use of fuel-efficient power generation and other innovative technologies. Since 2001, FPL has reduced its use of foreign oil by 99 percent by modernizing existing power plants into cleaner, more fuel-efficient plants. It is the first utility to bring commercial-scale solar power to Florida, including the world's first solar-natural gas hybrid.

On April 2, 2014, the Environmental Protection Agency presented Florida Power & Light Company with its Clean Air Excellence Award in recognition of the company's "green" vehicle fleet and customer education programs featuring its electric vehicles and their benefits. The awards recognize innovative programs that protect Americans' health and the environment, educate the public, serve their communities and stimulate the economy.

In 2014, FPL supported a broad base of environmental organizations with donations and memberships totaling in excess of $290,000. The organizations included, but were not limited to, the Everglades Foundation, the Conservancy of Southwest Florida, the Busch Wildlife Sanctuary, Inc., the Arthur R. Marshall Foundation and the Loggerhead Marinelife Center, Inc. In addition, part of the charitable giving was the result of an FPL employee 2014 Power to Care Event that raised funds dedicated to the Friends of MacArthur Beach State Park.

FPL employees serve as board members for many organizations that focus on environmental restoration, preservation, and stewardship. A partial list of these organizations includes: Loggerhead Marinelife Center, Inc., the Everglades Foundation, the Arthur R. Marshall Foundation, The Nature Conservancy, Grassy Waters Preserve, and the Palm Beach Zoo.

IV.B FPL's Environmental Policy

At FPL and its parent company, NextEra Energy, Inc., we are committed to being an industry leader in environmental protection and stewardship, not only because it makes business sense, but because it is the right thing to do. Our commitment to compliance, conservation, communication, and continuous improvement fosters a culture of environmental excellence and drives the sustainable management of our business planning, operations, and daily work.

In accordance with our commitments to environmental protection and stewardship, FPL and NextEra Energy, Inc. endeavor to:

Comply

- Comply with all applicable environmental laws, regulations, and permits
- Proactively identify environmental risks and take action to mitigate those risks
- Pursue opportunities to exceed environmental standards
- Participate in the legislative and regulatory process to develop environmental laws, regulations, and policies that are technically sound and economically feasible
- Design, construct, operate, and maintain our facilities in an environmentally sound and responsible manner

Conserve

- Prevent pollution, minimize waste, and conserve natural resources
- Avoid, minimize, and/or mitigate impacts to habitat and wildlife
- Promote the efficient use of energy, both within our company and in our communities

Communicate

- Communicate this policy to all employees and publish it on the corporate website
- Invest in environmental training and awareness to achieve a corporate culture of environmental excellence
- Maintain an open dialogue with stakeholders on environmental matters and performance

Continuously Improve

- Establish, monitor, and report progress toward environmental targets
- Review and update this policy on a regular basis
- Drive continuous improvement through ongoing evaluations of our environmental management system to incorporate lessons learned and best practices.

FPL's parent company, NextEra Energy, Inc. updated this policy in 2013 to reflect changing expectations and ensure that employees are doing the utmost to protect the environment. FPL complies with all environmental laws, regulations, and permit requirements. FPL designs, constructs, and operates its facilities in an environmentally sound and responsible manner. It also responds immediately and effectively to any known environmental hazards or non-compliance situations. FPL's commitment to the environment does not end there. FPL proactively pursues opportunities to exceed current environmental standards, including reducing waste and emission of pollutants, recycling materials, and conserving natural resources throughout its operations and day-to-day work activities. FPL also encourages the efficient use of energy, both within the Company and in communities served by FPL. These actions are just a few examples of how FPL is committed to the environment.

To ensure that FPL is adhering to its environmental commitment, it has developed rigorous environmental governance procedures and programs. These include its Environmental Assurance Program and Corporate Environmental Governance Council. Through these programs, FPL conducts periodic environmental self-evaluations to verify that its operations are in compliance with environmental laws, regulations, and permit requirements. Regular evaluations also help identify best practices and opportunities for improvement.

IV.C Environmental Management

In order to successfully implement the Environmental Policy, FPL has developed a robust Environmental Management System program to direct and control the fulfillment of the organization's environmental responsibilities. A key component of the system is an Environmental Assurance Program, which is described in section IV.D below. Other components of the system include: executive management support and commitment, a dedicated environmental corporate governance program, written environmental policies and procedures, delineation of organizational responsibilities and individual accountabilities, allocation of appropriate resources for environmental compliance management (which includes reporting and corrective action when non-compliance occurs), environmental incident and/or emergency response, environmental risk assessment/management, environmental regulatory development and tracking, and environmental management information systems.

As part of its commitment to excellence and continuous improvement, FPL created an enhanced environmental data management information system (EDMIS) which was fully implemented by the end of 2014. Environmental data management software systems are increasingly viewed as an industry best-management practice to ensure environmental compliance. FPL's top goals for this project are to: 1) improve the flow of environmental data between site operations and corporate services to ensure compliance, and 2) improve operating efficiencies. In addition, the EDMIS will help standardize environmental data collection, thus improving external reporting to the public.

IV.D Environmental Assurance Program

FPL's Environmental Assurance Program consists of activities that are designed to evaluate environmental performance, verify compliance with corporate policy as well as legal and regulatory requirements, and communicate results to corporate management. The principal mechanism for pursuing environmental assurance is an environmental audit. An environmental audit may be defined as a management tool comprising a systematic, documented, periodic, and objective evaluation of the performance of the organization and of the specific management systems and equipment designed to protect the environment. The primary objective of performing an environmental audit is to facilitate management control of environmental practices and assess compliance with existing environmental regulatory requirements and FPL policies. In addition to FPL facility audits, through the Environmental Assurance Program, FPL performs audits of third-party vendors used for recycling and/or disposal of waste generated by FPL operations. Vendor audits provide information used for selecting candidates or incumbent vendors for disposal and recycling needs.

FPL has also implemented a Corporate Environmental Governance System, in which quarterly reviews are performed by each business unit deemed to have potential for significant environmental exposures. Quarterly reviews evaluate operations for potential environmental risks and consistency with the company's Environmental Policy. Items tracked during the quarterly reviews include processes for the identification and management of environmental risks, metrics, and indicators and progress / changes since the most recent review.

IV.E Environmental Communication and Facilitation

FPL is involved in many efforts to enhance environmental protection through the facilitation of environmental awareness and in public education. Some of FPL's 2014 environmental outreach activities are summarized in Table IV.E.1.

Table IV.E.1: 2014 FPL Environmental Outreach Activities

Activity	Count (#)
Visitors to FPL's Energy Encounter at St. Lucie	2,669
Visitors to Manatee Park, Ft. Myers	216,401
Number of website visits to FPL's Environmental & Corporate Responsibility Websites	580,000
Visitors to Barley Barber Swamp (Treasured Lands Partnership)	8,517
Martin Energy Center Solar Tours	600
Solar Schools Program	• 92 schools and 10 demo sites completed as of 12/31/14 • Installed capacity for the 102 sites is 921 kW and can produce more than one million kWh annually • An additional 24-28 school/demo sites will come online by the end of 2015

IV.F Preferred and Potential Sites

Based upon its projection of future resource needs, FPL has identified eight (8) Preferred Sites and three (3) Potential Sites for future generation additions. Preferred Sites are those locations where FPL has conducted significant reviews, and has either taken action, is currently committed to take action, or is likely to take action, to site new generating capacity. Potential Sites are those sites that have attributes that support the siting of generation and are under consideration as a location for future generation. Some of these sites are currently in use as existing generation sites and some are not. The identification of a Potential Site does not indicate that FPL has made a definitive decision to pursue generation (or generation expansion or modernization in the case of an existing generation site) at that location, nor does this designation indicate that the size or technology of a generator has been determined. Analyses of any modernization candidates would include evaluation of numerous factors including: fuel delivery, transmission, permitting, etc. The Preferred Sites and Potential Sites are discussed in separate sections below.

IV.F.1 Preferred Sites

For the 2015 Ten Year Site Plan, FPL has identified eight (8) Preferred Sites. These include a combination of existing and new sites for the development of natural gas combined cycle, combustion turbines, and/or solar generation facilities.

The Port Everglades site is a location where a modernization project is in progress. This work consists of replacing the former steam generating units and replacing them with new combined cycle (CC) technology. The modernization work is scheduled to be completed in mid-2016. In addition, all of the existing gas turbines (GTs) at the Port Everglades site, and all but two of the existing GTs at the nearby Lauderdale site, are projected to be retired by the end of 2016. The two GTs that will remain will serve to provide black start capability. Five new combustion turbines

(CTs) are projected to be added at the Lauderdale site by the end of 2016 to partially replace the retired peaking capacity at these sites. These actions, taken to lower FPL's long-term costs, will also aid in addressing compliance with new air emissions standards.

Similarly, and as part of this GT replacement effort, all but two of the existing GTs at the Ft. Myers site will be retired and two new CTs will be added. In addition, the two existing CTs at the Ft. Myers site will be upgraded to increase their capacity. All of the Ft. Myers work is scheduled to be completed by the end of 2016.

The Okeechobee County site has been identified as a Preferred Site for new natural gas CC technology. As discussed in the Executive Summary, the new natural gas CC at this site represents FPL's best self-build generation option in 2019, and it will compete with proposals received in response to a capacity request for proposals (RFP) that was issued in March 2015.

The Okeechobee County site is also under consideration for future new photovoltaic (PV) facilities. In regard to PV, Charlotte, DeSoto, and Manatee Counties have been identified as the locations for new PV facilities that are expected to go in-service by the end of 2016.

Finally, the Turkey Point site is the location at which FPL plans to construct two new nuclear units, Turkey Point Units 6 & 7. The Nuclear Regulatory Commission recently announced a several year delay in their schedule to make a decision on FPL's pending Turkey Point Units 6 & 7 Combined Operating License Application (COLA). Due to this delay in the COLA schedule, and to changes in Florida's nuclear cost recovery rule, the earliest practical date for bringing the Turkey Point 6 & 7 units in-service is now beyond the 2015 through 2024 time period addressed in this Site Plan. Despite this change in timing of the two new nuclear units, this Site Plan continues to present the Turkey Point site as a Preferred Site for the new units.

Preferred Site # 1: Port Everglades Plant, Broward County

FPL is in the process of modernizing the Port Everglades Plant located within the City of Hollywood in Broward County with construction anticipated to be completed in 2016. Previously the site consisted of two 200 MW (approximate) and two 400 MW (approximate) steam generating units. The four units were taken out of service, dismantled, and removed from the site as part of the modernization project. The modernized site, named the Port Everglades Next Generation Clean Energy Center (PEEC), will consist of a single new Combined Cycle unit that replaces the original four steam units. The modernized unit will be highly efficient and have a lower-emission rate and will use less water than the original units at the site.

a. U.S. Geological Survey (USGS) Map

A USGS map of the PEEC site is found at the end of this chapter.

b. Proposed Facilities Layout

A general layout of the PEEC generating facilities is found at the end of this chapter.

c. Map of Site and Adjacent Areas

An overview map of the site and adjacent areas is also found at the end of this chapter.

d. Existing Land Uses of Site and Adjacent Areas

The Port Everglades Plant formerly consisted of two 200 MW (approximate) and two 400 MW (approximate) generating units with conventional dual-fuel fired steam boilers and steam turbines which were demolished in the Summer of 2013 to make way for the new Port Everglades Next Generation Clean Energy Center. The plant site includes minimal vegetation. Adjacent land uses include port facilities, barge access via port infrastructure, a rail line and associated industrial activities, as well as light commercial and residential development.

e. General Environment Features On and In the Site Vicinity

There are environmental benefits of replacing the former steam units at the Port Everglades Site with a new CC unit including a significant reduction in system air emissions and improved aesthetics at the site such as lower stack heights.

1. Natural Environment

The site is located adjacent to the Intracoastal Waterway (ICW) and is comprised of facilities related to electric power generation. It is located within a highly industrialized port that has active material and fuel handling facilities.

2. Listed Species

No adverse impacts to federal- or state-listed terrestrial plants and animals are expected in association with construction at the site, due to the existing developed nature of the site and lack of suitable onsite habitat for listed species. The plant provides warm water to the ICW pursuant to the facility's Manatee Protection Plan, which is a benefit to the area's manatees.

3. Natural Resources of Regional Significance Status

The Port Everglades Next Generation Clean Energy Center is located adjacent to the ICW. The construction and operation of a natural gas-fired CC generating facility at this location is consistent with the existing use at the site and is not expected to have any adverse impacts on the ICW, parks, recreation areas, or environmentally sensitive lands.

4. Other Significant Features

FPL is not aware of any other significant features of the site.

f. Design Features and Mitigation Options

The design is to replace the four former units, with one new unit of approximately 1,200 MW Summer capacity. The new unit will be a single CC unit that consists of three new CTs, three new heat recovery steam generators (HRSG), and a new steam turbine.

In addition, all of the existing GTs at the Port Everglades site are projected to be removed by the end of 2016 as part of the gas turbine replacement project discussed in the Lauderdale and Fort Myers Preferred Site discussions.

g. Local Government Future Land Use Designations

Local government future land use designation for the site is a combination of “Electrical Generating Facility” and “Utilities Use”. A land use map of the site and adjacent areas is also found at the end of this chapter.

h. Site Selection Criteria Process

The Port Everglades site has been selected due to consideration of multiple factors including system load, ability to provide generation in the Miami-Dade/Broward region to help balance load and generation in that region, and economics. Environmental issues were considered, but because the site has been previously utilized for power generation facilities, no environmental impacts will result from this modernization.

i. Water Resources

Water from the Intracoastal Waterway via Port Everglades Slip No. 3 is currently used for once-through cooling water supply. The new plant will only utilize portions of the existing once-through cooling water intake and discharge structures due to reduced water demand. Process and potable water for the modernized plant will come from the existing City of Ft. Lauderdale potable water supply.

j. Geological Features of Site and Adjacent Areas

FPL’s Port Everglades Next Generation Clean Energy Center site is underlain by the Surficial Aquifer System (SAS). The SAS in eastern Broward County is primarily composed of sand, sandstone, shell, silt, calcareous clay (marl), and limestone deposited during the Pleistocene and Pliocene ages. The sediments forming the aquifer system are the Pamlico Sand, Miami Oolite, Anastasia Formation, Key Largo Formation, and Fort Thompson Formation (Pleistocene) and the Tamiami Formation (Pliocene). The sediments in the eastern portion of Broward County where the plant is located are appreciably more permeable than in the west. The SAS is underlain by at least 600 feet of the Hawthorn formation (a confining unit). The Floridan Aquifer System (FAS) underlies the Hawthorn formation.

k. Projected Water Quantities for Various Uses

Approximately 600 million gallons per day (mgd) of cooling water will be cycled through the once-through cooling water system which is a reduction of more than 51% in cooling water when compared to that of the previous steam units. The estimated quantity of process water required is approximately 0.24 mgd for uses such as process water and service water. Potable water demand is expected to average 0.001 mgd.

l. Water Supply Sources by Type

The modernized plant will continue to use the Intracoastal Waterway as the source of once-through cooling water. Process and potable water for the new plant will come from the existing City of Ft. Lauderdale potable water supply.

m. Water Conservation Strategies Under Consideration

No additional water resources will be required as a result of the modernization project. The combined cycle technology will result in 51% less water used compared to the traditional steam generation units. Recovery and reuse of steam generator blowdown by mixing with cooling water flow also recycles water reducing need for fresh water. Therefore, no additional water resources will be required as a result of the modernization project.

n. Water Discharges and Pollution Control

The modernized plant will utilize portions of the existing once-through cooling water system for heat dissipation prior to discharge to the Intracoastal Waterway. The heat recovery steam generator blowdown will be reused to the maximum extent practicable or mixed with the cooling water flow before discharge. Reverse osmosis (R/O) reject will be mixed with the plant’s once-through cooling water system prior to discharge. Stormwater runoff will be collected and routed to stormwater ponds. The facility will employ a Best Management Practices (BMP) plan and Spill Prevention, Control, and Countermeasure (SPCC) plan to prevent and control the inadvertent release of pollutants.

o. Fuel Delivery, Storage, Waste Disposal, and Pollution Control

Natural gas for the new unit would be transported to the site via an existing natural gas pipeline to the site. New gas compressors to raise the gas pressure of the pipeline to the appropriate level for the new unit will be installed either at the existing site or off-site. Ultra-low sulfur light fuel oil, which is used as a backup fuel, would be received by truck, pipeline, or barge and stored in a new above-ground storage tank.

p. Air Emissions and Control Systems

The regulated air emission rates at the new plant would be approximately 90 % lower than the previous Port Everglades Plant's emission rates, resulting in significant annual emissions reductions and air quality benefits per unit of energy produced. The use of natural gas, ultra-low sulfur light fuel oil, and combustion controls would minimize air emissions of sulfur dioxide (SO2), particulate matter, and other fuel-bound contaminates from the unit and ensure compliance with applicable emission standards. Combustion controls similarly minimize the formation of nitrogen oxides (NOx), and the combustor design will limit the formation of carbon monoxide and volatile organic compounds. When firing natural gas, NOx emissions will be controlled using dry-low NOx combustion technology and selective catalytic reduction (SCR). Water injection and SCR will be used to reduce NOx emissions during operations when using ultra-low sulfur light fuel oil as backup fuel. Greenhouse gas emissions (GHGs) from combustion of natural gas at PEEC will achieve an emission rate substantially lower than the EPA proposed new source performance standard for GHGs. The CC design is equivalent to the Best Available Control Technology for air emissions, and minimizes such emissions while balancing economic, environmental, and energy impacts. Taken together, the design of PEEC will incorporate features that will make it among the most efficient and cleanest power plants in the State of Florida.

q. Noise Emissions and Control Systems

Noise from unit construction and operation at the site is expected to be below existing noise levels for residents near the site.

r. Status of Applications

FPL filed a need determination with the FPSC on November 21, 2011. The FPSC's final need order was issued on April 9, 2012. The project's Site Certification Application (SCA) was submitted January 24, 2012 resulting in the issuance, by the Siting Board of the State of Florida, of the Final Order PA 12-57 on October 9, 2012. FPL received a Prevention of Significant Deterioration (PSD) permit on May 1, 2012 and an Industrial Wastewater Facility permit on December 16, 2012. No other permits are required.

Preferred Site #2: Babcock Ranch Solar Energy Center, Charlotte County

The Babcock Ranch Solar Energy Center facility will be sited on approximately 443 acres in Charlotte County. The solar facility will be located approximately 10.5 miles north of the intersection of SR-80 and SR-31 and 0.7 miles east of State Road 31 and north of Tucker's Grade road. The Babcock Ranch Preserve, owned by the State of Florida, borders the facility directly to the north and northwest. The Babcock Ranch Community is located east and south of the facility. The facility is an approximately 74.5 MW (nameplate, AC) photovoltaic (PV) facility.

a. U.S. Geological Survey (USGS) Map

A USGS map of the Charlotte Solar site is found at the end of this chapter.

b. Proposed Facilities Layout

The proposed facilities layout is currently in development and not available at this time.

c. Map of Site and Adjacent Areas

An overview map of the site and adjacent areas is found at the end of this chapter.

d. Existing Land Uses of Site and Adjacent Areas

The Charlotte Solar site and adjacent lands are predominantly used for agricultural production. Currently, the site includes fallow sod fields, improved and unimproved pasture with a portion in a combination of pine flatwoods and freshwater marsh. The existing land use and zoning designations are Babcock Ranch Overlay and Overlay Zoning District. This land use and zoning allows for solar facilities.

e. General Environmental Features On and In the Site Vicinity

1. Natural Environment

The majority of the site is comprised of lands dedicated to agricultural production. FPL will mitigate for unavoidable wildlife and/or wetland impacts that occur from facility construction as required.

2. Listed Species

Although the site is predominately in agricultural production, results of protected species surveys performed in 2006, 2007 and 2009 reveal the project limits and surrounding landscape are utilized and/or have the potential to be utilized by a number of listed species. The project is located within the US Fish and Wildlife Service (USFWS) Panther Focus Area and is also located within the Core Foraging Area of known wood stork colonies.

Any impacts to the habitat of protected species associated with the PV facility are included within the mitigation plan for the Babcock Ranch Community. To compensate for the loss of habitat, mitigation activities will be performed in an area known as the “Curry Preserve” which is located on a portion of the Babcock Ranch Preserve owned by the State of Florida.

3. <u>Natural Resources of Regional Significance Status</u>

The Charlotte Solar site is in the area of the Babcock Preserve and east of the Cecil Webb Wildlife Management Area. Both of these natural areas are managed by the Florida Fish and Wildlife Conservation Commission. However, the construction and operation of a PV facility at this location is not expected to have any adverse impacts on parks, recreation areas, or environmentally sensitive lands.

4. <u>Other Significant Features</u>

FPL is not aware of any other significant features on the site.

f. <u>Design Features and Mitigation Options</u>

The design includes construction of a PV facility, onsite transmission substation, and site stormwater system to accommodate approximately 74.5 MW (nameplate AC) of power generation.

g. <u>Local Government Future Land Use Designations</u>

The existing and future land use on this site consists of agriculture and barren land. A land use map of the site and adjacent areas is also found at the end of this chapter.

h. <u>Site Selection Criteria Process</u>

The Charlotte site has been selected as the location of the PV facility based on various factors including system load, transmission interconnection, and economics.

i. <u>Water Resources</u>

Minimal amounts of water, if any, would be required for cleaning the PV panels. This water would be trucked to the site or obtained from existing onsite permitted water resources.

j. <u>Geological Features of Site and Adjacent Areas</u>

In general, the soil profile of the Surficial Aquifer System (SAS) consists of loose to medium dense fine sands with occasional thin stratum of slightly clayey fine sand. Groundwater can be encounter at the surface to a depth of a few feet below with fluctuations throughout the year due to seasonal variations in rainfall and other factors. As is typical of the rest of south Florida this site is underlain by the Intermediate Confining Unit and the Floridan Aquifer System.

k. Projected Water Quantities for Various Uses

Solar requires minimal amounts of water, if any, for cleaning the PV panels and would only be required in the absence of sufficient rainfall.

l. Water Supply Sources by Type

A water source is not required for this site. Any needed water may be brought to the site by truck or obtained from permitted water sources.

m. Water Conservation Strategies Under Consideration

The PV site does not require a permanent water source. Water conservation strategies may include selection and planting of low-to-no irrigation grass or groundcover.

n. Water Discharges and Pollution Control

The facility will employ Best Management Practices (BMP) to prevent and control the inadvertent release of pollutants.

o. Fuel Delivery, Storage, Waste Disposal, and Pollution Control

Fuel is not required and no waste products will be generated at the site.

p. Air Emissions and Control Systems

This technology does not generate air emissions.

q. Noise Emissions and Control Systems

This technology does not generate noise.

r. Status of Applications

FPL has obtained the required federal USACE 404 permit allowing for impact with mitigation to 9.3 acres of onsite wetlands during construction. The state Environmental Resources Permit (ERP) for the existing on-site facilities will be modified to incorporate revisions to the site layout and stormwater management system. Application will be made to Charlotte County for the local development approval.

Preferred Site #3: Citrus Solar Energy Center, DeSoto County

The Citrus Solar Energy Center site consists of approximately 841 acres and is located at 4051 Northeast Karson Street, approximately 0.3 miles east of U.S. Highway 17 and immediately north of Bobay Road in Arcadia, Florida. The site has been chosen for an approximately 74.5 MW (nameplate, AC) PV facility.

a. U.S. Geological Survey (USGS) Map

A USGS map of the Citrus Solar Energy Center site is found at the end of this chapter.

b. Proposed Facilities Layout

The proposed facilities layout is currently in development and not available at this time.

c. Map of Site and Adjacent Areas

An overview map of the site and adjacent areas is found at the end of this chapter.

d. Existing Land Uses of Site and Adjacent Areas

Existing land use on the site is agricultural. The adjacent areas include agriculture, forested and non-forested uplands.

e. General Environment Features On and In the Site Vicinity

1. Natural Environment

The approximate 841 acre site is comprised of lands dedicated for agricultural production with some wetland areas throughout the property.

2. Listed Species

Burrowing owls and gopher tortoises may be present within the proposed project area. If so, burrows of these species will be relocated to adjacent portions of the FPL property prior to construction under permits from Florida Fish and Wildlife Conservation Commission. Previous wildlife surveys have identified Audubon's Crested caracara foraging within the property, but no nests are located within the project area, and caracara have been rarely seen since the removal of cattle from the project area. Based on this information, no negative impacts to threatened or endangered species are anticipated as a result of the PV project.

3. Natural Resources of Regional Significance Status

There are no natural resources of regional significance at, or adjacent to, the site. The construction and operation of a PV generating facility is not expected to have any adverse impacts on parks, recreation areas, or environmentally sensitive lands.

4. Other Significant Features

FPL is not aware of any other significant features of the site.

f. Design Features and Mitigation Options

The design includes construction of a PV facility, onsite transmission substation, and site stormwater system to accommodate approximately 74.5 MW (nameplate, AC) of PV.

g. Local Government Future Land Use Designations

In 2009, DeSoto County instituted an Ordinance amending the Land Development Regulations by adding Utility Grade Solar Plant as a permitted use within an Agriculture-10 zoning district and an Ordinance amending the Future Land Use Map to change the FPL land from the Rural Agricultural category to the Electrical Generating Facility category. Solar facilities are allowed within this category.

A land use map of the site and adjacent areas is also found at the end of this chapter.

h. Site Selection Criteria Process

The site has been selected as the location of a PV facility based on various factors including system load, transmission interconnection, and economics.

i. Water Resources

Minimal amounts of water, if any, would be required for cleaning the PV panels and would only be required in the absence of sufficient rainfall. This water would be trucked to the site or obtained from existing onsite permitted water resources.

i. Geological Features of Site and Adjacent Areas

The Surficial Aquifer System soil types found on the Site include Anclote mucky fine sand (depressional), Basinger fine sand, Basinger fine sand (depressional), Eau Gallie fine sand, Immokalee fine sand, Myakka fine sand, Smyrna fine sand, and Valkaria fine sand. As is typical of the rest of south Florida this site is underlain by the Intermediate Confining Unit and the Floridan Aquifer System.

k. Projected Water Quantities for Various Uses

Solar requires minimal amounts of water, if any, for cleaning the PV panels in the absence of sufficient rainfall.

l. Water Supply Sources by Type

A water source is not required for this site. Any needed water may be brought to the site by truck or obtained from permitted water sources.

m. Water Conservation Strategies Under Consideration

The PV site does not require a permanent water source. Water conservation strategies will be implemented through the selection and planting of low to no irrigation grass or groundcover.

n. Water Discharges and Pollution Control

The facility will employ Best Management Practices (BMP) to prevent and control the inadvertent release of pollutants.

o. Fuel Delivery, Storage, Waste Disposal, and Pollution Control

Fuel is not required and no waste products will be generated at the site.

p. Air Emissions and Control Systems

Solar technology does not generate air emissions.

q. Noise Emissions and Control Systems

Solar technology does not generate noise.

r. Status of Applications

Application will be made to FDEP for state Environmental Resources Permit (ERP), USACE for federal wetlands permit, and Desoto County for local development approval.

Preferred Site #4: Manatee Solar Energy Center, Manatee County

The Manatee Solar Energy Center site consists of approximately 762 acres and is located in unincorporated north-central Manatee County. The PV site lies approximately 5 miles east of Parrish, Florida, approximately 5 miles east of U.S. Highway 301 and 9.5 miles east of Interstate Highway 75 (I-75). This site has been chosen for the addition of an approximately 74.5 MW (nameplate, AC) PV facility.

a. <u>U.S. Geological Survey (USGS) Map</u>

A USGS map of the Manatee Solar site is found at the end of this chapter.

b. <u>Proposed Facilities Layout</u>

The proposed facilities layout is currently in development and not available at this time.

c. <u>Map of the Site and Adjacent Areas</u>

A map of the site and adjacent areas is found at the end of this chapter.

d. <u>Existing Land Uses of Site and Adjacent Areas</u>

Existing land use on the site is agricultural. A portion of the site is zoned Planned Development / Public Interest (PD-PI), which will allow for electrical generation. The remainder of the site will be zoned from agriculture to PD-PI. The adjacent areas include agricultural, upland non-forested, forests, transportation, communication, and utilities.

e. <u>Environmental Features</u>

1. <u>Natural Environment</u>

FPL will mitigate for unavoidable wildlife and/or wetland impacts as needed as a result of a PV project constructed at this site.

2. <u>Listed Species</u>

The site is predominately agriculture and minimal impacts to federal- or state-listed terrestrial plants or animals are expected in association with construction at the site, due to the existing disturbed nature of the site and lack of suitable onsite habitat for listed species. In accordance with Florida Fish and Wildlife Conservation Commission, the project will be designed to maintain an adequate buffer from the active bald eagle nest located west of the site.

3. <u>Natural Resources of Regional Significance Status</u>

There are no natural resources of regional significance at, or adjacent to, the site. The construction and operation of a PV facility at this location is not expected to have any adverse impacts on parks, recreation areas, or environmentally sensitive lands.

4. <u>Other Significant Features</u>

FPL is not aware of any other significant features of the site.

f. Design Features and Mitigation Options

The design includes construction of a PV facility, onsite transmission substation, and site stormwater system to accommodate approximately 74.5 MW (nameplate, AC) of power generation.

g. Local Government Future Land Use Designations

Existing land use on the site is agricultural. In 2009, Manatee County instituted an ordinance amending the Manatee County Official Zoning Atlas to rezone approximately 620 acres from General Agriculture (A) to Planned Development Public Interest (PD-PI), as well as approve a General Development Plan to allow solar development. The project area has since been expanded north (approx. 383 acres) and new approvals will be sought to change the Official Zoning Atlas to allow solar development within the additional area.

A land use map of the site and adjacent areas is also found at the end of this chapter.

h. Site Selection Criteria Process

The site has been selected as the location of the PV facility based on various factors including system load, transmission interconnection, and economics.

i. Water Resources

Minimal amounts of water, if any, would be required for cleaning the PV panels. This water would be trucked to the site or obtained from existing onsite permitted water resources and would only be required in the absence of sufficient rainfall.

j. Geological Features of the Site and Adjacent Areas

The soil types found on the site include Anclote mucky fine sand (depressional), Basinger fine sand, Basinger fine sand (depressional), Eau Gallie fine sand, Immokalee fine sand, Myakka fine sand, Smyrna fine sand, and Valkaria fine sand.

k. Projected Water Quantities for Various Uses

Solar requires minimal amounts of water, if any, for cleaning the PV panels in the absence of sufficient rainfall.

l. Water Supply Sources by Type

The PV site does not require a permanent water source. Any needed water may be brought to the site by truck or obtained from permitted water sources.

m. Water Conservation Strategies Under Consideration

Water conservation strategies may include the selection and planting of low-to-no irrigation grass or groundcover.

n. Water Discharges and Pollution Control

The facility will employ Best Management Practices (BMP) to prevent and control the inadvertent release of pollutants.

o. Fuel Delivery, Storage, Waste Disposal, and Pollution Control

Fuel is not required and no waste products will be generated by site.

p. Air Emissions and Control Systems

This technology does not generate air emissions.

.

q. Noise Emissions and Control Systems

This technology does not generate noise.

r. Status of Applications

Applications will be submitted to rezone the northern extent of the site, to obtain County site plan approval, to modify an Environmental Resources Permit (ERP) to include the expanded project area, and to modify the USACE 404 permit to include the expanded project area.

Preferred Site # 5: Lauderdale Plant Peaking Facilities, Broward County

This site is located at the existing Lauderdale Plant property and consists of approximately 392 acres, within the Cities of Dania Beach and Hollywood in Broward County, Florida, east of U.S. Highway 441, north of Griffin Road, west of SW 30th Avenue, and south of Interstate 595.

The Lauderdale Plant currently includes two combined cycle units and two banks of 12 first generation simple cycle gas turbines (GTs) that began operation in the early 1970s. These GTs are used to serve peak and emergency demands in a quick-start manner. Each bank of GTs has a net capacity of 420 megawatts (MWs) and are authorized to operate on natural gas and distillate oil. FPL plans to retire 22 of the 24 existing GTs and partially replace this peaking capacity with 5 new combustion turbines (CTs). This GT removal with CT replacement is assumed to occur by the end of 2016.

a. U.S. Geological Survey (USGS) Map

A USGS map of the Lauderdale site and adjacent areas is found at the end of this chapter.

b. Proposed Facilities Layout

A facilities plot plan of the Lauderdale generating facilities is found at the end of this chapter.

c. Map of Site and Adjacent Areas

A USGS map of the Lauderdale site and adjacent areas is found at the end of this chapter.

d. Existing Land Uses of Site and Adjacent Areas

The existing land use at the site is commercial and the adjacent areas are a mixture of low to high density urban, transportation, communication, utilities, commercial, water, and some open land. The site is zoned general industrial by the City of Dania Beach.

e. General Environment Features On and In the Site Vicinity

1. Natural Environment

The majority of the project site is comprised of facilities related to electric power generation. The project site also includes approximately 14 acres of surrounding forested wetlands and upland spoil piles.

2. Listed Species

Based upon field assessments conducted in 2013, review of United States Fish and Wildlife (USFWS) and Florida Fish and Wildlife Conservation Commission (FWC) literature and databases, the Florida Natural Areas Inventory (FNAI) database of documented listed species occurrences, the lack of suitable habitat, and the land use of the surrounding areas, federally listed species are not anticipated to utilize the CT Project area.

3. Natural Resources of Regional Significance Status

There are no natural resources of regional significance adjacent to the site. The construction and operation of the CT Project at this location is consistent with the existing use at the site and is not expected to have any adverse impacts on parks, recreation areas, or environmentally sensitive lands.

4. Other Significant Features

FPL is not aware of any other significant features of the site.

f. Design Features and Mitigation Options

The project is to retire 22 of the 24 gas turbines (GTs) at the existing Lauderdale Plant (plus retire an additional 12 simple cycle GTs at the nearby Port Everglades Plant) and partially replace this capacity with 5 new highly efficient simple cycle CTs. The CTs operate in simple cycle mode and produce electrical energy by direct connection to an electric generator. The CTs will operate using natural gas and ultra-low sulfur distillate (ULSD) oil as fuel.

g. Local Government Future Land Use Designations

The site is zoned General Industrial by the City of Dania Beach, a designation intended to provide for light and medium intensity industrial, research, and assembly fabrication uses. Electrical power plants are permitted within a General Industrial zoning designation as a special exception use only, see Section r.

A land use map of the site and adjacent areas is also found at the end of this chapter.

h. Site Selection Criteria Process

The Lauderdale Plant site has been selected for the location of new CTs based on various factors including maximizing opportunities to utilize existing utility infrastructure, system load, transmission interconnection, and economics.

i. Water Resources

The CT Project will require a marginal increase in demineralized water that will be obtained from the existing Lauderdale Plant's water treatment system.

j. Geological Features of Site and Adjacent Areas

The geological layers beneath the site include the Surficial Aquifer System (SAS), the Intermediate Confining Unit (ICU), and the Floridan Aquifer System (FAS). According to the Natural Resource Conservation Service (NRCS) Soil Survey of Broward County, the SAS in the proposed facilities area is dominated by Okeelanta series muck.

The Okeelanta series consists of very deep, very poorly drained, rapidly permeable soils in large fresh water marshes and small depressional areas. In un-drained areas the water table is at depths of less than ten inches below the surface or the soil is covered by water 6 to 12 months during most years.

k. Projected Water Quantities for Various Uses

The CT Project consists of installing new CTs that are operated in simple cycle mode and do not require a heat dissipation system. Raw water from the Broward County will continue to be used for process water treatment system influent and fire protection. Water used for CT inlet air cooling and water injection for NOx control when using ULSD oil will be demineralized water from the existing process water treatment system.

l. Water Supply Sources by Type

The CTs do not require a heat dissipation system, therefore there are no associated cooling water uses. The proposed facility would continue to acquire water from existing water contracts with Broward County and would continue to use potable water from the City of Hollywood to provide drinking water for employees.

m. Water Conservation Strategies Under Consideration

No additional water resources would be required as a result of the CT Project.

n. Water Discharges and Pollution Control

There would be no surface water discharges required for the operation of the proposed facility. The stormwater management system has been designed to prevent direct discharge to surface waters.

The facility will employ a Best Management Practices (BMP) plan and Spill Prevention, Control, and Countermeasure (SPCC) plan to prevent and control the inadvertent release of pollutants.

o. Fuel Delivery, Storage, Waste Disposal, and Pollution Control

The fuel to be used in the CTs is natural gas and ULSD oil. Natural gas will be transported to the facility via existing pipeline. No onsite storage is provided for natural gas. ULSD oil would be trucked or piped to the facility and stored in double walled ULSD oil tanks.

p. Air Emissions and Control Systems

Air emission rates for NOx associated with the operation of the new CTs would be approximately 90 percent lower than the existing GT emission rates, resulting in significantly lower air quality impacts per hour of operation. In addition to lower air emissions, the maximum total air quality impacts for the site facility are predicted to be well below and in compliance with the National Ambient Air Quality Standards (NAAQS). For pollutants such as NO_2, the new CTs' total air quality impacts are predicted to be significantly reduced by 40 percent or more compared to the existing GTs.

The use of clean fuels (natural gas and ULSD oil) and combustion controls would minimize air emissions of SO_2, sulfuric acid mist (SAM), particulates (PM/PM10/PM2.5), and other fuel-bound contaminants and ensure compliance with applicable emission-limiting standards. Combustion controls will minimize the formation of NOx and the formation of CO and VOCs by combustor design. Further NOx reduction will be achieved by water injection during oil firing.

q. Noise Emissions and Control Systems

The construction and operation of the new CTs will not exceed the maximum permissible sound levels in Section 17-86 of the City of Dania Beach.

r. Status of Applications

A 404 dredge and fill permit has been issued by the U. S. Army Corps of Engineers (USACE) to allow for wetland impacts with mitigation associated with the project and a Prevention of Significant Deterioration (PSD) air permit has been issued by the Florida Department of Environmental Protection (FDEP). A modification of the PSD permit to include GHG emissions has been prepared by FPL for submittal to the FDEP. No other licenses or permits have been issued for the CT Project. FPL will submit applications to Broward County for a special exception use permitted within a General Industrial zoning designation and to the U.S. Environmental Protection Agency (EPA) for the Greenhouse Gas air permit.

Preferred Site # 6: Ft Myers Plant Peaking Facilities, Lee County

Florida Power & Light Company (FPL) plans to retire, replace, and upgrade components of the peaking facilities at the Fort Myers Power Plant. This site consists of approximately 460 acres located in the City of Tice (Fort Myers) in Lee County, Florida. The Plant property is located north of State Road 80 (Palm Beach Boulevard), south of the Caloosahatchee River, east of the Caloosahatchee Shores Community, and west of State Road 31.

The existing Fort Myers Plant consists of one natural gas Combined Cycle (CC) units, two natural gas and oil fired Combustion Turbine (CT) units, and one bank of 12 oil fired Gas Turbines (GTs) (peaking facilities) that have a combined capacity of 2,403 summer megawatts.

Presently, the bank of 12 first generation GTs (which started operation in the early 1970s) provide power during periods of peak demand and black start capability in the event of a power outage. FPL plans to add two new CTs and retire ten of the existing GTs by the end of 2016.The two new CTs will be more efficient with cleaner air emissions than the existing GTs. In addition, the two existing CTs will be upgraded to produce additional generation capacity.

a. U.S. Geological Survey (USGS) Map

A USGS map of the Fort Myers site and adjacent areas is found at the end of this chapter.

b. Proposed Facilities Layout

A general layout of the Fort Myers generating facilities is found at the end of this chapter.

c. Map of Site and Adjacent Areas

A USGS map of the Fort Myers site and adjacent areas is found at the end of this chapter.

d. Existing Land Uses of Site and Adjacent Areas

The existing land-use at the site is transportation, communication, utilities, barren land, and agricultural. Adjacent properties include low density urban, commercial, rangeland, open land, transportation, communication, and utilities. A Land Use / Land Cover Map is also found at the end of this chapter.

e. General Environment Features On and In the Site Vicinity

1. Natural Environment

The majority of the site is comprised of facilities related to electric power generation.

2. Listed Species

Based on the results of a 2013 biological assessment, which included a field evaluation and review of data obtained from the Florida Natural Areas Inventory (FNAI), the U.S. Fish and Wildlife Service (USFWS), and the Florida Fish and Wildlife Conservation Commission (FWC), no threatened or endangered species are expected to be affected by the proposed Project.

3. Natural Resources of Regional Significance Status

The Caloosahatchee and Orange Rivers are adjacent to the site. The construction and operation of the CT Project at this location is consistent with the existing use at the site and is not expected to have any adverse impacts on the Caloosahatchee River, the Orange River, parks, recreation areas, or environmentally sensitive lands.

4. Other Significant Features

FPL is not aware of any other significant features of the site.

f. Design Features and Mitigation Options

FPL will retire 10 of 12 GTs at the existing Fort Myers Plant, and replace them with two new highly efficient simple cycle CTs. In addition, the two existing CTs will be upgraded to produce additional capacity and enhanced performance. The CTs operate in simple cycle mode with associated stacks and produce electrical energy by direct connection to an electric generator. The CTs will operate using natural gas and ultra-low sulfur distillate (ULSD) oil as fuel. Two GTs may be retained for peaking and black start capabilities.

g. Local Government Future Land Use Designations

The site is zoned Industrial Light (IL) by Lee County, a designation intended to provide for areas devoted to various light industrial and quasi-industrial commercial uses. Electrical power plants are permitted within an IL designation. A land use map of the site and adjacent areas is also found at the end of this chapter.

h. Site Selection Criteria Process

The Fort Myers Plant site has been selected for the location of the new and upgraded peaking units based on various factors including maximizing opportunities to utilize existing utility infrastructure, system load, transmission interconnection, and economics.

i. Water Resources

The proposed facility will require a marginal increase in demineralized water that will be supplied by treating potable water obtained from Lee County.

j. Geological Features of Site and Adjacent Areas

According to the Natural Resource Conservation Service Soil (NRCS) Soil Survey of Lee County, Florida (1991), two soil types have been mapped within the proposed Project site: Caloosa fine sand and Urban Land. Notably, the soils within the Project site have been previously excavated to the depth of several meters and refilled, effectively eliminating the natural soil profile.

k. Projected Water Quantities for Various Uses

The project consists of CTs that are operated in simple cycle mode and do not require a heat dissipation system. Water used for CT inlet air cooling and water injection for NOx control when using ULSD oil will be demineralized water. Demineralized water will be obtained by treating potable water provided from Lee County.

l. Water Supply Sources by Type

As stated in the previous section the CTs do not require a heat dissipation system, therefore there are no associated cooling water uses. For all other water supply requirements, the proposed facility would acquire potable water from Lee County.

m. Water Conservation Strategies Under Consideration

No additional water resources would be required as a result of the CTs project.

n. <u>Water Discharges and Pollution Control</u>

There would be no surface water discharges required for the operation of the proposed facility. The stormwater management system has been designed to prevent direct discharge to surface waters.

The facility will employ a Best Management Practices (BMP) plan and Spill Prevention, Control, and Countermeasure (SPCC) plan to prevent and control the inadvertent release of pollutants.

o. <u>Fuel Delivery, Storage, Waste Disposal, and Pollution Control</u>

The fuel to be used in the CTs is natural gas and ULSD oil. Natural gas will be transported to the facility via existing pipeline. No onsite storage is provided for natural gas. ULSD oil would be trucked or barged to the facility and stored in existing ULSD oil tanks.

p. <u>Air Emissions and Control Systems</u>

Air emission rates for NOx with the new and upgraded CTs would be approximately 90 percent lower than the existing GT emission rates, resulting in significantly lower air quality impacts during operating hours. In addition to lower air emissions, the maximum total air quality impacts for the CT Project are predicted to be well below and in compliance with the National Ambient Air Quality Standards (NAAQS). For pollutants such as NO2, the CT Project's total air quality impacts are predicted to be significantly reduced by 40 percent or more compared to the existing GTs.

The use of clean fuels (natural gas and ULSD oil) and combustion controls would minimize air emissions of SO2, sulfuric acid mist (SAM), particulates (PM/PM10/PM2.5), and other fuel-bound contaminants and ensure compliance with applicable emission-limiting standards. Combustion controls will minimize the formation of NOx and the formation of CO and VOCs by combustor design. Further NOx reduction will be achieved by water injection during oil firing.

q. <u>Noise Emissions and Control Systems</u>

Noise from the new and upgraded CTs will not exceed the maximum permissible sound levels in Lee County noise control ordinance No. 93-15. The design of these new and upgraded CTs includes components and an enclosure which mitigate the emission of noise to the surrounding environment. Noise expected to be caused by unit construction at the site is expected to be below current noise levels for the residents nearest the site.

r. Status of Applications

FPL will apply for FDEP ERP for stormwater impacts and a PSD permit for air emissions. A Development Order Approval will be obtained from Lee County.

Preferred Site # 7: Okeechobee Site, Okeechobee County

FPL owns 2,800 acres of land in Northeast Okeechobee County. FPL plans to use approximately 200 acres of this land for development of a combined cycle (CC) unit at this site. A CC unit at this site has been determined to be FPL's best self-build generation option for meeting its capacity needs beginning in 2019. In March 2015, FPL issued a capacity request for proposals (RFP) to solicit proposals from outside parties for meeting this capacity need. FPL's CC unit at the Okeechobee site, and the proposals received in response to the RFP, will be evaluated by FPL and an Independent Evaluator to determine which option(s) is the best selection for FPL's customers.

Natural gas-fired CC generation at the site is possible due to the proximity to existing and planned natural gas pipelines. In addition, FPL currently views the Okeechobee site as one of the most likely sites to be used for future large-scale solar using photovoltaic (PV) generation facilities.

a. U.S. Geological Survey (USGS) Map

A USGS map of the Okeechobee site and adjacent areas is found at the end of this chapter.

b. Proposed Facilities Layout

The proposed facilities layout is currently in development and not available at this time.

c. Map of Site and Adjacent Areas

A USGS map of the Okeechobee site and adjacent areas is found at the end of this chapter.

d. Existing Land Uses of Site and Adjacent Areas

The Okeechobee site is predominantly used for agricultural production (cattle and citrus). Adjacent land uses include agriculture and conservation. The site is in an unincorporated, rural area of the county. FPL's Poinsett-Martin transmission line corridor abuts the property along the northern boundary.

e. General Environment Features On and In the Site Vicinity

1. Natural Environment

The majority of the 2,800 acre site is comprised of lands dedicated to agricultural production (unimproved pasture and fallow citrus). Approximately 400 acres consist of pine flatwoods, mixed forested wetlands, saw palmetto prairie, and freshwater marsh.

2. Listed Species

Minimal impacts to federal- or state-listed terrestrial plants or animals are expected in association with construction at the site, due to the previously disturbed nature of the site and lack of suitable onsite habitat for listed species.

3. Natural Resources of Regional Significance Status

The Okeechobee site abuts the western boundary of the Ft Drum Marsh, a water conservation area managed by the Saint Johns River Water Management District. The construction and operation of a power generating facility at this location is not expected to have any adverse impacts on that area or any other parks, recreation areas, or environmentally sensitive lands.

4. Other Significant Features

FPL is not aware of any other significant features of the site.

f. Design Features and Mitigation Options

Options include construction of CC and/or PV technologies. Mitigation for unavoidable impacts, if required, could occur through a combination of on- and off-site mitigation.

g. Local Government Future Land Use Designations

Local government future land use designation for the site is predominantly unimproved pasture. A land use map of the site and adjacent areas is also found at the end of this chapter.

h. Site Selection Criteria Process

The Okeechobee County site was selected as Preferred based on various factors including system load, transmission interconnection, proximity of the proposed Florida Southeast Connection and other natural gas pipelines, and economics. Expected environmental issues are minimal because the site has been previously disturbed and contains few wetlands that will be impacted by the construction and operation of the planned facilities.

i. Water Resources

Groundwater from the Surficial and Floridan Aquifers is anticipated to supply water to the Northeast Okeechobee County site for the combined cycle unit. Minimal amounts of water, if any, will be required for cleaning the PV panels. This water will be obtained from onsite water resources permitted for the CC unit.

j. <u>Geological Features of Site and Adjacent Areas</u>

The geological features of the Northeast Okeechobee County site are similar to that of most of South Florida. In general, the groundwater system underlying Okeechobee County consists of the SAS, the Intermediate Confining Unit (ICU), and the FAS. In this area, the SAS consists of approximately 100 to 250 feet of undifferentiated deposits of sand, shell, clay and silt. The ICU consists of approximately 200 feet of carbonate rocks interbedded with sandy and silty clay. The multiple layers of the FAS extend thousands of feet below the ICU.

k. <u>Projected Water Quantities for Various Uses</u>

Approximately 9 mgd of cooling water will be used in cooling towers, which reduces water use by 95 to 98% compared to once through cooling, for a CC unit at the Okeechobee site. The estimated quantity of water required for processing at a CC unit is approximately 0.24 million gallons per day (mgd) for uses such as process water and service water. Potable water demand is expected to average 0.001 mgd. Only minimal amounts of water, if any, would be required for cleaning the PV panels, and would only be required in the absence of sufficient rainfall. This water would be obtained from onsite water resources permitted for the CC unit.

l. <u>Water Supply Sources by Type</u>

The potential water supply source is groundwater from the SAS and the FAS. Additional evaluations are necessary to determine the exact source. Process and potable water for the new plant are also not determined and may come from the surficial aquifer.

m. <u>Water Conservation Strategies Under Consideration</u>

Combined cycle technology utilizes less water by design than traditional steam generation units. PV facilities are expected to have no water demands. Specific water conservation strategies will be evaluated and selected during the detailed design phase of any development project.

n. <u>Water Discharges and Pollution Control</u>

The CC plant is anticipated to utilize a closed cycle cooling (towers) system for heat dissipation. The heat recovery steam generator blowdown will be reused to the maximum extent practicable or mixed with the cooling water flow before discharge. Reverse osmosis (R/O) reject will be mixed with the plant’s cooling water flow prior to discharge. A deep injection well system known as an Underground Injection Control system (UIC) is proposed for disposal of non-hazardous industrial wastewater from the power generation process and non-hazardous construction-related water. Stormwater runoff would be collected and routed to stormwater ponds. The facility will employ Best Management Practices (BMP) and Spill

Prevention, Control, and Countermeasure (SPCC) plans to prevent and control the inadvertent release of pollutants.

o. Fuel Delivery, Storage, Waste Disposal, and Pollution Control

Natural gas for a new CC unit will be transported to the site via a new natural gas pipeline lateral. New gas compressors to raise the gas pressure of the pipeline to the appropriate level for the new unit may be necessary. Back-up fuel supplies of ultra-low sulfur light fuel oil will be received by truck or pipeline and stored in an above-ground storage tank to ensure reliability of operations.

p. Air Emissions and Control Systems

The use of natural gas, ultra-low sulfur light fuel oil, and combustion controls will minimize regulated air emissions of sulfur dioxide, particulate matter, and other fuel-bound contaminates from a CC unit and ensure compliance with applicable emission standards. Combustion controls similarly minimize the formation of $NO_{x,}$ and the combustor design will limit the formation of CO and VOCs. When firing natural gas, NO_x emissions will be controlled using dry-low NO_x combustion technology and selective catalytic reduction (SCR). Water injection and SCR will be used to reduce NO_x emissions during operations when using ultra-low sulfur light fuel oil as backup fuel. The CC facility emissions of GHGs from combustion of natural gas achieve an emission rate substantially lower than the EPA's proposed new source performance standards for GHGs. These design alternatives are equivalent to the Best Available Control Technology for air emissions, and minimize such emissions while balancing economic, environmental, and energy impacts. Taken together, the design of a CC unit would incorporate features that would make it among the most efficient and cleanest power plants in the State of Florida. PV generation does not produce air emissions.

q. Noise Emissions and Control Systems

Noise from unit construction is expected to be minimal. Noise from unit operation will not exceed Okeechobee County maximum permissible sound levels in an agricultural area.

r. Status of Applications

FPL has filed an UIC Exploratory Well and associated Dual Zone Monitoring Well for the Northeast Okeechobee County site. The application has been deemed complete and the Public Notice for the Draft Permit was published in early February 2015. A permit for the construction of the Exploratory Well and Dual Zone Monitoring Well is expected in Summer 2015. FPL will submit applications to the State of Florida for Site Certification as well as other permits needed to support the construction and operation of the project. The applications will be prepared as the planning and development of the project proceeds.

Preferred Site # 8: Turkey Point Plant, Miami-Dade County

The Turkey Point Plant (Turkey Point) is located on the west side of Biscayne Bay, 25 miles south of Miami. Turkey Point is directly on the shoreline of Biscayne Bay and is geographically located approximately 9 miles east of Florida City on Palm Drive. The land surrounding Turkey Point is owned by FPL and acts as a buffer zone. Turkey Point is comprised of two natural gas/oil conventional steam units (Units 1 & 2), two nuclear units (Units 3 & 4), one combined cycle natural gas unit (Unit 5), nine small diesel generators, and the cooling canals. A capacity uprate project for the two nuclear units was successfully completed in 2013. The Everglades Mitigation Bank (EMB), an approximately 13,000 acres, FPL-maintained natural wildlife and wetlands area that has been set aside, is located to the south and west of the site.

On May 14, 2014, the Florida Power Plant Siting Board authorized the site certification, with conditions, of Turkey Point 6 & 7. Each of these two units would provide 1,100 MW of nuclear generating capacity. Due to a delay in the Nuclear Regulatory Commission's (NRC) schedule to reach a decision in the Combined Operating License Application (COLA) submittal by FPL until late 2016, and to changes in Florida's nuclear cost recovery rule, the projected earliest practical in-service dates for the two new units are June 2027 (for Turkey Point Unit 6) and June 2028 (for Turkey Point Unit 7). These in-service dates are outside of the current ten-year time period (2015 through 2024) addressed in this Site Plan. However, because these two new nuclear units remain in FPL's resource plans, the Turkey Point site is again presented as a Preferred Site in this year's Site Plan.

In addition to the two new generating units, supporting buildings, facilities, and equipment will be located on the Turkey Point Units 6 & 7 site, along with a construction laydown area. Proposed associated facilities include: a nuclear administration building, a training building, a parking area, an FPL reclaimed water treatment facility and reclaimed water pipelines, radial collector wells and delivery pipelines, an equipment barge unloading area, transmission lines (and transmission system improvements elsewhere within Miami-Dade County), access roads and bridges, and potable water pipelines.

a. U.S. Geological Survey (USGS) Map

USGS maps of the Turkey Point area, with the proposed location of Turkey Point Units 6 & 7 identified, are found at the end of this chapter.

b. Proposed Facilities Layout

Maps of the general layout of Turkey Point Units 6 &7 are found at the end of this chapter.

c. Map of Site and Adjacent Areas

Land Use / Land Cover overview maps of the Turkey Point Units 6 & 7 site and adjacent areas are also found at the end of this chapter.

d. Existing Land Uses of Site and Adjacent Areas

Turkey Point Plant is currently home to five generating units and support facilities that occupy approximately 150 acres of the approximately 9,400-acre Turkey Point property. Prominent features beyond the power block area include the intake system, cooling canal system, switchyard, spent fuel storage facilities, and technical and administrative support facilities The cooling canal system occupies approximately 5,900 acres.

Two 400-megawatt (MW) (nominal) fossil fuel-fired steam electric generation units at Turkey Point have been in service since 1967 (Unit 1) and 1968 (Unit 2). These units have historically burned residual fuel oil and/or natural gas with a maximum equivalent sulfur content of one percent. Unit 2 is currently serving, not as a power generating unit, but as a synchronous condenser to provide voltage support to the southeastern end of FPL's transmission system. The two original 700-MW (nominal) nuclear units have been in service since 1972 (Unit 3) and 1973 (Unit 4) and were uprated to a combined total of approximately 1,632 (Summer) MW in 2013. Turkey Point Units 3 and 4 are pressurized water reactor (PWR) units. Turkey Point Unit 5 is a net 1,148 (Summer) MW natural gas-fired combined cycle unit that began operation in 2007. The site for the new Units 6 & 7 is south of existing Units 3 and 4 and occupies approximately 300 acres within the existing cooling canal system.

Properties adjacent to Turkey Point property are almost exclusively undeveloped land. The FPL-owned EMB is adjacent to most of the western and southern boundaries of Turkey Point property. The South Florida Water Management District (SFWMD) Canal L-31E is also situated to the west of Turkey Point property. The eastern portions of Turkey Point property are adjacent to Biscayne Bay, the Biscayne National Park (BNP), and Biscayne Bay Aquatic Preserve. The southeastern portion of Turkey Point property is bounded by state-owned land located on Card Sound. The Homestead Bayfront Park, owned and operated by Miami-Dade County, is situated to the north of the Turkey Point property.

e. General Environment Features On and In the Site Vicinity

1. Natural Environment

Turkey Point is located directly on the northwest, west, and southwest shoreline of Biscayne Bay and the Biscayne National Park, 25 miles south of Miami. Biscayne National Park was first established in 1968 as a National Monument and was expanded in 1980 to approximately 173,000 acres of water, coastal lands, and 42 keys. A portion of Biscayne Bay Aquatic Preserve, a state-owned preserve, is adjacent to the eastern boundary of the Turkey Point plant property. The Biscayne Bay Aquatic Preserve is a shallow, subtropical lagoon consisting of approximately 69,000 acres of submerged State land that has been designated as an Outstanding Florida Water.

The approximately 300-acre Turkey Point Units 6 & 7 site consists of the plant area and adjacent areas designated for laydown and ancillary facilities. The site includes hypersaline mud flats, man-made active cooling canals, man-made remnant canals, previously filled areas/roadways, mangrove heads associated with historical tidal channels, dwarf mangroves, open water /discharge canal associated with the cooling canals on the western portion of the site, wet spoil berms associated with remnant canals, and upland spoil areas.

2. Listed Species

Threatened, endangered, and/or animal species of special concern known to occur at the site, transmission line corridors, or in the nearby Biscayne National Park, include the peregrine falcon *(Falco peregrinus)*, wood stork *(Mycteria americana)*, American crocodile *(Crocodylus acutus)*, roseate spoonbill (*Ajaja ajaja)*, little blue heron *(Egretta caerulea),* snowy egret *(Egretta thula),* American oystercatcher *(Haematopus palliates),* least tern *(Sterna antillarum)*, the white ibis *(Eudocimus albus)*, Florida manatee (Trichechus manatus latirostris), eastern indigo snake (Drymarchon couperi), snail kite (Rostrhamus sociabilis plumbeus), white-crowned pigeon (Patagioenas leucocephala), and bald eagle *(Haliaeetus leucocephalus)*. No bald eagle nests are known to exist in the vicinity of the site. The federally listed, threatened American crocodile thrives at Turkey Point, primarily in and around the southern end of the cooling canals which lie south of the Turkey Point Unit 6 & 7 area. The majority of Turkey Point is considered American crocodile habitat due to the mobility of the species and use of the site for foraging, traversing, and basking. FPL manages a program for the conservation and enhancement of the American Crocodile and the program is credited with survival improvement and contributing to the downlisting of the American Crocodile from endangered to threatened.

Some listed flora species likely to occur at the site or vicinity include pinepink (Bletia purpurea), Florida brickell-bush (Brickellia mosieri), Florida lantana (Lantana depressa var. depressa), mullien nightshade (Solanum donianum), and lamarck's trema (Trema lamarckianum).

The construction and operation after construction, of Turkey Point Unit 6 & 7 project is not expected to adversely affect any rare, endangered, or threatened species.

3. Natural Resources of Regional Significance Status

Significant features within the vicinity of the site include Biscayne National Park, the Biscayne Bay Aquatic Preserve, Miami-Dade County Homestead Bayfront Park, and Everglades National Park. The portion of Biscayne Bay adjacent to the site is included within the Biscayne National Park. Biscayne National Park contains 180,000 acres, approximately 95 percent of which is open water interspersed with more than 40 keys. The Biscayne National Park headquarters is located approximately two miles north of Turkey Point and is adjacent to the Miami-Dade County Homestead Bayfront Park, which contains a marina and day-use recreational facilities.

4. Other Significant Features

FPL is not aware of any other significant features of the site.

f. Design Features and Mitigation Options

For Turkey Point Units 6 & 7, the technology proposed is the Westinghouse AP1000 pressurized water reactor (PWR). This design is certified by the Nuclear Regulatory Commission (NRC) under 10 CFR 52 and incorporates the latest technology and more advanced safety features than today's nuclear plants that have already achieved record safety levels. The Westinghouse AP1000 unit consists of the reactor, steam generators, pressurizer, and steam turbine/electric generator. Condenser cooling for the Units 6 & 7 steam turbines will be accomplished using six circulating water cooling towers. The makeup water reservoir is the reinforced concrete structure beneath the circulating water system cooling towers that will contain reserve reclaimed water capacity to be used for the circulating water system. The structures for the Westinghouse AP1000 are the nuclear island (containment building, shield building, and auxiliary building), turbine building, annex building, diesel generator building, and radwaste building. The plant area will also contain the Clear Sky substation (switchyard) that will connect Units 6 & 7 to FPL's transmission system. Mitigation plans for Turkey Point Units 6 & 7 include restoration areas as well as credits purchased from the Everglades Mitigation Bank.

g. Local Government future Land Use Designations

The Turkey Point Plant site is designated by the Miami-Dade County Comprehensive Development Management Plan as an IU-3 (Industrial, Utilities, and Communications) Unlimited Manufacturing District that carries a dual designation of MPA (Mangrove Protection

Area) in portions of the property. There are also areas designated GU – "Interim District." Designations for the surrounding area are primarily GU – "Interim District."

h. <u>Site Selection Criteria Process</u>

For Turkey Point Units 6 & 7, FPL conducted an extensive site selection analysis leading to the selection of the Turkey Point site as the site that, on balance, provided the most favorable location for developing new nuclear generation to serve FPL's customers. The Site Selection Study employed the principles of the Electric Power Research Institute (EPRI) siting guidelines and is modeled upon applicable NRC site suitability and National Environmental Policy Act (NEPA) criteria regarding the consideration of alternative sites. The study convened a group of industry and FPL subject matter experts to develop and assign weighting factors to a broad range of site selection criteria. Twenty-three candidate sites were then ranked using the siting criteria. This review allowed the list of candidates to be reduced until the best site emerged. Key factors contributing to the selection of the Turkey Point site include the existing transmission and transportation infrastructure to support new generation, the large size and seclusion of the site while being relatively close to the load center, and the long-standing record of safe and secure operation of nuclear generation at the site since the early 1970s.

i. <u>Water Resources</u>

In regard to Turkey Point Units 6 & 7, the primary source of cooling water makeup will be reclaimed water from the Miami-Dade County Water and Sewer Department (MDWASD), with potable water also from MDWASD. When reclaimed water is not available in sufficient quantity and quality of water needed for cooling, makeup water will be saltwater supplied by radial collector wells that are recharged from the marine environment of Biscayne Bay. Horizontal collector wells (radial collector wells) have become widely used for the purpose of inducing infiltration from surface water bodies into hydraulically-connected aquifer systems in order to develop moderate to high capacity water supplies. Turkey Point Units 6 & 7 wastewater will be discharged via on-site deep injection wells.

j. <u>Geological Features of Site and Adjacent Areas</u>

Turkey Point lies upon the Floridian Plateau, a partly-submerged peninsula of the continental shelf. The peninsula is underlain by approximately 4,000 to 15,000 feet of sedimentary rocks consisting of limestone and associated formations that range in age from Paleozoic to Recent. Little is known about the basement complex of Paleozoic igneous and metamorphic rocks due to their great depth.

Generally in Miami-Dade County, the surficial aquifer (Biscayne Aquifer) consists of a wedge-shaped system of porous clastic and carbonate sedimentary materials, primarily limestone and sand deposits of the Miocene to late Quaternary age. The Biscayne Aquifer is thickest along the eastern coast and varies in thickness from 80 to 200 feet thick. The surficial aquifer is typically composed of Pamlico Sand, Miami Limestone (Oolite), the Fort Thompson and Anastasia Formations (lateral equivalents), Caloosahatchee Marl, and the Tamiami formation. The lower confining layers below the surficial aquifer range in thickness from 350 to 600 feet and are composed of the Hawthorn Group. Beneath the Hawthorn Group, the Floridan Aquifer System ranges from 2,800 to 3,400 feet thick and consists of Suwannee Limestone, Avon Park Limestone, and the Oldsmar Formations.

k. Projected Water Quantities for Various Uses

The estimated quantity of water required for the new Turkey Point Units 6 & 7 for industrial processing is approximately 936 gallons per minute (gpm) for uses such as process water and service water. Approximately 55.3 million gallons per day (mgd) of cooling water would be cycled through the cooling towers. Water quantities needed for other uses such as potable water are estimated to be approximately 50,400 gallons per day (gpd) for Units 6 & 7.

l. Water Supply Sources and Type

The water for the various water needs of Turkey Point 6 & 7 will be obtained from a reclaimed water supply supplied by the Miami-Dade Water and Sewer Department, a saltwater supply, and a potable water supply from the Miami-Dade Water and Sewer Department. Reclaimed water will be used as makeup water to the cooling water system with saltwater from radial collector wells as a back-up water source to be used when reclaimed water is not available in sufficient quantity or quality.

Potable water will be used as makeup water for the service water system. The potable water supply will also provide water to the fire protection system, demineralized water treatment system, and other miscellaneous uses.

m. Water Conservation Strategies

Use of reclaimed water from MDWASD Turkey Point Units 6 & 7 helps Miami-Dade County meet approximately half of its wastewater reuse goals and will provide environmental benefits by reducing the volume of wastewater discharged by the County. In the absence of reuse opportunities, this treated domestic wastewater would likely continue to be discharged to the ocean or into deep injection wells.

Miami-Dade County is required to eliminate ocean outfalls and increase the amount of water that is reclaimed for environmental benefit and other beneficial uses. Turkey Point Units 6 & 7 will use reclaimed water 24 hours per day, 365 days per year when operating and when the reclaimed water is available in sufficient quantity and quality.

n. Water Discharges and Pollution Control

Turkey Point Units 6 & 7 will dissipate heat from the power generation process using cooling towers. Blowdown water or discharge from the cooling towers, along with other wastestreams, will be injected into the boulder zone of the Floridan Aquifer. Non-point source discharges are not an issue since there will be none at this facility. Stormwater runoff will be released to the closed-loop cooling canal system.

Turkey Point Units 6 & 7 will employ Best Management Practices (BMP) plans and Spill Prevention, Control, and Countermeasure (SPCC) plans to prevent and control the inadvertent release of pollutants.

o. Fuel Delivery, Storage, Waste Disposal, and Pollution Control

The Turkey Point Units 6 & 7, reactors will contain enriched uranium fuel assemblies.

New fuel assemblies will be transported to Turkey Point for use in Units 6 & 7 by truck from a fuel fabrication facility in accordance with U.S. Department of Transportation (DOT) and NRC regulations. Spent fuel assemblies being discharged will remain in the permitted spent fuel pool while short half-life isotopes decay.

After a sufficient decay period, the fuel would be transferred to a permitted on-site independent spent fuel storage installation facility or a permitted off-site disposal facility. Packaging of the fuel for off-site shipment will comply with the applicable DOT and NRC regulations for transportation of radioactive material.

The U.S. Department of Energy (DOE) is responsible for spent fuel transportation from reactor sites to a repository under the Nuclear Waste Policy Act of 1982, as amended. FPL has executed a standard spent nuclear fuel disposal contract with DOE for fuel used in Units 6 & 7.

p. Air Emissions and Control Systems

Regarding Turkey Point Units 6 & 7, the units will minimize FPL system air pollutant emissions by using nuclear fuel to generate electric power. This includes avoiding emissions of particulate matter (PM), sulfur dioxide (SO_2), nitrogen oxides (NO_x), carbon monoxide (CO), carbon dioxide (CO_2), and volatile organic compounds (VOC). The circulating water cooling towers will be equipped with high-efficiency drift or mist eliminators to minimize emissions of

PM to 0.0005 percent of the circulating water; which represents 99.99-percent control of potential drift emissions based on the circulating water flow.

The diesel engines necessary to support Turkey Point Units 6 & 7 and fire pump engines will be purchased from manufacturers whose engines meet the EPA's New Source Performance Standards (NSPS) Subpart IIII emission limits.

q. <u>Noise Emissions and Control Systems</u>

Field surveys and impact assessments of noise expected to be caused by activities associated with the Turkey Point Units 6 & 7 project were conducted. Predicted noise levels associated with these projects are not expected to result in adverse noise impacts in the vicinity of the site.

r. <u>Status of Applications</u>

The Turkey Point Units 6 & 7 Need Determination for this additional nuclear capacity was issued by the Florida Public Service Commission in April 2008. The Site Certification Application (SCA), under the Florida Electrical Power Plant Siting Act, was filed in June 2009 and on May 14, 2014, the Florida Power Plant Siting Board authorized the site certification, with conditions. In its final order, the Florida Power Plant Siting Board identified the West Consensus Corridor as the primary western corridor (comprising an alternate corridor proposed by the Miami-Dade Limestone Products Association and a portion of FPL's West Preferred Corridor) and FPL's West Preferred Corridor as a back-up western transmission line corridor. The use of the back-up western transmission line corridor will be necessary in the event the pending land exchange with the National Park Service and other agencies is not consummated on a timely basis.

A Combined Operating License Application for Units 6 & 7 was submitted to the NRC in June 2009. There are two components to that application; one is the Environmental Assessment (EA) and the other is the Safety component. In 2014 the US Nuclear Regulatory Commission informed FPL that their decision on the COLA was going to be delayed several years until late 2016. As a result of this delay, and changes in Florida's nuclear cost recovery rules, the earliest practical in-service dates of Turkey Point Units 6 & 7 (June 2017 and June 2028, respectively) have moved beyond the 10-year reporting window (2015 through 2024) of this Site Plan.

Besides the certification and the license, additional approvals have been issued for Turkey Point Units 6 & 7 including Miami-Dade County Unusual Use approvals that were issued in 2007 and 2013 and a Land Use Consistency Determination that was issued in 2013. The

Prevention of Significant Deterioration (Air permit) was issued in 2009. In addition, a permit to construct an exploratory well and a dual zone monitoring well, under the Underground Injection Control Program, was issued in 2010, and a permit to convert the exploratory well, to an injection well and to operationally test the system, was issued in 2013. Permits from the Federal Aviation Administration (FAA) for the containment structure were originally issued in 2009 and renewed in 2012.

IV.F.2 Potential Sites for Generating Options

Three (3) sites are currently identified as Potential Sites for future generation additions to meet FPL's projected capacity and energy needs.[5] These sites have been identified as Potential Sites due to considerations of location to FPL load centers, space, infrastructure, and/or accessibility to fuel and transmission facilities. These sites are suitable for different capacity levels and technologies, including both renewable energy and non-renewable energy technologies for various sites.

Each of these Potential Sites offer a range of considerations relative to engineering and/or costs associated with the construction and operation of feasible technologies. In addition, each Potential Site has different characteristics that will require further definition and attention.

Permits are presently considered to be obtainable for each of these sites. No significant environmental constraints are currently known for any of these sites. The Potential Sites briefly discussed below are presented in alphabetical order. At this time, FPL considers each site to be equally viable.

Potential Site #1: Hendry County

FPL has acquired an approximately 3,120-acre site in southeast Hendry County, off CR 833. The Hendry County site has been listed as a Preferred or Potential Site in previous FPL Site Plans as a possibility for a future PV facility and/or natural gas-fired CC generation. FPL currently views the Hendry site as one of the most likely sites to be used for future large-scale generation. A map of the property owned FPL and an overview map of the site and adjacent areas is found at the end of this chapter.

a. Geological Survey (USGS) Map

A USGS map of the site is found at the end of this chapter.

[5] As has been described in previous FPL Site Plans, FPL also considers a number of other sites as possible sites for future generation additions. These include the remainder of FPL's existing generation sites and other Greenfield sites. Greenfield sites that FPL currently does not own, or for which FPL has not currently secured the necessary rights to, are not specifically identified as Potential Sites in order to protect the economic interests of FPL and its customers.

b. Existing Land Uses of Site and Adjacent Areas

The existing and future land uses on the site are Agricultural and Upland Forest. The existing land uses adjacent to the site are predominately agricultural. The property to the south is the Seminole Big Cypress Reservation.

c. Environmental Features

The natural environment adjacent to the north, east, and west of the site are used predominately for agricultural activities such as improved, unimproved, and woodland pasture. The majority of the pasture lands include upland scrub, pine, and hardwoods.

FPL strives to have no adverse impacts on federal- or state-listed terrestrial plants and animals. Much of southwest Florida, including this area is considered habitat for the endangered Florida Panther. Although few or no impacts are expected in association with future construction at the site, FPL anticipates minimizing or mitigating for unavoidable wildlife or wetland impacts.

Future construction and operation of a solar and/or a natural gas-fired CC generating facility at this location is not expected to have any adverse impacts on parks, recreation areas, or environmentally sensitive lands.

d. Water Quantities Required

The estimated quantity of water required for processing at a CC unit is approximately 0.24 million gallons per day (mgd) for uses such as process water and service water. Potable water demand is expected to average 0.001 mgd. Approximately 7.5 mgd of cooling water would be used in cooling towers for one CC unit. Minimal amounts of water would be required for a PV facility.

e. Supply Sources

A Potential water supply source is groundwater, but additional evaluations are necessary to determine the exact source. Process and potable water for the new plant will come from the existing potable water supply. Specific water conservation strategies will be evaluated and selected during the detailed design phase of any development project.

Potential Site # 2: Martin County

FPL is currently evaluating potential sites in Martin County for a future PV facility. No specific locations have been selected at this time.

a. U.S. Geological Survey (USGS) Map

A USGS map of the county has been included at the end of this chapter.

b. Land Uses

This information is not available because a specific site has not been selected at this time.

c. Environmental Features

This information is not available because a specific site has not been selected at this time.

d. Water Quantities Required

Minimal amounts of water would be required for a PV facility.

e. Supply Sources

Minimal water would be required for a PV facility. A small amount, trucked in, may be needed to occasionally clean the PV panels in the absence of sufficient rainfall.

Potential Site # 3: Putnam Plant Site, Putnam County

FPL is currently evaluating the existing Putnam Plant site for future natural gas-fired generation. This 66 acre site is located on the east side of Highway 100 opposite the former FPL Palatka Plant in East Palatka. The Putnam site has been listed as a Potential Site in previous FPL Site Plans as a possibility for future natural gas-fired CC generation. FPL currently views the Putnam site as one of the most likely sites to be used for future large-scale generation.

a. U.S. Geological Survey (USGS) Map

A USGS map of the Putnam site is found at the end of this chapter.

b. Existing Land Uses of Site and Adjacent Areas

The Putnam site is designated as Industrial land use. Adjacent land uses include power generation and associated facilities (the former Palatka Plant) as well as Mixed Wetland Hardwoods, Residential, and Mixed Hardwood-Coniferous.

c. Environmental Features

The majority of the site is developed and has facilities necessary for power plant operations. No significant environmental features have been identified at this time. It is anticipated that there will be minimal impacts (if any) to federal- or state-listed terrestrial plants and animals in association with construction at the site, due to the existing developed nature of the site and lack of suitable onsite habitat for listed species. The construction and operation of a power generating facility at this location is not expected to have any adverse impacts on natural resources of regional significance and FPL is not aware of any other significant features of the site.

d. Water Quantities Required

The St John's River and/or regional water supply initiatives are potential water sources. Potable water demand is expected to average .001 million gallons per day (mgd). The estimated quantity of water required at a CC unit is approximately 0.24 mgd for uses such as process water and service water. Approximately 7.5 mgd of cooling water would be used in cooling towers for a CC unit.

e. Supply Sources

A potential water supply source is the St. John's River, but additional evaluation is necessary to determine the exact source. Process and potable water for the new plant will come from the existing potable water supply. CC and cooling tower technologies utilize less water by design than traditional steam generation units. Specific water conservation strategies will be evaluated and selected during the detailed design phase of the project development.

(This page is left intentionally blank.)

CHAPTER V

Other Planning Assumptions & Information

(This page is left intentionally blank.)

Introduction

The Florida Public Service Commission (FPSC), in Docket No. 960111-EU, specified certain information that was to be included in an electric utility's Ten Year Power Plant Site Plan filing. Among this specified information was a group of 12 items listed under a heading entitled "Other Planning Assumptions and Information." These 12 items concern specific aspects of a utility's resource planning work. The FPSC requested a discussion or a description of each of these items.

These 12 items are addressed individually below as separate "Discussion Items".

Discussion Item # 1: Describe how any transmission constraints were modeled and explain the impacts on the plan. Discuss any plans for alleviating any transmission constraints.

FPL's resource planning work considers two types of transmission limitations/constraints: external limitations and internal limitations. External limitations deal with FPL's ties to its neighboring systems. Internal limitations deal with the flow of electricity within the FPL system.

The external limitations are important because they affect the development of assumptions for the amount of external assistance that is available to the FPL system as well as the amount and price of economy energy purchases. Therefore, these external limitations are incorporated both in the reliability analysis and economic analysis aspects of resource planning. The amount of external assistance that is assumed to be available is based on the projected transfer capability to FPL from outside its system as well as historical levels of available assistance. In the loss of load probability (LOLP) portion of its reliability analyses, FPL models this amount of external assistance as an additional generator within FPL's system that provides capacity in all but the peak load months. The assumed amount and price of economy energy are based on historical values and projections from production costing models.

Internal transmission limitations are addressed by identifying potential geographic locations for potential new generating units that minimize adverse impacts to the flow of electricity within FPL's system. The internal transmission limitations are also addressed by developing the direct costs for siting potential new units at different locations, evaluating the cost impacts created by the new unit/unit location combination on the operation of existing units in the FPL system, and/or evaluating the costs of transmission additions that may be needed to address regional concerns regarding an imbalance between load and generation in a given region. Both of these site- and system-related transmission costs are developed for each different unit/unit location option or groups of options. When analyzing DSM portfolios, such as in a DSM Goals docket, FPL also examines the potential for utility DSM energy efficiency programs to avoid/defer regional transmission expenditures that would otherwise be needed to import power into that region by lowering electrical load in Southeastern Florida. In addition, transfer limits for capacity and energy that can be

imported into the Southeastern Florida region (Miami-Dade and Broward Counties) of FPL's system are also developed for use in FPL's production costing analyses. (A further discussion of the Southeastern Florida region of FPL's system, and the need to maintain a regional balance between generation and transmission contributions to meet regional load, is found in Chapter III.)

FPL's annual transmission planning work determines transmission additions needed to address limitations and to maintain/enhance system reliability. FPL's planned transmission facilities to interconnect and integrate generating units in FPL's resource plans, including those transmission facilities that must be certified under the Transmission Line Siting Act, are presented in Chapter III.

Discussion Item # 2: Discuss the extent to which the overall economics of the plan were analyzed. Discuss how the plan is determined to be cost-effective. Discuss any changes in the generation expansion plan as a result of sensitivity tests to the base case load forecast.

FPL typically performs economic analyses of competing resource plans using as an economic criterion FPL's levelized system average electric rates (i.e., a Rate Impact Measure or RIM approach). In addition, for analyses in which DSM levels are not changed, FPL uses the equivalent criterion of the cumulative present value of revenue requirements its system [6].

The load forecast that is presented in FPL's 2015 Site Plan was developed in November 2014. The only load forecast sensitivities analyzed during 2014/early 2015 were high load forecast sensitivities developed to analyze the quality of FPL's future reserves.

Discussion Item # 3: Explain and discuss the assumptions used to derive the base case fuel forecast. Explain the extent to which the utility tested the sensitivity of the base case plan to high and low fuel price scenarios. If high and low fuel price sensitivities were performed, explain the changes made to the base case fuel price forecast to generate the sensitivities. If high and low fuel price scenarios were performed as part of the planning process, discuss the resulting changes, if any, in the generation expansion plan under the high and low fuel price scenario. If high and low fuel price sensitivities were not evaluated, describe how the base case plan is tested for sensitivity to varying fuel prices.

[6] FPL's basic approach in its resource planning work is to base decisions on a lowest electric rate basis. However, when DSM levels are considered a "given" in the analysis (i.e., when only new generating options are considered), the lowest electric rate basis approach and the lowest system cumulative present value of revenue requirements basis approach yield identical results in terms of which resource options are more economic. In such cases FPL evaluates resource options on the simpler-to-calculate (but equivalent) lowest cumulative present value system revenue requirements basis.

The basic assumptions FPL used in deriving its fuel price forecasts are discussed in Chapter III of this document. FPL used three fuel cost, and three environmental compliance cost, forecasts in analyses supporting its 2014 nuclear cost recovery filing. Also, in response to a request from the FPSC Staff, FPL used three fuel cost forecasts in sensitivity case analyses for the 2014 DSM Goals docket.

A Medium fuel cost forecast is developed first. Then the Medium fuel cost forecast is adjusted, upwards (for the High fuel cost forecast) or downwards (for the Low fuel cost forecast), by multiplying the annual cost values from the Medium fuel cost forecast by a factor of (1 + the historical volatility in the 12-month forward price, one year ahead) for the High fuel cost forecast, or by a factor of (1 – the historical volatility of the 12-month forward price, one year ahead) for the Low fuel cost forecast.

The resource plan presented in this Site Plan is based, in part, on those prior analyses. For that reason, this resource plan has not been further tested for different fuel cost forecasts.

Discussion Item # 4: Describe how the sensitivity of the plan was tested with respect to holding the differential between oil/gas and coal constant over the planning horizon.

As described above in the answer to Discussion Item # 3, FPL used up to three fuel cost forecasts in its 2014/early 2015 resource planning analyses. While these forecasts did not represent a constant cost differential between oil/gas and coal, a variety of fuel cost differentials were represented in these forecasts.

Discussion Item # 5: Describe how generating unit performance was modeled in the planning process.

The performance of existing generating units on FPL's system was modeled using current projections for scheduled outages, unplanned outages, capacity output ratings, and heat rate information. Schedule 1 in Chapter I and Schedule 8 in Chapter III present the current and projected capacity output ratings of FPL's existing units. The values used for outages and heat rates are generally consistent with the values FPL has used in planning studies in recent years.

In regard to new unit performance, FPL utilized current projections for the capital costs, fixed and variable operating & maintenance costs, capital replacement costs, construction schedules, heat rates, and capacity ratings for all construction options in its resource planning work. A summary of this information for the new capacity options that FPL currently projects to add over the reporting horizon for this document is presented on the Schedule 9 forms in Chapter III.

Discussion Item # 6: Describe and discuss the financial assumptions used in the planning process. Discuss how the sensitivity of the plan was tested with respect to varying financial assumptions.

During 2014, FPL used the following financial assumptions: i) an incremental capital structure of 40.38% debt and 59.62% equity; (ii) a 5.14% cost of debt; (iii) a 10.5% return on equity; and (iv) an after-tax discount rate of 7.54%. In February 2015, the cost of debt changed to 5.05% and the after-tax discount rate changed to 7.51%. No sensitivities of these financial assumptions were used in FPL's 2014/early 2015 resource planning work.

Discussion Item # 7: Describe in detail the electric utility's Integrated Resource Planning process. Discuss whether the optimization was based on revenue requirements, rates, or total resource cost.

FPL's integrated resource planning (IRP) process is described in detail in Chapter III of this document.

The standard basis for comparing the economics of competing resource plans in FPL's basic IRP process is the impact of the plans on FPL's electricity rate levels with the objective generally being to minimize FPL's projected levelized system average electric rate (i.e., a Rate Impact Measure or RIM approach). As discussed in response to Discussion Item # 2, both the electricity rate perspective and the cumulative present value of system revenue requirement perspective yield identical results in terms of which resource options are more economical when DSM levels are unchanged between competing resource plans. Therefore, in planning work in which DSM levels were unchanged, the equivalent, but simpler-to-calculate, cumulative present value of revenue requirements perspective was utilized.

Discussion Item # 8: Define and discuss the electric utility's generation and transmission reliability criteria.

FPL uses three system reliability criteria in its resource planning work that addresses generation, purchase, and DSM options. One criterion is a minimum 20% Summer and Winter reserve margin. Another reliability criterion is a maximum of 0.1 days per year loss-of-load-probability (LOLP). The third criterion is a minimum 10% generation-only reserve margin (GRM) criterion. These three reliability criteria are discussed in Chapter III of this document.

In regard to transmission reliability analysis work, FPL has adopted transmission planning criteria that are consistent with the planning criteria established by the Florida Reliability Coordinating Council (FRCC). The

FRCC has adopted transmission planning criteria that are consistent with the Reliability Standards established by the North American Electric Reliability Council (NERC). The *NERC Reliability Standards* are available on the internet site (http://www.nerc.com/).

In addition, FPL has developed a *Facility Connection Requirements* (FCR) document as well as a *Facility Rating Methodology* document that are also available on the internet under the "Interconnection Request Information", and "FPL Facility Ratings Methodologies", directories respectively at https://www.oatioasis.com/FPL/index.html.

Generally, FPL limits its transmission facilities to 100% of the applicable thermal rating. The normal and contingency voltage criteria for FPL stations are provided below:

Normal/Contingency

Voltage Level (kV)	Vmin (p.u.)	Vmax (p.u.)
69, 115, 138	0.95/0.95	1.05/1.07
230	0.95/0.95	1.06/1.07
500	0.95/0.95	1.07/1.09
Turkey Point (*)	1.01/1.01	1.06/1.06
St. Lucie (*)	1.00/1.00	1.06/1.06

(*) Voltage range criteria for FPL's Nuclear Power Plants

There may be isolated cases for which FPL may have determined that it is acceptable to deviate from the general criteria stated above. There are several factors that could influence these criteria, such as the overall number of potential customers that may be impacted, the probability of an outage actually occurring, and transmission system performance.

Discussion Item # 9: Discuss how the electric utility verifies the durability of energy savings for its DSM programs.

The projected impacts of FPL's DSM programs on demand and energy consumption are revised periodically. Engineering models, calibrated with current field-metered data, are updated at regular intervals. Participation trends are tracked for all of FPL's DSM programs in order to adjust impacts each year for changes in the mix of efficiency measures being installed by program participants. For its load management programs, FPL conducts periodic tests of the load control equipment to ensure that the equipment is functioning correctly. These tests, plus actual, non-test load management events, also allow FPL to gauge the MW reduction capabilities of its load management programs on an on-going basis.

Discussion Item # 10: Discuss how strategic concerns are incorporated in the planning process.

The Executive Summary and Chapter III provide a discussion of a variety of system concerns/issues that influence FPL's resource planning process. Please see those chapters for a discussion of those concerns/issues.

In addition to these system concerns/issues, there are other strategic factors that FPL typically considers when choosing between resource options. These include: (1) technology risk; (2) environmental risk, and (3) site feasibility. The consideration of these factors may include both economic and non-economic aspects.

Technology risk is an assessment of the relative maturity of competing technologies. For example, a prototype technology, which has not achieved general commercial acceptance, has a higher risk than a technology in wide use and, therefore, assuming all else is equal, is less desirable.

Environmental risk is an assessment of the relative environmental acceptability of different generating technologies and their associated environmental impacts on the FPL system, including environmental compliance costs. Technologies regarded as more acceptable from an environmental perspective for FPL's resource plan are those that minimize environmental impacts for the FPL system as a whole through highly efficient fuel use, state-of-the-art environmental controls, generating technologies that do not utilize fossil fuels (such as nuclear and solar), etc.

Site feasibility assesses a wide range of economic, regulatory, and environmental factors related to successfully developing and operating the specified technology at the site in question. Projects that are more acceptable have sites with few barriers to successful development.

All of these factors play a part in FPL's planning and decision-making, including its decisions to construct capacity or purchase power.

Discussion Item # 11: Describe the procurement process the electric utility intends to utilize to acquire the additional supply-side resources identified in the electric utility's ten-year site plan.

As shown in this 2015 Site Plan, FPL's resource plan currently reflects the following major supply-side or generation resource additions: the on-going modernization at Port Everglades, the replacement of existing GT capacity with new CT capacity, the on-going upgrading of CTs in several existing CCs throughout

FPL's system, the implementation of the previously executed EcoGen PPA, the projected addition of new PV facilities, and the addition of new CC units.

In regard to the modernization project at Port Everglades, the project received a Florida Public Service Commission waiver from the Bid Rule due to attributes specific to the Port Everglades site and to modernization projects in general (such as use of existing land, water, transmission, etc.) plus other economic benefits to FPL's customers. This waiver from the Bid Rule was granted in Order No. PSC-11-0360-PAA-EI for Port Everglades.

CT upgrades are currently taking place at several CC units throughout the FPL system. FPL was approached by the original equipment manufacturer (OEM) of the CTs regarding the possibility of upgrading these units. Following negotiations with the OEM, and economic analyses that showed upgrading was cost-effective for FPL's customers, the decision was made to proceed with the CT upgrades. That process is underway and is scheduled to be completed in 2015.

The EcoGen PPAs, which were approved by the Commission in Order No. PSC-13-0205-CO-EQ dated 5/21/13, were the result of negotiations between U.S. EcoGen and FPL.

In regard to the planned PV facilities, the selection of equipment and installation contractors for these facilities will be done via competitive bidding.

Identification of projected self-build generation resources beyond those units already approved by the FPSC and Governor and Siting Board or units, such as the 2019 and 2023 CC units and the PV projects presented in this Site Plan, is required of FPL in its Site Plan filings. FPL's identification of these resources represents FPL's current view of alternatives that appear to be the best, most cost-effective self-build options at present. FPL reserves the right to refine its planning analyses and to identify and evaluate other options before making decisions regarding future capacity additions. Such refined analyses have the potential to yield a variety of self-build options, some of which may not require an RFP. If an RFP is issued for generation resources, FPL will choose the best alternative for its customers, regardless of whether it is a third party proposal to an RFP or an FPL self-build option. If an RFP for generation resources is not required, FPL will utilize a competitive bidding process to select equipment suppliers and installation contractors based on its assessment of price and supplier capability to realize the best generation option for its customers.

Discussion Item # 12: Provide the transmission construction and upgrade plans for electric utility system lines that must be certified under the Transmission Line Siting Act (403.52 – 403.536, F. S.) during the planning horizon. Also, provide the rationale for any new or upgraded line.

FPL has identified the need for a new 230 kV transmission line that required certification under the Transmission Line Siting Act that was issued in April 2006. The new line will connect FPL's St. Johns Substation to its Pringle Substation (shown on Table III.E.1 in Chapter III). The line will be constructed in two phases. Phase 1 was completed in May 2009 and consisted of a new line connecting Pringle to a new Pellicer Substation. Phase 2 will connect St. Johns to Pellicer and it is scheduled to be completed by December 2018. The construction of this line is necessary to serve existing and future customers in the Flagler and St. Johns areas in a reliable and effective manner.

BEFORE THE FLORIDA PUBLIC SERVICE COMMISSION

In re: Petition for prudence determination regarding new pipeline system by Florida Power & Light Company.	DOCKET NO. 130198-EI ORDER NO. PSC-13-0505-PAA-EI ISSUED: October 28, 2013

The following Commissioners participated in the disposition of this matter:

RONALD A. BRISÉ, Chairman
LISA POLAK EDGAR
ART GRAHAM
EDUARDO E. BALBIS
JULIE I. BROWN

PROPOSED AGENCY ACTION ORDER ON FLORIDA POWER & LIGHT COMPANY'S PROPOSED SABAL TRAIL TRANSMISSION, LLC AND FLORIDA SOUTHEAST CONNECTION PIPELINES

BY THE COMMISSION:

NOTICE is hereby given by the Florida Public Service Commission that the action discussed herein is preliminary in nature and will become final unless a person whose interests are substantially affected files a petition for a formal proceeding, pursuant to Rule 25-22.029, Florida Administrative Code.

Case Background

On July 26, 2013, Florida Power & Light Company (FPL) filed its petition in this docket requesting a determination by the Florida Public Service Commission (Commission), that its decision to enter into long-term natural gas transportation contracts is prudent, and that the associated costs are eligible for recovery through the Fuel and Purchased Power Cost Recovery Clause (Fuel Clause). The petition included testimony from five witnesses, with exhibits outlining FPL's need for additional firm natural gas transportation, a description of its request for proposals (RFP) process and the resulting contracts, and a request for approval of its planned cost recovery method. The petition was filed following FPL's selection of two projects to develop new natural gas transportation infrastructure into southern Florida, offering the most cost-effective alternative for its customers. These projects are referred to individually in the petition as the Northern Pipeline Project and the Southern Pipeline Project. The two projects are wholly separate pipelines owned and operated by different entities, and therefore are referred to collectively as a matter of convenience.

The instant docket is the culmination of a process, which began in 2009 when FPL petitioned us to develop, build, and operate the Florida EnergySecure Line. On April 7, 2009, FPL filed its petition in Docket No. 090172-EI requesting a determination of need for its proposed Florida EnergySecure Line, a 280-mile long, 30-inch diameter high pressure natural gas transmission pipeline that FPL sought to own and operate primarily for supplying natural gas to its newly modernized Cape Canaveral and Riviera Beach generating units. By Order No. PSC-09-0715-FOF-EI, we denied the petition finding that FPL had failed to adequately demonstrate that its Florida EnergySecure Line was the most cost-effective alternative for providing additional natural gas transmission capacity. However, we agreed that additional gas capacity was necessary for assuring the reliability of Florida's electric generating system in the future. In Order No. PSC-09-0715-FOF-EI, we stated, "we agree with the parties that increased gas transportation infrastructure is needed to meet future electricity needs, given the uncertainty surrounding both coal-fired and nuclear generation in the state."[1] Our Order directed FPL to "renew its request for proposals to fulfill its gas transportation capacity needs," and further stated that the "new RFP shall contain a specific, detailed request for proposals for a new pipeline, and specifications of the long term natural gas needs of FPL."[2] In addition, the Order stated that "[t]he RFP shall be provided to our staff for review prior to its issuance to ensure it is clear and complete."[3]

FPL provided the RFP for review on November 13, 2012. A public meeting was held on November 26, 2012 so that our staff and any other interested parties could have an opportunity to discuss and review FPL's RFP document prior to its issuance. In addition to our staff, representatives of the Office of Public Counsel (OPC) as well as potential project participants and other interested groups were present at the meeting. There were no objections to FPL issuing the RFP.

FPL issued its RFP on December 19, 2012. The RFP was noticed three times in *Platt's Gas Daily*, a widely distributed industry publication. FPL provided an internet website where interested persons could gather information and ask questions. FPL also held a workshop to facilitate understanding of the RFP and the bidding process prior to the April 3, 2013 due date for responses. An additional meeting was held on June 13, 2013 to discuss the results of the RFP solicitation, FPL's evaluation of the proposals, and the next steps to be taken in the process. Attendees included our staff, OPC, and representatives of the Florida Industrial Power Users Group (FIPUG). Based on discussion at the meeting, FPL provided an outline of topics that would be covered in the direct testimony filed with its petition.

FPL is not obligated by law to obtain our approval to enter into a long-term gas transportation contracts for the projects, as both contracts are governed by the Federal Energy Regulatory Commission (FERC). The contracts would only trigger our action at the time FPL seeks recovery of costs in the fuel clause proceeding. However, due to the substantial financial commitments involved, FPL is seeking our determination that FPL's decision to enter into long-term gas transportation contracts is prudent and that the associated costs are eligible for recovery through the fuel clause. FPL included a provision in its precedent agreement with each pipeline that requires our approval of the agreements. The contracts may be terminated without financial

[3] Id., page 6.

penalty if we do not make a prudency determination satisfactory to FPL. We have jurisdiction over the subject matter by the provisions of Chapter 366, Florida Statutes.

A. Additional Firm Natural Gas Transportation

Description of FPL's Existing Pipeline Capacity

Peninsular Florida is currently served by only two major natural gas pipelines. Florida Gas Transmission Company, LLC (FGT) is the larger of the two pipelines with approximately 3,100 million cubic feet per day (MMcf/day) of total gas deliverability. The second of the two pipelines is owned by Gulfstream Natural Gas System, LLC (Gulfstream) and has a maximum 1,300 MMcf/day of gas deliverability. Currently, FPL has firm contracts with Gulfstream for 53 percent of the design capacity of its system which is 695 MMcf/day. By 2017, FPL will have firm transportation contracts with FGT for 41 percent of its design capacity, a total of 1,274 MMcf/day. The FGT capacity serves approximately 65 percent of FPL's current total gas supply requirements, and Gulfstream serves the remaining 35 percent. However, FPL is not the only firm shipper for either system. The remaining capacity of Gulfstream is currently fully subscribed, and only 6 percent of FGT's capacity (approximately 184 MMcf/day), will *potentially* be available on a long-term firm contractual basis within the 2017 time frame. Additional natural gas transportation capacity will be necessary as FPL's and all of Florida's electric generation systems continue to grow. Nearly 68 percent of the state's electric generation, and more than 72 percent of FPL's total energy, was fueled by natural gas in 2012.

In general, natural gas pipeline transportation capacity availability is firm or non-firm. Firm transportation capacity is acquired through a contract for reservation of a certain portion of a pipe's daily throughput, which is continuously available to a utility to provide fuel for its generators. Utilities typically acquire non-firm transportation capacity by purchasing pipeline capacity that has been temporarily released by another customer, or by purchasing non-reserved capacity. Released capacity becomes available when another customer's need for gas is below their reserved portion. However, this type of capacity cannot be relied upon as it is not guaranteed. If a sufficient supply of fuel is not available when required to meet load, a utility risks a situation where it may be unable to fully utilize its generating assets, and it could be forced to increase its use of more expensive alternative fuels, demand response, or even load shedding. For this reason, it is important for FPL to have adequate gas transportation capacity available on a firm basis.

Description of Proposed Pipeline Projects

In its petition, FPL states that 400 MMcf/day of additional firm natural gas transportation capacity is required beginning in 2017. The primary factors driving this increased need are the three modernization projects currently in progress at FPL's Cape Canaveral, Riviera Beach, and Port Everglades natural gas plants to upgrade older, 1960's-era steam combustion turbine generating units to modern, and more efficient combined cycle technology. FPL proposes to meet this need by implementing two new contracts for firm pipeline capacity within the northern and southern portions of the state.

The Northern Pipeline project consists of a joint venture between a subsidiary of Spectra Energy Corporation, called Sabal Trail Transmission, LLC (Sabal Trail) and a newly formed subsidiary of FPL's parent company, Next-Era Energy, called U.S. Southeastern Gas Infrastructure LLC (USSGI). The Southern Pipeline project will be owned by another newly formed affiliate of FPL, called the Florida Southeast Connection (FSC). FPL has signed precedent agreements with these two companies for the initial 400 MMcf/day beginning in 2017, with options to provide additional increments of 200 MMcf/day in 2020 and beyond.

Our review of FPL's need for additional natural gas transportation capacity began by analyzing its customer load forecast for the period 2013 through 2032. Then we evaluated the planned generation resource portfolio identified to meet customer demand and energy requirements. The resulting natural gas requirement was then compared to both existing pipeline resources and the proposed contracts with Sabal Trail and FSC. In addition to a review of the current proposal, we compared each of the current forecasts with those presented in the request for a determination of need for the Florida EnergySecure Line, which proposed a 600 MMcf/day pipeline with a 2014 in-service date.

Load Forecasting

The load forecast contained in FPL's petition consists of two components: a base case forecast for both net energy for load (NEL) and summer peak demand, and a risk adjustment component for both NEL and summer peak demand that increases FPL's base-case forecast in order to reduce the risk of under forecasting FPL's future load growth.

FPL's base case forecast for NEL and summer peak demand are based upon three econometric models: a customer forecast model, a net energy for load per customer model, and a summer peak demand per customer model. These three models are the same as those used by FPL in their normal annual planning cycle and are used to produce projections of anticipated load growth for FPL's Ten-Year Site Plans (TYSPs) and other proceedings before the Commission. Our staff analyzed these models, including replicating the estimated model coefficients and associated statistics, and find them to be appropriate for forecasting purposes. Our staff also reviewed the forecast assumptions of anticipated economic and demographic conditions in FPL's service territory. These assumptions are drawn from reputable independent third party sources, including the University of Florida's Bureau of Economic and Business Research, the Florida Legislature's Office of Economic and Demographic Research, and IHS Global Insight. We reviewed these forecast assumptions and find them to be appropriate. Finally, the forecast produced by these models are adjusted to incorporate the effects of incremental wholesale and retail contracts, as well as the incremental load resulting from electric plug-in vehicles and Economic Development and Existing Facility Riders, which are not otherwise included in FPL's historical load levels.

The second component of FPL's load forecast is a risk adjustment factor designed to reduce the risk of under forecasting future load growth. The company indicated in its petition that because FPL is so highly dependent on natural gas-fired generation, the company's long term system reliability could be jeopardized if actual load growth exceeds forecasted growth.

To quantify this risk of under forecasting, FPL analyzed the long term forecasts contained in its TYSPs from 1988 through 2012 and compared these forecasts to actual load growth. In particular, for each year of the ten-year forecast horizon contained in the TYSPs, FPL calculated the differences between the forecasted values of NEL and summer peak demand and their corresponding actual values. From these differences, FPL was able to calculate a confidence interval of forecast accuracy for each of the ten years in the forecast horizon. These ten confidence intervals allow FPL to calculate how much their base case forecasts must be increased so that there is a 75 percent probability that actual NEL and summer peak demand will be less than or equal to their risk-adjusted forecasts. For the forecasts beyond the ten-year forecast horizon covered by the Ten-Year Site Plans (years 2023 through 2032), FPL utilized a constant adjustment factor associated with the ten-year forecast horizon for its NEL and summer peak demand forecasts. We reviewed the data from which FPL derived its risk adjustment factors and confirmed that the data was correctly taken from prior TYSPs and that the resultant forecast errors, variances, and confidence intervals were appropriately calculated.

In its response to a data request regarding the use of the risk-adjusted forecasting methodology, FPL stated that this project is the first time it has built contingencies into its gas transportation forecasting. FPL responded that "[t]he recent growth in gas usage and FPL's significant dependence on gas as a primary fuel dictate a measure of conservatism is employed in procuring gas transportation as we go forward."[4] FPL further explained that between 2010 and 2012, it exceeded its natural gas consumption forecasts generated that year by 114 MMcf/day, and anticipated this variation to increase to 140 MMcf/day in 2013.

Although we are unaware of any prior proceeding in which a risk-adjusted load forecast was utilized, we find that FPL's risk adjustment methodology does reasonably account for and adjust for the risk of under forecasting future load growth. This finding is predicated on two factors. First, the specifications of FPL's three forecasting models discussed above have not significantly changed since 1988. This fact implies that the forecast errors upon which the risk adjustment factors are based must be applicable to the current base case forecasts presented in FPL's petition. Second, FPL's methodology of basing the risk adjustment factors on historical forecast accuracy means that the risk adjustment factors include not only the modeling error (the error associated with reducing the complexities of consumer purchasing decisions regarding electricity to a relatively simple econometric model), but also the error associated with not being able to specify precisely what future economic/demographic conditions will prevail over the forecast period. FPL's proposed risk-adjusted methodology appropriately accounts for both sources of error, and we find it is a reasonable approach for controlling the risk of under forecasting future load growth.

FPL's choice of selecting a 75 percent confidence interval for its risk adjustment factor is somewhat subjective. For example, FPL could have selected a different confidence interval such as 67 percent confidence interval (with an attendant 33 percent chance of under forecasting), which would lower their risk adjusted forecasts. However, the intuitive appeal of FPL's

---

[4] See Document Number 05759-13, in Docket No. 130198-EI, FPL's response to Staff's Second Data Request, number 7, page 1 of 1, issued September 26, 2013.

selection of a 75 percent confidence interval is that it does reduce by half the risk of under forecasting load growth compared to the base case forecasts.

Overall, FPL's base case forecast for summer peak demand is down from that presented in the Florida EnergySecure Line proceeding. As illustrated in Figure 1, the base case forecast for summer peak demand in 2017 is 7.4 percent lower than the risk-adjusted forecast and 3.7 percent lower than the Florida EnergySecure Line forecast. By 2040, this gap increases to 13.0 percent for the risk-adjusted forecast and 6.3 percent for the Florida EnergySecure Line forecast.

Figure 1: Summer Peak Demand Forecasts (2013 – 2042)

Generation Resource Portfolios

After forecasting the increased future system load, the next step in determining FPL's future natural gas requirements was to develop projections of the generation resources that will be required to meet the increased load.

In its petition, FPL prepared two generation resource plans to analyze the effects of a potential delay in the construction of the new Turkey Point nuclear units 6 and 7 on natural gas requirements. The first (or base) case is consistent with FPL's 2013 TYSP and assumes Turkey Point units 6 and 7 enter service in 2022 and 2023, respectively. The second case, called nuclear delay, assumes these two units come into service four years later, in 2026 and 2027. Outside of the ten-year planning horizon, the next planned generating unit is a 3x1 greenfield combined cycle unit, similar in size to the Cape Canaveral, Riviera Beach, and Port Everglades modernized units, with an in-service date of 2025. The nuclear delay case accelerates the need for this unit, moving its in-service date up to 2022. All further need for new generation is projected to be met by building smaller natural gas-fired combined cycle units. These 'filler' units appear for planning purposes, and do not represent any specific unit planned by FPL. We find the use of filler units and the proposed in-service dates for both cases to be reasonable and we expect the resource plans to meet reserve margin requirements over the period reviewed.

Table 1 illustrates the in-service dates of new generating units under both the base case and nuclear delay case scenarios.

Table 1: Generation Addition Forecasts (2013 – 2030)

Planned Generation Additions By Year		
Year	**Base Case**	**Nuclear Delay**
2013	Cape Canaveral	Cape Canaveral
2014	Riviera Beach	Riviera Beach
2015		
2016	Port Everglades	Port Everglades
2017		
2018		
2019		
2020		
2021		
2022	Turkey Point unit 6	3x1 CC (1,269 MW)
2023	Turkey Point unit 7	
2024		Filler CC (635 MW)
2025	3x1 CC (1,269 MW)	Filler CC
2026	Filler CC (635 MW)	Turkey Point unit 6
2027	Filler CC	Turkey Point unit 7
2028	Filler CC

2030	Filler CC	Filler CC

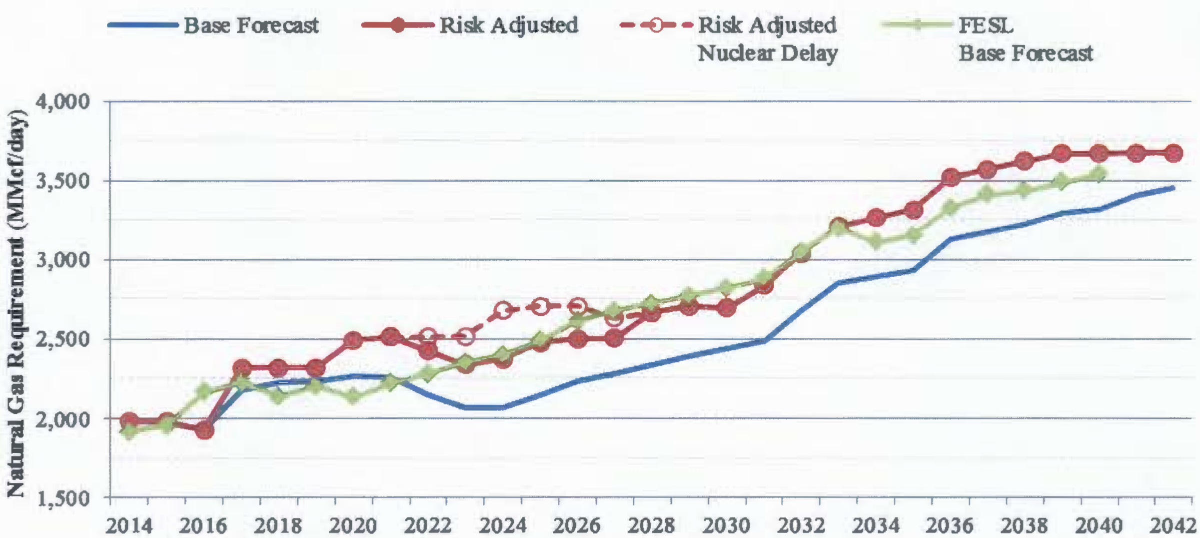
Natural Gas Transportation Requirement

As discussed above, additional natural gas transportation capacity will be necessary within the next few years as more natural gas-fired generating capacity is added. In 2012, FPL consumed more than 600,000 MMcf of natural gas. By 2017, this figure is expected to increase to at least 718,685 MMcf. The total percentage of FPL's electric power generated by natural gas is expected to be somewhat lower in the next few years, due primarily to increased nuclear production from the recently completed uprate projects of FPL's nuclear units. However, without having additional gas transportation infrastructure available in South Florida, FPL's natural gas-fired generating units will not be able to serve its customers efficiently and reliably.

Using the forecast load cases and generation resource portfolios previously discussed, FPL was able to develop forecasts of the resulting natural gas requirements on both an annual and a peak day basis. As only a finite amount of gas can be transported during any one period and no significant storage capacity for natural gas exists at FPL's plant sites, natural gas pipelines must be sized to meet peak daily loads.

FPL developed three forecasts for natural gas transportation requirements. We compared the first two forecasts by using the base generation resource plan with the base and risk-adjusted customer load forecasts. As a worst-case scenario for need, we compared the risk adjusted customer load forecast with the nuclear delay generation resource plan. These three scenarios were also compared to the Florida EnergySecure Line base forecast for natural gas requirements. Figure 2 details the peak day natural gas requirements for each of the scenarios.

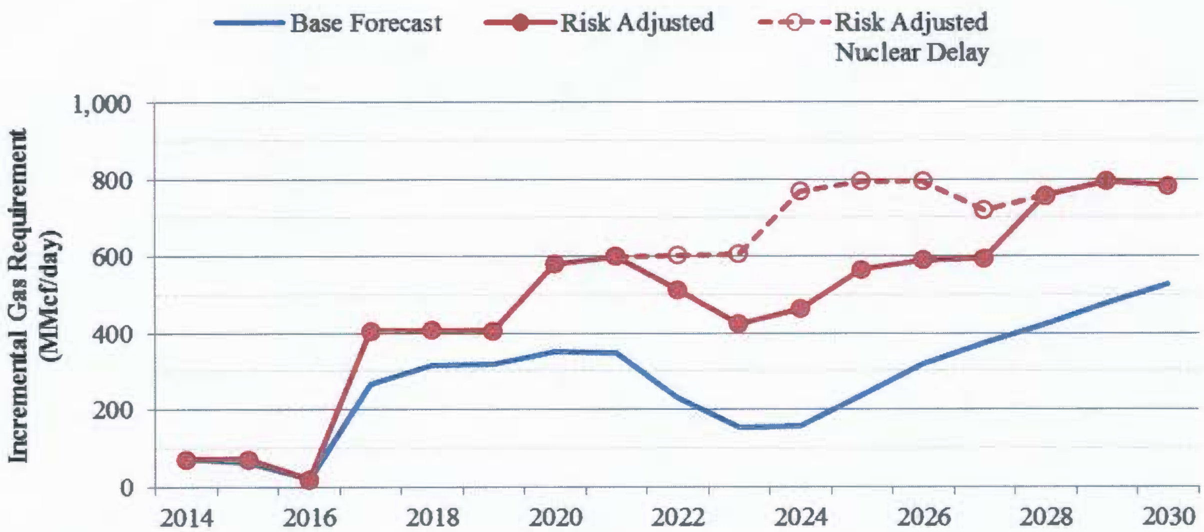
Figure 2: Natural Gas Peak Day Requirements (MMcf/day)



The base forecast projects a substantial increase in natural gas need in 2017 associated with the addition of the Port Everglades Energy Center and the loss of 375 MW of coal-fired capacity from St. John's River Power Park. The base forecast then indicates a slow increase until 2022, when nuclear generation from Turkey Point unit 6 reduces the need for natural gas. The risk-adjusted case projects a similar trend but gas needs rise to a slightly higher level, about 250 MMcf/day above the base forecast. The risk-adjusted nuclear delay case illustrates the additional fuel that will be required if Turkey Point units 6 and 7 are delayed by four years. These two forecasts differ by up to 300 MMcf/day in 2024, but become equivalent again in 2028 when both new nuclear units are in-service. The Florida EnergySecure Line gas requirement was included as an additional comparison. The lower rate of natural gas demand for the years 2017 through 2021 seen in the Florida EnergySecure Line forecast is primarily due to the earlier in-service date for Turkey Point units 6 and 7 discussed previously. Excepting the earlier inclusion of nuclear generation, the trends for increasing gas requirements are similar.

As seen in each of these scenarios, FPL's natural gas requirements exceed its existing firm contracted transportation capacity beginning in 2017. Figure 3 provides a closer look at the incremental firm natural gas transportation requirements for the period 2014 through 2030. The proposed contracts match the additional capacity required under the risk adjusted case, with the first optional incremental capacity addition in 2020 matching both risk adjusted cases. This increased gas requirement in 2020 is a result of all three modernization projects (Cape Canaveral, Riviera Beach, and Port Everglades) being online, as well as the loss of coal-fired generation at St. John's River Power Park.

Figure 3: Incremental Firm Gas Transportation Requirements (MMcf/day)



Decision

We reviewed FPL's forecast for customer load, its proposed generation resource portfolios, and the comparison of its resulting natural gas requirements with its existing natural gas transportation contracted capacity. Based on this review, we find that FPL has adequately demonstrated a need for an additional 400 MMcf/day of firm natural gas transmission capacity by 2017.

B. Most Cost-Effective Solution

Following the conclusion of the RFP process, FPL began the evaluation of the proposals it received as a result. In order to determine whether the projects selected by FPL were the most cost-effective, our staff reviewed the RFP and the selection process that resulted in FPL signing precedent agreements with Sabal Trail and FSC.

Evaluation of Project Proposals

The RFP requested that bidders provide proposals for 400,000 MMBtu/day (approximately equal to 400 MMcf/day)[5] of firm gas transportation capacity in 2017 with an incremental 200,000 MMBtu/day of firm capacity in 2020. In addition, FPL requested that the bidders include an optional incremental capacity of up to 400,000 MMBtu/day beyond the 2020 time period. Bidders could submit pricing on either a fixed or an adjustable demand charge, although FPL expressed its strong preference for fixed pricing in order to obtain pricing security for its customers. Any adjustable pricing had to include a price cap in order to limit exposure to price index volatility.

FPL received four bids for the Northern pipeline and one joint bid for the Northern and Southern pipelines. No separate bids for the Southern portion were received. The entities submitting bids (some of which were joint proposals from companies bidding as partners) represent all active pipelines in the Southeastern U.S. FPL also considered three self-build alternatives for the Southern pipeline, consisting of three configurations of pipe diameters: all 30-inch pipe (labeled proposal Ai), a combination of 30-inch and 36-inch pipe (labeled proposal Aii), and all 36-inch pipe (labeled proposal Aiii). Although FPL had specified its strong preference for fixed pricing, all proposals except the self-build options were based on adjustable demand charges. However, to meet bid requirements, all adjustable pricing included a price cap. The joint proposal for the Northern and Southern pipelines had significant deficiencies, which the bidder elected not to modify, so FPL eliminated it from further consideration. This situation left four proposals for the Northern pipeline and the three FPL self-build options for the Southern pipeline.

Table 2 illustrates the combined project reference numbers assigned by FPL during its evaluation of the RFP responses. Each of the four proposals for the Northern pipeline were evaluated using the three configurations of the pipe diameters for the Southern pipeline (proposals Ai, Aii, and Aiii) and assigned reference numbers 1 through 12.

Table 2 – Combined Project Numbers

Combined Project	1	2	3	4	5	6	7	8	9	10	11	12	13
Northern Proposal	1	2	3	4	1	2	3	4	1	2	3	4	1
Southern Proposal	Aii (36"/30")				Ai (30")				Aiii (36")				B

Combined project 13 consists of the Sabal Trail proposal for the Northern pipeline, and the non-compliant bid for the Southern pipeline. It is included for reference purposes only.

[5] The quantity "MMBtu/day" is equivalent to one million British thermal units of heat energy per day. Because FPL is ultimately concerned with the energy content of the gas, not the volumetric quantity, the contracts will be for units of MMBtu/day rather than MMcf/day (million cubic feet per day). Although the typical heat energy content of one cubic foot of natural gas is approximately one thousand Btus, consistent with industry practice FPL is requiring a quantity of energy to be delivered in its contracts to ensure the necessary amount of electric power can be generated.

The economic evaluation was primarily concerned with a Cumulative Present Value of Revenue Requirements (CVPRR) analysis over a 40-year project term. This type of analysis required that the entire system (including a Northern and a Southern pipeline) be taken into consideration, so FPL created a matrix consisting of each of the four proposals for the Northern pipeline that met the minimum requirements paired with each of the three self-build options submitted by Next-Era Energy for the Southern system. In order to perform the analysis, FPL evaluated the economics of gas transportation using production-cost simulations of its power supply system, including the costs and volumes of gas.

Because only one proposal received for the Southern pipeline was not an FPL self-build option, in order to ensure that the gas transportation charges for the self-build project were reasonably consistent with market prices, FPL performed an economic analysis of the non-compliant proposal using the indicative, non-firm pricing included in that proposal. The result of this analysis was that the non-compliant bid would be between $69 and $105 million more expensive than the best of the three compliant proposals.

The simulation model used in the economic analysis employed the same risk-adjusted load forecast utilized for determining the incremental gas transportation capacity requirement. This analysis took into consideration the fixed and variable costs, as well as the volume and timing of the needed gas transportation. After quantifying fuel and other variable costs, a production-cost modeling program was run in order to determine the differences in the CPVRR for each combined project. The analysis was performed under two different generation resource planning scenarios. The first is the base resource plan, and the second is the nuclear delay resource plan. As previously discussed, the nuclear delay case assumes that the in-service dates of the Turkey Point units 6 and 7 will be delayed by four years, meaning the units will come online in 2026 and 2027 instead of 2022 and 2023, respectively.

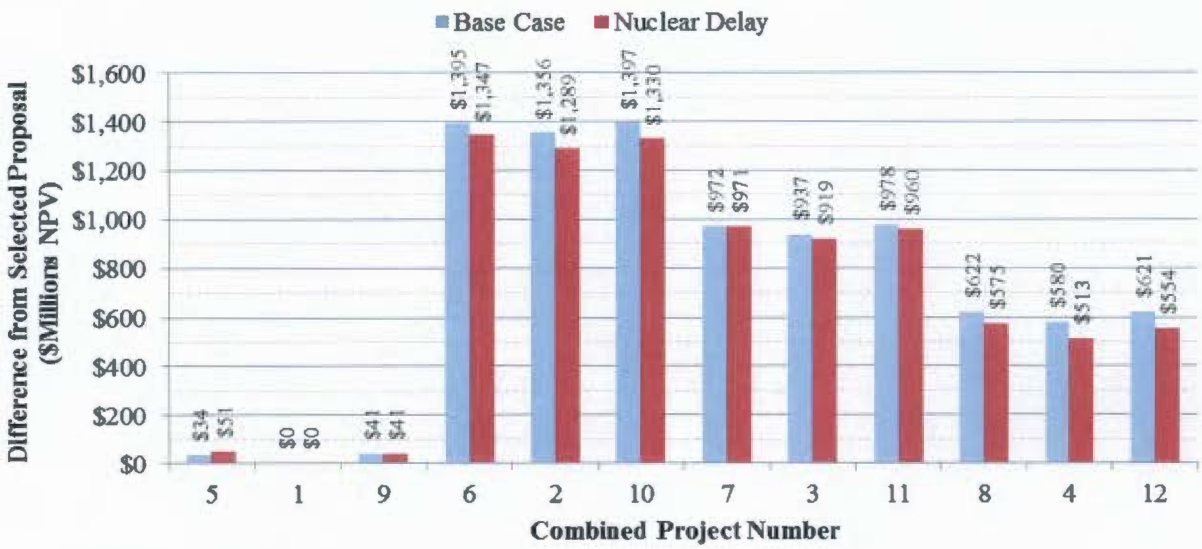
The evaluation of FPL's CVPRR analysis concluded that the combination of projects selected by FPL is indeed the most cost-effective. The magnitude of savings between the selected project's cost and that of the other potential projects depends on which resource plan, load forecast, and gas price forecast is utilized in the analysis.

The smallest margin of savings between the selected project and the next-most cost-effective project is $34 million (using a 40-year term). This comparison is, however, made using the same Northern pipeline proposal paired with two of the FPL self-build options. In fact, the differences between each of the three FPL self-build options are small enough to be insignificant. When using only the FSC for the Southern pipeline, the net present value cost differential between Sabal Trail and the next best Northern pipeline is about $450 million for a 25-year term and about $580 million for a 40-year term. Although the results of the various economic analyses differ widely, the conclusion remains the same: the combination of the Sabal Trail and FSC project is clearly the best alternative in terms of cost.

Cost-Effectiveness of Proposals

Figure 4 shows the cost differentials between the selected combination of projects and the other combined projects for the period 2017 through 2057. The horizontal axis shows the combined project numbers from Table 2. This chart clearly shows the relatively small differences in cost between the three FPL self-build alternatives when compared to the differences between the four Northern project proposals. In general, most of the proposals are also slightly more cost-effective for the nuclear delay case, but the overall difference is small.

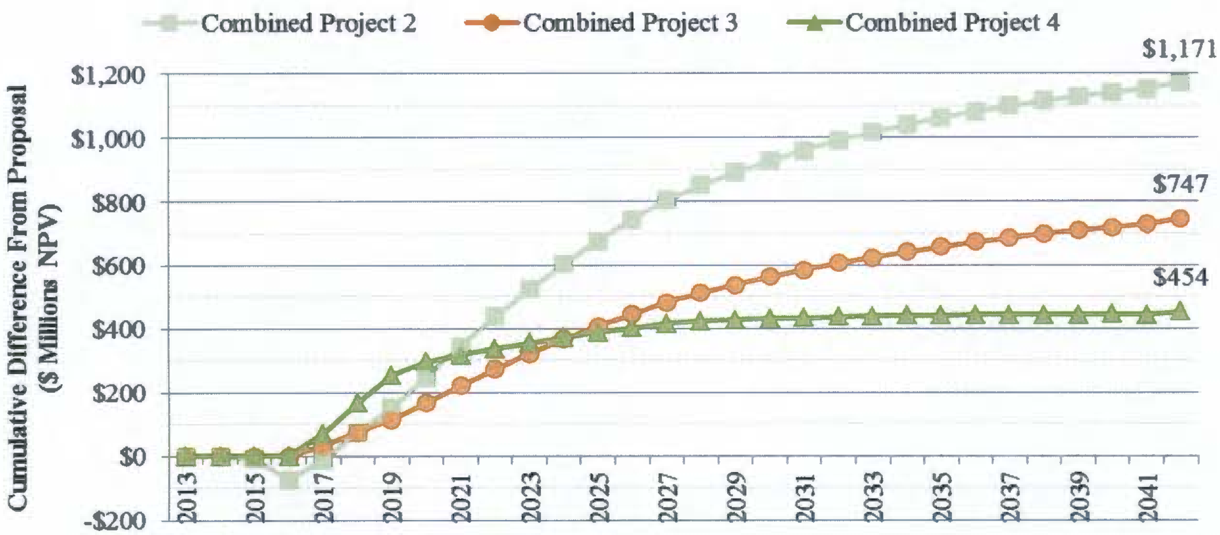
Figure 4: Comparison of the Cost-Effectiveness of the Combined Project Numbers



Source: FPL's response to our staff's second data request, no. 8

As illustrated above, the most cost-effective proposal is combined project 1, the proposed Sabal Trail and the FSC hybrid Aii combination. Using figures provided by FPL in a data request, we evaluated the savings for the various Northern pipeline proposals on an annual basis for the initial 25-year contract term, using the same FSC proposal for the southern segment. The baseline for the comparison is combined project 1. Positive values indicate higher costs, and negative values indicate savings. Only combined project 2 shows savings in any year when compared to combined project 1, but it is higher than the other two alternative proposals over the full contract term. Figure 5 shows the differences in total cost between combined projects 2, 3, and 4 using combined project 1 as a baseline.

Figure 5: Difference in Costs from Combined Project 1 Baseline



Source: FPL's response to our staff's second data request, no. 8

In addition to the economic evaluation, FPL also conducted a non-economic evaluation based on a comparative analysis of each project with respect to attributes that could not be measured in terms of cost. These attributes, while perhaps not as crucial in the overall evaluation, are also important components of the project and must therefore be taken into consideration. For example, a project that offers more opportunities for future expansion would offer a non-economic benefit. The selected Sabal Trail and FSC combined project meets FPL's strong preferences for Greenfield infrastructure and increased diversity of natural gas supply. In addition, the throughput volumes of the selected projects are easily increased using compression. However, in light of the considerable margin of cost-effectiveness for the Sabal Trail and FSC combined project, the significance of any non-economic factors was minimal.

Description of the Proposed Pipeline System

The Sabal Trail and FSC projects will provide FPL with approximately 400 MMcf/day additional capacities beginning in 2017, with an expansion to 600 MMcf/day in 2020. Optional expansions, each for an incremental 200 MMcf/day, are available to FPL, but must be elected by 2020 and 2024, respectively. These additions would become available to FPL between four and five years after the options have been taken.

The commencement point specified for the Sabal Trail pipeline system is identical to that designated in FPL's 2009 Florida EnergySecure Line project. Transcontinental Pipe Line Company's Compressor Station 85 ("Transco Station 85") in Choctaw County, Alabama provides access to non-traditional, onshore suppliers of natural gas, which is an important element to FPL because it introduces supply diversity into the system. Because FPL is currently served by only two natural gas companies, each of which provides gas mostly from Gulf of Mexico and Mobile, Alabama Bay area suppliers, gaining more diversity in its supply is an important component of the project and a primary concern to FPL.

The 2009 Florida EnergySecure Line project specified the "connection point" for the northern and southern parts of the system to be in Bradford County, Florida, near FGT Station 16. However, during the development of the RFP, several interested pipeline companies expressed the opinion that a better option was for a "hub" in the Orlando area due to the large potential customer base for contract opportunities. Therefore, in order to not only meet the primary goal of the RFP to fulfill FPL's increased need for natural gas transportation capacity, but also to further increase the diversity of the supply and to promote competition among suppliers, the chosen termination point is what will become the Central Florida Hub (CFH). The CFH, which is part of the contract for the Sabal Trail pipeline and will be constructed and operated by the same provider, will be an interconnection point between the Northern and Southern pipelines as well as with existing Gulfstream and FGT systems. The CFH will include facilities needed to provide hub wheeling services to deliver contracted capacities interchangeably between and among each of the pipelines, which further increases the flexibility and possible diversity for all the gas shippers in the area.

The Southern pipeline commences at the CFH and terminates at the existing natural gas yard at FPL's Martin Clean Energy Center (Martin), in Martin County, Florida. This terminus location allows for connectivity with the modernized generation plants at Cape Canaveral and Riviera Beach, and because both FGT and Gulfstream currently serve the Martin plant, the addition of the FSC will increase the supply alternatives available to FPL in the event of a pipeline disruption.

Cost Recovery

In response to its RFP, FPL received a total of four proposals for the Northern Pipeline Project and one joint proposal from two companies for the Southern Pipeline Project. Based on FPL's economic and non-economic evaluations, the Sabal Trail proposal was selected for the Northern Pipeline Project and the FSC proposal for the Southern Pipeline Project. Next-Era Energy is an equity stakeholder in Sabal Trail, and has agreed to operate Sabal Trail as a joint venture between Spectra and a newly formed Next-Era Energy subsidiary called USSGI. Also, FSC is a wholly owned subsidiary of Next-Era Energy, and an affiliate of FPL. FPL does not anticipate any charges coming from USSGI associated with the Northern Pipeline Project. However, FPL stated in a data request response that any costs incurred by FPL for goods or services provided to USSGI or FSC, will be charged in accordance with FPL's Cost Allocation Manual or through an Affiliate Management Fee, and would be subject to internal company review and audits to ensure compliance with Rule 25-6.1351 F.A.C. We have the authority to review any transactions with affiliated companies to ensure compliance with Rule 25-6.1351 F.A.C.

Based on Order Nos. 12645[6] and 14546[7], prudent and reasonable transportation charges incurred in the delivery of fuel are allowable expenses in the fuel and purchased power cost recovery clause. Therefore, pipeline charges associated with the delivery of natural gas to FPL's generating stations are eligible for recovery through the fuel clause. While we find that this project is cost effective relative to alternatives, we retain authority to determine the prudent cost and reasonableness of expenses charged to the fuel clause and will review these expenses annually as part of the fuel clause proceedings.

In its response to a data request regarding its plans for dispensing of any unused gas, FPL stated that, in periods of idle capacity due to lower loads, it "can pursue opportunities to release capacity on the new pipelines (or to release capacity on FGT and/or Gulfstream) to other shippers. All revenues generated from the capacity release transactions would be credited back to the customers through the Fuel Clause."[8]

Decision

Upon review, FPL's decision to enter into long-term natural gas transportation contracts with Sabal Trail and FSC was based on a fair and open RFP process. The contracts are projected to save up to $450 million over the term of the contracts when compared to the next most cost-effective proposal. We find that FPL is eligible to seek recovery of costs associated with the firm natural gas transportation contracts with Sabal Trail and FSC in the fuel clause, where they will be reviewed annually. The prudence of the actual transportation costs will be examined in the annual Fuel Docket proceedings.

Based on the foregoing, it is

ORDERED by the Florida Public Service Commission that Florida Power & Light Company has demonstrated a need for 400 MMcf/day of additional firm natural gas transmission capacity by 2017. It is further

ORDERED that Florida Power & Light is eligible to seek recovery of costs associated with firm natural gas transportation contracts in the fuel clause, where they will be reviewed annually. It is further

ORDERED that the provisions of this Order, issued as proposed agency action, shall become final and effective upon the issuance of a Consummating Order unless an appropriate petition, in the form provided by Rule 28-106.201, Florida Administrative Code, is received by the Commission Clerk, Division of the Commission Clerk, 2540 Shumard Oak Boulevard,

NOTICE OF FURTHER PROCEEDINGS OR JUDICIAL REVIEW

The Florida Public Service Commission is required by Section 120.569(1), Florida Statutes, to notify parties of any administrative hearing that is available under Section 120.57, Florida Statutes, as well as the procedures and time limits that apply. This notice should not be construed to mean all requests for an administrative hearing will be granted or result in the relief sought.

Mediation may be available on a case-by-case basis. If mediation is conducted, it does not affect a substantially interested person's right to a hearing.

The action proposed herein is preliminary in nature. Any person whose substantial interests are affected by the action proposed by this order may file a petition for a formal proceeding, in the form provided by Rule 28-106.201, Florida Administrative Code. This petition must be received by the Office of Commission Clerk, 2540 Shumard Oak Boulevard, Tallahassee, Florida 32399-0850, by the close of business on November 18, 2013.

In the absence of such a petition, this order shall become final and effective upon the issuance of a Consummating Order.

Any objection or protest filed in this/these docket(s) before the issuance date of this order is considered abandoned unless it satisfies the foregoing conditions and is renewed within the specified protest period.

Q.

What are the annual total reserve margin values and the Loss-Of-Load-Probability (LOLP) analysis for the period 2015 through 2025 with, and without, the Company's proposed 10 percent generation reserve margin?

A.

FPL interprets the interrogatory to be requesting projected total reserve margin and LOLP values for the resource plan that was the basis of FPL's proposed DSM goals both with and without the 10% GRM reliability criterion that FPL has adopted. That information is provided in Attachment No. 1. As indicated in the portion of FPL's response to Staff's Second Set of Interrogatories No. 53 that pertains to the RIM 337 MW resource plan, there is very little difference between this resource plan and how this resource plan would have changed if FPL had not adopted the GRM reliability criterion. The two resource plans differ only in two years and only by relatively small PPA MW amounts in those two years: by 113 MW in 2020 and by 130 MW in 2021. Therefore, there are differences in total reserve margin and LOLP values between the two resource plans in only these two years and these differences are relatively small. The differences that appear show small reliability advantages for the original resource plan that includes the GRM reliability criterion compared to an alternate resource plan that does not include these additional PPA MW amounts.

Meteorites, Impacts, and Mass Extinction

This document last updated on 01-Dec-2014

Meteorites

On February 15, 2013 a meteor exploded in the sky over Chelyabinsk, southern Russia. Although no people or buildings were hit by the resulting meteorite, the shockwave from the exploding object injured about 1500 people and caused damage to 7200 buildings in the region. The fireball and was caught on video, mainly by dash cameras throughout the region, which were posted on the internet by news organizations individuals. Although the Chelyabinsk meteorite probably weighed about 12,000–13,000 metric tonnes, and measured 17 to 20 m in diameter before it exploded, sientists were quick to point out that it was very small compared to other objects that could potentially hit the earth. The explosion released energy estimated at about 500 kilotons of TNT (about 20 to 30 times more energy than the Hiroshima atomic bomb). The event brought to the world's attention the very real hazards associated with the impact of objects from outer space.

A ***Meteorite*** is a piece of rock from outer space that strikes the surface of the Earth.

A ***Meteoroid*** is a meteorite before it hits the surface of the Earth.

Meteors are glowing fragments of rock matter from outside the Earth's atmosphere that burn and glow upon entering the Earth's atmosphere. They are more commonly known as shooting stars. Some meteors, particularly larger ones, may survive passage through the atmosphere to become meteorites, but most are small objects that burn up completely in the atmosphere. They are not, in reality, shooting stars.

Fireballs are very bright meteors.

Meteor Showers - During certain times of the year, the Earth's orbit passes through a belt of high concentration of cosmic dust and other particles, and many meteors are observed. The Perseid Shower, results from passage through one of these belts every year in mid-August, and Leonid shower occurs in mid-November.

Throughout history there have been reports of stones falling from the sky, but the scientific community did not recognize the extraterrestrial origin of meteorites until the 1700s. Within recent history meteorites have even hit humans-

- 1938 - a small meteorite crashed through the roof of a garage in Illinois
- 1954 - A 5kg meteorite fell through the roof of a house in Alabama.
- 1992 - A small meteorite demolished a car near New York City.

- 2003 - A 20 kg meteorite crashed through a 2 story house in uptown New Orleans

- 2003 - A shower of meteorites destroyed several houses and injured 20 people in India

Meteorite fragments have been found all over the surface of the Earth, although most have been found in Antarctica. In Antarctica they are easily seen on the snow covered surface or embedded in ice.

The fall of meteorites to the Earth's surface is part of the continuing process of accretion of the Earth from the dust and rock of space. When these rock fragments come close enough to the Earth to be attracted by its gravity they may fall to the Earth to become part of it. As we will see the evolution of life on the Earth has likely been affected by collisions with these space objects, and collisions could affect the Earth in the future as well.

Composition and Classification of Meteorites

Meteorites can be classified generally into three types:

- Stones - Stony meteorites resemble rocks found on and within the Earth. They are the most common type of meteorite, although because they resemble Earth rocks they are not commonly recognized as meteorites unless someone actually witnesses their fall. Stony meteorites are composed mainly of the minerals olivine, and pyroxene. Some have a composition that is roughly equivalent to the Earth's mantle. Two types are recognized:

    - ***Chondrites*** - Chondrites are the most common type of stony meteorite. They are made of olivine, pyroxene, and iron - nickel alloys that are magnetic. They are composed of small round spheres, called chondrules, made of the minerals olivine and pyroxene. They appear to have formed by rapid melting followed by rapid cooling early in the history of the solar system. Most chondrites have radiometric age dates of about 4.6 billion years.

    - ***Achondrites*** - Achondrites are composed of the same minerals as chondrites, but lack the chondrules. They appear to have been heated, melted, and recrystallized so that the chondrules are no longer present. Most resemble igneous rocks found on the Earth.

- Irons - Iron meteorites are composed of alloys of iron and nickel. They are easily recognized because they have a much higher density than normal crustal rocks. Thus, most meteorites found by the general populace are iron meteorites. All are magnetic. When cut and polished, iron meteorites show a distinct texture called a Widmanstätten pattern. This pattern results from slow cooling of a once hot solid material. Most research suggest that such slow cooling occurred in the core of much larger body that has since been fragmented. Iron meteorites give us a clue to the composition of the Earth's core.

- Stony Irons - Stony iron meteorites consist of a mixture of stony silicate material and iron. Some show the silicates embedded in a matrix of iron-nickel alloy. Others occur as a breccia, where fragments of stony and iron material have been cemented together by either heat or chemical reactions.

Origin of Meteorites

Most meteorites appear to be fragments of larger bodies called ***parent bodies***. These could have been small planets or large asteroids that were part of the original solar system. There are several possibilities as to where these parent bodies, or their fragments, originated.

- The Asteroid Belt
  The ***asteroid belt*** is located between the orbits of Mars and Jupiter. It consists of a swarm of about 100,000 objects called asteroids. ***Asteroids*** are small rocky bodies with irregular shapes that have a cratered surface. About 4,000 of these asteroids have been officially classified and their orbital paths are known. Once they are so classified they are given a name.

  The asteroids are either remnants of a planet that formed in the region between Mars and Jupiter but was later broken up by a collision with another planetary body, or are fragments that failed to accrete into a planet. The latter possibility is more likely because the total mass of the asteroids is not even equal to our moon. It does appear that some of the asteroids are large enough to have undergone internal differentiation. Differentiation is a process that forms layering in a planetary body (i.e. the Earth has differentiated into a core, mantle, and crust). If these larger asteroids did in fact undergo differentiation, then this could explain the origin of the different types of meteorites. Because of the shapes of the asteroids it also appears that some of them have undergone fragmentation resulting from collisions with other asteroids. Such collisions could have caused the larger bodies to be broken up into the smaller objects we observe as meteorites.

  - The Asteroids as Parent Bodies of Meteorites

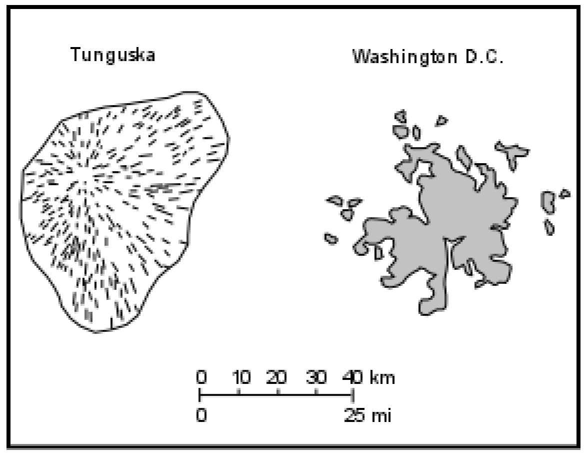
    Much evidence suggests that the asteroids could be the parent bodies of meteorites. The larger ones could have differentiated into a core, mantle, and crust. Fragmentation of these large bodies would then have done two things: First the fragments would explain the various types of meteorites found on Earth - the stones representing the mantle and crust of the original parent body, the irons representing the cores, and the stony irons the boundary between the core and mantle of the parent bodies. Second, the collisions that caused the fragmentation could send the fragments into Earth-crossing orbits.

  Some of the asteroids have orbits that bring them close to Earth. These are called ***Amor objects***. Some have orbital paths that cross the orbital path of the Earth. These are called ***Earth-crossing asteroids*** or ***Apollo objects***. All objects that have a close approach to the Earth are often referred to as ***Near Earth Objects*** or ***NEOs***. About 150 NEOs with diameters between 1 and 8 km are known, but this is only a fraction of the total number. Many NEOs will eventually collide with the Earth. These objects have unstable orbits because they are under the gravitational influence of both the Earth and Mars. The source of these objects is likely the asteroid belt.

- Comets as Parent Bodies of Meteorites

  A ***Comet*** is a body that orbits around the Sun with an eccentric orbit. These orbits are not circular like those of the planets and are not necessarily within the same plane as the planets. Most comets have elliptical orbits which send them to the far outer reaches of the solar system and back toward a closer approach to the sun. As a comet approaches the sun, solar radiation generates gases from evaporation of the comet's surface. These gases are pushed away from the comet and glow in the sun light, thus giving the comet its tail. While the outer surface of comets appear to composed of icy material like water and carbon dioxide solids, they likely contain a more rocky nucleus. Because of their eccentric orbits, many comets eventually cross the orbit of the Earth. Many meteor showers may be caused by the Earth crossing an orbit of a fragmented comet.

  The collision of a cometary fragment is thought to have occurred in the Tunguska region of Siberia in 1908. The blast was about the size of a 15 megaton nuclear bomb. It knocked down trees in an area about 850 square miles, but did not leave a crater. Although still controversial, the general consensus among scientists is that a cometary fragment about 20 to 60 meters in diameter exploded in the Earth's atmosphere just above the Earth's surface. A similar event if it happened over a large city, would be devastating.



- Other Sources

  While the asteroid belt seems like the most likely source of meteorites, some meteorites appear to have come from other places. Some meteorites have chemical compositions similar to samples brought back from the moon. Others are thought to have originated on Mars. These types of meteorites could have been ejected from the Moon or Mars by collisions with other asteroids, or from Mars by volcanic eruptions.

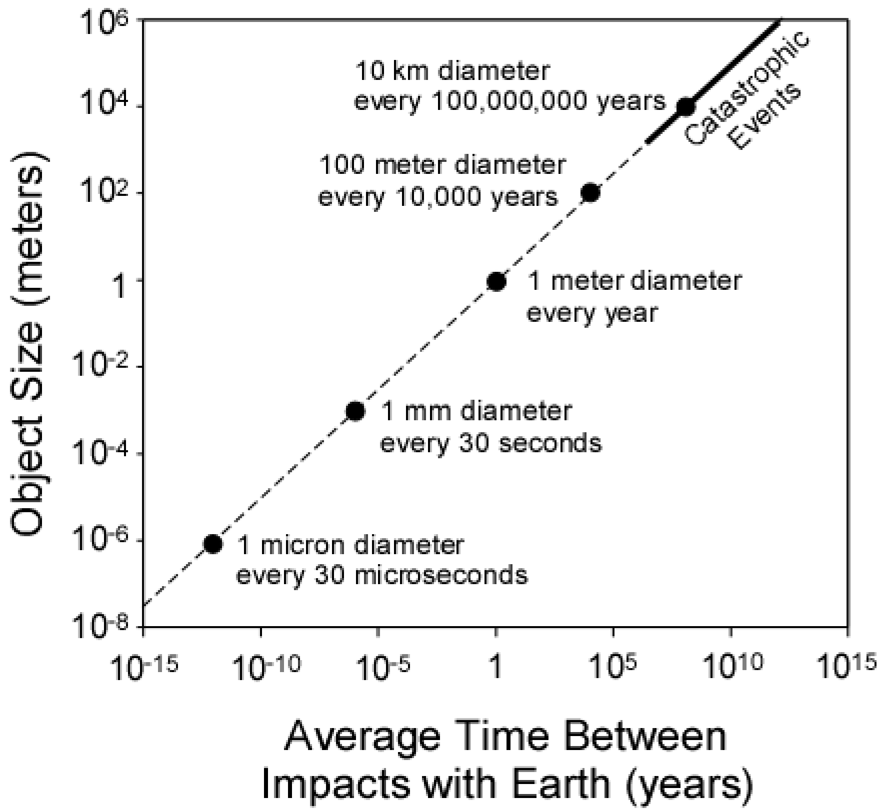
Impact Events

When a large object impacts the surface of the Earth, the rock at the site of the impact is deformed and some of it is ejected into the atmosphere to eventually fall back to the surface. This results in a bowl shaped depression with a raised rim, called an ***Impact Crater***. The size of the impact crater depends on such factors as the size and velocity of the impacting object and the angle at which it strikes the surface of the Earth.

Meteorite Flux and Size

Meteorite flux is the total mass of extraterrestrial objects that strike the Earth. This is currently about 10^7 to 10^9 kg/year. Much of this material is dust-sized objects called ***micrometeorites***. The frequency at which meteorites of different sizes strike the Earth depends on the size of the objects, as shown in the graph below. Note the similarity between this graph and the flood recurrence interval graphs we looked at in our discussion of flooding.

Tons of micrometeorites strike the Earth each day. Because of their small size, they do not usually burn up when entering the Earth's atmosphere, but instead settle slowly to the surface. Meteorites with diameters of about 1 mm strike the Earth about once every 30 seconds. Upon entering the Earth's atmosphere the friction of passage through the atmosphere generates enough heat to melt or vaporize the objects, resulting in so called shooting stars.



Meteorites of larger sizes strike the Earth less frequently. If they have a size greater than about 2 or 3 cm, they only partially melt or vaporize on passage through the atmosphere, and thus strike the surface of the Earth.

Objects with sizes greater than 1 km are considered to produce effects that would be catastrophic, because an impact of such an object would produce global effects. Such meteorites strike the Earth relatively infrequently - a 1 km sized object strikes the Earth about once every million years, and 10 km sized objects about once every 100 million years.

Velocity and Energy Release of Incoming Objects

The velocities at which small meteorites have impacted the Earth range from 4 to 40 km/sec. Larger objects would not be slowed down much by the friction associated with passage through the atmosphere, and thus would impact the Earth with high velocity. Calculations show that a meteorite with a diameter of 30 m, weighing about 300,000 tons, traveling at a velocity of 15 km/sec (33,500 miles/hour) would release energy equivalent to about 20 million tons of TNT.

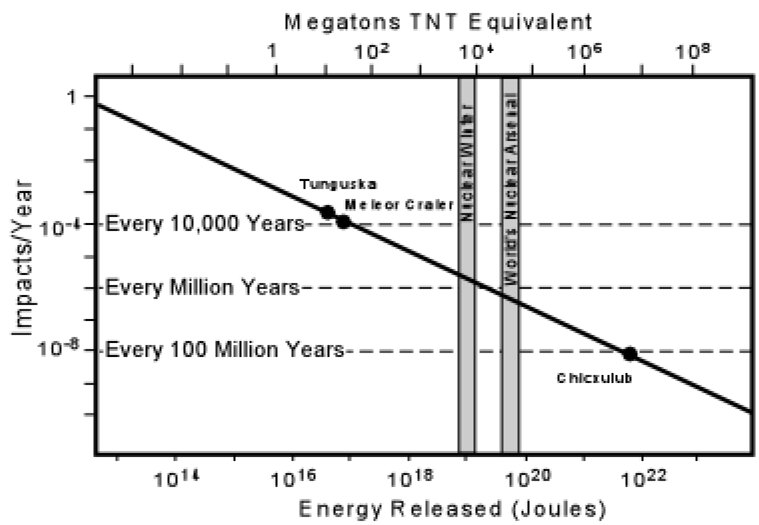
Such a meteorite struck at Meteor Crater, Arizona (the Barringer Crater) about 49,000 years ago leaving a crater 1200 m in diameter and 200 m deep.

The amount of energy released by an impact depends on the size of the impacting body and its velocity.

$$\mathbf{E = ½ MV^2}$$

where E = Energy, M = Mass (depends on size and density of the object), and V = Velocity

An impact like the one that struck the Yucatan Peninsula, in Mexico about 65 million years ago, thought responsible for the extinction of the dinosaurs and numerous other species, created the Chicxulub Crater, 180 km in diameter and released energy equivalent to about 100 million megatons of TNT.



For comparison, the amount of energy needed to create a nuclear winter on the Earth as a result of nuclear war is about 8,000 megatons, and the energy equivalent of the world's nuclear arsenal is about 60,000 megatons.

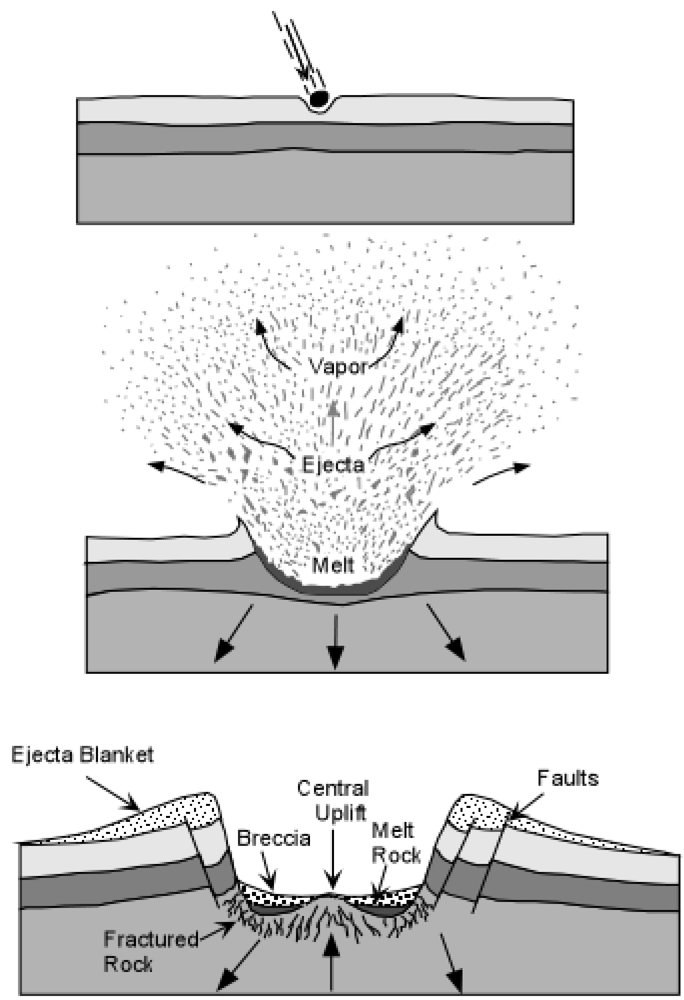
Cratered Surfaces

Looking at the surface of the Moon, one is impressed by the fact that most of the surface features of the moon are shaped by impact craters. The Earth is subject to more than twice the amount of impacting events than the moon because of its larger size and higher gravitational attraction. Yet, the Earth does not show a cratered surface like the moon. The reason for this is that the surface of the Earth is continually changing due to processes like erosion, weathering, tectonism, sedimentation, and volcanism. Thus, the only craters that are evident on the Earth are either very young, very large, or occurred on stable continental areas that have not been subject to intense surface modification processes. Currently, approximately 200 terrestrial impact structures have been identified, with the discovery rate of new structures in the range of 3-5 per year.

The Mechanics of Impact Cratering

When a large extraterrestrial object enters the Earth's atmosphere the initial impact with the atmosphere will compress the atmosphere, sending a shock wave through the air. Frictional heating will cause the object to heat and glow. Melting and even vaporization of the outer parts of the object will begin, but if the object is large enough, solid material will remain when it impacts the surface of the Earth.

Impacts of large meteorites have never been observed by humans. Much of our knowledge about what happens next must come from scaled experiments. As the solid object plows into the Earth, it will compress the rocks to form a depression and cause a jet of fragmented rock and dust to be expelled into the atmosphere. This material is called ***ejecta***. The impact will send a shock wave into the rocks below, and the rocks will be crushed into small fragments to form a breccia. Some of the ejecta will be hot enough to vaporize, and the heat generated by the impact could be high enough to actually melt the rock at the site of the impact. The shock wave entering the Earth will first move in as a compressional wave (P-wave), but after passage of the compressional wave an expansion wave (rarefaction wave) will move back toward the surface. This will cause the floor of the crater to be uplifted and may also cause the rock around the rim of the crater to bent upward. Faulting may also occur in the rocks around the crater, causing the crater to become enlarged, and have a concentric set of rings.



The ejecta will eventually settle back to the Earth's surface forming an ***ejecta blanket*** that is thick near the crater rim and thins outward from the crater. Rocks below the crater that were not melted by the impact will be intensely fractured. All of this would happen in a matter of 1 to 2 minutes.

Meteorite Impacts and Mass Extinctions

The impact of a space object with a size greater than about 1 km would be expected to be felt over the entire surface of the Earth. Smaller objects would certainly destroy the ecosystem in the vicinity of the impact, similar to the effects of a volcanic eruption, but larger impacts could have a worldwide effect on life on the Earth. We will here first consider the possible effects of an impact, and then discuss how impacts may have resulted in mass extinction of species on the Earth in the past.

Regional and Global Effects

Again, we as humans have no firsthand knowledge of what the effects of an impact of a large meteorite (> 1 km in size) or comet would be. Still, calculations can be made and scaled experiments can be conducted to estimate the effects. The general consensus is summarized here.

1. Massive earthquake - up to Richter Magnitude 13, and numerous large magnitude aftershocks would result from the impact of a large object with the Earth.

2. The large quantities of dust put into the atmosphere would block incoming solar radiation. The dust could take months to settle back to the surface. Meanwhile, the Earth would be in a state of continual darkness, and temperatures would drop throughout the world, generating global winter like conditions. A similar effect has been postulated for the aftermath of a nuclear war (termed a nuclear winter). Blockage of solar radiation would also diminish the ability of photosynthetic organisms, like plants, to photosynthesize. Since photosynthetic organisms are the base of the food chain, this would seriously disrupt all ecosystems.

3. Widespread wildfires ignited by radiation from the fireball as the object passed through the atmosphere would be generated. Smoke from these fires would further block solar radiation to enhance the cooling effect and further disrupt photosynthesis.

4. If the impact occurred in the oceans, a large steam cloud would be produced by the sudden evaporation of the seawater. This water vapor and CO_2 would remain in the atmosphere long after the dust settles. Both of these gases are greenhouse gases which scatter solar radiation and create a warming effect. Thus, after the initial global cooling, the atmosphere would undergo global warming for many years after the impact.

5. If the impact occurred in the oceans, giant tsunami would be generated. For a 10 km-diameter object the leading edge would hit the seafloor of the deep ocean basins before the top of the object had reached sea level. The tsunami from such an impact is estimated to produce waves from 1 to 3 km high. These could easily flood the interior of continents.

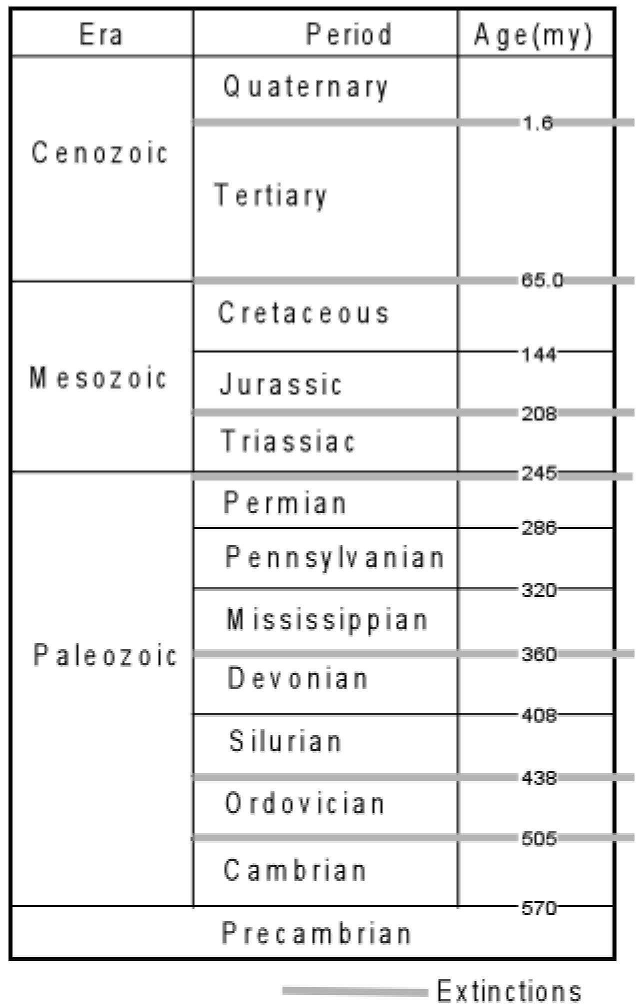
6. Large amounts of nitrogen oxides would result from combining Nitrogen and Oxygen in the atmosphere due to the shock produced by the impact. These nitrogen oxides would combine with water in the atmosphere to produce nitric acid which would fall back to the surface as acid rain, resulting in the acidification of surface waters.

The Geologic Record of Mass Extinction

It has long been known that extinction of large percentages families or species of organisms have occurred at specific times in the history of our planet. Among the mechanisms that have been suggested to have caused these mass extinctions have been large volcanic eruptions, changes in climatic conditions, changes in sea level, and, more recently, meteorite impacts. While the meteorite impact theory of mass extinctions has become accepted by many scientists for particular extinction events, there is still considerable controversy among scientists. In this course we will accept the possibility that an impact with a large object could have caused at least some of the mass extinction events, as it would certainly seem possible given the effects that an impact could have, as discussed above. Still, because of their are many other possibilities for the cause of mass extinctions, please read your book for the arguments against the impact theory.

Major extinction events occurred at

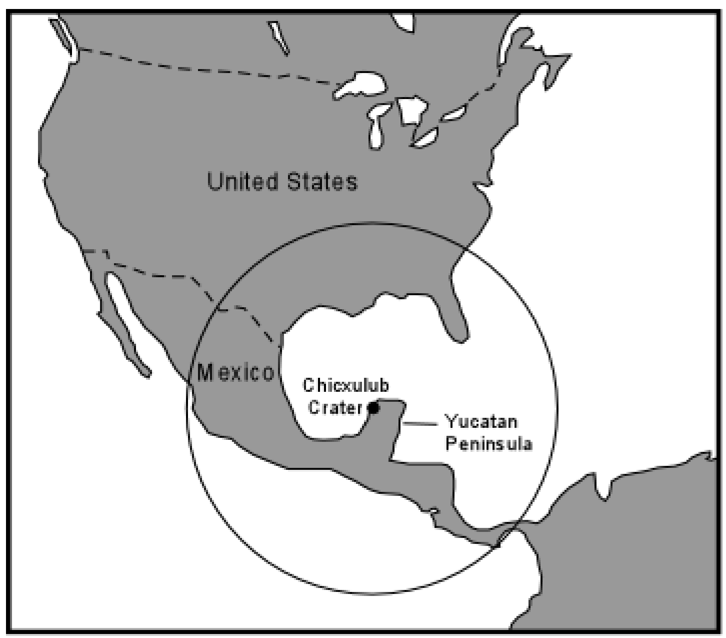
- the end of the Tertiary Period, 1.6 million years (m.y.) ago.
- the end of the Cretaceous Period, marking the boundary between the Cretaceous and Tertiary periods 65 m.y. ago. (Geologists use the letter K to stand for Cretaceous Period and the letter T for the Tertiary Period. Thus this boundary is commonly called the K-T boundary).
- the end of the Triassic, 208 m.y. ago.
- the end of the Permian, 245 m.y. ago (estimated that over 96% of the species alive at the time became extinct).
- the end of the Devonian, 360 m.y. ago
- the end of Ordovician, 438 m.y. ago
- the end of the Cambrian period, 505 m.y. ago



The mass extinction at the end of the Mesozoic Era, that is the Cretaceous - Tertiary boundary (often called the K-T boundary) 65 million years ago, shows much evidence that it was related to an impact with an extraterrestrial object. This event resulted in the extinction of over 50% of the species living at the time, including the dinosaurs. In 1978 a group of scientist led by Walter Alvarez of the University of California, Berkeley, were able to locate the K-T boundary very precisely in layers of limestones near Gubbio, Italy. At the boundary they found a thin clay layer. Chemical analysis of the clay revealed that it contains an anomalously high concentration of the rare element Iridium (Ir). Ir has extremely low concentrations in most crustal rocks, however it reaches very high concentrations in meteorites. The only other possible source of high concentrations of Ir is basaltic magmas. Over the next several years, the K-T boundary was located at several other sites throughout the world, and also found to have a thin clay layer with high concentrations of Ir. Although a large eruption of basaltic magma could not immediately be ruled out as the source of the high concentration of Ir, other evidence began to accumulate that the fallout of impact ejecta had been responsible for both the thin clay layers and the high concentrations of Ir. Among the evidence found at different localities where the K-T boundary is exposed is:

- Clay layers at some localities have a high proportion of black carbon that could have originated as soot produced by wildfires set off by an impact.
- Some of the clay layers contain grains of quartz with a crystal structure that shows evidence that the quartz was severely strained by a large shock.
- In some clay layers tiny grains of the mineral stishovite is found. Stishovite is a high pressure form of SiO_2 that is not found at the Earth's surface except around known meteorite impact sites. The mineral can only be produced as a result of extremely deep burial in the Earth, or by high pressure generated by an impact.
- Other clay layers contain tiny spherical droplets of glass, called spherules. The glass is not basaltic in composition, but could represent droplets of melt formed during an impact event.

At the time of these discoveries, there was no known impact structure on the Earth with an age of 65 million years. This is not unexpected, since 71% of the Earth's surface is covered by water, and is largely unexplored. But, in the late 1980s attention started to be focused on a buried impact site near the tip of the Yucatan Peninsula, in Mexico. Here oil geologists had drilled through layers of brecciated rock and found impact melt rock. Further geophysical studies revealed a circular structure about 180 km in diameter. Radiometric dating reveals that the structure, called the Chicxulub Crater, formed about 65 million years ago.



Although the crater itself is now filled and buried by younger rocks, drilling throughout the Gulf of Mexico has revealed the presence of shocked quartz, glass spherules, and soot in deposits the same age as the crater. In addition, geologists have found deposits from the tsunami that was generated by the impact all along the Gulf of Mexico coast extending considerable distance inland from the current shoreline. (See simulation at http://es.ucsc.edu/%7Eward/chix.mov) The size of the crater suggest that the object that produced it was about 10 km in diameter.

While there is still some debate among geologists and paloebiologists as to whether or not the extinctions that occurred at the K-T boundary were caused by the impact that formed Chicxulub Crater, it is clear that an impact did occur about 65 million years ago, and that it likely had effects that were global in scale. What would happen if another such event occurred while we humans dominate the surface of the Earth, and what could we as humans do, if anything to prevent such a catastrophic disaster?

Human Hazards

It should be clear that even if an impact of a large space object did not cause the extinction of humans, the effects would cause a natural disaster of proportions never witnessed by the human race. Here we first look at the chances that such an impact could occur, then look at how we can predict or provide warning of such an event, and finally discuss ways that we might be able to protect ourselves from such an event.

- **Risk** - It is estimated that in any given year the odds that you will die from an impact of an asteroid or comet are between 1 in 3,000 and 1 in 250,000. The table below shows the odds of dying in the U.S. from various other causes. Although this seems like long odds, you have a about the of dying from other natural disasters likes floods and tornadoes. In fact the odds of dying from an impact event are much better than the odds of winning the Powerball lottery.

Odds of Dying in the U.S. from Selected Causes in a Human Lifetime Data from Abbott (2012)	
Cause	Odds
Motor Vehicle Accident	1 in 90
Murder	1 in 185
Fire	1 in 250
Firearms Accident	1 in 2,500
Drowning	1 in 9,000
Flood	1 in 27,000
Airplane Crash	1 in 30,000
Tornado	1 in 60,000
Asteroid/Comet Impact Global	1 in 75,000
Earthquake	1 in 130,000
Lightning	1 in 135,000
Asteroid/Comet Impact Regional	1 in 1,600,000
Food Poisoning by Botulism	1 in 3,000,000
Shark Attack	1 in 8,000.000
Odds of winning the PowerBall	1 in 195,249,054

In March, 1989 an asteroid named 1989 FC passed within 700,000 km of the Earth, crossing the orbit of the Earth. It was not discovered until after it had passed through the orbit of the Earth. Its size was estimated to be about 0.5 km. Such a body is expected to hit the Earth about once every million years or so, and would release energy equivalent to about 10,000 megatons of TNT, a little greater than the energy released in a nuclear war, and enough to cause nuclear winter event (see graph above). Although 700,000 km seems like a long distance, it translates to a miss of the Earth by only a few hours at orbital velocities.

On March 19, 2004, a 30 m diameter asteroid, named 2004 FH, passed within 26,500 miles (43,000 km) of earth, just beyond the orbit of weather satellites. The object was small , and likely would have only caused a local effect if it had hit the earth's atmosphere, but it was discovered only 4 days before it passed.

On November 8, 2011, Asteroid 2005 YU55, 400 m in diameter passed within the moon's orbit. It was the first time such an object was known and photographed before it reached its nearest point to the earth - http://www.nasa.gov/multimedia/videogallery/index.html?media_id=120141271

In June of 2012, Asteroid 2012 LZ1 passed within about 3 million miles of Earth. Although it was never a threat, the fact that it was discovered only a few days before was alarming. Furthermore, its size was originally estimated to be only 500 m in diameter, as it passed, scientists realized that this was an underestimate. Its size turned out to be about 1 km.

- **The Torino Scale -** In order to develop a better means of communicating the potential hazards of a possible impact with a space object, scientists have developed a scale that describes the potential (see - http://neo.jpl.nasa.gov/torino_scale.html). The scale is called the ***Torino Scale,*** and is shown below.

Events Having No Likely Consequences (White Zone)	**0**	The likelihood of a collision is zero, or well below the chance that a random object of the same size will strike the Earth within the next few decades. This designation also applies to any small object that, in the event of a collision, is unlikely to reach the Earth's surface intact.
Events Meriting Careful Monitoring (Green Zone)	**1**	The chance of collision is extremely unlikely, about the same as a random object of the same size striking the Earth within the next few decades.
Events Meriting Concern (Yellow Zone)	**2**	A somewhat close, but not unusual encounter. Collision is very unlikely.
	3	A close encounter, with 1% or greater chance of a collision capable of causing localized destruction.
	4	A close encounter, with 1% or greater chance of a collision capable of causing regional devastation.
	5	A close encounter, with a significant threat of a collision capable of causing regional devastation.

Threatening Events (Orange Zone)	**6**	A close encounter, with a significant threat of a collision capable of causing a global catastrophe.
	7	A close encounter, with an extremely significant threat of a collision capable of causing a global catastrophe.
Certain Collisions (Red Zone)	**8**	A collision capable of causing localized destruction. Such events occur somewhere on Earth between once per 50 years and once per 1000 years.
	9	A collision capable of causing regional devastation. Such events occur between once per 1000 years and once per 100,000 years.
	10	A collision capable of causing a global climatic catastrophe. Such events occur once per 100,000 years, or less often.

- **Prediction and Warning** - In 1998 scientists and Congress approved the Spaceguard Survey which had a goal of identifying 90% of all NEOs with a size greater than 1 km. In September, 2011, NASA announced that they had identified 93% of all NEOs of this size and that of the total number estimated to exist (989) they had identified 911. For mid-sized NEOs, with sizes between 100 m and 1 km, 5,200 have been found and are being tracked, but it is estimated that there are still over 15,000 of such bodies that have not yet been discovered.

- **Mitigation** - Impacts are the only natural hazard that we can prevent from happening by either deflecting the incoming object or destroying it. Of course, we must first know about such objects and their paths in order to give us sufficient warning to prepare a defense. Sufficient time is usually thought to be about 10 years. This would likely give us enough time to prepare a space mission to intercept the object and deflect its path by setting off a nuclear explosion. Currently, however, there are no detailed plans. But, even if we did not have the ability to destroy or deflect such an object, 10 years warning would provide sufficient time to store food and supplies, and maybe even evacuate the area immediately surrounding the expected impact site.

Examples of questions on this material that could be asked on an exam

1. Define the following: (a) meteorite, (b) meteoroid, (c) shooting star, (d) meteor, (e) comet, (f) Apollo object, (g) asteroid belt, (h) Torino Scale.

2. What would be the global effects if an object greater than 1 km in size collided with Earth?

3. What is the evidence that large objects have collided with Earth in the past?

4. Is there any evidence that large objects have collided with Earth and had an effect on life? If so, what is the evidence and what were the effects?
5. What is the best possible mitigation for an impact disaster? How much time would we need to prepare such mitigation?

EXECUTIVE SUMMARY

Resource adequacy is of critical importance to utilities, consumers, and regulators. The financial impact of shedding firm load or having scarcity events in the electric energy market can be measured in billions of dollars as evidenced by the California Energy Crisis in the early 2000's and more recently during the extreme weather in Texas in the summer of 2011. These events illustrate that the value provided by electric service far exceeds the physical costs of producing the electricity. Surveys of electric service outage costs indicate that the Value of Lost Load (VOLL) can be $15,000/MWh[1] or greater while the production cost of a marginal unit can be only $50/MWh – a factor of 300x. This comparison, however, ignores a critical component of the economics of resource adequacy – the carrying costs of having excess capacity available during those peak hours. Assuming the carrying cost of new capacity is $100,000/MW-yr and VOLL is $15,000/MWh, the capacity must be used to prevent firm load shed more than 6 hours per year to be economically justified. However, in most regions, marginal capacity is needed to prevent firm load shed much less frequently. The resource adequacy standard many regions plan to is a Loss of Load Expectation (LOLE) of one firm load shed event in 10 years (herein referred to as 1-in-10 LOLE), suggesting the last resource added to the system is only needed approximately 0.3 hours per year[2]. At this frequency of utilization, VOLL would have to be an unrealistic $300,000/MWh to justify the last resource addition. For a point of reference, $300,000/MWh VOLL is comparable to $900 for keeping the power on in a normal sized house for one hour[3]. This review suggests that if marginal capacity's only benefit was avoiding firm load shed events, it is unlikely economics would justify maintaining a system as reliable as we have today. The example above illustrated the economics for only shedding firm load due to generation deficiency once every 10 years. However, actual resource adequacy is typically even higher than that. While distribution related outages occur several hours per year for most customers[4], most regions in the Eastern Interconnection have not experienced generation deficiency caused firm load shed events in decades.

But is resource adequacy solely about having enough capacity to meet firm load obligations? Or are there other benefits of reserves that should be considered when setting target Reserve Margins[5]? When load is high and supplies are scarce, market prices can far exceed the production cost of an efficient Combustion Turbine (CT). How much of these costs should be avoided by building additional capacity? There are also other substantive benefits of having robust levels of reserves such as avoiding the dispatch of high cost units or energy limited resources. Economic resource adequacy assessments should take a

---

[1] Estimates of VOLL vary widely. The range of estimates and their impact on resource adequacy planning are discussed in Section IV.

[2] A typical firm load shed event has a 3 hour duration. One event in 10 years equals 3 hours in 10 years or 0.3 hours per year.

[3] An average house uses 3kW on peak. Three kWh divided by 1000 kW/MW times $300,000/MWh = $900.

[5] In this paper, Reserve Margin is calculated by: (Total Capacity Resources – Expected Annual Peak Load) / Expected Annual Peak Load. Conventional resources and demand side programs are counted at full nameplate or designated capacity. Demand side resources are accounted for in projecting the Expected Annual Peak Load. Only a portion of intermittent resource nameplate capacity is counted as a capacity resource.

comprehensive approach to calculating the trade-off between the cost of additional capacity and the economic benefit provided by those resources. This white paper attempts to quantify this trade-off for a defined base case and a number of sensitivities. The point at which the cost of further resource additions is equal to the economic benefit provided by such additions is herein referred to as the economic reserve margin or economically optimal reserve margin or risk neutral economic reserve margin.

For the case study included in this paper, the economic optimal reserve margin is based on minimizing total systems costs from the perspective of the customers of a vertically integrated utility. These costs include all production costs of the utility plus net imports from outside regions plus the societal costs of firm load shed events. In this setup, during reliability events, only incremental purchases are assigned high costs since all load served by the utility's resources is priced at its respective production cost. In these hours, customers continue to receive the benefit of low cost, base load units such as coal and nuclear. The total customer costs then are a combination of low cost energy from existing resources plus incremental energy purchases from the market at higher costs during capacity shortfalls. Also, in this type of environment, a utility pays for incremental capacity costs which are included as part of total system costs. However, in structured markets, the cost of energy is the same for all load since energy is priced based on the marginal resource. If the market price of energy is $800/MWh, then all load must pay this price. However, the mechanism under which energy costs are ultimately passed on to customers can be quite different from region to region depending on market structure and whether or not a load serving entity self supplies a large portion of its load. Also, capacity costs are frequently handled differently. The question of economic reliability is fundamentally different in these markets and is addressed separately in this paper.

The following key conclusions were made based on the resource adequacy assessment research and simulated case study:

- Reviews of various resource adequacy assessments in the Eastern Interconnection indicate wide variations in the way capacity is counted, what level of benefit will be received from emergency operating procedures, and what assumptions and tools are used. Even though many regions use 1-in-10 LOLE or a similar metric, these variations make the comparison of reliability difficult.
- Most prior studies that evaluated the economics of resource adequacy indicated low optimal economic reserve margins. The authors believe this is primarily because only a subset of all customer benefits of the marginal capacity was captured.
- When considering all benefits (production cost savings, import cost savings during shortages, and the societal cost of Expected Unserved Energy (EUE)) of marginal capacity from the perspective of a customer of a single vertically integrated utility, the economic reserve margin is greater than that indicated by 1-in-10 LOLE for many regions. However, system size, resource mix, load shape, market availability and other factors can affect the optimum economic reserve margin and make it either higher or lower than the 1-in-10 LOLE based reserve margin.
- If economic targets were based solely on societal costs (production costs plus the cost of EUE) and ignored scarcity pricing that result in transfers of wealth to outside regions or generators, the economic target would decrease by several percentage points. However, the authors do not believe this setup is realistic or desirable.
- Risk analysis shows that a range of reserve margins slightly above the economic optimal reserve margin can avoid a number of potentially high cost scenarios for little additional cost.

- Modeling assumptions for neighboring regions such as weather diversity and import capability have a significant impact on both the 1-in-10 LOLE and economic optimal reserve margin
- Because unserved energy is de minimus at a 1-in-10 LOLE based reserve margin, the Value of Lost Load has little impact on the economic analysis. Instead it is driven by the dispatch of high cost resources and scarcity pricing events which occur much more frequently than loss of load events.
- Not all capacity resources provide the same value. Most resource planners recognize that wind and solar may provide little load carrying capability relative to their nameplate capacity. However, in addition to those resources, demand response, energy storage, and hydro also have very different load carrying capability as well as economic capacity value, and their respective value should be taken into account.
- Resource adequacy targets should evolve to properly balance the costs and benefits of reliability if the 1-in-10 LOLE based reserve margin level is not justified.
- Merchant generators in energy only markets will likely not recover their fixed costs at a 1-in-10 LOLE based reserve margin or an economic optimal reserve margin based on the perspective of customers in a regulated utility environment.
- Because all generators are paid the same price under current forward capacity market constructs, the total costs to consumers to maintain a 1-in-10 based reserve margin that is above the energy only market economic target will always be higher, however, there is some risk benefit seen by customers due to the reduction of high cost outcomes.

Future Analysis

While this white paper provides a number of informative conclusions to assist regulators in reviewing the reasonableness of resource adequacy plans, many questions remain outstanding that were beyond the scope of the original effort. This paper was not designed to identify the most appropriate economic reserve margins for particular regions, utilities, ISOs and RTOs, but the case studies indicate they could be different from current targets by 5% or more. If current reserve margin targets are 5% too high or 5% too low, the economic inefficiency for individual regions could be in the hundreds of millions of dollars per year. Further, case studies indicated that changing penetrations of demand response and intermittent resources can affect resource adequacy planning, but the way that the impact of these resources should be addressed is highly specific to individual markets. Also, how should economic resource adequacy be addressed by states in structured markets?

The results of this white paper should not be construed to suggest that resource adequacy planning is already approximately optimal in the Eastern Interconnection. There are significant opportunities for resource adequacy planning to produce substantial economic benefits for consumers. Additional analysis could provide key insights into how this could be accomplished.

- Potential Tasks:
  - Assess the economic efficiency of the reliability standards of particular regions, utilities, ISOs and RTOs in the Eastern Interconnect. To perform this assessment, the following steps would need to be performed:
    - Build load, resource, and transmission data for the remainder of the regions in the Eastern Interconnection
    - Refine unit availability data and transmission availability data for the regions already modeled.

    - Perform simulations for the entire Eastern Interconnection and determine one economic optimal reserve margin assuming coordinated planning across the entire Interconnect.
    - Provide comparisons of economically derived reserve margins to current resource adequacy plans.
    - Provide additional sensitivities around key assumptions such as scarcity pricing, economic load forecast uncertainty, and demand response constraints.
    - Analyze different market structures and rules to understand the impact. Use economic reliability simulations to estimate demand curves for capacity markets.
- Demand response programs play a significant and expanding role in addressing resource adequacy. As the penetration of demand response increases, the flexibility and availability required of these resources will also rise. The treatment of these programs in various market structures must also be considered as their value profile can be very different from traditional resources and can change vastly from program to program. Several sensitivities were performed to quantify some of these considerations, but additional work is warranted. The additional work would primarily examine different types of demand response programs with different characteristics. These include reliability only, economic, and real time pricing programs. Optimal demand response portfolios could also be developed.
- Resource adequacy is not just a concern during the peak hours of the year. Changing resource mixes will require different types of assessments to address flexibility requirements for many hours of the year due to wind and other intermittent resources. While the cost of intermittent resource integration has been addressed in a number of studies, the impact of intermittent resources on operational resource adequacy has not received as much focus. An additional assessment that captures the flexibility of existing resources, the variability of loads, and the variability of intermittent resources on time intervals from minutes to days could be performed with the Strategic Energy and Risk Valuation Model (SERVM) used for this white paper. In addition to providing an assessment of potential challenges including the frequency, magnitude, and financial impact of reliability problems due to intermittency, several alternative solutions could be modeled to identify the most reliable and cost effective approaches to mitigating these events.
- The work performed in this study could be leveraged to assess the reliability impact of certain transmission components probabilistically. Pairing SERVM with a transmission model such as EPRI's TransCARE would allow for the assessment of combined generation and transmission reliability. SERVM would be used to develop scenarios of load, weather, and unit commitment and feed subsets of those scenarios to the transmission module to understand the impact of probabilistic operation and failure of specific transmission components.

I. HISTORY OF RESOURCE ADEQUACY AND HOW TARGETS SHOULD EVOLVE

Resource Adequacy is a measure of an electric system‘s ability to provide adequate generation to meet all firm load obligations. If firm load obligations exceed the instantaneous generating capacity of a system, some firm load customers will have their access to electricity cut. This is a firm load shed event. Outages of firm load due to non-generation equipment failures and storms are not considered resource adequacy issues. Typical metrics of resource adequacy include Loss of Load Hours (LOLH), Loss of Load Probability (LOLP), Loss of Load Events (LOLE), and Expected Unserved Energy (EUE). LOLH is a count of the number of hours in a year expected to have firm load shed. LOLP is the ratio of hours or days expected to have any firm load shed to the total hours or days in a year and is expressed as a percentage. LOLE is typically measured as a count of the expected number of days with at least one hour of lost load. EUE is the sum of all the expected firm load energy shed measured in MWh. It is the only one of these metrics that considers the magnitude of the outage. (Section II expands on these definitions, interpretations, and implementations of traditional reliability metrics)

Most electrical systems in North America have a resource adequacy target based on a defined physical reliability metric. While informal reliability targets have likely been utilized since electricity was first commercialized, the first mention of probabilistic resource adequacy assessments using specific physical reliability metrics identified in our research was in technical papers from the 30's and 40's. Giuseppe Calabrese‘ 1947 paper ‗Generating Reserve Capacity Determined by the Probability Method‘ references setting reliability targets based on an expected number of days of loss of load over a given number of years[6]. C.W. Watchorn wrote several papers which discuss the development of appropriate system capacity reserves. In one such paper, Watchorn states "It is believed that a reasonable level of service reliability...is a probability of failure to carry the load of in the order of an average rate of one day in from eight to ten years".[7] However, the basis for that belief was not provided. Similar references to service reliability levels of 1 outage in every 10 years are made in dozens of technical papers from the 50's onward, although it is not clear from our review whether utilities or regions formalized resource adequacy targets around specific reliability metrics until several decades later. (See R. Billinton's bibliography of the history of resource adequacy assessments[8] for further references)

On November 9, 1965, a major electric power disruption in the Northeast US and Eastern Canada left 30 million people without power for over 12 hours. Although the cause of this event was primarily due to operator error, the event did occur during high load conditions.[9] In an effort to prevent the occurrence of similar events, electric utilities formed the North American Electric Reliability Council (NERC) in 1968. NERC reliability standards are focused on operating practices to ensure security (―the ability of the electric system to

withstand sudden disturbances such as electric short circuits or unanticipated loss of system elements."[10]). However, the renewed focus on overall reliability also led to the development of specific resource adequacy targets. Mid Atlantic Area Council (MAAC) Reliability Principles and Standards set in place in 1968 state: ―Sufficient megawatt generating capacity shall be installed to ensure that in each year for the MAAC system the probability of occurrence of load exceeding the available generating capacity shall not be greater, on the average, than one day in ten years."[11] Many other utilities and regions adopted similar standards.

How Should Resource Adequacy Targets Evolve?

One of the interesting aspects of reliability planning is that Resource Adequacy related outages represent a very small percentage of overall outages. As an example, the Brattle Group estimated that customers in Texas would average less than 1 minute per year of outages due to insufficient generation if the system was planned to maintain a 15% reserve margin.[12] This compares to an actual average of 100 - 300 minutes of outages per customer when all types of outages, including transmission and distribution outages, are considered.[13] Statistics are similar nationwide. A survey of utilities shows 107 minutes of outages per customer when all types of outages are considered.[14] Since resource adequacy events comprise only 1% or less of overall outages, why do they receive a high level of focus? Would a 1 in 5 or 1 in 2 LOLE be a reasonable level of physical reliability?

While 1-in-10 LOLE appears to be difficult to support from solely a physical reliability standpoint, several regions note other benefits of high levels of reliability. PJM states that "a well planned and adequate power system will lead to a secure system in day to day operations."[15] The California ISO suggests that high physical reliability supports the proper functioning of markets and that "market economics and reliability are inextricably intertwined." [16] There is little doubt that increased resource adequacy also plays a role in reducing high hourly market price scenarios. Many utilities mention additional unknowns beyond the factors considered in developing the 1-in-10 LOLE target such as fuel availability risk and environmental legislative risk that could force retirements of existing units. These points suggest there may be some margin of error embedded in the 1-in-10 LOLE target for some regions or utilities. In other words, unknown risks may push a system that is planned to

a 1-in-10 LOLE target to have reliability that is somewhat lower in actual practice. Beyond the benefits of high levels of reliability afforded by the 1 in 10 standard, resource planners may also have additional motivations for continuing to use the standard. The 1-in-10 LOLE target is simple to calculate and explain and it has substantial precedent.

However, in relation to other cost/benefit analysis performed in the electric power industry, resource adequacy based on the 1-in-10 LOLE standard appears disproportionate. For example, in ERCOT, avoiding a hypothetical addition of 3,250 MW of new combustion turbines (a capital cost savings of more than $1.5B) would only increase customer's average resource adequacy outages from 0.1 minutes per year to 2.8 minutes per year.[17] When compared with 100 - 300 minutes of distribution related outages per customer, the hypothetical combustion turbines do not appear to provide an economically justifiable reliability benefit. Later sections of this white paper quantify some of these other benefits of high reliability mentioned as qualitative motivations supporting the 1-in-10 LOLE standard. Further, with the changing generation resource mixes that include intermittent generation such as wind and solar and a greater penetration of demand response resources, economically optimal reserve margins may vary further from a 1-in-10 LOLE standard than seen in prior studies. Our conclusions in this paper suggest that resource adequacy targets should evolve to properly balance the costs and benefits of reliability if the 1-in-10 LOLE level is not justified.

II. 1 DAY IN 10 YEAR STANDARD

A. TERMINOLOGY

- Loss of Load Expectation (LOLE): Expected number of firm load shed events an electric system expects in a given year
- Loss of Load Probability (LOLP): probability of firm load shed events typically expressed as a % of total hours in a year
- Loss of Load hours (LOLH): Expected number of hours of firm load shed events an system expects in a given year
- 1-in-10 LOLE Standard: Most commonly calculated as 1 event in 10 years and equals 0.1 LOLE per year
- Reserve Margin: (Resources – Peak Firm Demand) / Peak Firm Demand
- Capacity Margin: (Resources – Peak Firm Demand) / Resources

Not all regions and planners use the same definitions for all of these terms. Some refer to LOLP as the probability of having one or more hours of loss of load in any year. Others refer to LOLE as an hourly metric.

B. SURVEY SUMMARY

The results of our survey show that most regions use a similar standard for setting or measuring generation adequacy. Under this standard, adequate reliability is defined as the level of reserves that provide an expectation of less than one event in 10 years due to generation deficiency. While there are a few regions or utilities that use different standards, this standard has been in place for several decades for many of the members of the Eastern Interconnection. Details around the approach used in each area including references are provided in the following sections.

Table 1. Survey Summary

NERC Assessment Area	Reliability Criterion
FRCC	Reserve Margin criteria of 15% as a Regional Reserve Margin (20% for Investor Owned Utilities (IOU) and 15% - 18% for other utilities); Loss of Load Probability (LOLP) criteria of 1 day in 10 years or 0.1 LOLP[18])
SERC	SERC does not have a mandatory reserve margin or resource adequacy requirement for its members; Example Approaches: SOCO/TVA: base target reserve margins on minimizing total customer costs including societal

[18] Based on Astrape's understanding of the FRCC documentation, LOLP of 0.1 is consistent with the traditional 1 event in 10 years since LOLP is being calculated in days per year. FRCC has substituted the term LOLP for LOLE.

	costs of unserved energy; Progress Energy Carolinas: base target on 1-in-10 LOLE and minimizing total customer costs similar to SOCO/TVA.
SPP	Capacity Margin Criterion of 12% for RTO members that are steam based and 9% for hydro based; Capacity margins must meet 1 day in 10 years defined as an LOLE of 2.4 hours per year.[19]
PJM	1-in-10 LOLE (0.1 LOLE)
MISO	1-in-10 LOLE (0.1 LOLE)
NPCC - NY-ISO	1-in-10 LOLE (0.1 LOLE)
NPCC - ISO-NE	1-in-10 LOLE (0.1 LOLE)
NPCC - Maritimes	Reserve Margin criterion of 20% and an 1-in-10 LOLE (0.1 LOLE)
NPCC - Quebec	1-in-10 LOLE (0.1 LOLE)
NPCC - IESO	1-in-10 LOLE (0.1 LOLE)
Saskatchewan	Standard is based on an undisclosed level of Expected Unserved Energy (MWh)
Manitoba	Both an energy criterion and a reserve margin criterion due to the fact that the region is predominantly hydro. The energy criterion requires adequate energy resources to supply the firm energy demand in the event that the lowest recorded coincident river flow conditions are repeated. The reserve margin is at least 12%.
MAPP	1-in-10 LOLE (0.1 LOLE); Some of MAPP's members self impose a planning reserve margin of 15% based on the LOLE study performed in 2009.

[19] SPP uses the term LOLE of 2.4 hours which is more traditionally defined as an LOLH of 2.4 hours.

ERCOT	Although ERCOT performs a resource adequacy assessment to determine a target reserve margin necessary to meet 1-in-10 LOLE, there is not a mandatory requirement for the region. ERCOT operates as an energy only market and therefore does not have mandatory capacity requirements.
WECC	In general, each balancing area has responsibility for meeting resource adequacy standards established by respective states in which they operate.

Making the determination of what level of reserves yields 1-in-10 LOLE is a complex task and requires the development of a number of assumptions. There is little consistency in this process from region to region. Recent changes to resource mixes including higher penetrations of wind, solar, and demand response (DR) resources have contributed to even greater disparity between regions. A recent initiative by NERC resulted in a recommended list of modeling assumptions which will help to reconcile some of the disparity[20].

In addition to the disparity of assumptions used in assessing 1-in-10 LOLE, the reporting of the reserve margin that meets 1-in-10 LOLE is not standardized. The primary differences in reserve margin reporting include:

1. The method of capacity accounting. Some regions count all nameplate capacity for all resources. Other regions only count dependable capacity, frequently described as economic load carrying capability (ELCC) of a resource. This is a particular concern for wind, solar, hydro, energy storage, and any other constrained resource. In addition, some regions count expected imports as a capacity resource where others recognize the imports in modeling but do not count those imports as resources in the reserve margin calculation.
2. Emergency operating procedure accounting. Some regions include emergency operating procedures such as voltage control as capacity resources.

The following table attempts to demonstrate the impact of both modeling assumption differences and reserve margin reporting differences for a subset of the regions reviewed in this report to give the reader an appreciation for the different assumptions across regions. Note that some differences are appropriate due to physical differences in either resources or load profiles. The following table does not attempt to differentiate between legitimate and illegitimate assumption differences.

[20] *GTRPMTF Final Report,* Retrieved August 25, 2012, from http://www.nerc.com/docs/pc/gtrpmtf/GTRPMTF_Meth_&_Metrics_Report_final_w._PC_approvals,_revisions_12.08.10.pdf

Table 2: Reserve Margins and Impact on Reserve Margin of Various Assumptions

	PJM	NYISO	NE-ISO	Southern Company	SPP
Reliability Criteria	0.1 LOLE	0.1 LOLE	0.1 LOLE	Economics	2.4 LOLH
Reserve Margin at Reliability Standard	15.30%	16.10%	11.7%	15.00%	10.20%
Study Input Assumptions (Note: these components are not additive.)					
Treatment of Non-Firm Imports (What percentage of capacity resources are from non-contracted external generation)	0.00%	0.00%	2.10%	0.00%	0.00%
Weather Uncertainty (How much higher than normal can load be in extreme cases?)	8.00%	7.30%	10.10%	7.00%	5.30%
Equivalent Forced Outage Rate (Expected percentage of capacity offline during peak conditions)	7.30%	6.80%	4.90%	1.80%	5.90%
Economic Load Growth Uncertainty (How much faster than expected can load grow due to economic conditions?)	1.00%	1.00%	0.00%	2.20%	0.00%
External Assistance Benefit (What percentage of load can be reliably served by external regions)	1.90%	8.60%	5.50%	3.00%	0.00%

ELCC Impact of Wind (Some regions derate their reserve margin to account for variability of wind. For regions that do not, how much would their reported reserve margin drop if they only counted the effective load carrying capability of wind in their reserve margin?)	0.00%	4.70%	0.00%	0.00%	0.00%
ELCC Impact of Demand Response (For regions that discount Demand Response capacity to reflect contract limitations, how much higher would reserve margins be if they counted the full contract capacity?)	0.00%	0.20%	0.00%	1.10%	0.00%
ELCC Impact of Hydro (How much higher would reserve margins be if a region counted full nameplate for all hydro resources?)	0.00%	1.30%	0.00%	0.00%	0.00%
Operating Reserve Procedure Impact (Some regions assume operating reserves would be eliminated before firm load would be shed. Compared to a conservative approach of always maintaining full operating reserves, how much additional capacity do these regions assume?)	1.20%	5.50%	2.10%	0.00%	0.00%
Voltage Reduction Counting (Some regions count voltage reduction as a resource when calculating reserve margin. Other regions do not count voltage reduction as a resource even though they have voltage reduction programs. Compared to the approach of counting voltage reduction as a resource, how does a region's assumption affect their reserve margin?)	2.00%	1.50%	1.50%	0.00%	0.00%

Voltage Reduction Modeling (Some regions do not assume in their modeling that voltage reduction will be used to avoid firm load shed even if it would be called in actual practice. Compared to the standard approach of modeling the expected voltage reduction, how does a region's assumption affect their reserve margin?)	2.00%	0.00%	0.00%	0.00%	0.00%

Table 2 illustrates that a number of reporting and modeling assumptions can have a substantial impact on the reported reserve margin. For instance, in New York, the nameplate capacity of wind is counted in the reserve margin calculation. However, in PJM, the reserve margin calculation only includes the effective capacity of wind. Both regions' studies recognize that wind does not contribute much to reliability, but the accounting difference makes for an unwieldy comparison. If the NYISO accounting treatment was similar to PJM, NYISO's reserve margin would be 11.4% instead of 16.1%. The other items listed in Table 2 further illustrate how difficult it is to compare reserve margins across regions.

Aspects of some regions' modeling approaches seem conservative in some areas or aggressive in other areas. After attempting to normalize for most significant variables, regions may have 1-in-10 LOLE based reserve margins that vary by nearly 10%. Much of this difference is likely due to actual differences in resource mixes, transmission interconnections, and load profiles. However, these factors contribute to making it difficult for Commissioners and other regulators to assess the reasonableness of current resource adequacy planning. Our conclusion is that because of these issues, resource adequacy plans cannot be taken at face value even if all regions plan to a consistent 1-in-10 LOLE standard. If one is interested in comparing resource adequacy from region to region, then it is vital to understand the details surrounding the input assumptions to be able to identify whether a study's results are realistic and can be compared appropriately to studies performed by other entities. The comparisons performed here do not result in an assessment of the reasonableness of any entity's resource adequacy assessment, but rather simply point out the significant differences between studies. As discussed in the future analysis section of this paper, additional work could be performed to assess the reasonableness of each entity's resource adequacy plan.

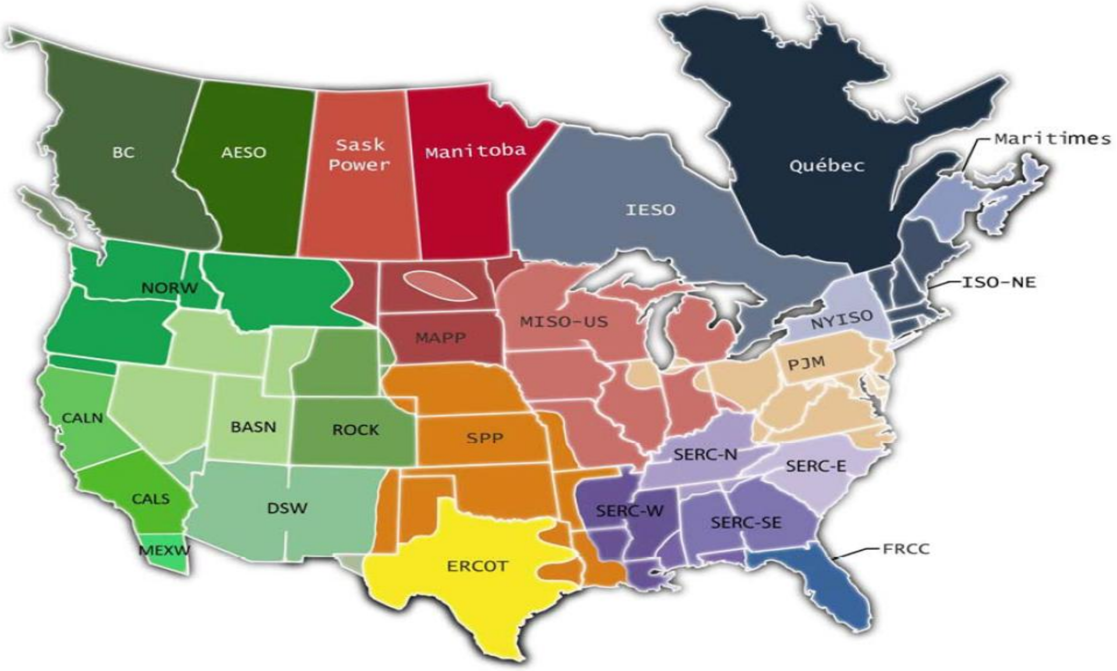
C. Detailed Regional Review

The following sections outline the resource adequacy metric that is used for each NERC Long Term Assessment Area and how it is defined. The sections also contain useful information on how the metric is applied and other key factors impacting resource adequacy decisions.

1. Region Definitions

For this analysis, we will use the NERC Long Term Assessment Areas because resource adequacy criteria and decisions are more often made at this level rather than the other groupings.

Figure 1. NERC Long Term Assessment Areas



2. Eastern Interconnection

- **<u>Florida Reliability Coordinating Council (FRCC)</u>**

Reliability Criterion: Reserve Margin criteria of 15% as a Regional Reserve Margin (20% for Investor Owned Utilities (IOU) and 15% - 18% for other utilities); Loss of load Probability (LOLP) criteria of 1 day in 10 years or 0.1 LOLP.

Based on the FRCC 2012 Load & Resource Reliability Assessment Report,

"The FRCC has a resource criterion of a 15% minimum Regional Reserve based on firm load. FRCC Reserve Margin calculations include merchant plant capacity that is under firm contract to load-serving entities. The FRCC assesses the upcoming ten-year summer and winter peak hours on an annual basis to ensure that the Regional Reserve Margin requirement is satisfied. Since the summer of 2004, the three Investor Owned Utilities (Florida Power & Light Company, Progress Energy Florida, and Tampa Electric Company) are currently maintaining a 20% minimum Reserve Margin planning criterion, consistent with a voluntary stipulation agreed to by the FPSC. Other utilities employ a 15% to 18% minimum Reserve Margin planning criterion."[21]

[21] *FRCC 2012 Load and Resource Reliability Assessment*, retrieved on September 1, 2012 from https://www.frcc.com/Reliability/Shared%20Documents/FRCC%20Reliability%20Assessments/FRCC%202012%20Load%20and%20Resource%20Reliability%20Assessment%20Report%20RE%20PC%20Approved%20071012.pdf

The FRCC performed a Loss of Load Probability (LOLP) study in 2009 to verify that the reserve margin criteria were sufficient to meet a maximum LOLP of 0.1 day in a given year. The usage of the term LOLP is different from the traditional definition because it is measured in days per year similar to LOLE. Based on our review, this LOLP of 0.1 in consistent with the traditional 1 event in 10 years. Based on the report, FRCC is also exploring the possibility of a ―generation only" reserve margin requirement since demand response penetration is projected to be quite high. Having substantial conventional resources may be important in systems with high penetration of demand response resources due to the voluntary aspect of demand response resources.

FRCC used the TIGER Model to perform its most recent LOLP studies.

- **Southeast Reliability Corporation (SERC)**

  SERC does not have a mandatory reserve margin or resource adequacy requirement for all of its members. Instead, resource adequacy targets are set by individual load serving members and may be subject to review by state regulators of individual members. With this approach, the final target reserve margins vary across the region. For this analysis, we focused on three of SERC's members (Southern Company, TVA, and Progress Energy Carolinas) which represent a portion of SERC-SE, SERC-N, and SERC-E. The information is based on recent IRP information.

  - **SERC-SE: Southern Company**

    Reliability Criterion: Target reserve margin is based on minimizing total system costs to customers.

    Southern Company published an ―Economic Study of the System Planning Reserve Margin for the Southern Electric System"[22] in 2009. Based on this report, Southern Company selected a target reserve margin of 15% which approximately minimizes costs and reduces risks to customers.

    To perform this study, Southern used the SERVM model, a resource tool licensed by Astrape Consulting.

  - **SERC-N: TVA**

    Reliability Criterion: Planning reserve margin based on minimizing total system costs to the customer which results in a 15 percent reserve margin.

---

[22] *Southern Electric Reserve Economic Study of the System Planning Reserve Margin for the Southern Electric System* , retrieved on September 1, 2012 from http://www.psc.state.ga.us/factsv2/Document.aspx?documentNumber=125981

Based on TVA's 2011 IRP, titled ―Integrated Resource Plan, TVA's Environmental and Energy Future"[23]

―TVA identified a planning reserve margin based on minimizing overall cost of reliability to the customer. This reserve margin was based on a stochastic analysis that considered the uncertainty of unit availability, transmission capability, economic growth and weather to compute expected reliability costs. From this analysis a target reserve margin was selected such that the cost of additional reserves plus the cost of reliability events to the customer was minimized. This target or optimal reserve margin was adjusted based on TVA's risk tolerance in producing the reserve margin used for planning studies. Based on this methodology, TVA's current planning reserve margin is 15 percent and is applied during both the summer and winter seasons."

TVA used the SERVM Model to perform its analysis.

- **SERC-E: Progress Energy Carolina**

Based on Progress Energy Carolina's 2012 IRP[24], Progress Energy uses a target reliability of one day in ten years LOLE for generation reliability assessments to set its minimum threshold. The company explains that a 14.5% reserve margin satisfies the one day in ten years LOLE criterion**,** but the company targets a range between 14.5% and 17% based on an economic analysis of total system costs to the customer.

Progress Energy Carolinas used the SERVM Model to perform its analysis in 2012.

- **Southwest Power Pool (SPP)**

Reliability Criterion: Capacity Margin criterion of 12% for RTO members that are steam based and 9% for hydro based; Capacity margins must meet 1 day in 10 Years defined as an LOLH of 2.4 hours per year.

Based on SPP'S 2010 Loss of Load Expectation Report[25], the SPP capacity margin criteria requires each control area within SPP to maintain a 12% capacity margin for steam-based utilities and 9% for hydro based utilities. SPP calculates the LOLE of one day in ten years based on probabilistic modeling and the modeling results show that capacity margins could decrease to 9.6% and still meet this LOLE standard. Based on the study, however, SPP defines one day in ten years differently than the traditional definition. SPP assumes that an LOLH of 2.4 hours per year is 1 day in 10 years instead of one

[23] *Integrated Resource Plan TVA's Environmental & Energy Future*, retreived on September 1, 2012 from http://www.tva.com/environment/reports/irp/pdf/Final_IRP_complete.pdf
[24] *Progress Energy Carolinas Integrated Resource Plan 2012*, retrieved on Dec 1, 2012 from http://www.energy.sc.gov/publications/ProgressEnergyResource%20Plan2012.pdf

event (0.1 LOLE) in 10 years. The difference is significant because 2.4 hours per year is much less reliable than one event in 10 years.

SPP uses ABB Gridview to assess its reliability.

- **PJM**

Reliability Criterion: 1-in-10 LOLE (0.1 LOLE)

Based on PJM's 2011 Reserve Requirement Study[26], the reserve margin requirement is 15.5% for the delivery period 2012/2013, 15.3% for the 2013/2014 delivery period, and 15.4% for the 2016/2017 delivery period. The reserve margin requirement supports a generation Loss of Load Expectation (LOLE) of one occurrence in ten years (LOLE = 0.1). PJM references RFC Standard BAL-502-RFC-01[27] as the reason the LOLE metric was adopted. The LOLE target reserve margin and various other calculations provide key inputs into the PJM Reliability Pricing Model (RPM). Through RPM, PJM ensures there are appropriate reserves to meet load. Individual Load Serving Entities (LSE) are not required to provide a specific reserve margin requirement and are allowed to make up shortfalls in the capacity markets. This aspect is much different than areas such as SERC, SPP, and FRCC where load serving entities are responsible for capacity procurement to meet the reliability criterion.

PJM uses the PRISM model to perform its resource adequacy planning and also uses GE MARS for supplemental modeling.

- **MISO**

Reliability Criterion: 1-in-10 LOLE (0.1 LOLE)

According to MISO's 2012 Planning Year LOLE Study[28], MISO uses a minimum planning reserve margin of 16.7% across the entire MISO region and is based on meeting a 1-in-10 LOLE target (0.1 LOLE). It is the LSE's responsibility to meet the reserve margin target provided by MISO. The recently approved annual auction allows LSE's to purchase capacity to overcome deficiencies or opt to pay a penalty rather than purchase in the auction. Since the planning reserve margin of 16.7% provided by MISO is a regional reserve margin that doesn't account for load diversity among its members, the target for individual LSEs is 11.3% of its annual peak load. It should also be noted that State Commissions have the authority to set planning reserve margins for their state.

[28] *Planning Year 2012 LOLE Study Report,* retrieved on September 2, 2012 from https://www.midwestiso.org/Library/Repository/Study/LOLE/2012%20LOLE%20Study%20Report.pdf

MISO uses the GE MARS model to perform its resource adequacy analysis in combination with PROMOD to establish its zonal areas.

- **NPCC**

All five regions within the NPCC region (NY-ISO, ISO-NE, Maritimes, Quebec, and IESO) require a reserve margin that at a minimum maintains an LOLE of 0.1 days per year. However, there are significant variations in how each area models the details of their system, surrounding regions, load, and other components. There are also differences in the application of the reserve requirements as NY-ISO and ISO-NE maintain resource adequacy through their structured capacity markets.

- **NPCC-NYISO**

Reliability Criterion: 1-in-10 LOLE (0.1 LOLE)

Based on the Installed Capacity Requirements study performed by NYSRC in Dec. 2011[29], the required reserve margin to meet the 1-in-10 LOLE standard is 16.1% for the period of May 2012 to April 2013. This study is performed annually to set the annual statewide Installed Capacity Requirement (ICR) for the New York control area. Similar to PJM, these required reserve margin results are used in the NYISO's structured forward capacity markets.

The LOLE analysis is performed using GE MARS.

- **NPCC-ISO-NE**

Reliability Criterion: 1-in-10 LOLE (0.1 LOLE)

ISO-NE is the planning coordinator for the New England Area of the Northeast Power Coordinating Council (NPCC). Similar to PJM and NYISO, the reserve requirements serve as inputs to the structured Forward Capacity Market (FCM) which is used to procure the required amount of installed capacity resources to maintain system reliability. Based on the ―New England 2011 Comprehensive Review of Resource Adequacy"[30], required resources are planned based on meeting the NPCC LOLE reliability criterion of no more than one day in ten years disconnection of non-interruptible customers.

The LOLE analysis is performed using GE MARS.

[29] *New York Control Area Installed Capacity Requirements For the period May 2012 – April 2013,* retreived on September 2, 2012 from *http*://www.nysrc.org/pdf/Reports/2012%20IRM%20Final%20Report.pdf

[30] *New England 2011 Comprehensive Review of Resource Adequacy*, retrieved on September 2, 2012 from https://www.npcc.org/Library/Resource%20Adequacy/NE_2011_Comprehensive_Review_of_Resource_Adequacy%20-%20RCC%20Approval%20-%2020111129.pdf

- **NPCC-Maritimes**

  Reliability Criterion: Reserve Margin criterion of 20% and 1-in-10 LOLE (0.1 LOLE)

  Maritimes uses a 20% reserve margin criterion for planning purposes but at the same time adheres to the NPCC requirement of not shedding firm load more than 1 day in 10 years. Based on the 2011 Interim Resource Adequacy Review[31], the region meets both of these requirements for 2012 – 2015.

  The LOLE analysis is performed using GE MARS.

- **NPCC-Quebec**

  Reliability Criterion: 1-in-10 LOLE (0.1 LOLE)

  Quebec adheres to the NPCC resource adequacy criterion. Based on an LOLE of 0.1, Quebec requires a 10% reserve margin for the 2012/2013 winter peak. By the 2015/2016 winter peak, Quebec requires a 12.2% reserve margin[32]. Because of its dependence on hydro generation to meet peak load, Quebec has also developed an energy criterion stating that sufficient resources should be available to go through a sequence of 2 consecutive years of low water inflows.

  The LOLE analysis is performed using GE MARS.

- **NPCC-IESO (Ontario)**

  Reliability Criterion: 1-in-10 LOLE (0.1 LOLE)

  Based on the Ontario Reserve Margin Requirements Report[33], IESO bases its reserve margin requirement on an LOLE of 0.1 days per year. The target for 2013 to meet the one day in 10 year target is 19.7% which the region meets easily with an anticipated reserve margin of 40.1%.

- **<u>Sask Power</u>**

  Reliability Criterion: Based on an unspecified expected unserved energy (EUE) criteria.[34]

  Per NERC's 2011 Long Term Resource Assessment (LTRA), Sask Power uses a 13% reserve margin based on probabilistic analysis of Expected Unserved Energy. The specific EUE metric used to set the target was unavailable. This is different than LOLE in that it takes into account the magnitude of the event. NERC has recently recognized the fact that LOLE does not take into account the magnitude of the event and in its latest probabilistic assessments has requested that EUE as a percent of demand be used instead of LOLE.

- **<u>Manitoba</u>**

  Reliability Criterion: Both an energy criterion and a capacity reserve margin criterion due to the fact that the region is predominantly hydro.

  The energy criterion requires adequate energy resources to supply the firm energy demand in the event that the lowest recorded coincident river flow conditions are repeated. The reserve margin is at least 12%. Based on Manitoba's 2010/2011 Power Resource Plan[35], Manitoba states that "the reserve margin of 12% has been adequate for Manitoba Hydro's predominantly hydro based system because of the relatively low outage rates of hydro generating units combined with relatively small size units."

- **<u>Mid Continent Area Power Pool (MAPP)</u>**

  Reliability Criterion: 1-in-10 LOLE (0.1 LOLE)

  Per the NERC's 2011 LTRA[36], some of MAPP's members self impose a planning reserve margin of 15% based on the LOLE study performed in 2009.

  Given that the focus of the paper surrounds the Eastern Interconnection, we have only included a few short comments on the ERCOT and WECC interconnections.

3. ERCOT

Reliability Criterion: 1-in-10 LOLE (LOLE of 0.1)

Although ERCOT performs a resource adequacy assessment to determine the reserve margin necessary to meet 1-in-10 LOLE, there is not a mandatory requirement for the region. ERCOT operates as an energy only market and therefore does not have mandatory capacity requirements.

[36] *2011 Long-Term Reliability Assessment,* retrieved on September 2, 2012 from http://www.nerc.com/files/2011LTRA_Final.pdf

4. WECC

In general, each balancing area has responsibility for meeting resource adequacy standards established by respective states in which they operate. Resource adequacy planning in WECC is similar to that in SERC.

- **CAISO**

The California ISO uses a resource adequacy requirement of 15% reserve margin set by the California Public Utility Commission's Resource Adequacy Program. It is our understanding that the 15% was derived from previous resource adequacy studies.

- **NWPP**

The Pacific Northwest uses an LOLP metric that states the following: "the likelihood of having at least one curtailment five years into the future must be 5% or less for the power supply to be deemed adequate."[37] They also include another metric 2) conditional value at risk (CVaR) to evaluate the likelihood, magnitude, duration, and seasonality of Energy-Not-Served (ENS) events.

III. PREVIOUS ECONOMIC STUDIES OF THE 1 DAY IN 10 YEAR STANDARD

A number of studies have been performed that evaluate the value of service reliability. The most common approach taken in these studies compares the direct and indirect costs of outages with the costs of generating capacity at a range of reserve margins. Some of the studies also take into account other benefits of reserve capacity including reduced purchase costs, offsetting higher cost resources, reducing the costs of voltage reduction, and reducing the costs of interrupting non-firm load customers. However, few of the studies surveyed explicitly estimate the reasonableness of existing physical reliability standards by comparing to economically optimal reserve margins. This is likely because the units of physical reliability events do not reflect their magnitude or duration. The cost of 1 event in 10 years is highly dependent on the size and duration of the event, neither of which is reflected in the metric. The following sections review specific studies of the value of service reliability.

A. ECONOMICS OF RELIABILITY FOR ELECTRIC GENERATION SYSTEMS (1973)

M.L. Telson‘s thesis titled the Economics of Reliability for Electric Generation Systems in 1973[38] was one of the earliest relevant studies which specifically addressed the reasonableness of physical reliability standards. His approach was similar to many of the other value of electric service studies which approximate an optimum reserve margin by comparing the cost of carrying additional capacity with the costs of outages at various reserve margins. Since his approach is used frequently, we will analyze it in some depth.

Mr. Telson does explicitly compare economically optimal reserve margins with reserve margins determined by physical metrics such as the 1-in-10 LOLE metric. His analysis suggests that reserve margins set by 1-in-10 LOLE are much higher than would be justified by an economic analysis. An economically set reserve margin might provide reliability as low as 1 event per year according to his analysis. A simplification of the related math states that 1 event per year with an outage cost of ~\$1/kWh and a duration of 12 hours is comparable to the carrying cost of a new unit at \$12/kW-yr. This is the optimal level because additional reserves would provide less than \$12/kW-yr of avoided outages, and fewer reserves would result in more than \$12/kW-yr of additional outages. Mr. Telson's analysis suggests that under typical reliability standards, customers are over-paying on a total cost basis by 4.1% compared to what they would pay under an economically optimal reserve margin even after considering societal outage costs. While the cost figures from 1973 are no longer applicable, more recent studies also make the point that it would take several hours per year of outages even with high outage costs to justify new capacity.

As additional support for a lower reserve margin target than indicated by the 1-in-10 LOLE standard, Mr. Telson compares generation adequacy related outages with transmission and distribution outages which are orders of magnitude more frequent. This report also highlights the conservative assumptions built into many of the 1-in-10 LOLE based reliability studies. Another limitation pointed out by Mr. Telson of most physical reliability studies is their lack of attention to the magnitude and duration of outages.

The support for Mr. Telson‘s position that an economic reserve margin should be less than a 1-in-10 LOLE target is dependent on the system conditions he assumed, many of which are not applicable to systems today. For example, in the early 1970‘s, load growth was

[38] *Economics of Reliability for Electric Generation Systems*, M.L. Telson, 1973

much higher with substantial uncertainty; unit performance was less reliable, the carrying cost of additional reserves was higher in real terms, and the cost of outages was lower in real terms. However, even with updated assumptions, we do not feel that Mr. Telson's approach considers all of the economic factors necessary for valuing the benefits of additional capacity. In fairness, his economic analysis is much more sophisticated than suggested by our example and includes a number of indirect economic impacts in addition to the direct costs mentioned.

B. Cost and Benefits of Over/Under Capacity in Electric Power System Planning (1978)

Another early significant study in our research results is titled ‗Costs and Benefits of Over/Under Capacity in Electric Power System Planning' and was performed for EPRI in 1978[39]. This study analyzed the economics of generation reliability for 4 utilities (Tennessee Valley Authority, Pacific Gas and Electric, Long Island Lighting Company, and Wisconsin Electric Power Company). This study uses a number of unique assumptions:

1. Load growth and capacity expansion uncertainty are primary drivers of the need for planning reserves. This is primarily a function of the high load growth period of the 1970's and is likely not applicable today.
2. Total variable costs for each different reserve margin level studied must be incorporated into the total cost comparison; not just the outage costs and capital costs. This analysis included the variable production costs of each unit plus the cost of purchasing electricity from interties, interrupting certain customers, and reducing voltage.
3. Environmental cost differences between different reliability levels should also be considered. While the costs were not explicitly included in the analysis, qualitative consideration was given to the environmental benefits or penalties at different levels of service reliability.

The study also results in a number of unique observations:

1. Asymmetry of Consumer Cost. Reserve margins much below the optimal reserve margin tend to have much higher costs than reserve margins much above the optimal reserve margin. This suggests that if two reserve margin levels have the same expected value, the higher reserve margin is a more appropriate selection based on its lower risk profile.
2. The total cost curve is relatively flat at a wide range of reserve margins near the optimal economic reserve margin. This also supports carrying higher reserve margins since the cost differences are not substantial.
3. The economically optimal reserve margin can vary substantially depending on the resource mix, unit performance, load and load growth profile, and other factors. The optimum reserve margins for the 4 utilities studied ranged by approximately 15%.

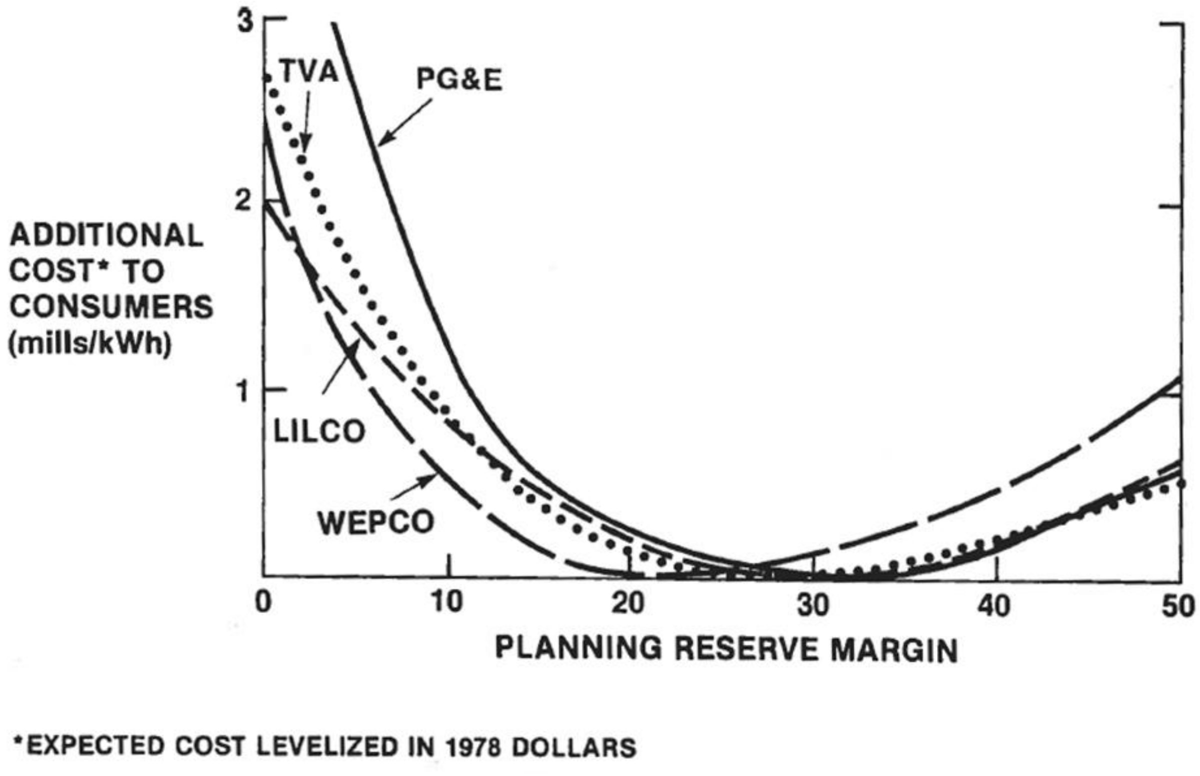
---

[39] Decision Focus, Incorporated, *Costs and Benefits of Over/Under Capacity in Electric Power System Planning,* EPRI EA-927, Project 1107, October 1978

4. Old technologies can have a substantial impact on the economically optimal reserve margin. If the marginal unit used to increase or decrease reserves has an operating cost less than a substantial portion of a utility's existing resources, the economically optimal reserve margin may be quite high. Regardless of how high the reserve margin is, as long as adding resources is offsetting the dispatch of a significant portion of existing resources, their addition could be economic.

The results of the analysis indicate that reasonable economic reserve margins fall in the range of 15% to 40% as shown in the Figure 2 below. While the study did not explicitly compare these reserve margin levels to 1-in-10 LOLE based reserve margins, the paper suggests that economic reserve margins are not necessarily lower than reserve margins determined by physical reliability metrics. Further, even at reserve margins above those standards, the additional costs are not that substantial. This conclusion is counter to a number of other value of service studies that indicate that economically set reserve margins are always lower than 1-in-10 LOLE based reserve margins.

Figure 2. Total Costs as a Function of Planning Reserve Margin

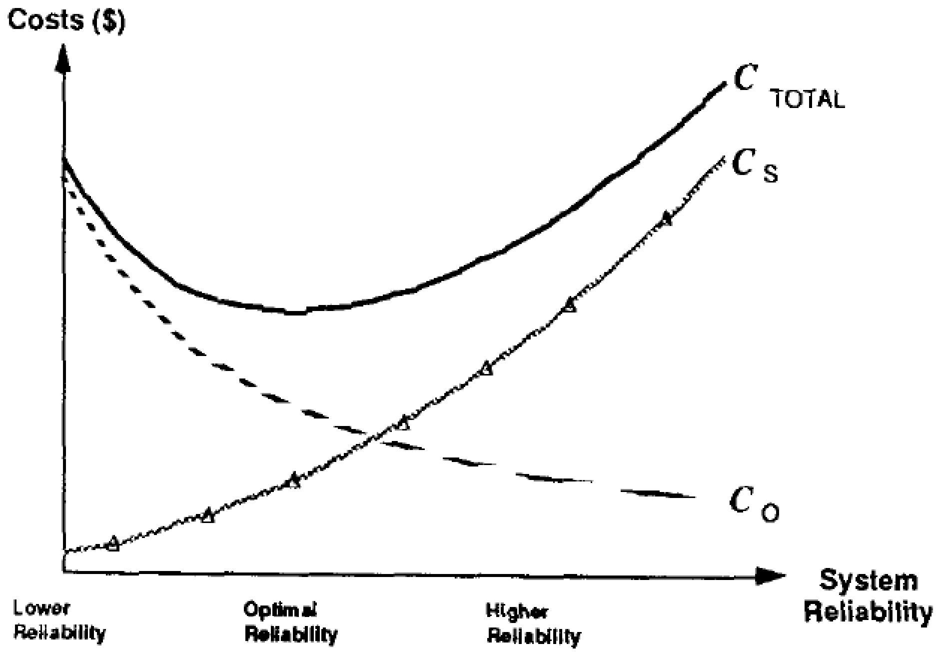


C. PGE Value of Service Reliability (1990)

In 1990 Sandra Burns and Dr. George Gross authored a paper called Value of Service Reliability[40] that studied the Value of Service approach to resource adequacy planning. Ms. Burns and Dr. Gross begin by stating valid points why physical metrics such as LOLE and LOLP are somewhat arbitrary and don't take into account the economic impact on customers. For example the paper said ~~—it~~ is difficult to determine from a societal point of view whether a 1 day in 10 years LOLP is more appropriate than 1 day in 5 years or 1 day in 20 years."

Next the paper discussed the Value of Service framework in which the marginal costs of additional reserves are compared against the marginal benefit of additional reserves. Figure 3 summarizes this method. Co represents cost to customers when demand cannot be met and Cs represents capital investment expenditures. As reliability increases (or reserve margin increases), investment expenditures increase while customer costs due to the utility not meeting demand decrease. At some point the benefit of the additional capacity is not justified.

Figure 3. Variation of Costs as a function of reliability

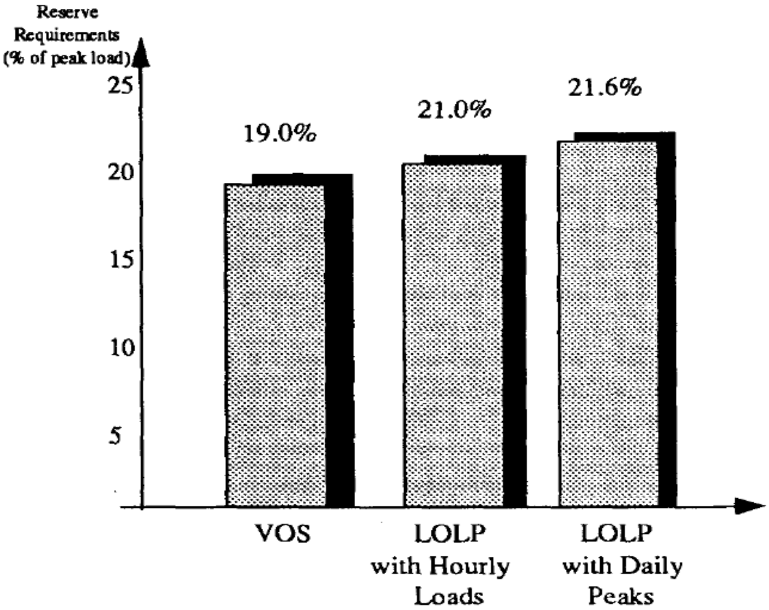


To develop a proper estimate for Co, PGE used recent customer outage surveys which resulted in a weighted average customer cost of $3/kWh. Next, the author compared the economic approach to two different physical reliability metrics. The first approach used hourly loads and calculated the reserve margin assuming an LOLH of 2.4 hours per year while the second method used daily peaks to calculate an LOLE of 0.1 days per year. The results are seen in Figure 4. The economic approach produced a lower reserve margin than the traditional physical reliability approaches.

---

40 Burns, Sandra and Gross, George, *Value of Service Reliability,* IEEE Transactions on Power Systems, Vol.5, No.3, August 1990

Figure 4. Value of Service vs. LOLP



The study implies a general relationship that a reserve margin based on value of service would be less than the 1-in-10 LOLE metric.

D. On an 'Energy Only' Electricity Market Design for Resource Adequacy (2005)

While this paper[41] by William Hogan was not specifically designed to address the economic reasonableness of using specific physical reliability metrics to set target reserve margins, it does address resource adequacy and the missing money problem in structured markets. Mr. Hogan's paper provides informative insights into the economics of resource adequacy from the perspective of generators. He proposes a number of improvements to the design of energy markets that could alleviate the need for additional capacity payments and still provide generators adequate revenue to cover their costs. He recognizes that in current markets, many generators do not fully recover their costs. His explanation for this gap is that "the missing money problem arises when occasional market price increases are limited by administrative actions such as price caps." While we agree that price caps are certainly a component of missing money, in the absence of a reserve margin target, generators theoretically should offer less capacity to the market such that, even with the price caps in place, generators still receive adequate revenue. Imagine a system with price caps at $500/MWh. With this low cap, fewer generating assets should be built since they can't expect adequate returns at a higher reserve margin. This lower reserve margin will result in scarcity situations more frequently producing adequate returns for marginal generators, however the tradeoff would be that physical reliability would decline.

[41] Hogan, William (2005), "On an ―Energy Only" Electricity Market Design for Resource Adequacy."

We are not suggesting that an energy market with low price caps is an ideal market structure. We are simply illustrating that regardless of market structure, generators should theoretically target a reserve margin that produces adequate returns regardless of the reliability implications.

One aspect of Hogan's solution for the missing money problem is to eliminate price caps and implement an administrative scarcity pricing curve. He states: "For any level of capacity that provides a given level of reliability, there is some set of shortage prices that would produce generator revenue streams that if correctly anticipated would be sufficient to sustain that level of capacity." While this is a valuable insight, it does not speak to whether the given level of reliability is economically appropriate. Hypothetically, the given level of reliability could require a 30% reserve margin. The administrative scarcity pricing curve would have to be extremely high, well above the true value of the reserves, in order to achieve cost recovery.

E. Reconsidering Resource Adequacy: Has the one-day-in-10-years criterion outlived its usefulness? (2010)

Mr. James Wilson recently published an article[42] in the Public Utilities Fortnightly examining the one-day-in-ten year standard and whether or not it was economic. Mr. Wilson states ―The 1-in-10 criterion always has been highly conservative--perhaps an order of magnitude more stringent than the marginal benefits of incremental capacity can justify—and capacity planning has been even more conservative in practice." He uses examples comparing the Value of Lost Load x LOLE x hours per event to Net Cost of New Entry (CONE) which represents the capital costs of a new combustion turbine net of energy and ancillary service revenues as shown in the table below. Utilizing the examples, in all cases the optimal amount of LOLE is higher than the 0.1 LOLE standard as shown in the following table. For example, in order to justify a $120,000/MW-year Net CONE, the resource must offset 6 LOLE events per year assuming 5 hours per event and a VOLL of $4,000/MWh. (Note: the units from the article for VOLL should be $/MWh and the units of Net Cone should be $/MW-yr)

[42] Wilson, James, *Reconsidering Resource Adequacy,* retrieved on September 4, 2012 from http://www.fortnightly.com/uploads/04012010_ResourceAdequacyP11.pdf

Table 3. Optimal LOLEs for Various VOLL and Capital Cost Assumptions

Value of service (VOLL)	Net Capital Cost (Net CONE)	Hours per outage event	Optimal LOLE	Optimal Nines
$/MW-year	$/MWH	hours/event	events/yr	
$4,000	$120,000	5	6.0	2.5
$4,000	$80,000	5	4.0	2.6
$4,000	$40,000	5	2.0	2.9
$2,000	$120,000	5	12.0	2.2
$2,000	$80,000	5	8.0	2.3
$2,000	$40,000	5	4.0	2.6
$20,000	$120,000	5	1.2	3.2
$20,000	$80,000	5	0.8	3.3
$20,000	$40,000	5	0.4	3.6

Moreover, Mr. Wilson states the following: ―The tendency is often to adopt conservative assumptions for many of these values, to make the overall result of the analysis conservative (i.e. erring on the side of too much rather than too little capacity and reliability, identifying too large rather than too small a reserve margin).” In conclusion, Mr. Wilson argues that the 1-in-10 LOLE standard is not an economic target and that economics would indicate much lower target reserve margins.

Mr. Wilson‘s article is primarily targeted toward the PJM system. In agreement with his assessment of PJM, our review of regions in the Eastern Interconnection indicates that PJM‘s planning study assumptions are potentially conservative. However, in concurrence with our other assessments, we believe that Mr. Wilson is not including some key components of the value of marginal capacity in his analysis. A marginal resource provides substantially more value than simply displacing firm load shed events.

F. The Economics of Resource Adequacy Planning: Why Reserve Margins Are Not Just About Keeping the Lights On (2010)

Astrape Consulting cooperated with the Brattle Group to write the paper titled ―The Economics of Resource Adequacy Planning”[43] which was published by NRRI in April of 2011.

The paper describes an economic approach to resource adequacy planning and compares it to results utilizing two different definitions of the 1-in-10 LOLE standard. The authors develop a case study using a resource adequacy model that not only calculated LOLE but also takes into account economic dispatch and costs. The methodology balances the cost of new capacity (CT) with the benefit the resource provides. In this study, the benefit is defined as the following:

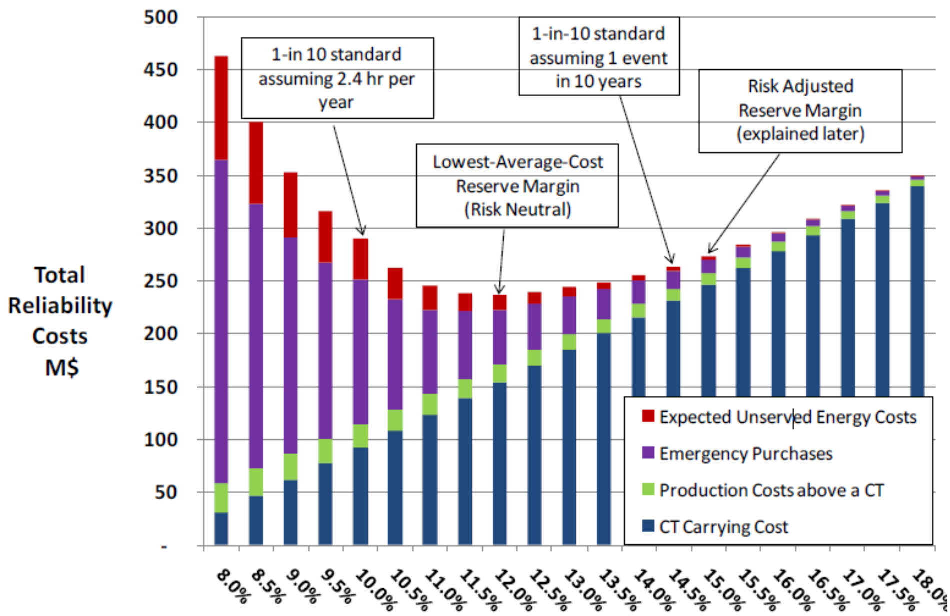
---

[43] Carden, Pfeifenberger, Wintermantel, *The Economics of Resource Adequacy Planning: Why Reserve Margins Are Not Just About Keeping the Lights On, NRRI, April 2011, retrieved on September 3, 2012 from* http://www.nrri.org/pubs/electricity/NRRI_resource_adequacy_planning_april11-09.pdf

- Production-Related Reliability Costs – defined as any costs of the system's physical generation above the dispatch cost of the new capacity resource. This includes the dispatch of higher-cost generators such as oil-fired turbines and old natural gas turbine units. The addition of a new capacity resource would offset some but not all of these costs.
- Emergency Purchase Costs – defined as the costs of any purchases at prices higher than the cost of the marginal capacity resource. In our simulations, these emergency purchase costs, including purchases associated with demand-side resources, can range from \$1/MWh above the dispatch cost of a CT to the cost of unserved energy (*e.g.*, well in excess of \$1,000/MWh) under extreme conditions.
- Unserved Energy Costs – The value of lost load to customers. This value typically is derived from customer surveys.

The point is made that the majority of costs from the California Energy Crisis were comprised of expensive energy prices in the marketplace and not due to firm load shed. A marginal resource has the ability to reduce scarcity pricing events as well as reduce firm load shed events. The results of the study are seen below. The economic reserve margin target (Lowest-Average-Cost Reserve Margin) was higher than a 2.4 LOLH based reserve margin and lower than a 1-in-10 LOLE based reserve margin. The authors make the point that dependent on the system, the economic reserve margin could be higher or lower than the 1-in-10 LOLE target.

Figure 5. Lowest Average Cost Reserve Margin



The fundamental distinction of this study is that there is a significant focus on the costs of emergency purchases and the impact of scarcity pricing in markets. Dependent on the severity of the weather and load forecast uncertainty in a particular case, it is reasonable to assume that a CT could be dispatched 0 hours up to 1,500 hours in a given year. In years where a CT is dispatched substantially, it is important to recognize all the benefits the resource provides. Alongside the weighted average or expected results, the authors discuss the importance of understanding the full distribution of potential costs from all scenarios comprised of combinations of weather and load forecast uncertainty. Given that reliability events are low-probability high-impact events, the tails of the distribution of possible scenarios are important.

One of the critiques of the approach put forward by Brattle and Astrape is that there was no weather diversity considered causing the scarcity pricing to be too high, and that the load forecast error distribution assumed provides limited flexibility in adjusting resource plans if load grows faster than expected. Reviewers have suggested that the conservative nature of these assumptions led to higher than optimal reserve margins. These critiques have been considered by the authors and have been incorporated in the simulations for this white paper. For example, each region‘s load was modeled based on hourly historical weather to ensure proper weather diversity is taken into account.

Additional Scholarly Works that Address the Economics of Reliability:

- Electric Utility System Reliability Analysis: Determining the Need for Generating Capacity (1988) by Biewald and Bernow
- Reliability Evaluations of Power Systems, Billinton (1990)
- Southern Company Reserve Margin Studies (1997, 2004, 2007, 2009)
- Louisville Gas and Electric Reserve Margin Study (2010)
- Peter Cramton and Steven Stoft (2006), "The Convergence of Market Designs for Adequate Generating Capacity."

In summary, we reviewed multiple economic studies which assessed the reasonableness of the 1-in-10 LOLE standard and summarized the findings of 6 of those studies. The EPRI Over/Under study and the study produced by Astrape Consulting/The Brattle Group demonstrated economic target reserve margins that could be below or above LOLE 1 day in 10 year targets. The remaining studies (Telson, PGE VOS, Wilson) all implied that the economic target would likely be lower than the 1-in-10 LOLE target. Given the sensitivity of the results to input assumptions, it is likely that changes to the cost of carrying capacity, the value of lost load, and load uncertainty since some of those studies were published would affect conclusions. Further, in reviewing methodologies, the major difference was defining the benefits that a marginal resource provides. The benefits defined varied across the studies from including all costs above the dispatch cost of a CT (i.e. emergency purchases, DR costs, and unserved energy) to only including the Value of Lost Load to customers.

Economists may argue that the economic optimal target should only be based on total societal costs which would include only total production costs (fuel burn + O&M) plus the cost of unserved energy and ignore the scarcity pricing situations that occur in the market place. The argument is that these high cost purchases only represent a transfer of wealth from one region to another or from customers to generators rather than an actual societal cost. However, the approach of only considering net societal costs largely ignores the bigger question of how costs and revenues are shared among the participants in the system. Assume an example system minimizes total societal costs at a reserve margin of 8%, and at this level total societal costs annually are $5 billion in fuel, O&M, and capital costs. When the economics of each participant are considered however, there may be significant market distortions. If this was an energy-only system and reserves approximately matched the minimum societal cost reserve margin of 8%, significant scarcity would be prevalent. The market price in many hours would be set by scarcity pricing even though the total production costs are still minimized at this low reserve margin. Because of this scarcity, generators may extract $8 billion in energy costs from consumers in a given year, a $3 billion transfer of wealth. This is ignored in the societal cost minimization approach, but represents a significant concern.

In competitive markets, if there is a distortion resulting in a transfer of wealth from consumers to generators, then new generation would theoretically enter the market until the marginal unit is only recovering its costs. The new capacity would raise the reserve margin and eliminate the wealth transfer. But now the system is no longer targeting the optimum reserve margin based on minimizing societal costs. The reserve margin target becomes the level at which generators recover costs. But as we will discuss in later sections of the report, total systems costs in an energy only market at the point of generator cost recovery may not be optimal when compared to other potential market structures.

The minimization of net societal costs approach is instructive in a number of ways. If an entire system consists only of vertically integrated utilities, and all transfers are passed on to customers at cost, and planning is coordinated between all utilities, the minimization of net societal costs is theoretically correct. The results from such an analysis could be compared to the minimum customer cost approach for a single utility to identify the magnitude of the inefficiency due to not coordinating all planning activities.

IV. VOLL ESTIMATES AND THEIR IMPACT ON RESOURCE ADEQUACY PLANNING

Over the last several decades, there have been many customer surveys and studies performed to estimate the value of lost load to customers. Two comprehensive studies which aggregated many of the individual surveys were performed for the U.S. Department of Energy (DOE) by Ernest Orlando Lawrence Berkeley National Laboratory in November 2003 and updated again in June 2009[44]. For this analysis, we will focus on the results from the June 2009 study. The study takes results from 28 customer value of service reliability studies conducted by 10 major US electric utilities over the 16 year period from 1989 to 2005. The majority of these studies are not available publicly and were only made available by utilities for this specific DOE study. The results were combined into a single meta-database and a regression model was developed to calculate customer costs per event by season, time of day, day of week, and geographical regions within the U.S.

The study divided customer groups into the following:

- Medium and Large Commercial and Industrial (more than 50,000 annual kWh usage)
- Small Commercial and Industrial (less than 50,000 annual kWh usage)
- Residential Customers

The following tables summarize the data found in the study.

Table 4. Value of Lost Load Summary: Summer Weekday Afternoon

Interruption Cost $/event	Momentary	30 minutes	1 hour	4 hours	8 hours
Medium and Large C&I	$ 11,756	$ 15,709	$ 20,360	$ 59,188	$ 93,890
Small C&I	$ 439	$ 610	$ 818	$ 2,696	$ 4,768
Residential	$ 2.70	$ 3.30	$ 3.90	$ 7.80	$ 10.70

$/kWh Unserved Energy at Customer Peak*	Momentary	30 minutes	1 hour	4 hours	8 hours
Medium and Large C&I		$ 30.83	$ 19.98	$ 14.52	$ 11.52
Small C&I		$ 85.50	$ 57.33	$ 47.23	$ 41.77
Residential		$ 1.30	$ 0.77	$ 0.38	$ 0.26

[44] Ernest Orlando Lawrence Berkeley National Laboratory, *Estimated Value of Service Reliability for Electric Utility Customers in the United States,* June 2009

*Peak Loads used to calculate interruption costs in $/kWh for each customer class were based on reported average kWh energy use and assumed an 80% load factor for medium and large customers, 40% load factor for small customers, and 30% load factor for residential[45]

In performing economic resource adequacy analysis, the $/kWh value associated with unserved energy at peak is the value that is typically used as the Value of Lost Load assumption. Assuming that firm load shed would be spread equitably among all customer classes, a weighted average of the system's customer class mix can be calculated to develop a system $/kWh value for the region being studied. The weighted average $/kWh for Unserved Energy using the 1 hour values is $26.02/kWh.

The table shows that as the duration of the outage increases, the $/kWh value decreases. The first hour is typically the most expensive as customers have an opportunity to mitigate the impact of an outage in subsequent hours. The results also show that Residential Customers have the lowest costs while Small C&I Customers have the greatest costs. This is logical as residential customers generally only have some discomfort and minor loss such as spoiled food during outages. We typically see the VOLL for residential customers to be less than $3/kWh. Businesses have a much higher cost. Technology has been a major driver for the increase in commercial business outage costs as computer systems have become so vital in today's work environment. For retail business, there is lost sales revenue as businesses may be forced to close during the outage. For industrial customers, the costs of lost product and lost revenue drive the estimates.

The next table shows how outage costs varied by season, day of week, region, and industry. It is seen that depending on the industry and size of the business, the VOLL can vary greatly. For Medium and Large C&I Customers, the outage costs can vary from $2.8/kWh to $40.9/kWh depending on the industry. For Small C&I Customers, costs range from $21.7/kWh to $108.7/kWh. VOLL is an uncertain value, but as our case study demonstrates, the assumption does not have a significant impact on the economics of resource adequacy. In a system that is planning to the 1-in-10 LOLE standard, the amount of expected unserved energy (EUE) is small and therefore limits its impact on economic results. While the raw average estimates from the aggregated studies indicated a much higher VOLL, due to the large variance in VOLL estimates, $15,000/MWh was assumed in the case study as a blended rate for residential, commercial, and industrial customers.

[45] Ernest Orlando Lawrence Berkeley National Laboratory, *Estimated Value of Service Reliability for Electric Utility Customers in the United States,* June 2009; Table ES-1 costs per event were converted to $/kWh based on the peak load assumption for each customer class.

Table 5. Cost per Event across Season, Day, Region, and Industry[46]

	Cost per Event of 1-Hour Outage					
	Medium and Large Commercial and Industrial Customers 2008$		Small Commercial and Industrial Customers 2008$		Residential Customers 2008$	
Season	Costs $	$/kWh*	Costs $	$/kWh*	Costs $	$/kWh*
Winter	$ 11,129	$ 10.9	$ 543	$ 38.1	2.9	$ 0.6
Summer	$ 15,628	$ 15.3	$ 737	$ 51.6	4.7	$ 0.9
Day						
Weekend	$ 2,249	$ 2.2	$ 459	$ 32.2	8.6	$ 1.7
Weekday	$ 16,478	$ 16.2	$ 765	$ 53.6	4	$ 0.8
Region						
Midwest	$ 12,294	$ 12.1	$ 732	$ 51.3		
Northwest	$ 3,552	$ 3.5	$ 341	$ 23.9	3.2	$ 0.6
Southeast	$ 23,797	$ 23.4	$ 799	$ 56.0	6.6	$ 1.3
Southwest	$ 5,946	$ 5.8	$ 967	$ 67.8	1.8	$ 0.4
West	$ 18,166	$ 17.8	$ 886	$ 62.1	3.7	$ 0.7
Industry						
Agriculture	$ 1,063	$ 1.0	$ 352	$ 24.7		
Mining	$ 18,501	$ 18.2	$ 1,545	$ 108.3		
Construction	$ 3,663	$ 3.6	$ 1,301	$ 91.2		
Manufacturing	$ 41,691	$ 40.9	$ 913	$ 64.0		
Telco. & Utilities	$ 8,837	$ 8.7	$ 810	$ 56.8		
Trade & Retail	$ 2,818	$ 2.8	$ 627	$ 43.9		
Fin., Ins. & R.E.	$ 5,790	$ 5.7	$ 975	$ 68.3		
Services	$ 4,810	$ 4.7	$ 531	$ 37.2		
Public Admin	$ 12,239	$ 12.0	$ 310	$ 21.7		

*Peak Loads for each customer class were based on the report's average kWh energy use and assumed an 80% load factor for medium and large customers, 40% load factor for small customers, and 30% load factor for residential [47]

Based on the variation of VOLL values provided by businesses, it is easy to recognize the need for demand response programs with different characteristics. For a customer with very low outage costs, it would be rational for them to curtail load when prices reach a threshold of $150/MWh while a customer who has high outage costs and no backup generation would likely not participate in a program. As part of the simulation portion of this paper, we analyze what happens to reliability as the penetration of demand resources increase without increasing the dispatch constraints. As DR penetration increases, energy prices will increase and DR resources will be called upon much more frequently. The estimation of

[46] No studies available to be summarized for black shaded cells.

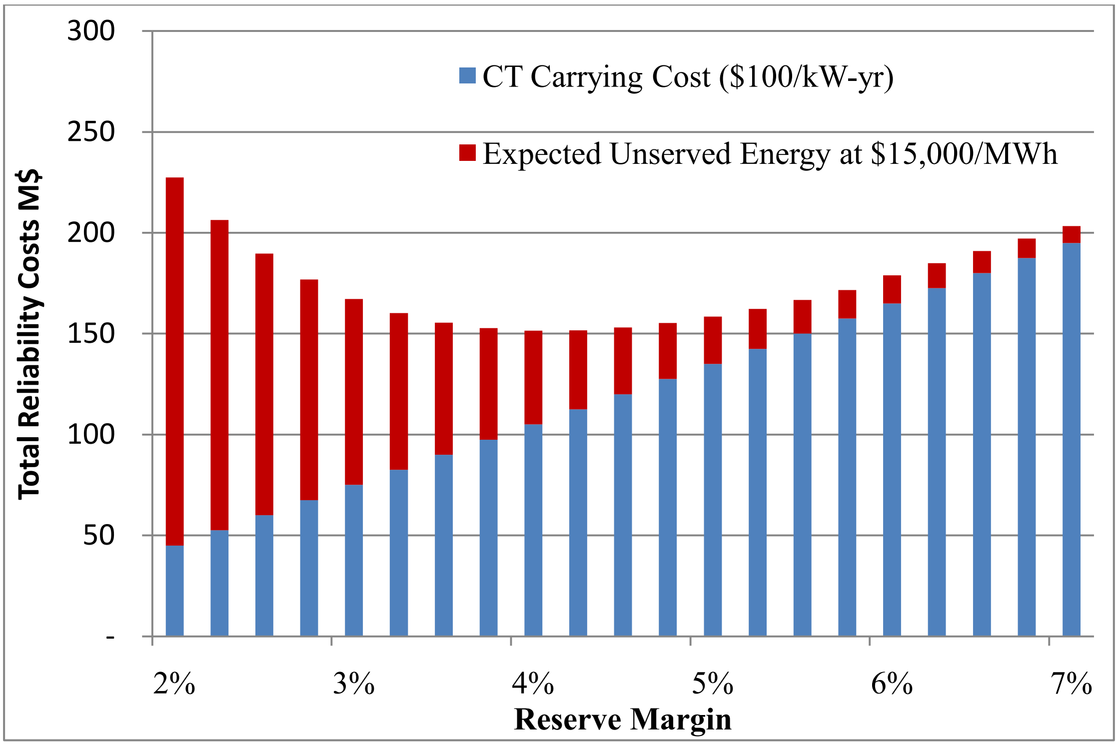
[47] Ernest Orlando Lawrence Berkeley National Laboratory, *Estimated Value of Service Reliability for Electric Utility Customers in the United States,* June 2009; Table 3-4, Table 4-4, and Table 5-4 average costs per event were converted to $/kWh based on the peak load assumption for each customer class.

these calls is going to be vital to resource adequacy planning in the next decade, particularly because DR resource participants are voluntary participants who may choose to discontinue participation if DR resource use hits thresholds of tolerance.

V. DETERMINING THE OPTIMAL RISK NEUTRAL AND RISK ADJUSTED ECONOMIC RESERVE MARGIN

Most of the research papers cited in Section III compared the cost of incremental capacity to the economic benefit of reduced unserved energy costs provided by the capacity under a vertically integrated utility environment. As an example of this methodology, if adding new capacity costs $100/kW-yr, and the value of lost load is $15,000/MWh, the new capacity would need to offset more than 6 hours of lost load per year to be economically justified. However, since the 1-in-10 LOLE standard represents only 0.3 hours of lost load per year, the economic reserve margin would be much lower than the 1-in-10 LOLE based reserve margin as shown in the Figure 6 below. The economic reserve margin is 4% in our case study if only EUE is taken into consideration as the benefit additional capacity provides. Again, this is the economic reserve margin for this particular analysis because adding capacity up to a 4% reserve margin costs less than the economic societal benefits of reduced EUE for this region. Above a 4% reserve margin, adding capacity costs more than the economic societal benefits produced in reducing EUE. A 4% reserve margin results in the minimum capacity plus EUE costs.

Figure 6. Cost of Capacity vs. Reduction in Expected Unserved Energy Costs



However, system planners should be attempting to minimize total system costs to customers, not just a subset of system costs. Every benefit of incremental capacity should be considered. In addition to avoiding the societal costs of shedding firm load, adding new efficient gas turbines would avoid the dispatch cost of many inefficient existing units and avoid expensive market purchases during hours when capacity is scarce. When taking these additional benefits into consideration, total system costs continue to drop as capacity is added well above a 4% reserve margin.

In the following case study we will explore potential methods of determining a risk neutral and optimal risk adjusted target based on total system costs to customers.

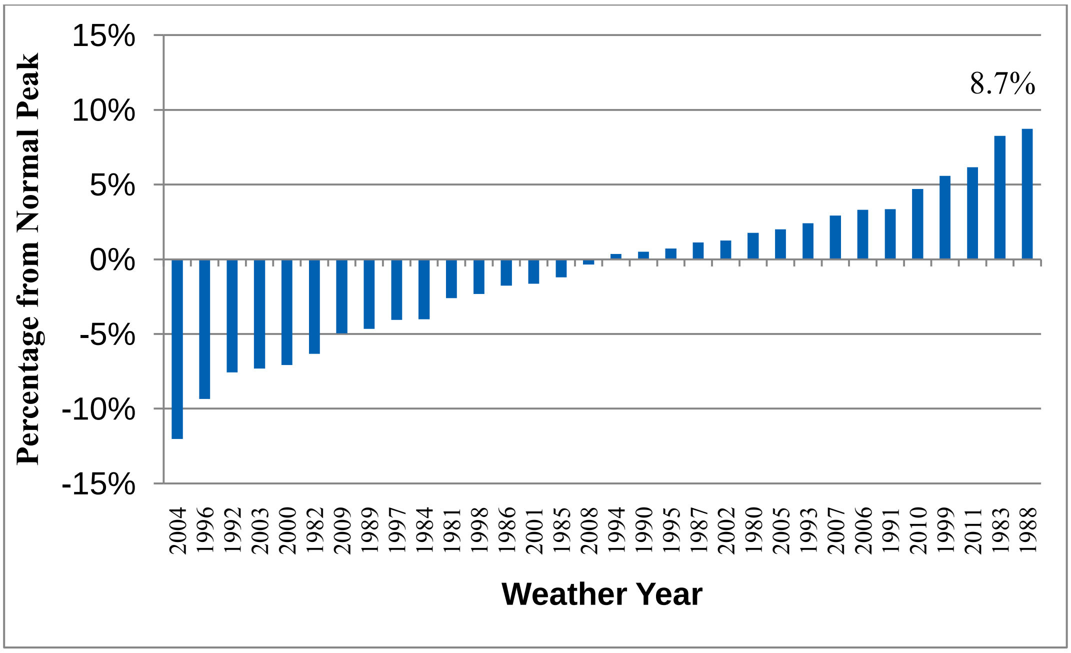
A. Case Study Description

The following is a brief overview of the case study setup. The Eastern Interconnection Planning Collaborative (EIPC) has recently performed its Eastern Interconnection Transmission Study. The primary objective of the EIPC study was to aggregate the modeling and regional transmission expansion plans of the entire Eastern Interconnection and to perform regional analyses to identify potential conflicts and opportunities between regions. The EIPC study simulates all loads, generating resources, and transmission resources for all individual regions. Input data for the case study presented in this report uses data from the EIPC study as inputs, including region definitions, load forecasts, generating resource mixes, and transmission capabilities. Because the scope of this white paper was limited, only a subset of 14 of the NEEM regions from the EIPC study was included. For resource adequacy studies, accurate representation of the uncertainty in loads and generator availability is necessary to capture the frequency of reliability events. Firm load shed and extremely high market prices are typically only concerns when loads are much higher than normal or generating resources are less available than normal.

To accommodate this additional uncertainty, we included distributions around the following variables:

- Weather Uncertainty. Figure 7 demonstrates that summer peak load could be as much as 8.7% higher than normal peak load due to weather uncertainty in the PJM Rest of MAAC (PJM ROM) region. This is fairly typical across most of the regions in the Eastern Interconnection. Weather also impacts hydro, thermal, and intermittent resources which was also captured in the case study (See Appendix A).

Figure 7. Weather Impact on Peak Load for PJM Rest of MAAC



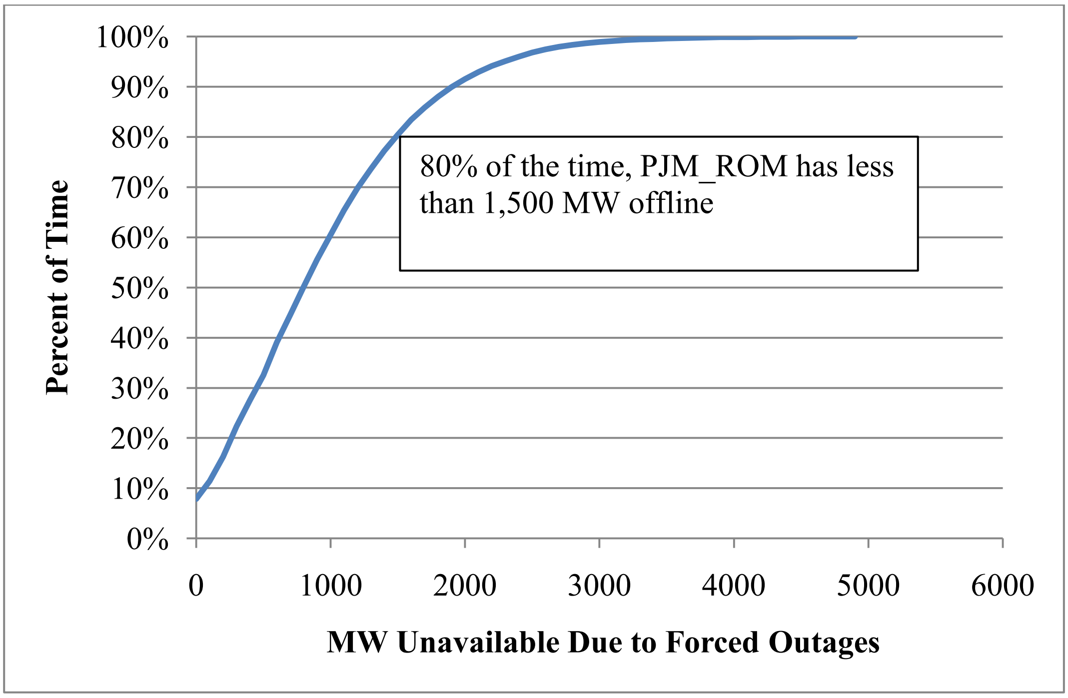
- Load Forecast Uncertainty. All loads for a given year could be as high as 5% higher (although this has a very low probability of occurring) than normal due to unexpected economic growth over a 4 year period as seen in the distribution in the Figure 8. The 6 discrete points in the table with associated probabilities were used in the simulation. This economic uncertainty captures the boom-bust cycle inherent in electric markets. Some years the market will have excess capacity above the target reserve margin and other years markets will be below the target reserve margin. This error distribution was developed from analyzing how well the Congressional Budget Office was able to forecast GDP three to four year out. That distribution of performance was translated to electric demand using a multiplier of .4% load growth for every 1% of GDP growth. The development of this distribution is further explained in the Appendix A.

Figure 8. Economic Load Forecast Error

Load Forecast Error	Probability
5.11%	6.25%
3.90%	18.75%
0.55%	31.25%
-1.76%	18.75%
-2.90%	12.50%
-4.54%	12.50%

- Unit Performance Uncertainty. Figure 9 shows that the study system is expected to have approximately 800 MWs in a forced offline state on average, but there are hours in which the system could have 2,000 MWs offline. The figure also shows that 80% of the time the region will have less than 1,500 MW offline due to forced outages.

Figure 9. Unit Performance Distribution



Additional modeling details can be found in Appendix A.

Each scenario modeled in SERVM[48] consists of one economic forecast error point and one weather year. The first scenario simulated used 1980 historical weather and a 5% under forecast of load growth. To build the loads for this year, the 8760 hour loadshape from the source weather year was multiplied by the economic forecast error multiplier. The resulting 8760 hour loadshape represents what the hourly loads would be expected to be in 2016 if the system experienced the same temperatures as 1980 and loads grew 5% faster than expected due to economic growth. This discrete scenario was simulated for 400 iterations. Each iteration runs for all 8760 hours for a single projected year (2016) attempting to match load and resources at the lowest system cost. Several stochastic variables including unit performance and dispatch error are used and result in independent costs and metrics for each iteration. The average of all the system costs and physical reliability metrics from all these iterations represent the expected values for this scenario.

In all, this process is repeated 192 times. Thirty two weather years combined with 6 economic forecast error points create 192 discrete scenarios. Simulating these scenarios for 400 iterations results in a full distribution of possible outcomes for the year 2016. It should also be noted that this process is applied to all regions in the study. When a 1980 weather year is being simulated, it is used for all regions. This modeling ensures that the actual differences in weather for each respective hour across the study system are captured. For example, when simulating July 9th, 1980, the loads for every region were developed using temperatures from July 9th, 1980. As the sensitivities demonstrate, the ability for one balancing area to provide assistance to another is critical, and understanding load diversity is a necessary component to that ability.

For this particular case study, we focused on the PJM Rest of MAAC (PJM_ROM) NEEM region from the EIPC Study. Although in reality this region is a participant in a structured market, for purposes of the base case analysis, it is treated as a vertically integrated utility. The purpose for this assumption is to simplify the economic comparison. When treated as a single vertically integrated utility, most of the internal load is served by resources within the region at those units‘ production cost. Purchases from outside the region are also assessed at their production cost unless the region is in a scarcity situation. Capacity is self-owned or procured through bilateral transactions between the utility and generators. Modeling the base case this way allows costs for consumers to be easily calculated. The economic reserve margin is based on minimizing total system costs for consumers. The applicability of this analysis to structured markets is discussed in section D of this chapter.

For this study, we set planning reserve margins for all other regions to their defined EIPC Study targets. Next, simulations were run for the study region from 10% reserves to 20% reserves in 2% intervals. To achieve the higher reserve margin levels, natural gas combustion turbine capacity was added. At each reserve margin level, LOLE, total system costs, and hourly market prices were tabulated. While the intent of economic reserve margin planning is to minimize total system costs to customers, the only difference between reserve margin levels is the addition of efficient CT capacity, so all base load costs can be ignored. Only costs that are above the dispatch costs of the marginal CT are tracked which represent the difference in total system costs. These system costs are made up of the following components:

[48] SERVM is an economic resource adequacy model that is used by utilities to develop optimal reserve margin targets using economics as well as LOLE.

1. Production Costs above the dispatch cost of a CT (i.e. the dispatch of oil resources)

2. Net Purchases above the dispatch cost of a CT. Anytime the studied region purchased or sold at costs higher than the marginal cost of a CT, the net purchase costs were tabulated.

3. Unserved Energy Costs (MWh of unserved energy * VOLL) For the base case, the VOLL of was assumed to be $15,000/MWh. A sensitivity around this assumption is included in the sensitivity section.

4. Carrying Cost of additional CT Capacity. For the base case, $100/kW-yr was assumed. Results will be shown ranging from $80/kW-yr to $120/kW-yr.

   For the case study, reserve margin was defined as the following:

   Reserve Margin = (Total Capacity Resources – Expected Peak Load) / (Expected Peak Load)

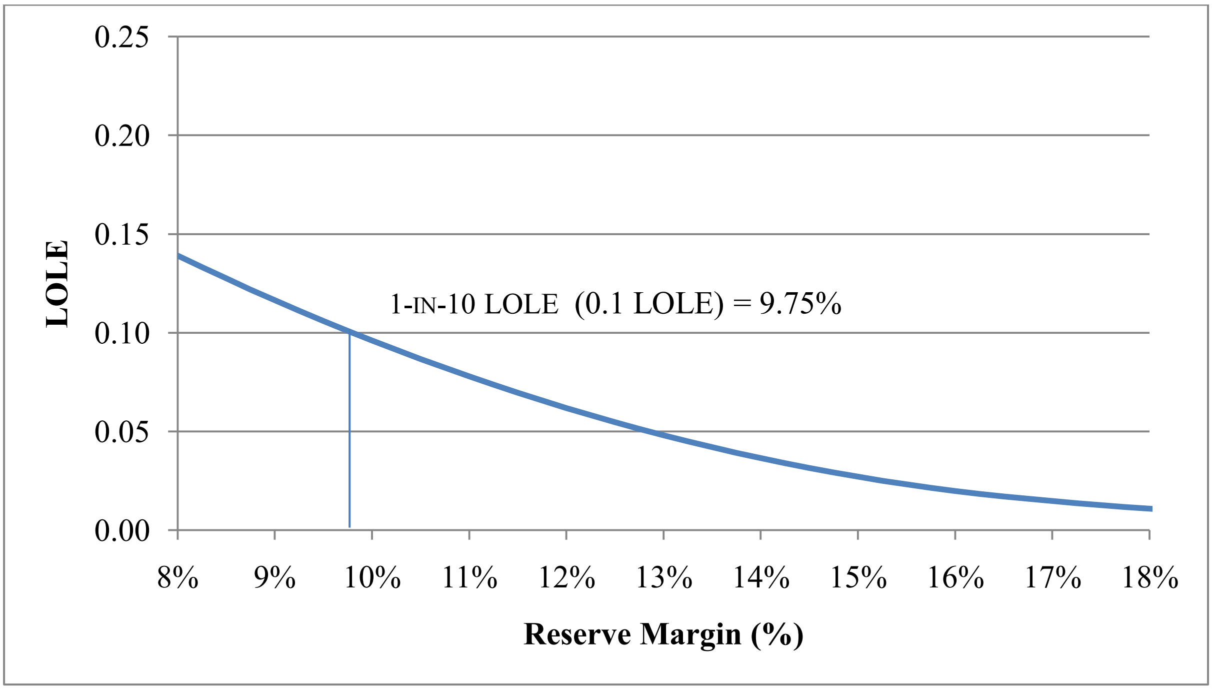
   where total resources includes all demand response resource capacity and the effective load carrying capability of wind and solar resources. See the appendix for these effective load carrying capability values.

B. Base Case Results Assuming a Vertically Integrated Utility

The following figures and sections discuss the Base Case Results.

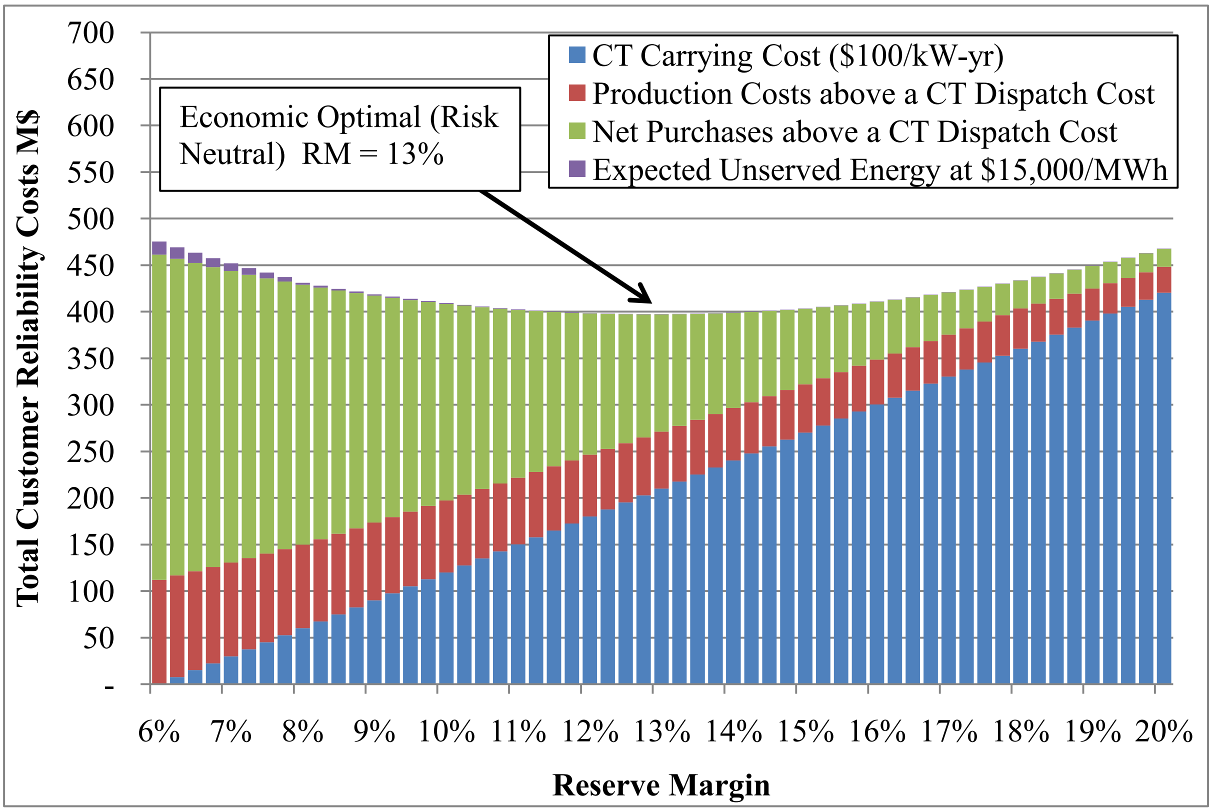
Figure 10 demonstrates that the reserve margin needed to meet the 1-in-10 LOLE standard (LOLE of 0.1) for the PJM_ROM region is 9.75%. An LOLH of 2.4 was met at below 8%. It should be noted that LOLE results are sensitive to input assumptions. As noted in the review of resource adequacy studies, PJM's own assessment indicates 1-in-10 LOLE for the entire PJM RTO falls at 15.3%. The two studies are not directly comparable since this analysis only considers one sub region of PJM and only generic unit outage data was used instead of utilizing actual historical generator availability data. However, one significant reason for this difference is that the PJM study assumes 3,500 MW of import capability, whereas the EIPC inputs assume 9,000 MW+ of import capability. Also, PJM derates 1,800 MW on peak due to temperature. The point here is not to challenge assumptions, but rather to demonstrate how large of a difference the selection of various inputs can change the results of the study. In addition to these, a number of other components that had the capability of shifting the 0.1 LOLE reserve margin by several percentage points were identified– at what point is demand response dispatched, will regions dispatch high cost or energy limited resources to support other regions, will a region shed firm load to maintain operating reserves, how much load diversity can be expected between regions, and will emergency hydro be available during peak load conditions. A few of these questions are addressed in the sensitivity section. While these assumptions can make a substantial difference in LOLE, they only affect a few hours per year or per decade, thus they typically don't have a meaningful impact on total costs or change the optimal economic reserve margin. Since the optimal economic reserve margin is affected by a much larger set of hours and events, it is typically less sensitive to minor inputs.

Figure 10. LOLE



The following figure, Figure 11, demonstrates the differences in system costs at a variety of reserve margin levels. The PJM ROM system represents ~30,000MW at peak load. A change of 1% reserve margin is approximately 300 MW. The carrying cost of this change is $30M/yr assuming the cost of capacity is $100/kW-yr. By adding this incremental capacity when the system is at a 10% reserve margin, total system energy costs (all production costs and purchase costs above the dispatch cost of a CT plus the cost of societal unserved energy) drop by $43M/yr and therefore justify the additional capacity. The additional capacity met a number of distinct needs. In some hours, the additional capacity was used to avoid high cost purchases. In other hours, the capacity avoided the dispatch of high cost resources such as oil turbines. During scarcity pricing conditions, the additional capacity may have avoided purchase costs and lowered market prices. A system that has 300 additional MW available will have lower scarcity prices than one which is 300 MW closer to not being able to serve firm load. And in extreme conditions, the additional capacity may have directly offset firm load shed. In looking at the graph, it is obvious that the benefit of reducing EUE is minor compared to the reduction in other costs as we have stated previously. The cost of EUE could vary greatly and have very little impact on the economics. Reliability at or near a 1-in-10 LOLE target already results in extremely low EUE.

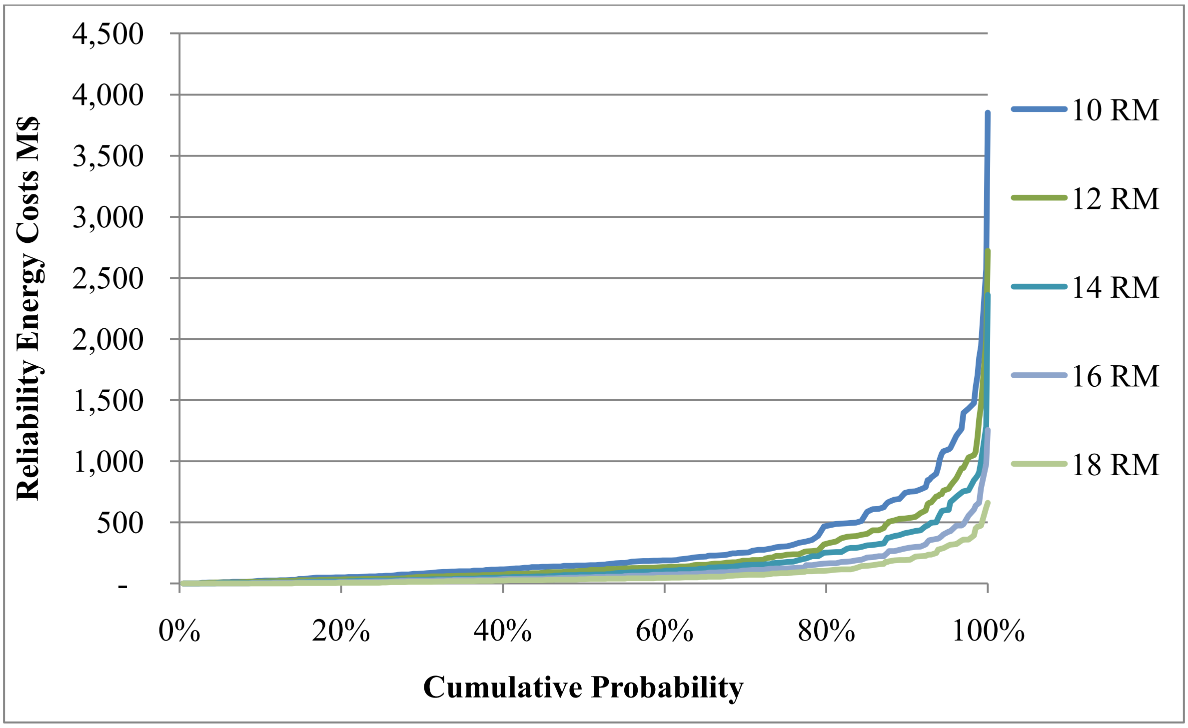
Figure 11. Economic Optimal (Risk Neutral) Reserve Margin[49]



Based on Figure 11, the minimum total system costs to customers is met at a reserve margin of 13%. The figure represents all system costs above the dispatch of a CT plus the cost of unserved energy plus the additional carrying cost of CT capacity over a range of reserve margins. It should be noted how flat the curve is between 12% and 15%. This says that there is some room to move within this range and not be penalized substantially by additional costs. Because this figure represents the average of 1000's of iterations (combinations of weather, load uncertainty, and unit performance), it hides the fact that individual years can be drastically different from the average. This economic target reserve margin doesn't put any additional emphasis on the extreme high cost outcomes, and is therefore defined as the risk neutral target reserve margin. When adding capacity in a regulated, vertically integrated market, the fixed costs are reasonably static whether procured through a PPA or through direct ownership by a utility. Based on detailed engineering estimates of the installed cost of CT capacity, resource planners can be fairly confident in the cost of capacity. In our example, 300 MW will cost approximately $30M per year. However, the incremental capacity may provide less than $1M in benefit in mild weather years during recessions or it may provide >$400M in value in years with extreme weather or unexpected load growth. Figure 12 shows the entire distribution of system energy costs (all production costs and purchase costs above the dispatch cost of a CT plus the cost of societal unserved energy) across different reserve margin levels. The high cost scenarios at the right hand of the chart represent the severe scenarios of extreme weather and under forecast of load.

[49] This figure represents customer system costs for a vertically integrated utility. Structured markets are discussed in later sections.

Figure 12. Distribution of System Energy Costs



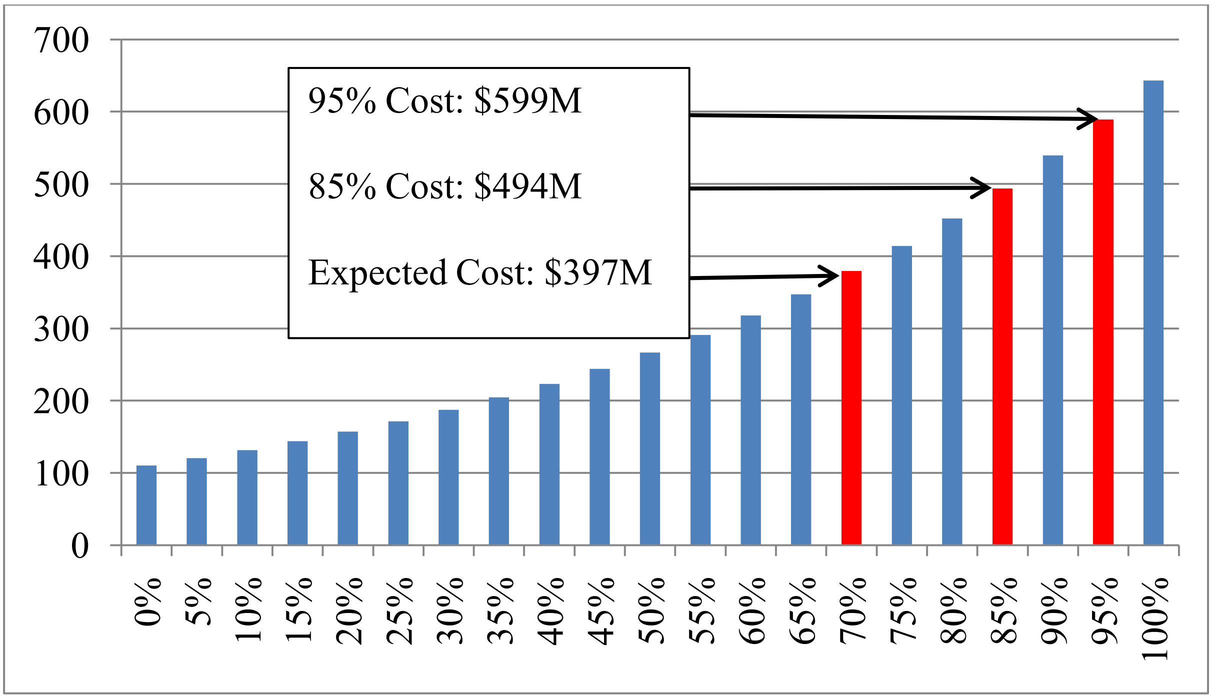
C. RISK ADJUSTED RESERVE MARGINS

To make the trade-off between volatile reliability energy costs (production costs above CTs, purchases above CTs, and EUE costs) and static fixed costs (carrying cost of capacity), a risk adjustment is likely justified to the risk neutral optimum reserve margin. In the same way that a homeowner is willing to pay $1000/year to insure his $100,000 house against loss even though the probability of loss is far less than 1%, load serving entities are likely willing to pay a fixed payment toward installed capacity to insure against an extreme scenarios shown on the previous figure, even if the fixed payment is slightly higher than the average economic benefit. But how much more in fixed costs should customers, planners, and regulators be willing to pay above the amount that is justified by the risk neutral optimum reserve margin?

Traditional risk metrics in the electric power industry include Value at Risk (VaR), Coefficient of Variation, and mean-variance frontiers. Value at Risk is a quantitative measurement of the amount of exposure at various confidence levels within a specific time interval. Coefficient of Variation and Mean-Variance Frontiers are comparisons of variation across various portfolios and planners utilize them to minimize variance in an economically competitive portfolio.

While the conventional definition of VaR is the risk of loss on a specific portfolio of financial assets, it is used in this example as the risk of additional costs above expected costs. The distribution of total production costs above the dispatch cost of a CT plus marginal CT carrying costs for the 13% reserve margin case is shown in Figure 13. The expected cost for this case is $397M. Eighty-five percent of all scenarios in this case have total costs of $494M or less and 95% have total costs below $599M.

Figure 13. Distribution of Total Costs (Production Costs and Purchases Costs Above a CT + CT Carrying Costs + Cost of Unserved Energy) at 13% Reserve Margin



Typically firms will evaluate VaR at 85%, 90%, or 95%. The distributions for each reserve margin in the chart above allow us to calculate the approximate VaR over a 5-year period for the entire range of possible scenarios. Subtracting the total system cost from the average system cost produces the VaR at the respective confidence level. The VaR at 85% is $494M - $397M = $97M. This means that in 85% of all weather scenarios and economic growth scenarios, total costs should not be more than $97M above the expected costs. The table below, Table 6, summarizes VaR at a range of confidence levels for each of several different possible reserve margin targets including the 13% reserve margin example presented in Figure 13 above.

Table 6. Risk Analysis

		Risks Above Expected Costs		
Reserve Margin	Total Expected Costs	VaR 85	VaR 90	VaR 95
%	M$	M$	M$	M$
10%	409.3	145.3	208.4	321.2
11%	402.5	128.2	182.9	277.6
12%	398.5	112.2	159.2	237.8
13%	397.4	97.2	137.2	201.7
14%	399.0	83.3	117.0	169.3
15%	403.4	70.5	98.5	140.7
16%	410.7	58.7	81.8	115.8
17%	420.7	47.9	66.8	94.6
18%	433.5	38.3	53.5	77.1
19%	449.2	29.7	42.0	63.3

As an example from the previous table, moving from 13% reserve margin (economic risk neutral reserve margin) to a 15% reserve margin reduces Var 95 (a measure of the risk above the expected case) from $201.7M to $140.7M while the change in expected system costs from 13% to 15% is only a $6M increase (as seen previouslyin Figure 11). Targeting a 15% reserve margin results in slightly higher costs than the minimum cost reserve margin, but provides substantial risk mitigation from a single utility perspective. The determination of an economic optimal risk adjusted reserve margin which represents the ideal tradeoff in risk and cost will depend on the risk appetite of the decision makers at the respective utility or regulatory body.

D. Structured Markets: The Consumer Perspective

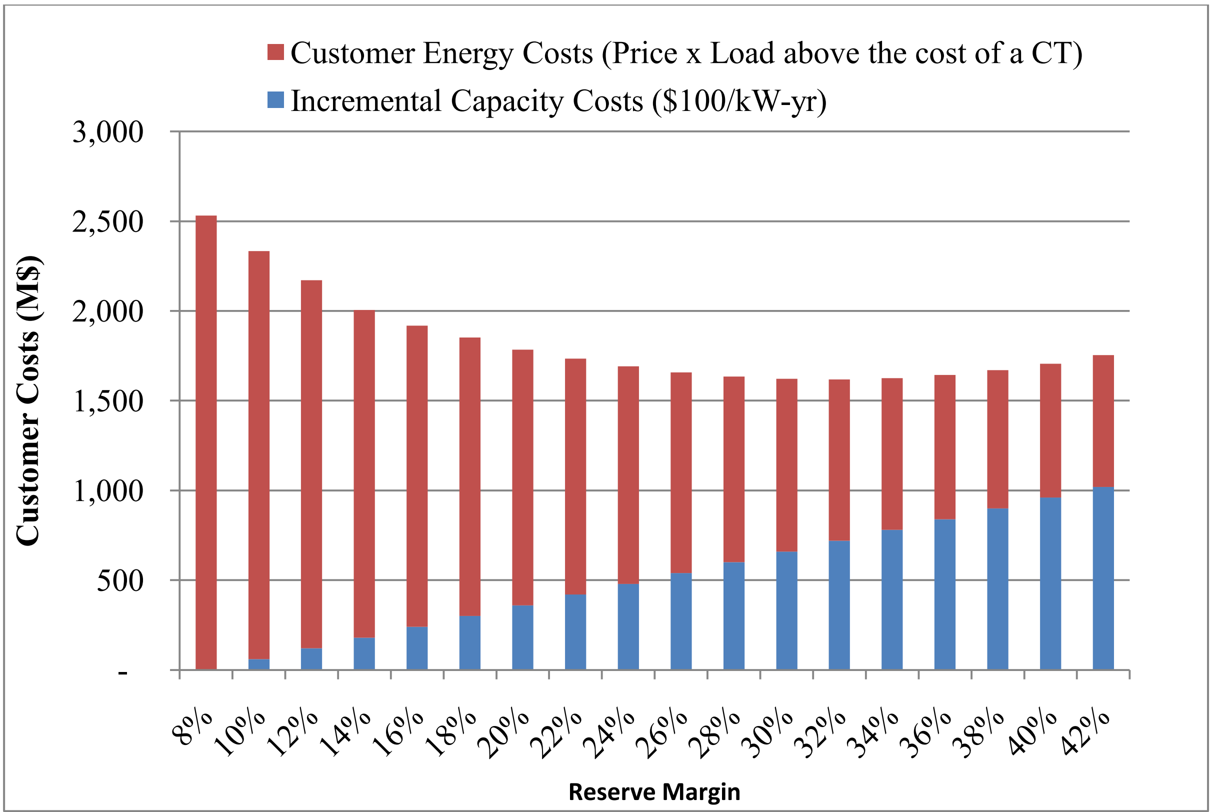
Economic reserve margin planning is contingent on market structure. In a vertically integrated utility environment with rate based assets, adding capacity only affects the cost of serving load that would have otherwise been met by resources with dispatch costs above the dispatch cost of that incremental resource. For example, imagine a utility which had no neighbors. The cost of serving load is only the physical production costs (fuel and variable O&M costs) of generating electricity to meet those loads. If this utility would typically dispatch oil turbines at loads above 30,000 MW at a cost of $300/MWh, the benefit of replacing the oil fleet with efficient gas turbines (with dispatch costs of $100/MWh) would only be the production cost savings ($200/MWh). In this example, if the oil fleet previously ran 100 hours per year, the benefit would only be \$20/kW-yr[50], not nearly enough to justify replacing the oil capacity.

However, under another market construct, the economic decision analysis would be very different. Imagine a wholly competitive energy market where all load serving entities are completely independent from generating companies. The load serving entity is forced to buy all its energy from the energy market at the market clearing price. Generators get paid based on which unit in the marketplace was on the margin, or which was the highest cost unit to be dispatched. For the owners of base load resources, having high cost oil generators on the system and in the dispatch for 100 hours per year could be a boon. Whenever a high cost unit is on the margin, each and every generator will be paid the dispatch cost of that unit, which in this example is \$300/MWh. If the system averaged 30,000 MW in load per hour, generators would receive \$900M[51] in aggregate over these hours. If the average production cost of those units was \$30/MWh, 90% of the revenue is operating profit. If the oil fleet was 1,000 MW in size, suppose replacing it with efficient gas turbines lowers the marginal cost in these hours to \$60/MWh. Now, the net revenue to all generators would only be \$180M[52] for these hours. The reduction in revenue of \$720M for generators is a direct benefit to consumers. In fact, since adding 1,000 MW of efficient CT lowered costs by \$720M per year, consumers would be getting \$720/kW-yr of benefit from capacity that should cost no more than \$100/kW-yr. However, base-load generators, that would no longer be receiving those revenues, may be dependent on this revenue to cover fixed costs. Any approach to identifying the ideal reserve margin target should consider both the generator and consumer‘s perspectives for the market structure being examined.

First, let us further consider the benefits of increased reserve margins to consumers in an energy only market structure. Using the same case study simulations, if we were to compare the energy market costs (assuming customers pay for their entire load at the market clearing prices) as seen below in Figure 14 to a proxy for incremental capacity costs, then the cost/benefit analysis could support reserve margins above 30% meaning there are still energy market savings greater than the incremental capacity costs at these reserve margin levels. The difference between this analysis and the results seen in the single regulated utility example previously shown in Figure 11 is due to the fact that load serving entities (customers) are paying the high spot prices for all load (30,000 MW) in a given hour versus only paying expensive prices for the high cost resources on the margin which may only be a couple hundred MWs of load.

[50] \$200/MWh * 100 hr/year = \$20/kW-yr
[51] \$30,000 MW * \$300/MWh * 100 hrs = \$900 M
[52] \$30,000 MW * \$60/MWh * 100 hrs = \$180 M

Figure 14. Illustration of Economic Target for a Load Serving Entity That Relies 100% on the Energy Market



This is a purely hypothetical exercise however. Setting a reserve margin target based on these customer savings is not feasible or desirable in current structured markets for several reasons. First of all, in energy only markets the incremental capacity costs shown in Figure 14 are not paid by consumers so the consumers would always benefit from higher reserve margins while energy margins for generators continually decrease. In structured markets that have forward capacity markets, all generators are paid the same capacity price. In the above example, only the incremental capacity costs were assumed to illustrate the comparison to the vertically integrated utility analysis in Figure 11. In addition, load serving entities in current RTOs often self supply or enter into bilateral agreements to cover a substantial portion of their load and balance the remainder of their load using the energy market. Under this scenario, the savings to customers would be greatly reduced and would more likely resemble the optimal reserve margin methodology that was shown previously in Figure 11. While the idea that a reserve margin well above 20% is ideal for consumers fully exposed to the energy market may be counterintuitive, it is simple to demonstrate. In PJM in 2010, reserve margins were well above 20%[53], but there were still 81 hours with energy prices more than $100/MWh higher than the dispatch cost of a CT. The load in these hours for the PJM_ROM region averaged 33,000 MW, so the total cost of energy above the cost of CTs was greater than $264M[54]. If an additional 1,100 MW of combustion turbines had been present,

[53] *2011 Long-Term Reliability Assessment,* retrieved on September 2, 2012 from http://www.nerc.com/files/2011LTRA_Final.pdfNERC LTRA

[54] 33,000 MW * 80 hours * $100/MWh = $264 M

presumably the costs above CTs would have been negligible[55]. This suggests that 1,100 MW of CTs can save $264M in one year compared to the carrying cost of that capacity at only $110M[56] per year. This lends some credence to our theory that consumers exposed to the energy markets can receive substantial benefits with new resources even at high reserves margins.

In the same region, however, energy margins for CTs were only ~$50/kW-yr. So CTs were not getting full cost recovery from the energy market, and yet consumers would have benefitted from substantially more capacity.

E. STRUCTURED MARKETS: THE GENERATOR PERSPECTIVE AND THE MISSING MONEY PROBLEM

Wholesale peaking generators have not been able to recover their fixed carrying costs in the past decade from energy markets. Even in regions with capacity markets which pay supplemental revenues to generators, without long-term bilateral agreements, CTs have been unable to cover costs[57].

But how critical of an issue is this? Economic optimal reserve margins for energy only markets are defined as the point at which marginal capacity can earn enough revenues to cover fixed costs. How far from this economic target are most structured markets today? CT energy margins are the summation of all the hourly market prices above the dispatch cost of a CT for a given year. As shown in Table 7, which presents the perspective of a merchant generator in such a market, CT energy margins and the frequency of prices above the dispatch cost of an efficient CT decrease as additional CTs are added to a system. These energy margins represent the weighted average energy margins in the Base Case simulations. Recall that the 1-in-10 LOLE based reserve margin was at 9.75% and the economic optimal reserve margin based on a single regulated utility was 13% (See Figure 11). The CT only receives $86/kW-yr at a 9.75% reserve margin and $73/kW-yr at a 13% reserve margin which is used to go towards covering its fixed costs of $100/kW-yr. The energy only economic optimal target reserve margin for this region is 7% because that is the point where a CT fully recovers its fixed costs.

Table 7. Merchant Generator Perspective

Reserve Margin	8%	10%	12%	14%	16%	18%
Expected CT Energy Margins ($/kW-yr)	$ 94.75	$ 85.63	$ 77.58	$ 70.57	$ 64.62	$ 59.72
CT Hours of Operation	1,211	1,104	1,007	978	926	897

How is it possible then that generators are only able to recover their fixed costs at a 7% reserve margin, but consumers of a vertically integrated utility have financial benefit to having reserve margins at 13%? In many hours in the simulations, the study region is

55 Load in these hours was 1,100 MW higher than in hours with prices equal to the dispatch cost of a CT, suggesting the addition of 1,100 MW of efficient CTs would bring the high prices down close to the cost of a CT.
56 1,100 MW * $100/kW-yr = $110 M
57 PJM, State of Market Report, 2010, Vol. 2, p. 33

purchasing power from outside regions. Take an example hour in which the region is purchasing 2,000 MW at $200/MWh. The addition of 500 MW of resources to the study region does more than just avoid purchase costs of 500 MW at $200/MWh. It actually brings down the cost of the remaining 1,500 MW that needed to be purchased. When the study region was originally purchasing power from the outside region, the clearing price was based on the unit that was on the margin in the outside region. In order for the study region to buy 2,000 MW, the outside region had to dispatch progressively higher cost resources. Since in the change case in which the study region added 500 MW of capacity, only 1500 MW needed to be purchased, the clearing price for the purchase will be lower (for this example assume purchase cost dropped to $150/MWh). So the addition of the resource provided $140/MWh of benefits for the 500 MWh of purchases it avoided[58]. It also achieved $50/MWh benefit for the 1,500MWh of purchases that were still made. The total benefit in this hour is $145,000[59] or $290 for each MWh of energy provided by the new resource[60]. So the benefit to the customer is higher than the revenues that might be seen by the new generator. This disconnect between the consumer perspective and the generator perspective was partially explained above, but there are additional reasons that generators have a difficult time recovering costs in many structured markets today.

1. Price Caps

Many regions have regulatory caps on bid prices at ranges between $1,000/MWh to $3,000/MWh. As discussed, this is less than VOLL and from a theoretical perspective suggests that consumers are not paying enough for resource adequacy. However, there is a reserve margin at which peaking generators would cover the cost regardless of where the price cap was set. If generators could achieve full cost recovery at an 11% reserve margin with no price caps, then generators should be able to achieve full cost recovery at perhaps an 8% reserve margin if there was a $1,000/MWh price cap. The point being that if the maximum price is lower than VOLL, generators should build less capacity such that high prices (but less than $1,000/MWh) are hit more frequently. Price caps are frequently cited as the primary reason for ―missing money"[61], yet the authors believe this is a small component of the overall market design problems.

2. Physical Reliability Targets

ERCOT is one of few energy-only markets in North America. As an energy only market, there is no explicit reserve margin target. However, ERCOT performs an LOLE study periodically which communicates to the system the reserve margin which would achieve 0.1 LOLE. While not a target, several of the LSEs in ERCOT may use that reserve margin for their own generation planning and either build or contract to maintain at least that level of reserves. The potential result of individual LSEs planning to the 0.1 LOLE reserve margin is that the aggregate system reserve margin may be equal to or higher than the 0.1 LOLE reserve margin. If a region consisted of 10 LSEs, all of which planned to the same reserve margin independently, the aggregate reserve margin would be higher since there is diversity between disparate loads. But regardless of how a region

---

[58] The load serving entity paid the $60/MWh dispatch price of the resource instead of the $200/MWh market price

[59] (140 * 500 + 50 * 1,500) = $145,000

[60] $145,000 / 500 MWh = $290/MWh

[61] Hogan, William (2005), "On an ―Energy Only" Electricity Market Design for Resource Adequacy."

ends up with a reserve margin that is equal to or higher than the 0.1 LOLE, the impact on CT energy margins is typically negative. As shown in our simulations, the expected CT energy margin at a 0.1 LOLE reserve margin is less than the carrying cost of capacity even with no energy price caps. To clarify the theoretical reason for this disparity, an illustration will be helpful.

Imagine that regions planned to a reliability target of one event in 10,000 years. To achieve this lofty goal, reserve margins may need to be at 30%. With a 30% reserve margin, there would be very few, if any, hours with energy costs much above the dispatch cost of CTs. Unlimited price caps would make no difference since there would almost always be additional capacity available to prevent scarcity prices. So if load serving entities or a portion of the load serving entities in a region plan to an LOLE target, it is possible that system reserve margins may be higher than the levels at which generators would receive cost recovery.

3. Economic Growth Slowdown

Since 2000, the US economy has consistently grown at slower rates each year than was expected 4 years prior.[62] When the economy grows slower than expected, load grows slower than expected. Since generation expansion is planned years in advance, new generation has come online while the load it was meant to serve has not materialized. An example utility may have expected 1,000 MW of load to appear due to a growing economy and so built new generation. However, much of that load did not appear over the past 10 years and so reserve margins rose. With reserve margins not only above the level which would achieve cost recovery for efficient CTs, but also above 0.1 LOLE based reserve margins which typically result in low CT energy margins, returns for peaking generation have been consistently small. Presumably, at some point the economy will begin to grow faster than economists expect and load growth may outstrip resource additions, resulting in lower reserve margins and higher returns for peaking generators. However, as discussed in other sections, reserves would need to drop substantially in order for this to occur.

To be clear, this issue is different from the issue related to the use of physical reliability metrics in setting reserve margin targets. Even if the economy was experiencing robust growth, the use of physical reliability metrics could still negatively affect the energy revenues generators could expect. Slow economic growth simply adds to the disparity produced by high reserve margin targets since realized reserve margins end up being even higher than the high reserve margin targets when the economy grows slowly.

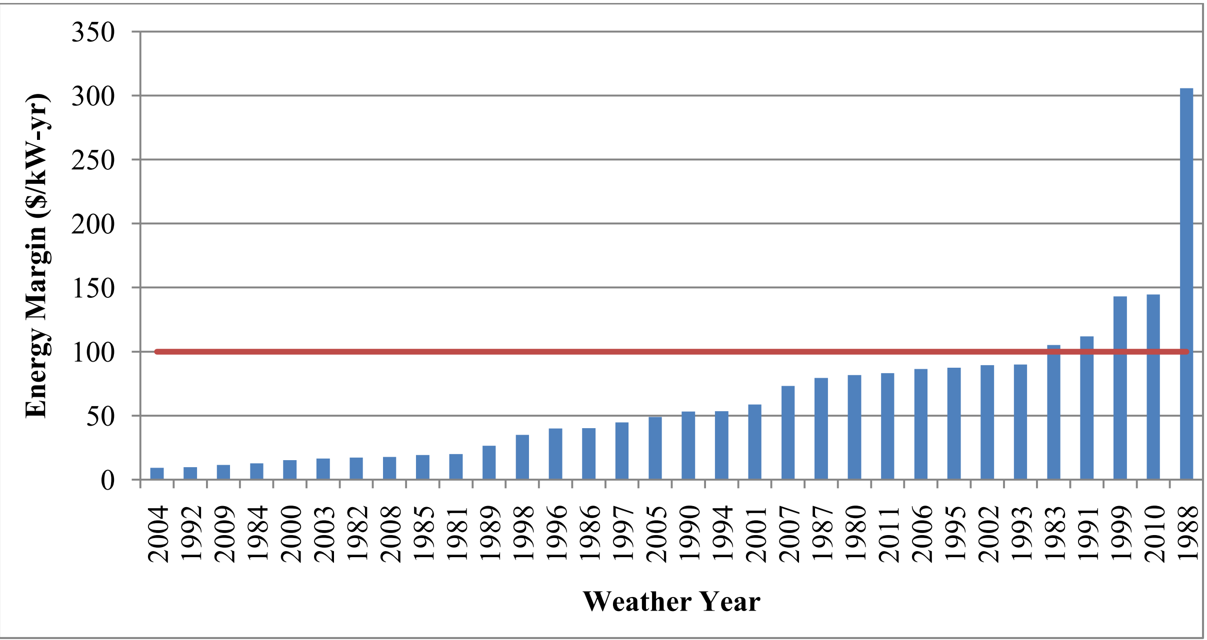
4. Weather Volatility

Even with a regulatory-enforced scarcity pricing curve designed to achieve full cost recovery for peaking generators, differences in weather patterns mean that many years energy prices would be lower than needed for generators to recover costs. Figure 15 shows results from the Base Case simulations for the study region. In a small number of possible weather years, returns would far exceed the necessary levels to cover carrying costs. However, in a large percentage of years, revenues would be far less than necessary. This is not a feasible market space for many developers who rely on debt to

[62] See CBO forecast for 2000-2013

finance the construction of their facilities. If a generator cannot demonstrate its ability to cover specific debt service ratios each year, it will not be eligible for debt financing.

Figure 15. CT Energy Margins by Weather Year



5. Generator Market Forecasting

The authors will not venture to guess the skill level of generators determining when markets will be in equilibrium such that new generation can cover fixed costs. However, this task is quite difficult, so expectations of their accuracy should be quite low. This analysis must typically be performed 5 years in advance of the new generation coming online and take into account dozens of variables including load growth rates, fuel costs, market interaction, regulatory intervention, scarcity pricing, emission prices, resource mix changes, demand response impacts, and bidding strategies.

In summary, each of the components mentioned above contribute to the missing money problem. It is not an isolated issue simply due to a single design flaw as frequently cited. Since generators in energy only markets prefer low reserve margins to achieve cost recovery what is the best way to incentivize generator investment to achieve 1-in-10 LOLE and/or achieve a higher reserve margin that is more economic for consumers. Forward capacity markets have been designed in many of the existing structured markets to alleviate this disconnect. In this capacity market design, all generators are provided additional capacity payments to allow new generators to recover fixed costs at a reserve margin that meets 1-in-10 LOLE standard. The setback to this approach is that while consumer energy costs are reduced at the 1-in-10 LOLE level, the fact that capacity payments are paid to all capacity forces total customer costs to be higher than if reserve margins remained at the lower energy only economic reserve margin target. This is further illustrated in the next section. Another method used to solve this problem is to force load serving entities to enter into bilateral contracts up to a specified reserve margin. This method is used in the California ISO (CAISO) today. One advantage of this method is that it allows generators to enter into long term contracts which provide revenue stability versus a forward capacity market which only provides revenue in the short term. It also allows load serving entities to make decisions on capacity based on long term cost projections.

F. SUMMARY RESULTS FOR DIFFERENT MARKET CONSTRUCTS

Table 8 summarizes the findings of the base case results from the perspective of a single vertically integrated regulated utility, energy only market, and energy plus forward capacity market. Table 8 shows that the economic optimal reserve margin for the regulated utility is 13% based on the consumer‘s total system cost perspective as defined in Section A of this Chapter . This target resides several percentage points above the 1-in-10 LOLE based 9.75% reserve margin. The reserve margin target for the energy only market is 7% based on the level of reserves at which a new CT will recover its costs. Under an energy only construct, consumers would benefit from higher reserve margins but energy margins are lower than the minimum required to sustain the higher reserve margin. For the energy plus forward capacity market construct, the target reserve margin is assumed to be based on 1-in-10 LOLE[63] which is 9.75% and it is assumed that the capacity payment paid to all generators at this level is enough that when combined with energy margins a CT will recover its fixed costs.

From a total system costs perspective, the regulated utility provides the lowest cost at its target reserve margin. It should be noted that the results for each construct were developed from the same simulations meaning there were no benefits recognized from a more coordinated economic dispatch that an RTO/ISO would provide. The energy only construct‘s total costs at a 13% reserve margin are much lower per year, but in theory this reserve margin would not materialize because generators would not recover their fixed costs at this level. The energy plus capacity market construct produces higher costs as reserve margins increase from the 7% energy only economic target because the additional capacity payments are made to all generators. If targeting 1-in-10 LOLE, the total costs including a capacity payment that made generators whole is $7.925 B as shown in the table. It should be noted that there is also some risk benefit seen with the structures that result in higher reserve margin targets because the volatility related to energy costs decreases as reserve margins increase.

Assuming idealized resource mixes and purely competitive or efficiently regulated markets, the cost comparison below illustrates how the structure that results in the lowest reserve margin does not necessarily produce the lowest system cost.[64]

Table 8. Total System Costs at Target Reserve Margin Levels

	Target Reserve Margin	Total System Costs at Target (Billion $)
Regulated Utility	13.00%	$7.805
Energy Only Market	7.00%	$7.860
Energy plus Capacity Market	9.75%	$7.925

To be clear, the point of this table is not to state that the regulated utility environment is the optimal structure. Energy only and energy plus capacity markets offer a number of attributes such as fostering competition and diverse resources that may result in lower total system costs for customers. This table just highlights that market structure can have a

63 Forward capacity markets in the Eastern Interconnection currently base targets on 1-in-10 reliability metrics. These include PJM, NY-ISO, and ISO-NE.

64 These total system costs include all capacity costs and energy costs (not just costs above the dispatch costs of a CT) to meet load as well as the societal costs of unserved energy.

significant impact on both reliability and total system costs and should be considered when performing resource adequacy planning.

G. Selection of Marginal Resource in Economic Reserve Planning

It is important to remember that the identification of a target reserve margin based on economics is contingent on the marginal resource used to vary reserve margins. A single point estimate of the ideal reserve margin assumes that all capacity should be treated as equal. In reality, economic resource adequacy planning must consider the implications for all types of resources that may provide resource adequacy. The economic trade-off analysis is highly dependent on the characteristics of the capacity being added. All capacity is not equal. Adding demand response capacity will not provide as much economic benefit since it is not dispatched until prices are much higher or reliability is a more pressing concern. In generic SERVM modeling runs, the average market price when CTs are dispatched is ~$70/MWh. The average market price when demand response is called may be $500/MWH+. This indicates that the system costs between reserve margins will be drastically different if CTs are the marginal unit type vs. demand responses resources. The carrying costs are also different between the resource types. Also, the incremental decision may not be the addition of a new resource; it may be the retirement of an old high-cost resource. While 1-in-10 LOLE is an attractive metric because of its simplicity, the reserve margin determined through this method treats all capacity the same. If a resource can keep the lights on as effectively as a combustion turbine, the different product characteristics are immaterial. But the metric doesn‘t provide guidance to what type of resources should be used to meet peak requirements and leads to many uneconomic resource procurements. Resource planning is unfortunately a complicated process that requires the assessment of both the economic and physical reliability contributions of resources.

VI. IMPACT OF VARYING DEFINITIONS, CALCULATIONS, AND APPLICATIONS OF 1 IN 10 ON ECONOMICS

Based on the research performed in Section III, the majority of entities in the Eastern Interconnection that use a physical metric for setting reserve margin targets use the 1 day in 10 year standard. Of those that use the 1 day in 10 year standard, all but one use an identical definition for the metric. SPP is the only entity that uses a different definition. SPP assumes 2.4 LOLH versus the standard 1 event in 10 years (0.1 LOLE). The latter is more stringent and leads to a higher reserve margin level. In this study, using the 2.4 LOLH definition typically results in a reserve margin 5% lower than the 0.1 LOLE derived reserve margin. However, although SPP measures reliability against the less stringent 2.4 LOLH metric, their reserve margin target is set at a higher level than suggested by the metric, potentially obviating the difference in expected reliability.

As part of this paper, the authors were asked to address how the varying definitions, calculations, and applications of the 1 day in 10 years standard impact the economics of resource adequacy. If regions planned reliability using the lower 2.4 LOLH instead of the 0.1 LOLE, reliability costs would be much higher. The base case simulations indicate reliability costs (excluding capacity costs) at the 0.1 LOLE equal to $290M/yr while the reliability costs at 2.4 LOLH are $450M/yr, a difference of $160M/yr. The 2.4 LOLH scenario has lower capital costs since it has a lower reserve margin, but even after adjusting for capital cost savings, the less stringent 2.4 LOLH developed reserve margin would result in additional total system costs of $40M/yr compared to planning using the 0.1 LOLE definition. In addition, those numbers do not reflect what would happen if all regions used the lower standard. The base case assumes that other regions still maintain higher reserves, muting the impact of the less stringent standard. If all regions planned using the lower standard, average costs would be expected to be exorbitant. In addition, average economics doesn't adequately consider the risk of high impact scenarios. In cases in which load was much higher than expected or units didn't perform as well as expected, the additional costs of only maintaining reserves to meet the 2.4 LOLH on average could be in the billions of dollars. The base case economic simulations indicated that the difference in costs for the most extreme case if planning to 0.1 LOLE versus planning to 2.4 LOLH could be greater than $2B for a single year.

For a small region with few interconnections, the 0.1 LOLE and the 2.4 LOLH based reserve margins could potentially both be higher than the optimal economic reserve margin, but in general, the base case simulations demonstrate that using the 2.4 LOLH definition likely results in a more risky and high cost system if modeled accurately. Compared to the 0.1 LOLE, the economic optimum reserve margin could be higher or lower depending on a number of system attributes including system size, market structure, neighbor assistance availability, and transmission availability. And depending on assumptions such as how emergency operating procedures will be employed and how capacity is counted, the comparison is further complicated.

The sensitivities presented in the next section show how some of these assumptions drive the 1-in-10 LOLE target and the economics of resource adequacy. Based on our past experience, the 1-in-10 LOLE target is more sensitive to these assumptions than a methodology that uses an economic framework. An LOLE method can be driven by one event or one peak hour while the economics that measure more than the cost of firm load shed are impacted by many more hours across the year and are therefore less sensitive. From our perspective, it is critical for regulators and planners to know if its target reserve margin is economic.

VII. IMPACT OF INTERCONNECTED MARKETS AND BROAD PLANNING ON RESOURCE ADEQUACY AND 1 IN 10 CALCULATIONS

Astrape performed several sensitivities around the regulated utility base case to show the impact that interconnected markets and inter-regional commerce have on the resource adequacy of the region being studied. If markets are highly interconnected and well coordinated among regions, then resource adequacy targets could be lowered. In the base case, there is substantial transmission capability between the study region (PJM_ROM) and surrounding neighbors. In fact, the limit to and from PJM_E and PJM_R_RTO is virtually unlimited as the 8,000 MW transfer capability is rarely fully utilized. With these limits, it is likely that the constraint is capacity on the other side of the interface rather than the transmission capability.

A. Island Sensitivity

The first sensitivity that was simulated treated PJM_ROM as an island. This sensitivity is purely academic since it in no way represents reality. When the case is simulated, the region would need to carry an 18% reserve margin to meet the 1-in-10 LOLE standard. This compares to a 9.75% reserve margin to meet the same criteria in the base case. Given these results, it could be stated that surrounding regions via load diversity and generator diversity provide approximately 8% of reserves for the PJM_ROM region. For this sensitivity, economics were not evaluated.

B. Allow Neighboring Regions To Dispatch Demand Response In Order To Assist Neighboring Regions

The next sensitivity was designed to understand the impact of allowing regions to dispatch demand response resources in order to assist another region. The typical approach to demand response is to only call on it during emergency conditions. In actual practice, it is unlikely that one region would dispatch emergency demand resources in order to be able to sell generation to other regions. However, there is a range of types of demand response, some of which may self-dispatch at lower prices or may have substantial availability. These resources may be dispatched more frequently and may possibly be used in a way that allows one region to sell to other regions. The base case did not allow these resources to be called in order to free up other capacity to be sold to neighbors. The change case was to eliminate this constraint. If one region was able to meet firm load obligations and operating reserve requirements in an hour, and had additional demand response capacity, SERVM was configured to allow the demand response resource to dispatch and sell energy to another region. In this change case, the reserve margin needed to maintain 0.1 LOLE shifted from 9.75% to less than 7%. The economic optimum shifted from 13% to approximately 12%. This change in emergency dispatch affects the 0.1 LOLE based reserve margin more than the economic reserve margin because LOLE is more sensitive to what occurs in these peak hours.

C. Operating Reserve Sensitivity

For the base case simulations, all regions were given a 2% spinning reserve requirement and a 4% total operating reserve requirement. Firm load shed occurred if operating reserves dropped below the 2% spinning reserve requirement. In this sensitivity, the spinning reserve requirement was allowed to be completely depleted before shedding firm load. As expected, the results of the sensitivity showed that both the 1-in-10 LOLE target and economic target dropped by 2%.

D. System Equivalent Forced Outage Rate (EFOR) Sensitivity

The Equivalent Forced Outage Rate (EFOR) is the average percentage of capacity unavailable when needed. The 1-in-10 LOLE target and the economic optimal target both shifted with a 1 to 1 ratio as system EFOR shifted. In other words, when system EFOR for the region was increased by 3%[65], the 1-in-10 LOLE target shifted from 9.75% to 12.75% and the economic target shifted from 13% to 16%.

E. Remove all Load Diversity Among Neighbors

If load diversity is removed completely and all regions reached peak load at the same time, then the target to meet a 1-in-10 LOLE standard shifts from 9.75% to 15.5%. The economic target shifts from 13% to 18%. The impact during peak hours impacts LOLE slightly more than it impacts the economic target.

F. Transmission Sensitivities

Two sensitivities were performed for transmission. In the first, all transfer capabilities between regions were reduced by 50%. In the second a distribution was used for each interface representing the availability of the interface. The distribution for this sensitivity is shown in Figure 16. By using this distribution, the range of transmission availability can be captured from 0% to 100%.

Figure 16. Distribution of Transmission Availability

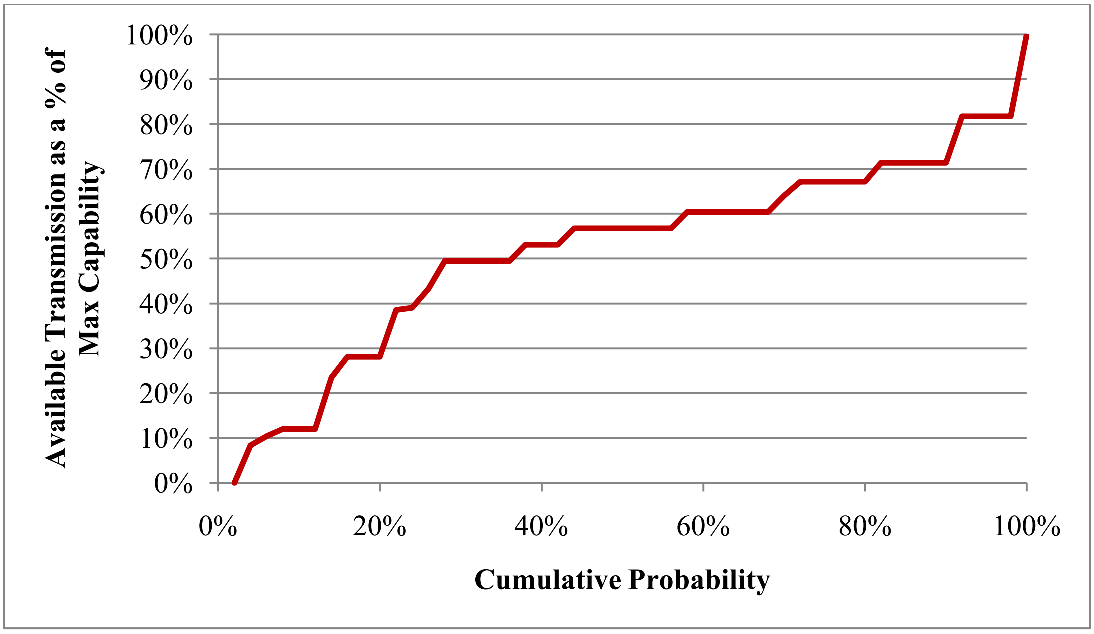


Table 9 shows the results of the two sensitivities. Using the distribution shown above in Figure 16 impacts both the 1-in-10 LOLE and economic optimal reserve margin more than just reducing the capability by 50%. This is logical because the distribution is more stringent in that there are hours where no transfers will be allowed to occur. Because the region being studied has substantial oil resources in its mix, it is purchasing a substantial amount of energy for economic reasons. When transmission is limited, these purchases decrease and the

[65] The starting system EFOR of 5% was increased to 8%.

optimal reserve margin level increases considerably. Accurately capturing the import capability of a region has a high significant impact on results.

Table 9. Transmission Sensitivities

	Reserve Margin @ 1-in-10 LOLE Standard	Economic Optimal Reserve Margin	Avg. Demand Response Call Hours Per Year at 10% RM
Base Case	9.75%	13.00%	4.5
50% Transmission Capability	11.75%	17.00%	15
Transmission Distribution	14.00%	20.00%	13

Since the base case uses static high transfer limits, the base case results are likely too optimistic for both the economic optimal reserve margin and the 1-in-10 LOLE reserve margin. Using refined transfer limits would likely show that for the targeted region, the optimum economic and 1-in-10 LOLE reserve margins would be several percentage points higher. The table above indicates a reasonable upper limit for where these values could fall.

G. Expanding Topology

A sensitivity was performed to understand how expanding the overall topology would impact the optimal reserve margin for PJM_ROM. For the sensitivity, SOCO and NE-ISO were added to the topology. By adding two additional regions, the LOLE target shifted from 9.75% to 9.25% and the economic target shifted from 13% to 12.5%. Even though PJM-ROM is not directly connected to either region, the dynamic market clearing resulted in more efficient dispatch and the additional regions provide extra load and generator diversity. This indicates that modeling the entire Eastern Interconnection could result in lower targets than indicated by the base case results.

H. Summary

A summary of these results for both the base case and numerous sensitivity cases is shown in Table 10. The overall takeaway is that an optimal level of reserves depends greatly on assumptions made about surrounding interconnections and installed capacity of neighboring regions. These sensitivities also illustrate the need for further analysis in which the full Eastern Interconnection is simulated and appropriate assumptions are verified for a number of these categories.

Table 10. Summary of Analysis Results for Base and Sensitivity Cases

	Reserve Margin @ 1-in-10 LOLE Standard	Economic Optimal Reserve Margin	Avg. Demand Response Call Hours Per Year at 10% RM
Base Case	9.75%	13.00%	4.5
Island Case: No Neighbor Assistance	18.00%		21.5
No Weather Diversity Among Neighbors	15.50%	18.00%	9.4
50% Transmission Capability	11.75%	17.00%	15
Transmission Distribution	14.00%	20.00%	13
All Regions Allowed to Share DR Resources	7.00%	12.00%	5
Allowing All Operating Reserves to be Depleted	7.75%	11.00%	4.5
EFOR 3% Increase	12.75%	16.00%	5.9
Expand Topology	9.25%	12.50%	4.25

VIII. ECONOMIC SENSITIVITIES

Sensitivities were performed both on the VOLL and the cost of CT capacity additions. Changing VOLL from $5,000/MWh to $30,000/MWh had no impact on the economic optimal reserve margin. The reason is that the amount of EUE at 13% reserve margin is only ~20MWh and represents reliability above the 1-in-10 LOLE standard. Firm load shed events are not driving the economics to be minimized at a 13% reserve margin. An additional sensitivity analyses varied the cost of CT capacity from $80/kW-yr to $120/kW-yr. Table 11 below shows that the economic optimum is more sensitive to capital costs.

Table 11. Economic Sensitivities

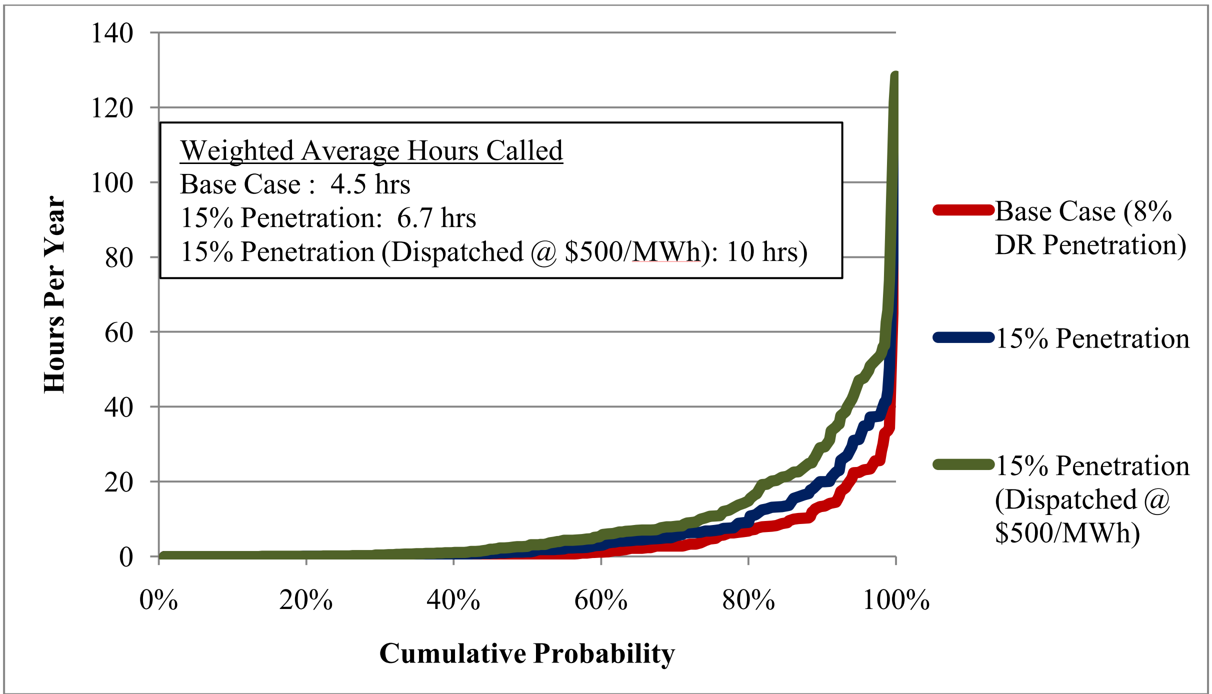
	Economic Optimal Reserve Margin
Base Case: VOLL@15,000/MWh CT Carrying Costs @ $100/kW-yr	13.00%
VOLL @ $5,000/MWh	13.00%
VOLL @ $30,000/MWh	13.00%
CT Carrying Costs @$80/kW-yr	15.25%
CT Carrying Costs @$120/kW-yr	10.25%

IX. RESOURCE MIX SENSITIVITIES AND HOW STATES CAN POSITIVELY INFLUENCE RESOURCE ADEQUACY

A. DEMAND RESPONSE SENSITIVITIES

Demand Response plays a key role in resource adequacy assessments. The key attributes of DR that impacted simulation results are the number of hours the resource can realistically be called in a given year, the point in the dispatch that DR is called, and the percentage of total capacity represented by DR (this percentage is also referred to as the penetration). If DR is called by a utility when prices hit $200/MWh versus $500/MWh, then the resource will provide much more economic value but will obviously need to be available more hours in the year. Figure 17 shows the distribution of expected demand response calls for the base case and two sensitivities with different penetration levels. Recall that the base case assumptions assume that DR is only called after all other options have been exhausted including expensive purchases up to $2,500/MWh and are limited to 150 hours per year. So in the base case, DR is exclusively used for reliability purposes and is always available since its dispatch is so infrequent. Also in the base case, DR provides 8% of the overall capacity mix for the region. The other two curves represent the senstivitiy cases where (1) DR penetration is 15% and resources are called at $2,500/MWh (2) DR penetration is 15% plus resources are called at $500/MWh. Additional sensitivities assuming the resources are called at $200/MWh would show increased frequency of dispatch and the necessary call limits would expand.

Figure 17. DR Call Summary



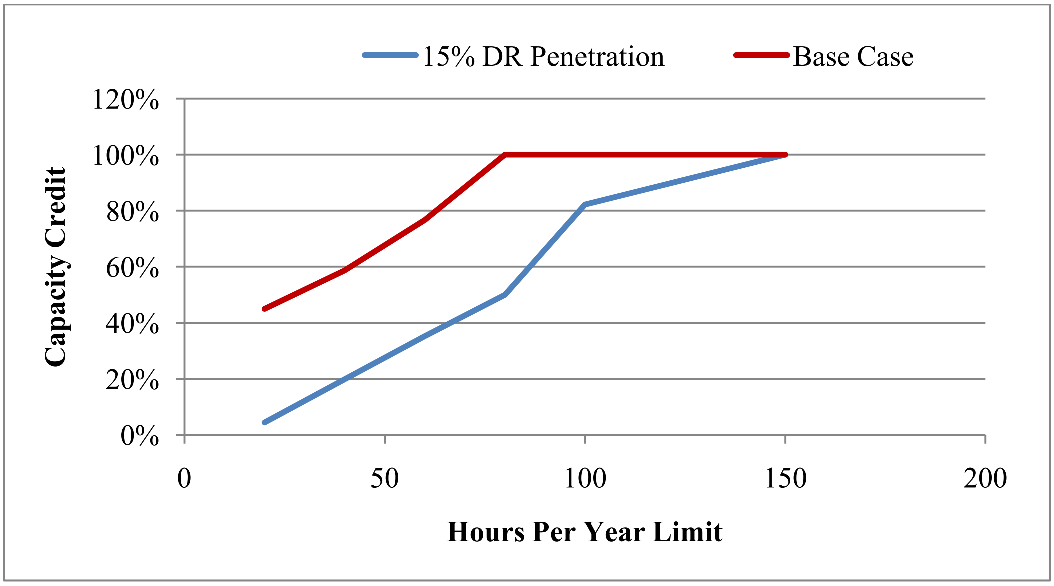
The next step in the evaluation was to determine how the 1-in-10 LOLE and economic reserve margin would change based on moving from 8% to 15% penetration. Table 12 displays the results. Because the DR was still treated as a reliability-only resource, the physical LOLE metric only shifted slightly and the 1-in-10 LOLE target shifted from 9.75% to 11%. This shows that the 150 hour call limits on the resource were almost enough to maintain the same reliability even with a higher penetration. However, the economic reserve margin was impacted more substantially because when the DR was added, a substantial amount of CT capacity had to be removed from the region to keep the same reserve margin level. Now the region is forced to purchase more energy since several thousand MWs of capacity that was being dispatched at less than $100/MWh was removed. Given this, the economic optimal target moves from 13% to 17%.

Table 12. DR Penetration Sensitivity

	Reserve Margin @ 1-in-10 LOLE Standard	Economic Optimal Reserve Margin	Avg. Demand Response Call Hours at 10% RM
Base Case: DR 8% Penetration	9.75%	13.00%	4.5
DR 15% Penetration	11.00%	17.00%	7

The last set of simulations pertaining to DR calculated the capacity credit of the resource assuming different call limits and different penetration levels. For purposes of the analyses, we are defining capacity credit of a resource as the reliability contribution that it provides the system compared to a fully dispatchable resource with 100% availability. So a resource that can only be dispatched 20 hours a year will not provide the same level of reliability as a resource that can be dispatched perfectly for 8,760 hours per year. Figure 18 shows the capacity credit of DR for the base case under different call limits and under a 15% penetration case with the same call limits. The figure shows that in the Base Case (8% penetration level) a 50 hour per year DR resource dispatched for reliability will only provide 63% capacity credit. Under a 15% penetration level, the same resource only provides 28% capacity credit. The higher penetration level would need the capacity more frequently and if it can only be called 50 hours it would be less valuable under that scenario.

Figure 18. DR Capacity Credit

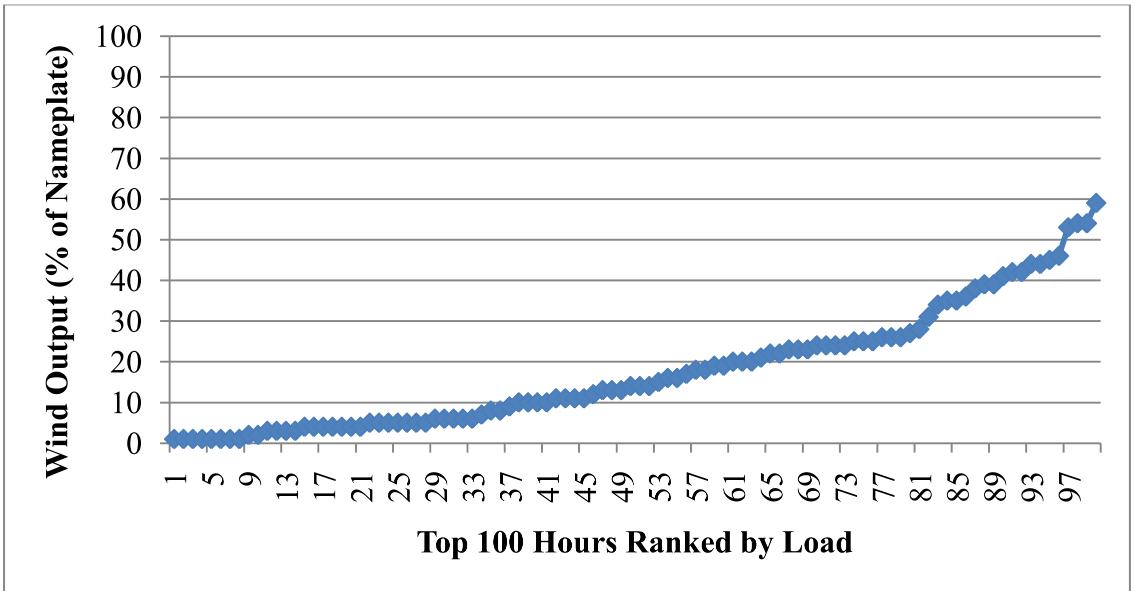


Understanding the risks and benefits offered by DR is critical given the penetration levels that some regions are approaching. Some utilities in Florida are already calculating "generation only" reserve margins and are considering using such a criterion in their resource planning decisions. This is due, in part, because there is uncertainty on how the DR will perform, including DR participant tolerance levels, as they are called upon more frequently. If states are going to consider further implementation of DR, it is important to ensure that the right amount and type are being added and these resources are being incentivized and valued correctly. States will need to understand all the dynamics and risks that could occur with DR. Some of these have been demonstrated in this case study simulation. Further simulations could assist in understanding this dynamic.

B. Intermittent Resource Sensitivities

Intermittent resources have a fundamentally different resource adequacy profile from conventional resources. The forced outage status of thermal generators is nearly completely independent. Fuel supply, transmission issues, and shared facilities can cause some units to be unavailable simultaneously, but typically outages are independent. Intermittent resources such as wind and solar, however, are dependent on weather conditions which are highly correlated across large geographic areas. For example, with a wind fleet of 1,000 MW in a 50,000 MW system, this does not create significant concern. At a higher penetration of 10,000 MW in a 50,000 MW system, the loss of wind resources will be a more significant issue. Because of wind's intermittency, the capacity value or effective load carrying capability (ELCC) of wind is already much lower than its nameplate capacity. Generally, at low penetration, the ELCC of wind should be close to the average output during peak conditions. If peak load occurs in the summer between 2:00 and 4:00 PM, a rough approximation of wind's ELCC would be the average output during these hours. For many regions, this output is between 15% and 25%. For our studied region, the wind output during the top 100 load hours is shown in Figure 19. The distribution is sorted by wind output and not peak load. The average output of wind is 18% of nameplate rating.

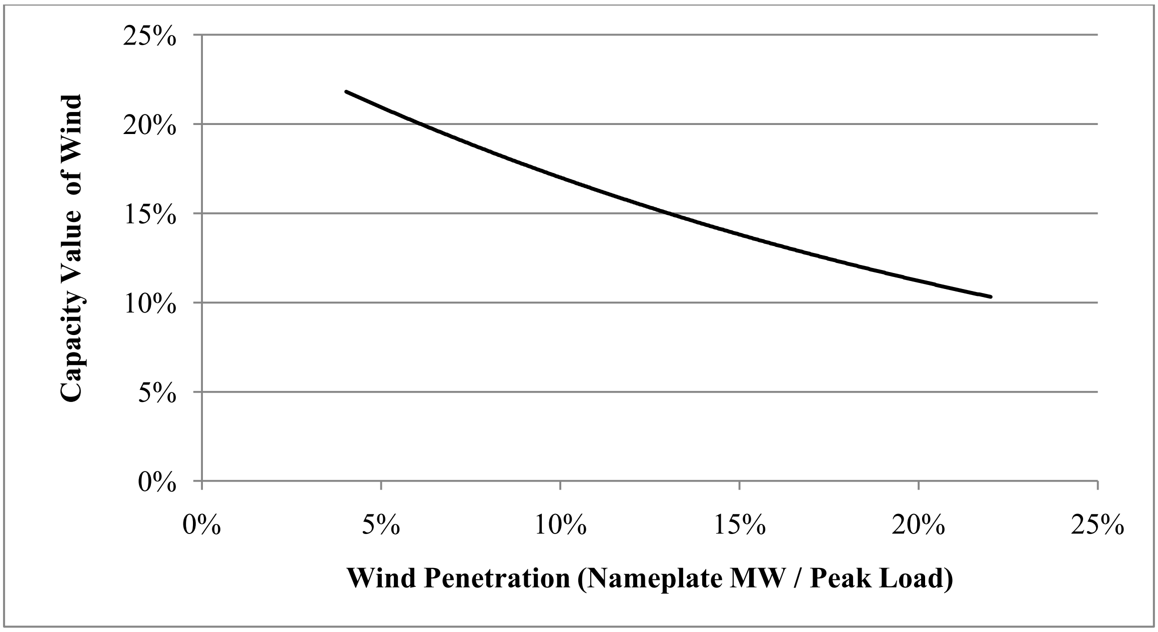
Figure 19. Wind Output During Peak Load Hours



However, this distribution also shows that in some peak hours, the wind output is much less than 18%. At a low penetration of 1,000 MW of nameplate wind, a region giving the wind fleet ELCC credit of 180 MW based on the average output during peak, this is not likely a reliability issue. Getting 180 MW less than expected is not a significant concern. It would be similar to losing a small thermal generator. If the wind fleet is a much larger 10,000 MW, having an output much smaller than the average output during peak conditions has a much larger impact on the system because it would correlate to losing 1,800 MW of capacity - a much more significant event.

To capture this difference, SERVM was used to determine the ELCC of wind at several penetration levels. When increasing the size of the wind portfolio, the same profile was used for all wind, so the correlation was perfect. This assumption is too conservative, because in reality, as penetration increases, a system would get some diversity benefit. But Figure 20 illustrates that as penetration increases, the capacity value or ELCC drops due to the reasons explained above. At low penetration, the ELCC can be slightly greater than the average output during peak if the system is energy limited rather than capacity limited. Having wind available at other times allows the system to conserve energy limited resources such as demand side resources and pumped storage or other hydro in hours that are lower than the peak so that those resources are available during peak hours. At high penetration, the ELCC is approximately half its value at low penetration.

Figure 20. Wind Penetration Study



These simulations did not capture the impact that intermittent resources has on ancillary service needs. Since the output of wind can vary substantially on a minute to minute basis, additional reserves may be necessary to fully integrate the wind profile. This is potentially an additional impact to reliability and warrants further analysis.

As the penetration of intermittent resources increases, regulators need to be aware of and prepared to address the changing impact these resources have on the economics of resource adequacy and on physical reliability.

C. Energy Storage Sensitivities

One proposed solution for intermittent resources is often to use energy storage technologies to firm up wind and other intermittent resources. Energy storage could address intra-hour uncertainties as well as hourly and daily uncertainties due to the intermittent profiles of wind and solar. The incremental intra-hour needs of regulation, operating reserves, and load following due to wind are well met by energy storage because, for these services, only 1-2 hours of storage may be needed. For the longer term uncertainties, the question of how many hours of storage is adequate to fully back-up wind resources. Would 4 hours of storage be adequate to make the wind energy be dependable? 8 hours? 16 hours?

The answer is likely dependent on the existing system as well as the penetration of intermittent resources. At low levels of penetration, energy storage solutions could likely have a lower peak capacity to energy storage ratio. For example, with only 1,000 MW of wind in a 50,000 MW system, each energy storage installation might only need 2 MWh of storage for every 1 MW the installation is able to deliver on peak. At higher penetrations of wind, each energy storage installation might need 10 MWh of storage for every 1 MW of peak output.

The fundamental issue when crafting an energy storage solution for intermittent resources is to identify the most cost effective solution. Given the right energy storage technology, it may be possible to build enough storage capacity with tremendous energy reserves to be able to fully firm up all wind capacity. But is this economically efficient? Even if the cost of energy storage drops substantially in the future, the ideal economic solution likely includes only firming a portion of the wind fleet combined with a mix of types of energy storage. Additional simulations could be performed to design optimal energy storage resource expansion plans that minimize the cost of integrating wind.

D. Distributed Generation

Distributed Generation (DG) is generation that produces electricity at or near the point of use and is generally small compared to centralized power stations. Distributed generation includes on site wind, solar arrays, micro-turbines, fuel cells, combined heat and power, and back-up or emergency power units. Based on a Department of Energy Report[66] released in 2007, there are an estimated 12 million distributed generation units installed in the U.S. with a combined capacity of approximately 200 GW. The report estimates that 84 GW of this capacity is consumer owned combined heat and power (CHP) systems and the majority of the remaining capacity consists of backup power units used only during emergency situations. These on-site units are generally not much larger than 1 MW in size, but in aggregate represent a large amount of capacity.

From a resource adequacy perspective, the difficulty with distributed generation is that utility system operators typically do not have full control to dispatch the resource during times of peak load. Because of this, the majority of these resources are typically not counted toward a reserve margin. An additional complexity raised by these resources is how load forecasts are accounting for the load that these resources are serving. As discussed in other sections of this paper, the proper counting of resources such as DG, DR, wind, and other energy limited resources is essential in optimal resource adequacy planning. To the extent that distributed generation owners and utility planners can better coordinate dispatch schedules and provide operators assurance that the resource will be available when called, there is potential for these resources to provide capacity in resource plans rather than through construction of new generation facilities. Generally, larger cogeneration and backup resources are counted but because the majority of all DG is less than 1 MW, a large percentage of these resources are not contributing to reserve margin calculations. States should continue to encourage this coordination, when cost-effective, in an attempt to further optimize resource adequacy.

---

[66] *The Potential Benefits of Distributed Generation and Rate_Related Issues That May Impede Their Expansion,* retrieved on November 2, 2012 from http://www.ferc.gov/legal/fed-sta/exp-study.pdf

Aside from resource adequacy, states should help foster cost-effective DG by ensuring tariff rates and other subsidies such as investment/production tax credits are properly incentivizing these resources. Because of the size of these resources, new DG does not benefit from the economies of scale of a new traditional centralized power station and may need to make up the difference in order to be economically competitive with these traditional generation sources through specific advantages such as co-generation benefits, transmission benefits, fuel source, or subsidies. Regarding transmission, states should continue to ensure that interconnection rules and guidelines are fair and allow these types of resources to be developed.

X. ALTERNATIVES TO THE 1-IN-10 LOLE CRITERIA

A. NORMALIZED EUE

NERC has recently required all long assessment areas to perform probabilistic reliability studies for their systems and report a new metric which it calls ―Normalized EUE". This is the percentage of load that was unserved.

Pros:

- The metric provides more information than LOLE because it incorporates the magnitude of the firm load shed event versus only counting the event.
- The metric is more easily comparable across regions because it calculates the magnitude of EUE as a percentage.

Cons:

- There is currently no threshold in place in the U.S. that has been studied stating that a system should be planned to meet a specific percentage of Normalized EUE.
- Normalized EUE doesn't take into account customer costs.

B. MINIMIZATION OF TOTAL SYSTEM COSTS

As the paper has discussed, assessing the reserve margin which produces the minimum system costs from the perspective of the consumer provides valuable insight.

Pros:

- Evaluating the economics provides customers and regulators with a sense of what the costs are for various levels of reliability and whether or not meeting a 1-in-10 LOLE standard is justified.
- An economic study better portrays the risk of resource adequacy. As seen in the results, reliability events are low probability but high cost events.
- Because firm load shed events are so infrequent, it is difficult to calibrate loss of load expectation models. Analyzing economics allows planners to know whether or not their reliability expectations are reasonable by being able to calibrate their economic results to actual historical costs.

Cons:

- Evaluating the economics alongside physical reliability metrics requires more effort.
- A few key assumptions such as the cost of unserved energy, cost of new capacity, and scarcity pricing have to be developed.

XI. RECOMMEND DETAILED PROCESS AND PROPOSAL TO ASCERTAIN THE ECONOMICS OF RESOURCE ADEQUACY

A. ENTIRE EASTERN INTERCONNECTION ASSESSMENT

Since this case study in this paper only used a subset of the Eastern Interconnection, we propose to the states that there would be value in examining the economics of resource adequacy as well as physical reliability metrics of the entire Eastern Interconnection. Analysis could be performed on an individual region basis as well as for the aggregate Eastern Interconnection. It is expected that an optimal economic reserve margin target for the Eastern Interconnection that is well coordinated and dispatched efficiently would likely be lower than a composite level resulting from target set by individual entities. Another view of the analysis could only analyze societal costs (fuel burn + O&M + unserved energy costs) across the Eastern Interconnection.

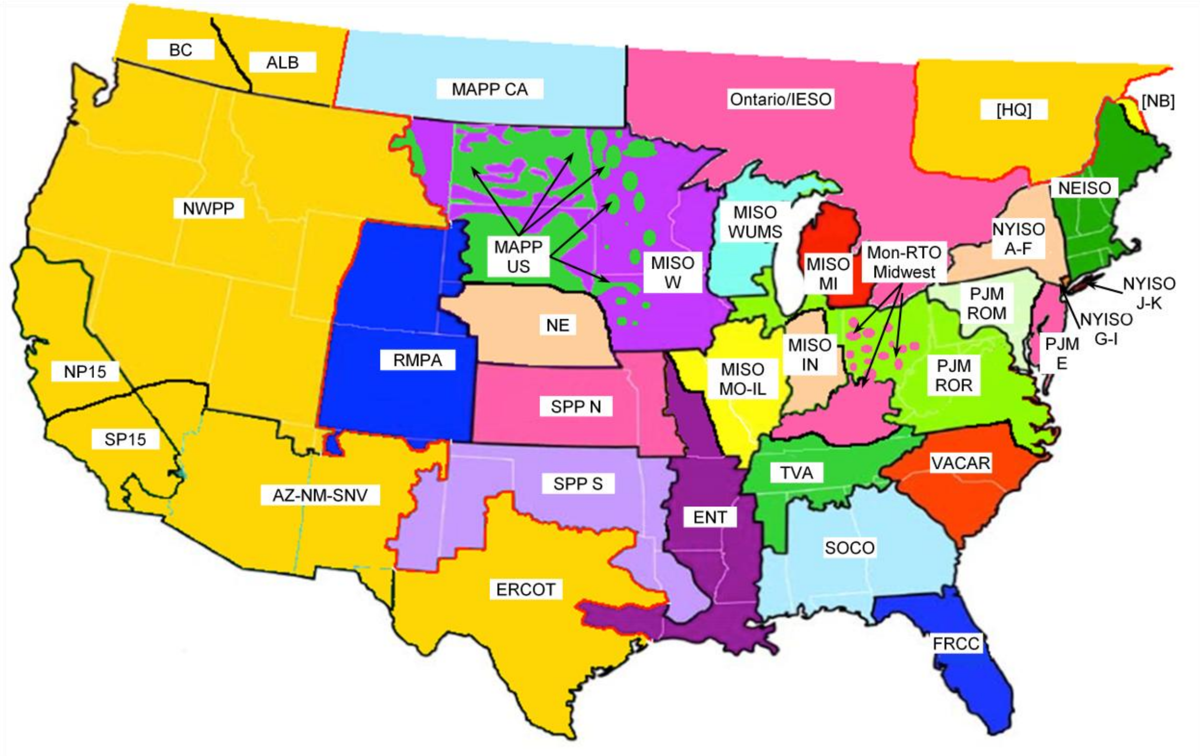
We propose using the EIPC data in a similar fashion to the way the data was used for this study. Load forecasts, fuel forecasts, and unit characteristics could all be obtained from EIPC data because the assumptions have already been well vetted by the participants. The data that would still need to be further developed or gathered to produce accurate resource adequacy results by entity and in aggregate would include the following:

- Distributions of load uncertainty due to weather for the remaining regions
- Distributions of load uncertainty due to economic growth uncertainty
- Actual historical generator availability data (GADS Data) by unit
- Demand resource characteristics
    - Reliability only
    - Economic
    - Call limits
    - Forecasted amounts
- Emergency Operating Procedures
    - Voltage reduction ability
    - Definition of when exactly a firm load shed event occurs (i.e. before or after depleting operating reserves, voltage control, etc)
- Wind and solar profiles by region and correlations to each other
- Hydro variability by region based on historical rainfall
- Energy efficiency projections by region
- Interface capability between regions and distributions around these assumptions representing the interface availability during peak conditions.

Astrape would recommend using a similar approach to the case study included in this paper. SERVM would be necessary to model the major uncertainties surrounding resource adequacy and capture all possible outcomes. It is expected that all benefits and costs associated with adding additional capacity across a range of reserve margins would be tabulated to gain a full understanding of the cost/benefit relationship. At the same time, it would be important to also calculate physical reliability metrics such as LOLE, LOLH, and EUE for all the scenarios simulated.

The topology for the Eastern Interconnection for the recommended study is included in the following figure. The regions within WECC and ERCOT would not be included in the analysis. The regions not already included in this paper's case study include HQ, IESO, NB, NEISO, MAPP US, NE, SPP-N, SPP-S, ENT, SOCO, and FRCC.

Figure 21. Study Topology[67]



The effort required to model the remaining areas in the Eastern Interconnection would not be inordinate given a significant portion has already been done. Astrape would propose incorporating actual historical GADS data rather than using the generic EFOR data provided in the EIPC data. Astrape would also need substantial collaboration regarding emergency operating procedures by each region as well as developing a better distribution of the transfer capability between regions.

Additional sensitivities surrounding market structure, scarcity pricing, demand response, and load forecast error assumptions should also be simulated to understand the impact they may have on the Base Case in this paper. Also the authors suggest simulating analysis using a different marginal resource such as demand response or combined cycle capacity.

It is anticipated that this effort could also result in state by state assessments of both the physical reliability and economic efficiency provided by the resource plans of utilities and other entities.

[67] Study would not include WECC or ERCOT

B. ADDITIONAL RELIABILITY CONSIDERATIONS WITH EVOLVING RESOURCE MIXES

1. Demand Response Analysis

This paper demonstrated the importance of understanding demand response and how it impacts resource adequacy but many important questions have not been answered. If the full Eastern Interconnection model is developed, more meaningful analysis of DR programs is possible. Also, based on the data developed by the national labs for EISPC regarding demand response, there is much to be learned in this area with additional simulations. Scenarios to be explored could include:

- Simulating the 4 DR penetration possibilities developed by Oak Ridge National Laboratories[68] under the full range of weather, load and unit performance scenarios developed by Astrape. The penetration levels range from 6% - 30% and consist of a number of different types of programs.
- Assessing the energy and capacity value of pricing programs under a range of views of the future, including several of the alternate views explored in the EIPC study.
- Additional simulations assessing the impact of other contract constraints including days per week, hours per day, hours per month.
- Additional simulations to explore the impact of potential customer fatigue and changing price responsiveness.

2. Evaluating the Impact of Intermittent Resources on Operational Reliability

Because SERVM performs a full economic dispatch, the effort performed for the long-term physical and economic reliability assessments could be leveraged to analyze operational reliability. Although SERVM is an hourly model, intra-hour impacts could also be assessed by applying a distribution of 5-minute, 15-minute, and 30-minute uncertainty to the available resources in the model. Results of these simulations would allow planners to quantify the economic costs and reliability impact of increasing penetration of wind and solar from an operational standpoint. The costs of the necessary ancillary services such as regulation, load following, and additional operating reserves could be easily captured, as well as the financial impact of having to over commit resources to be able to ensure reliability will not be a concern. Potential mitigation strategies could also be explored using SERVM to identify the technologies and scheduling practices that protect reliability and minimize system costs in future environments.

3. Probabilistic Transmission Availability Impact

The data needs mentioned above anticipate the need for better transmission information, but do not include simulating probabilistic transmission component failures. SERVM could be used in conjunction with transmission modeling tools such as EPRI's TransCARE[69] to assess the combined generation and transmission reliability for discrete regions in the Eastern Interconnection. The scope for such an assessment has been developed separately by NARUC.

---

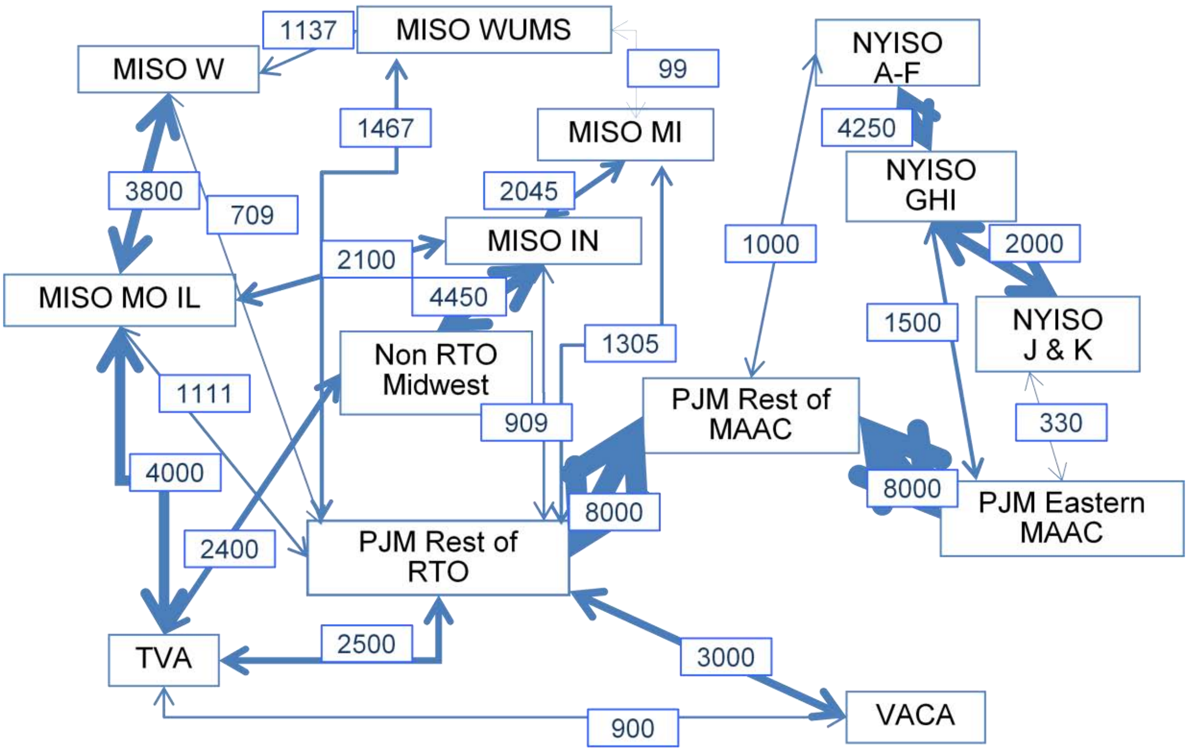
[68] Demand Response Assessment for Eastern Interconnection retrieved on Dec 1, 2012 at http://communities.nrri.org/documents/68668/19533034-7afe-4e7e-98fc-c4b511213871

[69] TransCARE is used is used for reliability assessment of composite generation and transmission systems.

XII. APPENDIX A

For the case study, Astrape Consulting constructed a model that included a significant portion of the Eastern Connection. All of the modeling data was taken from the current EIPC study including load forecasts, existing unit data, and transmission capability between regions. Below is the topology that was used for case study.

Figure A1. Topology



The resource adequacy software used for the case study is the Strategic Energy and Risk Valuation Model (SERVM)[70]. The probabilistic model was specifically designed for this type of analysis because it not only calculates traditional reliability metrics for a system (i.e. LOLE, LOLH) but also incorporates economic commitment and dispatch which allows for economics to be taken into account.

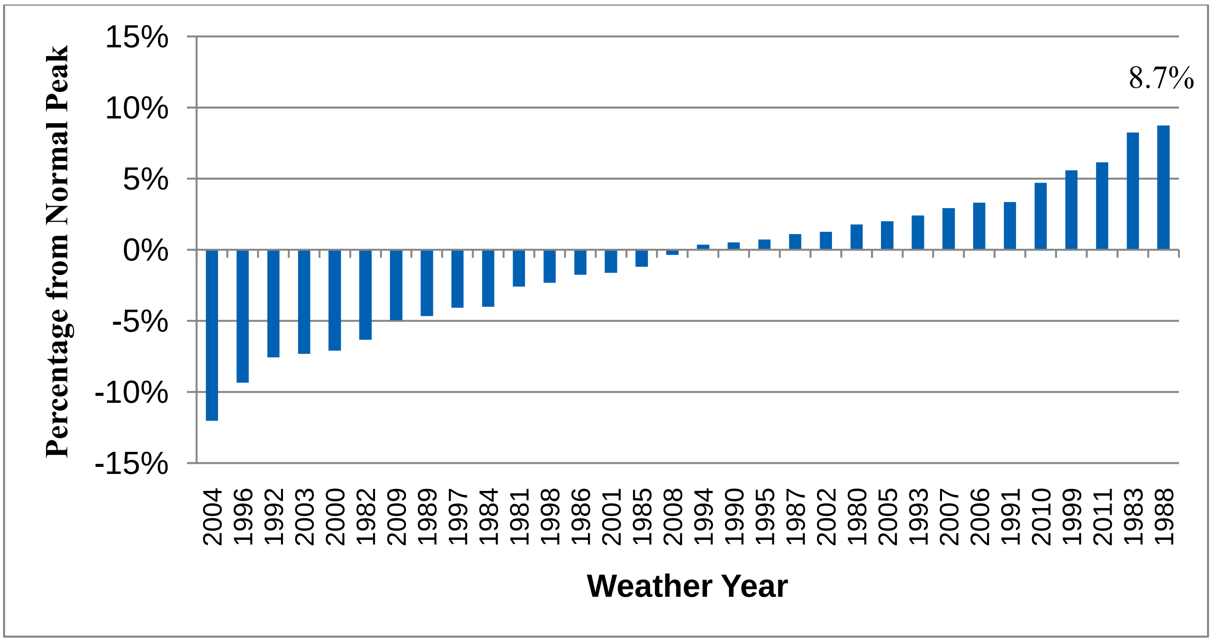
Resource adequacy studies have key attributes that differentiate it from typical production cost modeling studies. First, the study time frame typically examines one year in the near future versus studying longer time frames. This one year is then analyzed for all possible outcomes to assess the probability of a shortfall in capacity. For this case study, the year 2016 was chosen since it provides the lead time for new generation to be installed if reserve margin targets need to be changed. The most important variables driving capacity shortfalls include a combination of the following three uncertainties: weather uncertainty, economic load forecast uncertainty, and unit performance.

[70] SERVM is an economic resource adequacy model that is used by utilities to develop optimal reserve margin targets using economics as well as LOLE.

Weather

Weather uncertainty has an impact on both load and resources. The impact on load was modeled by simulating 32 synthetic load shapes representing the last 32 years of weather. Synthetic load shapes were created by developing a relationship between the last five years of load and temperature history using a neural net model. Each region has a unique load and weather relationship. These relationships were then applied to the last 32 years of weather to create 32 synthetic load shapes for each region. Each of these shapes represent what 2016 load could look like if the region experiences the same weather conditions from a historical year. Each load shape was given equal probability of occurrence in the simulation. The following figure provides an example of how high summer peak load can be above normal peak load for the PJM Rest of MAAC Region.

Figure A.2. Summer Weather Variability on Load for PJM_ROM



The following tables demonstrate the weather diversity incorporated into the loads. The first table shows on average over the 32 years of weather history, where each region is compares to its non-coincident peak load when the entire system peaks. The non-coincident peak of the system is 412,251 MW while the coincident system peak is 394,450MW which represents 4.5% weather diversity across the region.

Table A.1. Weather Diversity

Region	Average Load When Total System is Peaking (MW)	Average Non-Coincident Peak Load (MW)	Load Diversity with Neighbors (Region non-coincidental peak - Region coincidental peak)/(Region coincidental peak) (%)
PJM ROM	29,689	30,031	1.2%
PJM-E	35,731	36,143	1.2%
PJM ROR	105,726	107,319	1.5%
TVA	34,001	35,833	5.4%
VACAR	48,135	50,204	4.3%
NON-MIDWEST-ISO	11,272	11,729	4.1%
NYISO-A-F	11,154	11,934	7.0%
NYISO-G-I	4,220	4,515	7.0%
NY ISO-J-K	16,550	17,708	7.0%
MISO-IN	20,294	21,382	5.4%
MISO-MO-IL	20,434	21,530	5.4%
MISO-W	25,611	29,242	14.2%
MISO-MI	18,906	20,729	9.6%
MISO-WUMS	12,725	13,952	9.6%

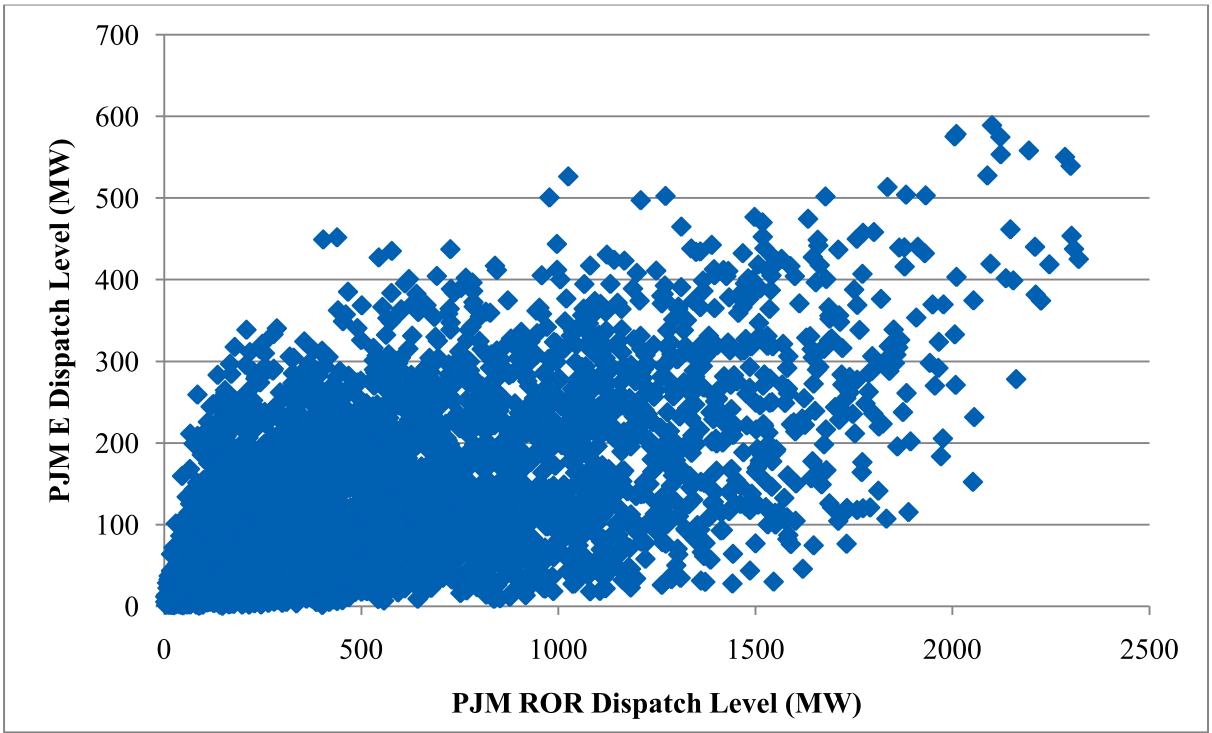
The next table represents the average of how far the neighboring region's load is relative to its own normal peak load in hours when the PJM_ROM is at its peak load. This is an average over 32 years of weather history. So on average, when PJM_ROM is at its peak load, then VACAR is within 6.7% of its normal peak load.

Table A.2. Neighbor Region's Load During PJM_ROM Region Peak

Region	Average Load When PJM_ROM is at its Peak Load (MW)	Average Non-Coincident Peak Load (MW)	Average Diversity with Study Region Peak Load (%)
PJM ROM	30,031	30,031	0.0%
PJM-E	36,143	36,143	0.0%
PJM ROR	103,682	107,319	3.4%
TVA	33,386	35,833	6.8%
VACAR	46,848	50,204	6.7%
NON-MIDWEST-ISO	10,880	11,729	7.2%
NYISO-A-F	11,022	11,934	7.6%
NYISO-G-I	4,170	4,515	7.6%
NY ISO-J-K	16,354	17,708	7.6%
MISO-IN	19,264	21,382	9.9%
MISO-MO-IL	19,397	21,530	9.9%
MISO-W	24,571	29,242	16.0%
MISO-MI	18,051	20,729	12.9%
MISO-WUMS	12,149	13,952	12.9%

Weather uncertainty also impacts the operation of hydro, wind, and solar resources. To take this into account, historical hydro energy data from each region was used to capture the amount of hydro energy available in each of the 32 weather years. For wind resources, the 2004 - 2006 EWITS data was utilized. The model draws stochastically by month and day from the 3 year period ensuring that the correlation from region to region is maintained. In other words, if July 5, 2006 was randomly drawn, then the profiles for all regions from that day were utilized. In examining the data, there was a significant correlation between regions as shown in the following figure. In hours when the PJM wind output was low, it was likely to be low in other regions as well.

Figure A.3. Wind Correlation between Regions (PJM_East/PJM_Rest of RTO)



The table below shows the capacity credit given to intermittent resources by region for the case study.

Table A.3. Capacity Credit of Intermittent Resources

NEEM Region	Technology	Capacity Credit
All Regions	Photovoltaic	30%
All Regions	Solar Thermal	30%
All Regions	Offshore Wind	20%
New York	Wind	10%
PJM (-E, -ROM, -ROR)	Wind	13%
TVA	Wind	12%
All Other Regions	Wind	15%

Economic Load Forecast Error

The second uncertainty - load growth forecast error - is the measure of the extent to which load forecasters will underestimate or overestimate economic growth for the next several years depending on the year being studied. The following distribution was used for the case study. This distribution was developed from a historical analysis of how well the Congressional Budget Office was able to forecast GDP four years in the future. The GDP uncertainty was converted to load uncertainty by multiplying by 40% - the assumed relationship of load growth to economic growth. The figure shows that in the most extreme case (lowest probability), load growth could be under forecasted by 5% over a four year period.

If it is assumed that demand response is the marginal resource, then it is likely that the economic load forecast error could be reduced to examine uncertainty over 1 – 2 years. The analysis completely changes under this approach because the capacity costs and benefit of a marginal DR resource are likely less than a marginal CT. The fact that the acquisition of DR is not unlimited also poses a concern in the authors‘ opinion.

Figure A4. Economic Load Forecast Error

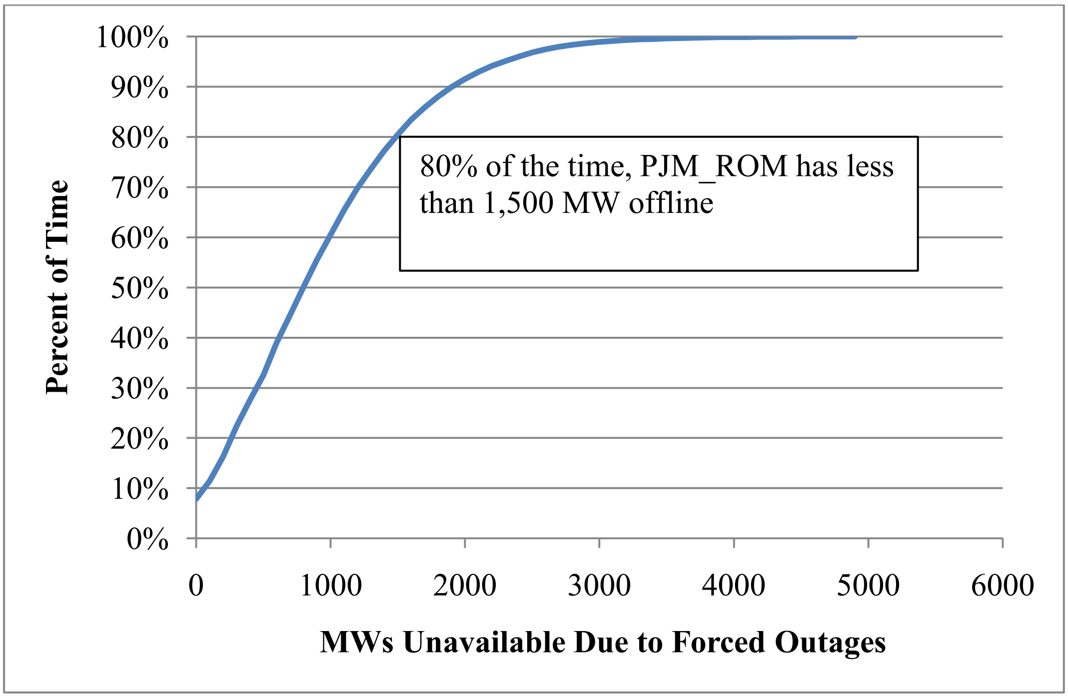
Load Forecast Error	Probability
5.11%	6.25%
3.90%	18.75%
0.55%	31.25%
-1.76%	18.75%
-2.90%	12.50%
-4.54%	12.50%

Unit Performance

The last major driver is unit performance. It is important to simulate the percent of time that a system will have a significant amount of generation offline due to forced outages, including partial outages. The model uses Monte Carlo techniques to simulate random generator failures. SERVM users actually enter in time to fail and time to repair distributions instead of a unit Equivalent Forced Outage Rate (EFOR). For this study, Astrape scaled distributions to achieve the target EFORs that were used in the EIPC Study. It should be noted that the EFOR data provided in the EIPC study was generic by unit type and that real historical GADS data would be needed for these results to provide more than an indicative conclusion.

The following chart shows a distribution representing the amount of MWs offline due to forced outage as a percentage of time. The figure shows that it is expected to have approximately 800 MW of capacity offline in a given hour, but that there are iterations where there can be several thousand MWs offline in a given hour. The chart also shows that 80% of the time the region will have less than 1,500 MW offline due to forced outages.

Figure A.5. Unit Performance Distribution



Hydro Modeling

SERVM utilized 32 years of historical hydro energy in the model. The variability of river flows can impact resource adequacy greatly. SERVM models the resources as either run of river, minimum flow constraints, or peak shaving. The total hydro capacity for each region was separated into the three categories. Run of river is defined as providing constant capacity for all 8760 hours of the year. The minimum flow constraints force the unit to be dispatched for at least a certain amount of hours each day at a certain capacity level. SERVM optimizes the dispatch around the peak for its peak shaving hydro resources.

Pump Storage Modeling

The pump storage resources are dispatched based on economics. The resources will pump during off peak hours and generate during peak hours if economic.

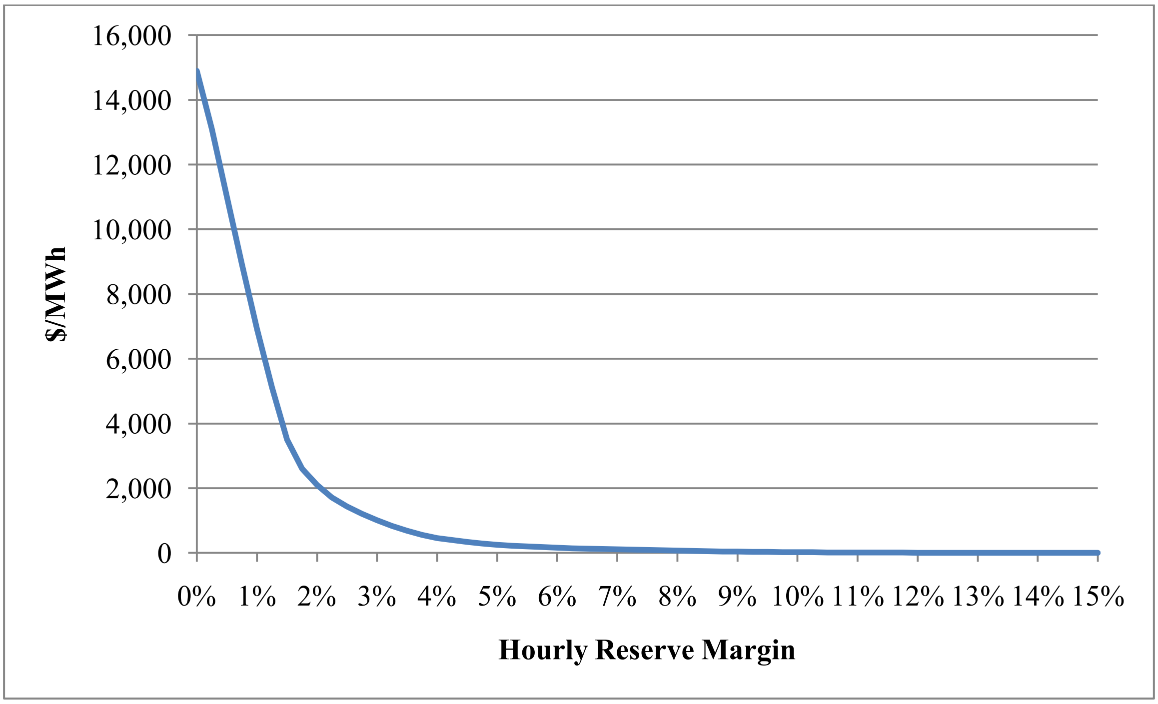
Demand Response Modeling

Demand response resources are modeled as capacity with specific call limits and strike price. For this case study, all demand response was given call limits of 150 hours per year and treated as reliability only with a dispatch price of $2,500/MWh. In other words, demand response was only called after all other alternative have been exhausted including expensive market purchases.

Scarcity Pricing

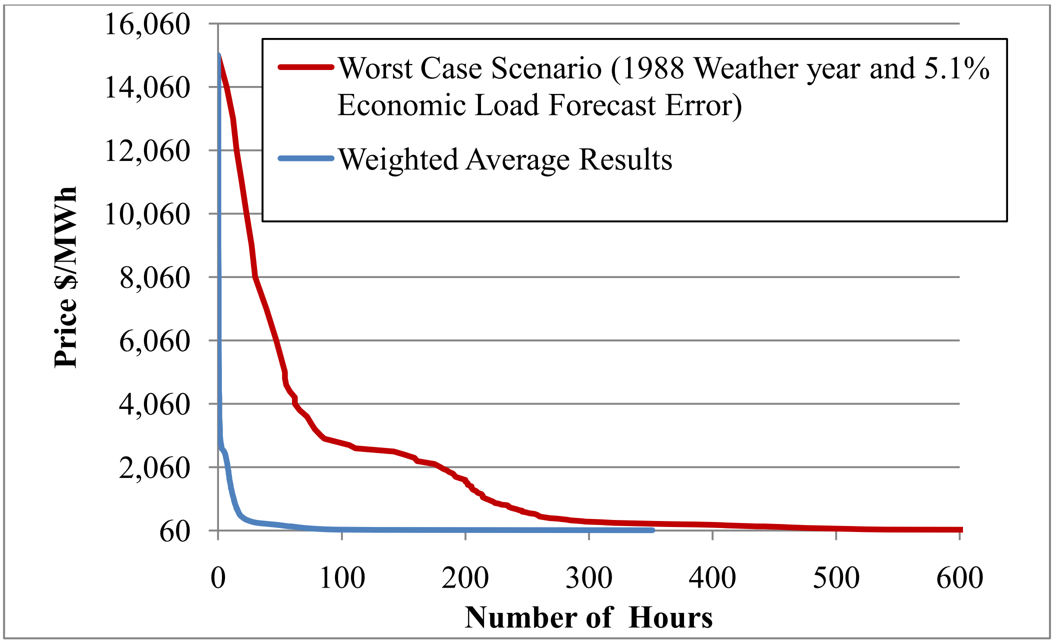
A scarcity pricing curve was developed by Astrape based on past experience of looking at historical market prices in different regions across the country. As the hourly reserve margin for a region decreases, the scarcity price approaches the VOLL. The following figure shows the curve that was actually used in the case study. The 0% level represents the point at which firm load is shed in order to maintain 2% spinning reserves in the case study. Because the modeling takes into account recent weather years, the authors were able to compare energy margins from the model to actual PJM energy margins in 2010-2011 to get comfortable with the scarcity pricing curve.

Figure A6. Scarcity Pricing Curve



Based on the base case results, the following figure shows a price duration curve at a 10% reserve margin level for the weighted average of all scenarios and the worst scenario simulated shows the number of hours that are expected to occur at different market price thresholds. As expected, it is seen that prices above $2,000/MWh are rare.

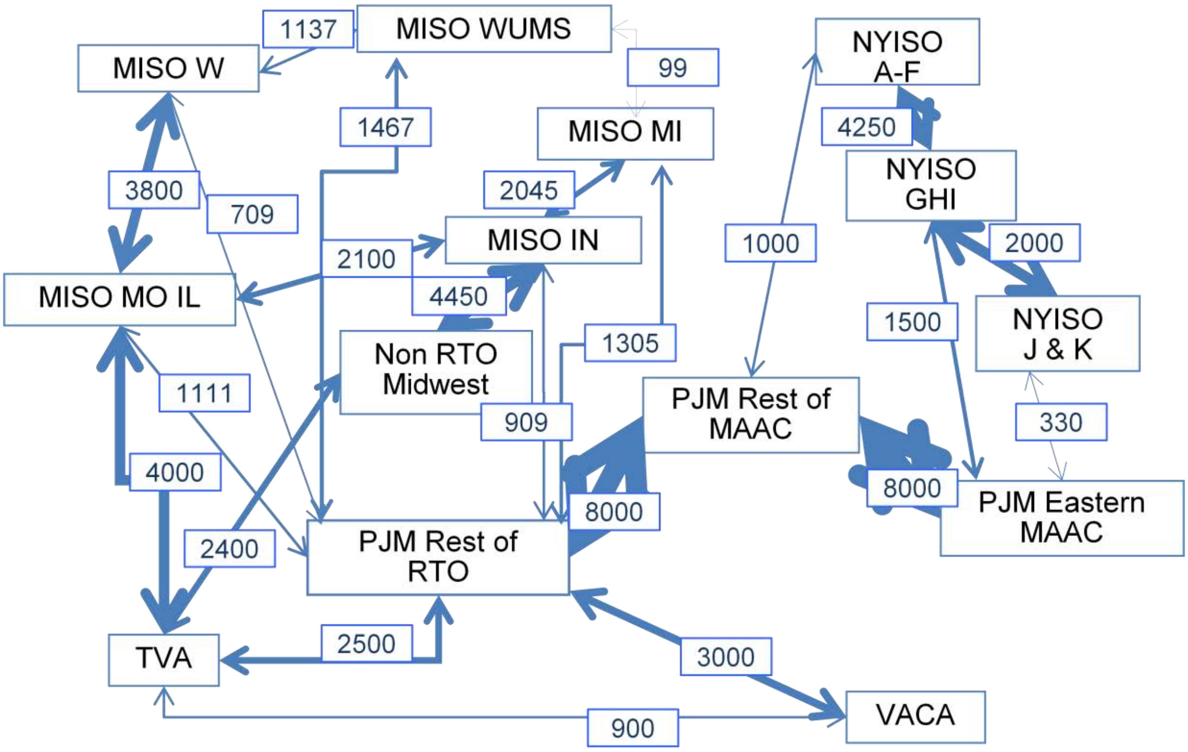
Figure A.7. Frequency of Scarcity Pricing @ 10% Reserve Margin



Transmission Interface

The following figure shows the transmission limits that were used for the Case Study which were direct inputs from the EIPC study. To perform more accurate simulations, Astrape suggests developing availability distributions for these interface limits rather than entering a constant value.

Figure A8. Transmission Interface Limits



Neighbor Modeling

SERVM's market clearing algorithms allow regions to share resources based on economics but subject to transmission limits. For example, if the TVA region is short capacity in a given hour, then their initial market price is equal to the VOLL. If VACAR is long, then VACAR can provide resources to lower the market price in TVA. If there was unlimited transfer capacity, then all regions would have the same hourly market price curve.

It should be noted that SERVM allows users to designate which resources can be shared. For this study, regions were not allowed to dispatch demand response resources in order to sell to other regions. Figure A.8 shows the target reserve levels for each NEEM Region in the study.

Figure A.9. Neighbor Target Reserve Margins

Reserve Margin Area	Reserve Requirement	NEEM Region(s)
MISO	17.4%*	MISO_IN
		MISO_MI
		MISO_MO-IL

In re: Generic investigation into the aggregate electric utility reserve margins planned for Peninsular Florida.	DOCKET NO. 981890-EU ORDER NO. PSC-99-2507-S-EU ISSUED: December 22, 1999

The following Commissioners participated in the disposition of this matter:

JOE GARCIA, Chairman
J. TERRY DEASON
SUSAN F. CLARK
E. LEON JACOBS, JR.

APPEARANCES:

JAMES D. BEASLEY and LEE WILLIS, Ausley & McMullen, Post Office Box 391, Tallahassee, Florida 32302, appearing on behalf of Tampa Electric Company.

JOSEPH A. McGLOTHLIN, McWhirter, Reeves, McGlothlin, Davidson, Dekker, Kaufman, Arnold & Steen, 117 South Gadsden Street, Tallahassee, Florida 32301, appearing on behalf of Reliant Energy Power Generation.

VICKI GORDON KAUFMAN and JOHN MCWHIRTER, McWhirter, Reeves, McGlothlin, Davidson, Dekker, Kaufman, Arnold & Steen, 117 South Gadsden Street, Tallahassee, Florida 32301, appearing on behalf of the Florida Industrial Power Users Group.

GARY L. SASSO, Carlton, Fields, Ward, Emmanuel, Smith & Cutler, P.A., Post Office Box 2861, St. Petersburg, Florida 33731, appearing on behalf of Florida Power Corporation.

MATTHEW M. CHILDS, Steel, Hector & Davis, 215 South Monroe Street, Suite 601, Tallahassee, Florida 32301, appearing on behalf of Florida Power & Light Company.

DEBRA SWIM, Legal Environmental Assistance Foundation, 1115 North Gadsden Street Tallahassee, Florida 32301, appearing on behalf of Legal Environmental Assistance Foundation (LEAF).

ROY YOUNG, Young, van Assenderp and Varnadoe, P. A., P. O. Box 1833, Tallahassee, Florida 32302-1833, appearing on behalf of the City of Lakeland and Kissimmee Utility Authority.

PAUL SEXTON, Thornton Williams & Associates, 215 South Monroe Street, Suite 600-A, Tallahassee, Florida 32301, appearing on behalf of the Florida Reliability Coordinating Council, Inc.

JON C. MOYLE, JR. Moyle, Flanigan, Katz, Kolins, Raymond & Sheehan, 210 South Monroe Street, Tallahassee, Florida 32301, appearing on behalf of PG&E Generating Company.

ROBERT SCHEFFEL WRIGHT, Landers & Parsons, 310 West College Avenue, Tallahassee, Florida 32302, appearing on behalf of Duke Energy New Smyrna Beach Power Company, Ltd., L.L.P.

FREDERICK M. BRYANT, General Counsel, Florida Municipal Power Agency, 2010 Delta Boulevard, Tallahassee, Florida 32315, appearing on behalf of Florida Municipal Power Agency.

THOMAS J. MAIDA, III, Foley & Lardner, Post Office Box 508, Tallahassee, Florida 32302, appearing on behalf of Seminole Electric Cooperative.

KENNETH A. HOFFMAN, Rutledge, Ecenia, Underwood, Purnell and Hoffman, P. O. Box 511, 215 South Monroe Street, Suite 420, Tallahassee, Florida 32302-0551, appearing on behalf of the City of Tallahassee.

MICHAEL B. WEDNER, Office of General Counsel, 117 West Duval Street, Suite 480, Jacksonville, Florida 32202, appearing on behalf of Jacksonville Electric Authority.

ROBERT V. ELIAS, GRACE JAYE and COCHRAN KEATING, FPSC Division of Legal Services, 2540 Shumard Oak Boulevard, Tallahassee, Florida 32399-0850, appearing on behalf of the Florida Public Service Commission Staff.

ORDER APPROVING STIPULATION

BY THE COMMISSION:

During our reviews of the Ten Year Site Plans filed in 1997 and 1998, we expressed concerns about the adequacy of the reserve margins planned for Peninsular Florida. At the December 15, 1998, Internal Affairs meeting, we directed staff to open this docket to consider the reserve margins planned for Peninsular Florida electric utilities.

By Order No. PSC-99-1274-PCO-EI, nineteen issues were identified for consideration in this proceeding. The investor-owned utilities, the cooperative utilities, several municipal utilities, the various intervenors, and Commission staff filed testimony concerning these issues. The hearing was scheduled for November 2nd and 3rd, 1999.

At the outset of the hearing, Florida Power & Light Company (FPL), Florida Power Corporation (FPC), and Tampa Electric Company (TECO), presented a proposal designed to settle the case; addressing what they believe are the Commission's major concerns. By the proposal, these three utilities stipulated to voluntarily adopting a twenty percent reserve margin planning criterion. Each of these three utilities would achieve the twenty percent level by the summer of 2004. Further, pursuant to the proposal, no decisions would be made concerning the specifically enumerated issues, and the docket would be closed. FPL, FPC, and TECO would be the only utilities adopting the twenty percent criteria.

Other parties argued in support of and against the proposal. The Florida Industrial Power Users Group (FIPUG) requested additional time to present a counter-proposal. The hearing was continued until November 30, 1999, and the parties were directed to attempt to reach a negotiated settlement. FIPUG offered a counter-proposal on November 17, 1999. No settlement was reached.

At the continued hearing, we considered both proposals. After discussion, FPL, FPC, and TECO agreed to further modifications to their proposal. A document incorporating these agreed-upon changes was filed on December 15, 1999. A copy of this document (hereinafter the "Stipulation") is included in this Order as Attachment A and is incorporated herein by reference. FPL, FPC, and TECO have each agreed to achieve a planned twenty percent reserve margin by the summer of 2004. In response to concerns expressed by some of the other parties, each utility has agreed to make a good faith effort to notify the Commission if it opts to modify the twenty percent criterion. The three utilities signing the Stipulation further acknowledge in paragraph 9 at page 4 that

> the Commission shall retain the ability and discretion to consider all facts and circumstances applicable to a given utility and/or peninsular Florida. Further, with respect to the evaluation of the adequacy of reserves in peninsular Florida, the Commission may employ any methodology and consider any facts and circumstances it deems appropriate, subject to applicable legal requirements.

We approve the Stipulation agreed to by Florida Power & Light Company, Florida Power Corporation, and Tampa Electric Company. It addresses the basic concern about the adequacy of planned reserve margins for Peninsular Florida. Collectively, these three utilities plan for approximately 80 percent of the Peninsular Florida load. Thus, a twenty percent planning criterion adopted by these three utilities is a significant increase over the fifteen percent criterion currently employed.

Further, we will convene a workshop to receive and consider information regarding how distributed resources, both demand and supply-side, may be used to meet Florida's energy service reliability needs. In addition, we will convene a workshop for the consideration of the appropriate relationship between the non-firm load of an individual utility and the total reserves required to maintain the utility's appropriate reserve margin.

Based on the foregoing, it is therefore

ORDERED by the Florida Public Service Commission that the Stipulation agreed to by Florida Power & Light Company, Florida Power Corporation, and Tampa Electric Company, which is included in this Order as Attachment A and is incorporated by reference herein, is approved. It is further

ORDERED that this docket shall be closed.

By ORDER of the Florida Public Service Commission this 22nd day of December, 1999.

Blanca S. Bayó

BLANCA S. BAYÓ, Director
Division of Records and Reporting

(S E A L)

RVE

NOTICE OF FURTHER PROCEEDINGS OR JUDICIAL REVIEW

The Florida Public Service Commission is required by Section 120.569(1), Florida Statutes, to notify parties of any administrative hearing or judicial review of Commission orders that is available under Sections 120.57 or 120.68, Florida Statutes, as well as the procedures and time limits that apply. This notice should not be construed to mean all requests for an administrative hearing or judicial review will be granted or result in the relief sought.

Any party adversely affected by the Commission's final action in this matter may request: 1) reconsideration of the decision by filing a motion for reconsideration with the Director, Division of Records and Reporting, 2540 Shumard Oak Boulevard, Tallahassee, Florida 32399-0850, within fifteen (15) days of the issuance of this order in the form prescribed by Rule 25-22.060, Florida Administrative Code; or 2) judicial review by the Florida Supreme Court in the case of an electric, gas or telephone utility or the First District Court of Appeal in the case of a water and/or wastewater utility by filing a notice of appeal with the Director, Division of Records and reporting and filing a copy of the notice of appeal and the filing fee with the appropriate court. This filing must be completed within thirty (30) days after the issuance of this order, pursuant to Rule 9.110, Florida Rules of Appellate Procedure. The notice of appeal must be in the form specified in Rule 9.900(a), Florida Rules of Appellate Procedure.

BEFORE THE FLORIDA PUBLIC SERVICE COMMISSION

In re: Generic investigation into the aggregate electric utility reserve margins planned for Peninsular Florida
_______________________/

Docket No. 981890-EU

STIPULATION

WHEREAS, the Florida Public Service Commission initiated this proceeding regarding reserve margins of Peninsular Florida utilities in December 1998; and

WHEREAS, subsequent to that date Staff and parties identified certain issues to be addressed and procedures to be followed; and

WHEREAS, Florida Power & Light Company (FPL), Florida Power Corporation (FPC), and Tampa Electric Company (TECO) (collectively, the IOUs) have asserted, and continue to assert, that the scope of the proceeding has been expanded beyond the intent of the Commission, and that the procedural posture of this proceeding is such that the Commission cannot lawfully take formal action that would affect their substantial interests at this time; and

WHEREAS, in Orders No. PSC-99-1274-PCO-EU and No. PSC-99-1716-PCO-EU the Commission overruled the IOUs' procedural objections, clarified the scope of the docket, identified specific issues to be addressed, and confirmed its intent to conduct a formal evidentiary proceeding in this docket and take the actions it deems appropriate; and

WHEREAS, Reliant Energy Power Generation, Inc (Reliant Energy), Florida Industrial Power Users Group (FIPUG), PG&E Generating Company (PG&E), the Legal Environmental Assistance Foundation, Inc. (LEAF), and Duke Energy North America, LLC, and Duke Energy New Smyrna Beach Power Company, Ltd., LLP (Duke Energy), (hereinafter referred to as Intervenors), filed Petitions to Intervene in which they alleged the actions contemplated by the Commission in this docket would affect their substantial interests; and

WHEREAS, the Commission granted Intervenors' petitions to intervene, and Intervenors have participated as full parties to the proceeding; and

WHEREAS, on October 29, 1999, FPC, acting on behalf of the IOUs, submitted to the Commission Staff a proposal for the resolution of the issues in this proceeding; and

WHEREAS, upon receipt of the proposal the Commission continued the hearing scheduled for November 2, 1999 and convened on that date a conference of all parties for the purpose of discussing the proposal of the IOUs; and

WHEREAS, upon consideration of the IOUs' proposal, without waiving their respective litigation positions and for the purposes of compromise and settlement, the undersigned, representing all of the parties to this proceeding that have been identified by the Commission or allowed by Commission to intervene, have decided to prepare this Stipulation, and present it to the Commission for the purpose of concluding this docket.

NOW, THEREFORE, the parties stipulate and agree as follows:

1. The IOUs will each voluntarily adopt a minimum reserve margin planning criterion of twenty percent (20%).

2. The twenty percent (20%) reserve margin planning criterion will be a minimum; no maximum or cap will be represented or implied by this criterion.

3. No utility other than the three IOUs identified hereinabove is agreeing to adopt a twenty percent (20%) reserve margin planning criterion by virtue of this Stipulation.

4. The IOUs will calculate the minimum twenty percent (20%) reserve margin by employing their current methodology; i.e., Reserve Margin (%) = [(Total Firm Capacity – Peak Firm Demand)/Peak Firm Demand] x 100, where Total Firm Capacity will be based on generating capacity owned by the IOUs or capacity for which there is a firm commitment to these IOUs and

where Peak Firm Demand means total demand reduced by demand side resources.

5. The IOUs will undertake to implement the twenty percent reserve margin criterion over a transition period of four years, meaning that they will plan to achieve a twenty percent (20%) reserve margin by the Summer of 2004.

6. The IOUs agree to adopt the twenty percent (20%) reserve margin planning criterion with the good faith intention of maintaining that planning criterion for the indefinite future, but each IOU must reserve the prerogative individually to modify its planning criteria to adapt to relevant circumstances. By the same token, it is understood that the Commission remains free to initiate an investigation or to take other appropriate action to review and to respond to any changes that the IOUs may make in the future regarding their planning criteria.

7. Should any IOU exercise its prerogative to change its twenty percent (20%) minimum reserve margin planning criterion discussed herein, such IOU will make a good faith effort to provide notice of the change to the Commission.

8. Neither the adoption by the IOUs of the minimum twenty percent (20%) planning criterion nor the approval of this Stipulation by the Commission shall be deemed to create any presumption that capacity additions must be through any particular mix of generation and/or demand-side resources. Nor shall said adoption or approval be deemed to create any presumption with respect to any proposals for adding generating capacity or create a presumption that a generating capacity addition proposed by any entity is not needed. All current and future proceedings under the Electrical Power Plant Siting Act, including those for the consideration of merchant plants, and all statutes, rules, regulations, and policies bearing on the Commission's determination of need for new generation (including the need determination criteria in § 403.519, Florida Statutes); the IOUs' obligation to solicit proposals for generating capacity; and the

obligations of the IOUs to otherwise prudently avail themselves of reasonably available conservation alternatives and cost-effective resource options; and the obligations of the IOUs to best serve their retail customers through their respective resource planning processes, are unaffected by this Stipulation and the approval thereof.

9. The parties acknowledge that for all regulatory purposes, the Commission shall retain the ability and discretion to consider all facts and circumstances applicable to a given utility and/or peninsular Florida. Further, with respect to the evaluation of the adequacy of reserves in peninsular Florida, the Commission may employ any methodology and may consider any facts and circumstances it deems appropriate, subject to applicable legal requirements.

10. The Commission is encouraged to take the following actions in conjunction with the approval of this Stipulation:

A. Convene a workshop, with the participation and the assistance of the Regulatory Assistance Project, to receive and consider information regarding how distributed resources, both demand and supply-side, may be used to meet Florida's energy service reliability needs, to be followed by any additional proceedings and/or actions relative to this matter that the Commission deems appropriate.

B. Convene a workshop for the consideration of the appropriate relationship between the non-firm load of an individual utility and the total reserves required to maintain the utility's appropriate minimum reserve margin, to be followed by any additional proceedings and/or actions relative to this matter that the Commission deems appropriate.

11. The parties enter into this Stipulation for the purpose of effecting a compromise and of achieving closure of this docket. By its participation in this Stipulation, no party expresses its endorsement of any individual provision included by any other party.

12. By entering this Stipulation, no party waives any position it has taken with respect to any aspect of this proceeding or any of the issues identified in this proceeding or any other proceeding. Further, no party waives the right and opportunity to petition the Commission to institute any action designed to provide any relief deemed appropriate or desirable by that party at any time.

13. The parties to this Stipulation agree that, by approving this Stipulation, the Commission does not waive its right and ability, pursuant to governing law, to initiate any proceeding or take any action for which it has requisite jurisdiction and authority.

14. In the event the Commission declines to approve this Stipulation in its entirety, it shall become null and void.

AGREED this 14th day of December 1999.

Rating the States on Their Risk of Natural Gas Overreliance

www.ucsusa.org/naturalgasoverreliance

Technical Document

Union of Concerned Scientists

Rating the States on Their Risk of Natural Gas Overreliance presents the results of an analysis of the current and future potential for natural gas overreliance in the power sector for each of the 50 states. An earlier UCS work (Deyette et al. 2015) examined a range of issues around the risks of natural gas overreliance for electricity generation nationally. This analysis builds on that work with a focus on individual states and a subset of natural gas risks, using multiple metrics to assess those risks.

The text below explains the focus of the analysis, the multiple-metric approach, the details for each metric, and the summary graphics. It also includes a discussion of notes and limitations, and reference materials.

Focus

Rating the States is focused on the financial risks to consumers associated with excessive use of natural gas for electricity generation, with analysis carried out at the state level.

- **Power sector.** The power sector is a subset of the broad range of uses for natural gas, from heating homes and businesses to powering buses to serving as a feedstock for various industrial processes. The power sector has seen rapid change with regard to natural gas usage in recent decades, both in absolute terms and in terms of change within the sector (its portion of overall electricity generation, for example). It has also been the target of substantial investment in new infrastructure due to growing interest in natural gas—in terms of power plants and the pipelines that serve them.
- **Financial risks to consumers.** Natural gas for electricity generation offers potential benefits but also challenges, including environmental and financial, both near- and long-term. For electric ratepayers, financial risks can include those stemming from the volatility of the fuel price, the costs of carbon pollution, and the possibility that investments in natural gas infrastructure (power plants and pipelines) will not pay off, and therefore ratepayers will incur additional costs for such “stranded assets.” In some states, vertically integrated electric utilities both generate electricity and serve end users, while other states have restructured their electricity markets to allow for competition in power generation. In theory, the latter approach insulates customers from some generation risks, leaving them instead to be borne by shareholders of generator companies. The distinction between the two types of state markets is not black and white, however, and either type can lead to customers—rather than utility companies, generators, or shareholders—bearing the bulk of the consequences of natural gas overreliance.[1]
- **States**. Some aspects of the energy sector are multi-state, and are therefore the responsibility of the federal government (approval of interstate pipelines and transmission lines, for example). However, many of the signals provided to the private sector about the role of natural gas in the power sector come from state legislatures, governors, public utility commissions, and others (support for fossil fuels, renewable energy, or energy efficiency, for example). Such decisions can influence the scale and scope of private-sector investment in natural gas or other forms of energy.

Ratings

This analysis assesses states based on five metrics focused on natural gas generation, natural gas capacity, and carbon emissions, either in absolute terms or as a function of some other parameter (overall electricity generation, for example). For each metric, threshold levels identify a high level of risk of overreliance associated with the metric, a moderate level, and a low level.

Rather than attempting to identify what an ideal state looks like with regard to low-risk natural gas use, this analysis points to some aspects of risk of natural gas overreliance, and examines which states exhibit characteristics that suggest higher levels of such risk.

[1] In December 2014, for example, Florida’s public service commission allowed Florida Power & Light Co. to pass on to electricity customers costs (or savings) associated with an investment in natural gas hydraulic fracturing operations in Oklahoma (Testa 2014). In October 2015, the Massachusetts Department of Public Utilities found that electric utilities in that state can enter into long-term contracts with natural gas pipeline companies (Sullivan 2015).

Metrics

The metrics selected for this analysis are aimed at assessing a range of aspects of each state's current and prospective natural gas usage for electricity generation.

METRIC 1. NATURAL GAS GENERATION AS A SHARE OF IN-STATE ELECTRICITY PRODUCTION (2014)

Electricity can be generated from a range of fuels, and most states—like the nation as a whole—produce electricity using a mix of resources, including coal, natural gas, nuclear, and renewables. One indicator of how reliant a state is on natural gas is to compare how much of its in-state electricity generation comes from natural gas versus all other fuels. The more a state's electricity mix is dominated by natural gas, the more consumers in that area can expect to be exposed to the fuel's near- and long-term economic risks, including price volatility. This metric involves calculating the portion of each state's in-state electricity production generated using natural gas.

Source: Electricity Information Administration (EIA 2015a)

Data: Net generation from electricity power plants, annual, by state and fuel type, 2014 (preliminary)

Analysis: For each state, we calculated the percent of electricity generation from natural gas in 2014 by dividing the megawatt-hours (MWh) generated using natural gas by the total MWh generated using all fuels. In 2014, the EIA reported only one region (Washington, DC) not generating any electricity, and two regions not generating electricity from natural gas (Hawaii and Washington, DC). Wyoming was listed as "NM" for "not meaningful" natural gas generation based on preliminary 2014 results.[2] We assigned Hawaii, Washington, DC, and Wyoming a risk rating of "Low."

Threshold setting: States with 50 percent or more of their 2014 in-state electricity generation coming from natural gas were assigned a risk rating of "High." State portfolios ranging from 25 to 49 percent were rated as "Moderate," and states with less than 25 percent of their in-state electricity generation coming from natural gas were rated as "Low." Overall, 26.2 percent of the electricity generated in the United States in 2014 came from natural gas.

METRIC 2. INCREASE IN PERCENT OF IN-STATE ELECTRICITY GENERATION FUELED BY NATURAL GAS (2008–2014)

Natural gas has undergone rapid growth in the electric power sector over the past decade, including to replace large amounts of coal to serve electricity needs on a fairly constant basis (that is, to provide "baseload" generation). From 2008 to 2014, natural gas jumped from generating 20.2 percent of the national electricity mix to 26.2 percent, while coal slid from 49.5 percent to 39.9 percent over the same period. In some states, the shift in natural gas generation was even greater. As a result, electricity consumers in these states now have a rapidly growing share of their electricity coming from a historically volatile fuel, which increases their exposure to natural gas price volatility. This metric measures the change in percent of natural gas in a state's electricity generation portfolio from 2008 to 2014.

Source: Electricity Information Administration (EIA 2015a)

Data: Net generation from electricity power plants, annual, by state and fuel type, 2008 and 2014 (preliminary)

Analysis: For each state, we calculated the percent of electricity generation from natural gas in 2008 and 2014 by dividing the MWh generated using natural gas by the total MWh generated using all fuels. We then subtracted the 2008 value from the 2014 value to arrive at the change in percent. In 2014, the EIA reported only one region (Washington, DC) not generating any electricity, and two regions not generating electricity from natural gas (Hawaii and Washington, DC).

---

[2] For reference, over the previous five years Wyoming's generation from natural gas ranged from 37 to 99 MWh per year, representing less than 1 percent of its total annual electricity generation.

Wyoming was listed as “NM” for “not meaningful” natural gas generation based on preliminary 2014 results. In 2008, Hawaii, North Dakota, and Washington, DC, were all recorded as not generating electricity from natural gas. We assigned Hawaii, North Dakota, Washington, DC, and Wyoming a risk rating of “Low.”

Threshold setting: States increasing the share of natural gas in their electricity generation portfolios by 10 or more percentage points between 2008 and 2014 were assigned a risk rating of “High.” States with gains ranging from 5 to 9 percentage points were rated as “Moderate,” and states undergoing a change of less than 5 percentage points were rated as “Low.” Overall, the percent of natural gas in the national generation mix increased by about 6 points over the same period.

METRIC 3. NATURAL GAS CAPACITY AS A SHARE OF POWER PLANTS BEING BUILT (2014–2017)

Power providers, regulators, and elected officials in each state need to plan their future electricity resource mix based on projected increases in demand, scheduled power plant retirements, and reliability needs. One indication of an increasing reliance on natural gas can be captured by analyzing the share of new electricity generating capacity based on natural gas that is expected to come online within the next several years. Significant additions of natural gas capacity may lock states in to investments in power plants and pipelines, whose costs and losses when idled, underused, or abandoned may be passed through to customers. This metric assesses the portion of new power plant capacity coming online between 2014 and 2017 that is fueled by natural gas.

Source: SNL Financial (2015)

Data: Asset data for power plant units scheduled to be in service between 2014 and 2017, with a build phase development status of “Completed,” “Construction Begun,” or “Advanced Development;” asset data for power plant units undergoing fuel conversion from coal to natural gas between 2014 and 2017.

Analysis: For each state, we calculated the generating capacity from natural gas power plant units being built and expected to be in service between 2014 and 2017. We also calculated the additional generating capacity as a result of power plant unit conversions from coal to natural gas during the same period. We then added these two values and divided the result by the total new generating capacity and coal-to-gas conversions between 2014 and 2017.The result is the percentage of natural gas as a share of new generating capacity.

Threshold setting: States in which 50 percent or more of new capacity is to be based on natural gas (new power plants or coal-to-gas conversions) between 2014 and 2017 were assigned a risk rating of “High.” States ranging from 25 to 49 percent were rated as “Moderate,” and states with natural gas accounting for less than 25 percent of new in-state capacity were rated as “Low.” Overall, 56 percent of the generating capacity being built in the United States during this time frame is expected to be fueled by natural gas.

METRIC 4. TOTAL PROJECTED NATURAL GAS CAPACITY IN 2017

Some states already have a significant amount of natural gas capacity, and this total is set to increase in many states given the construction of new natural gas power plants and coal-to-gas conversions already under way. By looking at the absolute value of electricity generating capacity fueled by natural gas, this metric shows several states at risk of relying heavily on natural gas. The greater the generation capacity based on natural gas, the more consumers are at risk of exposure to the negative consequences associated with plants and other infrastructure becoming underused, idled, or even abandoned over time. This metric is based on each state’s total projected natural gas capacity in 2017.

Source: Electricity Information Administration (EIA 2015b), SNL Financial (2015)

Data: From the EIA, “Existing capacity by energy source, by producer, by state back to 2000 (annual data from the EIA-860);” from SNL, asset data for power plant units in service between 2014 and 2017 with a status of “Completed,” “Construction Begun,” or “Advanced Development;” asset data for power plant units switching from coal to gas between 2014 and 2017.

Analysis: For each state, we calculated existing natural gas capacity in 2013 across the entire electric power sector, generating capacity from natural gas being built and expected to be in service between 2014 and 2017, and generating capacity that will be in service between 2014 and 2017 as a result of conversions from coal to natural gas. We added these three values to arrive at the total electric capacity projected to be fueled by natural gas in 2017.

Threshold setting: States with a total natural gas generating capacity of 10,000 megawatts (MW) or more were assigned a risk rating of “High.” For reference, 10,000 MW of natural gas generating capacity is capable of powering several million households. States ranging from 5,000 to 9,999 MW were rated as “Moderate,” and states with less than 5,000 MW of total natural gas generating capacity in 2017 were rated as “Low.”

METRIC 5. POWER SECTOR CARBON DIOXIDE EMISSIONS (2013)

As the single largest contributor of global warming emissions in the United States (and with a range of viable low-carbon alternatives available to it), the electric power sector has a major role to play in reducing the carbon intensity of the national economy. With the recent issuance of the Environmental Protection Agency’s Clean Power Plan, states must now choose how they will meet the plan’s carbon-reduction requirements for power plant emissions. Critically, although natural gas burns cleaner than coal for electricity generation, even a wholesale shift from coal to natural gas would be insufficient to meet long-term climate goals, as natural gas still emits significant emissions upon combustion (Fleischman, Sattler, and Clemmer 2013). For states with particularly high carbon emissions, then, an existing or developing overreliance on natural gas means that more drastic action will be required over the long term to continue reducing carbon emissions. In the interim, electricity consumers in those states will be forced to pay for shortsighted decisions their states are making today. This metric assesses the total carbon dioxide emissions released by the electric power sector in each state in 2013.

Source: Electricity Information Administration (EIA 2015c)

Data: U.S. electric power industry estimated emissions by state, 1990–2013 (EIA-767, EIA-906, EIA-920, EIA-923)

Analysis: For each state, the EIA provides annual data on carbon dioxide, sulfur dioxide, and nitrogen oxide emissions released by type of power producer and energy source. We pulled carbon dioxide data for the entire electric power industry across all energy sources in 2013. Each data point was converted from metric tons to million metric tons (MMT).

Threshold setting: States with total electric power industry emissions of 50 MMT or more of carbon dioxide in 2013 were assigned a risk rating of “High,” while states emitting between 25 and 49 MMT were rated as “Moderate,” and those emitting less than 25 MMT were rated as “Low.”

SUMMARY METRIC: STATES AT HIGHEST RISK OF NATURAL GAS OVERRELIANCE

Each metric within this analysis is intended to stand on its own as an indicator of a state’s exposure to one of the multiple risks associated with natural gas overreliance. However, the metrics can also be viewed in aggregate to better appreciate the constellation of risk factors that a state may face. Because the metrics are designed to gauge different aspects of risk exposure, a state with multiple “High” risk ratings may be exposing its electricity consumers to more risks associated with natural gas than a state with a single “High” risk rating.

Further, there are some states that just miss a “High” rating but are still exposing their consumers to greater risks than others; therefore, a consideration of states’ “Moderate” ratings in combination with their “High” designations can provide a more complete picture of their potential for overreliance on natural gas.

Data Table

Dark red indicates "High" risk rating, medium red indicates "Moderate", and pink indicates "Low".

State	Metric 1	Metric 2	Metric 3	Metric 4	Metric 5	Number of "High" Risk Ratings	Number of "Moderate" Risk Ratings
Alabama	32%	17.2	98%	14,200	67.0	4	1
Alaska	51%	-9.9	89%	1,400	3.8	2	-

Notes and Limitations

This analysis is focused on the financial risks facing consumers living in states that are, or are moving toward being, overly reliant on natural gas for electricity generation. The analysis focuses on the state level because, as noted above, many of the decisions that shape the electric sector are made at the state level. States are not, for the most part, islands when it comes to electricity generation and consumption, however; indeed, states commonly import and export electricity across state lines. Data about such imports and exports are generally available only as net flows, however, without a breakdown of shares of specific fuel sources in such flows (that is, what type of power plant generated the electricity flowing across a particular state boundary). A state's electricity generation portfolio may therefore not be perfectly representative of the fuel mix of electricity actually consumed within a state's borders, and consumers may be exposed to fewer or greater risks of natural gas overreliance than their state's own generation portfolio would suggest.

The purposefully tight scope of this analysis means that indicators are also limited in their capacity to capture broader risks to consumers from their state's overreliance on natural gas, making the analysis a conservative estimate of the risks facing consumers. Major environmental challenges associated with natural gas production and transport, for example, are not included. Should the issue of methane leakage over the life cycle of natural gas use remain insufficiently resolved, for example, states (and their consumers) may need to contend with higher costs due to higher greenhouse gas emissions being associated with the fuel.

This analysis also does not attempt to identify the ideal role for natural gas within a state's generation portfolio. Instead, it works to identify those states in—or heading toward—a position of overreliance. Given that, indicators actively identify those states exhibiting the highest risk levels, but do not identify any states as definitively "overreliant" on natural gas. Conversely, states without broad indications of risk of overreliance on natural gas are not necessarily free of reliance and risk. Also, states with low natural gas usage (and risk) by most measures may be in such a position because of heavy dependence on coal generation, which presents a host of problems and risks of its own.

Acknowledgments

This project was made possible in part through the generous support of Common Sense Fund, Energy Foundation, The William and Flora Hewlett Foundation, The Joyce Foundation, and Wallace Genetic Foundation, Inc.

For their expert review of the analysis, we thank Peter Shattuck (Acadia Center) and N. Jonathan Peress (EDF). We also thank UCS staff members who provided important input on the analysis and presentation, including Angela Anderson, Rachel Cleetus, Steve Clemmer, Jeff Deyette, Kathleen Rest, Megan Rising, Ashley Siefert, and Laura Wisland. Finally, we thank Audrey Eyring and Matt Heid for inspiring the graphical approach, Bryan Wadsworth for making the presentation more readable, Tyler Kemp-Benedict for making it more beautiful, and Colleen MacDonald and Beaconfire for making it broadly accessible.

The opinions expressed herein do not necessarily reflect those of the organizations that funded the work or the individuals who reviewed it. The Union of Concerned Scientists bears sole responsibility for the content.

This analysis was conducted by Paula Garcia, Julie McNamara, and John Rogers.

FLORIDA PUBLIC SERVICE COMMISSION
DOCKET: 150196-EI EXHIBIT: 59
PARTY: STAFF
DESCRIPTION: FPL's Response to Staff's Interrogatories, Nos. 1-10, 32-34, 44 (including supplemental), 45, 58-63,...

QUESTION:
On page 5, lines 8-10, of Witness Feldman's direct testimony, Witness Feldman states that FPL's base case load forecasts presented in his testimony are the same forecasts presented in FPL's 2015 Ten Year Site Plan (TYSP). The following questions relate to FPL's 2015 TYSP and 2014 TYSP.

a. Referring to the last paragraph on page 30 of FPL's 2015 TYSP and page 29 of FPL's 2014 TYSP, please explain why FPL reduced its projected customer growth from 1.4% for the period 2014 – 2023 to 1.3% for the period 2015 – 2024.

b. Referring to Schedule 2.1 of FPL's 2015 TYSP, columns 8 and 9 (Commercial class), please explain why the current projections of the Average No. of Customers and the Average kWh Consumption Per Customer are both lower than the projections in FPL's 2014 TYSP for every year throughout the common forecast time horizon.

c. Referring to Schedule 2.2 of FPL's 2015 TYSP, columns 11 and 12 (Industrial class), please explain why the projection of the Average No. of Customers is higher than the projection developed in the 2014 TYSP, while the projection of the Average kWh Consumption Per Customer is significantly lower than the projection developed in FPL's 2014 TYSP for every year throughout the common forecast time horizon.

d. Referring to Schedule 3.1 Forecast of Summer Peak Demand (MW) of FPL's 2015 TYSP column (3), please explain why the forecasted annual Wholesale is increased significantly from 2014 level for the period 2015 – 2020 then drops back to 2014 level for the period 2021 – 2024.

e. Referring to Schedule 3.1 Forecast of Summer Peak Demand (MW) of FPL's 2015 TYSP column (7), please explain why the forecasted annual Residential Conservation is reduced for the period 2015 – 2018 but increased for the period 2020 – 2023, compared to the forecast presented in FPL's 2014 TYSP.

f. Referring to Schedule 4 Previous Year Actual and Two-year Forecasts of Retail Peak Demand and Net Energy for Load (NEL) by Month contained in the 2015 and the 2014 TYSPs, please explain the reasons (other than the weather) which caused FPL's 2014 actual NEL to be lower than FPL's 2014 forecast.

RESPONSE:

a. The projected customer growth forecast in the 2015 TYSP was reduced from 1.4% in the 2014 TYSP to 1.3% because of the removal of Vero Beach from

FPL's forecast. In the 2014 TYSP it was assumed that FPL would begin serving the City of Vero Beach beginning in 2015. In the 2015 TYSP Vero Beach was removed from the forecast.

b. Similar to the response to subpart (a) above, the projected number of commercial customers in the 2015 TYSP is lower than that projected in the 2014 TYSP due to the removal of Vero Beach from the 2015 TYSP forecast. This also results in a lower use-per-customer as the Vero Beach commercial customers were forecast to have a higher use-per-customer than FPL commercial customers.

c. The average number of industrial customers is higher in the 2015 TYSP than in the 2014 TYSP due to a higher projection of small GS-1 industrial customers. These customers are primarily temporary and construction accounts. The increase in the number of these accounts is due to an improving economy and improving housing market. Since these customers comprise the largest share of industrial customers and have significantly lower use per customer, the faster growth of this group of customers results in a lower overall use per customer for the industrial class.

d. The wholesale summer peak forecast increases during the 2015-2020 time period due to the inclusion of the Seminole Electric Cooperative (Seminole) as a wholesale customer. The contract with Seminole ends in May 2021, therefore Seminole does not contribute to FPL's 2021-2024 summer peaks.

e. The forecast for Residential Conservation in FPL's 2015 TYSP is lower in the 2015-2018 time period because the 2014 TYSP includes the 2014 contributions to DSM of approximately 120 MW based on FPL's then-current DSM Goals, which were reset by the commission to the 2004 Goals levels. Residential Conservation is higher in the 2015 TYSP for the 2020-2023 time period because FPL's 2014 TYSP utilized a forecast for Residential Conservation based on FPL's proposed DSM Goals of 337MW of total DSM, while FPL's 2015 TYSP utilized FPL's DSM Plan of 526MW of total DSM.

f. In evaluating any energy forecast variance, weather must be considered. The actual level of cooling degree hours and heating degree days were both lower than normal in 2014. This accounts for nearly one-quarter of the difference between actual and forecast NEL in 2014. Other than weather, the first reason why NEL was lower than projected was the actual CPI for energy was more than 5% higher than forecast during 2014, resulting in lower sales. Second, the forecast presented in Schedule 4 of our Ten Year Site Plan does not have any adjustments for DSM. Adjusting for DSM would have resulted in a lower forecast than that presented in the Ten Year Site Plan. Third, with the improving economy and housing market, it was expected that there would be an uplift in sales as empty homes became occupied. This uplift in sales did not materialize as anticipated.

QUESTION:
Referring to page 8, lines 17-19 of Witness Feldman's direct testimony, please identify and explain in detail the term "consistent set of assumptions" used throughout the load forecast.

RESPONSE:

All of the variables used in the customer, peak, and NEL models are from the same data sources and are of the same forecast vintage. Additionally, weather used in all of the models are calculated consistently using the same weather stations and the same methodology in developing the composite temperature.

QUESTION:
Referring to page 9, lines 14-16 of Witness Feldman's direct testimony, please explain how the population growth projections provided by the Bureau of Economic and Business Research and the Office of Economic Demographic Research are used to forecast growth of customers.

RESPONSE:

The population projection provided by the University of Florida's Bureau of Economic and Business Research is used as an explanatory variable in our econometric models used to forecast total customers and residential customers. Florida population growth is an important driver of customer growth and has historically been the most significant variable in projecting the number of customers in FPL's service territory.

QUESTION:
Referring to page 11 of Witness Feldman's direct testimony, please explain in detail how FPL forecasts the annual summer peak?

RESPONSE:

We begin by updating our databases with the most recent year of data for variables which may be considered or used in the summer peak model. Next, we review the previous year's weather normalized forecast variance in order to evaluate the prior year's model. Drivers which may affect the summer peak such as population growth, weather, codes and standards, and the economy, among others, are considered. Variables are developed from these drivers which are likely to affect the summer peak. Any variables considered must be consistently measurable over the model calibration period and there must be a reasonable forecast available from a reliable third party source for each variable considered for use in the model. A potential summer peak per customer model is then developed with the variables identified. A review of the model statistics, including the R^2, MAPE, and Durbin-Watson statistic are evaluated, along with ensuring that the coefficients are significant and have the correct signs and that there is no observable pattern in the residuals. Modifications to the model are made as dictated by the model statistics. The model output is then multiplied by the forecast number of customers to develop a preliminary summer peak forecast. Next, factors that may affect the forecast, but are not included in the historical data and therefore not picked up in the econometric model, such as plug-in electric vehicles, distributed solar generation, changes in wholesale contracts, and the impact of the Economic Development riders are developed and included in the forecast. The summer peak forecast is evaluated for reasonableness by looking at historical trends and comparisons with the prior forecast.

QUESTION:
On page 13, lines 11-12, of Witness Feldman's direct testimony, Witness Feldman states that the real price of gasoline, which "lagged one month," was incorporated into the summer peak model as a proxy for energy prices.

a. Please identify whether FPL's actual electricity price, Consumer Price Index (CPI) – Energy, or a gasoline price proxy were included as model variables for capturing the impact of energy price on FPL's Peak Demand Forecasts and NEL Forecasts appearing in each of FPL's TYSPs from 2010 through 2015.

b. For each year-to-year change in model variables identified in Interrogatory No. 5a, please explain the rationale for making the change.

c. Please explain the reasons FPL used the gasoline price proxy, instead of FPL's actual electricity price, as an explanatory variable for model construction.

d. Please explain why the real price of gasoline was used as a proxy for energy prices.

e. Please explain why the real price of gasoline used as a proxy for energy prices lagged one month.

f. Please the differences, in terms of forecasting accuracy, when using the proxy of real price of gasoline lagged one month versus using the actual variable of real FPL's electricity prices. Please support your response with a comparison of the forecasted versus actual summer peak demand data for 2013 – 2014, and a list of model accuracy data (standard errors, t-statistics, as well as the summary statistics) for 2015 – 2019.

RESPONSE:

a.	2010 TYSP	NEL used real electric prices (12 month moving average) Summer peak used real electric prices
	2011 TYSP	NEL used real electric prices (12 month moving average) Summer peak used real electric prices
	2012 TYSP	NEL used CPI for energy Summer peak used real electric prices
	2013 TYSP	NEL used CPI for energy Summer peak used CPI for Energy (three month moving average)
	2014 TYSP	NEL used CPI for energy Summer Peak used the real price of gasoline lagged one month
	2015 TYSP	NEL used CPI for energy Summer Peak used the real price of gasoline lagged one month

There are no price terms used in the winter peak model.

b. Effective with the 2012 TYSP, the NEL forecast began incorporating the CPI for energy as a model variable rather than the real price of electricity. This change was made because modelling showed that customers at the time were becoming less sensitive to the price of electricity (which was then declining in real terms), and more sensitive to overall energy prices (which at the time were increasing significantly). Effective with the 2013 TYSP, the summer peak forecast began incorporating the CPI for energy as a model variable rather than the real price of electricity. This change helped maintain a good statistical fit in the forecasting model. Effective with the 2014 TYSP, the summer peak forecast began incorporating the real price of gasoline lagged one month rather than the CPI for energy for similar reasons.

c. FPL has found that using a proxy for energy prices, in some cases can be superior to using the real price of electricity as a variable in its forecasting models. This can be particularly the case when electricity prices are stable or declining while other energy prices are increasing and volatile, as has been the case in recent years. Under these conditions, many consumers must budget for their total energy purchases, not just electricity. The use of a proxy for energy prices, be it the CPI for energy or the real price of gasoline lagged one month, reflects the fact that consumers must frequently manage to an overall energy budget. The use of the real price of gasoline lagged one month can be appropriate as a proxy for energy prices in forecasting the summer peak because of the prominent role the price of gasoline plays in the decisions of consumers, particularly during the summer months.

d. Please see the response to subpart (c) above.

e. Lagging the real price of gasoline one month in the summer peak model improved the significance of the gasoline price term and helped maintain a good statistical fit in the forecasting model.

f. Please see Attachment No. 1.

QUESTION:
Referring to Witness Feldman's direct testimony, page 26, lines 9-11, please explain why FPL used the Consumer Price Index for determining impact of energy price on electric consumption per customer but used real gasoline prices for determining impact of energy prices in summer peak demand as testified on page 13, lines 11-12.

RESPONSE:
The Consumer Price Index for Energy Prices and the real price of gasoline were both used as proxies for the overall cost of energy goods to consumers. The real price of gasoline can be more volatile than the CPI for Energy Prices. As a result, the more stable CPI for Energy Prices generally provided better model statistics when used in the Net Energy for Load model. The volatility in the real gasoline prices has been less of an issue in modelling the annual summer peak which is not subject to month-to-month fluctuations. Depending on the time period being evaluated, either the real price of gasoline or the CPI for Energy Prices may be appropriate for modelling the summer peak.

QUESTION:

Referring to Witness Feldman's direct testimony, page 25, lines 7-9:

a. Please compare the NEL forecast to the aggregate of billed sales by rate class forecasts.

b. Please explain whether FPL has previously used the total NEL versus billed energy sales approach to forecast energy sales. If yes, what is the modelling accuracy for each approach (forecasted vs. the actual energy sales)?

RESPONSE:

a. Below is a table comparing FPL's NEL forecast with the aggregate of the billed sales forecast by revenue class.

MWh	NEL	Forecasted Billed Sales
2015	119,712,544	113,117,490
2016	122,406,843	115,679,613
2017	123,945,598	117,157,296
2018	125,432,505	118,580,271
2019	127,069,635	120,119,803
2020	128,851,360	121,815,566
2021	129,237,426	122,226,832
2022	130,076,692	122,979,639
2023	131,495,329	124,319,680
2024	133,275,800	126,004,519

Note: values are not adjusted for DSM

b. FPL has consistently used the NEL forecast in calibrating the billed sales forecasts since the 2001 TYSP. The improvement in the forecast accuracy from using this methodology is shown below for recent history.

	2014 TYSP	2013 TYSP	2012 TYSP	2011 TYSP
Actual Weather-Normalized NEL	116,623,974	112,175,798	111,348,964	109,322,958
Forecasted NEL based on Output of the Revenue Class Models	118,690,918	115,381,625	111,796,366	113,526,646
NEL Variance based on Revenue Class Sales Models	-1.7%	-2.8%	-0.4%	-3.7%
Official NEL Forecast based on NEL Model	117,784,561	112,935,144	111,020,889	111,430,252
NEL Variance based on Official NEL Forecast	-1.0%	-0.7%	0.3%	-1.9%
Improvement in Absolute Variance using Official NEL Forecast	0.8%	2.1%	0.1%	1.8%

Note: Forecasts are for current year, i.e., 2014 TYSP Forecast is for the year 2014

QUESTION:
Referring to pages 14-16 of Witness Feldman's direct testimony regarding the out-of-model adjustments made to forecasts of NEL and summer peak demands:

a. Apart from the existing energy contracts FPL owned, please state whether FPL used any other information to project the annual incremental wholesale loads for the period 2015 to 2024.

b. Please explain how the annual projected amounts of Economic Development Rider and Existing Facility Economic Rider were derived for years 2016 – 2024. In particular, please explain how the 2019 addition of 27 MW to summer peak was derived.

c. Referring to page 16, lines 13-18m, of Witness Feldman's direct testimony, please explain how FPL determines its share of the state forecast of installed capacity of distributed solar generation for years other than 2014. Please also explain and clarify the term "solar profiles".

RESPONSE:
a. The projection of the incremental wholesale loads for the period 2015 through 2024 is based strictly on wholesale transactions where there is signed contract for a power sale.

b. Adjustments due to the Economic Development Rider and Existing Facility Economic Rider are developed by FPL's Economic Development Department. Based on negotiations with potential or existing customers, and knowledge of potential customers considering locating in FPL's service territory, an estimate of the number of customers and their associated KW is projected. For the year 2019, the 27 MW is based on 15 new commercial and industrial customers expected to be added. An expansion factor is used to take the estimated KW associated with these customers to the generation level. Historical data from our existing customers for the appropriate rate class are used to estimate the portion of the new load that will be coincident with FPL's summer peak. In this manner, the projected contribution to the summer peak by this group of customers is derived.

c. FPL begins with a state of Florida forecast of installed capacity of distributed solar generation developed by Greentech Media (GTM). The forecast for residential and commercial customers is purchased by year. FPL then uses our net metering data to determine the 2014 installed capacity of distributed solar generation for our own residential and commercial customers. From these data, and GTM's statewide estimates, we calculated our share of the state total distributed solar generation for residential and commercial customers. These shares are held constant throughout the forecast horizon.

Solar profiles are the estimated hourly profiles, by month, showing the percentage of annual distributed solar generation for each hour. For example, all months between the hours of 9 pm and 7 am show zero solar generation. Conversely, March through May, for hours ending 1 pm and 2 pm show the highest solar generation. All other hours would be somewhere in between these two levels of solar irradiance.

QUESTION:
Referring to Witness Feldman's direct testimony, page 29, lines 11-14, please specify the "minor modifications" FPL made to improve its forecasting models used in the instant petition.

RESPONSE:
Minor modifications made to the 2015 TYSP forecasts include updating the estimation period to include more recent actuals, removing the variable for empty homes from the NEL model since it was no longer a statistically significant variable, and incorporating adjustments to account for distributed solar generation.

Additionally, some of the weather terms in the winter peak model were changed. The average winter peak temperature on the day of the peak and the heating degree day buildup two days prior to the peak were replaced with the minimum temperature on the day of the winter peak. Also, the dummy for winter peaks with a minimum temperature below 40 degrees was dropped from the current model.

QUESTION:
Referring to Staff's First Set of Production of Documents No. 1:

a. Please identify the filename and worksheet responsive to each requested electronic document(s).

b. For each electronic document request, please specify a fully descriptive name of each row and column of data if not already provided in the worksheets, and

c. Please define the units of the data appearing within each of the electronic worksheets if not clearly identified within the worksheet itself.

RESPONSE:
Filename: 2015_TYSP_no_inact RevNEPACT EstThruAug
Worksheets: Data, Coef, MStat
The column headings and units in the Data worksheet from column C to column W are as follows:

NEL per customer (MWh), HDD based on 45 degrees, January HDD, February HDD, March HDD, December HDD, Impact of Codes and Standards (MWh per customer), Weighted real per capita income, lag of CPI for Energy Prices, January CDH, February CDH, March CDH, April CDH, May CDH, June CDH, July CDH, August CDH, September CDH, October CDH, November CDH, and December CDH.

The variable names in rows 3 – 22 of column A in the Coef worksheet correspond directly to columns D to W in the Data worksheet.

Filename: Summer_Peak_2014TYSP_model_updated
Worksheets: Data, Coef, MStat
The column headings and units in the Data worksheet from column B to column G are as follows:

Summer peak per customer (KW), CDH two days prior to peak day, maximum temperature on the peak day, Impact of Codes and Standards (KW per customer), Disposable household income, and the real price of gasoline lagged one month.

The variable names in rows 3 – 7 of column A in the Coef worksheet correspond directly to columns B to G in the Data worksheet.

Filename: Total_Customers_2015TYSPAltDummy Jul14Pop Thru July and Res_Cust_2015_TYSP AltDummy Jul14Pop Thru July
Worksheets: Data, Coef, MStat
In the Data worksheet, column D is population, and column E is a dummy variable for the impact of the implementation of Smart Meters.
The variable names in rows 3 – 4 of column A in the Coef worksheet correspond directly to columns D and E in the Data worksheet.

Filename: GS1_Customers OUT JULY21 2014
Worksheets: Data, Coef, MStat
In the Data worksheet, column C is GS1 Industrial Customers, Column D is the Florida employment to population ratio, and column E is the 16 month lag of housing starts.
The variable names in rows 3 – 4 of column A in the Coef worksheet correspond directly to columns D and E in the Data worksheet.

Filename: STHwy_Cust and Sales July_2014
Worksheets: Data, Coef, MStat
In the Data worksheet, column C is Street & Highway customers, and column D is the lag of Street & Highway customers.
The variable name in row 3, column A in the Coef worksheet is the lag of Street & Highway customers.

AFFIDAVIT

Richard Feldman

State of Florida)

County of Palm Beach)

I hereby certify that on this 7TH day of OCTOBER, 2015, before me, an officer duly authorized in the State and County aforesaid to take acknowledgments, personally appeared Richard Feldman who is personally known to me, and she acknowledged before me that she sponsored the answer(s) to Interrogatory No(s). 1-10 from Staff's 1st Set of Interrogatories to Florida Power & Light Company in Docket No. 150196-EI, and that the response(s) is true and correct based on her personal knowledge.

In Witness Whereof, I have hereunto set my hand and seal in the State and County aforesaid as of this 7th day of october, 2015.

Neyla Cheraso

Notary Public, State of Florida

Notary Stamp:

NEYLA CHERASO

My Comm. Expires Sep 22, 2019
Bonded through National Notary Assn.

NOTARY PUBLIC STATE OF FLORIDA

QUESTION:
Page 62 of Exhibit SRS-1 of Dr. Sim's direct testimony, contains a table identifying firm purchase power changes during the timeframe 2014-2023. For each purchase power agreement that is expiring, please discuss, in detail, FPL's efforts to extend the life of the contract.

RESPONSE:

The following Florida Power & Light Company (FPL) purchased power contract expirations are identified on Page 62 of Exhibit SRS-1:

1. **Cedar Bay PPA retirement – 2016**

   The Cedar Bay PPA was cancelled on September 24, 2015, pursuant to the acquisition of Cedar Bay approved by the Commission in Order No. PSC-15-0401-AS-EI in Docket No. 150075. As shown in the exhibit, the PPA retirement is offset in 2016 by the addition of Cedar Bay to FPL's generation fleet. The unit will be available throughout 2016 for reliability purposes and then will be retired in 2017. The overall transaction saves customers $70 million (CPVRR).

2. **UPS Replacement – 2016**

   The UPS Replacement contract is actually three contracts with affiliates of Southern Company. These contracts are for the output from Plant Scherer Unit 3 (165 MW), Plant Franklin (190 MW) and Plant Harris (600 MW). After transmission losses this accounts for 928 MW delivered to FPL's system. These contracts were approved by the Commission in Docket No. 040001-EI.

   All three contracts have a normal termination date of December 31, 2015. Both the Franklin and Harris contracts contained an option to extend the contract through December 31, 2017, which option had to be exercised prior to the end of 2010. In 2010, FPL evaluated the option and found it not cost effective for FPL's customers.

   In the spring of 2015, FPL explored the feasibility of extending all or portions of the Southern Company contracts or purchasing energy and capacity from other Southern Company units. Due to the high fixed costs of transmission and the associated transmission losses on Southern's system, none of the options offered by Southern Company were cost effective for FPL's customers.

3. **St. John's River Power Park (SJRPP) suspension of energy – 2019**

   FPL purchases 30% of the output of SJRPP under a power purchase agreement with JEA. Since JEA funded their ownership interest in SJRPP with tax-free municipal bonds, the portion of the energy produced that can be sold to an IOU is limited by IRS regulations.

This limit is expected to be reached in the 2nd quarter of 2019. Since the delivery restriction is a function of IRS rules, purchases under the PPA are not subject to extension.

QUESTION:

Page 101 of Exhibit SRS-1 of Dr. Sim's direct testimony, provides that analyses conducted during 2013 and early 2014 showed that it would be cost-effective to retire the existing units, Putnam Units 1 and 2, and replace the capacity with new combined cycle capacity at a later date. Please provide a detailed summary of the analyses described in above-referenced statement.

RESPONSE:

Please see Attachment No. 1 for the requested detailed summary.

QUESTION:
Page 105 of Exhibit SRS-1 of Dr. Sim's direct testimony, provides that the generation only reserve margin value is "calculated by setting to zero all incremental energy efficiency and load management, plus all existing load management."

a. Please state whether FPL has ever experienced reduced customer participation in load management programs as a result of FPL interrupting or curtailing customers participating in load management programs. If yes, please provide an explanation of such event(s).
b. For each year since 1998, please provide the information in the table below for commercial and industrial customers. Please provide all requested data electronically in MS Excel format with all formulas intact.

Total Load Control Capabilities (MW)	Number of Load Control Events	Maximum Demand Reduction During a Single Event (MW)

c. For each year since 1998, please provide the following information in the table below for residential customers. Please provide all requested data electronically in MS Excel format with all formulas intact.

Total Res. Interruptible Load Control Capabilities (MW)	Number of Res. Load control customers interrupted during Load Control Events	Maximum Demand Reduction from residential load control During a Single Event (MW)

RESPONSE:
a. To date, FPL has not experienced significant voluntary drop outs by participants in its load management programs similar to the widespread drop outs that occurred in the late 1990s for other Florida utilities. However, FPL notes that concern over potential voluntary drop outs from load management programs is not the sole driver, nor even one of the primary drivers, of FPL's use of generation-only reserve margin (GRM) reliability criterion. FPL provided a detailed discussion of the reasons why a GRM criterion was adopted on pages 53 to 55 of its 2014 Ten Year Site Plan and on pages 55 to 56 of its

2015 Ten Year Site Plan and has addressed the GRM criterion in several other of its recent Site Plans, dating back to 2011.

b. The requested information is presented in Table Staff-34b, which is contained in Attachment No. 1. Capacity values are at the generator.

c. The requested information is presented in Table Staff-34c, which is contained in Attachment No. 1. Capacity values are at the generator.

QUESTION:
For each self build option identified in Exhibit SRS-5 (page 1 of 2) of Dr. Sim's direct testimony, please provide the projected capacity changes for each year of the analysis. Please provide this information in a format similar to Table ES-1 in FPL's 2014 Ten-Year Site Plan. Please provide all requested data electronically in MS Excel format with all formulas intact.

RESPONSE:

Please see Attachment No. 1 for the requested information.

QUESTION:

For each self build option identified in Exhibit SRS-5 (page 1 of 2) of Dr. Sim's direct testimony, please provide the projected capacity changes for each year of the analysis. Please provide this information in a format similar to Table ES-1 in FPL's 2014 Ten-Year Site Plan. Please provide all requested data electronically in MS Excel format with all formulas intact.

RESPONSE:

Please see Attachment No. 1 (Table Staff Supplemental-44).

QUESTION:
For each self build option identified in the table titled Third Step found in Exhibit SRS-5 (page 2 of 2) of Dr. Sim's direct testimony, please provide the projected capacity changes for each year of the analysis. Please provide this information in a format similar to Table ES-1 in FPL's 2014 Ten-Year Site Plan. Please provide all requested data electronically in MS Excel format with all formulas intact.

RESPONSE:

Please see Attachment No. 1 for the requested information.

QUESTION:
On page 11, lines 6-9, of FPL Witness Feldman's direct testimony, Witness Feldman indicates that weather conditions, economic growth, codes and standards, and changing patterns of customer behavior are the factors affect FPL's summer peak demand. Please explain how "changing patterns of customer behavior" are incorporated into FPL's summer peak per customer model in a way similar to Witness Feldman's discussion regarding how weather conditions, economic conditions and codes and standards are incorporated into the summer peak per customer model. (See pages 11–13 of Witness Feldman's direct testimony.)

RESPONSE:
Changing patterns of customer behavior are incorporated into FPL's summer peak per customer model via the model coefficients and intercept term. Each coefficient captures behavioral changes of customers in terms of energy usage, due to changes in weather, income, gasoline prices, and the implementation of energy efficiency measures.

QUESTION:
Please refer to FPL Witness Feldman's direct testimony, page 11, lines 17–19, for the following questions:

a. Please explain in detail how the summer peak per customer model was calibrated and provide all the relevant information.
b. Please specify the years of which the annual historical data are used for the model calibration.
c. Please state whether FPL always uses the historical data on the same two weather series, the maximum temperature on the day of the summer peak and the sum of the cooling degree hours two days prior to the peak day, to calibrate its summer peak per customer model. (See page 11, lines 18–19)
d. Please explain the reasons FPL specifically choose the aforementioned two weather series for model calibration.
e. If the response to No. 59(c) is negative, please explain why. Please also specify the type of weather data series used for model calibration and identify the corresponding docket number as well.
f. Apart from the historical weather data series discussed in No. 59(c) above, please state whether FPL used any other historical data series for the model calibration.

RESPONSE:

a. The summer peak per customer model is a multiple linear regression model and was calibrated using the software program MetrixND. This software was developed by Itron. Please refer to FPL's response to Staff's First Request for Production of Documents, No. 1 for the historical data used to calibrate the model, along with forecasted data and model statistics, including the coefficients.
b. The model is calibrated using the historical years 1990-2014.
c. FPL has used, in our summer peak model, the same two weather series, namely, the maximum temperature on the day of the summer peak and a term for the heat buildup since the 2011 Ten Year Site Plan. The summer peak models utilized in the 2006 through 2010 Ten Year Site Plan forecasts also utilized one weather variable for the temperature and one for the heat buildup. However, the average daily temperature on the peak day was used rather than maximum peak day temperature in the 2006 through 2010 Ten Year Site Plan forecasts. The change to the maximum temperature on the day of the summer peak was made to improve the statistical fit of summer peak model. In the 2005 Ten-Year Site Plan forecast, only a temperature variable was included in the summer peak model. The addition of a variable for the heat buildup was made effective with the 2006 Ten-Year Site Plan forecast in order to improve the statistical fit of the summer peak model.
d. The maximum temperature on the day of the summer peak and the sum of the cooling degree hours two days prior to the peak day are used to calibrate the summer peak model

for two reasons. One, they have strong statistical significance, and two, they make logical sense as variables that significantly influence the summer peak.

e. As explained in subpart (c) of the response to this interrogatory, small refinements to the weather variables incorporated into the summer peak model have been made over time in order to improve the model's statistical fit based on the available historical data. Listed below are the weather data series used in model calibration where these series differ from what is in the current summer peak model, along with the corresponding docket number in which the forecast was utilized.

Weather Data Series	Docket No.
1) Average temperature on the summer peak day and heat buildup	080677-EI and 090172-EI
2) Maximum temperature on the summer peak day	050045-EI

f. Non-weather historical data series used to calibrate the summer peak model include real disposable income per household, one month lag in the real price of gasoline, and a variable to account for Codes and Standards. Also included in the model is an indicator variable for the year 1990.

QUESTION:
Please refer to FPL Witness Feldman's direct testimony, page 16 for the following questions:

a. Please state the actual/ estimated impact of distributed solar generation, in MW, for each year 2014 through 2019. (See page 16, lines 5–8)
b. Please provide details of the "solar profiles" FPL used to derive Megawatt hours (MWh) of distributed solar. (See page 16, line 18)

RESPONSE:
a.

	Installed MWdc	Solar Summer Peak (MW)	Solar Impact on FPL Summer Peak (MW)
2014	**34**	**11**	**0**
2015	**51**	**17**	**6**
2016	**82**	**28**	**17**
2017	**104**	**36**	**25**
2018	**133**	**46**	**35**
2019	**164**	**57**	**46**

Notes: Impact on FPL summer peak is incremental from 2014. 2014 solar summer peak MW is included in historical data.

b. Please see Attachment No. 1 for "solar profiles" used to calculate the MWh of distributed solar generation. Below is a brief description of the methodology used to develop these profiles.

1) Solar profiles are developed based on average hourly output. Profiles are in a 12X24 matrix format.
2) Profiles are based on three types of system orientations:

	Orientation	Share
Residential	South	50%
	Southwest	25%
	Southeast	25%
Commercial	South	80%
	Southwest	10%
	Southeast	10%

3) Average hourly output values are converted to represent Annual kWh/kW_{DC}.
4) Hourly values are calculated as a percentage of total annual kWh.

QUESTION:
Referring to FPL's response to Staff's First Set of Interrogatories No. 2, please specify what each of the assumptions is and explain why that assumption is necessary and appropriate for developing FPL's forecasts of customer growth, summer peak demand, and net energy for load.

RESPONSE:
Listed below are each of the assumptions used in developing the load forecast and the reasons why each is necessary and appropriate to use in FPL's forecasts.

1. **Population growth** is the primary driver of FPL's customer growth. Florida population is the most important variable in determining the forecast number of customers. As the population increases, so do the number of households, and hence customers along with the businesses needed to support these households. The statistics from FPL's customer model confirms the importance of population growth on the FPL customer forecast.
2. **Weather** is a key driver in electricity usage and is an important input into FPL's summer peak and net energy for load models. While the specification for weather varies between the models, the weather data used in developing these weather variables are based on the same hourly weather values.
3. **The economy** affects both the summer peak and net energy for load. The economy determines how much income consumers have to spend on all goods and services, including electricity. In addition, the economy determines the overall level of energy prices which also influences the amount of electricity consumption.
4. **Codes and Standards** directly impact both the summer peak and net energy for load. As codes and standards mandate efficiency improvements in energy using equipment, less usage is required. As such, improving efficiencies due to codes and standards need to be accounted for in FPL's forecasts.

QUESTION:
Please refer to FPL's response to Staff's First Set of Interrogatories No. 13 for the following questions:

a. Please provide FPL's 7/27/2015 base case natural gas and light fuel oil short term and long term price forecasts (annualized and monthly).
b. Please provide FPL's 7/27/2015 high band natural gas and light fuel oil short term and long term price forecasts (annualized and monthly).
c. Please provide FPL's 7/27/2015 low band natural gas and light fuel oil short term and long term forecasts (annualized and monthly).
d. Please provide CPVRR first stage analyses, similar to that provided in Exhibit SRS-4 of FPL Witness Dr. Sim's Direct Testimony, based on FPL's 7/27/2015 base case, high band, and low band natural gas and light fuel oil price forecasts.
e. Please provide CPVRR second stage analyses, similar to that provided in Exhibit SRS-5 of FPL Witness Dr. Sim's Direct Testimony, based on FPL's 7/27/2015 base case, high band, and low band natural gas and light fuel oil price forecasts.

RESPONSE:

a. Please see Attachment No. 1 (Table Staff-62 (Part a), (Part b), and (Part c)).

b. Please see Attachment No. 1 (Table Staff-62 (Part a), (Part b), and (Part c)).

c. Please see Attachment No. 1 (Table Staff-62 (Part a), (Part b), and (Part c)).

d. Staff Interrogatory 62 d & e requested that FPL update two analyses that FPL had performed as part of its overall next planned generating unit (NPGU) analyses in 2014 and early 2015. The request was to update these analyses substituting FPL's July 27, 2015 fuel cost forecast for the fuel cost forecasts that were used at the time for each of the two analyses.

The updated analyses utilize this July 2015 fuel cost forecast (low, base, and high bands). However, FPL has also updated a number of other inputs to the analyses. These other updates include:

- A new October 2015 load forecast; and,
- Various other assumptions that were not then available and, therefore, had not been utilized during each stage/step in the NPGU analyses, but which were updated and incorporated into FPL's 2015 Ten-Year Site Plan, including: (i) the 2016 PV additions, (ii) the new schedule for GT replacements in Broward and Lee counties, (iii) the mutually agreed upon decision with Cedar Bay to sell that generating unit to FPL and FPL's plans to subsequently retire that unit, and (iv) the 2027/2028 in-service dates for Turkey Point 6 & 7.

Utilizing all of these updated assumptions and forecasts, FPL performed three scenario analyses. One scenario utilizes the July 2015 base case fuel cost forecast, another scenario utilizes the July 2015 low band fuel cost forecast, and the third scenario utilizes the July 2015 high band fuel cost forecast.

FPL has combined key generating options analyzed in the two previous, separate stages of analyses presented in Exhibits SRS-4 and SRS-5 into one set of analyses which examines the following self-build generating options. Please see Attachment No. 2 (Table Staff-62 (Parts d & e)):

- The 1,622 MW OCEC Unit 1 that was designated as FPL's NPGU in the capacity RFP;

- An enhanced 1,633 MW version of the OCEC Unit 1 (as referenced on page 36 of FPL witness Sim's direct testimony);
- Enhanced CT designs of 231 MW (Summer) capacity in 5 x 0, 6 x 0, and 7 x 0 configurations; and,
- The two most competitive non-GE CC units from the original analyses.

As shown in this response, the original 1,622 MW OCEC Unit 1 is still projected to be more economic than any of the CT and non-GE generation options; thus, the overall conclusions and recommendations reflected in the Petition for a determination of need and the supporting pre-filed testimony remain unchanged.

e. Please see the response to subpart (d) above.

QUESTION:
Please refer to FPL's response to Staff's First Request for Production of Document No. 1, regarding FPL use of historical annual data to estimate the summer peak demand forecasting model, for the following questions:

a. Please explain the reasons FPL did not use historical monthly data for the model estimation in the instant case.
b. Please identify FPL's summer peak demand forecasts produced since 2005 that were estimated based on monthly data, and the purpose for which such forecasts were used.

RESPONSE:
a. FPL did not use historical monthly data to estimate the summer peak demand forecasting model because the summer peak occurs once per year. As such, annual data and not monthly data are appropriate for estimation purposes.
b. FPL has never used monthly data in estimating the summer peak demand forecasts.

QUESTION:
On page 12, lines 17-23, of Dr. Sim's direct testimony, Dr. Sim states the following:

> "FPL utilizes three reliability criteria to project the timing and magnitude of its future resource needs. The three reliability criteria are:
>
> - A minimum total reserve margin (total RM) for Summer and Winter of 20%;
> - A minimum generation-only reserve margin (GRM) for Summer and Winter of 10%; and
> - A maximum loss-of-load-probability (LOLP) of 0.1 day per year."

Please describe how FPL determined that 10% is an appropriate level for a generation-only reserve margin (i.e., did FPL start with a 5 percent GRM and incrementally evaluate different levels).

RESPONSE:

The rebuttal testimony of FPL witness Sim in this docket details why and how the GRM reliability criterion was developed by FPL. A summary of this information is as follows:

- FPL conducted analyses that utilized both a resource planning perspective and a system operations perspective.
- FPL also used both historical and projected perspectives in these analyses.
- The analyses looked at pairs of resource plans that had identical total reserve margins (for example, each of the two resource plans might have a 20.4% total reserve margin), but that total reserve margin would have been reached in one resource plan with more incremental DSM MW/less incremental generation MW, while the other resource plan would have less incremental DSM MW/more incremental generation MW.
- FPL used the generation-only reserve margin (GRM) calculation as a metric by which to refer to these differences in these resource plans. A resource plan with more incremental DSM MW/less incremental generation MW has a lower GRM than a resource plan with less incremental DSM MW/higher incremental generation MW.
- From the resource planning perspective, the plan with more incremental DSM MW/less incremental generation MW (*i.e.*, a lower GRM) consistently was projected to have higher LOLP values than the other plan consisting of less incremental DSM MW/more incremental generation MW (*i.e.*, a higher GRM), even though both resource plans had an identical total reserve margin value. Thus, from an LOLP perspective, a resource plan with a lower GRM results in a less reliable FPL system than a resource plan with a higher GRM.

- From the system operations perspective, the plan with a lower GRM was consistently projected to have less MW in reserve for the system operators' to use, compared to the resource plan with a higher GRM, when examining projections of unexpected higher load and/or unexpected higher levels of generating unit unavailability.
- In regard to specific GRM levels, shortly after the 2009 DSM Goals decision, when very high levels of DSM were set as FPL's DSM Goals, FPL projected that its GRM would drop to 4.7% near the end of the decade. Consequently, FPL's analyses of the comparative reliability of the FPL system used 5% as a low end of the range of possible GRM values. The upper end of the GRM range that was examined was approximately 13%. The two results described above, both for the resource planning perspective and the system operations perspective, were consistently projected for all analyses throughout this 5% to 13% GRM range.
- FPL decided upon a minimum GRM value of 10% based on a recommendation from its system operations department. Their recommendation attempted to ensure that their operators have approximately 2,650 MW of generation reserves. This value was based on the following assumptions (MW values are approximate): (i) 1,500 MW for possible loss of the largest unit, (ii) 700 MW as an average of the total MW out-of-service at any given time for both planned and unplanned maintenance, and (iii) 450 MW for FPL's share of Florida's reserve-sharing obligations. The total 2,650 MW was a close match to a 10% GRM value. Therefore, FPL selected 10% as its minimum GRM criterion value. This specific value is expected to be reviewed in future FPL reliability analyses.
- This third reliability criterion is designed to complement, not replace, the maximum 0.1 day/year LOLP and 20% minimum total reserve margin reliability criteria that FPL also uses. In regard to the 20% total reserve margin criterion, the GRM criterion essentially provides guidance regarding what mix of DSM and generation resources should be added to maintain/enhance the reliability of FPL's system while meeting the minimum total reserve margin criterion of 20%.

QUESTION:

Referring to FPL's response to Staff's Second Set of Interrogatories No. 34, Attachment 1, Tab 2 of 2, FPL's response for the year 2008 indicates that the Company's maximum demand reduction during a single event (1,249 MW) exceeded the Company's total load control capabilities (966 MW). Please describe in detail, the 2008 event that resulted in the demand reduction of 1,249 MW.

RESPONSE:

FPL's residential load management customers can select that their air conditioners can be interrupted in either a "cycle" or "shed" mode. If the cycle mode is selected, FPL will interrupt each air conditioner during a load management event for a period of 15 or 17.5 minutes each half hour. This process repeats as needed until an event ends. FPL staggers the interruptions of these cycle customers so that a levelized amount of aggregate load management is achieved. In contrast, the air conditioners for customers who select the shed option are interrupted at the start of an event and remain interrupted for the duration of the event. FPL reports its residential load management capability reflecting the normal method of operation (*i.e.*, the mix of "cycle" and "shed" mode selected by customers). Load management under normal operations would have yielded a maximum 966 MW of load reduction in 2008. However, in an extreme emergency such as occurred on February 26, 2008, FPL is permitted to control the "cycle" customers in "shed" mode. Because all customers' air conditioners are interrupted simultaneously (without the cycle mode's staggering), more MWs can be produced. This emergency method was used during the 2008 event, which yielded the reduction of 1,249 MW.

QUESTION:

On page 38, lines 17-19, of Dr. Sim's rebuttal testimony, Dr. Sim states that "the FPSC order [in the 2009 DSM Goals docket] meant that FPL's resource plans would be more dependent on DSM resources, and less reliant on generation resources…." Please revise Exhibit SRS-2, of Dr. Sim's direct testimony, assuming DSM additions per the 2009 DSM Goals docket for 2015 through 2019.

RESPONSE:

Table Staff 84 provides three different versions of Exhibit SRS-2, see Attachment No. 1. The first version, Table Staff-84a, is essentially identical to Exhibit SRS-2 except that it has added 3 new columns (1a, 6a, and 6b) with blank values in two of the columns (1a and 6a). These two columns with blank values will be used in the second and third versions of the tables. The projected results on the right hand side of Table Staff-84a are identical to those in Exhibit SRS-2.

Table Staff-84b assumes that the incremental difference between the 2015 through 2019 DSM additions and the 2014 DSM Goals are added in those years on top of the 2014 DSM Goals (as shown in Column 6a), and that no new generation is added (as shown in Column 1a).

Table Staff-84c assumes that just the 2014 DSM Goals are added (as is the case in Table Staff-84a) by showing zeroes in Column 6a. This table also shows that OCEC Unit 1 is added as planned in 2019 as shown in Column 1a.

In regard to the results, Table Staff-84a, and the original Exhibit SRS-2, both show that FPL has a large resource need beginning in 2019, which increases in 2020. The 20% total reserve margin criterion shows that FPL needs 988 MW by 2019 to meet that criterion. The 10% generation-only reserve margin (GRM) criterion shows that FPL needs an additional 64 MW of generation resources by 2019, *i.e.,* for a total of 1,052 MW, to enable FPL to also meet the GRM criterion.

Table Staff-84b assumes that FPL adds approximately 463 MW more DSM by 2019 than the 252 MW that is currently planned for FPL (and which is accounted for in Column 6). This results in approximately 715 MW of DSM additions in this scenario. However, no new generation is assumed to be added in this scenario. Thus, FPL would definitely become more reliant on DSM for meeting its reliability needs in this scenario. This table also shows that this significant amount of additional DSM only reduces, but does not meet the FPL's 988 MW need dictated by the 20% total reserve margin criterion. In addition to these reliability concerns, such high levels of DSM were found not to be cost-effective under the RIM screening test in both the 2009 and 2014 DSM Goals dockets. As discussed in the 2014 DSM Goals docket and in this docket, DSM is less cost-effective now for FPL's system than it was in 2009. Therefore, this additional DSM would be even less cost-effective now than it was projected to be in 2009, thus raising electric rates for all FPL customers and significantly increasing monthly bills for non-participants.

Furthermore, this DSM addition does nothing to meet FPL's 10% generation-only reserve margin criterion. The projected GRM value in 2019 is still at 5.8%, which remains well short of the 10% minimum GRM requirement. This very low GRM level is also at a level that led to the system reliability and system operations concerns that resulted in the need for FPL to establish the GRM criterion. Therefore, FPL's 2019 resource needs in this scenario remain at 1,052 MW of generation capacity.

Table Staff-84c assumes that FPL adds OCEC Unit 1 in 2019 and adds the amount of DSM set in the 2014 DSM Goals docket. In this scenario, which represents FPL's resource plan, both FPL's total reserve margin and GRM reliability criteria are met. Thus, FPL is projected to both meet all of its reliability criteria and to do so with the most cost-effective DSM and generation resource additions.

QUESTION:

On page 49, lines 8-12, of Dr. Sim's rebuttal testimony, Dr. Sim states that not allowing FPL to build the Okeechobee Clean Energy Center Unit 1 would result in "lower reliability for all utility customers in peninsular Florida."

a. Please state whether, if constructed, Okeechobee Clean Energy Center Unit 1 would be the largest generating unit in Florida and explain your response.
b. If yes, please explain how this would impact other utilities in peninsular Florida.

RESPONSE:

a. In part, yes, and in part, no. By 2019, the OCEC combined cycle Unit 1 will be the largest generating unit in terms of Summer capability. However, Fort Myers combined cycle Unit 2 would be the largest generating unit in Florida in terms of Winter capability.

b. The statement above quoted in FPL witness Sim's rebuttal testimony refers to the negative impact that would occur to system reliability for both customers served by FPL's system, and customers served by other utility systems in peninsular Florida, if OCEC Unit 1 is not allowed to be built and brought into service in 2019. If that scenario were to occur, FPL's total reserve margin would drop to 15.7% in 2019 and 14.3% in 2020 as explained in FPL's witness Sim's direct testimony. There would also be a corresponding drop in the total reserve margin for peninsular Florida, thus signifying a lower level of reliability for the peninsular Florida electric system without OCEC Unit 1. Therefore, the reliability of peninsular Florida's electric system will definitely be lowered if OCEC Unit 1 were not added in 2019.
In regard to other considerations, the addition of OCEC Unit 1 will increase fuel supply diversity in Florida by its access of the new Sabal Trail/FSC natural gas pipeline. OCEC Unit 1 is also projected to burn natural gas more efficiently than any natural gas-fired unit in Florida, thus putting downward pressure on natural gas usage, natural gas pricing, and emissions (including CO_2 emissions) compared any other natural gas-fired unit that might be substituted for OCEC Unit 1.

QUESTION:
On page 5, lines 7-8, of Witness Feldman's direct testimony, Witness Feldman indicated that FPL's long-term forecasts include base case projections of customers, peak demands, and net energy for load.

a. Please provide any documents containing the historical data used to estimate the econometric model that projects the number of customers by rate class and total.

b. Please provide any documents containing the projected independent variables used to project the number of customers through 2024. Please include any adjustments made to the output of the model to derive the final forecasted number of customers by rate class and total.

c. Please provide any documents containing the customer growth forecast model equation as well as any assumptions used in the model development. Please also provide the coefficients, standard errors, t-statistics, as well as the summary statistics of such model.

d. Please provide any documents containing the historical data used to estimate the econometric model that projects summer peak demand per customer.

e. Please provide any documents containing the projected independent variables used to project summer peak demand per customer through 2024. Please include any adjustments made to the output of the model to derive the final forecasted summer peak demand.

f. Please provide any documents containing the summer peak demand per customer forecast model equation as well as the assumptions used in the model development. Please also provide the coefficients, standard errors, t-statistics, as well as the summary statistics of such models.

g. Please provide any documents containing the historical data used to estimate the econometric model that projects Net Energy for Load (NEL).

h. Please provide any documents containing the projected independent variables used to project net energy for load through 2024. Please include any adjustments made to the output of the model to derive the final forecasted NEL.

i. Please provide any documents containing the NEL forecast model equation as well as the assumptions used in the model development. Please also provide the coefficients, standard errors, t-statistics, as well as the summary statistics for such model.

RESPONSE:
Attached are the files containing the historical data used to estimate the econometric models for summer peak and net energy for load. These files also contain the projections for all of the independent variables in the models along with the associated model statistics.

Also attached are the files containing the same information as described above for all of our customer forecasts that utilize econometric models. Please note that we produce forecasts by revenue class, not by rate class. For the commercial and industrial revenue classes the forecasts are developed for small, medium, and large customers, however, only the small commercial and GS-1 industrial groups are developed using econometric models.

QUESTION:
On page 5, lines 11-17, of Witness Feldman direct testimony, Witness Feldman indicated that FPL's long-term forecasts include risk-adjusted projections of summer peak demands which were based on analysis of the differences between actual and forecasted values of the summer peak.

a. Please provide any documents containing the historical forecast accuracy data used to calculate the risk-adjustment incorporated into the risk-adjusted summer peak demand per customer forecast.

b. Please provide any documents containing the historical forecast accuracy data used to calculate the risk-adjustment incorporated in the risk-adjusted NEL forecast, if any.

RESPONSE:
Please see the provided file for the historical forecast accuracy data, for the summer peak and net energy for load, used to calculate the risk-adjusted forecasts. Please refer to the worksheets named "SP_fan_Current" and "NEL Fan Current."

FPL's Response to Staff's Request for Production of Documents, No. 3.

Note: See excel file contained on Staff Exhibit CD for No. 3

QUESTION:
On page 28, lines 7-12, of Witness Feldman's direct testimony, Witness Feldman testified that similar out-of-model adjustments are made to forecasts of NEL, summer and winter peak demands. Please provide any documents containing the actual adjustment amounts related to each adjustment factor for each year from 2015 – 2024 in an Excel Table format similar to Table 1 below.

Table 1. Adjustment Amounts Made to the Forecasting Models

	Summer Demand (MW)						Net Energy for Load (GWh)					
	Wholesale	Plug-in Electric Vehicles	Economic Development Rider	Existing Facility Economic Rider	Distributed Solar Generation	Total	Wholesale	Plug-in Electric Vehicles	Economic Development Rider	Existing Facility Economic Rider	Distributed Solar Generation	Total
2015												
2016												
2017												
2018												
2019												
2020												
2021												
2022												
2023												
2024												

RESPONSE:
Please see the documents provided, specifically the worksheets named "Summer Peak", "Winter Peak", and "Monthly_NEL_Model."

QUESTION:
Referring to page 14, lines 2-4, of Witness Feldman's direct testimony, please provide any documents identifying, by year starting in 2015 through 2024, the source, quantity, level of firmness, and contractual status of incremental wholesale load which, when summed by year, matches the year to year differences in the Wholesale Load Forecast (Column 3) found in Schedule 3.1 of FPL's 2015 TYSP.

RESPONSE:
See document provided. Please refer to the worksheet named "Summary CP" column L.

FPL's Response to Staff's Interrogatories, Nos. 19, 25, 26, 66, 71, 74, 75

FLORIDA PUBLIC SERVICE COMMISSION
DOCKET: 150196-EI EXHIBIT: 60
PARTY: STAFF
DESCRIPTION: FPL's Response to Staff's Interrogatories, Nos. 19, 25, 26, 66, 71, 74,

QUESTION:
On page 11, lines 1-2 of Dr. Sim's direct testimony, Dr. Sim states that FPL took account of all identified cost-effective renewable energy.

a. Please state how much (MW) wind generation FPL identified in determining the need for OCEC Unit 1.
b. Please state whether FPL considers wind generation a firm resource, and provide an explanation.

RESPONSE:
a. FPL has not identified any cost-effective wind generation in its service territory to-date primarily due to relatively low average wind speeds in FPL's service territory. Consequently, there are no wind MW of generation included in the resource plan which was used to project FPL's 2019 capacity needs.

b. Wind energy is an intermittent energy source. Therefore, FPL believes that only a portion, if any, of a wind turbine's nameplate rating would be appropriate to assign as firm capacity. This is the same fundamental view that FPL takes with solar energy, another intermittent energy source. For solar, the firm capacity value for any specific solar facility is based on several factors including specific location, orientation, and type of solar facility.

QUESTION:
On page 23, lines 7-10, of Dr. Sim's direct testimony, Dr. Sim states that a significant amount of land would be required to site the amount of photovoltaic (PV) that would be needed to supply 1,052 firm MW of solar capacity. Please describe the number of acres FPL estimates would be required to site 1,052 firm MW of solar capacity.

RESPONSE:
FPL is currently assigning a 52% of nameplate value as firm capacity to its three 74.5 MW photovoltaic (PV) projects that are scheduled to go in-service by late 2016. FPL also projects that as more PV is added to its system, the firm capacity value will diminish because the earlier PV will move the remaining peak load that will be met by non-PV resources towards a later hour in the day, thus reducing the contribution from additional PV to meeting that later peak. Based on that projection, if FPL were to assume a 50% of nameplate firm capacity value for future PV, and a 10 acres per MW-AC (nameplate) value, as reasonable assumptions, then approximately 21,040 acres would be needed to meet a 1,052 MW firm capacity need in 2019 with PV.

(1,052 firm MW / 0.50 firm MW-to-nameplate MW) x (10 acres/nameplate MW) = 21,040 acres.

QUESTION:
On page 24, lines 2-5, of Dr. Sim's direct testimony, Dr. Sim testifies that "FPL has now begun applying a methodology for determining what firm capacity values PV facilities are projected to deliver."

a. Please describe, in detail, FPL's methodology for determining what firm capacity values PV facilities are projected to deliver.
b. For the years 2015-2025, please provide FPL's estimated firm capacity contribution from solar PV facilities.

RESPONSE:

a. The new methodology employed by FPL for determining firm capacity value for photovoltaic (PV) facilities is based on measuring the output of a specific solar facility at the time of the system's summer peak load. Summer peak load is assumed to take place annually in August between 4 and 5 p.m. For existing facilities, the firm capacity value is based on historical data, while for solar facilities under consideration the value is based on projections of a specific project's hourly energy output. This summer firm capacity value varies based on the location, orientation, technology, and other design characteristics of the specific facility. Because the output of PV panels degrades over time, FPL assumes that the firm capacity value of PV facilities will similarly degrade over time.

   Similar analysis was performed for the FPL system's winter peak load which usually occurs early in the morning. At this time of the day, there is little or no solar energy generated by solar facilities, so FPL assumes that solar facilities have no firm capacity value at time of winter peak.

b. FPL's current resource plan as shown in FPL's 2015 Site Plan projects the following firm capacity values for existing and projected PV facilities through 2025:

- Space Coast PV: 10 MW nameplate rating and approximately 3 MW firm capacity;
- DeSoto PV: 25 MW nameplate rating and approximately 12 MW firm capacity; and,
- 2016 PV facilities (3): 223.5 MW nameplate rating (3 74.5 MW units) and approximately 116 MW total firm capacity.

<u>**AFFIDAVIT**</u>

Steven R. Sim

Dr. Steven Sim

State of Florida)

County of Palm Beach)

I hereby certify that on this 20th day of October, 2015, before me, an officer duly authorized in the State and County aforesaid to take acknowledgments, personally appeared **Dr. Steven Sim**, who is personally known to me, and he acknowledged before me that he sponsored the answer(s) to Interrogatory No(s). 17-31 and 33-47 from Staff's 2nd Set of Interrogatories to Florida Power & Light Company in Docket No. 150196-EI, and that the response(s) are true and correct based on his personal knowledge.

In Witness Whereof, I have hereunto set my hand and seal in the State and County aforesaid as of this 20th day of October, 2015.

Traci D. Goldwire

Notary Public, State of Florida

Notary Stamp: TRACI D. GOLDWIRE
Notary Public - State of Florida
Commission # FF 233425
My Comm. Expires Jul 31, 2019
Bonded through National Notary Assn.

QUESTION:

On page 13, lines 19-20, of Dr. Sim's direct testimony, Dr. Sim states that: "FPL's new DSM goals for 2015 through 2024 were fully accounted for in the reliability analysis." Please explain how FPL accounted for incremental conservation and load management beyond 2024.

RESPONSE:

FPL first notes that projected DSM impacts after 2024 have no impact on FPL's reliability needs for the year 2019.

FPL assumed that 50 MW per year of incremental DSM from FPL DSM programs would be added beyond 2024 through the year 2030. Furthermore, this projected impact from FPL DSM programs is in addition to the projected impacts of energy efficiency codes and standards that are accounted for in FPL's load forecast.

QUESTION:

Referring to page 16, lines 5-8, of Witness Feldman's direct testimony, please estimate the number of roof-top solar facilities that would be needed to meet FPL's projected need in 2019.

RESPONSE:

It would require approximately 400,000 average-sized residential roof-top photovoltaic (PV) systems to meet FPL's projected need in 2019. As a point of reference, FPL residential customers have installed approximately 3,200 PV systems to-date. This calculation is based on the following assumptions:

1. 2013-2015 weighted average size of residential customers' PV systems of 7.8 KW.
2. Summer peak coincidence factor of 34% based on FPL's Measurement & Verification study.

QUESTION:

Referring to FPL's response to Staff's Second Set of Interrogatories No. 25, FPL states that "FPL is currently assigning a 52% of nameplate value as firm capacity to its three 74.5 MW photovoltaic (PV) projects." Please state whether FPL assigned a firm capacity value to PV facilities in any of its previous need determination proceedings and explain your response.

RESPONSE:

No. Prior to 2015, FPL had not assigned a firm capacity value to its existing PV facilities, or to planned PV facilities, in any previous need determination proceedings. As indicated in FPL's last few Site Plans (prior to FPL's 2015 Ten-Year Site Plan), FPL had not assigned a firm capacity value to its PV facilities but has been examining whether a non-zero firm capacity value might be appropriate. During 2014, FPL finalized a methodology it now uses to evaluate firm capacity values for future PV facilities. FPL introduced the results of applying that methodology for both its existing and future PV facilities in its 2015 Ten-Year Site Plan. That methodology is now being used in FPL's resource planning work for which PV is a generation alternative.

QUESTION:

Referring to FPL's response to Staff's Second Set of Interrogatories No. 25, FPL assumes 10 acres per MW-AC for the calculation provided in its response. On page 102 of FPL's 2015 Ten-Year Site Plan, FPL summarizes a proposed solar facility that is projected to have a capacity of 74.5 MW-AC sited on 443 acres. Please describe the site-specific characteristics of the proposed solar facility that result in approximately 6 acres per MW-AC.

RESPONSE:

The planned solar facility referenced in the question is the Babcock Ranch Solar Energy Center in Charlotte County, FL. This planned solar facility benefits from very efficient site characteristics that allowed it to utilize significantly less acreage than the more typical metric of 10 acres per MWac. It has an approximately square shape and has limited natural or manmade features that needed to be avoided. Both of these features allow for a highly optimized solar field layout. The other two solar projects being planned in the 2015 Ten Year Site Plan (Citrus Solar Energy Center in DeSoto County and Manatee Solar Energy Center in Manatee County) have natural features such as wetlands and protected habitats coupled with manmade features such as oddly shaped boundaries, drainage ditches, roads, and other improvements which allow for the construction of approximately 1 MW per 10 acres. When planning a large portfolio of solar projects, it is more typical to have site features that require some reduction in the practical area on which solar projects can be built. In FPL's experience, 10 acres per MWac is an average result that is suitable for long term planning assessments.

&

FPL's Response to Staff's Request for Production of Documents, Nos. 6a and 6b (the latter includes Confidential Document No. 07172-15, part 4)

FLORIDA PUBLIC SERVICE COMMISSION
DOCKET: 150196-EI EXHIBIT: 61
PARTY: STAFF
DESCRIPTION: FPL's Response to Staff's Interrogatories, Nos. 11, 12 (without Confidential Attachment No. 1), 13,...

QUESTION:
On page 7, line 14, and page 5, lines 9-11, Witness Stubblefield stated that OCEC Unit 1 will burn natural gas as the primary fuel source, and utilize a form of light fuel oil as a backup fuel source. Please identify and discuss expected industry trends and factors for natural gas and light fuel oil that will affect the FPL during the period 2015 through 2024.

RESPONSE:

The U.S. Energy Information Administration (EIA) determines industry trends that will potentially affect the industry as a whole and, in turn, the end users of the commodities, such as natural gas and light fuel oil. The industry trends identified by the EIA include growth in U.S. energy production, a modest growth rate of U.S. energy demand, and improved efficiency in the end-use sectors.

The EIA expects the growth in U.S. energy production to be led by crude oil, including refined products such as light fuel oil, and natural gas. It expects strong growth in domestic crude oil production from tight formations, which will lead to a decline in net petroleum imports and growth in net petroleum product exports. In addition, the EIA projects LNG exports to begin a large ramp of 0.3 trillion cubic feet (TCF) in 2016 to 2.6 TCF in 2024. Although exports seem to be rising, the EIA forecasts that U.S. energy demand will grow at a modest rate of about 0.2% per year from 2015 through 2024, driven mainly by the adoption of more energy-efficient technologies and existing policies that promote increased energy efficiency.

QUESTION:
Referring to Witness Stubblefield's direct testimony, pages 6, lines 21-22 and page 7, lines 1-2, please identify the independent variables representing worldwide demand, production capacity, economic growth, environmental legislation, and politics in the model used to forecast the future price of fossil fuels.

RESPONSE:

Florida Power & Light Company (FPL) does not forecast fossil fuel commodity pricing. FPL relies on NYMEX (which is not based on a model but on the actual natural gas futures market) and PIRA Energy Group to determine fossil fuel commodity pricing. PIRA, one of the leading fuel forecasting providers serving over 80% of US gas and electric companies, presents their clients with an annual update that describes many of the forecasting assumptions and drivers behind their commodity models. We have provided a copy of the most recent information available from PIRA as Confidential Attachment No. 1 to this response. This information describes the many variables considered by PIRA in its model to forecast the future price of fossil fuels.

Confidential Attachment No. 1 will be provided to Staff with FPL's Request for Confidential Classification (RFCC). The confidential information will be made available to the other parties for inspection at FPL's Tallahassee Office at 215 South Monroe Street, Suite 810, Tallahassee, Florida, during regular business hours, 8 a.m. to 5 p.m., Monday through Friday, upon completion of a Non-Disclosure Agreement and upon reasonable notice to FPL's counsel.

QUESTION:
Please identify the sources and dates of FPL's most recent short term and long term fuel price forecasts (natural gas and light fuel oil).

RESPONSE:

Florida Power & Light Company (FPL) periodically updates/refreshes its fuel cost forecasts.

FPL utilizes the following data sources:

- Gas & Oil price data: NYMEX, PIRA Energy Group, and EIA
- SO2 and NOX Allowances: Amerex Brokers LLC
- Unit Emissions Rates: EPA Clean Air Markets Division – Part 75 Monitor data

FPL's most recent fuel price forecast for natural gas and light fuel oil had the following dates:

- Short Term: 07/27/2015
- Long Term: 07/27/2015

QUESTION:
Please refer to the U.S. Energy Administration's (EIA) *Annual Energy Outlook 2015*, found at http://www.eia.gov/beta/aeo/#/?id=13-AEO2015 (Table: Total Energy Supply, Disposition, and Price Summary, Reference Case).

a. Please complete the following table comparing FPL's natural gas price forecast (commodity) with the EIA's natural gas price forecast (nominal, $/MMBtu) as referenced above, including unit and percent differences for all years 2015 – 2024. Please also provide an electronic version of this table in excel format.

	FPL's 11/3/14 Forecasted Natural Gas Price	EIA's 2015 Reference Case Forecasted Natural Gas Price	Difference (FPL-EIA)	Difference
	(Nominal ¢/mmBtu)	(Nominal ¢/mmBtu)	(Nominal ¢/mmBtu)	(%)
2015				
2016				
2017				
2018				
2019				
2020				
2021				
2022				
2023				
2024				

b. Please explain on whether the two forecasts referenced above in Interrogatory No. 14a are directly comparable for projecting natural gas prices for all years 2015 – 2024. Why or why not?

c. If the FPL and EIA's natural gas price forecast are comparable, please identify the most likely reasons known to FPL for any significant price difference in the forecasts.

RESPONSE: (do not edit or delete this line or anything above this)

a. Please see below for the completed table comparing Florida Power & Light Company's (FPL) natural gas price forecast (commodity) with the U.S. Energy Administration's (EIA) natural gas price forecast. Portions of this table have been identified as confidential. The table below is also being provided in excel format as Confidential Attachment No. 1.

The confidential portions of this response and Confidential Attachment No. 1 will be provided to Staff with FPL's Request for Confidential Classification (RFCC). The confidential information will be made available to the other parties for inspection at FPL's Tallahassee Office at 215 South Monroe Street, Suite 810, Tallahassee, Florida, during regular business hours, 8 a.m. to 5 p.m., Monday through Friday, upon completion of a Non-Disclosure Agreement and upon reasonable notice to FPL's counsel.

Year	FPL's 11/3/14 Forecasted Natural Gas Price $/MMBtu	EIA's 2015 Reference Case Forecasted Natural Gas Price ($/MMBtu)	Difference (FPL-EIA) ($/MMBtu)	Difference (%)
2015	[redacted]	$3.82	[redacted]	
2016		$3.90		
2017		$4.09		
2018		$4.61		
2019		$5.07		
2020		$5.54		
2021		$5.79		
2022		$5.97		
2023		$6.25		
2024		$6.48		

b. FPL and EIA's forecasted prices could be comparable as they are both forecasting the same commodity. However, because FPL incorporates a forecast from The PIRA Energy Group as part of its forecasting methodology, FPL's forecast differs from EIA's forecast. While PIRA may use the same high level drivers as EIA, such as LNG export demand or increased productivity in shale production and their effects on the natural gas price, each agency develops their models independently and may interpret each input differently. As FPL does not have access to the models or their differences, it becomes increasingly difficult to explain the variances listed in response to subpart (a) above. FPL's methodology, which has been consistent for many years, uses the forward curve for natural gas commodity prices to project 2015 and 2016. For the next two years (2017 and 2018), FPL used a 50/50 blend of the November 3, 2014 forward curve and the most current projections at the time from The PIRA Energy Group. The remaining years use the annual projections from The PIRA Energy Group.

c. As referenced in the response to subpart (b) above, FPL's methodology differs from EIA's methodology. The differences make it difficult to compare the prices and give an accurate description of each of the variances included in the response to subpart (a) above.

Florida Power & Light Company
Docket No. 150196-EI

FPL 000428
OCEC NEED

QUESTION:
Please identify and discuss steps that FPL has taken to ensure natural gas supply availability and transportation over the years 2015 through 2024.

RESPONSE:

Florida Power & Light Company (FPL) continues to focus on identifying and evaluating alternatives that would most cost-effectively maintain and/or enhance FPL's access to natural gas supplies. These alternatives include obtaining additional access to diversified sources of natural gas such as shale gas from the Mid-Continent, the prolific gas supplies in the Marcellus and Utica shale basins, and securing natural gas reserves. In addition, FPL has secured 4.0 Bcf of firm natural gas storage capacity, which remains an important tool to help mitigate the risk of supply disruptions. FPL continues to evaluate its gas storage portfolio and is likely to subscribe for additional gas storage capacity to help increase reliability, provide the necessary flexibility to respond to demand changes, and diversify its overall portfolio.

Over the past several years, FPL has acquired upstream gas transportation capacity on several pipelines (the Southeast Supply Header, LLC, Gulf South Pipeline Company, LP, and the Transcontinental Gas Pipeline Company, LLC) to allow for greater diversity and access to multiple supply basins. FPL will continue to pursue upstream alternatives that further diversify and enhance FPL's gas transportation portfolio. FPL's existing contracts with Florida Gas Transmission Company and Gulfstream Natural Gas System, which serve FPL's natural gas power plants, are long-term in nature and include provisions which allow FPL to extend these contracts through a right of first refusal. FPL has also contracted for long-term gas transportation on the Sabal Trail Transmission (Sabal Trail) and Florida Southeast Connection (FSC) pipelines. Sabal Trail and FSC will significantly enhance FPL's gas supply diversity and reliability when the pipelines are placed into service in 2017.

QUESTION:
Please identify and discuss expected liquefied natural gas (LNG) industry factors and trends that will impact FPL, including the potential impact on the price and availability of natural gas, for the period 2015 through 2024.

RESPONSE:

According to the U.S. Energy Administration's (EIA) 2015 AEO Reference Case, annual LNG Exports are expected to rise about 200% to 0.3 TCF and an incremental 160% to 0.75 TCF in 2016 and 2017, respectively. Annual LNG Exports will then begin to stabilize and finally stay constant beginning in 2030 at about 3.4 TCF annually. However, EIA forecasts little to no change in the natural gas price for 2016 and a 3% increase in 2017. This indicates that the drastic increase in forecasted LNG exports will not make a large impact in the near term gas prices. However, as the forecasted exports begin to grow larger in volume, natural gas prices begin to rise. For example, in 2018, the EIA forecasts LNG exports to be above 1 TCF, while it forecasts natural gas prices to rise 11% year over year , showing that there would be more of an impact in the latter years due to higher export volumes. The EIA states that LNG exports depend largely on the effects of resources levels and oil prices.

AFFIDAVIT

Heather Stubblefield

State of Florida)

County of Palm Beach)

I hereby certify that on this 5 day of Oct., 2015, before me, an officer duly authorized in the State and County aforesaid to take acknowledgments, personally appeared Heather C. Stubblefield who is personally known to me, and she acknowledged before me that she sponsored the answer(s) to Interrogatory No(s). 11, 12, 13, 14, 15 & 16 from Staff's 1st Set of Interrogatories to Florida Power & Light Company in Docket No. 150196-EI, and that the response(s) is true and correct based on her personal knowledge.

In Witness Whereof, I have hereunto set my hand and seal in the State and County aforesaid as of this 5 day of October, 2015.

Maritza Miranda-Wise

Notary Public, State of Florida

Notary Stamp:

MARITZA MIRANDA-WISE
MY COMMISSION # FF 002868
EXPIRES: May 30, 2017
Bonded Thru Notary Public Underwriters

QUESTION:
Referring to Exhibits SRS-4 and SRS-5 of Dr. Sim's direct testimony, please state whether FPL considered environmental costs in its CPVRR analyses.

a. If not, please explain the reasons.
b. If yes, please discuss FPL's methodology for developing its environmental costs.
c. If yes, please complete the table below summarizing FPL's estimated environmental costs for each year of FPL's CPVRR analysis. Please provide all requested data electronically in MS Excel format with all formulas intact.

Year	CO2 ($/ton nominal)	SO2 ($/ton nominal)	NOx ($/ton nominal)

RESPONSE:

a. FPL did include projected environmental compliance costs for SO2, NOX, and CO2 in its analyses of self-build generation options.

b. To develop the environmental costs used in the evaluation of FPL's self-build generation options, FPL relied on ICF International's National Emission Price forecasts developed in 2012 for SO_2, NO_X, and CO_2 as the starting points. These ICF forecasts were provided in 2010 (real) dollars for each year starting in 2012 for SO_2 and NO_X, and for the years 2023 through 2030 for CO_2. Based on discussions with ICF, FPL both converted those 2010 real dollar values to nominal dollars and extrapolated the values out into the future.

c. The Table in Attachment No. 1 provides the nominal \$/ton values for SO_2, NO_X, and SO_2 used in the analyses. The table shows two different sets of values for these three types of emissions. The values used in the first stage of FPL's analyses are on the left-hand side of the table and show that CO_2 costs were projected to start in the year 2023. The right-hand side of the table presents the updated values that were used in the second stage of the analyses and these show that CO_2 costs were projected to start in the year 2020. The reason for the change in the start date for CO_2 costs was to match the projected start year in the draft rules for EPA's Clean Power Plan.

The changes in SO2 and NOX values from the first stage to the second stage of the analyses were due to the Supreme Court's ruling in 2014 that countermanded a late 2011 District Court of Appeals in D.C. decision to stay the EPA's Cross-State Air Pollution Rule. This more recent decision resulted in changes in the compliance cost projections for both SO_2 and NO_X. After discussions with ICF, FPL incorporated these new compliance cost projections into its second stage analyses.

QUESTION:
On page 14 lines 19-21, of Witness Kingston's direct testimony, Witness Kingston testifies that peak firing and wet compression can be turned on for additional power production. Please explain, in detail, how peak firing differs from duct firing.

RESPONSE:

Peak firing, as used in Witness Kingston's direct testimony, refers to increasing the firing temperature in the combustion section of the gas turbine resulting in increased power output from the gas turbine as well as increased power output in the steam turbine as a result of additional gas turbine exhaust energy.

Duct firing refers to combusting natural gas with additional burners installed in the heat recovery steam generator resulting in additional steam production and increased power output from the steam turbine.

QUESTION:
On page 20, lines 21-22, of Witness Kingston's direct testimony, Witness Kingston testifies that the principal components of OCEC Unit 1 are estimated to cost $1,031.5 million. Please describe, in detail, how FPL estimated the cost of the principal components.

RESPONSE:

FPL estimates costs internally using staff personnel. The estimate is based on previous project experience with adjustments for project schedule, specific site conditions and scope, and anticipated market conditions during the period of project execution.

QUESTION:
For each project identified in Exhibit JKK-3 of Witness Kingston's direct testimony, please provide FPL's estimated heat-rate at time of approval, and the actual heat-rate realized by the project.

RESPONSE:

FPL Combined Cycle Plants Heat Rate Comparison

Project	Estimated heat rate at time of PSC approval (Btu/kWh)[1]	Actual heat-rate at the Commercial In Service Date[2] (Btu/kWh)
Martin Unit 8	6,850	6,714
Manatee Unit 3	6,850	6,696
Turkey Point Unit 5	6,835	6,732
West County Units 1 and 2	6,582 Unit 1 6,582 Unit 2	6,606 Unit 1 6,613 Unit 2
West County Unit 3	6,582	6,517
Cape Canaveral Unit 3	6,580[3]	6,314
Riviera Beach Unit 5	6,576[3]	6,302

[1] Represents estimated base average net operating heat rate @ 75°F/60% relative humidity as stated in the direct testimony of the applicable witness for each PSC need determination case.
[2] Represents the actual heat rate from the performance test conducted to validate performance guarantees
[3] Estimated heat rate in subsequent Ten Year Site Plan Filings (2010-2013) decreased due to revised technology selection (Cape Canaveral Unit 3 = 6,484 Btu/kWh; Riviera Beach Unit 5 = 6,480 Btu/kWh).

QUESTION:
On page 8, lines 8-9, of witness Heather C. Stubblefield's direct testimony, Witness Stubblefield testifies that the cost of additional gas transportation facilities has been included in the evaluation of OCEC Unit 1.

a. Please state the cost of the additional gas transportation facilities included in the evaluation of OCEC Unit 1.
b. Please describe, in detail, how the cost of additional gas transportation facilities was developed.
c. Please describe, in detail, the additional gas transportation facilities included in the evaluation of OCEC Unit 1.

RESPONSE:

a. The costs were provided in $/MMBtu and were added to the original demand charge Florida Power & Light Company (FPL) had negotiated for the Florida Southeast Connection (FSC) pipeline. Please see Confidential Attachment No. 1 for the revised pricing utilized by FPL.

b. FSC furnished a proposed transportation rate inclusive of all costs to develop, own, and operate a new lateral from the FSC to OCEC. The lateral will be sized to transport approximately 206,000 Mcf per day of natural gas at 650 psig to the meter and pressure regulation interconnection gas yard at the OCEC site.

   FSC prepared the proposal based on an evaluation of technical and physical requirements to build, own and operate a new greenfield lateral. Evaluation criteria used in the development of the lateral project scope include: FPL's gas transport and delivery requirements by the required commercial operation date; interconnection requirements at both FSC and the OCEC gas yard; pipeline routes and route conditions; and required permits, approval and authorizations required to site, construct and place the pipeline into service.

c. The facilities that are planned to be installed to serve OCEC include:

- Yard piping, valves, fittings, and pig launcher at the connection point to the Florida Southeast Connection Pipeline
- Approximately 4.5 miles of 16" pipeline to the OCEC
- Yard piping, valves, fittings, and pig receiver at the gas yard located on the OCEC site
- Isolation/Insulating flange assemblies at point of Custody Transfer
- Filter/separator and associated condensate storage tank
- Multipath ultrasonic flow meters with flow conditioners and block valves and actuators
- Gas quality monitoring equipment (*e.g.*, gas chromatograph)

- Electronic flow measurement equipment with control enclosure
- Electric power system including grounding and lightning protection
- Instrumentation
- Perimeter fencing and gates

Confidential Attachment No. 1 will be provided to Staff with FPL's Request for Confidential Classification (RFCC). The confidential information will be made available to the other parties for inspection at FPL's Tallahassee Office at 215 South Monroe Street, Suite 810, Tallahassee, Florida, during regular business hours, 8 a.m. to 5 p.m., Monday through Friday, upon completion of a Non-Disclosure Agreement and upon reasonable notice to FPL's counsel.

QUESTION:
Please refer to FPL's response to Staff's First Request for Production of Documents No. 6 for the following questions:

a. Please state the source(s) and date(s) of each of FPL's reported natural gas and fuel oil transportation price forecasts (variable and, as applicable, fixed).
b. Please describe the methodology FPL used to forecast natural gas and fuel oil transportation price (variable and, as applicable, fixed).

RESPONSE:

a. The natural gas transportation price forecasts for fixed and variable costs are the actual contractual rates under FPL's natural gas transportation agreements with our pipeline counterparties. The current contractual rates as of the date of the fuel price forecast are used for the entire period of the forecast. For fuel oil, the transportation price forecast is based on historical data and market conditions. This data is updated periodically under no specific timetable.
b. As stated in subpart (a) above, FPL's methodology for forecasting natural gas transportation pricing is based on FPL's current contractual rates. Fuel oil primarily serves as a back-up fuel on FPL's system which results in sporadic consumption and resupply requirements. Therefore, FPL does not have long-term contracts in place for fuel oil transportation. Transportation for fuel oil is arranged based on each individual transaction. Transportation price forecasts are based on historical data and are adjusted periodically for market conditions.

AFFIDAVIT

Heather C. Stubblefield

State of Florida)

County of Palm Beach)

I hereby certify that on this 6th day of November, 2015, before me, an officer duly authorized in the State and County aforesaid to take acknowledgments, personally appeared Heather C. Stubblefield, who is personally known to me, and she acknowledged before me that she sponsored the answer(s) to Interrogatory No. 64 from Staff's 3rd Set of Interrogatories to Florida Power & Light Company in Docket No. 150196-EI, and that the response(s) is true and correct based on her personal knowledge.

In Witness Whereof, I have hereunto set my hand and seal in the State and County aforesaid as of this 6th day of November, 2015.

QUESTION:

Referring to Exhibit SRS-1, page 204 of 309, of Dr. Sim's direct testimony that discusses FPL's financial assumptions used in the Company's 2014 Ten-Year Site Plan, please list and discuss all financial and economic assumptions used in FPL's economic evaluation of OCEC Unit 1 including, but not limited to, capital structure, discount rate, general inflation rate, and tax assumptions.

RESPONSE:

The first stage of the OCEC Unit 1 analyses and steps 1 and 2 of the second stage of the analyses used the following financial assumptions: i) a capital structure of 40.38% debt and 59.62% equity; (ii) a 5.14% cost of debt; (iii) a 10.5% return on equity; and (iv) an after-tax discount rate of 7.54% while step 3 of the second stage of the analyses was based on the cost of debt and the after-tax discount rate that changed slightly to 5.05% and 7.51%, respectively. For both stages of the analyses, the OCEC Unit 1 book life is thirty years and tax life is twenty years.

The capital replacement escalation for the OCEC unit based on contract is approximately 2.0%, general capital escalation for other capital expenditures other than OCEC is 3.0% and escalation of O&M costs is 2.5%. This was consistent in both stages of the analyses.

QUESTION:
Referring to FPL's response to Staff's Second Set of Interrogatories No. 36, Attachment 1, Tab 1 of 1, please describe how FPL estimated the following plant specifications:

a. Planned Outage Factor
b. Forced Outage Factor
c. Equivalent Availability Factor
d. Annual Fixed O&M
e. Annual Variable O&M

RESPONSE:

a. Planned Outage Factor: estimated based on FPL historical performance per the North American Reliability Council ("NERC") – Generating Availability Data Systems ("GADS") codes.

b. Forced Outage Factor: based on FPL historical performance per the NERC GADS codes

c. Equivalent Availability Factor: based on FPL historical performance per the NERC GADS codes.

d. Annual Fixed O&M: consists of three areas of expenses: personnel, periodic maintenance, and capital replacement costs. Personnel expenses were developed using the extensive operating experience from the current FPL operating fleet, while periodic maintenance and capital replacement costs were estimated by utilizing manufacturer recommendations and the overhaul planning cycles. The annual stream of fixed O&M dollars described above is levelized in 2019 dollars. The value provided in Staff Table – 36 is the fixed O&M levelized dollars divided by the summer capacity.

e. Annual Variable O&M: was estimated by evaluating each site's need for water and chemicals to meet all environmental and emissions requirements. Water considerations assessed whether nearby sources of water could be utilized, and requirements for demineralized water for specific plant purposes. Annual cost of chemicals necessary to maintain proper water quality and to control emissions from NOx coming out of the combustion turbine are also part of the variable O&M expense. The annual variable O&M provided in Staff Table – 36 is the value, in $/MWh, for 2019. The annual variable O&M costs described above is divided by the product of the summer capacity of the unit (MW), 8760 hours and 85% capacity factor.

QUESTION:

Referring to FPL's response to Staff's Second Set of Interrogatories No. 39, FPL states "FPL relied on ICF International's National Emission Price forecasts developed in 2012."

a. Please state whether FPL has a more recent price forecast for emissions.
b. If yes, please provide the recent price forecast in a format similar to the format provided in FPL's response to Staff's Interrogatory No. 39(c).
c. If yes, please provide CPVRR first stage analyses, similar to that provided in Exhibit SRS-4 of FPL Witness Dr. Sim's direct testimony, based on FPL's most recent price forecast for emissions.
d. If yes, please provide CPVRR first stage analyses, similar to that provided in Exhibit SRS-5 of FPL Witness Dr. Sim's direct testimony, based on FPL's most recent price forecast for emissions.

RESPONSE:

a. FPL does not have a more recent price forecast for emissions.

b. Please see FPL's response to subpart (a) of this interrogatory.

c. Please see FPL's response to subpart (a) of this interrogatory.

d. Please see FPL's response to subpart (a) of this interrogatory.

QUESTION:
Referring to FPL's response to Staff's First Set of Interrogatories No. 42, Attachment 1, Tab 1 of 10, FPL's response states that: "Bill impact is calculated using the difference in revenue requirements of a particular option compared to the 1582 MW CC."

a. Please provide the estimated bill impact ($/1,000 kWh) associated with the OCEC Unit 1, for the years 2019 through 2028. Please do not provide this information as the difference in revenue requirements of a particular option compared to the OCEC Unit 1.
b. Please provide the estimated average bill impact ($/1,000 kWh) associated with the OCEC Unit 1 over the life of the unit. Please do not provide this information as the difference in revenue requirements of a particular option compared to the OCEC Unit 1.

RESPONSE:

a. Attachment No. 1 provides a bill impact projection of OCEC Unit 1 through 2043 compared to a scenario in which no other self-build generation option is assumed to be added in 2019 in place of OCEC Unit 1; *i.e.*, a "no build in 2019" scenario. Please see Attachment No. 1 for the requested information.

   FPL's prior response to Staff's Second Set of Interrogatories No. 42 provided a series of bill impact projections between OCEC Unit 1 and other self-build generation options that would also fully meet FPL's resource needs in 2019. Thus FPL's response provided a bill impact projection of scenarios that provide FPL's customers with a comparable level of system reliability. From a resource planning perspective, FPL believes that this "apples to apples" comparison in regard to system reliability is the more meaningful perspective with which to view projected bill impacts for FPL's customers.

   FPL notes that the projected bill impacts provided in Attachment No. 1 are based on scenarios that are projected to have significantly different levels of system reliability. The OCEC Unit 1 scenario will allow FPL to meet all three of its reliability criteria. The "no build in 2019" scenario will result in two of FPL's three reliability criteria being violated and, therefore, represents a much less reliable FPL system. From a resource planning perspective, this bill impact comparison is definitely not an "apples to apples" comparison. This bill impact comparison will be larger than those presented in FPL's response to Staff interrogatory 42 because the "no build in 2019" scenario does not incur expenses for adding new resources in 2019, thus resulting much lower system reliability for this scenario.

b. Please see FPL's response to subpart (a) of this interrogatory.

QUESTION:
Referring to FPL's response to Staff's Second Set of Interrogatories No. 45, Attachment 1, Tabs 1 through 5, FPL's response contained a note that FPL "Used 659 MW CC filler units for un-sited CC capacity from year 2023 through 2025 to facilitate optimization simulation convergence and reduce running time."

a. Please describe what FPL means by "optimization simulation convergence."
b. Please state whether FPL's use of filler units is consistent with previous FPL need determination filings.

RESPONSE:

a. Optimization simulation convergence refers to the simulation run time of the EGEAS model used in the referenced analysis. EGEAS is a dynamic optimization program used in resource planning that can optimize the resource plans given various planning alternatives. In EGEAS, unit additions are based on meeting the reliability criteria and either minimizing the levelized system average electric rate or minimizing the cumulative present value of revenue requirements. The number of resource plans created and the simulation run time depend on the number and type of available generation alternatives. The use of a 660 MW CC unit as a filler alternative (*i.e.*, unit that meets the reliability criteria after the NPGU need year) significantly reduced the simulation run time. In addition, the selection of this filler unit also ensured the development of a set of resource plans that included all the available technology choices being evaluated in 2019.

b. The use of filler units is consistent with previous FPL need determination filings.

QUESTION:
Referring to page 6, lines 11-13, of Witness Stubblefield's direct testimony, please provide documents containing the following documents that FPL used in support of its OCEC Unit 1 petition.

a. The model used to forecast natural gas and light fuel oil.

b. FPL's commodity, transportation, and delivered fuel price forecasts (exclusive of financial hedging impacts) for natural gas and light fuel oil used.

RESPONSE:

Please refer to the confidential document provided for the requested information to subpart (b). Florida Power & Light Company (FPL) utilizes a proprietary model from a vendor and does not have access to the model or inputs associated with the model; as a result, FPL has no responsive documents to subpart (a).

The confidential document will be provided to Staff with FPL's Request for Confidential Classification (RFCC). The confidential information will be made available to the other parties for inspection at FPL's Tallahassee Office at 215 South Monroe Street, Suite 810, Tallahassee, Florida, during regular business hours, 8 a.m. to 5 p.m., Monday through Friday, upon completion of a Non-Disclosure Agreement and upon reasonable notice to FPL's counsel.

FLORIDA PUBLIC SERVICE COMMISSION
DOCKET: 150196-EI   EXHIBIT: 62
PARTY: STAFF
DESCRIPTION: FPL's Response to Staff's Interrogatories, Nos. 20, 21, 51, 55, 56, 70, 72. See also excel files co...

QUESTION:
On page 17, lines 14-16, of Dr. Sim's direct testimony, Dr. Sim states that, with regard to self-build generation options, "coal-fired technologies were removed from consideration due to current and prospective environmental concerns and regulations."

a. Please describe the prospective environmental concerns and regulations that are being referenced in Dr. Sim's testimony.
b. Please provide a hypothetical timeline for the construction of new integrated gasification combined cycle capacity sufficient to meet FPL's projected 2019 need.

RESPONSE:
a. The primary environmental reason for not considering coal fired electric generation technologies for future electric generation in Florida is the pending finalization of EPA's Standards of Performance for Greenhouse Gas Emissions from New, Modified, and Reconstructed Stationary Sources for Electric Utility Generating Units (New Unit New Source Performance Standard (NSPS)) promulgated under the Clean Air Act Section 111(b), released on August 3rd, 2015). The requirements of this rule alone prevent the construction and operation of new coal fired electric generation. The new unit NSPS rule establishes a 1,400 lbs. CO2/MWh NSPS for newly constructed fossil fuel steam generating units, including efficient supercritical pulverized coal (SCPC) utility boilers implementing partial post-combustion carbon capture and storage technology to reduce CO2 emissions. This limit and expected partial capture and sequestration of carbon also applies to integrated gasification and combined cycle (IGCC) coal projects. Though EPA indicates there are projects that have achieved this rate of CO2 reduction throughout North America, the majority of these projects are research-related or DOE Demonstration Projects. FPL is unaware of any cost effective or commercially available options for building a SCPC generating facility with carbon capture capability. Further, there is not a carbon sequestration option currently available in Florida to use as storage/disposal of the captured CO2.

In addition, the costs of carbon capture and sequestration technology to meet the compliance limit imposed by the EPA's Standards of Performance for Greenhouse Gas Emissions rule for new units are prohibitive. In fact, the Department of Energy states that today's commercially available post-combustion capture technologies may increase the cost of electricity for a new pulverized coal plant by up to 80 percent and result in a 20 to 30 percent decrease in efficiency due to parasitic energy requirements. Additionally, many of today's commercially available post-combustion capture technologies have not been demonstrated at scales large enough for power plant applications. (Post Combustion Carbon Capture Research article from Office of Fossil Energy, U.S. Department of Energy, (See link http://energy.gov/fe/science-innovation/carbon-capture-and-storage-research/carbon-capture-rd/post-combustion-carbon)

FPL also has determined that new coal fired generation in Florida is not practical due to the requirements that are imposed by the existing Mercury and Air Toxics Standards (MATS). The MATS rule imposes strict limits on Hazardous Air Pollutants (HAPS) regulated by the Clean Air Act. For coal fired generation, this rule requires several costly types of pollution control equipment that results in significant parasitic loads on the plant with increased water usage and requires significantly more land than other technologies. To remove particulates and HAPs metals including mercury from the flue gas, coal units would require electrostatic precipitators and fabric filters to capture many tons of ash that must then be recycled or managed in landfills. The coal combustion cycle also requires Flue Gas Desulferization Scrubbers (FGD) that need significant quantities of water and limestone storage to reduce SO2, mercury, hydrochloric acid, and particulate emissions. Following the scrubber treatment of the flue gas to reduce these pollutant emissions, the significant volumes of resulting by-product gypsum must be managed as a product or as a waste alongside the waste ash in landfills.

Finally, the resources required for the use of coal-fired generation are more imposing on the general population than those of other generation types. In Florida, coal fired generation would require increased train or truck traffic to haul limestone and coal and possibly backhaul gypsum and ash. The construction of a coal plant requires project specific landfills to manage the scrubber and ash waste.

b. FPL is not considering an integrated gasification combined cycle (IGCC) unit at this time. The development of IGCC units has been plagued with significant problems, including cost overruns, schedule delays and performance shortfalls. Based on recent, smaller capacity projects in Mississippi and Indiana (approximately 600 MW each), construction of an IGCC unit would take a minimum of five years. Prior to commencement of construction, it is anticipated that the regulatory approval process including determination of need and receipt of required construction and operating permits would take a minimum of two years. Thus the hypothetical timeline for the construction of new IGCC capacity sufficient to meet FPL's projected 2019 need would be at least seven years and could not be placed in service to meet FPL's 2019 resource need.

QUESTION:
On page 17, lines 16-18, of Dr. Sim's direct testimony, Dr. Sim states that "due to the 2019 need date, new nuclear capacity was removed from consideration because such capacity could not be added by that time." Please provide a hypothetical timeline for the construction of new nuclear capacity sufficient to meet FPL's projected 2019 need.

RESPONSE:
FPL is currently pursuing new nuclear capacity with its Turkey Point 6 & 7 project. Each of these two nuclear units is 1,100 MW. Therefore, each of these units would be capable of meeting FPL's 1,052 MW need in 2019 if the new nuclear units could be brought into service by mid-2019. However, as explained in the recently concluded 2015 nuclear cost recovery docket before the Florida Public Service Commission, FPL projects that 2027 and 2028 are the earliest practical deployment dates for these new nuclear units.

QUESTION:
On page 18, lines 10-12, of Witness Kingston's direct testimony, Witness Kingston testifies that the site design of OCEC Unit 1 allows for operation at full capacity for "72 hours of continuous operation using back-up fuel." Please discuss whether the proposed site can be supported to provide more than 72 hours of continuous operation (i.e. can fuel be transported to the site).

RESPONSE:

Liquid fuel (distillate oil) can be transported to the site by tanker truck, however, the number of tanker truck deliveries required to keep the proposed OCEC Unit 1 operating continuously at full capacity would be 215 trucks per day. This scenario is not logistically feasible. FPL's intent is to maintain inventory levels to ensure 72 hours of continuous, full load operation prior to an event that would necessitate the need for distillate oil consumption. If natural gas supply disruptions result in distillate oil consumption at OCEC Unit 1 and/or other FPL facilities, FPL will immediately take action to replenish the supply of distillate oil based on the system-wide status of its distillate oil inventory. The actual rate of replenishment at each specific site will vary depending on distillate oil availability, truck availability, projected unit dispatch and current inventory levels throughout FPL's distillate capable fleet.

QUESTION:
On page 7, lines 17-22, of witness Heather C. Stubblefield's direct testimony, Witness Stubblefield testifies that FPL has contracted with Sabal Trail for capacity sufficient to meet FPL's system gas requirements including the addition of OCEC Unit 1 in 2019. Please explain, in detail, how the delay or cancellation of the Sabal Trail natural gas pipeline would impact OCEC Unit 1.

RESPONSE:

Florida Power & Light Company (FPL) does not anticipate a delay or cancellation of the Sabal Trail or Florida Southeast Connection (FSC) pipeline projects. The Federal Energy Regulatory Commission (FERC) issued the draft Environmental Impact Statement (EIS) in September stating that the combined project will not have a significant environmental impact. The final EIS is expected by the end of the year. The final FERC certificate is expected in the first quarter of 2016. This is within the timeline required to complete construction and be in service by May 2017. OCEC is not expected to require gas for testing until September 2018; therefore, even if there was an unforeseen delay beyond May 2017, there is a "cushion" of 15 months before gas is required to be delivered to OCEC.

In the highly unlikely scenario the Sabal Trail project is cancelled, FPL would have to evaluate alternatives to try to connect one of the existing pipelines, FGT or Gulfstream, to OCEC. Unfortunately, FPL does not currently have excess capacity in either FGT or Gulfstream; therefore, even if OCEC could be connected to one of these pipelines, currently there is not sufficient capacity to serve this plant and all of FPL's existing facilities using natural gas if the Sabal Trail project is cancelled.

QUESTION:
Referring to page 7, lines 17-22, of witness Heather C. Stubblefield's direct testimony, Witness Stubblefield testifies that FPL has contracted with Sabal Trail Transmission, LLC and Florida Southeastern Connection, LLC for incremental gas transportation capacity. Please complete the table below summarizing FPL's gas transportation capacity service for the years 2015-2024. Please provide all requested data electronically in MS Excel format with all formulas intact.

Year	FGT (%)	Gulf Stream (%)	Sabal Trail (%)	Other (%)
2015				
2016				
2017				
2018				
2019				
2020				
2021				
2022				
2023				
2024				

RESPONSE:

Please see below for table summarizing Florida Power & Light Company's gas transportation capacity service for the years 2015-2024. Attachment 1 to this response contains this table in Excel format with all formulas intact.

Totals may not add due to rounding	FGT (%)	Gulfstream (%)	Sabal Trail (%)	Upstream Pipelines [1] (%)
2015	42.4%	23.4%		34.2%
2016	42.4%	23.4%		34.1%
2017	38.4%	22.0%	8.5%	31.2%
2018	36.9%	21.1%	12.1%	29.9%
2019	36.9%	21.1%	12.1%	29.9%
2020	35.5%	20.3%	15.5%	28.7%
2021	34.8%	19.9%	17.2%	28.2%
2022	34.8%	19.9%	17.2%	28.2%
2023	34.8%	19.9%	17.2%	28.2%
2024	34.8%	19.9%	17.2%	28.2%

[1] Only FGT, Gulfstream and Sabal Trail deliver gas directly to FPL's plants. The Upstream Pipelines (Transcontinental Gas Pipeline, Gulf South, & Southeast Supply Header) provide diversified supply for FGT, Gulfstream and Sabal Trail. The annual totals assume FPL will extend all existing contracts beyond their initial term which is FPL's current intent.

QUESTION:

On page 15, at lines 11-12, of Witness Kingston's direct testimony, Witness Kingston states that "OCEC Unit 1 will be dispatched ahead of other efficient FPL combined cycle units, resulting in significant fuel savings to FPL's customers." Please complete the table below summarizing FPL's estimated fuel consumption, through 2049, for each resource plan identified in Exhibit SRS-5, page 1 of 2, of Dr. Sim's direct testimony. Please provide all requested data electronically in MS Excel format with all formulas intact.

Natural Gas (MMBtu)	Oil (Bbl)

RESPONSE:

The requested data is provided on Table Staff-70, see Attachment No. 1.

QUESTION:

Referring to FPL's response to Staff's Second Set of Interrogatories No. 20, FPL states that "the development of IGCC units has been plagued with significant problems, including cost overruns, schedule delays and performance shortfalls." Please complete the table below summarizing the specifications of a hypothetical 600 MW IGCC power plant. Please provide all requested data electronically in MS Excel format with all formulas intact.

Net Generation MW (Summer)	
Installed Cost ($ Million)	
Fixed O&M ($/kw-yr) 2015$	
Variable O&M ($/MWh) 2015$	
Heat Rate (BTU/kwh)	
Equivalent Availability (%)	
Capacity Factor (%)	

RESPONSE:

FPL has not developed a self-build option for a hypothetical 600 MW IGCC power plant. FPL is providing the information in Table 72, see Attachment No. 1, for two recently licensed, approximately 600 MW, IGCC facilities in Mississippi and Indiana, based on publically available project information.

FPL's Response to Staff's Request for Production of Documents, No. 7. See also pdf file contained on Staff Exhibit CD for No. 7

FLORIDA PUBLIC SERVICE COMMISSION
DOCKET: 150196-EI EXHIBIT: 63
PARTY: STAFF
DESCRIPTION: FPL's Response to Staff's Interrogatories, Nos. 17, 18, 22, 23, 24, 27, 28, 29, 30, 31, 36 (includin...

QUESTION:
On page 8, lines 9-13, of Dr. Sim's direct testimony, Dr. Sim states that FPL evaluated three specific FPL-owned sites at which new generation could be built. Please describe, in detail, FPL's process for evaluating the three specific FPL-owned sites. Please also include a discussion regarding any factors considered in FPL's evaluation process.

RESPONSE:
FPL self-build generation analyses primarily focused on gas-fired generation options: combined cycle (CC) and combustion turbines (CT). The three sites that were evaluated are greenfield sites in Okeechobee and Hendry counties and a brownfield site in Putnam County. FPL's evaluation process consisted of three basic steps. First, each generation option to be considered at one of these sites was assumed to be in place at that site in 2019 and Turkey Point 6 & 7 were assumed to be added in their respective projected in-service years. Second, greenfield filler units (combined cycle units) were added as needed in all other years to meet FPL's projected remaining resource needs for the analysis period. Third, the system costs for this resource plan were projected for the analysis period to develop a cumulative present value of revenue requirements (CPVRR) value for this resource plan.

This process was repeated for all combinations of these three specific sites and generation technologies for 2019. The CPVRR values for all of the resource plans were then compared. The evaluation examined a number of system costs including: capital, fixed O&M, variable O&M, capital replacement, fuel, firm gas transportation, start up, transmission losses, and system emissions.

The evaluation of these technologies at these sites accounted for various site-specific considerations including:

- The likelihood of being able to obtain all permits and approvals that would be required to ensure a June 1, 2019 in-service date;
- Generation construction costs at the site;
- Transmission-related costs, including losses, at the site;
- The cost of getting sufficient firm gas to the site; and,
- The cost of sufficient water that would be used at the site.

QUESTION:
On page 9, lines 3-5, of Dr. Sim's direct testimony, Dr. Sim states that OCEC Unit 1 will enhance the efficiency of FPL's generating system.

a. Please provide the heat rate for each generating unit currently on FPL's system.
b. Please state whether FPL plans to negotiate a guarantee, regarding the heat rate, of OCEC Unit 1.
c. Please provide FPL's estimated system heat rate for the years 2015-2025.

RESPONSE:

a. Please see Attachment No. 1 for this information.
b. FPL plans to negotiate heat rate and other performance guarantees with its equipment suppliers and Engineering, Procurement and Construction (EPC) contractor for OCEC Unit 1.
c. Please see Attachment No. 2 for this information.

QUESTION:
On page 20, lines 1-17, of Dr. Sim's direct testimony, Dr. Sim testified that FPL utilized several computer models to perform its economic evaluation of its self-build generation options.

a. Please describe, in detail, each computer model used to evaluate the self-build generation options.
b. Please state whether or not FPL has used any of the computer models described above in any of its prior determinations of need cases.

RESPONSE:
a. The following models were used in FPL's evaluation of self-build generation options that occurred leading up to the designation of OCEC Unit 1 as FPL's Next Planned Generating Unit in FPL's capacity RFP for its 2019 need:

- PMArea: A commercially available production costing model designed to account for variable costs (such as fuel and variable O&M). (Note that beginning in early 2015, FPL switched to the UPLAN production costing model);
- Fixed Cost Spreadsheet: An FPL spreadsheet designed to account for and compare non-variable costs.
- EGEAS: A commercially available optimization model designed to account for both variable and non-variable costs.

b. Yes. The PMArea and Fixed Cost Spreadsheet models have been used in all of FPL's prior determination of need cases since the Martin 8 and Manatee 3 need filing. The EGEAS model, which was recently reactivated by FPL, was used in the Martin 8 and Manatee 3 determination of need filing.

QUESTION:
On page 20 (line 23) through 21 (line 2), of Dr. Sim's direct testimony, Dr. Sim states that FPL determined it was "unlikely that new capacity could be brought in-service at the Hendry site in time to address the 2019 need." Please provide an explanation as to why it is unlikely that new capacity could be brought in-service at the Hendry site in time to address the 2019 need.

RESPONSE:
During the time period in which FPL was evaluating its self-build generation options, the Hendry site was the subject of litigation regarding the land use designation for the site. FPL viewed it was unlikely that the litigation would be resolved in time to enable FPL to construct a new combined cycle unit and have it in-service by June 1, 2019. Therefore, FPL removed the Hendry site from consideration for addressing its 2019 need. In February 2015, FPL applied to Hendry County for a comprehensive plan amendment for the site. FPL expects the approval in November 2015 but the possibility exists that litigation could take several years before the property is available for construction. Therefore, Hendry remains a likely site for meeting FPL's resource needs after 2019, but is not a candidate to meet FPL's 2019 need.

QUESTION:
On page 21, lines 10-12, of Dr. Sim's direct testimony, Dr. Sim states that the best resources plan with a CC unit at the Okeechobee site was projected to be $65 million cumulative present value revenue requirements (CPVRR) more economic than the best resource plan with a CC unit sited at Putnam. Please complete the table below summarizing the CPVRR evaluation that resulted in the described $65 million in savings. Please provide all requested data electronically in MS Excel format with all formulas intact.

	$ millions, CPVRR
Capital (Generation)	
Capital (Transmission)	
O&M	
Fuel	
Environmental	
Other	
Total	

RESPONSE:
Please refer to Attachment No. 1 for the requested information.

QUESTION:
On page 26, lines 1-2, of Dr. Sim's direct testimony, Dr. Sim testifies that FPL examined "refinements to the GE 7HA.02 that included updated assumptions for heat rate, costs, and capacity (MW)." Please explain what prompted these "refinements" (i.e. GE provided new information).

RESPONSE:

Once the GE 7HA.02 combustion turbine was identified as the best GE combustion turbine model for a combined cycle (CC) unit to meet FPL's 2019 need, FPL examined different characteristics for the non-combustion turbine portion of the CC. Using information that had been previously provided by GE, FPL conducted analyses of variations regarding the remaining portions of the CC unit, including with and without duct firing, a higher pressure steam cycle with the same steam temperature, and higher steam cycle temperatures with the same steam pressure. The objective of examining these, and perhaps other, potential refinements of the GE 7HA.02 was to identify how each variation affected capacity, heat rates, and costs in order to select the variation that resulted in the lowest CPVRR cost for FPL's customers.

QUESTION:
On page 26, lines 7-10, of Dr. Sim's direct testimony, Dr. Sim testifies that the "GE 7HA.02 CT without duct firing, but with peak firing and wet compression, emerged as $42 million CPVRR more economic choice compared to the former leading candidate…." Please complete the table below summarizing the CPVRR evaluation that resulted in the described $42 million in savings. Please provide all requested data electronically in MS Excel format with all formulas intact.

	$ millions, CPVRR
Capital (Generation)	
Capital (Transmission)	
O&M	
Fuel	
Environmental	
Other	
Total	

RESPONSE:

Please refer to Attachment No. 1 for the requested information.

QUESTION:
On page 30, lines 11-13, of Dr. Sim's direct testimony, Dr. Sim states that a specific bidder refused to submit the required Bid Evaluation Fee. Please state whether the referenced bidder provide a reason or explanation for refusing to pay the Bid Evaluation Fee, and the explanation, if provided.

RESPONSE:
The party who offered an incomplete submittal to FPL's capacity RFP, which did not include the required Bid Evaluation Fee, was immediately contacted by FPL on the evening of May 15, 2015, which was the day on which the bids were due to FPL and the day this submission was received. FPL's May 15, 2015 e-mail to the submitting entity stated (the entity's name has been removed):

> *"This note confirms that FPL has received your bid in response to FPL's capacity RFP. However, one of the RFP's Minimum Requirements is that a check for the RFP Evaluation Fee of $25,000 accompany the bid materials. There was no such check included in the box containing (the party's) bid materials. If FPL is to consider (the party's) bid, we need to receive the RFP Evaluation Fee. FPL requests that (the party) submit the check by 5:00 p.m. next Tuesday, May 19th. (The mailing address is included in the RFP document.) Upon receipt of the evaluation fee, we will begin to review your bid's compliance with the RFP's other Minimum Requirements."*

On May 16 and 17, 2015, FPL reviewed the party's submittal and found numerous other deficiencies whereby the submission failed to meet the minimum requirements of the RFP, including incomplete and conflicting data as discussed in the direct testimony of FPL witness Sim. Consequently, the value of any analysis of this problematic information would have been questionable at best.

On May 18, 2015, the submitting party sent FPL a reply e-mail. Their reply is as follows:

> *"Thanks very much for the note. In regards to the bidder fee, as we read through the RFP, we were concerned that while we are a very large provider of competitively priced energy and capacity products in the market, as well as a company that is engaged in tolling/ppa arrangements throughout the US, that your strict RFP requirements were not commercially consistent with market expectations for a solicitation of this nature, therefore we are not comfortable providing a bid fee with our offer.*
>
> *If, upon review of our proposal, FPL sees value in what we have offered, we will certainly understand if our proposal is affected by the bid fee in your economic analysis of alternatives.*
>
> *We appreciate your review and would very much look forward to an opportunity to discuss a mutually beneficial arrangement in the event you think our offer is competitive.*
>
> *Thank you very much for your consideration."*

FPL interpreted this reply to indicate that the party had no intention of submitting an evaluation fee to enter into a competitive RFP process, but instead wished to move directly to discussions/negotiations regarding their project proposal. This response from the submitting party, plus the numerous problems with the information submitted, led FPL to take no further action regarding this incomplete submittal that failed to satisfy the minimum requirements of the RFP.

QUESTION:

On page 37, lines 11-16, of Dr. Sim's direct testimony, Dr. Sim states that if the Commission denies the need determination for the OCEC Unit 1 and no other self build option is allowed to replace the unit, FPL's generation only reserve margin (GRM) would fall to 5.8 percent. Please complete the table below assuming the in-service date of OCEC Unit 1 is delayed one year and no other generation or purchased power replaces the unit, assuming the same timeframe FPL used to evaluate the resource plans identified in Exhibit SRS-5 of Dr. Sim's direct testimony. Please provide all requested data electronically in MS Excel format with all formulas intact.

	Difference from resource plan with OCEC Unit 1 in 2019 ($ millions, CPVRR)
Capital (Generation)	
Capital (Transmission)	
O&M	
Fuel	
Environmental	
Other	
Total	

RESPONSE:

FPL notes that the requested comparison is not a comparison of comparable resource plans. The hypothetical resource plan in which no resource option is added in 2019 fails to meet two of FPL's reliability criteria and, therefore, is a plan with lower system reliability in 2019 compared to the resource plan in which the Okeechobee CC unit is added in 2019.

The requested information is presented in Attachment No. 1.

QUESTION:
On page 38, lines 14-17, of Dr. Sim's direct testimony, Dr. Sim states that FPL's system air emissions would increase if OCEC Unit 1 is not constructed. Please provide FPL's estimated SO2, NOX, and CO2 emissions for the years 2017-2026.

RESPONSE:

Dr. Sim's statement refers to the increase in FPL's projected system air emissions of a resource plan with simple cycle CTs instead of a resource plan that would have the more fuel-efficient Okeechobee combined cycle unit placed in-service. FPL is providing a projection of system SO2, NOX, and CO2 emissions for the years 2017 through 2026 for two of the resource plans provided in SRS-4: (1) Okeechobee 3x1 CC GE 7HA.02 and Summer capacity of 1,523 MW, and (2) Okeechobee 7x0 CT GE 7FA.05 and Summer capacity of 1,419. This information is presented in Attachment No. 1.

QUESTION:
For each generation option identified in Exhibit SRS-3, please provide plant specifications in a format similar to Exhibit JKK-8 of FPL Witness Jacquelyn K. Kingston's direct testimony.

RESPONSE:

The information requested is presented in Attachment No. 1.

QUESTION:

For each generation option identified in Exhibit SRS-3, please provide plant specifications in a format similar to Exhibit JKK-8 of FPL Witness Jacquelyn K. Kingston's direct testimony.

RESPONSE:

Please see Attachment No. 1 (Table Staff 36 Supplemental).

QUESTION:

Exhibit SRS-4 of Dr. Sim's direct testimony provides the CPVRR results of FPL's in the first stage of analyses.

a. Please state the time frame over which the CPVRR analyses were performed.
b. Please explain why FPL believes the timeframe identified in response to part 37(a) above, is appropriate for evaluating potential generating options.

RESPONSE:

a. The time frame over which FPL's first stage analyses were performed was from 2014 through 2049.

b. FPL believes the above-mentioned time frame is appropriate for evaluating potential self-build generation options because it allows FPL to fully account for the projected 30-year lives of both the combustion turbine and combined cycle units.

QUESTION:
Referring to Exhibit SRS-4 of Dr. Sim's direct testimony, please explain why the GE Model of CT units (7FA.05) considered in the CT generating options is different from the GE Model of CT units (7HA.02) considered in the CC generating options.

RESPONSE:

Either combustion turbine model is capable of operating in simple cycle mode as a stand-alone CT or as part of a combined cycle (CC). For example, versions of the 7FA CT have been utilized in earlier FPL CC units. However, the combustion turbine technology is continually advancing. At roughly the same time FPL commenced its evaluation of self-build generating options for meeting its 2019 need, FPL had decided that the GE 7FA.05 model was the most cost-effective choice for a simple cycle CT. Consequently, the new CTs in Broward and Lee counties that will replace older, existing gas turbines at those sites will be GE 7FA.05 units. Subsequent analyses for potentially meeting the 2019 need with CC units showed that the GE 7HA.02 model was a better, more cost-effective selection for a CC application.

QUESTION:
Referring to Exhibits SRS-4 and SRS-5 of Dr. Sim's direct testimony, please state whether FPL considered fuel cost sensitivities (i.e. high natural gas costs) in its CPVRR analyses.

a. If no, please explain the reasons.
b. If yes, please provide the fuel cost sensitivities in the same format as Exhibit HCS-1 of FPL Witness Heather C. Stubblefield's direct testimony.
c. If yes, please discuss FPL's methodology for developing its fuel cost sensitivities.
d. If yes, please provide the results of FPL's CPVRR analyses assuming the additional fuel cost sensitivities.

RESPONSE:

a. FPL did not include a high natural gas cost forecast in its analyses. The reason for this is that the results of FPL's first stage analyses showed that combined cycle (CC) options had a significant cost advantage over combustion turbine (CT) options based on use of a medium fuel cost forecast. If a sensitivity analysis had been performed that used a high gas cost forecast, the advantage of CC units over CT units would have only increased. Thus no such high gas cost sensitivity analysis was necessary in the first stage of the analyses. In the second stage of the analysis, only CC options were analyzed. Because all of the CC options had heat rates that were within a narrow range, no fuel cost sensitivities were warranted.

b. Please see FPL's response to subpart (a) of this interrogatory.

c. Please see FPL's response to subpart (a) of this interrogatory.

d. Please see FPL's response to subpart (a) of this interrogatory.

QUESTION:

For each self build option identified in Exhibit SRS-5 (page 1 of 2) of Dr. Sim's direct testimony, please provide the following information for each year of the analysis. Please provide all requested data electronically in MS Excel format with all formulas intact.

Annual Revenue Requirements (Generation Capital) ($millions, 2015 $)	Annual Revenue Requirements (Transmission Capital) ($millions, 2015 $)	Annual Revenue Requirements (O&M) ($millions, 2015 $)	Annual Revenue Requirements (Fuel) ($millions, 2015 $)	Annual Revenue Requirements (Environmental) ($millions, 2015 $)	Total ($millions, 2015 $)	Customer Bill Impact ($/1,000 kWh)

RESPONSE:

Please see Attachment No. 1 for the corrected Table #42.

QUESTION:

For each self build option identified in the table titled Third Step found in Exhibit SRS-5 (page 2 of 2) of Dr. Sim's direct testimony, please provide the following information for each year of the analysis. Please provide all requested data electronically in MS Excel format with all formulas intact.

Annual Revenue Requirements (Generation Capital) ($millions, 2015 $)	Annual Revenue Requirements (Transmission Capital) ($millions, 2015 $)	Annual Revenue Requirements (O&M) ($millions, 2015 $)	Annual Revenue Requirements (Fuel) ($millions, 2015 $)	Annual Revenue Requirements (Environmental) ($millions, 2015 $)	Total ($millions, 2015 $)	Customer Bill Impact ($/1,000 kWh)

RESPONSE:

Please see Attachment No. 1 for the corrected Table #43.

QUESTION:

For each self build option identified in the table titled Third Step found in Exhibit SRS-5 (page 2 of 2) of Dr. Sim's direct testimony, please provide the following information for each year of the analysis. Please provide all requested data electronically in MS Excel format with all formulas intact.

Annual Revenue Requirements (Generation Capital) ($millions, 2015 $)	Annual Revenue Requirements (Transmission Capital) ($millions, 2015 $)	Annual Revenue Requirements (O&M) ($millions, 2015 $)	Annual Revenue Requirements (Fuel) ($millions, 2015 $)	Annual Revenue Requirements (Environmental) ($millions, 2015 $)	Total ($millions, 2015 $)	Customer Bill Impact ($/1,000 kWh)

RESPONSE:

Please see Attachment No. 1 (Table Staff Supplemental-43). In this table, two sets of seven tables are provided. The first set provides annual nominal cost values for each resource plan that allow a bill impact projection to be performed. The second set of tables provides annual present value cost values discounted to 2015.

QUESTION:
For each self build option identified in Exhibit SRS-5 (page 1 of 2) of Dr. Sim's direct testimony, please provide the following information for the years 2017-2026:

a. The net generation for each generating unit on FPL's system.
b. The capacity for each generating unit on FPL's system.

RESPONSE:

Please see Attachment No. 1 for the requested information.

QUESTION:
For each self build option identified in the table titled Third Step found in Exhibit SRS-5 (page 2 of 2) of Dr. Sim's direct testimony, please provide the following information for the years 2017-2026:

a. The net generation for each generating unit on FPL's system.
b. The capacity for each generating unit on FPL's system.

RESPONSE:

Please see the Attachment No. 1 for the requested information.

AFFIDAVIT

Dr. Steven Sim

State of Florida)

County of Palm Beach)

I hereby certify that on this 20th day of October, 2015, before me, an officer duly authorized in the State and County aforesaid to take acknowledgments, personally appeared **Dr. Steven Sim**, who is personally known to me, and he acknowledged before me that he sponsored the answer(s) to Interrogatory No(s). 17-31 and 33-47 from Staff's 2nd Set of Interrogatories to Florida Power & Light Company in Docket No. 150196-EI, and that the response(s) are true and correct based on his personal knowledge.

In Witness Whereof, I have hereunto set my hand and seal in the State and County aforesaid as of this 20th day of October, 2015.

Notary Public/State of Florida

Notary Stamp:

TRACI D. GOLDWIRE
Notary Public - State of Florida
Commission # FF 233425
My Comm. Expires Jul 31, 2019
Bonded through National Notary Assn.

QUESTION:
Please refer to FPL's response to Staff's First Set of Interrogatories No. 13 for the following questions:

a. Please provide FPL's 7/27/2015 base case natural gas and light fuel oil short term and long term price forecasts (annualized and monthly).
b. Please provide FPL's 7/27/2015 high band natural gas and light fuel oil short term and long term price forecasts (annualized and monthly).
c. Please provide FPL's 7/27/2015 low band natural gas and light fuel oil short term and long term forecasts (annualized and monthly).
d. Please provide CPVRR first stage analyses, similar to that provided in Exhibit SRS-4 of FPL Witness Dr. Sim's Direct Testimony, based on FPL's 7/27/2015 base case, high band, and low band natural gas and light fuel oil price forecasts.
e. Please provide CPVRR second stage analyses, similar to that provided in Exhibit SRS-5 of FPL Witness Dr. Sim's Direct Testimony, based on FPL's 7/27/2015 base case, high band, and low band natural gas and light fuel oil price forecasts.

RESPONSE:

a. Please see Attachment No. 1 (Table Staff-62 (Part a), (Part b), and (Part c)).

b. Please see Attachment No. 1 (Table Staff-62 (Part a), (Part b), and (Part c)).

c. Please see Attachment No. 1 (Table Staff-62 (Part a), (Part b), and (Part c)).

d. Staff Interrogatory 62 d & e requested that FPL update two analyses that FPL had performed as part of its overall next planned generating unit (NPGU) analyses in 2014 and early 2015. The request was to update these analyses substituting FPL's July 27, 2015 fuel cost forecast for the fuel cost forecasts that were used at the time for each of the two analyses.

The updated analyses utilize this July 2015 fuel cost forecast (low, base, and high bands). However, FPL has also updated a number of other inputs to the analyses. These other updates include:

- A new October 2015 load forecast; and,
- Various other assumptions that were not then available and, therefore, had not been utilized during each stage/step in the NPGU analyses, but which were updated and incorporated into FPL's 2015 Ten-Year Site Plan, including: (i) the 2016 PV additions, (ii) the new schedule for GT replacements in Broward and Lee counties, (iii) the mutually agreed upon decision with Cedar Bay to sell that generating unit to FPL and FPL's plans to subsequently retire that unit, and (iv) the 2027/2028 in-service dates for Turkey Point 6 & 7.

Utilizing all of these updated assumptions and forecasts, FPL performed three scenario analyses. One scenario utilizes the July 2015 base case fuel cost forecast, another scenario utilizes the July 2015 low band fuel cost forecast, and the third scenario utilizes the July 2015 high band fuel cost forecast.

FPL has combined key generating options analyzed in the two previous, separate stages of analyses presented in Exhibits SRS-4 and SRS-5 into one set of analyses which examines the following self-build generating options. Please see Attachment No. 2 (Table Staff-62 (Parts d & e)):

- The 1,622 MW OCEC Unit 1 that was designated as FPL's NPGU in the capacity RFP;

- An enhanced 1,633 MW version of the OCEC Unit 1 (as referenced on page 36 of FPL witness Sim's direct testimony);
- Enhanced CT designs of 231 MW (Summer) capacity in 5 x 0, 6 x 0, and 7 x 0 configurations; and,
- The two most competitive non-GE CC units from the original analyses.

As shown in this response, the original 1,622 MW OCEC Unit 1 is still projected to be more economic than any of the CT and non-GE generation options; thus, the overall conclusions and recommendations reflected in the Petition for a determination of need and the supporting pre-filed testimony remain unchanged.

e. Please see the response to subpart (d) above.

AFFIDAVIT

Steven R. Sim

Dr. Steven Sim

State of Florida)

County of Palm Beach)

I hereby certify that on this 4th day of November, 2015, before me, an officer duly authorized in the State and County aforesaid to take acknowledgments, personally appeared **Dr. Steven Sim**, who is personally known to me, and he acknowledged before me that he sponsored the answer(s) to Interrogatory No(s).62 from _Staff's 3rd __Set of Interrogatories to Florida Power & Light Company in Docket No. 150196-EI, and that the response(s) are true and correct based on his personal knowledge.

In Witness Whereof, I have hereunto set my hand and seal in the State and County aforesaid as of this 4th day of November, 2015.

QUESTION:

Referring to FPL's response to Staff's Second Set of Interrogatories No. 42, Attachment 1, Tabs 1 through 10, FPL's response contained a note that states: "To capture 30 years of system cost for options with inservice dates in 2019, the model utilizes a five year extension period from 2044 through 2048. However the model only provides a CPVRR sum for this extension period." For each response (Tabs 1-10), please provide the CPVRR sum for the years 2044 through 2048.

RESPONSE:

The information requested is provided in Attachment No. 1.

QUESTION:

Referring to FPL's response to Staff's First Set of Interrogatories No. 43, Attachment 1, Tabs 1 through 5, FPL's response contained a note that states: "To capture 30 years of system cost for options with inservice dates in 2019, the model utilizes a five year extension period from 2044 through 2048. However the model only provides a CPVRR sum for this extension period." For each response (Tabs 1-5), please provide the CPVRR sum for the years 2044 through 2048.

RESPONSE:

The inclusion of an extension period in this analysis does not change the selection of the best technology choice. The information requested is provided in Attachment No. 1.

QUESTION:
Referring to FPL's response to Staff's Second Set of Interrogatories No. 45, Attachment 1, Tab 1 of 5:

a. Please provide the same information that was requested in Staff's Interrogatory No. 45, assuming each capacity addition identified in FPL's response is delayed one year, and no other generation or purchased power replaces the delayed capacity.
b. Please provide the following information in the table below based on the resource plan identified in part (a) above. Please provide all requested data electronically in MS Excel format with all formulas intact.

	Difference from resource plan identified in FPL's response to Staff's Interrogatory No. 45, Attachment 1, Tab 1 of 5. ($ millions, CPVRR)
Capital (Generation)	
Capital (Transmission)	
O&M	
Fuel	
Environmental	
Other	
Total	

RESPONSE:
a. Please see Staff Table 83(a)-Corrected, contained in Corrected Attachment No. 1.
b. Please see Staff Table 83(b)-Corrected, contained in Corrected Attachment No. 2.

FPL's Response to Staff's Request for Production of Documents, No. 7.

RESUME OF ALAN S. TAYLOR

AREAS OF QUALIFICATION

Independent evaluation services for competitive bidding resource selection, integrated resource planning, market analysis, risk assessment, and strategic planning

EMPLOYMENT HISTORY

- President, Sedway Consulting, Inc., Boulder, CO, 2001-present
- Senior Member of PA Consulting, Inc., Boulder, CO, 2001
- Vice President, Global Energy Business Sector, PHB Hagler Bailly, Inc., Boulder, CO, 2000
- From Senior Associate to Principal, Utility Services Group, Hagler Bailly Consulting, Inc., Boulder, CO, 1991-1999
- Senior Consultant, Energy Management Associates, Atlanta, GA, 1983-1988
- Internships at: Pacific Gas & Electric Company, San Francisco, CA (1990)
  Lawrence Berkeley National Laboratory, Berkeley, CA (1989-1991)
  MIT Resource Extraction Laboratory, Cambridge, MA (1982)
  Baltimore Gas and Electric Company, Baltimore, MD (1980)

EDUCATION

- Walter A. Haas School of Business, University of California at Berkeley, MBA, Valedictorian, Corporate Finance, 1991
- Massachusetts Institute of Technology, BS, Energy Engineering, 1983

PROFESSIONAL EXPERIENCE

- Conducted numerous competitive bidding project evaluations for conventional generating resources, renewable facilities, and off-system power purchases; analyzed thousands of such power supply proposals.
- Developed and/or reviewed dozens of requests for proposals for utility resource solicitations.
- Assisted in or monitored contract negotiations with hundreds of shortlisted bidders in utility resource solicitations.
- Testified on utility competitive bidding solicitation results, affiliate transactions, cost recovery procedures, rate case calculations, and incentive ratemaking proposals.
- Managed the development of market price forecasts of North American and European electricity markets under deregulation.
- Performed financial modeling of electric utility bankruptcy workout plans.
- Trained and assisted many of the nation's largest electric and gas utilities in their use of operational and strategic planning computer models.

SELECTED PROJECTS

2015 **California Solicitation for Capacity Resources**
Client: Southern California Edison

Currently serving as the Independent Evaluator (IE) in Southern California Edison's (SCE) annual Resource Adequacy (RA) Request for Offers (RFO). Mr. Taylor is managing a team that is conducting an independent analysis of all offers, monitoring the negotiations with shortlisted bidders, and preparing for the submission and analysis of final offers that will result in contracts that will help the utility fulfill some or all of its California RA capacity requirements for 2016-2019.

2015 **Minnesota Solicitation for New Solar PV Resources**
Client: Minnesota Power Company

Provided independent evaluation services in a focused solicitation for 10 MW of solar photovoltaic (PV) generation at a specific site in Minnesota. Power purchase agreement (PPA) bids were compared to the utility's selected engineering-procurement-construction (EPC) bid in which the utility would oversee the development of a project that it would ultimately own. The PPA bids were required to include buy-out provisions at various milestones during the terms of the PPAs. Mr. Taylor assisted with the development of the request for proposals (RFP), performed a parallel economic evaluation of the utility's EPC and all competing PPA proposals, monitored communications with bidders, and provided a report for filing with the Minnesota Public Utilities Commission regarding the results of the solicitation.

2014- **California Solicitation for Energy Storage Resources**
2015 Client: Southern California Edison

Currently serving as the IE in SCE's Energy Storage RFO that is seeking approximately 16 MW of energy storage resources to be developed in California as part of a regulatory requirement to promote the commercialization of utility-scale energy storage projects. Mr. Taylor is managing a team that has performed a parallel evaluation (to the utility's) of the initial indicative and final energy storage offers (using Sedway Consulting's proprietary model). The team also monitored all negotiations with shortlisted bidders to ensure fair and consistent treatment of counterparties.

2014 **Analysis of Ohio Hedging Transaction**
Client: Ohio Energy Group

Analyzed and provided expert testimony in AEP-Ohio's Energy Security Plan/Standard Service Offer proceeding regarding the hedging and price stabilizing benefits of a proposed rider for the net benefits associated with utility's entitlement to the Ohio Valley Electric Corporation's generating assets.

2013-2014 **California Solicitations for Resources and Energy Auctions**
Client: Southern California Edison

Served as the IE in SCE's Local Capacity Requirements (LCR) RFO for 1,900-2,500 MW of new local capacity resources from energy efficiency, demand response, energy storage and/or gas-fired facilities. Also served as the IE for all five of SCE's 2013 reverse energy auctions of the dispatch rights to facilities under power purchase agreements executed with developers of facilities selected in the utility's 2006 New Generation RFO.

2013-2014 **Florida Solicitation for Resources**
Client: Duke Energy Florida

Provided Independent Monitor/Evaluator services in a solicitation for over 1,600 MW of power supplies for Duke Energy Florida's supply portfolio that were needed by the end of 2018. Mr. Taylor participated in all bidder conferences, was copied on all emails between the utility and bidders, performed an independent evaluation of all proposals, and testified before the Florida Public Service Commission regarding the solicitation's results.

2013 **Minnesota Solicitation for New Resources**
Client: Minnesota Power Company

Provided independent evaluation services in a solicitation for 220 MW of wind generation in Minnesota; bids were compared to the utility's proposal to develop its own wind farm. Mr. Taylor assisted with the development of the request for proposals (RFP), performed a parallel economic evaluation of the utility's facility and all competing proposals, monitored communications and negotiations with shortlisted bidders, and provided a report for filing with the Minnesota Public Utilities Commission regarding the results of the solicitation.

2013 **Kentucky Renewable Resource Analysis**
Client: Kentucky Industrial Utility Customers

Provided expert analysis and testimony on behalf of customers of Kentucky Power regarding a renewable energy purchase agreement for output from a new 58 MW biomass facility that is expected on-line in 2017.

2006-2013 **California Solicitations for Conventional and Renewable Resources**
Client: Southern California Edison

Served as the IE in 23 solicitations for power or gas supplies in southern California – one, as noted above, for SCE's 2013 LCR RFO, an earlier one for over 2,500 MW of new conventional resources, four for renewable energy purchases to help SCE meet its state Renewables Portfolio Standard (RPS) requirements, five for near-term capacity resources, eight for reverse energy auctions of the dispatch rights to facilities under power purchase agreements, and four for gas financial hedging products. Mr. Taylor managed a Sedway Consulting team to perform a parallel evaluation of all proposals, monitor communications and negotiations with power suppliers, and support the review of the final selected proposals by the Procurement Review Group – a collection of non-market-participant stakeholders and regulators who are/were provided confidential access to the evaluation results at intermediate stages. He has filed IE reports and sponsored testimony before the California Public Utilities Commission concerning the results of most of these solicitations.

2012 **Florida Solicitation for New Resources**
Client: Tampa Electric Company

Served as an independent evaluator in a solicitation for 500 MW of power supplies in Florida. New capacity had to be on-line by 2017; bids were compared to the utility's proposal to repower four existing combustion turbines into a larger combined-cycle facility. Mr. Taylor assisted with the development of the RFP, performed a parallel evaluation of all proposals, monitored communications and negotiations with contracting counterparties, and testified before the Florida Public Service Commission regarding the solicitation's results.

2011 **Minnesota Solicitation for Wind Resources**
Client: Minnesota Power

Provided independent evaluation services in a solicitation for 100 MW of wind generation in Minnesota. Proposals competed with a utility proposal to develop its own wind farm. Mr. Taylor assisted with the development of the RFP and performed a parallel economic evaluation of the utility's facility and all competing proposals.

2005- **California Solicitations for Conventional and Renewable Resources**
2010 Client: Pacific Gas & Electric

Served as the Independent Evaluator in four solicitations for new power supplies in northern California – one for 2,200 MW of new conventional resources, another for up to 1,200 MW of new generating resources from any source, and two others for between 1,400 and 2,800 GWh/year of renewable energy purchases. Mr. Taylor managed a Sedway Consulting team to perform a parallel evaluation of all proposals, monitor communications and negotiations with power suppliers, and support the review of the final selected proposals by the Procurement Review Group – a collection of non-market-participant stakeholders and regulators who were provided confidential access to the evaluation results at intermediate stages. He has filed IE reports and sponsored testimony before the California Public Utilities Commission concerning the results of most of these solicitations.

2007- **Florida Solicitation for New Resources**
2008 Client: Florida Power & Light

Provided independent evaluation services in Florida Power & Light's solicitation for 1,250 MW of new power supplies for 2011. Mr. Taylor performed a parallel economic evaluation to that which was undertaken by the utility. His work efforts allowed all proposal parameters to be cross-checked and corrected where necessary. He sponsored testimony before the Florida Public Service Commission concerning the results of the solicitation evaluation.

2007- **Avoided Cost Analysis for Interruptible Loads**
2008 Client: Public Service Company of Colorado

Provided an independent assessment of Public Service Company of Colorado's peaking resource avoided costs for use in the utility's development of customer credits for its interruptible service tariff.

2007- **Florida Solicitations for New Resources**
2008 Client: Tampa Electric Company

Provided independent evaluation services in two separate Tampa Electric Company solicitations for 600 MW of new power supplies for 2013, as a market test for the utility's proposals to develop initially an integrated gasification combined cycle (IGCC) facility and later a gas-fired combined cycle facility.

2004- **Regulatory Support of Commission Staff**
2005 Client: Utah Division of Public Utilities

Assisted staff for the Utah Division of Public Utilities in the division's efforts to analyze PacifiCorp's 2005 rate case. Mr. Taylor reviewed production cost modeling results and forecasts of system-wide fuel and purchase power costs.

2004- **Minnesota Solicitation for New Resources**
2005 Client: Minnesota Power

Provided independent evaluation services in a solicitation for 200 MW of firm power supplies. Mr. Taylor reviewed all proposals and performed a parallel economic evaluation among proposed turnkey facilities and power purchases.

2004 **Canadian Solicitations for Conventional and Renewable Resources**
Client: Ontario Energy Ministry

Participated in a broader consulting team and provided assistance in the development of RFPs for 2,500 MW of conventional resources and 300 MW of renewable resources. New long-term sources of power were sought to replace regional coal-fired generation.

2003- **Florida Solicitation for New Resources**

2004 Client: Florida Power & Light

Provided independent evaluation services in Florida Power & Light's solicitation for 1,100 MW of new power supplies for 2007. Mr. Taylor performed a parallel economic evaluation of all proposals and reviewed, cross-checked, and corrected (where necessary) the utility's analyses. He sponsored testimony before the Florida Public Service Commission concerning the results of the solicitation evaluation.

2002- **Minnesota Solicitation for New Resources**
2003 Client: Northern States Power

Assisted in the evaluation of a large number of multi-option proposals for new power supplies in the 2005-2009 time frame. Mr. Taylor was the independent evaluator in two separate solicitations. He managed a team of individuals in the evaluation of responses for both Requests for Proposals (RFPs). In the first solicitation, contingent proposals were received that could serve as replacement contracts for 1,100 MW of nuclear capacity if NSP were forced to decommission its Prairie Island power plant in 2007. In the second solicitation, NSP sought approximately 1,000 MW of new supplies to supplement its existing supply portfolio. The evaluation included the review of over a dozen proposed wind projects.

2002 **Florida Revisions to Bidding Rule**
Client: Consortium of utilities

Provided the Florida Public Service Commission with recommendations concerning appropriate revisions to the state's bidding rule. Mr. Taylor participated in public workshops to provide the benefits of his extensive experience in performing competitive bidding solicitations and to convey what changes should or should not be made to Florida's existing bid rule to ensure the selection of the best resources for the state's electricity customers.

2002 **Arizona Testimony Concerning Competitive Bidding Solicitations**
Client: Harquahala Generating Company, LLC

Filed testimony before the Arizona Corporation Commission in the Generic Proceedings Concerning Electric Restructuring Issues and Associated Proceedings. Mr. Taylor's testimony provided the Commission with information about competitive bidding processes that he had seen work in other states. Also, his testimony addressed various concerns that were raised by Arizona Public Service as to the feasibility of implementing competitive bidding in Arizona.

2002 **Florida Solicitation for New Resources**
Client: Florida Power & Light

Provided independent evaluation services in Florida Power & Light's solicitation for 1,750 MW of new power supplies in the 2005-2006 time frame. Mr. Taylor performed a parallel economic evaluation to that which was undertaken by the utility. His work efforts allowed all proposal parameters to be cross-checked and corrected where necessary. Also, he provided suggestions on resource optimization modeling approaches that ensured the most comprehensive examination of thousands of potential combinations of proposals.

2001 **Wisconsin Testimony Concerning Competitive Bidding Solicitations**
Client: MidWest Independent Power Suppliers

Provided testimony in a proceeding before the Wisconsin Public Service Commission on behalf of a consortium of independent power producers. Mr. Taylor testified on the benefits and timing of a competitive bidding solicitation that Wisconsin Electric Power Company (WEPCO) should be ordered to conduct prior to the utility's development of $2.8 billion in self-build generation facilities (embodied in a WEPCO proposal called Power the Future – 2). Without the benefits of a competitive solicitation, there would be no defensible means of ensuring that the utility's customers were being offered the best, most cost-effective resources.

FPL's Response to ECOSWF's Interrogatories, Nos. 1, 3, 4, 15. See also excel files contained on Staff Exhibit CD for Nos. 1, 3, 4.

FLORIDA PUBLIC SERVICE COMMISSION
DOCKET: 150196-EI EXHIBIT: 64
PARTY: STAFF
DESCRIPTION: FPL's Response to ECOSWF's Interrogatories, Nos. 1, 3, 4, 15. See also excel files contained on Sta...

QUESTION:
For each month from 2015-2024, please provide the monthly Loss of Load Probability from the Loss of Load Probability calculation presented in Exhibit KRR 5-A for the plan without a 10% generation only reserve margin.

RESPONSE:

The requested information is presented in Attachment No. 1.

QUESTION:
For each month from 2015-2024, please provide the monthly Loss of Load Probability from the Loss of Load Probability calculation presented in Exhibit 6 to Dr. Sim's deposition in this docket.

RESPONSE:

The requested information is presented in Attachment No. 1.

QUESTION:
For each month from 2015-2024, please provide the monthly Loss of Load Probability for the base case load forecast without the addition of OCEC Unit 1.

RESPONSE:

FPL interprets this question to be asking for a revised LOLP projection that is based on Exhibit 6 of FPL witness Sim's deposition in this docket. Please see Attachment No. 1 for this projection.

QUESTION:
Please explain how FPL ensures that it does not pursue an uneconomically high level of reliability in its generation construction and operation planning.

RESPONSE:

FPL performs its reliability analyses using three reliability criteria: (i) a minimum 20% total reserve margin, (ii) a maximum of 0.1 day per year loss-of-load-probability (LOLP), and (iii) a minimum generation-only reserve margin (GRM). The minimum 20% total reserve margin criterion was approved by the FPSC for use by each of peninsular Florida's three IOUs. This criterion has reliability implications not only for each of the IOUs' individual systems, but also has implications for all of peninsular Florida's electric reliability. The LOLP criterion is commonly used in the electric utility industry. The GRM criterion is designed to guide the selection of resources with which FPL meets the 20% total reserve margin criterion.

When planning its system, FPL seeks to identify the resource plan with the lowest electric rate impact that meets all three of its reliability criteria. This is accomplished through the extensive planning analyses that FPL continually conducts.

AFFIDAVIT

FLORIDA PUBLIC SERVICE COMMISSION
DOCKET: 150196-EI EXHIBIT: 65
PARTY: FLORIDA POWER & LIGHT COMPANY (FPL) – (REBUTTAL)
DESCRIPTION: Steven R. Sim SRS-6

Incorrect and/or Misleading Statements Made in the Testimonies of Rábago, Wilson, and Mims

	Witness	Starting Page/Line	Incorrect and/or Misleading Testimony Statement	Correct Information
1	Rábago	5/9	*"This significant increase in the already planned growth in generation stands in stark contrast to forecasted growth rates for customer population, load, and household income over the same period."* **(Misleading)**	Capacity needs are driven by a variety of factors including load growth, reserve margin requirements, unit retirements, and termination of power purchase agreements. Decisions on a unit's actual capacity are based on an economic decision-making process, once the capacity needs are known.
2	Rábago	6/5	*"How does the Company forecast LOLP? …It does not. As a result, the LOLP test really has no practical meaning in this application."* **(Incorrect)**	FPL provides a forecast of LOLP every year with its Ten Year Site Plan as part of FPL's response to Supplemental Data Requests. Also, the witness' testimony actually uses some of those forecasted LOLP values in his testimony.
3	Rábago	7/13	*"This number[LOLP] indicates that the proposed NPGU is not required in order to maintain system reliability or integrity."* **(Incorrect)**	The need for the NPGU is not based on LOLP, nor has FPL ever stated that it was. LOLP is merely one of three reliability criteria that FPL utilizes to determine the timing and magnitude of its resource needs. The other two reliability criteria are projected not to be met in 2019, thus indicating a need to add resources in that year.

Incorrect and/or Misleading Statements Made in the Testimonies of Rábago, Wilson, and Mims

	Witness	Starting Page/Line	Incorrect and/or Misleading Testimony Statement	Correct Information
4	Rábago	9/6	*"In all, the factors suggesting a need to reexamine both the RM and GRM test include…the potential for increased reliance on other generation in the Eastern Interconnection."* **(Incorrect)**	FPL's reliance on the Eastern Interconnection is limited by transmission capacity access into Florida from Georgia as well as the high transmission losses that would be incurred bringing this energy to FPL's load centers.
5	Rábago	10/9	*"In short, the Company should conduct an objective and quantitative assessment of the ratepayer impact measure of its generation construction program over the past fifteen years in order to honestly claim customer benefits."* **(Incorrect and Misleading)**	It is incorrect to suggest that the FPSC has not been doing its job during these past 15 years as he alludes to here. The FPSC regularly holds evidentiary hearings in which power plant decisions are scrutinized before the FPSC grants a need determination and cost recovery for the new units. In other words, just this sort of analysis is regularly carried out by the FPSC.
6	Rábago	11/4	*"…the Company appears to have recently decided that they would like to have another generating unit operating by 2019, and they built a case to support that conclusion."* **(Incorrect and Misleading)**	The need for new capacity in 2019 is clearly demonstrated by FPL's filing in this docket that shows: (i) a projected need in 2019, (ii) OCEC Unit 1 is the most cost-effective self-build generating option, (iii) no viable market generation alternatives to OCEC Unit 1, and (iv) the continued trend of declining DSM cost-effectiveness.

Incorrect and/or Misleading Statements Made in the Testimonies of Rábago, Wilson, and Mims

	Witness	Starting Page/Line	Incorrect and/or Misleading Testimony Statement	Correct Information
7	Rábago	15/12	*"The Company evaluates the DSM resource option solely for its ability to meet all of the increase in forecasted need. This approach is unrealistic, does not consider matching an increase in demand side resources coupled with a smaller NPGU."* **(Incorrect)**	FPL evaluates DSM options versus the planned generating unit on a per kW basis. This provides the best opportunity for DSM measures to pass economic screening analyses versus generation. Consequently, FPL does not evaluate DSM *"solely for its ability to meet all of the increase in forecasted need."* In addition, DSM is continuing its trend of declining cost-effectiveness.
8	Rábago	15/17	*"Options not considered include sufficient demand side resources to defer the NPGU for a single year, for example."* **(Incorrect)**	FPL has already accounted for all DSM found to be readily available and cost-effective in the 2013-2014 DSM Goals docket. Since that time, the trend of declining cost-effectiveness for DSM has continued. Therefore, there is no additional cost-effective DSM with which to partially address FPL's 2019 need. In fact, FPL's 2019 need would likely be larger if DSM's cost-effectiveness had been re-analyzed in 2015.
9	Rábago	15/18	*"Instead, the Company constructs a hyperbolic hypothetical in which 800MW of new DSM must be obtained solely through increases in the residential air-conditioning control program."* **(Incorrect and Misleading)**	This hypothetical was included merely to provide an example of the huge amount of additional, cost-effective DSM that would be required to fully meet the need. It was clearly hypothetical because there is no additional, readily available DSM that is cost-effective on FPL's system.

Incorrect and/or Misleading Statements Made in the Testimonies of Rábago, Wilson, and Mims

	Witness	Starting Page/Line	Incorrect and/or Misleading Testimony Statement	Correct Information
10	Rábago	16/12	*"The Company does not evaluate the solar option from the perspective of the time frame required to develop that option."* **(Misleading)**	This statement ignores the uncertainties involved with meeting the 2019 need with solar and the fact that other, much more certain generation options would have to be bypassed if FPL were to wait several more years just to minimize the uncertainties surrounding solar. These issues were addressed in direct testimony.
11	Rábago	16/16	*"As detailed by Company witness Sim, the fact that the Company uses such a large, self-build NPGU size has a significant impact on dampening participation by non-utility bidders."* **(Misleading)**	The testimony referenced after this statement refers to the results of FPL's previous Bid process. These results were included to demonstrate that FPL's self-build option in that RFP prevailed over other bids because of economics, not simply because of its large size. Bidders were free to bid to provide all or a portion of FPL's 1,052 MW need. FPL believes that potential bidders were discouraged by the economic strength of OCEC Unit 1, primarily its cost and heat rate, not by its MW size.
12	Rábago	17/15	*"The Company reliance on the 10% generation-only reserve margin is also a significant factor in the Company's justifications for building new capacity."* **(Incorrect)**	The additional MW need required based on the 10% GRM over the 20% standard RM is only 64 MW, a very small amount compared to FPL's total system and, therefore, not a significant factor in this docket.

Incorrect and/or Misleading Statements Made in the Testimonies of Rábago, Wilson, and Mims

	Witness	Starting Page/Line	Incorrect and/or Misleading Testimony Statement	Correct Information
13	Rábago	19/14	*"…the Commission should direct the Company to explore 'extreme' or 'fast response' demand response resources specifically designed to provide reliability support."* **(Incorrect and Misleading)**	FPL already has approximately 2,000 MW of fast response resources in its residential and commercial/industrial load management programs.
14	Wilson	7/5	*"…FPL witness Dr. Steven Sim testified during his telephonic deposition … that no such study or substantive analysis existed."* **(Incorrect and/or Misleading)**	In the deposition, FPL witness Sim interpreted the question to mean analyses which, starting from scratch, were designed to identify a specific RM value to use as a criterion. In has been many years since FPL did such a study, in large part due to the 20% stipulation reached in 1999. However, FPL has performed analyses that compared a 20% criterion versus a 15% criterion as discussed in the rebuttal testimony.
15	Wilson	7/20	*"…in 2010, the North Carolina Utilities Commission required Duke Energy Carolinas to conduct a reserve margin study… The result of Duke Energy Carolinas' reserve margin study (provided as Exhibit (JDW-2) was to reduce Duke's reserve margin from 17% to 15.5%, which had a material impact on Duke's resource plan."* **(Misleading)**	Mr. Wilson selectively chose to mention this 2010 study, but selectively decided not to mention the 2015 study in which Duke energy Carolinas decided not only to restore the 17% reserve margin criterion, but to consider for the first time a dual Summer/Winter reserve margin criterion.

Incorrect and/or Misleading Statements Made in the Testimonies of Rábago, Wilson, and Mims

	Witness	Starting Page/Line	Incorrect and/or Misleading Testimony Statement	Correct Information
16	Wilson	11/2	*"I am not aware of any other utility that uses a GRM criterion."* **(Incorrect and/or Misleading)**	Although FPL has no way of knowing what Mr. Wilson may be aware of, he should be aware that TECO has utilized a similar supply-side reserve margin criterion for many years and continues to use it.
17	Wilson	12/17	*"…but those goals have been superseded by significantly lower goals adopted by the Commission in 2014 and are no longer in effect for FPL."* **(Misleading)**	This statement ignores the obvious possibility that FPL's DSM goals could be set again at very high levels. In fact, Mr. Wilson and SACE have been advocating - and continue to advocate - for just such very high DSM goals.
18	Wilson	15/4	*"But to the extent that peak events in June are driven by the same type of hot conditions that are more likely to occur in August, these programs should perform identically. I am unaware of evidence that energy efficiency or load control program technologies perform less effectively on a hot June or October day than on an equally hot August day."* **(Incorrect and Misleading)**	The probabilistic study referenced examines the effect of a DSM measure on reliability across all months, not just months reasonably close to Summer. Also, the statement ignores the possibility of a utility having generation problems on a mild weather day and the possibility of previously set DSM implementation levels being lowered due to lowered DSM cost-effectiveness cancelling the program or significantly reducing incentive payments.

Incorrect and/or Misleading Statements Made in the Testimonies of Rábago, Wilson, and Mims

	Witness	Starting Page/Line	Incorrect and/or Misleading Testimony Statement	Correct Information
19	Wilson	15/9	*"FPL cites uncertainty about the performance of future EE programs, presenting a reliability risk in the form of load forecast uncertainty. This analysis is unreliable because it (1) is out of date (based on 2002 technology) and (2) is based on a simple average of program uncertainty without any evidence that averaging is the proper statistical technique, given the likelihood that there are relationships between the program outcomes.21 This type of analysis should be supported by a current evaluation, measurement and verification (EM&V) study conducted by an independent consultant and its novel application in this circumstance certainly requires greater scrutiny."* **(Misleading)**	Mr. Wilson misinterpreted the use of this data. It was never used in either the LOLP-based analyses or the system operations-based analyses. It was merely developed to get a ballpark idea of what the uncertainty range around DSM kW reductions per installation (and by program type) might be. Mr. Wilson's reference to EM&V confirms that there is uncertainty regarding the performance of DSM once it is installed. In addition, there is also uncertainty regarding the number of DSM installations that may occur in the future due to changes in DSM cost-effectiveness. However, FPL did not utilize either of these DSM uncertainty factors in its LOLP-based or system operations-based analyses.
20	Wilson	16/8	*"The GRM designed by FPL includes energy conservation programs, which are not subject to 'fatigue'. In fact, just the opposite as many of these programs involve the use of passive measures (e.g., insulation) or installation of lower power equipment."* **(Misleading and Irrelevant)**	Load management fatigue was not a factor in the LOLP-based and system operations-based analyses that led FPL to adopt the GRM criterion.

Incorrect and/or Misleading Statements Made in the Testimonies of Rábago, Wilson, and Mims

	Witness	Starting Page/Line	Incorrect and/or Misleading Testimony Statement	Correct Information
21	Wilson	21/4	*"By adopting an unnecessary and wrongly designed criterion, FPL's customers will carry the cost of unnecessary power plant construction."* **(Incorrect and Misleading)**	The criterion is needed to ensure reliability on FPL's system and is correctly designed for the specific conditions of FPL's system. In addition, FPL's resource planning considers the electric rate impact of all resource options when considering resource additions to FPL's system.
22	Wilson	21/20	*"If FPL had made greater investments in energy efficiency and pursued opportunities to procure renewable energy in South Carolina, it might be possible for FPL to avoid adding any additional natural gas power plants - including the proposed OCEC Unit 1 - and the costs that they represent for customers."* **(Incorrect and Confusing)**	FPL neither operates in South Carolina nor adds renewable resource options in South Carolina. And there is no additional readily available, cost-effective DSM on FPL's system with which to meet FPL's 2019 resource needs. In addition, FPL is already tripling its solar generating resources in 2016 and is actively evaluating more solar resources.
23	Wilson	22/9	*"In other words, FPL's newest solar facilities are not the result of FPL's resource planning process as described in the ten-year site plan, but are the result of some other business development process that is not clearly described."* **(Incorrect)**	This statement appears to be a misinterpretation of FPL's Site Plan document. The process behind the selection of FPL's 3 new solar units is clearly described on Page 80 of FPL's 2015 Ten Year Site Plan which describes the activities carried out in FPL's 2014/early 2015 resource planning work. In addition, FPL's direct testimony describes how solar was evaluated as part of its resource planning process for the feasibility of addressing FPL's 2019 need.

Incorrect and/or Misleading Statements Made in the Testimonies of Rábago, Wilson, and Mims

	Witness	Starting Page/Line	Incorrect and/or Misleading Testimony Statement	Correct Information
24	Wilson	23/11	*"...I cannot speculate as to the extent that solar technologies could substitute for any need that may exist (now or in the future) for a combined cycle natural gas plant. I would expect FPL to increase its plans to invest in solar resources if solar was included in the capacity optimization process."* **(Misleading)**	Solar is actively being evaluated in FPL's on-going resource planning work. As viable cost-effective solar applications are identified in this evaluation of resource options, FPL will likely incorporate them into its resource plan.
25	Mims	4/8	*"It would seem that if FPL is truly trying to diversify its fuel sources, at least one of these resources [solar or nuclear] would be increasing as a percent of total generation over time, not just natural gas."* **(Incorrect and Misleading)**	The statement ignores the fact that FPL's solar contribution will triple in 2016. Also, the discussion and associated table is very selective in regard to the years addressed. The years appear to have been carefully chosen to leave out recent fuel diversity additions such as: 110 MW of solar around 2010, more than 500 MW of additional nuclear capacity around 2012, and 2,200 MW of new nuclear capacity in 2027/2028. Furthermore, SACE actively opposed these nuclear additions which have enormous fuel diversity benefits as well as fuel hedge and environmental cost hedge benefits.

Commission Proceedings
Approving or Applying 20% Reserve Margin

Docket No(s). / Order No(s).	Company	Proceeding Type	Commission Statement /Action
981890 PSC-99-2507-S-EU	FPL, FPC, TECO	Generic Investigation	Commission approved 20% reserve margin stipulation for FPL, FPC and TECO. "During our reviews of the Ten Year Site Plans filed in 1997 and 1998, we expressed concerns about the adequacy of the reserve margins planned for Peninsular Florida. At the December 15, 1998, Internal Affairs meeting, we directed staff to open this docket to consider the reserve margins planned for Peninsular Florida electric utilities. … We approve the Stipulation agreed to by Florida Power & Light Company, Florida Power Corporation, and Tampa Electric Company. It addresses the basic concern about the adequacy of planned reserve margins for Peninsular Florida. Collectively, these three utilities plan for approximately 80 percent of the Peninsular Florida load. Thus, a twenty percent planning criterion adopted by these three utilities is a significant increase over the fifteen percent criterion currently employed."
991973 PSC-00-0504-PAA-EQ	FPC	Standard Offer	Commission granted rule waiver, in part because of 20% reserve margin standard. "If the waiver were not granted, FPC's efforts to meet the new 20% reserve margin would be frustrated."
001064 PSC-01-0029-FOF-EI	FPC	Need Determination	Commission granted a determination of need for Hines Unit 2. "We find that Florida Power Corporation has a need for additional capacity to maintain the reliability and integrity of its system, as contemplated by Section 403.519, Florida Statutes. The record shows that FPC has demonstrated **a** need for additional capacity to meet its 20 percent minimum reserve margin criteria. … In Order No. PSC-99-2507-S-EU, Docket No. 981890-EU, the Commission approved the stipulation reached by the peninsular Florida investor-owned utilities (IOUs). These IOUs agreed to implement a 20 percent minimum reserve margin criteria to be fully effective by the summer of 2004. P r i o r to t h i s stipulation, FPC utilized a 15 percent minimum reserve margin criteria. As shown in Exhibit 10, answers to staff's interrogatories, FPC's projected reserve margin in the winter of 2003/04 is 18.4 percent, if Hines 2 is not brought into service. FPC needs only

Docket No(s). / Order No(s).	Company	Proceeding Type	Commission Statement /Action
			approximately 130 MW to precisely reach a 20 percent reserve margin in the winter of 2003/04. FPC will violate its 20 percent minimum reserve margin criterion, in the winter of 2004/05, if Hines 2 is delayed. FPC, therefore, is only accelerating the proposed capacity addition six months in order to meet the stipulation."
001437 PSC-00-2434-PAA-EI	FPL	Depreciation	Commission approved new depreciation rates for units added to meet the 20% reserve margin criterion. "Subsequently, by Order No. PSC-99-2507-S-EU, issued December 22, 1999, in Docket No. 981890-EU, FPL agreed to a minimum reserve margin planning criterion of twenty percent reserve beginning with the Summer of 2004. To achieve this goal, FPL now plans to install six CTs at Ft. Myers, which will initially operate in a stand-alone mode until the overall completion of the repowering, currently projected for June 1, 2002."
010107 PSC-01-1337-PAA-EI	FPL	Depreciation	Commission approved new depreciation rates for units added to meet the 20% reserve margin criterion. "By Order No. PSC-99-2507-S-EU, issued December 22, 1999, in Docket No. 981890-EU, FPL agreed to a minimum reserve margin planning criterion of twenty percent reserve beginning with the Summer of 2004. However, in an effort to achieve this goal by the Summer of 2001, FPL plans to install two combustion turbines (CTs) at the Martin Site in June, 2001. These units will initially operate in a stand-alone peaking mode with planned conversion to natural gas-fired, combined-cycle generators in the 2005-2006 time period to meet FPL's expected increased customer growth and usage."
	FPL, FPC, TECO	2001 TYSP Review	Commission determined *Ten-Year Site Plans* filed by the utility companies are suitable for planning purposes. "The Commission has reviewed *Ten-Year Site Plans* filed by twelve (12) reporting utilities and two (2) merchant plant companies. The Commission has determined that the *Ten-Year Site Plans* filed by the utility companies are ***suitable*** for planning purposes. Forecasted reserve margins for Peninsular Florida range from 20% to 23% during summer peak seasons, and from 23% to 26% during winter peak seasons. The Commission makes no determination on the suitability of the merchant plant filings."
020262 020263 PSC-02-1743-FOF-EI	FPL	Need Determination	Commission granted a determination of need for Martin Unit 8 and Manatee Unit 3. "We find that Florida Power & Light company has a need for additional capacity to maintain the reliability and integrity of its system, which will be provided by-

Docket No(s). / Order No(s).	Company	Proceeding Type	Commission Statement /Action
			Manatee Unit 3 and Martin Unit 8. FPL has an estimated need for 1,122 MW of additional capacity for Summer, 2005, and an additional need for 600 MW of capacity for Summer, 2006. The 1,107 MW of summer capacity from Manatee Unit 3 will contribute to FPL's electric system reliability and integrity. With the addition of that capacity, FPL's projected reserve margin for Summer, 2005 is 19.92%. In order to precisely meet a planning reserve margin criterion of 20.0%' FPL needs only 15 MW of capacity with the addition of Manatee Unit *3* in Summer, 2005. Therefore, FPL does not have a pressing reliability need for the entire 789 MW of capacity from Martin Unit 8 until Summer, 2006. As discussed below, however, the record shows that it is more cost-effective for FPL to place Martin Unit 8 into commercial service in 2005 rather than 2006."
020295 PSC-02-0909-PAA-EQ	FPC	Standard Offer	Commission granted waiver of a Commission rule because of the need to meet the 20% reserve margin criterion. "We agree that if the waiver is not granted, FPC's efforts to meet the new 20% reserve margin would be frustrated. On November 30, 1999, we approved an agreement between FPC, FPL, and TECO adopting a 20% reserve margin planning criterion starting in the summer of 2004. A delay in the RFP process could seriously jeopardize FPC's ability to bring Hines 3 on line by the December, 2005, in-service date."
020332 PSC-02-1103-PAA-EI	FPL	Depreciation	Commission approved depreciation rates for units added by FPL to meet the 20% reserve margin criterion. "By Order No. PSC-99-2507-S-EU, issued December 22, 1999, in Docket No. 981890-EU, FPL agreed to a minimum reserve margin planning criterion of twenty percent beginning with the Summer of 2004. To achieve this goal in a more timely fashion, FPL installed six CTs at Ft. Myers in *2000* and 2001, initially operating in a stand-alone mode. This provided immediate increases to the FPL system. With the recent addition of the six HRSGs, Ft. Myers became a combined cycle operating facility on May 31, 2022."
020953 PSC-03-0175-FOF-EI	FPC	Need Determination	Commission granted a determination of need for Hines Unit 3. "Reserve Margin PACE questioned whether there is a present need for the Hines Unit 3. PACE argues that FPC has done well over the past with a 15 percent reserve margin and if this margin is maintained, Hines Unit 3 is not needed. Regardless of past experience, however, Order No. PSC-99-2507-S-EU,issued December 22, 1999, in Docket No.

Docket No(s). / Order No(s).	Company	Proceeding Type	Commission Statement /Action
			981890-EUf requires Florida's investor owned utilities (IOUs) to increase minimum planning reserve margins to a 20% reserve margin by the summer of 2004. By approving the stipulation proposed by the IOUs and issuing the above Order, we have already determined that 20% is the appropriate reserve margin criteria, and the IOUs are required to utilize this criteria, unless modified in a subsequent proceeding. To provide reliable service, utilities are required to maintain a margin of generating capacity above the firm demand of their customers (planned reserves). At any given time during the year, some generating plants will be out of service and unavailable due to forced outages, periodic maintenance, refueling of nuclear plants, etc. Therefore, adequate reserves must be available to provide for this unavailable capacity and for higher than projected peak demand due to forecast uncertainty and abnormal weather. The proper forum to address what minimum reserves are necessary should be in a generic docket, as was previously done, and not in a particular utility's power plant need determination docket. FPC has relied heavily in the past on demand side management (DSM) to meet its reserve requirements. FPC cannot use DSM as often or with the same duration as physical generation without eventually affecting customer participation levels, as was demonstrated by FPC's customer attrition from its DSM programs in 1998 and 1999. The record indicates FPC's DSM programs are becoming less cost-effective compared to the cost of generation. For these reasons, FPC is attempting to build up its physical reserve percentage." … "In summary, we find that FPC's load forecast is reasonable. FPC's projected reserve margin in the winter of 2005/2006 is 17 percent if Hines Unit 3 is not brought into service, and therefore FPC will violate its 20 percent minimum reserve margin in the winter of 2005/06 . FPC projects that the growth in winter peak demand will average approximately 159 MW a year from 2002/03 to 2006/07, with a projected peak in 2006/07 of 9,195 MW. FPC has projected a growth in winter peak demand of 416 MW for the period 2004/05 to 2006/07. Therefore, we find that Hines Unit 3 will be needed by December 2005 , to maintain FPC' s electric system reliability and integrity."
	FPL, PEF, TECO	2002 TYSP Review	Commission determined *Ten-Year Site Plans* filed by the utility companies are suitable for planning purposes.

Docket No(s). / Order No(s).	Company	Proceeding Type	Commission Statement /Action
			"The Commission has reviewed *Ten-Year Site Plans* filed by twelve (12) reporting utilities and two (2) merchant plant companies. The Commission has determined that the *Ten-Year Site Plans* filed by the utility companies are ***suitable*** for planning purposes. Forecasted statewide reserve margins range from 24% to 27% during summer peak seasons, and from 27% to 31% during winter peak seasons. The Commission makes no determination on the suitability of the merchant plant filings."
030866 PSC-03-1329-PAA-EQ	PEF	Standard Offer/ Bid Rule Waiver	Commission granted a waiver of the Bid Rule due to a likely inability to meet the 20% reserve margin criterion. "We believe that if the waiver is not granted, Progress's efforts to meet the 20% reserve margin would be frustrated. In 1999, an agreement was approved between Progress Energy Florida, Florida Power & Light Company, and Tampa Electric Company adopting a 20% reserve margin planning criterion, effective with the summer of 2004. See Order No. PSC-99-2507-S-EU, issued December 22, 1999, Docket No. 981890-EU, In Re: Generic Investigation into the Adequate Electric Utility Reserve Margins Planned f o r Peninsular Florida. A delay in the RFP process could seriously jeopardize Progress's ability to bring Hines 4 on line by the December 2007 in-service date, an action which is necessary to ensure that the Company maintains a 20% reserve margin. As a result, we agree with the Company that this potential impairment to the reliability of Progress's generation resources constitutes "substantial hardship" within the meaning of Section- 120.542, Florida Statutes."
	FPL, PEF, TECO	2003 TYSP Review	Commission determined *Ten-Year Site Plans* filed by the utility companies are suitable for planning purposes. "The Commission has reviewed *Ten-Year Site Plans* filed by eleven reporting utilities and one independent power producer (IPP). The Commission has determined that the *Ten-Year Site Plans* filed by the utility companies are ***suitable*** for planning purposes. Forecasted statewide reserve margins range from 23% to 26% during summer peak seasons, and from 26% to 30% during winter peak seasons. The Commission makes no determination on the suitability of the IPP filing."
040029 040031 040033 PSC-04-0763-PAA-EG	FPL PEF TECO	DSM Goals DSM Goals DSM Goals	Established DSM goals for FPL, PEF, and TECO using avoided costs calculated assuming a 20% reserve margin.

Docket No(s). / Order No(s).	Company	Proceeding Type	Commission Statement /Action
PSC-04-0769-PAA-EG PSC-04-0765-PAA-EG			
040206 PSC-04-0609-FOF-EI	FPL	Need Determination	Commission granted a determination of need for Turkey Point Unit 5. “There is a need for the proposed Turkey Point Unit 5, taking into account the need for electric system reliability and integrity, as this criterion is used in Section 403.519, Florida Statutes. Absent the timely addition of Turkey Point Unit 5, FPL’s summer reserve margins will fall to 14.7 percent in the summer of 2007, well below the Commission-approved 20 percent reserve margin planning criterion. Further, the addition of Turkey Point Unit 5 will enhance FPL’s operating flexibility and system reliability in Southeast Florida by reducing the growing imbalance between generation and load in this region.”
	FPL, PEF, TECO	2004 TYSP Review	Commission determined *Ten-Year Site Plans* filed by the utility companies are suitable for planning purposes. “The Commission has reviewed *Ten-Year Site Plans* filed by eleven reporting utilities and one independent power producer (IPP). The Commission has determined that the *Ten-Year Site Plans* filed by the utility companies are suitable for planning purposes. Forecasted statewide reserve margins range from 23% to 26% during summer peak seasons, and from 26% to 30% during winter peak seasons. The Commission makes no determination on the suitability of the IPP filing.”
	FPL, PEF, TECO	2005 TYSP Review	Commission determined *Ten-Year Site Plans* filed by the utility companies are suitable for planning purposes. “ Based on our review, the Commission finds the Ten-Year Site Plans filed by the eleven reporting utilities to be suitable.”
060225 PSC-06-0555-FOF-EI	FPL	Need Determination	Commission granted a determination of need for West County 1 & 2. “We find that there is a need for FPL’s proposed West County Units 1 and 2, taking into account the need for electric system reliability and integrity, as this criterion is used in Section 403.519, Florida Statutes. Without completing West County Unit 1 by June 2009, FPL’s and Peninsular Florida’s electric system reliability and integrity would be significantly reduced. FPL would also fail to meet its 20 percent reserve margin planning criterion. Without the unit, FPL’s summer reserve margin for 2009 would decrease to 15.5% and decrease further in each following year.”
060387 PSC-06-0743-PAA-EQ	PEF	PPA Approval	Commission approved a PPA with a renewable resource, Florida Biomass. “By the terms of the negotiated contract, the Florida Biomass combined cycle

Docket No(s). / Order No(s).	Company	Proceeding Type	Commission Statement /Action
			generator is to be operational no later than December 1, 2009, with net output projected to be 116 MW. PEF's 2006 Ten Year Site Plan shows projected growth of approximately 200 MW of demand each year. PEF asserts that it will need additional capacity by 2009 to maintain its 20% reserve margin. The next planned unit is the Bartow Repowering Project, currently scheduled to come on line in June 2009. There are six additional units planned through 2015 to meet PEF's demonstrated need for capacity in that period. While PEF has not included the Florida Biomass contract as a firm resource in its 2006 Ten Year Site Plan, if the contract is approved, PEF will include the projected committed capacity as a firm resource."
	FPL, PEF, TECO	2006 TYSP Review	Commission determined *Ten-Year Site Plans* filed by the utility companies are suitable for planning purposes. "Pursuant to Section 186.801, Florida Statutes, the Florida Public Service Commission (Commission) has reviewed the Ten-Year Site Plans filed by the eleven reporting utilities and finds them to be suitable."
070100 PSC-07-0456-PAA-EQ	FPL	Depreciation	Approved of Depreciation rates for Turkey Point Unit 5. "By Order No. PSC-99-2507-S-EU,2 FPL agreed to a minimum reserve margin planning criterion of 20 percent beginning in the summer of 2004. However, in 2003, FPL's integrated resource planning work determined that an additional 1,066 megawatts (MW) of capacity was needed by the summer of 2007. If the additional megawatts were not obtained, FPL and the Peninsular Florida's electric system reliability and integrity would be reduced and the required 20 percent reserve margin would not be met for 2007. Also, the balance between the amount of generating capacity located in southeast Florida and the electrical load would not be maintained. Pursuant to Order No. PSC-04-0609-FOF-EI,3 the Commission approved the construction of Turkey Point Unit 5 to meet FPL's needed capacity."
070602 PSC-08-0021-FOF-EI	FPL	Need Determination for Expansion	Commission granted a determination of need for expansion of Turkey Point and St. Lucie nuclear units. "There is a need for the Turkey Point nuclear power plant ("PTN") and St. Lucie nuclear power plant ("PSL") uprates, taking into account the need for electric system reliability and integrity, as this criterion is used in Section 403.519(4), Florida Statutes. Without the uprates, FPL's electric system reliability and integrity will be significantly reduced, and FPL will fail to meet its 20% reserve margin beginning in 2012 ….

Docket No(s). / Order No(s).	Company	Proceeding Type	Commission Statement /Action
			FPL has future resource needs of 490 MW of incremental capacity in 2012. All demand side management ("DSM") that is known to be cost-effective through 2013 is already reflected in FPL's 2006/2007 resource planning work, which identified this capacity need. Consequently, to meet FPL's summer reserve margin criterion of 20% through 2013, FPL needs new capacity in the form of power plant construction and or purchases."
070650 PSC-08-0237-FOF-EI	FPL	Need Determination	Commission granted a determination of need for for Turkey Point units 6 and 7. "There is a need for Turkey Point 6 and 7, taking into account the need for electric system reliability and integrity, as this criterion is used in Section 403.519(4), F.S. FPL argues that there is a need for Turkey Point 6 and 7 because overall system demand is expected to grow by 40%. FPL further contends that without Turkey Point 6 and 7, the reserve margin would fall below 20% and FPL would have to rely more heavily on DSM, which would render FPL's system less reliable. … Based on the foregoing, we find that FPL's capacity need projections are reasonable. We note that no party took issue with the load forecast. FPL's need was determined after taking into account 1,899 MW of additional DSM, all other currently committed supply projects, 414 MW of recently approved nuclear capacity includes previously certified nuclear uprates in 2012 and 2013 as well as new uncertified gas CC units in 2011, 2015, 2016, and 2017, includes previously certified nuclear uprates in 2012 and 2013, but no new gas units and 287 MW of renewable generation, although none are yet contracted, from 2 biomass projects and 3 municipal waste-to-energy projects. FPL's need for additional capacity to meet rising electricity demands cannot be satisfied with additional purchased power from renewable generation. Additional DSM programs and renewables are not capable of deferring the need for additional capacity. In conclusion, the evidence shows that FPL has a need for 8,350 MW of additional capacity beginning in the 2011 through 2020 period. Turkey Point 6 and 7 will provide only a portion of FPL's need for capacity."
		2007 TYSP Review	Commission determined *Ten-Year Site Plans* filed by the utility companies are suitable for planning purposes. "Pursuant to Section 186.801, Florida Statutes, the Commission has reviewed the

Docket No(s). / Order No(s).	Company	Proceeding Type	Commission Statement /Action
			utilities' 2007 Ten-Year Site Plans and finds them to be suitable because the plans were responsive to the energy policies in place at the time of filing."
080407 080408 080409 PSC-09-0855-FOF-EG		DSM Goals	The Commission approved DSM Goals based on avoided cost calculation for FPL, FPC and TECO that employed a 20% reserve margin criterion.
080203 080245 080246 PSC-08-0591-FOF-EI	FPL	Need Determination	Commission granted a determination of need for West County Energy Center Unit 3, Conversion of Riviera Plant, and Conversion of Cape Canaveral Plant. "FPL has demonstrated a reliability need for additional resource capacity in 2013. Usually, when a company seeks to satisfy a need for additional resource capacity using natural gas facilities, a petition for need determination would be submitted approximately 3 years before the facility's in-service date. The company decided, however, that unique economic opportunities and site-specific circumstances made it more cost effective to build WCEC 3 for operation in 201 1 and perform the conversions at Cape Canaveral and Riviera by 2013 and 2014. FPL contends that it will not be able to perform the conversions of Cape Canaveral and Riviera without approval of the proposed WCEC 3. FPL chose gas-fired combined cycle units as its resource option to meet its capacity needs. This decision was made primarily because coal and nuclear generation have longer construction times and would not be able to provide the additional capacity in the time needed. This approach will maintain FPL's reserve margin above 20 percent throughout the period."
080512 PSC-08-0707-PAA-EQ	PEF	PPA Approval	Commission approved a PPA with Vision/FL, LLC. "The Facility is projected to have a maximum nominal generating capacity of 50 MW. After serving internal loads, the Facility will provide firm capacity of approximately 40 MW to PEF. The expected annual energy amounts to 3 11,853 MWh. As a renewable energy resource, Vision's projected committed capacity of 40 MW will be independent **of** the current fossil fuel infrastructure as it uses a separate, distinct supply mechanism for its biomass fuel. It is noted that the addition of 40 MW of firm capacity and energy from Vision in 2010 to PEF pursuant to the contract will not completely defer or avoid the need for additional capacity in order to meet a 20% reserve margin. However, the Facility will displace energy generated by fossil fuels, reducing the state's dependence on these resources and promoting fuel diversity."

Docket No(s). / Order No(s).	Company	Proceeding Type	Commission Statement /Action
		2008 TYSP Review	Commission determined *Ten-Year Site Plans* filed by the utility companies are suitable for planning purposes. “The Commission has reviewed the Ten-Year Site Plans filed by the eleven reporting utilities and finds that the projections of load growth appear reasonable and that the reporting utilities have identified additional generation facilities required in order to maintain an adequate supply of electricity at a reasonable cost. Therefore, the Commission finds the 2008 Ten-Year Site Plans filed by the eleven reporting utilities to be suitable for planning purposes.”
		2009 TYSP Review	Commission determined *Ten-Year Site Plans* filed by the utility companies are suitable for planning purposes. “The Commission has reviewed the Ten-Year Site Plans filed by the 11 reporting utilities and finds that the projections of load growth appear reasonable and that the reporting utilities have identified additional generation facilities required in order to maintain an adequate supply of electricity at a reasonable cost. Therefore, the Commission finds the 2009 Ten-Year Site Plans filed by the 11 reporting utilities to be suitable for planning purposes.”
		2010 TYSP Review	Commission determined *Ten-Year Site Plans* filed by the utility companies are suitable for planning purposes. “The Commission finds the 2010 Ten-Year Site Plans filed by the eleven reporting utilities to be suitable for planning purposes. While the plans are suitable for planning purposes, they are subject to modification due to factors such as changes to fuel cost, energy use projections, evolving technology, and shifting energy policy. Therefore, the Commission will continue to closely monitor the future rate of load growth in Florida and its effect on the need for additional generation and transmission facilities in the state.”
110018 PSC-11-0293-FOF-EI	FPL	Need Determination	Commission granted a determination of need for expansion of Solid Waste Authority of Palm Beach County unit. “FPL determines the magnitude and timing of its resource needs based on a minimum reserve margin. The reserve margin represents available generating capacity during peak demand periods. FPL has established a minimum reserve margin of 20 percent above peak demand for reliability purposes. FPL has identified a reliability need beginning in 2016. This projection is consistent with FPL's 2011 Ten Year Site Plan ("TYSP"). Commencing in 2015, SW A will provide the output

Docket No(s). / Order No(s).	Company	Proceeding Type	Commission Statement /Action
			if the Expanded Facility as firm capacity and energy to FPL. … Upon review, we find that the Joint Petitioners are persuasive in their argument that the Expanded Facility will improve electric system reliability and integrity on FPL's system. FPL is currently projecting a need for additional capacity. The Expanded Facility, projected to provide between 70 and 80 MW of firm capacity by 2015, will satisfy a portion of FPL's projected need. Therefore, the SWA Expanded Facility will contribute to the reliability and integrity of FPL's electric system. In addition to providing additional capacity, the Expanded Facility, which will be located in Southeast Florida, has attributes that will address two system concerns for FPL: a) enhancing fuel diversity; and b) maintaining a regional balance between load and generating capacity, particularly in Southeastern Florida. We find that there is a need for the SWA Expanded Facility taking into account the need for electric system reliability and integrity, as this criterion is used in Section 403.519, F.S.
110309 PSC-12-0187-FOF-EI	FPL	Need Determination	Commission granted a determination of need for Port Everglades plant. "There is a need for Port Everglades Next Generation Energy Center, taking into account the need for electric system reliability and integrity. Based on the 20 percent reserve margin criterion adopted by FPL pursuant to a stipulation with this Commission, FPL projected in its filing that additional capacity to meet firm peak demand will be needed by the summer of 2016. If FPL did not construct PEEC until 2019, the Company's projected reserve margin would drop to 18.2 percent in 2017 and 2018 and would be primarily made up of Demand Side Management resources. After accounting for all projected DSM from cost-effective programs approved by this Commission, FPL' s projections at the time of the filing indicate that by 2016, the Company will have a capacity need of 284 MW in order to adhere to FPL's minimum reserve margin criterion of 20 percent. The timing of FPL's projected need was largely driven by the expiration of existing purchased power agreements totaling 1,306 MW of summer capacity and the decision to place certain units into inactive reserve mode. PEEC will provide 1,277 MW of capacity to help satisfy the Company's capacity needs through 2020."

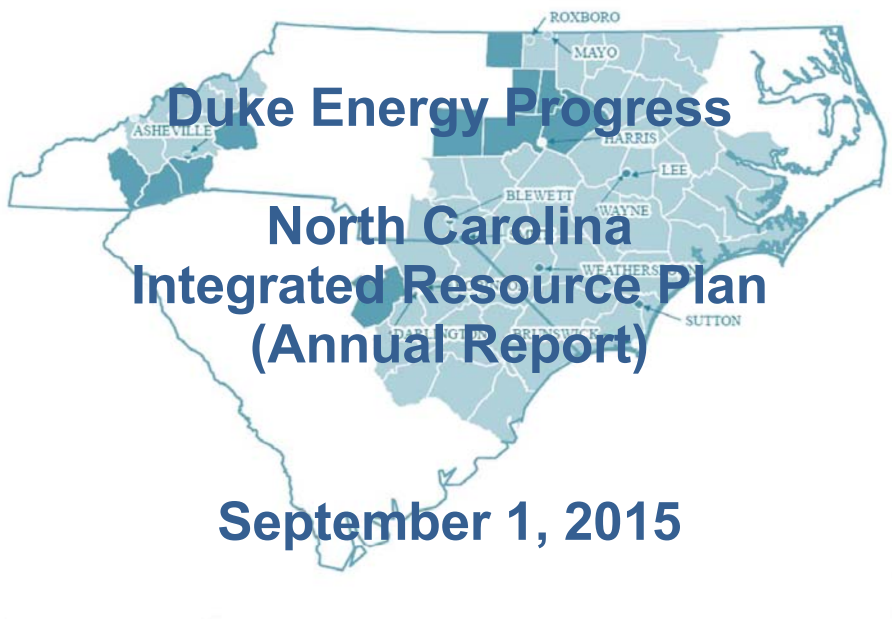
Docket No(s). / Order No(s).	Company	Proceeding Type	Commission Statement /Action
	FPL, DEF, TECO	2011 TYSP Review	Commission determined *Ten-Year Site Plans* filed by the utility companies are suitable for planning purposes. “The Commission has reviewed the Ten-Year Site Plans filed by the eleven reporting utilities, as well as supplemental data provided through data requests, and finds that the projections of load growth appear reasonable. The reporting utilities have identified sufficient additional generation facilities to maintain an adequate supply of electricity at a reasonable cost. Therefore, the Commission finds the 2011 Ten-Year Site Plans filed by the reporting utilities, augmented with supplemental data provided, to be suitable for planning purposes.”
120234 PSC-13-0014-FOF-EI	TECO	Need Determination	Commission granted a determination of need for Polk unit 205 conversion. “We find that there is a need for Polk 2-5 as proposed by TECO to maintain electric system reliability and integrity as this criterion is used in Section 403.519(3), F.S. For planning purposes, TECO utilizes a 20 percent firm reserve margin reliability criteria above the system firm peak demand. After taking into account load growth, existing power plant unit capacity, firm purchased power agreements, and demand-side management (DSM), TECO's summer reserve margin is projected to fall below 20 percent in 2017. By providing up to approximately 459 MW of additional capacity, Polk 2-5 will help TECO meet its needs for additional capacity beginning in 2017.”
120314 PSC-13-0164-PAA-EQ	FPL	PPA Approval	Commission approved PPA agreements with U.S. EcoGen. “FPL maintains a planning reserve margin of 20 percent pursuant to a stipulation approved by this Commission.[1] FPL’s next major generating additions are the Cape Canaveral Modernization (1,210 MW) in 2013, the Riviera Modernization (1,212 MW) in 2014, and the Port Everglades Modernization (1,277 MW) in 2016, followed by Turkey Point Units 6 and 7 (1,100 MW each) in 2022 and 2023. … The firm capacity to be delivered under the terms of the Contracts, and the resulting potential to defer or delay a portion of FPL’s next generating unit, meets

[1] *See* Order No. PSC-99-2507-S-EU, issued December 22, 1999, in Docket No. 981890-EU - In re: Generic investigation into the aggregate electric utility reserve margins planned for Peninsular Florida.

Docket No(s). / Order No(s).	Company	Proceeding Type	Commission Statement /Action
			the requirement of Rule 25-17.0832(3)(a), F.A.C. (which addresses the need for capacity by the purchasing utility and the state as a whole). Therefore, upon review, we find that approval of the proposed Contracts will enhance FPL's system reliability, encourage the use of renewable fuels in Florida, and promote fuel diversity for FPL's ratepayers."
	FPL, DEF, TECO	2012 TYSP Review	Commission determined *Ten-Year Site Plans* filed by the utility companies are suitable for planning purposes. "The Commission has reviewed the Ten-Year Site Plans filed by the eleven reporting utilities, as well as supplemental data provided through data requests, and finds that the projections of load growth appear reasonable. The reporting utilities have identified sufficient additional generation facilities to maintain an adequate supply of electricity at a reasonable cost. Therefore, the Commission finds the 2012 Ten-Year Site Plans filed by the reporting utilities, augmented with supplemental data provided, to be suitable for planning purposes."
130199 130200 130201 PSC-14-0696-FOF-EU	FPL, DEF, TECO	DSM Goals	The Commission approved DSM Goals based on avoided cost calculation for FPL, FPC and TECO that employed a 20% reserve margin criterion.
	FPL, DEF, TECO	2013 TYSP Review	Commission determined *Ten-Year Site Plans* filed by the utility companies are suitable for planning purposes. "Based on its review, the Commission finds the 2013 TYSPs filed by the reporting utilities, augmented with supplemental data provided, to be suitable for planning purposes. Since the TYSP is not a binding plan of action for electric utilities, the Commission's classification of these Plans as suitable or unsuitable does not constitute a finding or determination in docketed matters before the Commission. The Commission may address any concerns raised by a utility's TYSP at a public hearing."
140110 PSC-14-0557-FOF-EI	DEF	Need Determination	Commission granted a determination of need for Citrus County plant. "As described by Witness Borsch, DEF employs two reliability criteria in its resource planning process: (1) a loss of load probability criterion, and (2) a reserve margin criterion. Witness Borsch stated that DEF's resource plans have been reviewed by this Commission each year since the early 1990s in the annual Ten-Year Site Plan review process. Witness Borsch asserted that the Company's need for the

Docket No(s). / Order No(s).	Company	Proceeding Type	Commission Statement /Action
			proposed Citrus County Plant in the summer of 2018 is driven by the aforementioned reserve margin criterion. DEF's minimum reserve margin threshold is 20 percent and the Company calculates its reserve margin based on the relationship between peak load and total capacity available to serve that load. In addition to DEF's claimed need to satisfy its reserve margin criterion, Witness Borsch testified that the Citrus County Plant would provide reliability and stability to the Florida electric grid as determined by the Florida Reliability Coordinating Council, Inc. … There is no record evidence to indicate the recession has fundamentally altered DEF's expected forecast result for 2018 demand in a manner that casts doubt on the forecast. We find DEF's load forecast presented in this docket to be reasonable for the purposes of determining the need for DEF's proposed Citrus County Plant in 2018. Based on the evidence in the record, if DEF did not construct the proposed Citrus County Plant in 2018, the projected reserve margin could drop as low as 12.3 percent in 2018."
140111 PSC-14-0590-FOF-EI	DEF	Need Determination	Commission granted a determination of need for Hines unit Chiller project. "Based on the evidence in the record, we recalculated DEF's originally filed reserve margin to ensure that the Company still has a reliability need in 2017. Table 2, below, shows that DEF's reserve margin in 2017 would fall to 19 percent absent any new generation. This represents a 94 MW need. Although, the need is relatively small, Witness Borsch testified that the addition of the Hines Project is cost-effective even when the capacity of the project was not needed to meet the Company's reserve margin criteria. We also note that no party in this docket disputed the need for the Hines Project. … Given a 20 percent reserve margin criterion, we find that the evidence in the record demonstrates a need for the Hines Project beginning in 2017. Based on our calculations, if DEF did not construct the proposed Hines Project in 2017, the projected reserve margin could fall below the Company's 20 percent criterion."
	FPL, DEF, TECO	2014 TYSP Review	Commission determined *Ten-Year Site Plans* filed by the utility companies are suitable for planning purposes. "The Commission has reviewed the 2014 Ten-Year Site Plans and finds that the projections of load growth appear reasonable. The reporting utilities have identified sufficient additional generation facilities to maintain an adequate supply of

Docket No(s). / Order No(s).	Company	Proceeding Type	Commission Statement /Action
			electricity at a reasonable cost. The Commission will continue to monitor the impact of current and proposed EPA Rules and the state's dependence on natural gas for electricity production. Based on its review, the Commission finds the 2014 Ten-Year Site Plans to be suitable for planning purposes. Since the Plans are not a binding plan of action for electric utilities, the Commission's classification of these Plans as suitable or unsuitable does not constitute a finding or determination in docketed matters before the Commission. The Commission may address any concerns raised by a utility's Ten-Year Site Plan at a public hearing."



Duke Energy Progress

North Carolina Integrated Resource Plan (Annual Report)

September 1, 2015

PUBLIC

FLORIDA PUBLIC SERVICE COMMISSION
DOCKET: 150196-EI EXHIBIT: 67
PARTY: FPL
DESCRIPTION: Steven R. Sim SRS-8

DEP NC 2015 IRP
TABLE OF CONTENTS

SECTION **PAGE:**

1. INTRODUCTION

For more than a century, Duke Energy Progress (DEP) has provided affordable and reliable electricity to customers in North Carolina (NC) and South Carolina (SC) now totaling more than 1.5 million in number. Each year, as required by the North Carolina Utilities Commission (NCUC) and the Public Service Commission of South Carolina (PSCSC), DEP submits a long-range planning document called the Integrated Resource Plan (IRP) detailing potential infrastructure needed to match the forecasted electricity requirements for our customers over the next 15 years.

The 2015 IRP is the best projection of how the Company's energy portfolio will look over the next 15 years, based on current data assumptions. This projection will change as variables such as projected load forecasts, fuel prices, new environmental regulations and other outside factors change.

On July 20, 2015, the NCUC ordered that the IRP process between biennial IRPs be significantly streamlined. As such, the remainder of this document provides the information ordered by the NCUC for this update (odd year) IRP.

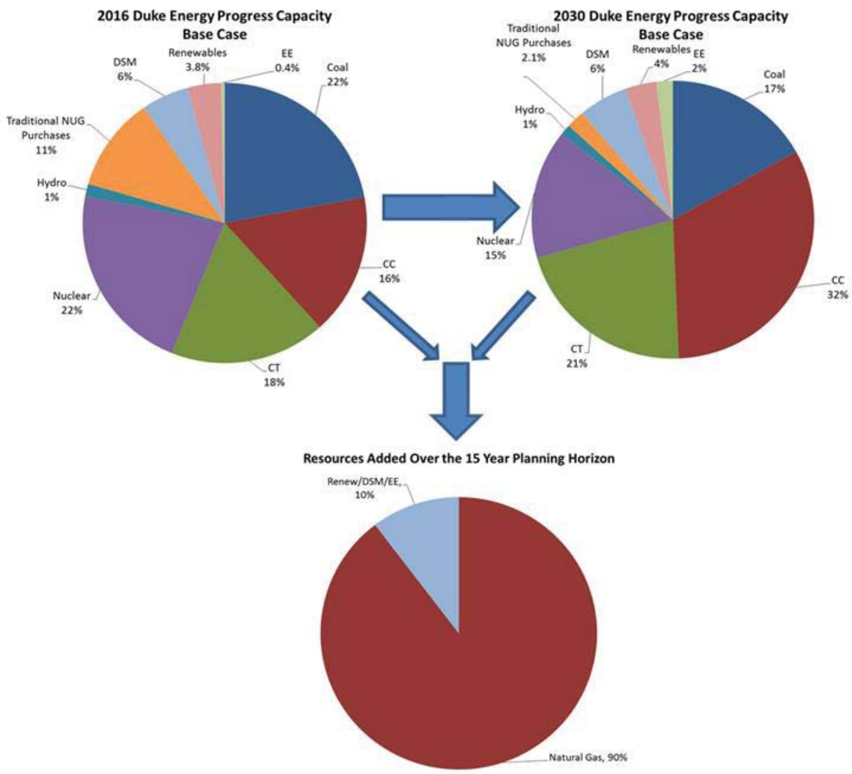
The Company files separate 2015 IRPs for North Carolina and South Carolina. However, the IRP analyzes the system as one DEP utility across both states including customer demand, energy efficiency (EE), demand side management (DSM), renewable resources and traditional supply-side resources. As such, the quantitative analysis contained in both the North Carolina and South Carolina filings is identical, while certain sections dealing with state-specific issues such as state renewable standards or environmental standards may be specific to that state's IRP.

2. 2015 IRP SUMMARY

As 2015 is an update year for the IRP, DEP developed two cases based on the results of the 2014 IRP. The first case, or the "Base Case" is an update to the presented Base Case in the 2014 IRP which includes the expectation of carbon legislation beginning in 2020. Additionally, a "No Carbon Sensitivity" was developed in which no carbon legislation is considered. All results presented in this IRP represent the Base Case, except where otherwise noted.

As shown in the 2015 IRP Base Case, projected incremental needs are driven by load growth and the retirement of aging combustion turbine (CT) and coal-fired resources. The 2015 IRP seeks to achieve a reliable, economic long term power supply through a balance of incremental renewable resources, EE, DSM, nuclear, and traditional supply-side resources planned over the coming years. In order to reliably and affordably meet our customers' needs into the future, the Company projects the need for incremental investments in these resources as depicted in the charts below.

Chart 2-A 2016 and 2030 Base Case Summer Capacity Mix and Sources of Incremental Capacity



The additional assets included over the 15 year planning horizon were selected as the most reliable and affordable resource mix to meet customer demand into the future. Furthermore, the selected mix of renewable resources, EE programs, DSM programs, nuclear generation, and state-of-the-art natural gas facilities also help the Company maintain a diversified resource mix while reducing the environmental footprint associated with each unit of energy production.

3. IRP PROCESS OVERVIEW

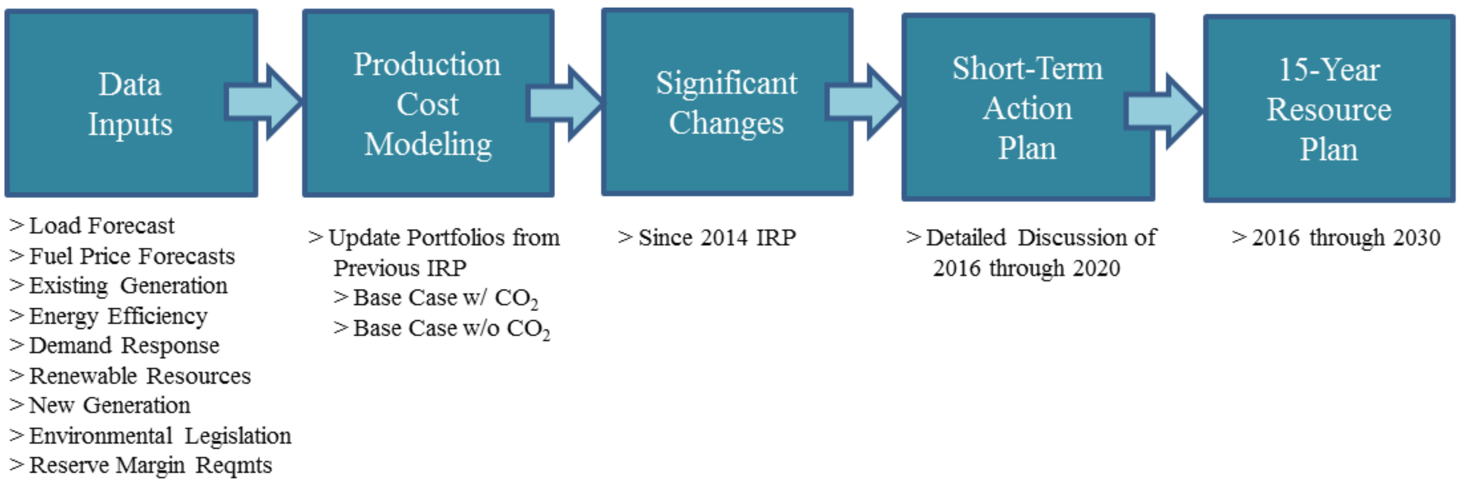
To meet the future needs of DEP's customers, it is necessary for the Company to adequately understand the load and resource balance. For each year of the planning horizon, the Company develops a load forecast of cumulative energy sales and hourly peak demand. To determine total resources needed, the Company considers the peak demand load obligation plus a 17% minimum planning reserve margin. The projected capability of existing resources, including generating units, EE and DSM, renewable resources and purchased power contracts, is measured against the total resource need. Any deficit in future years will be met by a mix of additional resources that reliably and cost-effectively meet the load obligation and planning reserve margin while complying with all environmental and regulatory requirements. It should be noted that DEP considers the non-firm energy purchases and sales associated with the Joint Dispatch Agreement (JDA) with Duke Energy Carolinas (DEC) in the development of its independent Base Case. To accomplish this, DEP and DEC plans are determined simultaneously to minimize revenue requirements of the combined jointly-dispatched system while maintaining independent reserve margins for each company.

The use of a 17% reserve margin represents an increase over last year's IRP that is discussed in more detail in Chapter 4. As discussed in Chapter 4, this increase does not materially impact the near-term resource needs of the Company as projected in the Short-Term Action Plan but rather influences the subsequent years of the plan.

For the 2015 Update IRP, the Company presents a Base Case with a CO_2 tax beginning in 2020. The current assumption of a CO_2 tax is intended to serve as a placeholder for future carbon regulation. Consistent with this assumption, the final Environmental Protection Agency (EPA) Clean Power Plan (CPP) was released in mid-August and each state is in the process of developing individual state plans to comply with the rule as discussed in Chapter 4. Furthermore, a primary focus of this update IRP is the Short-Term Action Plan (STAP) which runs from 2016 to 2020. It was determined that the inclusion of the CO_2 tax did not have a significant impact on the STAP, and therefore the majority of the data presented in this report is taken from the CO_2 case (Base Case).

Figure 3-A represents a simplified overview of the resource planning process in the update years (odd years) of the IRP cycle.

Figure 3-A Simplified IRP Process



4. SIGNIFICANT CHANGES FROM THE 2014 IRP

As an initial step in the IRP process, all production cost modeling data is updated to include the most current and relative data. Throughout the year, best practices are implemented to ensure the IRP best represents the Company's generation system, conservation programs, renewable energy and fuel costs. The data and methodologies are regularly updated and reviewed to determine if adjustments can be made to further improve the IRP process and results.

As part of the review process, certain data elements, with varying impacts on the IRP, inevitably change. A discussion of newly included or updated data elements that had the most substantial impact on the 2015 IRP is provided below.

a) Load Forecast

The 2015 DEP Spring Load Forecast is updated to include the most current data available at this time. The process and models for the load forecast remain the same, however the method by which utility energy efficiency (UEE) [1] impacts are incorporated into the load forecast has changed since the 2014 IRP. UEE programs are energy efficiency programs that were developed and offered to customers by the Company The impacts of UEE on the load forecast do not include load reductions from free-riders. Free-riders are those customers who would have adopted the energy efficiency program regardless of incentives provided by the Company.

Program lives of UEE programs were previously considered indefinite in the IRP process, but in this year's IRP, are more clearly incorporated in the load forecast. Many UEE programs have a finite program life, much like the useful life of any generating resource. By including the useful life of the programs, the Company is better able to account for the UEE programs available to the DEP system, and as such represent a more realistic and accurate representation of these programs. A numerical representation of the impacts of these changes and impacts to the load forecast are included in Chapter 5.

In the development of the load forecast, many variables may cause the load forecast projection to change. A brief comparison of the growth of the DEP load forecast is presented in Table 4-A and a more detailed discussion can be found in Chapter 5.

[1] The term UEE is utilized in the load forecasting sections which represents utility-sponsored EE impacts net of free riders. The term "Gross EE" represents UEE plus naturally occurring energy efficiency in the marketplace.

Table 4-A 2015 DEP Load Forecast Growth Rates vs. 2014 Load Forecast Growth Rates (Retail and Wholesale Customers)

	2015 Forecast (2016 – 2030)			**2014 Forecast (2015 – 2029)**		
	Summer Peak Demand	**Winter Peak Demand**	**Energy**	**Summer Peak Demand**	**Winter Peak Demand**	**Energy**
Excludes impact of new EE programs	1.5%	1.3%	1.2%	1.6%	1.5%	1.3%
Includes impact of new EE programs	1.3%	1.2%	1.2%	1.4%	1.3%	1.0%

b) Renewable Energy

The Company is committed to full compliance with the North Carolina Renewable Energy Portfolio Standard (NC REPS). Currently signed projects and additional resources needed to fully comply with NC REPS are included in the 2015 IRP. There is currently a large influx of solar resources in the interconnection queue in the DEP system. With this influx, more solar projects are utilized to meet the NC REPS general compliance requirement, replacing biomass and wind resources that were represented in the 2014 IRP.

Additionally, the newly approved South Carolina Distributed Energy Resource Program (SC DERP) has been included. The SC DERP was approved by the PSCSC on July 15, 2015. The Company's commitment to meet the increasing goals of this program through 2020 is included in the 2015 IRP.

Finally, growing customer demand for renewable generation is driving the need for additional solar resources. These resources are included as Utility-owned projects and are projected in the IRP. Such projects are incremental to NC REPS or SC DERP compliance renewables. Utility-owned projects include the expected projects procured by the Company that will increase the capacity of renewable generation on the DEP system.

As mentioned above, DEP has seen a large influx of solar resources in the interconnection queue. A summary of the projects currently in the interconnection queue is represented in Table 4-B. The table shows not only the amount of resources, but also the type of resources.

Table 4-B DEP QF Interconnection Queue

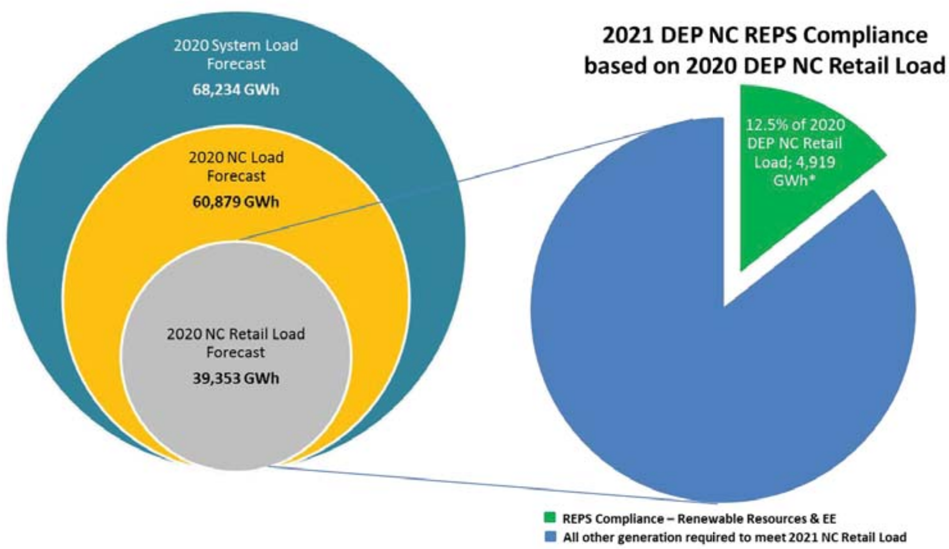
Utility	Facility State	Energy Source Type	Number of Pending Projects	Pending Capacity MW AC
DEP	**NC**	Biogas	2	7
		Biomass	3	53
		Landfill Gas	2	16
		Other	2	1
		Solar	436	3244
		Wood Waste	1	5
DEP	**NC Total**		**446**	**3326**
	SC	Solar	37	605
	SC Total		**37**	**605**
DEP Total			**483**	**3931**

Renewables Compliance

A large portion of the renewable resources added over the planning horizon are a result of complying with NC REPS. The pie charts presented in Chapter 2 above represent the capacity of each asset by fuel type. However, the NC REPS compliance plan sets compliance targets based upon retail energy sales. As such, the renewable *capacity* percentage detailed above is not adequate for determining the Company's compliance with the NC REPS *energy* target.

In an effort to explain NC REPS compliance needs, Chart 4-A shows the energy forecasts and the ultimate NC REPS compliance need for DEP.

Chart 4-A DEP - Meeting NC REPS Compliance



*** 4,919 GWh represents the projected amount of Renewables and EE required to meet REPS compliance in 2021 based on the NC Retail load forecast for the year 2020. The cumulative EE and renewables energy on the DEP system is expected to be greater than what is represented here. Additionally, NC REPS allows 65% of the 2021 target to be met by EE and Out of State Renewable Energy Certificates (RECs).**

c) Addition of Combined Heat & Power (CHP) to the IRP

Combined Heat and Power (CHP) systems, also known as cogeneration, generate electricity and useful thermal energy in a single, integrated system. CHP is not a new technology, but an approach to applying existing technologies. Heat that is normally wasted in conventional power generation is recovered as useful energy, which avoids the losses that would otherwise be incurred from separate generation of heat and power. CHP incorporating a CT and heat recovery steam generator (HRSG) is more efficient than the conventional method of producing usable heat and power separately via a gas package boiler.

Duke Energy is exploring and working with potential customers with good base thermal loads on a regulated Combined Heat and Power offer. The CHP asset will be included as part of Duke Energy's IRP as a placeholder for future projects as described below. The steam sales are credited back to the revenue requirement of the projects to reduce the total cost of this generation grid resource. Along with the potential to be a competitive cost generation resource, CHP can result in CO_2 emission reductions, and present economic development opportunities for the state.

Projections for CHP have been included in the following quantities in the 2015 IRP:

2019: 20 MW
2021: 20 MW

As CHP continues to be pursued, future IRP processes will incorporate additional CHP as appropriate.

Additional technologies evaluated as part of the 2015 IRP are discussed in Chapter 6.

d) Reserve Margin

In 2012, DEP and DEC hired Astrape Consulting to conduct a reserve margin study for each utility. Astrape conducted a detailed resource adequacy assessment that incorporated the uncertainty of weather, economic load growth, unit availability and transmission availability for emergency tie assistance. Astrape analyzed the optimal planning reserve margin based on providing an acceptable level of physical reliability and minimizing economic costs to customers. The most common physical metric used in the industry is to target a system reserve margin that satisfies the one day in 10 years Loss of Load Expectation (LOLE) standard. This standard is interpreted as one firm load shed event every 10 years due to a shortage of generating capacity. From an economic perspective, as planning reserve margin increases, the total cost of reserves increases while the costs related to reliability events decline. Similarly, as planning reserve margin decreases, the cost of reserves decreases while the costs related to reliability events increase, including the costs to customers of loss of power. Thus, there is an economic optimum point where the cost of additional reserves plus the cost of reliability events to customers is minimized. Based on past reliability assessments, results of the Astrape analysis, and to enhance consistency and communication regarding reserve targets, both DEP and DEC had adopted a 14.5% minimum summer planning reserve margin for scheduling new resource additions.

In 2015, DEP and DEC contracted again with Astrape Consulting to perform an updated resource adequacy study. The Companies believe that the study was warranted at this time due to several factors. First, the severe, extreme weather experienced in the service territory the last two winter periods was so impactful to the systems that additional review with the inclusion of recent years' weather history was warranted. Second, since the last reliability study the system has added, and projects to add, a large amount of resources that provide meaningful capacity benefits in the summer only. From a peak reduction perspective such summer oriented resources include solar generation, HVAC load control and chiller uprates to existing natural gas combined cycle units. The interconnection queue for solar facilities shows potential to add significantly to the solar resources already incorporated in the system.

Initial results of this updated study indicate that a 17% summer planning reserve margin is required to maintain the one day in 10 year LOLE standard. As such, DEP has utilized a 17% planning reserve margin in the 2015 IRP as opposed to the 14.5% reserve margin used in the 2014 IRP. However, preliminary findings also indicate that a summer-only reserve margin target may not be adequate for providing long term reliability given the increasing levels of summer-only resources. Additional study is needed to determine whether dual summer/winter planning reserve margin targets are required in the future. Once the final results are determined, any changes will be included in the 2016 IRP.

Adequacy of Projected Reserves

DEP's resource plan reflects reserve margins ranging from 17.0% to 21.9%. Reserves projected in DEP's IRP meet the minimum planning reserve margin target and thus satisfy the one day in 10 years LOLE criterion. The projected reserve margin exceeds the minimum 17% target by 3% or more in 2016-2018 primarily due to a decrease in the load forecast compared to earlier projections. The projected reserve margin exceeds the target by 3% or more in 2022 as a result of the economic addition of a large combined-cycle facility.

A significant increase in projected solar capacity causes reserves to exceed 3% of the target in 2023. The projected reserve margin also exceeds the target by 3% or more in 2027 as a result of the economic addition of a large block of combustion turbine capacity.

The IRP provides general guidance in the type and timing of resource additions. Since capacity is generally added in large blocks to take advantage of economies of scale, it should be noted that projected planning reserve margins in years immediately following new generation additions will often be somewhat higher than the minimum target. Large resource additions are deemed economic only if they have a lower Present Value Revenue Requirement (PVRR) over the life of the asset as compared to smaller resources that better fit the short-term reserve margin need. Development of detailed self-build projects and utilization of the Request for Proposals (RFP) process to consider purchased power alternatives will ensure the Company selects the most cost-effective resource additions. Reserves projected in DEP's IRP are appropriate for providing an economic and reliable power supply.

e) <u>Fuel Costs</u>

In the 2014 IRP, the first 5 years of natural gas prices were based on market data and the remaining years were based off of fundamental pricing. Market prices represent liquid, tradable gas prices offered at the present time, also called "future or forward prices." These prices represent an actual contractually agreed upon price that willing buyers and sellers agree to transact upon at a specified future date. As such, assuming market liquidity, they represent the markets view of spot prices for a given point in the future. Fundamental prices developed through external econometric models, on the other hand, represent a projection of fuel prices into the future taking into account changing supply and demand assumptions of the changing dynamics of the external marketplace. The natural gas market has become more liquid, and there are now multiple buyers and sellers of natural gas in the marketplace that are willing to transact at longer transaction terms. Due to the evolving natural gas market, DEP and DEC are using market based prices for the first 10 years of the planning period (2016 – 2025). Following the 10 years of market prices, the Companies transition to fundamental pricing over a 5 year period with 100% fundamental pricing in 2030 and beyond.

As in the 2014 IRP, coal prices continue to be based on 5 years of market data in the 2015 IRP. In order to account for the impact on coal prices by using a longer market based natural gas price, the companies are transitioning to fundamental coal pricing over a 10 year period (2021 to 2030), using the same growth rate as natural gas through that time period. Previously the Companies moved to fundamental coal prices once market prices were unavailable, but the

Companies believe this creates an unrealistic disconnect between coal and natural gas prices in the medium term.

f) New Resource Retirements/Additions

Asheville Plant

As part of the Western Carolinas Modernization Project (WCMP) announced in the spring of 2015, the combined 376 MW Asheville 1 & 2 coal units are planned to be retired no later than January 31, 2020. The retired units are expected to be replaced with a 663 MW natural gas combined cycle unit on site in November 2019, along with necessary and associated natural gas delivery and electric transmission infrastructure projects. Additionally, an undetermined amount of solar generation is planned for installation at the same site shortly after the retirement of the coal plants. The Certificate of Public Convenience and Necessity (CPCN) for the new combined cycle unit is expected to be filed with the NCUC in the fourth quarter of 2015. As part of the WCMP, the three fuel oil combustion turbine units totaling 126 MW that were planned for Asheville in 2019, as included in the 2014 DEP IRP Short-Term Action Plan, are no longer necessary and have been removed from the 2015 IRP.

This retirement date for the Asheville coal units represents an acceleration of approximately 10 years from previous planning assumptions. The retirements of the units, and the corresponding investments in the required infrastructure to replace those units, are being accelerated due to a culmination of several factors. These factors include continued declines in natural gas prices, the unique opportunity to take advantage of an economic gas delivery project by the local gas distribution company, and the opportunity to avoid significant investment in additional environmental controls at the coal units that would be required by 2020.

In summary, benefits from the WCMP include, but are not limited to:

- Significant fuel cost reductions through the construction of new transmission infrastructure and combined cycle plant coupled with eliminating the uneconomic utilization of the coal units.
- Avoidance of significant capital expenditures for further environmental controls on the coal units.
- Avoidance of costs associated with three fuel oil combustion turbine units that would be required in the absence of the WCMP.
- Engagement in a unique opportunity to partner with the local gas distribution company to bring cost-effective natural gas supply to the western Carolinas.
- Enhanced reliability following multiple polar vortex events.

Sutton and Lee Inlet Air Chillers

The 2014 IRP called for installation of 137 MW of inlet air chiller technology at Sutton and Lee combined cycle plants prior to the summer of 2018. The most recent analysis of summer reserves shows that these chillers can be delayed until at least the summer of 2019. The 2015 IRP shows installation in May 2019, and a slight downward adjustment of capacity to 135 MW (77 MW at Lee CC and 58 MW at Sutton CC). The benefits to winter capacity from these chillers is not included in the plan as the chiller technology only provides summer peaking capability.

Purchase of NCEMPA Portion of Assets

The North Carolina Eastern Municipal Power Agency (NCEMPA) previously owned partial interest in several Duke Energy Progress plants, including Brunswick Nuclear Plant Units 1 and 2, Mayo Plant, Roxboro Plant Unit 4 and the Harris Nuclear Plant. The Power Agency's ownership interest in these plants represented approximately 700 megawatts of generating capacity. DEP's prior IRPs included NCEMPA's ownership share of the jointly owned assets along with the associated load obligation.

Boards of directors of Duke Energy and the NCEMPA approved an agreement for Duke Energy Progress to purchase the Power Agency's ownership in these generating assets. All required regulatory approvals have been completed and the agreement closed on July 31, 2015. DEP is now 100% owner of these previously jointly owned assets. Under the agreement, Duke Energy Progress will continue meeting the needs of NCEMPA customers previously served by the Power Agency's interest in Duke Energy Progress' plants.

g) EPA Clean Power Plan (CPP)

On August 3, 2015, the EPA signed the final CO_2 emission limits rule for existing fossil-fuel power plants, known as the "Clean Power Plan". The regulation is promulgated under Section 111(d) of the Clean Air Act and is sometimes referred to as "111(d)". The rule is both lengthy (over 1550 pages) and complex. There have been considerable legal questions raised since the initial proposal and the rule remains controversial both at the state and federal levels.

EPA has made substantial changes from the proposed rule it released in June 2014 and a complete analysis will take time. The rule maintains a building block approach and preserves the first three building blocks of heat rate improvement, re-dispatch to natural gas and construction of renewables. Building block 4, which in the proposal established energy efficiency targets, has been eliminated from the final rule. There are new elements in the final rule including additional compliance options, a model trading program and a "clean energy incentive program" to encourage early investments in renewable generation and demand-side energy efficiency.

Regulation under Section 111(d) of the Clean Air Act requires EPA to set the program requirements in a guideline document it issues to the states. The document must include:

"An emission guideline that reflects the application of the best system of emission reduction … that has been adequately demonstrated for designated facilities," taking into account both the "cost of achieving such emission reductions" as well as the "remaining useful life of sources."

States use the EPA guidance document to develop their own regulations – often referred to as a state implementation plan (SIP). States have primary implementation and enforcement authority and responsibility for the regulation.

State emission reduction goals were calculated based on EPA's determination of the "Best System of Emission Reduction" (BSER) for existing plants. Since no technology is commercially available to reduce CO_2 emissions at fossil fueled power plants, EPA proposed that the application of building blocks across the entire electric generation system was appropriate for determining the degree of emission reduction that would be achievable.

States have until September 6, 2016 to submit a complete plan or a partial plan with an extension request. States receiving an extension must submit a final state implementation plan (SIP) by September 6, 2018. EPA plans to take one year to review state plans (this could be a significant challenge for the Agency to accomplish). Duke Energy's compliance obligations will be finalized once a state compliance plan has been approved. If a state chooses not to submit a plan or a plan is deemed to be inadequate, EPA will impose a federal plan on the state.

North Carolina

The North Carolina 2030 rate target increased from 992 lbs. CO_2/MWh (proposed rule) to 1,136 lbs./MWh (final rule). In addition, the final rule includes a 2030 mass cap for North Carolina of 51,266,234 tons of CO_2. It remains unclear if the increased rate will make it easier or more difficult to comply given the uncertainty surrounding the treatment of new natural gas combined cycle (NGCC) units. Early indications are that the NC Department of Environment and Natural Resources (NC DENR) will pursue submittal of a final plan based on what utilities can achieve at the individual affected unit, referred to as 'Building Block 1', to the EPA by the September 2016 deadline. With seven operational coal-fired stations and a growing fleet of NGCC units, the final rule and implementation plan will certainly impact generation in North Carolina, but the extent of these impacts remains unclear.

South Carolina

The South Carolina 2030 rate target increased from 772 lbs. CO_2/MWh (proposed rule) to 1,156 lbs./MWh (final rule). In addition, the final rule includes a 2030 mass cap for South Carolina of 25,998,968 tons of CO_2. The SC Department of Health and Environmental Control has a robust stakeholder group evaluating options and intends to apply for the two year extension, pushing back the date for submittal of a final rule to September 2018. Duke Energy operates no coal-fired generation in South Carolina, so the impact of the rule is anticipated to be minimal.

h) Transmission Planned or Under Construction

This section contains the planned transmission line and substation additions since the 2014 IRP. Only those projects added since the 2014 IRP are included. A discussion of the adequacy of DEP's transmission system is also included. Table 4-C lists the transmission projects that are planned to meet reliability needs. This section also provides information pursuant to the North Carolina Utilities Commission Rule R8-62.

Table 4-C: DEP Transmission Line and Substation Additions

	Location		Capacity	Voltage	
Year	**From**	**To**	**MVA**	**KV**	**Comments**
2016	Falls	-	336	230/115	New
2016	Selma	-	336	230/115	Upgrade
2018[2]	Vanderbilt	West Asheville	307	115	Upgrade
2018[3]	Richmond	Raeford	1195	230	Relocate, new
2018[4]	Ft. Bragg Woodruff St.	Raeford	1195	230	Relocate, new
2019	Craggy	Enka	799	230	New
2019	Asheville Plant	-	448	230/115	New
2020	Jacksonville	Grants Creek	1195	230	New
2020	Newport	Harlowe	681	230	New

[2] The date for this project in the 2014 IRP was 2016. The project has been re-scheduled for 2018.
[3] This project was included in the 2014 IRP, however some parameters have been made and are represented on the following pages.
[4] This project was included in the 2014 IRP, however some parameters have been made and are represented on the following pages.

Rule R8-62: Certificates of environmental compatibility and public convenience and necessity for the construction of electric transmission lines in North Carolina.

(p) Plans for the construction of transmission lines in North Carolina (161 kV and above) shall be incorporated in filings made pursuant to Commission Rule R8-60. In addition, each public utility or person covered by this rule shall provide the following information on an annual basis no later than September 1:

(1) For existing lines, the information required on FERC Form 1, pages 422, 423, 424, and 425, except that the information reported on pages 422 and 423 may be reported every five years.

Please refer to the Company's FERC Form No. 1 filed with NCUC in April, 2015.

(p) Plans for the construction of transmission lines in North Carolina (161 kV and above) shall be incorporated in filings made pursuant to Commission Rule R8-60. In addition, each public utility or person covered by this rule shall provide the following information on an annual basis no later than September 1:

(2) For lines under construction, the following:

- *a. Commission docket number;*
- *b. Location of end point(s);*
- *c. Length;*
- *d. Range of right-of-way width;*
- *e. Range of tower heights;*
- *f. Number of circuits;*
- *g. Operating voltage;*
- *h. Design capacity;*
- *i. Date construction started;*
- *j. Projected in-service date;*

The following pages represent those projects in response to Rule R8-62 parts (1) and (2).

DEP has no transmission line projects currently under construction.

(p) Plans for the construction of transmission lines in North Carolina (161 kV and above) shall be incorporated in filings made pursuant to Commission Rule R8-60. In addition, each public utility or person covered by this rule shall provide the following information on an annual basis no later than September 1:

(3) For all other proposed lines, as the information becomes available, the following:

a. County location of end point(s);
b. Approximate length;
c. Typical right-of-way width for proposed type of line;
d. Typical tower height for proposed type of line;
e. Number of circuits;
f. Operating voltage;
g. Design capacity;
h. Estimated date for starting construction (if more than 6 month delay from last report, explain); and
i. Estimated in-service date (if more than 6-month delay from last report, explain). (NCUC docket no. E-100, sub 62, 12/4/92; NCUC docket no. E-100, sub 78a, 4/29/98.)

The following pages represent those projects in response to Rule R8-62 part (3).

Richmond – Raeford 230 kV Line Loop-In

Project Description: Loop-In the existing 230 kV transmission line from the Richmond 230 kV Substation in Richmond County to the Ft. Bragg Woodruff St 230 kV Substation in Cumberland County at Raeford 230 kV Substation in Hoke County.

a. County location of end point(s); Hoke County
b. Approximate length; 5 miles
c. Typical right-of-way width for proposed type of line; 125 feet
d. Typical tower height for proposed type of line; 80 -120 feet
e. Number of circuits; 1
f. Operating voltage; 230 kV
g. Design capacity; 1195 MVA
h. Estimated date for starting construction; September 2015
i. Estimated in-service date; June 2018

Ft. Bragg Woodruff St – Raeford 230 kV Line loop-in

Project Description: Loop-In the existing 230 kV transmission line from the Richmond 230 kV Substation in Richmond County to the Ft. Bragg Woodruff St 230 kV Substation in Cumberland County at Raeford 230 kV Substation in Hoke County.

a. County location of end point(s); Hoke County
b. Approximate length; 5 miles
c. Typical right-of-way width for proposed type of line; 125 feet
d. Typical tower height for proposed type of line; 80 – 120 feet
e. Number of circuits; 1
f. Operating voltage; 230 kV
g. Design capacity; 1195 MVA
h. Estimated date for starting construction; September 2015
i. Estimated in-service date; June 2018

Craggy – Enka 230 kV Line

Project Description: Construct new 230 kV transmission line from the Craggy 230 kV Substation in Buncombe County to the Enka 230 kV Substation also in Buncombe County.

a. County location of end point(s); Buncombe County
b. Approximate length; 10 miles
c. Typical right-of-way width for proposed type of line; 125 feet
d. Typical tower height for proposed type of line; 80 – 120 feet
e. Number of circuits; 1
f. Operating voltage; 230 kV
g. Design capacity; 799 MVA
h. Estimated date for starting construction; September 2016
i. Estimated in-service date; December 2019

Jacksonville – Grants Creek 230 kV Line

Project Description: Construct new 230 kV transmission line from the Jacksonville 230 kV Substation in Onslow County to the Grants Creek 230 kV Substation in Onslow County.

a. County location of end point(s); Onslow County
b. Approximate length; 15 miles
c. Typical right-of-way width for proposed type of line; 125 feet
d. Typical tower height for proposed type of line; 80 – 120 feet
e. Number of circuits; 1
f. Operating voltage; 230 kV
g. Design capacity; 1195 MVA
h. Estimated date for starting construction; September 2016
i. Estimated in-service date; June 2020

Newport – Harlowe 230 kV Line

Project Description: Construct new 230 kV transmission line from the Newport 230 kV Substation in Carteret County to the Harlowe 230 kV Substation in Carteret County.

a. County location of end point(s); Carteret County
b. Approximate length; 8 miles
c. Typical right-of-way width for proposed type of line; 125 feet
d. Typical tower height for proposed type of line; 80 – 120 feet
e. Number of circuits; 1
f. Operating voltage; 230 kV
g. Design capacity; 681 MVA
h. Estimated date for starting construction; September 2016
i. Estimated in-service date; June 2020

DEP Transmission System Adequacy

DEP monitors the adequacy and reliability of its transmission system and interconnections through internal analysis and participation in regional reliability groups. Internal transmission planning looks 10 years ahead at available generating resources and projected load to identify transmission system upgrade and expansion requirements. Corrective actions are planned and implemented in advance to ensure continued cost-effective and high-quality service. The DEP transmission model is incorporated into models used by regional reliability groups in developing plans to maintain interconnected transmission system reliability. DEP works with DEC, NCEMC and ElectriCities to develop an annual NC Transmission Planning Collaborative (NCTPC) plan for the DEP and DEC systems in both North and South Carolina. In addition, transmission planning is coordinated with neighboring systems including South Carolina Electric & Gas (SCE&G) and Santee Cooper under a number of mechanisms including legacy interchange agreements between SCE&G, Santee Cooper, DEP, and DEC.

The Company monitors transmission system reliability by evaluating changes in load, generating capacity, transactions and topography. A detailed annual screening ensures compliance with DEP's Transmission Planning Summary guidelines for voltage and thermal loading. The annual screening uses methods that comply with SERC policy and NERC Reliability Standards and the screening results identify the need for future transmission system expansion and upgrades. The transmission system is planned to ensure that no equipment overloads and adequate voltage is maintained to provide reliable service. The most stressful scenario is typically at peak load with certain equipment out of service. A thorough screening process is used to analyze the impact of potential equipment failures or other disturbances. As problems are identified, solutions are developed and evaluated.

Transmission planning and requests for transmission service and generator interconnection are interrelated to the resource planning process. DEP currently evaluates all transmission reservation requests for impact on transfer capability, as well as compliance with the Company's Transmission Planning Summary guidelines and the FERC Open Access Transmission Tariff (OATT). The Company performs studies to ensure transfer capability is acceptable to meet reliability needs and customers' expected use of the transmission system. Generator interconnection requests are studied in accordance with the Large and Small Generator Interconnection Procedures in the OATT and the North Carolina Interconnection Procedures.

Southeastern Reliability Corporation (SERC) audits DEP every three years for compliance with NERC Reliability Standards. Specifically, the audit requires DEP to demonstrate that its transmission planning practices meet NERC standards and to provide data supporting the

Company's annual compliance filing certifications. SERC conducted a NERC Reliability Standards compliance audit of DEP in the fall of 2014. DEP received "No Findings" from the audit team.

DEP participates in a number of regional reliability groups to coordinate analysis of regional, sub-regional and inter-balancing authority area transfer capability and interconnection reliability. Each reliability group's purpose is to:

- Assess the interconnected system's capability to handle large firm and non-firm transactions for purposes of economic access to resources and system reliability;

- Ensure that planned future transmission system improvements do not adversely affect neighboring systems; and

- Ensure interconnected system compliance with NERC Reliability Standards.

Regional reliability groups evaluate transfer capability and compliance with NERC Reliability Standards for the upcoming peak season and five- and ten-year periods. The groups also perform computer simulation tests for high transfer levels to verify satisfactory transfer capability.

Application of the practices and procedures described above have ensured DEP's transmission system is expected to continue to provide reliable service to its native load and firm transmission customers.

5. LOAD FORECAST

The Duke Energy Progress Spring 2015 Forecast provides projections of the energy and peak demand needs for its service area. The forecast covers the time period of 2016 – 2030 and represents the needs of the following customer classes:

- Residential
- Commercial
- Industrial
- Other Retail
- Wholesale

Energy projections are developed with econometric models using key economic factors such as income, electricity prices, industrial production indices, along with weather and appliance efficiency trends. Population is also used in the Residential customer model. While regression analysis has consistently yielded reasonable results over the years, processes are continually reviewed and compared between jurisdictions in an effort to improve upon the forecasting process. Large unforeseen events however, such as the "great recession" or the loss of large wholesale customers, will cause forecasts to differ from actual results.

The economic projections used in the Spring 2015 Forecast are obtained from Moody's Analytics, a nationally recognized economic forecasting firm, and include economic forecasts for the states of North Carolina and South Carolina.

The Retail forecast consists of the three major classes: Residential, Commercial and Industrial.

The Residential class sales forecast is comprised of two projections. The first is the number of residential customers, which is driven by population. The second is energy usage per customer, which is driven by weather, regional economic and demographic trends, electric price and appliance efficiencies.

The usage per customer forecast was derived using a Statistical Adjusted End-Use Model (SAE). This is a regression based framework that uses projected appliance saturation and efficiency trends developed by Itron using Energy Information Administration (EIA) data. It incorporates naturally occurring efficiency trends and government mandates more explicitly than other models. The outlook for usage per customer is essentially flat through much of the forecast horizon, so most of the growth is primarily due to customer increases. The projected growth rate of Residential in the Spring 2015 Forecast after all adjustments for Utility EE programs, Solar and Electric Vehicles from 2016-2030 is 1.3%.

The Commercial forecast also uses a SAE model in an effort to reflect naturally occurring as well as government mandated efficiency changes. The three largest sectors in the Commercial class are Offices, Education and Retail. Commercial is expected to be the fastest growing class, with a projected growth rate of 1.5%, after adjustments.

The Industrial class is forecasted by a standard econometric model, with drivers such as total manufacturing output, textile output, and the price of electricity. Overall, Industrial sales are expected to grow 0.9% over the forecast horizon, after all adjustments.

County population projections are obtained from the North Carolina Office of State Budget and Management as well as the South Carolina Budget and Control Board. These are then used to derive the total population forecast for the counties that comprise the DEP service area.

Weather impacts are incorporated into the models by using Heating Degree Days and Cooling Degree Days with a base temperature of 65. The forecast of degree days is based on a 10 year average.

The appliance saturation and efficiency trends are developed by Itron using data from the EIA. Itron is a recognized firm providing forecasting services to the electric utility industry. These appliance trends are used in the residential and commercial sales models.

Peak demands were projected using the SAE approach in the Spring 2015 Forecast. The peak forecast was developed using a monthly SAE model, similar to the sales SAE models, which includes monthly appliance saturations and efficiencies, interacted with weather and the fraction of each appliance type that is in use at the time of monthly peak.

Assumptions

Below are the projected average annual growth rates of several key drivers from DEP's Spring 2015 Forecast.

	2016 - 2030
Real Income	2.7%
Mfg. IPI	2.1%
Population	1.0%

In addition to economic, demographic, and efficiency trends, the forecast also incorporates the expected impacts of utility-sponsored energy efficient programs, as well as projected effects of electric vehicles and behind the meter solar technology.

Wholesale

The wholesale contracts that are included in the load forecast are listed in Table 10-A in Chapter 10.

Historical Values

It should be noted that the long-term structural decline of the Textile industry and the recession of 2008-2009 have had an adverse impact on DEP sales. The worst of the Textile decline appears to be over, and Moody's Analytics expects the Carolina's economy to show solid growth going forward.

In tables 5-A & 5-B below the history of DEP customers and sales are given. As a note, the values in Table 5-B are not weather adjusted.

Table 5-A Retail Customers (Thousands, Annual Average)

	2005	2006	2007	2008	2009	2010	2011	2012	2013	2014
Residential	1,123	1,149	1,174	1,195	1,207	1,216	1,221	1,231	1,242	1,257
Commercial	205	210	214	216	215	216	217	219	222	222
Industrial	4	4	4	4	5	5	4	4	4	4
Total	1,332	1,363	1,392	1,415	1,426	1,437	1,443	1,455	1,468	1,484

Table 5-B Electricity Sales (GWh Sold - Years Ended December 31)

	2005	2006	2007	2008	2009	2010	2011	2012	2013	2014
Residential	16,003	16,664	16,259	17,200	17,000	17,117	19,108	17,764	16,663	18,201

Total System	55,928	56,340	55,682	57,209	56,489	55,400	58,316	55,903	55,031	57,601

Utility Energy Efficiency

A new process for reflecting the impacts of UEE on the forecast was introduced in Spring 2015. In the latest forecast, the concept of 'Program Life' for a program was included in the calculations. For example, if the accelerated benefit of a residential UEE program is expected to have occurred 7 years before the energy reduction program would have been otherwise adopted, then the UEE effects after year 7 are subtracted ("rolled off") from the total cumulative UEE. With the SAE models framework, the naturally occurring appliance efficiency trends replace the rolled off UEE benefits serving to continue to reduce the forecasted load resulting from energy efficiency adoption.

The table below illustrates this process.

- Column A: Total energy demand for DEP before any reduction for UEE
- Column B: Total incremental cumulative UEE
- Column C: Roll-off amount of the historical UEE programs
- Column D: Roll-off amount of the incremental future UEE programs
- Column E: Total net UEE benefits (column B less columns C & D)
- Column F: Total DEP energy demand after incorporating UEE (column A less column E)

Table 5-C UEE Program Life Process (MWh)

	A	B	C	D	E	F
	Forecast Before EE	Total Cumulative EE	Roll-Off Historical UEE	Roll-Off Forecasted UEE	UEE to Subtract From Forecast	Forecast After UEE
2016	66,805,005	1,611,837	37,998	0	1,573,839	65,231,166
2017	67,539,168	1,789,279	104,966	0	1,684,313	65,854,855

Note: UEE Data is net of free riders

Results

Tabulations of class forecasts and sales are given in Table 5-D and Table 5-E. The sales forecasts are after all adjustments for UEE, Solar and Electric Vehicles.

Table 5-D Retail Customers (Thousands, Annual Average)

	Residential Customers	Commercial Customers	Industrial Customers	Other Customers	Retail Customers
2016	1,292	225	4	1	1,523
2017	1,309	227	4	2	1,542
2018	1,325	229	4	2	1,560
2019	1,342	231	4	2	1,578
2020	1,358	233	4	2	1,596
2021	1,373	235	4	2	1,614
2022	1,389	237	4	2	1,632
2023	1,404	239	5	2	1,649
2024	1,419	241	5	2	1,667
2025	1,434	244	5	2	1,683
2026	1,448	246	5	2	1,700
2027	1,463	248	5	2	1,717
2028	1,478	250	5	2	1,734
2029	1,492	252	5	2	1,751
2030	1,507	255	5	2	1,767

Table 5-E Electricity Sales (GWh Sold - Years Ended December 31)

	Residential Gwh	Commercial Gwh	Industrial Gwh	Other Gwh	Retail Gwh
2016	17,967	14,043	10,412	1,620	44,042
2017	18,166	14,207	10,497	1,618	44,487
2018	18,383	14,418	10,574	1,615	44,990
2019	18,620	14,635	10,658	1,612	45,525
2020	18,878	14,863	10,758	1,610	46,107
2021	19,095	15,048	10,836	1,607	46,587
2022	19,354	15,252	10,920	1,605	47,130
2023	19,615	15,476	11,020	1,602	47,713
2024	19,897	15,734	11,120	1,600	48,351
2025	20,125	15,952	11,219	1,597	48,894
2026	20,402	16,201	11,316	1,595	49,514
2027	20,681	16,460	11,416	1,593	50,150
2028	21,042	16,756	11,514	1,591	50,904
2029	21,304	17,008	11,611	1,589	51,511
2030	21,616	17,311	11,723	1,587	52,236

Tabulations of the utility's forecasts, including peak loads for summer and winter seasons of each year and annual energy forecasts, both with and without the impact of UEE programs, are shown below in Tables 5-G and 5-H.

Load duration curves, with and without UEE programs, follow Tables 5-G and 5-H, and are shown as Charts 5-A and 5-B.

The values in these tables reflect the loads that Duke Energy Progress is contractually obligated to provide and cover the period from 2016 to 2030.

For the period 2016-2030, the Spring 2015 Forecast resulted in the following growth rates:

Table 5-F Growth Rates of Retail and Wholesale Customers (2016-2030)

	2015 Forecast (2016 – 2030)		
	Summer Peak Demand	**Winter Peak Demand**	**Energy**
Excludes impact of new EE programs	1.5%	1.3%	1.2%
Includes impact of new EE programs	1.3%	1.2%	1.2%

The peaks and sales in the tables and charts below are at the generator, except for the Class sales forecast, which is at meter.

Table 5-G Load Forecast without Energy Efficiency Programs & Before Demand Reduction Program

YEAR	SUMMER (MW)	WINTER (MW)	ENERGY (GWH)
2016	13,048	12,767	66,805
2017	13,224	12,938	67,539
2018	13,402	13,133	68,364
2019	13,595	13,342	69,176
2020	13,949	13,531	70,004
2021	14,208	13,703	70,640

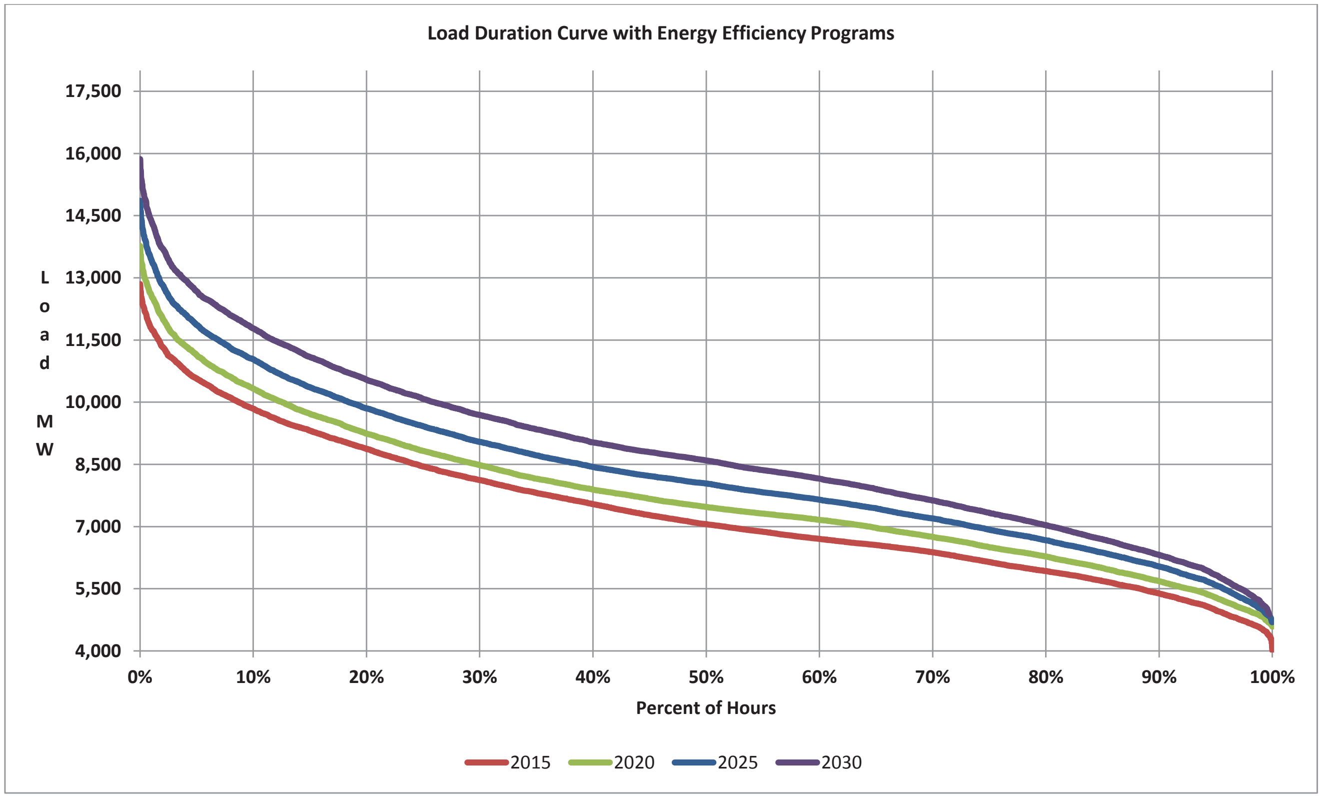
Chart 5-B Load Duration Curve with Energy Efficiency Programs & Before Demand Reduction Programs



6. DEVELOPMENT OF RESOURCE PLAN

The following section details the Company's expansion plan and resource mix that is required to meet the needs of DEP's customers over the next 15 years. The section also includes a discussion of the various technologies considered during the development of the IRP, as well as, a summary of the resources required in the "No Carbon" sensitivity case.

DEP - Assumptions of Load, Capacity, and Reserves Table

The following notes are numbered to match the line numbers on the Summer Projections of Load, Capacity, and Reserves table. All values are MW except where shown as a Percent.

1. Planning is done for the peak demand for the Duke Energy Progress System.

2. Firm sale of 150 MW through 2024.

3. Cumulative energy efficiency and conservation programs (does not include demand response programs).

4. Peak load adjusted for firm sales and cumulative energy efficiency.

5. Existing generating capacity reflecting designated additions, planned uprates, retirements and derates as of January 1, 2015.

   Includes total unit capacity of jointly owned units.

6. Capacity Additions include:

   Planned nuclear uprates totaling 29 MW in the 2017-2018 timeframe.

   Planned combined cycle uprates totaling 135 MW in 2019.

   84 MW Sutton Blackstart combustion turbine addition in 2017.

   A short-term 350 MW PPA is included in 2017, and removed in the fall of 2017.

   This PPA is a placeholder to ensure compliance with the minimum planning reserve margin and will be re-evaluated in the coming months.

7. Planned Retirements include:

   Sutton CT Units 1, 2A and 2B in 2017 (61 MW).

   Darlington CT Units 1-11 by 2020 (553 MW).

   Blewett CT Units 1-4 and Weatherspoon CT units 1-4 in 2027 (180 MW).

   Robinson 2 in 2030 (741 MW).

8. Sum of lines 5 through 7.

DEP - Assumptions of Load, Capacity, and Reserves Table (cont.)

9. Cumulative Purchase Contracts have several components:

   Purchased capacity from PURPA Qualifying Facilities, Anson and Hamlet CT tolling, Butler Warner purchase, Southern CC purchase, and Broad River CT purchase.

   Additional line items are shown under the total line item to show the amounts of renewable and traditional resource purchases. Renewables in these line items are not used for NC REPS compliance.

10. New nuclear resources economically selected to meet load and minimum planning reserve margin Capacity must be on-line by June 1 to be included in available capacity for the summer peak of that year and by December 1 to be included in available capacity for the winter peak of that year.

    No new nuclear resources were selected in the Base Case in the 15 year study period.

11. New combined cycle resources economically selected to meet load and minimum planning reserve margin.

    Capacity must be on-line by June 1 to be included in available capacity for the summer peak of that year and by December 1 to be included in available capacity for the winter peak of that year.

    Addition of 895 MW of combined cycle capacity in 2021, 2022 and 2030.

12. New combustion turbine resources economically selected to meet load and minimum planning reserve margin.

    Capacity must be on-line by June 1 to be included in available capacity for the summer peak of that year and by December 1 to be included in available capacity for the winter peak of that year.

    Addition of 828 MW of combustion turbine capacity in 2021 and 2027.

13. New CHP resources. 20 MW in 2019 and 20 MW in 2021.

14. Cumulative solar, biomass, hydro and wind resources to meet NC REPS and SC DERP compliance.

    Also includes utility-owned solar.

DEP - Assumptions of Load, Capacity, and Reserves Table (cont.)

15. Sum of lines 8 through 14.

16. Cumulative Demand Side Management programs including load control and DSDR.

17. Sum of lines 15 and 16.

18. The difference between lines 17 and 4.

19. Reserve Margin = (Cumulative Capacity-System Peak Demand)/System Peak Demand

    Line 18 divided by Line 4.

    Minimum target planning reserve margin is 17%.

Technologies Considered

Similar to the 2014 IRP, the Company considered a diverse range of technology choices utilizing a variety of different fuels in order to meet future generation needs in the 2015 IRP.

As in the 2014 IRP, the Company conducted an economic screening analysis of various technologies. Through the screening process the following technologies were considered as part of the more detailed quantitative analysis phase of the planning process in the 2015 IRP, with changes from the 2014 IRP highlighted and explained in further detail below.

- Base load – 723 MW Supercritical Pulverized Coal with CCS
- Base load – 525 MW IGCC with CCS
- Base load – 2 x 1,117 MW Nuclear units (AP1000)
- Base load – **895 MW** – 2x2x1 Advanced Combined Cycle (Inlet Chiller and Duct Fired)
- **Base load – 20 MW – CHP** (CT with HRSG)
- Peaking/Intermediate – **828 MW** 4-7FA CTs
- Renewable – 150 MW Wind - On-Shore
- Renewable – 5 MW Landfill Gas
- Renewable – 25 MW Solar Photovoltaic (PV)

Combined Cycle base capacities and technologies: Based on proprietary third party engineering studies, the 2x2x1 Advanced CC saw an increase in base load of 29 MWs. The older version base 2x1 CC and the 3x1 Advanced CC were not considered in the updated IRP. However, as the Company begins the process of evaluating particular technologies for future undesignated generation needs, these technologies, along with other new technologies, may be considered based on factors such as generation requirements, plot size, new environmental regulations, etc.

Combustion Turbine base capacities and technologies: Based on proprietary third party engineering studies, the F-Frame CT technology saw an increase in base load of 36 MWs. The LM6000 CTs were not considered in the updated IRP. However, as the Company begins the process of evaluating particular technologies for future undesignated generation needs, these technologies, along with other new technologies, may be considered based on factors such as generation requirements, plot size, new environmental regulations, etc.

CHP: As mentioned previously, two 20-MW Combined Heat & Power units are considered in the 2015 IRP and are included as resources for meeting future generation needs. Duke Energy is exploring and working with potential customers with good base thermal loads on a regulated CHP offer and, as CHP continues to be implemented, future IRP processes will incorporate additional CHP as appropriate.

In addition to the technologies listed above, Li-ion batteries with off-peak charging were considered in the screening process as an energy storage option. Energy Storage in the form or battery storage is becoming more feasible with the advances in battery technology and the reduction in battery cost; however, their uses have been concentrated on frequency regulation, solar smoothing, and/or energy shifting from localized renewable energy sources with a high incidence of intermittency (i.e. solar and wind applications).

Centralized generation will likely remain the backbone of the grid for Duke Energy in the long term; however, in addition to centralized generation it is possible that distributed generation will begin to share more and more grid responsibilities over time as technologies such as energy storage increase our grid's flexibility. At this point however, the screening analysis shows that costs are still prohibitive for large scale battery technologies to be considered in the IRP.

<u>Expansion Plan and Resource Mix</u>

A tabular presentation of the 2015 Base Case resource plan represented in the above LCR table is shown below:

Table 6-C DEP Base Case Resources– Summer (with CO_2)

Duke Energy Progress Resource Plan (1) Base Case - Summer					
Year	**Resource**			**MW**	
2016	-			-	
2017	Sutton Blackstart CTs	Nuclear Uprates		84	14
2018	Nuclear Uprates			15	
2019	CC Uprates	CHP		135	20
2020	Asheville CC			663

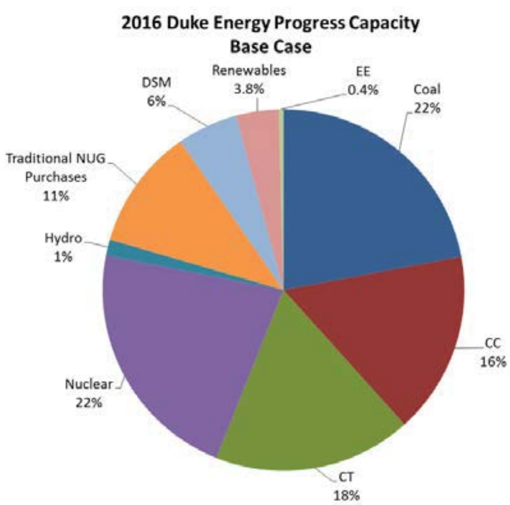
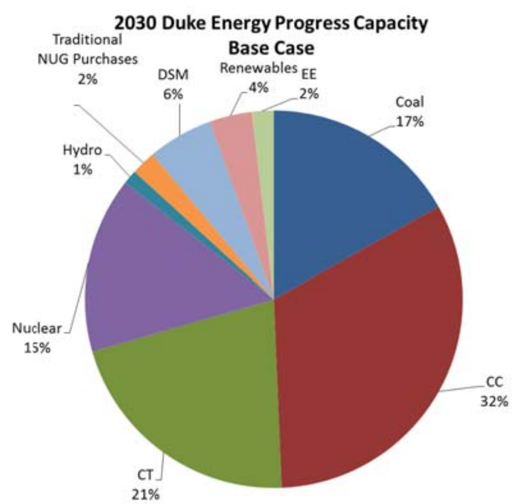
DEP Base Case Resources Cumulative Summer Totals - 2016 - 2030	
Nuclear	29
CC	3483
CT	1740
CHP	40
Total	5292

The following charts illustrate both the current and forecasted capacity by fuel type for the DEP system, as projected in the Base Case. As demonstrated in Chart 6-A, the capacity mix for the DEP system changes with the passage of time. In 2030, the Base Case projects that DEP will have a smaller reliance on coal and a higher reliance on gas-fired resources, nuclear, renewable resources and EE as compared to the current state.

Chart 6-A 2016 & 2030 Base Case Summer Capacity Mix





As a sensitivity, the Company developed a No Carbon Price scenario (No Carbon Sensitivity). The expansion plan for this case is shown below in Table 6-E. Table 6-F summarizes the capacity additions for the No Carbon Sensitivity case by technology type.

Table 6-E No Carbon Sensitivity – Summer

Duke Energy Progress Resource Plan (1) No Carbon Sensitivity - Summer						
Year	**Resource**			**MW**		
2016	-			-		
2017	Sutton Blackstart CTs	Nuclear Uprates		84	14	
2018	Nuclear Uprates			15		
2019	CC Uprates	CHP		135	20	
2020	Asheville CC			663

7. SHORT-TERM ACTION PLAN

The Company's Short-Term Action Plan, which identifies accomplishments in the past year and actions to be taken over the next five years, is summarized below:

Continued Reliance on EE and DSM Resources

The Company is committed to continuing to grow the amount of EE and DSM resources utilized to meet customer growth. The following are the ways in which DEP will increase these resources:

- Continue to execute the Company's EE and DSM plan, which includes a diverse portfolio of EE and DSM programs spanning the residential, commercial, and industrial classes.

- Continue on-going work to develop and implement additional cost-effective EE and DSM products and services. Since the last biennial IRP, DEP has implemented the following new program offerings: Residential New Construction Program, Energy Efficient Lighting Program and Small Business Energy Saver Program.

- Continue to seek enhancements to the Company's EE/DSM portfolio by: (1) adding new or expanding existing programs to include additional measures, (2) program modifications to account for changing market conditions and new measurement and verification (M&V) results and (3) other EE research & development pilots.

- Over the 5 year period represented in the Short-Term Action Plan, DEP projects to add an incremental 115 MW of EE and 149 MW of DSM.

Continued Focus on Renewable Energy Resources

- DEP is committed to full compliance with NC REPS in North Carolina and SC DERP in South Carolina. Due to pending expiries of Federal and State tax subsidies for solar development, the Company has experienced a substantial increase in solar QFs in the interconnection queue. With this significant level of interest in solar development, DEP continues to procure renewable purchase power resources, when economically viable, as part of its Compliance Plans. DEP is also pursuing the addition of new utility-owned solar on the DEP system.

- DEP continues to evaluate market options for renewable generation and procure capacity, as appropriate. PPAs have been signed with developers of solar PV and landfill gas resources. Additionally, REC purchase agreements have been executed for purchases of unbundled RECs from wind, solar PV, solar thermal and hydroelectric facilities.

- DEP continues to pursue CHP opportunities, as appropriate.

Addition of Clean Natural Gas Resources

- Begin construction on the Sutton Blackstart CTs in 2016 to be available for the summer peak of 2017. The Company's petition for a Certificate of Public Convenience and Necessity (CPCN) was approved by the NCUC with an order issued on August 3, 2015.

- Pursue the addition of a new combined cycle at the Asheville facility in the 2019 timeframe as part of the WCMP.

- Continue to evaluate older CTs on the DEP system. The Company is evaluating the condition and economic viability of the older CTs on the system. In doing so, DEP is preparing for the potential retirement of these units. This includes determining the type of resources needed to reliably replace these units to maintain a minimum planning reserve margin.

- Take actions to ensure capacity needs beginning in 2021 are met. In addition to seeking to meet the Company's EE and DSM goals and meeting the Company's NC REPS and SC DERP requirements, actions to secure additional capacity may include purchased power, short-term PPAs or Company-owned generation. The 2015 IRP projects that the best resources to meet this 2021 demand are combined cycle units.

- Placeholder for a short-term PPA of 350 MW is included in 2017 to meet 17% reserve margin. This will continue to be reviewed in future IRPs.

Expiration of Wholesale Purchase Contracts (CONFIDENTIAL)

In the 2016-2020 timeframe, DEP has [redacted] of wholesale purchase contracts that are scheduled to expire. At this time, DEP is not relying on contract extensions on these contracts. As such, these contract expirations are included in the IRP and Short-Term Action Plan. A summary of those expirations is shown in Table 7-A below. In addition to the expirations shown in this five year period, additional contracts expire during the 15 year IRP study period.

Table 7-A Wholesale Purchase Contract Expirations (CONFIDENTIAL)

[redacted]

Continued Focus on System Reliability and Resource Adequacy for DEP System

As previously stated, DEP has retained Astrape Consulting to conduct a reserve margin study to examine the resource adequacy of the DEP system. Based upon the recent extreme winter weather, the potential for continued extreme weather, and the large amount of expected solar resource additions, the Company felt that new examination of the reliability of the system and the adequacy of the resources was warranted.

Initial results of this updated study indicate that a 17% summer planning reserve margin is required to maintain the one day in 10 year loss of load expectation (LOLE). As such, DEP has utilized a 17% planning reserve margin in the 2015 IRP as opposed to the 14.5% reserve margin used in the 2014 IRP. However, preliminary findings also indicate that a summer-only reserve margin target may not be adequate for providing long term reliability given the increasing levels of summer-only resources. Additional study is needed to determine whether dual summer/winter planning reserve margin targets are required in the future. Once the final results are determined, any changes will be included in the 2016 IRP.

The 2015 IRP includes a placeholder for a short-term 350 MW purchased power agreement (PPA) in 2020 to satisfy the increase in the planning reserve margin to 17%. The need for this short-term PPA will be reevaluated after the reserve margin study is completed and there is greater certainty regarding reserve margin target(s), load and resource needs.

Continued Focus on Regulatory, Environmental Compliance & Wholesale Activities

- Retired older coal generation. As of December 2013, all of DEP's older, un-scrubbed coal units have been retired. DEP has retired 1,600 MW of older coal units in total since 2011.

- Retire Asheville coal units. The Company expects to retire the existing Asheville coal units no later than January 31, 2020 and replace with new combined cycle generation as part of the WCMP. The Asheville units have a combined capacity of 376 MW.

- Continue to prepare for the final rule of EPA's Clean Power Plan.

- Continue to investigate the future environmental control requirements and resulting operational impacts associated with existing and potential environmental regulations such as MATS, the Coal Combustion Residuals rule, the Cross State Air Pollution Rule (CSAPR), and the new Ozone National Ambient Air Quality Standard (NAAQS).

- Aggressively pursue compliance in North Carolina and South Carolina in addressing coal ash management and ash pond remediation. Ensure timely compliance plans and their associated costs are contemplated within the planning process and future integrated resource plans, as appropriate.

- Continue to pursue existing and potential opportunities for wholesale power sales agreements within the Duke Energy balancing authority area.

- Continue to monitor energy-related statutory and regulatory activities.

- Continue to examine the benefits of joint capacity planning and pursue appropriate regulatory actions.

A summarization of the capacity resources for the reference plan in the 2015 IRP is shown in Table 7-B below. Capacity retirements and additions are presented as incremental values in the year in which the change is projected to occur. The values shown for renewable resources, EE and DSM represent cumulative totals.

Table 7-B DEP Short-Term Action Plan

Duke Energy Progress Short-Term Action Plan								
			Compliance Renewable Resources (Cumulative Nameplate MW)			Other Non-Compliance Renewables (Cumulative Nameplate MW) (4)		
Year	Retirements	Additions	Wind (1)	Solar (1)	Biomass/Hydro (3)	Solar/Biomass/Hydro	EE	DSM (2)
2016			0	459	171	397	67	871
2017	61 MW Sutton CTs (Units 1, 2A, 2B)	84 MW Sutton Blackstart CTs 14 MW Nuc Uprate	0	462	206	409	96	923
2018		15 MW Nuc Uprate	0	465	164	408	125	967
2019		20 MW CHP 135 MW CC Uprate	0	467	164	407	155	1004
2020	406 MW Darlington CT (Units 1-3, 5, 7-10) 376 MW Asheville Coal	663 MW Asheville CC 350 MW CT PPA (5)	0	468	167	407	183	1021

Notes:

(1) Capacity is shown in nameplate ratings. For planning purposes, wind presents a 13% contribution to peak and solar has a 44% contribution to peak.

(2) Includes impacts of grid modernization.

(3) Biomass includes swine and poultry contracts.

(4) Other renewables includes NUGs and utility-owned projects.

(4) This is a placeholder PPA for 2020, and removed in 2021.

8. OWNED GENERATION

DUKE ENERGY PROGRESS OWNED GENERATION

Duke Energy Progress' generation portfolio includes a balanced mix of resources with different operating and fuel characteristics. This mix is designed to provide energy at the lowest reasonable cost to meet the Company's obligation to serve its customers. Duke Energy Progress-owned generation, as well as purchased power, is evaluated on a real-time basis in order to select and dispatch the lowest-cost resources to meet system load requirements. In 2014, Duke Energy Progress' nuclear and coal-fired generating units met the vast majority of customer needs by providing 46% and 26%, respectively, of Duke Energy Progress' energy from generation. Hydroelectric generation, Combustion Turbine generation, Combined Cycle generation, solar generation, long term PPAs, and economical purchases from the wholesale market supplied the remainder.

The tables below list the Duke Energy Progress' plants in service in North Carolina (NC) and South Carolina (SC) with plant statistics, and the system's total generating capability.

Existing Generating Units and Ratings [1, 3]
All Generating Unit Ratings are as of December 31, 2014 unless otherwise noted.

Coal						
	Unit	**Winter (MW)**	**Summer (MW)**	**Location**	**Fuel Type**	**Resource Type**

Harris #1	New Hill, NC	10/24/26	12/12/2008	10/24/2046

Note 1: The license renewal application for the Blewett and Tillery Plants was filed with the FERC on 04/26/06; the Company is awaiting issuance of the new license from FERC. Pending receipt of a new license, these plants are currently operating under a renewable one-year license extension which has been in effect since May 2008. Although Progress Energy has requested a 50-year license, FERC may not grant this term.

Note 2: Estimated - New license expiration date will be determined by FERC license issuance date and term of granted license.

9. CONCLUSIONS

DEP continues to focus on the needs of customers by meeting the growing demand in the most economical and reliable manner possible. The Company continues to improve the IRP process by determining best practices and making changes to more accurately and realistically represent the DEP System in its planning practices. The 2015 IRP represents a 15 year projection of the Company's plan to balance future customer demand and supply resources to meet this demand plus a 17% minimum planning reserve margin. Over the 15-year planning horizon, DEP expects to require 5,292 MW of additional generating resources in addition to the incremental renewable resources, EE and DSM already in the resource plan.

The Company focuses on the needs of the short-term, while keeping a close watch on market trends and technology advancements to meet the demands of customers in the long-term. The Company's short-term and long-term plans are summarized below:

Short-Term

Over the next 5 years, DEP's 2015 IRP focuses on the following:

- Begin construction on the Sutton Blackstart CTs in 2016 to be available for the summer peak of 2017.
- Pursue the addition of a new combined cycle at the Asheville facility in the 2019 timeframe as part of the WCMP.
- Take actions to ensure capacity needs beginning in 2021 are met.
- Complete the resource adequacy study currently underway with Astrape Consulting.
- Procure CHP resources as cost-effective and diverse generation sources, as appropriate.
- Continue to meet NC REPS and SC DERP compliance plans and invest in additional cost-effective renewable resources.
- Continue to invest in EE and DSM in the Carolinas region.

Long-Term

Beyond the next 5 years, DEP's 2015 IRP focuses on the following:

- Continue to seek the most cost-effective, reliable resources to meet the growing customer demand in the service territory. Currently, those are new combined cycle units and combustion turbine units in the 15 year planning horizon.
- Procure CHP resources as cost-effective and diverse generation sources, as appropriate.

- Continue to meet NC REPS and SC DERP compliance plans by investing in additional renewable resources and EE on the DEP system.
- Continue to invest in DSM in the Carolinas region.

DEP's goal is to continue to diversify the DEP system by adding a variety of cost-effective, reliable, clean resources to meet customer demand. Over the next 15 years, the Company projects filling the increasing demand with investments in natural gas, renewables, and EE and DSM.

10. NON-UTILITY GENERATION AND WHOLESALE

The following information describes the tables included in this chapter.

Wholesale Sales Contracts
This table includes wholesale sales contracts that are included in the 2015 Load Forecast. This information is **CONFIDENTIAL**.

Wholesale Purchase Contracts
This table includes all wholesale purchase contracts that are included as resources in the 2015 IRP. This information is **CONFIDENTIAL**.

Non-Utility Generation Contracts
This table includes all Non-Utility Generation contracts that have been signed since the 2014 IRP. This list includes contracts signed since June 1, 2014, as this was the date utilized in the tables in Appendix H in the 2014 IRP. This list is up to date as of June 30, 2015. This information is **CONFIDENTIAL**, so the customer names have been redacted.

The Duke Energy Progress

NC Renewable Energy & Energy Efficiency Portfolio Standard (NC REPS) Compliance Plan

September 1, 2015

NC REPS Compliance Plan
Table of Contents

INTRODUCTION:

Duke Energy Progress, LLC (DEP or the Company) submits its annual Renewable Energy and Energy Efficiency Portfolio Standard (NC REPS or REPS) Compliance Plan (Compliance Plan) in accordance with NC Gen. Stat. § 62-133.8 and North Carolina Utilities Commission (the Commission) Rule R8-67(b). This Compliance Plan, set forth in detail in Section II and Section III, provides the required information and outlines the Company's projected plans to comply with NC REPS for the period 2015 to 2017 (the Planning Period). Section IV addresses the cost implications of the Company's REPS Compliance Plan.

In 2007, the North Carolina General Assembly enacted Session Law 2007-397 (Senate Bill 3), codified in relevant part as NC Gen. Stat. § 62-133.8, in order to:

- Diversify the resources used to reliably meet the energy needs of consumers in the State;
- Provide greater energy security through the use of indigenous energy resources available within the State;
- Encourage private investment in renewable energy and energy efficiency; and
- Provide improved air quality and other benefits to energy consumers and citizens of the State.

As part of the broad policy initiatives listed above, Senate Bill 3 established the NC REPS, which requires the investor-owned utilities, electric membership corporations or co-operatives, and municipalities to procure or produce renewable energy, or achieve energy efficiency savings, in amounts equivalent to specified percentages of their respective retail megawatt-hour (MWh) sales from the prior calendar year.

Duke Energy Progress seeks to advance these State policies and comply with its REPS obligations through a diverse portfolio of cost-effective renewable energy and energy efficiency resources. Specifically, the key components of Duke Energy Progress' 2015 Compliance Plan include: (1) energy efficiency programs that will generate savings that can be counted towards the Company's REPS obligation; (2) purchases of renewable energy certificates (RECs); (3) operations of company-owned renewable facilities; and (4) research studies to enhance the Company's ability to comply with its REPS obligations in the future. The Company believes that these actions yield a diverse portfolio of qualifying resources and allow a flexible mechanism for compliance with the requirements of NC Gen. Stat. § 62-133.8.

In addition, the Company has undertaken, and will continue to undertake, specific regulatory and operational initiatives to support REPS compliance, including: (1) submission of regulatory applications to pursue reasonable and appropriate renewable energy and energy efficiency initiatives in support of the Company's REPS compliance needs; (2) solicitation, review, and analysis of proposals from renewable energy suppliers offering RECs and diligent pursuit of the most attractive opportunities, as appropriate;

and (3) development and implementation of administrative processes to manage the Company's REPS compliance operations, such as procuring and managing renewable resource contracts, accounting for RECs, safely interconnecting renewable energy suppliers, reporting renewable generation to the North Carolina Renewable Energy Tracking System (NC-RETS), and forecasting renewable resource availability and cost in the future.

The Company believes these actions collectively constitute a thorough and prudent plan for compliance with NC REPS and demonstrate the Company's commitment to pursue its renewable energy and energy efficiency strategies for the benefit of its customers.

I. REPS COMPLIANCE OBLIGATION:

Duke Energy Progress calculates its NC REPS Compliance Obligations[5] for 2015, 2016, and 2017 based on interpretation of the statute (NC Gen. Stat. § 62-133.8), the Commission's rules implementing Senate Bill 3 (Rule R8-67), and subsequent Commission orders, as applied to the Company's actual or forecasted retail sales in the Planning Period, as well as the actual and forecasted retail sales of those wholesale customers for whom the Company is supplying REPS compliance services. The Company's wholesale customers for whom it supplies REPS compliance services are the Town of Sharpsburg, the Town of Stantonsburg, the Town of Lucama, the Town of Black Creek, Town of Winterville and the City of Waynesville (Waynesville compliance provided for 2015 only, as DEP's contract with Waynesville expires 12/31/2015) (collectively referred to as Wholesale or Wholesale Customers)[6]. Table 1 below shows the Company's retail and Wholesale customers' REPS Compliance Obligation.

---

[5] For the purposes of this Compliance Plan, Compliance Obligation is more specifically defined as the sum of Duke Energy Progress' native load obligations for both the Company's retail sales and for wholesale native load priority customers' retail sales for whom the Company is supplying REPS compliance. All references to the respective Set-Aside requirements, the General Requirements, and REPS Compliance Obligation of the Company include the aggregate obligations of both Duke Energy Progress and the Wholesale Customers. Also, for purposes of this Compliance Plan, all references to the compliance activities and plans of the Company shall encompass such activities and plans being undertaken by Duke Energy Progress on behalf of the Wholesale Customers.

[6] For purposes of this Compliance Plan, Retail Sales is defined as the sum of Duke Energy Progress' retail sales and the retail sales of the wholesale customers for whom the company is supplying REPS compliance.

Table 1: Duke Energy Progress' NC REPS Compliance Obligation

Compliance Year	Previous Year DEP Retail Sales (MWhs)	Previous Year Wholesale Retail Sales (MWhs)	Total Retail sales for REPS Compliance (MWhs)	Solar Set-Aside (RECs)	Swine Set-Aside (RECs)	Poultry Set-Aside (RECs)	REPS Requirement (%)	Total REPS Compliance Obligation (RECs)
2015	37,490,737	212,347	37,703,084	52,784	26,392	202,536	6%	2,262,185
2016	37,084,787	120,748	37,205,535	52,088	26,044	255,925	6%	2,232,332
2017	37,500,664	121,215	37,621,879	52,671	52,671	257,740	6%	2,257,313

Note: Obligation is determined by prior-year MWh sales. Thus, retail sales figures for compliance years 2015 and 2016 are estimates.

As shown in Table 1, the Company's requirements in the Planning Period include the solar energy resource requirement (Solar Set-Aside), swine waste resource requirement (Swine Set-Aside), and poultry waste resource requirement (Poultry Set-Aside). In addition, the Company must also ensure that, in total, the RECs that it produces or procures, combined with energy efficiency savings, is an amount equivalent to 6% of its prior-year retail sales in compliance years 2015, 2016 and 2017. The Company refers to this as its Total Obligation. For clarification, the Company refers to its Total Obligation, net of the Solar, Swine, and Poultry Set-Aside requirements, as its General Requirement.

II. REPS COMPLIANCE PLAN:

In accordance with Commission Rule R8-67b(1)(i), the Company describes its planned actions to comply with the Solar, Swine, and Poultry Set-Asides, as well as the General Requirement below. The discussion first addresses the Company's efforts to meet the Set-Aside requirements and then outlines the Company's efforts to meet its General Requirement in the Planning Period.

A. SOLAR ENERGY RESOURCES:

Pursuant to NC Gen. Stat. § 62-133.8(d), the Company must produce or procure solar RECs equal to a minimum of 0.14% of the prior year's total electric energy in megawatt-hours (MWh) sold to retail customers in North Carolina in 2015, 2016 and 2017.

Based on the Company's actual retail sales in 2014, the Solar Set-Aside is 52,784 RECs in 2015. Based on forecasted retail sales, the Solar Set-Aside is projected to be approximately 52,088 RECs and 52,671 RECs in 2016 and 2017, respectively.

The Company's plan for meeting the Solar Set-Aside in the Planning Period is described in further detail below.

1. Company-Owned Solar Facilities

As the result of a solar RFP issued in February 2014, DEP announced plans to acquire and construct three solar facilities in North Carolina, totaling 128 MW of capacity: a 65MW facility in Duplin County; a 40MW facility in Wilson County and a 23MW facility in Bladen County. In addition, the Camp Lejeune Solar Facility will add approximately 13 MW of solar PV capacity to DEP's system and is the Company's first solar facility at a military base. All of these Company-owned projects are anticipated to be online by the end of 2015.

2. Solar PPAs and Solar REC Purchase Agreements

DEP has executed multiple solar REC purchase agreements with third parties. These agreements include contracts with multiple counterparties to procure solar RECs from both solar photovoltaic (PV) and solar water heating installations. Also as part of the 2014 solar RFP, DEP signed power purchase agreements with five new solar projects, totaling 150 MW of capacity. Additional details with respect to the REC purchase agreements are set forth in Exhibit A.

3. Residential Solar PV Program

The Company also maintains a residential solar PV program, which offers incentives to customers who install solar. In exchange, the Company receives RECs created by the systems for 5 years. By year-end 2015, the Company expects total program participation of approximately 4MW of solar PV from around 900 program participants.

4. Review of Company's Solar Set-Aside Plan

The Company has made and continues to make reasonable efforts to meet the Solar Set-Aside requirement in the Planning Period, and remains confident that it will be able to comply with this requirement. Therefore, the Company sees minimal risk in meeting the Solar Set-Aside and will continue to monitor the development and progress of solar initiatives and take appropriate actions as necessary.

B. SWINE WASTE-TO-ENERGY RESOURCES

Pursuant to NC Gen. Stat. § 62-133.8(e), as amended by the NCUC *Final Order Modifying the Swine Waste Set-Aside Requirement and Providing Other Relief,* Docket No. E-100, Sub 113 (November 2014), for calendar years 2015 and 2016, at least 0.07%, and in 2017, at least 0.14% of prior-year total retail electric energy sold in aggregate by utilities in North Carolina must be supplied by energy derived from swine waste. The Company's Swine Set-Aside is estimated to be 26,392 RECs in 2015, 26,044 RECs in 2016, and 52,671 RECs in 2017.

Swine waste-to-energy compliance challenges have been numerous and varied. Three paths to the creation of swine waste-to-energy RECs have been identified, although each faces unique challenges.

1. On-farm generation

Projects consisting of digestion and generation on a single farm or tight cluster of farms often face gas production and feedstock agreement challenges, as well as interconnection difficulties. The Company understands that many farms in NC are contract growers and have only limited term agreements with the integrators. Accordingly, many contract growers are not in a position to provide a firm supply of waste sufficient to support project financing. The Company is exploring ways to overcome such risks.

2. Centralized digestion

This type of system would benefit farmers that cannot individually construct and operate an anaerobic digester manure handling system on their own due to the capital expense or just don't have the number of animals required to operate a digester successfully or cost effectively. Farms located close to each other could share the cost of the centrally located digester system. The centralized digester operated by an individual or private company would carry out the operation and maintenance of the digester and its mechanical systems. It would have the same advantages as on-farm digesters of odor reduction, pathogen and weed seed destruction, biogas production and a stable effluent ready to fertilize fields and crops.

The Company recognizes that NIMBY ("Not In My Back Yard") issues may scuttle some developers' plans for overcoming fuel supply and interconnection problems faced by more rural, on-farm projects.

3. Injected/Directed biogas

In theory, injected biogas reduces costs by using large, efficient centralized generation in the place of smaller, less-efficient reciprocating engines typical of other projects. However, practically, the Company has found such solutions in North Carolina to be economically challenged, in part due to additional gas clean-up requirements prior to injection and the general lack of physical proximity between clusters of farms and pipeline infrastructure.

The Company continues to explore directed biogas opportunities, including promising opportunities outside of North Carolina where the gas would be transported on interstate pipelines used for fuel in one of the Company's combined cycles.

In spite of Duke Energy Progress' active and diligent efforts to secure resources to comply with its Swine Waste Set-Aside requirements, the Company will not be able to procure sufficient volumes of RECs to meet its pro-rata share of the swine waste set-aside requirements in 2015. The Company remains actively engaged in seeking additional resources and continues to make every reasonable effort to comply with the swine waste set-aside requirements.

The Company's ability to comply in 2016 and 2017 remains highly uncertain and subject to multiple variables, particularly relating to counterparty achievement of projected delivery requirements and commercial operation milestones. Additional details with respect to the Company's compliance efforts and REC purchase agreements are set forth in Exhibit A and the Company's tri-annual progress reports, filed confidentially in Docket E-100 Sub113A.

Due to its expected non-compliance in 2015, the Company has submitted a motion to the Commission for approval of a request to relieve the Company from compliance with the swine-waste requirements until calendar year 2016 by delaying the compliance obligation for a one year period.

C. POULTRY WASTE-TO-ENERGY RESOURCES

Pursuant to NC Gen. Stat. § 62-133.8(f), as amended by NCUC *Final Order Modifying the Poultry and Swine Waste Set-Aside Requirements and Providing Other Relief*, Docket No. E-100, Sub 113 (March 2014), for calendar year 2015, at least 700,000 MWhs, and for 2016 and 2017, at least 900,000 MWhs, of the prior year's total electric energy sold to retail electric customers in the State or an equivalent amount of energy shall be produced or procured each year from poultry waste, as defined per the Statute and additional clarifying Orders. As the Company's retail sales share of the State's total retail megawatt-hour sales is approximately 29%, the Company's Poultry Set-Aside is estimated to be 202,536 RECs in 2015, 255,925 RECs in 2016, and 257,740 in 2017.

In spite of Duke Energy Progress' active and diligent efforts to secure resources to comply with its Poultry Waste Set-Aside requirements, the Company will not be able to procure sufficient volumes of RECs to meet its pro-rata share of the poultry set-aside requirements in 2015. The Company remains actively engaged in seeking additional resources and continues to make every reasonable effort to comply with the poultry waste set-aside requirements.

Several near-term challenges remain to the Company's meeting the poultry set-aside targets in the future. To date, only a handful of poultry projects are operating and online in North Carolina. Ramping up to meet the increased compliance targets for 2015 - 2017 has been problematic because other suppliers have either delayed projects or lowered the volume of RECs to be produced. The Company is, nevertheless, encouraged by the growing use of thermal poultry RECs and the proposals that it has recently received from developers.

The Company's ability to comply in 2016 and 2017 remains uncertain and largely subject to counterparty performance. Additional details with respect to the Company's compliance efforts and REC purchase agreements are set forth in Exhibit A and the Company's tri-annual progress reports, filed confidentially in Docket E-100 Sub113A.

Due to its expected non-compliance in 2015, the Company has submitted a motion to the Commission for approval of a request to relieve the Company from compliance with the poultry-waste requirements until calendar year 2016 by delaying the compliance obligation for a one year period.

D. GENERAL REQUIREMENT RESOURCES

Pursuant to NC Gen. Stat. § 62-133.8, Duke Energy Progress is required to comply with its Total Obligation in 2015, 2016, and 2017 by submitting for retirement a total volume of RECs equivalent to 6% of retail sales in North Carolina in the prior year: approximately 2,262,185 RECs in 2015, 2,232,332 RECs in 2016, and 2,257,313 RECs in 2017. This requirement, net of the Solar, Swine, and Poultry Set-Aside requirements, is estimated to be 1,980,473 RECs in 2015, 1,898,275 RECs in 2016, and 1,894,231 in 2017. The various resource options available to the Company to meet the General Requirement are discussed below, as well as the Company's plan to meet the General Requirement with these resources.

1. Energy Efficiency

During the Planning Period, the Company plans to meet 25% of the Total Obligation with Energy Efficiency (EE) savings, which is the maximum allowable amount under NC Gen. Stat. § 62-133.7(b)(2)c. The Company continues to develop and offer its customers new and innovative EE programs that will deliver savings and count towards its future NC REPS requirements. The Company has attached a list of those EE measures that it plans to use toward REPS compliance, including projected impacts, as Exhibit B.

2. Hydroelectric Power

Duke Energy Progress plans to use hydroelectric power from two sources to meet the General Requirement in the Planning Period: (1) Wholesale Customers' Southeastern Power Administration (SEPA) allocations; and (2) hydroelectric generation suppliers whose facilities have received Qualifying Facility (QF or QF Hydro) status. Wholesale Customers may also bank and utilize hydroelectric resources arising from their full allocations of SEPA. When supplying compliance for the Wholesale Customers, the Company will ensure that hydroelectric resources do not comprise more than 30% of each Wholesale Customers' respective compliance portfolio, pursuant to NC Gen. Stat. § 62-133.8(c)(2)c. In addition, RECs from QF Hydro facilities will be used towards the General Requirements of Duke Energy Progress' retail customers. Please see Exhibit A for more information.

3. Biomass Resources

Duke Energy Progress plans to meet a portion of the General Requirement through a variety of biomass resources, including landfill gas to energy, combined heat and power, and direct combustion of biomass fuels. The Company is purchasing RECs from multiple biomass facilities in the Carolinas, including landfill gas to energy facilities and biomass-fueled combined heat and power facilities, all of which qualify as renewable energy facilities. Please see Exhibit A for more information on each of these contracts.

Duke Energy Progress notes, however, that reliance on direct-combustion biomass remains limited in long-term planning horizons, in part due to continued uncertainties around the developable potential of such resources in the Carolinas and the projected availability of other forms of renewable resources to offset the need for biomass.

4. Wind

Duke Energy Progress plans to meet a portion of the General Requirement with RECs from wind facilities. While the Company expects to rely upon wind resources for REPS compliance, the extent and timing of that reliance will likely vary commensurately with changes to supporting policies and prevailing market prices. The Company recognizes that some land-based wind developers are presently pursuing projects of significant size in North Carolina. While successful projects have to navigate a litany of obstacles, these obstacles are not insurmountable. The Company also has observed that opportunities may exist to transmit land-based wind energy resources into the Carolinas from other regions, which could supplement the amount of wind that could be developed within the Carolinas.

5. Use of Solar Resources for General Requirement

Duke Energy Progress plans to meet a portion of the General Requirement with RECs from solar facilities. The Company views the downward trend in solar equipment and installation costs over the past several years as a positive development. Additionally, new solar facilities also benefit from generous supportive Federal and State policies that are expected to be in place beyond 2015. While uncertainty remains around possible alterations or extensions of policy support, as well as the pace of future cost declines, the Company fully expects solar resources to contribute to our compliance efforts beyond the solar set-aside minimum threshold for NC REPS during the Planning Period.

6. Review of Company's General Requirement Plan

The Company has contracted for or otherwise procured sufficient resources to meet its General Requirement in the Planning Period. Based on the known information available at the time of this filing, the Company is confident that it will meet this General Requirement during the Planning Period and submits that the actions and plans described herein represent a reasonable and prudent plan for meeting the General Requirement.

E. SUMMARY OF RENEWABLE RESOURCES

The Company has evaluated, procured, and/or developed a variety of types of renewable and energy efficiency resources to meet its NC REPS requirements within the compliance Planning Period. As noted above, several risks and uncertainties exist across the various types of resources and the associated parameters of the NC REPS requirements. The Company continues to carefully monitor opportunities and unexpected developments across all facets of its compliance requirements. Duke Energy Progress submits that it has crafted a prudent, reasonable plan with a diversified balance of renewable resources that will allow the Company to comply with its NC REPS obligation over the Planning Period.

III. COST IMPLICATIONS OF REPS COMPLIANCE PLAN

A. CURRENT AND PROJECTED AVOIDED COST RATES

The current variable rate represents the avoided cost rate in Schedule CSP-29 (NC), Distribution Interconnection, approved in the Commission's *Order Establishing Standard Rates and Contract Terms for Qualifying Facilities*, issued in Docket No. E-100, Sub 127 (July 27, 2011). The current long-term rates represent the annualized avoided cost rates approved in the Commission's *Order on Motion to Suspend Avoided Cost Rates*, issued in Docket No. E-100, Sub 136 (December 21, 2012). The projected avoided cost rates represent the annualized avoided cost rates proposed by the Company in Docket No. E-100, Sub 140.

The projected avoided costs rates contained herein are subject to change, particularly as the underlying assumptions change and as the methodology for determining the avoided cost is addressed by the North Carolina Utilities Commission in pending Docket No. E-100, Sub 140. Primary assumptions that impact avoided cost rates are turbine costs, fuel price projections, and the expansion plans. Changes to these assumptions are addressed in greater detail in the current Integrated Resource Plan.

Table 2: Current and Projected Avoided Cost Rates Table

[BEGIN CONFIDENTIAL]

CURRENT AVOIDED ENERGY AND CAPACITY COST (from E-100 Sub 136)			
	On-Peak Energy[1] ($/MWh)	**Off-Peak Energy[1] ($/MWh)**	[redacted]
2016	47.44	38.53	
2017	47.05	40.20	
2018	54.14	42.60	

PROJECTED AVOIDED ENERGY AND CAPACITY COST			
	On-Peak Energy[5] ($/MWh)	**Off-Peak Energy[5] ($/MWh)**	[redacted]
2016	36.99	32.89	
2017	38.60	34.46	
2018	37.04	34.13	

Notes: (1) On-peak and off-peak energy rates based on Option B hours and information and assumptions available concurrent with the 2014 IRP and derived using methodology approved in Docket No. E-100, Sub 136
(2) Capacity Cost column provides the installed CT cost with AFUDC
(3) Turbine cost agreed upon in E-100 Sub 136 settlement
(4) Turbine cost proposed in E-100, Sub 140 divided by summer capacity rating
(5) On-peak and off-peak energy rates based on Option B hours and information and assumptions available concurrent with the methodology proposed in Docket No. E-100, Sub 140
(6) Does not incorporate additional considerations used in rate calculation and is subject to change

B. PROJECTED TOTAL NORTH CAROLINA RETAIL AND WHOLESALE SALES AND YEAR-END NUMBER OF CUSTOMER ACCOUNTS BY CLASS

The tables below reflect the inclusion of the Wholesale Customers in the Compliance Plan.

Table 3: Retail Sales for Retail and Wholesale Customers

		2014 Actual	2015 Forecast	2016 Forcast	2017 Forecast
Retail MWh Sales		37,490,737	37,084,787	37,500,664	37,909,134
Whoesale MWh Sales		212,347	120,748	121,215	121,684
Total MWh Sales		37,703,084	37,205,535	37,621,879	38,030,818

Note: The MWh sales reported above are those applicable to REPS compliance years 2015 – 2017, and represent actual MWh sales for 2014, and projected MWh sales for 2015 and 2017.

Table 4: Retail and Wholesale Year-end Number of Customer Accounts

		2014 (Actual)	2015 (Projected)	2016 (Projected)	2017 (Projected)
Residential Accts		1,215,618	1,232,841	1,247,894	1,265,529
General Accts		198,063	199,849	200,952	202,759
Industrial Accts		2,123	2,109	2,099	2,090

Note: The number of accounts reported above are those applicable to the cost caps for compliance years 2015 – 2017, and represent the actual number of accounts for year-end 2014, and the projected number of accounts for year-end 2015 through 2017.

C. PROJECTED ANNUAL COST CAP COMPARISON OF TOTAL AND INCREMENTAL COSTS, REPS RIDER AND FUEL COST IMPACT

Projected compliance costs for the Planning Period are presented in the cost tables below by calendar year. The cost cap data is based on the number of accounts as reported above.

Table 5: Projected Annual Cost Caps and Fuel Related Cost Impact

	2015	2016	2017
Total projected REPS compliance costs	$175,742,700	$238,968,551	$ 251,665,511
Recovered through the Fuel Rider	$150,405,592	$206,151,650	$ 214,179,630
Total incremental costs (REPS Rider)	$ 25,337,108	$ 32,816,901	$ 37,485,881
Total including Regulatory Fee	$ 25,370,140	$ 32,859,684	$ 37,534,751
Projected Annual Cost Caps (REPS Rider)	$ 46,419,866	$ 74,002,944	$ 74,670,196

been explained in FPL's testimony presented in support of its request for a determination of need for WCEC 3, because, whether with or without the proposed plant conversions, adding WCEC 3 in 2011 is the most economic resource available to FPL in 2011 through 2013, it would not be beneficial to FPL's customers to implement any other alternative. Therefore, adding WCEC 3 in 2011 is necessary and appropriate if FPL is to proceed with the cleaner, high efficiency conversion of Canaveral and Riviera and continue to ensure system reliability.

Q. Is the 20% reserve margin planning criterions appropriate for use in FPL's IRP process?

A. Yes. The 20% reserve margin reliability criterion utilized by FPL in its integrated resource planning process has been reviewed and approved by the Commission and it is appropriate and necessary to ensure reliable service for FPL's customers.

Q. Could FPL lower the planning reserve margin reliability criterion to 15% and still provide reliable service to its customers?

A. No. A 15% reserve margin is not adequate to ensure reliable service in FPL's system.

Q. How was FPL's current reserve margin criterion of 20% established?

A. Prior to 1999 FPL used a reserve margin criterion of 15%. It should be noted that FPL's reserves at that time consisted more heavily of generation reserves, with load management contributing less than half of what it will provide in 2014. However, the Commission initiated in the late 1990s a proceeding to determine what the appropriate reserve margin criterion should be to ensure reliability of electric service in the future, recognizing rapid increases in electric loads, the introduction and expansion of new technologies, and recognition that fuel supply interruptions could occur. After audits were performed by the Commission Staff, and after several stakeholders, including Florida's investor-owned utilities, presented their analyses and conclusions, all parties agreed that a 20% reserve margin for the investor-owned utilities was the appropriate level that would ensure reliability of service in the utilities' systems, as well as in peninsular Florida. These investor-owned utilities stipulated that they would agree to use a 20% reserve margin as one of the reliability criteria for resource planning, in addition to a probabilistic criterion such as LOLP, beginning in the summer of 2004. This stipulation was approved by the Commission.

Q. Why is a 15% reserve margin not adequate to ensure reliability in FPL's system?

A. Because a 15% reserve margin, as used in the resource planning process, would provide a level of generation reserves that would be too low to offset the consequences of commonly occurring differences between the assumptions used in FPL's long term plan and actual operating conditions, especially if those differences occur at times when FPL has scheduled planned maintenance outages for one or more generating units.

Q. What differences are you referring to?

A. There are a number of such differences, as one would expect when recognizing that six or more years can separate forecasts that are used to make resource decisions from actual conditions at the time the resource plan is implemented. To illustrate my point I will provide a numerical example that addresses two differences: one is the point in time during the year in which the peak load actually occurs, and the other is the difference between the actual magnitude of the peak load in a future year (2014) and the projected magnitude of the peak for that year that would have been forecasted six years earlier (2008).

Q. How will you present this illustration?

A. I will first use a calculation very similar to that presented in Exhibit SRS-2 attached to the testimony of FPL witness Sim to show, pursuant to the resource planning process FPL follows to determine future needs, how a projected reserve margin of 15% would be achieved for the summer of 2014. This calculation is presented in my Exhibit RS-3. The only difference between this calculation and that presented in SRS-2 is that the former includes sufficient firm generating capacity in FPL's portfolio to reach a reserve margin of 15%. The forecasted load for 2014 was developed in 2008 as part of FPL's IRP process. Column 3 shows the total projected capacity available in FPL's system in the summer of 2014 (27,502 MW). Column 4 shows the projected peak load in the summer of 2014 (26,576 MW). Column 5 shows the quantity of projected DSM available in the summer of 2014 (2,651 MW).

Column 6 shows the projected "firm" peak load; that is, that portion of the projected peak load that cannot be mitigated through the exercise of DSM. This projected "firm" peak load is equal to the projected peak load less the projected DSM, or 23,925 MW. It should be noted that this demonstrates that in its resource planning process FPL first considers all the cost-effective DSM as a resource before determining what additional supply-side resources are required.

Column 7 shows the projected generation reserves compared to the projected "firm" load. This projected generation reserve compared to projected "firm" peak load is equal to projected capacity available less projected "firm" peak load, or 3,577 MW. Column 8 shows the projected reserve margin that this projected generation reserve provides compared to the "firm" peak load; it is equal to the projected generation reserve against "firm" peak load divided by "firm" peak load, expressed as a percent. This is the reserve margin that is used in FPL's resource planning process to develop and compare plans that will provide a 20% reserve margin relative to "firm" peak load. In this case, however, the projected reserve margin against the projected "firm" peak load, after all the DSM is utilized is 15% in the summer of 2014. As column 9 shows, FPL would need to add 1,208 MW of additional firm capacity in order to meet the 20% reserve margin criterion.

Q. You indicated that the calculation above is consistent with FPL's resource planning process. How does FPL allocate resources to meet actual electric load?

A. In actual daily operations FPL dispatches its generation resources in economic order, with lowest cost generation first, to produce all the electricity its customers need. It is only if generation resources are insufficient to meet actual load that the load management portion of DSM is utilized. I am providing an example of the effect of having only 15% reserve margin in my Exhibit RS-4, page 1 of 2. For simplicity, my example assumes that all the DSM consists of load management. First, it is assumed that actual conditions in 2014 are the same as shown on Exhibit RS-3. In other words, the peak load is 26,576 MW and total capacity available is 27,502 MW. Therefore, FPL would be able to meet the load and have 926 MW of unused generation. It would also have 2,651 MW of unused DSM for total reserves of 3,577 MW. This is the same total of reserves as shown on column 7 of Exhibit RS-3, but note that only 926 MW are generation reserves. In other words, in actual operations, generation reserves are only about one fourth of total reserves, with DSM providing three fourths of the reserve. Another way to look at these results is that, in effect, accepting a 15% reserve margin criterion would result in generation reserves that actually provide less than 4% operational reserve margin. Applying the rest of the reserve margin, which is provided by DSM, requires partial curtailment of service to customers who subscribe to load control. This is the situation that would exist in 2014 if all happens as was forecasted six years earlier, in 2008.

Q. **How would a difference between the projected and actual date of a year's peak load affect FPL's ability to meet its customer's needs?**

A. FPL's forecast typically projects that the summer peak load will occur in August and, at present, no plant outages for inspection and maintenance are planned during that month. However, the peak load can occur in June and July when such plant outages are planned. In fact, in the last 16 years the actual peak load day has occurred in August only 9 times. Therefore, it has been a fairly common occurrence that the peak day has occurred in June or July, instead of August.

Q. **How would the actual peak day occurring in June of 2014 instead of August affect the results presented above, assuming FPL were to plan for a 15% reserve margin in 2014?**

A. Typically, about 800 MW of generation capacity will be out of service for planned maintenance in the month of June. Therefore, if the projected peak for 2014 were to occur in June, instead of having 926 MW of generation reserves on the peak load day FPL would have only 126 MW of generation reserves. In other words, the operational reserve margin provided by generation resources in this situation would be not 4%, but only 0.5%.

Q. How would a difference between the actual and projected magnitude in the peak load affect FPL's ability to meet its customer's needs?

A. If the actual peak load in a particular year is significantly greater than had been projected at the time the resource plan was developed for that year as much as six years earlier, unless the reserves are adequate FPL would not be able to meet its customers' needs.

Q. What has been the average percent difference between the actual peak load and the peak load forecast developed six years earlier?

A. On average in the last four years the actual peak load has been 7.3% higher than had been projected six years before. As stated previously, FPL's resource plan that includes the proposed addition of WCEC in 2011 and the conversions of Canaveral and Riviera by 2013 and 2014, respectively utilizes FPL's most recent peak load forecast developed in 2008.

Q. How would your results above change if instead of the actual peak in 2014 occurring in August it occurred in June, and if the actual magnitude of the peak load were 7.3% higher than the forecast, consistent with the three-year average percent variance, and assuming that FPL plans for a 15% reserve margin in 2014?

A. The actual peak load in June of 2014 would be 28,516 MW, which would exceed by 1,814 MW the amount of generation capability of 26,702 MW. In other words, if "average" differences were to occur in only these two areas that affect FPL's ability to meet its customers' needs, based on a 15% reserve margin criterion FPL would be short of generation resources to serve its customers and would be forced to exercise 1,814 MW of the DSM capability, or almost 70% of all DSM. In fact, FPL would then have zero generation reserves and would have only 821 MW of DSM left to address all other possible unexpected occurrences.

Q. Under these circumstances wouldn't FPL return to service all generation facilities that are scheduled for planned maintenance to meet the higher than projected peak load?

A. FPL would indeed try to bring as many of the resources as possible back in service. However, depending on the type of technology scheduled for planned maintenance, the type of maintenance activity to be performed or the stage at which the maintenance work is when there are indications that a significant peak load is likely, FPL may not be able to return generation to service quickly enough to meet the peak load requirement. It should be noted that as FPL continues to add advanced gas turbines to its system, there will be less and less flexibility regarding scheduling planned outages. For advanced gas turbine technology, inspections and maintenance must be performed on a strict schedule to avoid the risk of catastrophic technical failure.

Q. In your calculations above have you assumed that any unplanned generation or transmission outages would occur on the peak day?

A. No. The results provided above assume that all generation that is scheduled to operate on the peak day is operating at maximum capacity and that there are no transmission interruptions. Similarly, this calculation assumes that there are no fuel interruptions and that FPL is not providing emergency assistance to other utilities. In other words, the calculations represented in these examples reflect perfect performance of all systems, with only commonly recurring differences between actual operating conditions and the forecast on which the resource plan is based. The results above indicate that even if everything in 2014 were to occur exactly as projected, generation reserves would only be adequate to mitigate the effect of a combination of unplanned outages and interruptions totaling up to 926 MW. To put this in perspective, FPL has more than 20 generating units with generating capacity greater than 400 MW, of which 9 have a generating capacity greater than 630 MW. Therefore, unplanned outages that could exceed 926 MW are not rare.

If the only deviation from the forecast is that the peak occurs in June when 800 MW of capacity is out of service for a planned maintenance outage, the resulting generation reserves of 126 MW would not be adequate to mitigate the effect of any unplanned outage except for one occurring in FPL's smallest peaking units. As can be seen, the 15% reserve margin criterion is not adequate to ensure reliable service.

Q. How would the results with the higher adjusted peak load occurring in June of 2014 change when FPL maintains a 20% reserve margin?

A. As shown in Exhibit RS-3, maintaining a 20% reserve margin would require total generation capacity to be 28,711 MW in 2014. As shown in Exhibit RS-4, page 2 of 2, this plan would result in available generating capacity of 27,911 MW (after accounting for the 800 MW out for planned maintenance in

June 2014) plus 2,635 MW of DSM for a total of 30,546 MW of resources against the higher adjusted total peak of 28,516 MW. In this situation FPL would be able to meet load demand, provided that it exercises 605 MW of DSM, leaving a DSM reserve of 2,030 MW to meet any other unexpected circumstance. It is important to note that even with a 20% reserve margin in 2014, the occurrence of ordinary differences between planned and actual peak load conditions such as those presented in this example could use up all generation reserves and about 23% of available DSM would have to be utilized. That leaves only 77% of the DSM reserves, and no generation reserves to offset all other unplanned occurrences, against which the reserve margin is intended to protect FPL's customers. For this reason FPL believes that maintaining a 20% reserve margin criterion for resource planning purposes is in the best interest of its customers.

Q. Is this example intended to demonstrate that FPL's 20% reserve margin criterion will always be the correct level of reserve margin to apply to resource planning?

A. No. This example shows that the Commission should dismiss any suggestion that a 15% reserve margin planning criterion would be adequate. The results above show that a 15% reserve margin reliability criterion is totally inadequate to ensure that FPL could provide reliable service to its customers. Furthermore, these analysis results demonstrate that the additional reliability provided by a 20% reserve margin planning criterion compared to what it would be with a 15% reserve margin is very valuable to FPL's customers.

The question regarding the proper level of reserve margin for future resource planning processes would need to be addressed in an independent proceeding and the implementation date of any change should be far enough into the future to allow utilities to incorporate it into their strategic and operational planning processes, especially because it could well be determined that a reserve margin greater than 20% would be appropriate in the future. It is important to note that the reserve margin criterion is a critical starting point in a utility's multi-year process of identifying need for new resources, obtaining data on the various alternatives, evaluating those alternatives, selecting the best alternative to meet that need, negotiating contract for equipment and construction services or purchased power, and presenting a petition to the Commission to obtain a determination of need. If this basic foundation of the process were to be changed as part of the need determination proceeding, there would be no basis on which a utility could begin the planning process. This view is consistent with the Commission's own views, expressed in Commission Order No. PSC-03-0175-FOF-EI regarding a need determination petition for Progress Energy Florida's Hines Unit 3 in which the Commission stated that it is inappropriate to consider a change to the reserve margin planning criterion in a particular utility's need determination proceeding.

Calculation of FPL's Reserve Margin in Summer of 2014

Maintaining a 15% Reserve Margin

	(1)	(2)	(3) = (1)+(2)	(4)	(5)	(6)=(4)-(5)	(7)=(3)-(6)	(8)=(7)/(6)	(9)=((6)*1.20)-(3)

* The Peak Load Forecast is FPL's Feb 2008 load forecast that includes Lee County load.

* * DSM values shown represent cumulative load management and incremental conservation capability.

EXAMPLE WHY 15% RESERVE MARGIN IS INADEQUATE
OPERATIONS WITH NO WCEC 3 NOR PLANT CONVERSIONS

ADDED 325 MW PPA TO MEET 15% RESERVE MARGIN IN 2014

Year	Month	Week	Total Generating Capacity (MW)	Planned Maintenance (MW)	Available Generating Capacity (MW)	Peak Load (MW)	Generating Capacity Reserves (MW)	DSM Available for Use (MW)	DSM Reserves (MW)	Total Reserves (MW)
2014	August	4	27,502	0	27,502	26,576	926	2,651	2,651	3,577

The above outcome assumes everything occurs in 2014 exactly as forecasted six years earlier, in 2008.

Year	Month	Week	Total Generating Capacity (MW)	Planned Maintenance (MW)	Available Generating Capacity (MW)	Peak Load (MW)	Generating Capacity Reserves (MW)	DSM Available for Use (MW)	DSM Reserves (MW)	Total Reserves (MW)
2014	June	1	27,502	(800)	26,702	26,576	126	2,635	2,635	2,761

The above outcome assumes that the forecasted peak occurs in June; otherwise, there is no change.

Year	Month	Week	Total Generating Capacity (MW)	Planned Maintenance (MW)	Available Generating Capacity (MW)	Peak Load (MW)	Generating Capacity Reserves (MW)	DSM Available for Use (MW)	DSM Reserves (MW)	Total Reserves (MW)
2014	June	1	27,502	(800)	26,702	28,516	**(1,814)**	2,635	**821**	**821**

The above outcome assumes that the peak occurs in June, and that the actual peak is higher than forecasted, and the variance is equal to the average percent variance observed in 2004 - 2007.

Note:

The results above assume that all generating capacity except that explicitly scheduled for maintenance is operating at maximum capacity (i.e., no forced outages), that there are no fuel supply interruptions or transmission interruptions, and that FPL is not providing assistance to any other utility.

EXAMPLE WHY 15% RESERVE MARGIN IS INADEQUATE

OPERATIONS WITH WCEC 3 AND CONVERSIONS OF CANAVERAL AND RIVIERA

Year	Month	Week	Total Generating Capacity (MW)	Planned Maintenance (MW)	Available Generating Capacity (MW)	Peak Load (MW)	Generating Capacity Reserves (MW)	DSM Available for Use (MW)	DSM Reserves (MW)	Total Reserves (MW)
2014	August	4	28,711	0	28,711	26,576	2,135	2,651	2,651	4,786

The above outcome assumes everything occurs in 2014 exactly as forecasted seven years earlier.

Year	Month	Week	Total Generating Capacity (MW)	Planned Maintenance (MW)	Available Generating Capacity (MW)	Peak Load (MW)	Generating Capacity Reserves (MW)	DSM Available for Use (MW)	DSM Reserves (MW)	Total Reserves (MW)
2014	June	1	28,711	(800)	27,911	26,576	1,335	2,635	2,635	3,970

The above outcome assumes that the forecasted peak occurs in June; otherwise, there is no change.

Year	Month	Week	Total Generating Capacity (MW)	Planned Maintenance (MW)	Available Generating Capacity (MW)	Peak Load (MW)	Generating Capacity Reserves (MW)	DSM Available for Use (MW)	DSM Reserves (MW)	Total Reserves (MW)
2014	June	1	28,711	(800)	27,911	28,516	**(605)**	2,635	2,030	2,030

The above outcome assumes that the peak occurs in June, and that the actual peak is higher than forecasted, and the variance is equal to the average percent variance observed in 2004 - 2007.

Note:

The results above assume that all generating capacity except that explicitly scheduled for maintenance is operating at maximum capacity (i.e., no forced outages), that there are no fuel supply interruptions or transmission interruptions, and that FPL is not providing assistance to any other utility.

A Look at January 11, 2010 If FPL Had Planned to a 15% Total Reserve Margin Criterion

I. What Actually Occurred with FPL Planning to a 20% Total Reserve Margin Criterion

		(1)	(2)	(3)	(4) = (2) - (3)	(5)	(6) = (4) - (5)	(7) = (1) - (6)	(8) = (7) / (6)	(9) = (7) - (5) - (3)

A Look at January 11, 2010 If FPL Had Planned to a 15% Total Reserve Margin Criterion

II. What Is Projected to Have Occurred If FPL Had Planned to a 15% Total Reserve Margin Criterion

		(1)	(2)	(3)	(4)	(5)	(6)	(7)	(8)	(9)
					= (2) - (3)		= (4) - (5)	= (1) - (6)	= (7) / (6)	= (7) - (5) - (3)
		Total Projected Capacity	**Forecasted Peak Load**	**Forecasted Utility EE**	**Peak Load After EE**	**Forecasted or Remaining LM**	**Forecasted Firm Load After EE and LM**	**Total Reserves**	**Total Reserve Margin as % of Firm Load**	**Generation Reserves**
		(MW)	**(MW)**	**(MW)**	**(MW)**	**(MW)**	**(MW)**	**(MW)**	**(%)**	**(MW)**
(1)	**2009 TYSP resource plan projection for Summer 2010**	22,916	21,147	220	20,927	1,899	19,028	3,888	20.4%	1,769
(2)	**2009 TYSP resource plan projection for Winter 2010**	26,852	18,790	114	18,676	1,705	16,971	9,881	58.2%	8,062
(1a)	**Adjusted resource plan for Summer 2010 assuming 15% RM criterion**	21,882	21,147	220	20,927	1,899	19,028	2,854	15.0%	735
(1b)	**Adjusted resource plan for Winter 2010 assuming the same Summer/Winter ratio for total projected capacity**	25,640	18,790	114	18,676	1,705	16,971	8,669	51.1%	6,850
	Note that all subsequent rows present adjustments to show how Jan 2010 peak day actual conditions would have differed from planned conditions shown on row (2b) if FPL had planned to a 15% total reserve margin									
	Load Adjustments on Jan 2010 peak day									
(3)	**Adjustment**				6,196					
(4)	**Resulting operating conditions on 2010 Winter peak hour**	25,640			24,872	1,705	23,167	2,473	10.7%	768
	Generation / Load Management Adjustments on Jan 2010 peak day									
(5)	**Adjustments**	(1,980)			(561)	(561)				
(6)	**Operating conditions on 2010 Winter peak hour**	23,660			24,311	1,144	23,167	493	2.1%	(651)
	Emergency Sales adjustments on Jan 2010 peak day resulted in 24,346MW of FPL load and 561MW of emergency sales. Total load (FPL and 3rd parties) served is 24,872MW									
(7)	**Adjustment**				561					
(8)	**Operating conditions on 2010 Winter peak hour**	23,660			24,872	1,144	23,728	(68)	-0.3%	(1,212)
	TP Unit 4 Adjustment (if occurred at peak hour)									
(9)	**Adjustment**	(750)			(750)	(750)				
(10)	**Operating conditions on 2010 Winter peak hour**	22,910			24,122	394	23,728	(818)	-3.4%	(1,212)

Note: An inability to serve 68 MW would impact ~39,000 customers. An inability to serve 818 MW would impact ~471,000 customers.

The Need for a 3rd Reliability Criterion for FPL: a Generation-Only Reserve Margin (GRM) Criterion

Bob Barrett
VP Finance
February 28, 2014

A Note Regarding this New Presentation

- **This presentation first addresses 4 "carry over" topics from the Dec. 6th meeting:**
  1. What does a projected LOLP value really mean?
  2. LM customer "fatigue" benchmarking results.
  3. Benefits of generation reserves during pre-hurricane periods.
  4. Emergency declarations and regulatory scrutiny.

- **The presentation then discusses FPL's need for a new reliability criterion from 3 perspectives:**

1. A "looking back" analysis of the Winter peak day of 2010 and what might have occurred if FPL had entered that January having a Summer GRM of 10% or 5%*
2. A "looking forward" analysis using the year 2021
3. Why 10% is a reasonable value for the new GRM criterion

- **The presentation concludes with a summary of "next steps"**

* Unless otherwise noted, all GRM values are Summer GRM values (because the Summer GRM values will have the most impact on resource planning)

Executive Summary

- A generation-only reserve margin (GRM) reliability criterion is desirable from an operational perspective for several reasons:

    - If two resource plans have an identical total reserve margin value, but one plan has a 10% GRM and the other a 5% GRM, the 10% GRM plan can provide operators with hundreds of additional MW of reserves (generating and/or load management) during severe peaks

    - A higher GRM plan can also provide operators with significant additional reserves when hurricanes force early shut downs of nuclear units

- A GRM reliability criterion is also desirable from a resource planning perspective because it can lower LOLP projections

- A GRM criterion of a minimum of 10% matches well with Operation's projected need for 2,650 MW of "operational generation reserves" (i.e., generation above forecasted load)

The 1st topic, "what does an LOLP value mean?", is addressed both by looking at the calculation and providing an interpretation

How is an LOLP Value Calculated?

- LOLP calculations project the probability that a utility will not be able to serve 100% of its firm load (i.e., at least 1 MW of firm load cannot be served) during the time period analyzed after all available generation and LM have been used
- LOLP calculations do not provide information regarding: (1) the MW amount that cannot be served; and (2) the duration of the event
- The probability of not being able to serve all firm load is calculated for the peak hour for each day in the year
- These daily probabilities are then summed to derive a monthly probability of not being able to meet firm load on a peak hour during the month
- Then the monthly probabilities are summed to derive an annual probability of not being able to meet firm load on a peak hour during the year
- Thus an LOLP value is a sum of daily probabilities (which can exceed 1.00) and the LOLP value is commonly expressed in terms of "days per year"

A monthly breakdown of previously provided annual LOLP projections is provided below

Monthly Breakdown of Previous LOLP Values

- **In the 12/06/2013 presentation, two LOLP values were presented for the year 2021: 0.0358 days/year for a 5% GRM plan and 0.0257 days/year for a 10% GRM plan**
- **The following table shows a monthly breakdown of these values:**

Month	w/ 5% GRM ---------------- Projected Days per Individual Month	w/ 5% GRM Projected Cumulative Days per Year	w/ 10% GRM ------------------- Projected Days per Individual Month	w/ 10% GRM Projected Cumulative Days per Year
January	0.000018	0.0000	0.000003	0.0000
February	0.000000	0.0000	0.000000	0.0000
March	0.000030	0.0000	0.000004	0.0000
April	0.000002	0.0001	0.000001	0.0000
May	0.000065	0.0001	0.000022	0.0000
June	0.001522	0.0016	0.000819	0.0008
July	0.000436	0.0021	0.000351	0.0012
August	0.001456	0.0035	0.001203	0.0024
September	0.031795	0.0353	0.023089	0.0255
October	0.000506	0.0358	0.000210	0.0257
November	0.000000	0.0358	0.000000	0.0257
December	0.000000	0.0358	0.000000	0.0257
Annual Days per Year =		**0.0358**		**0.0257**

LOLP discussion may be "flipped" from "days per year" to "years per day" terms to provide an easier-to-use interpretation

A Useful Interpretation of LOLP Values

- **If one assumes that a projected LOLP value for a given year remains constant for each year in an LOLP analysis, one can project how many years will pass before the utility will not be able to meet firm load (i.e., before the sum of the annual LOLP values = 1.0) by dividing the annual LOLP into 1.0**

- **Some utilities, such as Hawaiian Electric Company, use this "years per day" format when reporting results of LOLP analyses**

- **The 5% GRM plan had an annual LOLP value of 0.0358 which converts to 27.9 years, and the 10% GRM plan had an annual LOLP value of 0.0257 or 38.9 years, before LOLP sums to 1.0**

In this analysis, the 10% GRM plan is projected to allow FPL to meet firm load for 11 more years without an interruption than with the 5% GRM plan

Docket No. 150196-EI
The Need for a 3rd Reliability Criterion for FPL:
A Generation-Only Reserve Margin (GRM) Criterion
Exhibit SRS-11, Page 6 of 33

Regarding the 2nd topic of LM "fatigue", benchmarking data was sought from multiple sources

Benchmarking Results

- **The DSM group contracted with Esource to canvas various industry leaders (utilities / consultants)**
- **No empirical data exists on customer fatigue due to over use of LM, but opinions received are in-line with FPL's view regarding avoiding LM fatigue:**
  - No greater than 10 events/year
  - Events should be spread out throughout the year (e.g., not all in summer or extreme winter events)
  - Events should not be prolonged (e.g., greater than 2-3 hours)
- **Ahmad Faruqui, Ph.D., an industry expert, stated this is a question "for which I have not been able to find any good data"**
  - He implied a range for which fatigue may occur: "Survey results indicate that the maximum realistic call duration for ERCOT is 4 hrs. and frequency should be no greater than 10 events/year."

LM benchmarking on customer fatigue is inconclusive

FPL

The 3rd topic is the relevance of generation reserves to address generation needed prior to hurricane landfall

Generation Margins Needed Pre-Hurricane

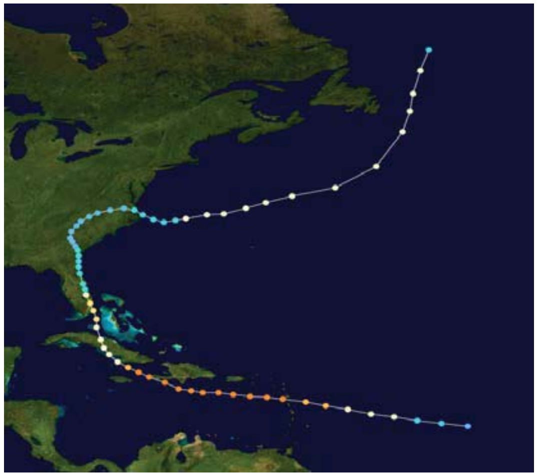
- **Prior to land fall, loads are high due to customers cooling their homes and lowering refrigerator temperatures**
- **High loads prior to land fall occur while FPL is shutting down specific units**
  - For example, a hurricane impacting the St. Lucie units (almost 2,000 MW of generation/gross output), must go to 60% output as early as 24 hours prior to land fall, and complete shut down at 18 hours prior to hurricane winds at the site.
- **Activation of LM due to a capacity shortfall prior to landfall would have an impact on our customers' preparations including efforts to pre-cool their homes**
- **A generation reserve of approximately 2,650 MW (as discussed on slide 20 – Operational generation reserves) provides additional reliability, allowing service for our customers prior to hurricane impact**

Operations prior to hurricane landfall must consider the unavailability of specific generation and impact to customers

If a hurricane impacts both PTN and PSL, there is high potential to shut down both units

PTN and PSL Impact and Generation Reserves

- Over the past 100 years, multiple hurricanes have impacted the PTN and PSL areas
- In 1960, Hurricane Cleo (Category 2) may have resulted in sustained hurricane force winds at both PTN and PSL (no anemometers in area)
- Both plants, with output of approx. 3,600 MW, would need to shut down if affected



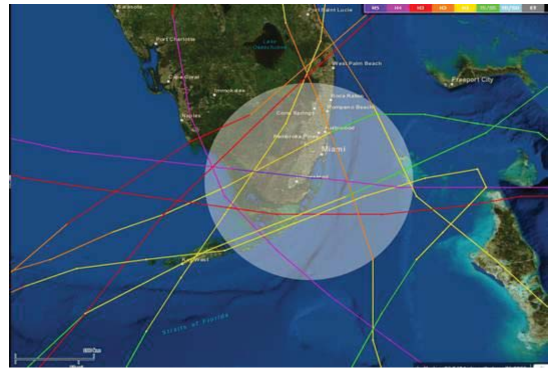
- The operational generation reserves provide additional reliability to mitigate the unavailability of generation prior to hurricane impact

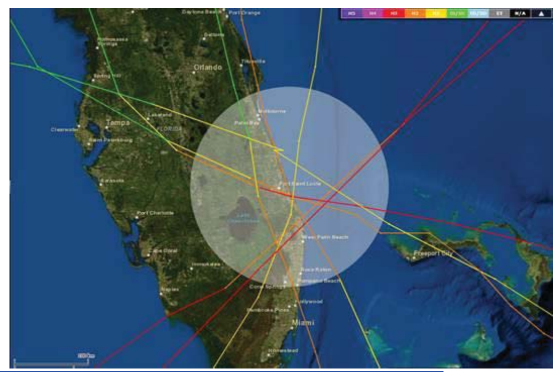
The impact of a hurricane affecting PTN and PSL would require the use of large amounts of LM. Shedding of firm customers is not expected.

Generation reserves are needed to account for generation during periods prior to hurricane landfall

Generation Reserves Needed Pre-Hurricane

- **From the period of 1960-2013 eleven hurricanes tracked within 65 nautical miles of Turkey Point and another 8 hurricanes tracked within 65 nautical miles of St. Lucie**
  - Turkey Point hurricanes would reduce the total reserve margin from 21.0% (year 2021) to 13.9%
  - St. Lucie hurricanes would reduce the total reserve margin from 21.0% (year 2021) to 12.2%





The impact from a hurricane to one of the nuclear sites is significant, resulting in the loss of most of the generation

The 4th topic is that the potential for regulatory implications due to emergency operations declarations

North American Electric Reliability Corporation (NERC) Standards

- **EOP-002 NERC Reliability Standard: Declaration of Energy Emergency Alert (EEA)**
  - FPL's plan based on its interpretation of EOP-002 which is to declare an EEA-2 when LC capability is less (or close to less) than the required reserves necessary to cover the loss of largest FPL unit (FM2 at 1,515 MW by 2021)
    - -- Note: EEA-3 is when load shedding is eminent or underway
  - FPL plan will not result in a declaration for limited (e.g., less than 400 MW) use of LC
    - -- FPL has not declared an EEA under EOP-002
  - From discussions with peers in the Southeast and limited information on NERC website, FPL's practice appears to be consistent with historical declarations in other regions

FPL.

The 4th topic is that the potential for regulatory implications also influences FPL's operating philosophy (Cont'd)

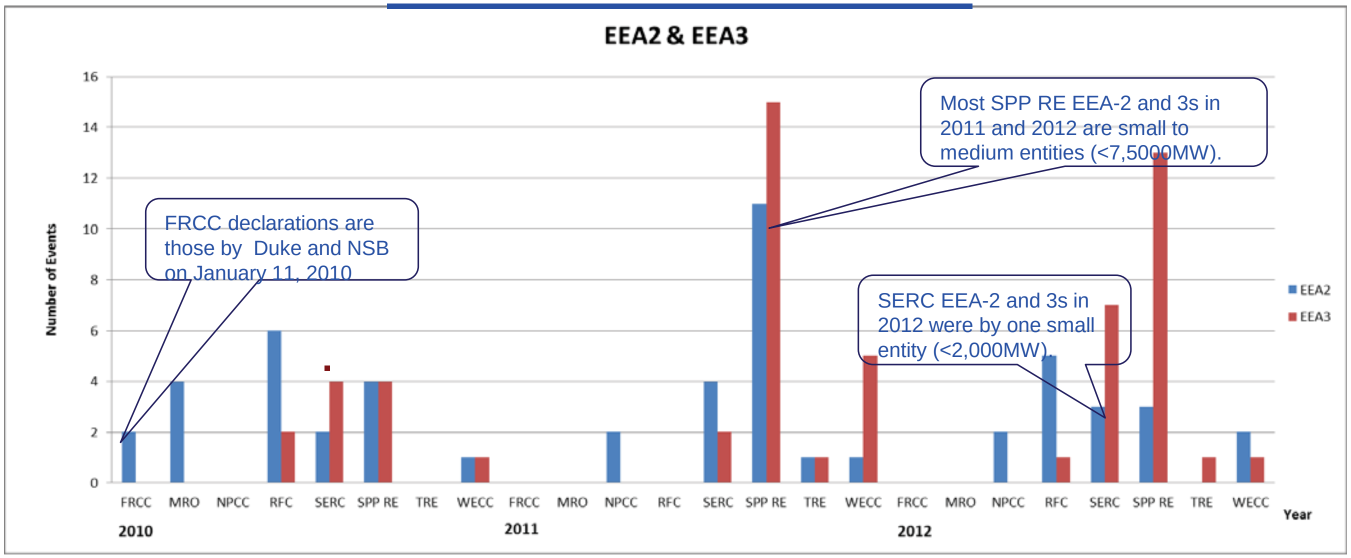
North American Electric Reliability Corporation (NERC) Standards

- **EOP-002 triggers for EEA-2s is not clear, and recognized as such industry-wide**
  - Standard implies that a declaration of an EEA-2 is linked to LC deployment
  - FRCC procedure linking the FRCC Emergency Capacity Plan with EOP-002 does clarify triggers for EEA-2
- **NERC tracks EEA-2s and EEA-3s under EOP-002 to measure the number of events declared during peak load periods, this may serve as leading indicator of capacity shortfall**

FPL

NERC historical tracking of alert declarations varies by region

EEA-2 and EEA-3 Events



- **Legitimate emergencies will be tracked by NERC**
  - NERC states that EEA-2 events calling solely for activation of DSM or interruption of non-firm load will be excluded from the metric in the future as demand response is a legitimate resource and are not of direct concern regarding reliability.

The potential, form, and results of regulatory scrutiny based on what NERC considers too many legitimate emergencies is unclear

The need for a new GRM reliability criterion can be supported by 3 points

FPL's Need for a New Reliability Criterion

- **These 3 points (presented in decreasing order of importance) are:**
  1. "All resource plans with identical total reserve margins are not created equal" from an operational perspective (a higher GRM plan will result in significantly more total resources - generation and load management - available for system operators than a lower GRM plan in severe peak conditions)
  2. A resource plan with a higher GRM value is projected to be more reliable from an LOLP perspective (slides 3 through 5)
  3. A resource plan with a higher GRM value is projected to have to use its LM resources less frequently (from 12/06/13 presentation)
- **In regard to point 1 above:**
  – This point can be demonstrated by a "look backwards" analysis of Winter 2010 (slides 15 – 17 and Appendix slides 24 - 27)
  – This point can also be demonstrated by a "looking forward" analysis for Summer and Winter for the year 2021 (slides 18 & 19 and Appendix slides 28 -33)

In the "look backwards" analysis, several perspectives were taken of the Winter peak day in 2010

Regarding the January 2010 Peak Day

- **The first perspective was of what actually happened on that day (the 2009 Site Plan's projections for the year 2010 were used as the starting point for this analysis)**
- **The second perspective was to see how FPL's system would have fared if the resource plan had been different with a GRM of 10% in 2010 (but an identical Summer total RM of 20.4%)**
- **The third perspective was to see how FPL's system would have fared if the resource plan had been different with a GRM of 5% in 2010 (but an identical Summer total RM of 20.4%)**

Sufficient generation reserves are needed for peak load periods

January 11, 2010 (7- 8 AM) – All Time FPL Peak Load

- **Relative to the 2009 Ten Year Site Plan (TYSP), the total reserves for the Winter were 58.2% with a Generation Reserve Margin (GRM) of 42.9%. The Summer reserve margin was 20.4% with an 8.4% GRM**
  - FPL's load was 24,872 MW, 6,196 MW higher than forecasted
  - FPL entered day with 7.4% reserves, all in load management (LM)
  - 24,872 MW of generation was available
  - FPL implemented C/I LM and voltage reduction (561 MW)
  - FPL sold 526 MW of emergency power
  - 1,144 MW of LM remained available during the peak hour
  - No firm load was curtailed by FPL or any other Florida utility
  - Several hours after the peak hour Turkey Point 4 (PTN4) tripped with 750 MW of generation

In Winter 2010, the generation reserves were just sufficient to provide reliable operations with no curtailment of firm load in Florida

FPL.

Analyses of Winter 2010, using different GRM values, provide a couple of key "takeaways"*

Takeaways from the January 2010 Peak Day Analyses

	Firm Load is Shed?		
Scenario	**W/ TP4**	**W/O TP4**	**Comments**
Actual: 8.4% GRM	No	No	If PTN4 would have tripped prior to the peak, FPL would have implemented additional LM
w/ 10% GRM	No	No	A 10% GRM (as compared to a 5%) would have resulted in a 659 MW increase in LM reserves, and no utilities would have had to shed firm load Similar to the 8.4% GRM scenario, if PTN4 would have tripped prior to the peak, FPL would have implemented additional LM
w/ 5% GRM	No	Yes	W/O TP4 either FPL or another utility in Florida would have had to shed 52 MW of firm load impacting over 30,000 customers

* The actual analyses are presented in Appendix slides 24 - 27

On 1/11/10, a 5% GRM would have resulted in 30,000 firm load customers being shed, but a 10% GRM would have provided 659 MW of additional reserves

A "looking forward" analysis of 2021 addressed both Summer and Winter with 5% and 10% GRM-based resource plans

<u>How the Analyses of 2021 Were Conducted</u>

- The 2013 Site Plan's resource plan for the year 2021 was the starting point: 6.9% GRM, 21.0% Summer total RM, and 34.5% Winter total RM
- Then two alternate resource plans with the same 21.0% Summer total RM, but either 5% or 10% Summer GRM were "constructed" for Summer (comparable alternate resource plans for Winter 2021 were also constructed)
- To simplify the analysis, the alternate plans <u>differed in regard to EE and generation only</u> (similar results would occur if LM instead of EE had been varied in the plans)
- Identical changes of 9% were made to forecasted load, EE, and available generation (the percentage change chosen is arbitrary, but reasonable and consistent)
- The resulting available generation and total resources remaining after these changes were made are compared (note that EE's impact has already "happened" at the peak)

FPL

The "looking forward" analyses of resource plans for 2021 provides additional support for a 10% GRM-based resource plan compared to a 5% GRM-based plan

Key Points from the "Looking Forward" Analyses

- Only the 10% GRM-based resource plan is projected to allow FPL to meet firm load in both Summer and Winter of 2021
- Furthermore, when comparing the two GRM-based resource plans, the 10% GRM-based plan provides significantly more MW of resources for both Summer and Winter

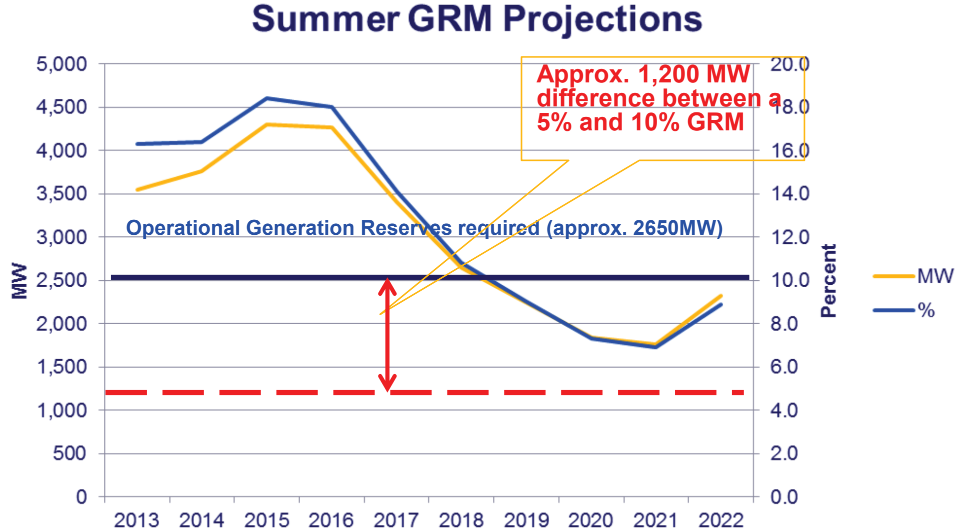
	Summer of 2021			Winter of 2021		
	w/ 10% GRM	w/ 5% GRM	Increased Total Reserves w/ 10% GRM	w/ 10% GRM	w/ 5% GRM	Increased Total Reserves w/ 10% GRM
Total Reserves Remaining after Load, EE, and Generation Adjustments	34	(169)	202	2,921	2,193	728

This "looking forward" analysis again shows system operators will have more resources for their use with a 10% GRM, rather than a 5% GRM, resource plan

Docket No. 150196-EI
The Need for a 3rd Reliability Criterion for FPL:
A Generation-Only Reserve Margin (GRM) Criterion
Exhibit SRS-11, Page 19 of 33

A 10% GRM criterion is a reasonable, easy-to-articulate proxy for FPL's operational generation reserves need

GRM Projections from FPL's 2013 Site Plan



- **FPL's goal is to maintain ~ 2,650 MW of Operational Generation Reserves to cover the following operational situations:**
  - Expected unavailable generation (687 MW)
  - The generation loss of the largest the largest unit (1,515 MW)
  - Real time operating reserves deployable within 15 minutes as part of the Florida Reserve Sharing Group (450 MW by 2021)

A 10% GRM is consistent with FPL's required operational reserves

FPL has begun using the new GRM criterion in its resource planning process and in 2014 analyses to be filed w/ the FPSC

Next Steps regarding the GRM Criterion

- Text explaining why FPL is using the new criterion will be included in the 2014 TYSP filing and as part of the DSM Goals testimony
- The explanation focuses on analyses comparing resource plans with 10% GRM vs. 5% GRM and include these key points :
  - A 10% GRM results in hundreds of MW of additional operational reserves on severe peak days
  - A 10% GRM results in lower LOLP projections
  - A 10% GRM criterion matches well with the approximately 2,650 MW of generation reserves necessary for operations
- Analyses supporting the 2014 TYSP and DSM Goals filings in April, and the 2014 NCRC filing in early May, all are using the 10% GRM criterion
- These analyses all assume that the 10% GRM criterion must be met beginning in the Summer of 2019

FPL is not making a separate filing seeking official FPSC approval for FPL's GRM criterion

Next Steps regarding the GRM Criterion (Continued)

- No separate filing/request seeking official FPSC approval for the new GRM criterion will be made
- The only time the FPSC has officially approved a reliability criterion is in the late 1990s when it approved the voluntary stipulation by FPL, TECO, and DEF to move from a 15% to a 20% total reserve margin criterion to close an FPSC docket examining Florida reserves
- TECO did not request approval for its similar supply side reserve margin which it has been using for approximately 10 years
- It is anticipated that discovery requests focused on the new GRM criterion will be received in regard to both the TYSP and DSM Goals filings

FPL

Appendix

FPL and others utilities in Florida were marginally able to serve their entire firm load and FPL met its operational reserve requirements with an 8.4% GRM

Generation / Load Management (CILC and Voltage reduction) Adjustments of on Jan 2010 peak day											
	(1,980)			(561)	(561)						---
Operating conditions on 2010 Winter peak hour	24,872			24,311	1,144	23,167	1,705	7.4%	561	2.3%	**Yes**
Emergency Sales adjustments on Jan 2010 peak day resulted in 24,346MW of FPL load and 526MW of emergency sales. Total load (FPL and 3rd parties) served is 24,872MW											
Emergency sales (recallable)				526							---
Operating conditions on 2010 Winter peak hour	24,872			24,872	1,144	23,728	1,144	4.8%	0	0.0%	**Yes**
TP Unit 4 Nuclear Trip on Jan 2010 prior to peak day											
TP Nuclear Adjustment	(750)			(750)	(750)						---
Operating conditions on 2010 Winter peak hour	24,122			24,122	394	23,728	394	1.7%	**0**	0.0%	**Yes**

Two “what if” analyses examined how FPL would have fared if it had entered Winter 2010 with a higher (10%) or lower (5%) GRM

“What If”for January 2010 Peak Day w/ 10% GRM

	(1)	(2)	(3)	(4) = (2) - (3)	(5)	(6) = (4) - (5)	(7) = (1) - (6)	(8) = (7) / (6)	(9) = (1) - (2) or = (1) - (4)	(10) = (9) / (2)	(11)
	Total Projected Capacity	Forecasted Peak Load	Forecasted Utility EE	Peak Load After EE	Forecasted LM (w/o scram MW)	Forecasted Firm Load After EE and LM	Total Reserves	Total Reserve Margin as % of Firm Load	Generation Reserves	Generation Reserve Margin	All firm load served by FPL and/or other FL utility?
	(MW)	(MW)	(MW)	(MW)	(MW)	(MW)	(MW)	(%)	(MW)	(%)	---
Creation of Revised 10% GRM Summer Plan and Corresponding Winter Plan											---
Modify the 2009 TYSP resource plan for Summer 2010 to achieve a 10% GRM	23,262	21,147	(72)	21,219	1,899	19,320	3,941	20.4%	2,115	10.0%	---
Using Winter vs Summer differentials, and the modified Summer resource plan, create a comparable resource plan for Winter 2010	27,216	18,790	(37)	18,827	1,705	17,122	10,094	59.0%	8,426	44.8%	Yes
Load Adjustments on Jan 2010 peak day											
Increase in FPL load served after EE but prior to LM utilization				6,231							
Resulting operating conditions on 2010 Winter peak hour due to load	27,216		(37)	25,058	1,705	23,353	3,863	16.5%	2,158	8.6%	Yes
Generation / Load Management / Further FPL Load Adjustments of on Jan 2010 peak day											
	(1,980)			(561)	(561)						
Resulting operating conditions on 2010 Winter peak hour w/ load, LM, & generation adjustments	25,236			24,497	1,144	23,353	1,883	8.1%	739	3.0%	Yes
Emergency Sales Adjustments on Jan 2010 peak day											
Emergency sales				526							
Resulting operating conditions on 2010 Winter peak hour w/ load, LM, & generation adjustments+Em. Sales	25,236			25,023	1,144	23,879	1,357	5.7%	213	0.9%	Yes
TP Unit 4 Nuclear Trip on Jan 2010 prior to peak day											
TP Nuclear Adjustment	(750)			(750)	(750)						
Resulting operating conditions on 2010 Winter peak hour w/ load, LM, generation & TP adjustments	24,486			24,273	394	23,879	607	2.5%	213	0.9%	Yes

* The 2010 Tony letter showed FPL unit capability as 23,333 MW for Winter 2010 & 22,142 MW for Summer. The Winter/Summer ratio is 1.054.

FPL’s generation and LM resources would have been greater with a 10% GRM than with 8.4% GRM

FPL

The second "what if" analysis examined how FPL would have fared if it had entered Winter 2010 with a lower (5%) GRM

"What If"for January 2010 Peak Day w/ 5% GRM

	(1)	(2)	(3)	(4) = (2) - (3)	(5)	(6) = (4) - (5)	(7) = (1) - (6)	(8) = (7) / (6)	(9) = (1) - (2) or = (1) - (4)	(10) = (9) / (2)	(11)
	Total Projected Capacity	Forecasted Peak Load	Forecasted Utility EE	Peak Load After EE	Forecasted LM (w/o scram MW)	Forecasted Firm Load After EE and LM	Total Reserves	Total Reserve Margin as % of Firm Load	Generation Reserves	Generation Reserve Margin	All firm load served by FPL and/or other FL utility?
	(MW)	(MW)	(MW)	(MW)	(MW)	(MW)	(MW)	(%)	(MW)	(%)	---
Creation of Revised 5% GRM Summer Plan and Corresponding Winter Plan											---
Modify the 2009 TYSP resource plan for Summer 2010 to achieve a 5% GRM	22,204	21,147	806	20,341	1,899	18,442	3,762	20.4%	1,057	5.0%	---
Using Winter vs Summer differentials, and the modified Summer resource plan, create a comparable resource plan for Winter 2010	26,102	18,790	418	18,372	1,705	16,667	9,435	56.6%	7,312	38.9%	**Yes**
Load Adjustments on Jan 2010 peak day											
Increase in FPL load served after EE but prior to LM utilization				6,231							
Resulting operating conditions on 2010 Winter peak hour due to load	26,102		418	24,603	1,705	22,898	3,204	14.0%	1,499	6.1%	**Yes**
Generation / Load Management / Further FPL Load Adjustments of on Jan 2010 peak day											
	(1,980)			(561)	(561)						
Resulting operating conditions on 2010 Winter peak hour w/ load, LM, & generation adjustments	24,122			24,042	1,144	22,898	1,224	5.3%	80	0.3%	**Yes**
Emergency Sales Adjustments on Jan 2010 peak day											
Emergency sales				526							
Resulting operating conditions on 2010 Winter peak hour w/ load, LM, & generation adjustments+Em. Sales	24,122			24,568	1,144	23,424	698	3.0%	(446)	-1.8%	**No**
TP Unit 4 Nuclear Trip on Jan 2010 prior to peak day											
TP Nuclear Adjustment	(750)			(750)	(750)						
Resulting operating conditions on 2010 Winter peak hour w/ load, LM, generation & TP adjustments	23,372			23,818	394	23,424	(52)	-0.2%	(446)	-1.9%	**No**

* The 2010 Tony letter showed FPL unit capability as 23,333 MW for Winter 2010 & 22,142 MW for Summer. The Winter/Summer ratio is 1.054.

Even after exhausting FPL's generation and LM resources, FPL would not have been able to meet its firm load with a 5% GRM

FPL

Regarding a "look forward" to 2021, the 5% Summer GRM-based resource plan was examined first in regard to Summer peak

"What If" Summer 2021 Peak Day w/ 5% GRM

	(1)	(2)	(3)	(4) = (2) - (3)	(5)	(6) = (4) - (5)	(7) = (1) - (6)	(8) = (7) / (6)	(9) = (1) - (2) or = (1) - (4)	(10) = (9) / (2)
Summer	Total Projected Capacity	Forecasted Peak Load	Forecasted Utility EE	Peak Load After EE	Forecasted LC	Forecasted Firm Load After EE and LC	Total Reserves	Total Reserve Margin as % of Firm Load	Generation Reserves	GRM
	(MW)	(MW)	(MW)	(MW)	(MW)	(MW)	(MW)	(%)	(MW)	(%)
5% GRM resource plan	26,838	25,560	1,230	24,330	2,150	22,180	4,658	21.0%	1,278	5.0%
Higher-than-Projected Peak Load *		2,300								
Lower-than-projected EE Reduction *			(111)							
Resulting actual operating conditions on 2021 peak hour	26,838	27,860	1,119	26,741	2,150	24,591	2,247	9.1%	97	0.3%
Unavailable Generation *	(2,415)									
Resulting actual operating conditions on 2021 peak hour after Generation Adjustment	24,423	27,860	1,119	26,741	2,150	24,591	(169)	-0.7%	(2,319)	-8.3%

* A 9% adjustment was made to the starting point value in the first row.

With the 5% GRM plan, FPL would not be able to meet Summer firm load (as seen by the negative 169 MW) of Total Reserves in Col. 7)

FPL

The 10% Summer GRM-based resource plan was examined next in regard to Summer peak

"What If" Summer 2021 Peak Day w/ 10% GRM

Summer	Total Projected Capacity	Forecasted Peak Load	Forecasted Utility EE	Peak Load After EE	Forecasted LC	Forecasted Firm Load After EE and LC	Total Reserves	Total Reserve Margin as % of Firm Load	Generation Reserves	GRM
	(1)	(2)	(3)	(4) = (2) - (3)	(5)	(6) = (4) - (5)	(7) = (1) - (6)	(8) = (7) / (6)	(9) = (1) - (2) or = (1) - (4)	(10) = (9) / (2)
	(MW)	(MW)	(MW)	(MW)	(MW)	(MW)	(MW)	(%)	(MW)	(%)
10% GRM resource plan	28,116	25,560	174	25,386	2,150	23,236	4,880	21.0%	2,556	10.0%

Lower-than-projected EE Reduction *			(16)							
Resulting actual operating conditions on 2021 peak hour	28,116	27,860	158	27,702	2,150	25,552	2,564	10.0%	414	1.5%
Unavailable Generation *	(2,530)									
Resulting actual operating conditions on 2021 peak hour after Generation Adjustment	25,586	27,860	158	27,702	2,150	25,552	34	0.1%	(2,117)	-7.6%

* A 9% adjustment was made to the starting point value in the first row.

With the 10% GRM plan, FPL would be able to meet Summer firm load (as seen by the positive 34 MW of Total Reserves)

The 5% Summer GRM-based resource plan was examined next in regard to Winter peak

"What If" Winter 2021 Peak Day w/ 5% GRM

	(1)	(2)	(3)	(4) = (2) - (3)	(5)	(6) = (4) - (5)	(7) = (1) - (6)	(8) = (7) / (6)	(9) = (1) - (2) or = (1) - (4)	(10) = (9) / (2)
Winter	Total Projected Capacity	Forecasted Peak Load	Forecasted Utility EE	Peak Load After EE	Forecasted LC	Forecasted Firm Load After EE and LC	Total Reserves	Total Reserve Margin as % of Firm Load	Generation Reserves	GRM
	(MW)	(MW)	(MW)	(MW)	(MW)	(MW)	(MW)	(%)	(MW)	(%)
Winter resource plan corresponding to the Summer plan w/ 5% GRM	28,287	23,601	637	22,964	1,597	21,367	6,920	32.4%	4,686	19.9%
Higher-than-Projected Peak Load *		2,124								
Lower-than-projected EE Reduction *			(57)							
Resulting actual operating conditions on 2021 peak hour	28,287	25,725	580	25,145	1,597	23,548	4,739	20.1%	3,142	12.2%
Unavailable Generation *	(2,546)									
Resulting actual operating conditions on 2021 peak hour after Generation Adjustment	25,741	25,725	580	25,145	1,597	23,548	2,193	9.3%	596	2.3%

* A 9% adjustment was made to the starting point value in the first row.

With the 5% GRM resource plan, FPL would be able to meet Winter firm load with 2,193 MW of Total Reserves to spare

FPL

The 10% Summer GRM-based resource plan was then examined in regard to Winter peak

"What If" Winter 2021 Peak Day w/ 10% GRM

Winter	Total Projected Capacity	Forecasted Peak Load	Forecasted Utility EE	Peak Load After EE	Forecasted LC	Forecasted Firm Load After EE and LC	Total Reserves	Total Reserve Margin as % of Firm Load	Generation Reserves	GRM
	(1)	(2)	(3)	(4) = (2) - (3)	(5)	(6) = (4) - (5)	(7) = (1) - (6)	(8) = (7) / (6)	(9) = (1) - (2) or	(10) = (9) / (2)
	(MW)	(MW)	(MW)	(MW)	(MW)	(MW)	(MW)	(%)	(MW)	(%)
Winter resource plan corresponding to the Summer plan w/ 10% GRM	29,634	23,601	90	23,511	1,597	21,914	7,720	35.2%	6,033	25.6%
Higher-than-Projected Peak Load *		2,124								
Lower-than-projected EE Reduction *			(8)							
Resulting actual operating conditions on 2021 peak hour	29,634	25,725	82	25,643	1,597	24,046	5,588	23.2%	3,991	15.5%
Unavailable Generation *	(2,667)									
Resulting actual operating conditions on 2021 peak hour after Generation Adjustment	26,967	25,725	82	25,643	1,597	24,046	2,921	12.1%	1,324	5.1%

* A 9% adjustment was made to the starting point value in the first row.

With the 10% GRM resource plan, FPL would be able to meet Winter firm load with 2,921 MW of Total Reserves to spare

FPL

Another "look forward to 2021" case was analyzed in which LM, not EE, was allowed to vary

"What If" Summer 2021 Peak Day w/ 5% GRM & LM Varying

	(1)	(2)	(3)	(4) = (2) - (3)	(5)	(6) = (4) - (5)	(7) = (1) - (6)	(8) = (7) / (6)	(9) = (1) - (2) or = (1) - (4)	(10) = (9) / (2)
Summer	Total Projected Capacity	Forecasted Peak Load	Forecasted Utility EE	Peak Load After EE	Forecasted LC	Forecasted Firm Load After EE and LC	Total Reserves	Total Reserve Margin as % of Firm Load	Generation Reserves	GRM
	(MW)	(MW)	(MW)	(MW)	(MW)	(MW)	(MW)	(%)	(MW)	(%)
5% GRM resource plan	26,838	25,560	830	24,730	2,550	22,180	4,658	21.0%	1,278	5.0%
Higher-than-Projected Peak Load *		2,300								
Lower-than-projected EE and LM Reduction *					(230)					
Resulting actual operating conditions on 2021 peak hour	26,838	27,860	830	27,030	2,321	24,710	2,128	8.6%	-192	-0.7%
Unavailable Generation *	(2,415)									
Resulting actual operating conditions on 2021 peak hour after Generation Adjustment	24,423	27,860	830	27,030	2,321	24,710	(287)	-1.2%	(2,608)	-9.4%

* A 9% adjustment was made to the starting point value in the first row.

With the 5% GRM plan, FPL would not be able to meet Summer firm load (as seen by the negative 287 MW of Total Reserves in Col. 7)

Another “look forward to 2021” case was analyzed in which LM, not EE, was allowed to vary - continued

“What If” Summer 2021 Peak Day w/ 10% GRM & LM Varying

Summer	Total Projected Capacity	Forecasted Peak Load	Forecasted Utility EE	Peak Load After EE	Forecasted LC	Forecasted Firm Load After EE and LC	Total Reserves	Total Reserve Margin as % of Firm Load	Generation Reserves	GRM
	(MW)	(MW)	(MW)	(MW)	(MW)	(MW)	(MW)	(%)	(MW)	(%)
10% GRM resource plan	28,116	25,560	830	24,730	1,494	23,236	4,880	21.0%	2,556	10.0%
Lower-than-projected EE and LM Reduction *		2,300								
Lower-than-projected EE Reduction *					(134)					
Resulting actual operating conditions on 2021 peak hour	28,116	27,860	830	27,030	1,360	25,671	2,445	9.5%	1,086	3.9%
Unavailable Generation *	(2,530)									
Resulting actual operating conditions on 2021 peak hour after Generation Adjustment	25,586	27,860	830	27,030	1,360	25,671	(85)	-0.3%	(1,445)	-5.2%

* A 9% adjustment was made to the starting point value in the first row.

With the 10% GRM plan, FPL comes closer to meeting Summer firm load (as seen by the negative 85 MW of Total Reserves in Col. 7)

FPL

Re: **Florida Power & Light Company's 2015 Status/Update report on Storm Hardening/Preparedness and Distribution Reliability**

Dear Mr. Ballinger:

Pursuant to Order No. PSC-06-0781-PAA-EI, I am enclosing for filing in the above docket the original and seven copies of Florida Power & Light Company's ("FPL's") status report and update of its *Storm Preparedness Initiatives,* which was filed in Docket No. 060198-EI on June 1, 2006. Consistent with Staff's request at its October 30, 2006 workshop, FPL has consolidated into the enclosed document the following additional information:

(1) Wood Pole Inspection Report required by Order No. PSC-06-0144-PAAEI, issued in Docket No. 060078-EI on February 27, 2006;

(2) Distribution Reliability Report required by rule 25-6.0455, F.A.C.; and,

(3) A discussion of FPL's 2012 results for storm hardening facilities;

If there are any questions regarding this transmittal, please contact me at 561-304-5633.

Sincerely,

Scott A. Goorland

Enclosures

EXECUTIVE SUMMARY – FPL's MARCH 2, 2015 FILING

In 2014, FPL continued to invest in and take significant steps to strengthen its electrical infrastructure and enhance its emergency response capabilities. Included in this ongoing work were pole inspections, system infrastructure hardening, vegetation management, as well as other storm preparedness initiatives. Additionally, FPL continued to deliver excellent overall reliable service for its customers.

In 2015, FPL plans to continue its efforts to accelerate the strengthening of its electric infrastructure against severe weather and maintain its strong everyday reliability for customers.

This filing provides details about these efforts and is organized into two major sections: (1) Storm Preparedness/Infrastructure Hardening; and (2) Reliability. The first section concentrates on FPL's efforts to strengthen its distribution and transmission systems and enhance storm response capabilities. Initiatives addressed in this section include: Pole Inspections; System Hardening; 10 Storm Preparedness Initiatives; and 2015 Storm Season Readiness. The second section of this report includes information about FPL's service reliability, including 2014 results and 2015 plans for the distribution and transmission systems.

The following are brief overviews of each of these two sections:

Section 1: STORM PREPAREDNESS/INFRASTRUCTURE HARDENING

Pole Inspections

Distribution – In 2014, consistent with its FPSC-approved plan, FPL initiated its second eight-year pole inspection cycle.

- In 2014, FPL inspected approximately 1/8 of its pole population and completed all remaining follow-up work resulting from the 2013 pole inspections.
- In 2015, FPL plans to complete inspections on approximately 1/8 of its pole population, as well as complete all remaining follow-up work resulting from the 2014 pole inspections.

Transmission – In 2014, FPL completed all transmission pole/structure inspections consistent with its FPSC-approved plan.

- In 2014, FPL performed ground level visual inspections on 100% of its transmission poles/structures. Additionally, FPL performed climbing or bucket truck inspections on approximately 1/6 of its wood poles/structures, 1/6 of all 500kV structures, 1/10 of its other concrete and steel poles/structures and conducted storm and pre-construction mitigation patrols on all concrete and steel poles/structures. Also, FPL completed all follow-up work resulting from the 2013 inspections.

- In 2015, FPL plans to conduct ground level visual inspections on 100% of its transmission poles/structures; perform climbing or bucket truck inspections on approximately 1/6 of its wood poles/structures, 1/6 of all 500kV structures and 1/10 of its concrete and steel poles/structures; and complete all follow-up work identified from the 2014 inspections.

System Hardening

Distribution

Consistent with FPL's FPSC-approved 2013–2015 Electric Infrastructure Storm Hardening Plan (see Order PSC-13-0639-PAA-EI in Docket No. 130132-EI), FPL continued to implement its three-prong approach in 2014 by applying: (1) extreme wind loading criteria (EWL) to critical infrastructure facilities (CIF); (2) incremental hardening, up to and including EWL, to "Community Project" feeders; and (3) construction design guidelines that require EWL for the design and construction of all new overhead facilities, major planned work, relocation projects, and daily work activities.

- In 2014, FPL applied EWL on 75 feeder projects serving various CIF, e.g., police/fire stations and water treatment plants, one highway crossing and 16 "01" switches. FPL also applied incremental hardening to 21 "Community Projects", i.e., feeders that serve essential community needs such as grocery stores, gas stations and pharmacies. Additionally, FPL's Design Guidelines were applied to all new construction and other construction activities described above. Finally, FPL installed submersible equipment to mitigate the impact of significant water intrusion in six of the 12 vaults in the Miami downtown electric network that are located just at or within the FEMA 100-year flood elevation levels.

- FPL also continued to promote overhead-to-underground conversions in 2014, completing one project that qualified under its Governmental Adjustment Factor (GAF) tariff.

- In 2015, FPL plans to apply EWL on 65 CIF feeder projects, one highway crossing and 16 "01" switches. FPL will also incrementally harden, up to and including EWL, 38 Community Project feeders. FPL's Design Guidelines will again be used for all new construction activities. Finally, FPL will complete its efforts to install submersible equipment to mitigate the impact of significant water intrusion in the remaining six vaults in the Miami downtown electric network that are located just at or within the FEMA 100-year flood elevation levels.

Transmission
Storm hardening details for Transmission are provided in Storm Preparedness Initiative No. 4

Storm Preparedness Initiatives

(1) Vegetation Trim Cycles – In 2014, FPL continued its three-year average cycle and mid-cycle programs for feeders and its six-year average trim cycle for laterals.

(2) Joint Use Audits – Approximately 20 percent of FPL's jointly used poles are audited annually through its joint use surveys. Additionally, joint use poles are inspected through FPL's pole inspection program. Survey and inspection results continue to show that through FPL's joint use processes and procedures, along with cooperation from joint pole owners and third-party attachers, FPL has properly identified and accounted for joint use facilities.

(3) Six-year Transmission Structure Inspection Cycle – In 2014, FPL performed ground level visual inspections on 100% of its transmission poles/structures. Additionally, FPL performed climbing or bucket truck inspections on approximately 1/6 of its wood transmission system poles/structures, 1/6 of its 500 kV structures, 1/10 of its other concrete and steel poles/structures and conducted storm and pre-construction mitigation patrols on all concrete and steel poles/structures.

(4) Hardening the Transmission System – In 2014, FPL continued executing its plan to replace all wood transmission structures in its system, completed the replacement of all ceramic post insulators with polymer insulators within its system and continued with its installation of flood monitoring equipment in substations that are more susceptible to flooding.

(5) Distribution Geographic Information System (GIS) – FPL completed its five originally approved key Distribution GIS improvement initiatives in 2011. These initiatives included developing a post-hurricane forensic analysis tool and the addition of poles, streetlights, joint use survey and hardening level data to the GIS. Updates to the GIS continue as data is collected through inspection cycles and other normal daily work activities.

(6) Post-Storm Forensic Collection/Analysis – FPL has post-storm forensic data collection and analysis plans, systems and processes in place and available for use. No major storms affected FPL's service territory in 2014; therefore, no forensic collection or analysis was required.

(7) Overhead (OH) and Underground (UG) Storm Performance – FPL has plans, systems and processes in place to capture OH and UG storm performance. No major storms affected FPL's service territory in 2014; therefore, no data collection or analysis was required.

(8) Increased Coordination with Local Governments – In 2014, FPL continued its efforts to improve local government coordination. Activities included: (1) meetings with county emergency operations managers to discuss critical infrastructure locations in each jurisdiction; (2) inviting federal, state, county and municipal emergency management personnel to participate in FPL's annual company-wide storm preparedness dry run and; (3) FPL External Affairs managers conducted 483 community presentations, providing information on storm readiness and other topics of community interest.

(9) Collaborative Research on Hurricanes/Storm Surge – Collaborative research efforts led by the Public Utility Research Center (PURC) have resulted in greater knowledge of appropriate vegetation management practices during storm and non-storm periods, wind during storm and non-storm events, and hurricane and damage modeling to further understand the costs and benefits of undergrounding.

(10) Natural Disaster Preparedness/Recovery Plans – FPL's Storm Emergency Plan identifies emergency conditions and the responsibilities and duties of the FPL emergency response organization for severe weather and fires. The plan covers the emergency organization, roles and responsibilities and FPL's overall severe storm emergency processes. These processes describe the planning activities, restoration practices, public communications, and coordination with government, training, practice exercises and lessons-learned evaluation systems. The plan is reviewed annually and revised as necessary.

2015 Storm Season Readiness

FPL's comprehensive storm plan focuses on readiness, restoration and recovery in order to respond safely and as quickly as possible in the event the electrical infrastructure is damaged by a storm. FPL is well-prepared for the 2015 storm season and continues to train and hone its storm preparedness and response capabilities.

In addition to the initiatives to strengthen its system and improve storm preparedness discussed previously, FPL will complete the following additional storm preparedness activities prior to the start of storm season:

- Extensive storm restoration training based on employees' storm roles;
- Annual company-wide hurricane dry run in late April/early May;
- Management workshops throughout the storm season to keep focus on key storm restoration policies/processes;
- Plan for and review of mutual assistance agreements to ensure they are adequate and ready;
- Continue to focus on improving outage communications and estimated restoration times to customers;
- Clear vegetation from all feeder circuits serving top critical infrastructure (e.g. top CIF hospitals, 911 centers, special needs shelters, police and fire stations, etc.) prior to the peak of hurricane season; and

- Implement new technology to be utilized by storm damage assessors to improve damage assessment collection/analysis capabilities.

Section 2: RELIABILITY

Total FPL System (Distribution and Transmission) – Overall reliability is best gauged by SAIDI (System Average Interruption Duration Index), considered the most relevant and best overall reliability indicator because it encompasses two other standard industry performance metrics for reliability: SAIFI (System Average Interruption Frequency Index) and CAIDI (Customer Average Interruption Duration Index). In 2014, FPL continued to provide strong overall reliability for its customers, achieving an overall adjusted SAIDI of 66.6 minutes (2013 – 65.6 minutes).

Distribution – FPL's 2014 overall adjusted distribution reliability, as measured by SAIDI was 63.8 (2013 – 61.4). 2014 adjusted results for SAIFI were 0.99 interruptions per customer (2013 – 0.89 interruptions). Adjusted 2014 results for CAIDI were 64.5 minutes (2013 – 68.7 minutes) and adjusted MAIFIe for 2014 was 8.7 momentary events (2013 – 9.1 momentary events).

Transmission – In 2014, FPL's Transmission/Substation adjusted SAIDI was 2.8 minutes (2013 – 4.2 minutes), adjusted SAIFI was 0.21 interruptions per customer (2013 – 0.22 interruptions) and adjusted MAIFI was 0.7 momentary events (2013 – 0.7 momentary events).

Re: Docket No. ___________; Petition for Approval of Florida Power & Light Company's Demand-Side Management Plan

Dear Ms. Stauffer:

Please find enclosed for filing the Petition for Approval of Florida Power & Light Company's ("FPL's") Demand-Side Management ("DSM") Plan, including Attachment 1 (FPL's proposed DSM Plan with Appendix A and Appendix B) and Attachment 2 (tariff sheets proposed for cancellation in both legislative and final format).

Consistent with direction received from FPSC staff, FPL will also be submitting 5 hard copies and 3 compact discs containing FPL's filing in electronic format.

If there are any questions regarding this filing, please contact me at 561-304-5226.

Sincerely,

s/ Jessica A. Cano

BEFORE THE FLORIDA PUBLIC SERVICE COMMISSION

In re: Petition for Approval of) Florida Power & Light Company's) Demand-Side Management Plan)	Docket No. __ Filed: March 16, 2015

PETITION FOR APPROVAL OF FLORIDA POWER & LIGHT COMPANY'S DEMAND-SIDE MANAGEMENT PLAN AND REQUEST TO CANCEL CLOSED ON CALL TARIFF SHEETS

Florida Power & Light Company ("FPL" or "the Company"), pursuant to Section 366.82, Florida Statutes; Rules 25-9.001(3), 25-17.0021, and 28-106.201, Florida Administrative Code; and Order No. PSC-14-0696-FOF-EU (issued Dec. 16, 2014), petitions the Florida Public Service Commission ("Commission") to approve FPL's Demand-Side Management ("DSM") Plan ("DSM Plan" or "Plan") filed herewith, including the cancellation of the closed On Call tariff sheets and consolidation of customers into the open Residential Load Control tariff, and to authorize FPL to recover through the Energy Conservation Cost Recovery ("ECCR") clause the reasonable and prudent expenditures associated with the implementation of this DSM Plan. In support of this petition FPL states as follows:

1. FPL is a corporation with headquarters at 700 Universe Boulevard, Juno Beach, Florida 33408. FPL is an investor-owned utility operating under the jurisdiction of this Commission pursuant to the provisions of Chapter 366, Florida Statutes. Any pleading, motion, notice, order or other document required to be served upon FPL or filed by any party to this proceeding should be served upon the following individuals:

Kenneth A. Hoffman
Vice President Regulatory Affairs
Florida Power & Light Company
215 S. Monroe Street, Ste 810
Tallahassee, FL 32301
(850) 521-3919
(850) 521-3939 (fax)
Ken.Hoffman@fpl.com

Jessica A. Cano, Esq.
Principal Attorney
Florida Power & Light Co.
700 Universe Blvd
Juno Beach, FL 33408
(561) 304-5226
(561) 691-7135 (fax)
Jessica.Cano@fpl.com

2. This Petition is being filed consistent with Rule 28-106.201, Fla. Admin. Code. The agency affected is the Florida Public Service Commission, located at 2540 Shumard Oak Boulevard, Tallahassee, Florida 32399. This case does not involve reversal or modification of an agency decision or an agency's proposed action. Therefore, subparagraph (c) and portions of subparagraphs (e), (f) and (g) of Rule 28-106.201(2) are not applicable to this Petition. In compliance with subparagraph (d), FPL states that it is not known which, if any, of the issues of material fact set forth in the body of this Petition, or the DSM Plan and attachments filed herewith, may be disputed by others.

3. FPL is subject to the Florida Energy Efficiency and Conservation Act ("FEECA"), Sections 366.80-366.85 and 403.519, Florida Statutes. Pursuant to FEECA and the Commission rules implementing FEECA, FPL is required to file a DSM Plan for Commission approval to meet the new DSM Goals established for FPL by Order No. PSC-14-0696-FOF-EU. *See* §366.82(7), Fla. Stat. (2014); Rule 25-17.0021(4), Fla. Admin. Code. FPL also is entitled to seek recovery of associated expenditures through the ECCR clause. *See* §366.82(11), Fla. Stat. (2014); Rule 25-17.015, Fla. Admin. Code. FPL has a substantial interest in whether the Commission approves its DSM Plan and authorizes cost recovery for Plan implementation expenditures and customer incentives.

FPL's Proposed DSM Plan

4. FPL's proposed DSM Plan consists of six residential programs (including one specifically targeted at low income residential customers), seven business programs, a Conservation Research and Development ("CRD") program for evaluating new technologies, a Cogeneration and Small Power Production program, and seven Solar Pilots that expire at the end of 2015.[1] FPL's low income program, while itself not cost-effective, will enhance low income customer awareness of and access to (i) energy efficiency education, (ii) low-cost and quick-payback measures, and (iii) other DSM programs that are cost-effective, consistent with the direction provided by the Commission in Order No. PSC-14-0696-FOF-EU.

5. FPL's proposed DSM Plan is included as Attachment 1, which is incorporated herein by reference. The subparts of Rule 25-17.0021(4), Fla. Admin. Code, setting forth the required information for each proposed program, are satisfied therein. FPL's DSM Plan includes Appendix A, which shows the individual program cost-effectiveness screening test results, using the Commission's approved cost-effectiveness methodology. FPL's DSM Plan also includes Appendix B, which shows the specific changes to FPL's existing DSM programs that are reflected in its proposed Plan. The development of FPL's proposed Plan relied upon the same cost-effectiveness-related inputs and assumptions that were utilized and accepted by the Commission in FPL's recent DSM Goals docket (Docket No. 130199-EI). The resulting Plan reflects related impacts to the number of measures and levels of rebates that can be offered cost-effectively at this time.

---

[1] FPL's Solar Pilots were approved by Order No. PSC-11-0079-PAA-EG. None of the Solar Pilots is currently cost-effective. Pursuant to stipulation approved by Order No. PSC-14-0632-FOF-EG, these pilots will expire at the end of 2015. FPL is not proposing any changes to its Solar Pilots and does not intend to seek any changes to the pilots' Program Standards previously approved by Commission Staff.

Cancellation of FPL's Closed Residential On Call Tariff Sheets

6. For almost three decades, FPL's DSM Plan has included some form of residential load management. Within FPL's current Residential Load Management DSM program there are customers participating under two different tariffs: the "Residential On Call" tariff ("On Call Tariff") which has been closed to new participants since 2003, and the "Residential Load Control" tariff ("Load Control Tariff"), which was approved as a pilot in 2003 and as a permanent program in 2007. Both the On Call Tariff and the Load Control Tariff provide residential customers who volunteer to participate in the program a monthly bill credit in exchange for permitting FPL to interrupt the power to certain appliances (i.e., central electric air conditioning, electric space heating, electric water heaters, and swimming pool pumps.) Credits vary depending upon the type and control cycle of appliances selected by the customer. The only difference between the closed and open tariffs is the bill credit amount for two of the appliance control options: central electric air conditioning cycling and electric water heating. These load management tariffs enable the Company to reduce demand at times of system emergencies, allowing the Company to defer or avoid capacity additions that would otherwise be needed.

7. As a result of normal program attrition, participation in the closed On Call Tariff has been declining since its closure. Today, only about 30% of the total participants in the overall Residential Load Management program remain on the closed On Call Tariff. As part of this DSM Plan, FPL is proposing to transfer the remaining customers participating under the closed On Call Tariff to the open Load Control Tariff and cancel all tariff sheets associated with the closed On Call Tariff. Specifically, FPL requests cancellation of FPL's Third Revised Tariff Sheet No. 8.207, Fourth Revised Tariff Sheet No. 8.208, and Second Revised Tariff Sheet No.

8.209. Those tariff sheets, in both legislative and proposed final format, are attached to this petition as Attachment 2. Customers transferred from the closed to the open tariff would be notified after issuance of the consummating order in this docket, and would begin seeing the new bill credits consistent with the currently-approved Load Control Tariff thereafter, consistent with each customer's billing cycle.[2]

8. After cancellation of the closed On Call Tariff sheets and transfer of remaining customers to the Load Control Tariff, all participating residential customers will receive the same bill credits for the same type of participation. This addresses a price disparity that currently exists between the two groups of participating customers, who provide identical benefits to the general body of customers. As demonstrated in Attachment A to the DSM Plan, the open tariff (that will continue for all participants) is highly beneficial from a participant's perspective.[3] Moreover, this consolidation will lower both administrative and incentive ECCR costs to the general body of customers, while maintaining more than sufficient program participation for FPL to meet its new DSM Goals.

Conclusion

9. FPL's DSM Plan is designed to achieve the annual DSM Goals established by the Commission in Order No. PSC-14-0696-FOF-EU. FPL's DSM Plan will reduce the growth rate of weather-sensitive peak demand, reduce and control the growth rate of energy consumption, increase the conservation of expensive resources, and increase the efficiency of the electrical system, as demonstrated by the data included in Attachment 1. Additionally, FPL's DSM Plan

[2] Regardless of the fact that the program remains cost-effective for participants, customers who are transferred from the closed On Call Tariff to the open Load Control Tariff would be free to terminate their participation in the program at any time with seven days' notice (including prior to the transfer), consistent with the current tariffs.

[3] Consistent with Attachment A, the program will continue to be referred to as the "Residential Load Management (On Call) Program."

can be reasonably monitored. FPL's monitoring efforts for each of its DSM programs and research projects are set forth in the program summaries in FPL's DSM Plan. For all the foregoing reasons, FPL's DSM Plan, including the transfer of customers from the closed to the open Residential Load Control Tariff and cancellation of associated tariff sheets, should be approved.

WHEREFORE, FPL respectfully requests that the Commission: (i) approve FPL's DSM Plan, as provided in Attachment 1; (ii) approve the cancellation of FPL's Residential On Call Tariff, the transfer of remaining customers on that tariff to the open Residential Load Control Tariff, and the revised tariff sheets provided in Attachment 2; (iii) authorize FPL to recover reasonable and prudent expenditures associated with the implementation of this DSM Plan through the ECCR clause; and (iv) grant such other relief as may be appropriate.

Respectfully submitted,

Jessica A. Cano

Florida Bar No. 37372

ATTACHMENT 2

~~RESIDENTIAL LOAD MANAGEMENT PROGRAM~~
~~(FPL "ON CALL" PROGRAM)~~
~~(CLOSED SCHEDULE)~~

~~RATE SCHEDULE: RSL~~

~~AVAILABLE:~~

~~Available only within the geographic areas served by the Company's Load Management System.~~

~~APPLICATION:~~

~~To Customers receiving service under Rate Schedule RS-1 who were active participants in this program as of April 1, 2003 and who utilized at least one of the following installed electrical appliances on the premises that was designated as of April 1, 2003:~~

~~1. Conventional electric water heater~~
~~2. Central electric air conditioning~~
~~3. Swimming pool pump (including pool sweeps as appropriate)~~
~~4. Central electric space heating*~~

~~*Central electric space heating systems alone are ineligible for program participation. These systems are eligible for program participation only when one or more of the other 3 appliances listed above is signed up for participation.~~

~~This Rate Schedule is not applicable for service to commonly owned facilities of condominium, cooperative, or homeowners' associations. Service under this Rate Schedule is not transferable to either new Customers requesting service at any premises that were designated by a Customer participating in this program prior to April 1, 2003 OR to the Customers participating in this program as of April 1, 2003 who discontinue service at the premises designated prior to April 1, 2003.~~

~~SERVICE:~~

~~The same as specified in Rate Schedule RS-1.~~

~~LIMITATION OF SERVICE:~~

~~The same as specified in Rate Schedule RS-1. The specified electrical appliances shall be interrupted at the option of the Company by means of load management equipment installed at the Customer's premises.~~

~~MONTHLY CREDIT:~~

~~Customers receiving service under this schedule will receive a credit on the monthly bill as follows:~~

~~DEVICE (OPTION)~~	~~APPLICABILITY~~	~~CREDIT~~
~~1. Conventional electric water heater~~	~~Year-round~~	~~$ 3.50~~
~~2. Central electric air conditioning (Option C)~~	~~April-October~~	~~$ 6.00~~
~~3. Central electric air conditioning (Option S)~~	~~April-October~~	~~$ 9.00~~
~~4. Swimming pool pump~~	~~Year-round~~	~~$ 3.00~~
~~5. Central electric space heating (Option C)~~	~~November-March~~	~~$ 2.00~~
~~6. Central electric space heating (Option S)~~	~~November-March~~	~~$ 4.00~~

~~Total monthly credit shall not exceed 40 percent of the Rate Schedule RS-1 "Base Energy Charge" actually incurred for the month (if the Budget Billing Plan is selected, actual energy charges will be utilized in the calculations, not the levelized charges) and no credit will be applied to reduce the Minimum bill specified on Rate Schedule RS-1.~~

~~Note: Option C or Option S (listed below) may be selected for either central air conditioning or heating systems. If both appliance types are participating in the program, the same option must be selected.~~

RESERVED FOR FUTURE USE

RESERVED FOR FUTURE USE

~~(Continued from Sheet No. 8.207)~~

~~INTERRUPTION SCHEDULES FOR ELECTRICAL APPLIANCES~~

~~The Customer's participating electrical appliances will be interrupted only during the following periods except as noted below:~~

~~April 1 through October 31: 3 p.m. to 10 p.m.~~

~~November 1 through March 31: 5 a.m. to 11 a.m.~~
~~4 p.m. to 10 p.m.~~

~~The interruption schedules available for each appliance are as follows:~~

~~1. Conventional electric water heating equipment may be interrupted up to, but not to exceed, 240 minutes per day.~~

~~2. Central electric air conditioning equipment may be interrupted under one of the following options selected by the Customer:~~

~~Option C equipment may be interrupted an accumulated total of 15 minutes during any 30 minute period with a cumulative interruption time of up to 180 minutes per day. If normal operation of the Program is not able to provide sufficient demand reduction to divert an emergency situation, central electric air conditioners may be interrupted for 17.5 minutes during any 30 minute period with a cumulative interruption time of up to 210 minutes per day.~~

~~Option S equipment may be interrupted up to, but not to exceed, 180 minutes per day.~~

~~3. Swimming pool pump equipment may be interrupted up to, but not to exceed, 240 minutes per day.~~

~~4. Central electric space heating equipment may be interrupted under one of the following options selected by the Customer:~~

~~Option C equipment may be interrupted an accumulated total of 15 minutes during any 30 minute period with a cumulative interruption time of up to 180 minutes per day.~~

~~Option S equipment may be interrupted up to, but not to exceed, 180 minutes per day.~~

~~The limitations on interruptions of electrical equipment shall not apply during emergencies on the Company's system or to interruptions caused by force majeure or other causes beyond the control of the Company.~~

~~TERM OF SERVICE:~~

~~During service under this Rate Schedule, a Customer may discontinue service by giving the Company seven (7) days advance notice. If, upon seven (7) days advance notice, the Customer requests to change interruption options, the selection of electrical appliances connected to the load management equipment, or have one or more appliances removed from participation in the program on or subsequent to April 1, 2003, then the Customer will be ineligible to participate further in the program.~~

~~SPECIAL PROVISIONS~~

~~1. The Company shall not be required to install load management equipment if the installation cannot be economically justified for reasons such as: excessive installation costs, oversized/undersized heating or cooling equipment or abnormal utilization of equipment, including vacation or other limited occupancy residences.~~

~~2. Billing under this Rate Schedule will commence upon the installation and completion of required inspections of the load management equipment.~~

~~3. Multiple units of any particular appliance type must all be connected with load management equipment to qualify for the credit attributable to that appliance type. In such circumstances, only a single credit for that appliance type will be applied. Pool sweeps, when coupled with pool pumps, are included in this category.~~

~~(Continued on Sheet No. 8.209)~~

RESERVED FOR FUTURE USE

RESERVED FOR FUTURE USE

~~(Continued from Sheet No. 8.208)~~

~~4. Installation of the load management equipment at the Customer's home is to be the sole responsibility of a licensed, independent contractor. The Customer agrees that the Company shall not be liable for any damages or injuries that may occur as a result of the interruption or restoration of electric service pursuant to the terms of this schedule.~~

~~5. The following types of electric water heaters are ineligible for participation in the program: solar water heaters, heat recovery units and heat pump water heaters.~~

~~6. If the Company determines that the Customer no longer uses one or more of the appliances signed up for program participation, then the Company has the right to remove the appropriate load management equipment and to discontinue the appropriate credits.~~

~~7. The Customer shall give the Company and the licensed, independent contractor reasonable access for installing, maintaining, testing and removing the Company's load management equipment, and for verifying that the equipment effectively controls the Customer's appliances as intended by this schedule.~~

~~8. If the Company determines that the effect of equipment interruptions has been offset by the Customer's use of supplementary or alternative electrical equipment, then service under this schedule may be discontinued and the Customer billed for all prior Monthly Credits received under this Rate Schedule over a period not to exceed six (6) months.~~

~~9. If the Company determines that its load management equipment on the Customer's premises has been rendered ineffective by mechanical, electrical or other devices or actions ("tampering"), then the Company may discontinue the Customer's participation in the program and bill for all expenses involved in removal of the load management equipment, plus applicable investigative charges. The Company may rebill all prior Monthly Credits received by the Customer from an established tampering date. If such a date cannot be established, then rebilling of the Monthly Credits shall be for the lesser of the number of months receiving service under this Rate Schedule or the previous twelve (12) months.~~

~~10. Service under this Rate Schedule is applicable only to eligible electrical equipment that was installed at the designated premises as of April 1, 2003. Installation of any new (but not replacement) electrical appliances on or subsequent to April 1, 2003 will not be eligible for service under this Rate Schedule.~~

~~11. Service under this Rate Schedule may not be combined with any other Residential Load Management Program or any other program with a provision for crediting on the Customer's monthly bill for eligible electrical appliances connected to load management equipment which may be offered by FPL in the future.~~

FLORIDA PUBLIC SERVICE COMMISSION
DOCKET: 150196-EI EXHIBIT: 75
PARTY: ECOSWF
DESCRIPTION: Sim/FPL Residential Load Program Rate Sheets

RESIDENTIAL LOAD CONTROL PROGRAM

RATE SCHEDULE: RLP

AVAILABLE:

Available only within the geographic areas served by the Company's Load Management System.

APPLICATION:

To Customers receiving service under Rate Schedule RS-1 who elect to participate in this Residential Load Control Program ("Program") on or after April 1, 2003 and who utilize at least one of the following installed electrical appliances at the Customer's premise:

1. Conventional electric water heater
2. Central electric air conditioning
3. Swimming pool pump (including pool sweeps as appropriate)
4. Central electric space heating*

*Central electric space heating systems alone are ineligible for Program participation. These systems are eligible for Program participation only when one (or more) of the other 3 appliances listed above is (are) signed up for participation.

This Rate Schedule is not applicable for service to commonly-owned facilities of condominium, cooperative, or homeowners' associations.

SERVICE:

The same as specified in Rate Schedule RS-1

LIMITATION OF SERVICE:

The same as specified in Rate Schedule RS-1. The specified electrical appliances shall be interrupted at the option of the Company by means of load management equipment installed at the Customer's premise.

MONTHLY CREDIT:

Customers receiving service under this Rate Schedule will receive a credit on the monthly bill as follows:

	DEVICE (OPTION)	APPLICABILITY	CREDIT
1.	Conventional electric water heater	Year-round	$ 1.50
2.	Central electric air conditioning (Option C)	April-October	$ 3.00
3.	Central electric air conditioning (Option S)	April-October	$ 9.00
4.	Swimming pool pump	Year-round	$ 3.00
5.	Central electric space heating (Option C)	November-March	$ 2.00
6.	Central electric space heating (Option S)	November-March	$ 4.00

Total monthly credit shall not exceed 40 percent of the Rate Schedule RS-1 "Base Energy Charge" actually incurred for the month (if the Budget Billing Plan is selected, actual energy charges will be utilized in the calculations, not the levelized charges) and no credit will be applied to reduce the Minimum bill specified on Rate Schedule RS-1.

Note: Option C or Option S (listed below) may be selected for either central air conditioning or heating systems. If both appliance types are participating in the Program, the same option must be selected.

(Continued on Sheet No. 8.218)

(Continued from Sheet No. 8.217)

INTERRUPTION SCHEDULES FOR ELECTRICAL APPLIANCES

The Customer's participating electrical appliances will be interrupted only during the following periods except as noted below:

April 1 through October 31:	2 p.m. to 10 p.m.
November 1 through March 31:	5 a.m. to 11 a.m. 4 p.m. to 10 p.m.

The interruption schedules available for each appliance are as follows:

1. Conventional electric water heating equipment may be interrupted up to, but not to exceed, 240 minutes per day.

2. Central electric air conditioning equipment may be interrupted under one of the following options selected by the Customer:

   Option C equipment may be interrupted an accumulated total of 15 minutes during any 30 minute period with a cumulative interruption time of up to 180 minutes per day. If normal operation of the Program is not able to provide sufficient demand reduction to divert an emergency situation, central electric air conditioners may be interrupted for 17.5 minutes during any 30 minute period with a cumulative interruption time of up to 210 minutes per day.

   Option S equipment may be interrupted up to, but not to exceed, 180 minutes per day.

3. Swimming pool pump equipment may be interrupted up to, but not to exceed, 240 minutes per day.

4. Central electric space heating equipment may be interrupted under one of the following options selected by the Customer:

   Option C equipment may be interrupted an accumulated total of 15 minutes during any 30 minute period with a cumulative interruption time of up to 180 minutes per day.

   Option S equipment may be interrupted up to, but not to exceed, 180 minutes per day.

The limitations on interruptions of electrical equipment shall not apply during emergencies on the Company's system or to interruptions caused by force majeure or other causes beyond the control of the Company.

TERM OF SERVICE:

During service under this Rate Schedule, a Customer may change interruption options or the selection of electrical appliances connected to the load management equipment or discontinue service under this Rate Schedule by giving the Company 7 days advance notice. If the Customer requests to have one or more appliances removed from participation in the Program, the Customer will be ineligible to participate with such appliance(s) again in the Program for one year (12 months) from the time participation ended.

SPECIAL PROVISIONS

1. The Company shall not be required to install load management equipment if the installation cannot be economically justified for reasons such as: excessive installation costs, oversized/undersized heating or cooling equipment or abnormal utilization of equipment, including vacation or other limited occupancy residences.

2. Billing under this Rate Schedule will commence upon the installation and completion of required inspections of the load management equipment.

3. Multiple units of any particular appliance type must all be connected with load management equipment to qualify for the credit attributable to that appliance type. In such circumstances, only a single credit for that appliance type will be applied. Pool sweeps, when coupled with pool pumps, are included in this category.

(Continued on Sheet No. 8.219)

(Continued from Sheet No. 8.218)

4. Installation of the load management equipment at the Customer's premise is to be the sole responsibility of a licensed, independent contractor. The Customer agrees that the Company shall not be liable for any damages or injuries that may occur as a result of the interruption or restoration of electric service pursuant to the terms of this Rate Schedule.

5. The following types of electric water heaters are ineligible for participation in the Program: solar water heaters, heat recovery units and heat pump water heaters

6. If the Company determines that the Customer no longer uses one or more of the appliances signed up for Program participation, then the Company has the right to remove the appropriate load management equipment and to discontinue the appropriate credits.

7. The Customer shall give the Company and the licensed, independent contractor reasonable access for installing, maintaining, testing and removing the Company's load management equipment, and for verifying that the equipment effectively controls the Customer's appliances as intended by this Rate Schedule.

8. If the Company determines that the effect of equipment interruptions has been offset by the Customer's use of supplementary or alternative electrical equipment, then service under this Rate Schedule may be discontinued and the Customer billed for all prior Monthly Credits received under this Rate Schedule over a period not to exceed six (6) months.

9. If the Company determines that its load management equipment at the Customer's premise has been rendered ineffective by mechanical, electrical or other devices or actions ("tampering"), then the Company may discontinue the Customer's participation in the Program and bill for all expenses involved in removal of the load management equipment, plus applicable investigative charges. The Company may rebill all prior Monthly Credits received by the Customer from an established tampering date. If such a date cannot be established, then rebilling of the Monthly Credits shall be for the lesser of the number of months receiving service under this Rate Schedule or the previous twelve (12) months.

Re: 2014 Demand-Side Management (DSM) Annual Report

Dear Mr. Brown:

In accordance with Rule 25-17.0021(5), Florida Administrative Code, Florida Power & Light Company ("FPL") is submitting its 2014 DSM Annual Report. The Report includes the results of FPL's DSM Plan as approved by Order No. PSC-11-0346-PAA-EG (consummated by Order No. PSC-11-0590-FOF-EG). FPL's DSM Plan consists of the DSM programs approved by the Commission in 2004 and subsequent modifications approved by the Commission in 2006.

FPL developed internal demand and energy targets ("FPL Targets") following the Commission's approval of its current DSM Plan. The FPL Targets are based on the incentive levels and a similar program mix contained in FPL's approved DSM Plan as well as adjustments for 2012 Florida Building Code changes. Below is a table comparing FPL's 2014 performance to the FPL Targets:

	Residential and Business Combined			Residential			Business		
	Actual Total Achieved	FPL Target	% Variance	Actual Total Achieved	FPL Target	% Variance	Actual Total Achieved	FPL Target	% Variance
Summer Peak MW	142.1	131.1	8%	99.1	80.3	23%	43.0	50.8	-15%
Winter Peak MW	66.6	79.0	-16%	51.1	56.0	-9%	15.5	23.1	-33%
GWh Energy	222.1	156.4	42%	162.6	101.1	61%	59.4	55.3	7%

On a combined basis, FPL achieved the Summer MW and GWh targets. The value of demand and energy savings for FPL's general body of customers is unrelated to whether the savings occur in the residential or business sector.

In the enclosed report, FPL's performance is compared to the demand and energy goals established by Order No. PSC-09-0855-FOF-EG, issued December 30, 2009, in Docket No. 080407-EG ("2009 Goals"). The results are summarized on page one of the attached report. In

2014, FPL achieved DSM savings within 15% of the residential Summer MW and business Winter MW goals. On a combined basis, FPL's 2014 achievements exceeded 2013. FPL's 2014 residential and business sector-level achievements also exceeded 2013, with the exception of business GWh. Achievement in the business sector continues to be affected by customers deferring projects due to budget constraints as a result of the slow economic recovery. As indicated in the transmittal letter accompanying last year's DSM Annual Report, variances from the 2009 DSM Goals are expected because FPL's approved DSM Plan was not designed to meet the 2009 Goals.

Please do not hesitate to contact me should you have any questions.

Sincerely,

for Wayne Besley
Director, Demand-Side Management Programs

Enclosures

RESEARCH & DEVELOPMENT

Conservation Research & Development ("CRD") Program: CRD is an umbrella program under which FPL researches a wide variety of new technologies to evaluate their potential for reductions in peak load and energy as well as customer bill savings. Florida's climatic conditions are unique so the studies must incorporate the effects of our hot humid environment. Favorable evaluation results can lead to incorporation in FPL's DSM programs. Examples of technologies that have been included are: Energy Recovery Ventilators; Demand Control Ventilation; and Residential Air Conditioning Duct Plenum Seal. Examples of other potentially viable candidates currently being considered are: variable speed pool pumps; hotel occupancy sensors; and residential heat pump water heaters.

FPL partners in its research projects with the Florida Solar Energy Center and engineering departments of several Florida universities. In 2014, FPL had active research projects with five universities. In addition, FPL participates in relevant co-funded projects through the U.S. Department of Energy ("DOE"). This co-funding enables FPL to participate in larger research projects at a fraction of the total cost.

In 2014, two CRD projects were completed. The first was field testing of a water misting system for the condenser coils of air-cooled large HVAC and refrigeration equipment at a supermarket. The second was Phase I of the co-funded DOE Building America Deep Retrofit project which is aimed at improving energy efficiency of existing homes with low-cost ("shallow") and higher-cost ("deep") retrofits.

Two projects began in 2014 which will be completed in 2015. First is Phase II of the DOE project which is focusing on a new set of deep retrofit measures. Equipment was installed in 2014 and data collection and analysis will be conducted in 2015. Second is a field research project at a supermarket to quantify the savings of a control system which varies the speed of the evaporator fan and the position of the supply air damper on a large rooftop HVAC unit.

Renewable Research & Demonstration ("RRD"): RRD's overall objectives are to: (a) increase awareness of mainstream solar technologies; and (b) evaluate emerging renewable technologies and their applications. The three strategies to meet these objectives are:

1. Demonstrate commercially-available photovoltaic ("PV") or solar water heating ("SWH") systems in real-world field installations.
2. Conduct specific research projects to quantify the performance of renewable products which are less well known, but worthy of closer examination.
3. Educate contractors and the public about the proper way to install solar systems for best performance.

To achieve these, FPL has: installed PV systems and educational displays at public facilities with large numbers of visitors, funding scientific research conducted by Florida universities or other qualified laboratories to test emerging renewable energy technologies, and partnering with universities and technical centers to increase access for solar contractors' training and providing education to FPL's residential and business customers.

In 2014, FPL completed four renewable demonstration installations – the Central Florida Zoo in Sanford, Equine Assisted Therapies at Tradewinds Park in Coconut Creek, Florida Gateway College in Lake City, and the Palm Beach Zoo. FPL also completed four renewable research projects – a solar tracker, hybrid thin film PV, hybrid solar thermal panels, and a solar thermal assisted residential HVAC. Data will continue to be collected on several of the sites for longer term analysis.

OTHER CONSERVATION ACTIVITIES

Cogeneration & Small Power Production: The objective of this program is to facilitate cogeneration and small power production facilities. In 2014, there were purchases from thirteen facilities. These facilities produced 2,503 GWh, summer demand of 748 MW and winter demand of 214 MW

ORDER APPROVING STIPULATION

BY THE COMMISSION:

During our reviews of the Ten Year Site Plans filed in 1997 and 1998, we expressed concerns about the adequacy of the reserve margins planned for Peninsular Florida. At the December 15, 1998, Internal Affairs meeting, we directed staff to open this docket to consider the reserve margins planned for Peninsular Florida electric utilities.

By Order No. PSC-99-1274-PCO-EI, nineteen issues were identified for consideration in this proceeding. The investor-owned utilities, the cooperative utilities, several municipal utilities, the various intervenors, and Commission staff filed testimony concerning these issues. The hearing was scheduled for November 2nd and 3rd, 1999.

At the outset of the hearing, Florida Power & Light Company (FPL), Florida Power Corporation (FPC), and Tampa Electric Company (TECO), presented a proposal designed to settle the case; addressing what they believe are the Commission's major concerns. By the proposal, these three utilities stipulated to voluntarily adopting a twenty percent reserve margin planning criterion. Each of these three utilities would achieve the twenty percent level by the summer of 2004. Further, pursuant to the proposal, no decisions would be made concerning the specifically enumerated issues, and the docket would be closed. FPL, FPC, and TECO would be the only utilities adopting the twenty percent criteria.

Other parties argued in support of and against the proposal. The Florida Industrial Power Users Group (FIPUG) requested additional time to present a counter-proposal. The hearing was continued until November 30, 1999, and the parties were directed to attempt to reach a negotiated settlement. FIPUG offered a counter-proposal on November 17, 1999. No settlement was reached.

At the continued hearing, we considered both proposals. After discussion, FPL, FPC, and TECO agreed to further modifications to their proposal. A document incorporating these agreed-upon changes was filed on December 15, 1999. A copy of this document (hereinafter the "Stipulation") is included in this Order as Attachment A and is incorporated herein by reference. FPL, FPC, and TECO have each agreed to achieve a planned twenty percent reserve margin by the summer of 2004. In response to concerns expressed by some of the other parties, each utility has agreed to make a good faith effort to notify the Commission if it opts to modify the twenty percent criterion. The three utilities signing the Stipulation further acknowledge in paragraph 9 at page 4 that

> the Commission shall retain the ability and discretion to consider all facts and circumstances applicable to a given utility and/or peninsular Florida. Further, with respect to the evaluation of the adequacy of reserves in peninsular Florida, the Commission may employ any methodology and consider any facts and circumstances it deems appropriate, subject to applicable legal requirements.

We approve the Stipulation agreed to by Florida Power & Light Company, Florida Power Corporation, and Tampa Electric Company. It addresses the basic concern about the adequacy of planned reserve margins for Peninsular Florida. Collectively, these three utilities plan for approximately 80 percent of the Peninsular Florida load. Thus, a twenty percent planning criterion adopted by these three utilities is a significant increase over the fifteen percent criterion currently employed.

Further, we will convene a workshop to receive and consider information regarding how distributed resources, both demand and supply-side, may be used to meet Florida's energy service reliability needs. In addition, we will convene a workshop for the consideration of the appropriate relationship between the non-firm load of an individual utility and the total reserves required to maintain the utility's appropriate reserve margin.

Based on the foregoing, it is therefore

ORDERED by the Florida Public Service Commission that the Stipulation agreed to by Florida Power & Light Company, Florida Power Corporation, and Tampa Electric Company, which is included in this Order as Attachment A and is incorporated by reference herein, is approved. It is further

ORDERED that this docket shall be closed.

By ORDER of the Florida Public Service Commission this 22nd day of December, 1999.

Blanca S. Bayó

BLANCA S. BAYÓ, Director
Division of Records and Reporting

(S E A L)

RVE

NOTICE OF FURTHER PROCEEDINGS OR JUDICIAL REVIEW

The Florida Public Service Commission is required by Section 120.569(1), Florida Statutes, to notify parties of any administrative hearing or judicial review of Commission orders that is available under Sections 120.57 or 120.68, Florida Statutes, as well as the procedures and time limits that apply. This notice should not be construed to mean all requests for an administrative hearing or judicial review will be granted or result in the relief sought.

Any party adversely affected by the Commission's final action in this matter may request: 1) reconsideration of the decision by filing a motion for reconsideration with the Director, Division of Records and Reporting, 2540 Shumard Oak Boulevard, Tallahassee, Florida 32399-0850, within fifteen (15) days of the issuance of this order in the form prescribed by Rule 25-22.060, Florida Administrative Code; or 2) judicial review by the Florida Supreme Court in the case of an electric, gas or telephone utility or the First District Court of Appeal in the case of a water and/or wastewater utility by filing a notice of appeal with the Director, Division of Records and reporting and filing a copy of the notice of appeal and the filing fee with the appropriate court. This filing must be completed within thirty (30) days after the issuance of this order, pursuant to Rule 9.110, Florida Rules of Appellate Procedure. The notice of appeal must be in the form specified in Rule 9.900(a), Florida Rules of Appellate Procedure.

BEFORE THE FLORIDA PUBLIC SERVICE COMMISSION

In re: Generic investigation into the aggregate electric utility reserve margins planned for Peninsular Florida
/

Docket No. 981890-EU

STIPULATION

WHEREAS, the Florida Public Service Commission initiated this proceeding regarding reserve margins of Peninsular Florida utilities in December 1998; and

WHEREAS, subsequent to that date Staff and parties identified certain issues to be addressed and procedures to be followed; and

WHEREAS, Florida Power & Light Company (FPL), Florida Power Corporation (FPC), and Tampa Electric Company (TECO) (collectively, the IOUs) have asserted, and continue to assert, that the scope of the proceeding has been expanded beyond the intent of the Commission, and that the procedural posture of this proceeding is such that the Commission cannot lawfully take formal action that would affect their substantial interests at this time; and

WHEREAS, in Orders No. PSC-99-1274-PCO-EU and No. PSC-99-1716-PCO-EU the Commission overruled the IOUs' procedural objections, clarified the scope of the docket, identified specific issues to be addressed, and confirmed its intent to conduct a formal evidentiary proceeding in this docket and take the actions it deems appropriate; and

WHEREAS, Reliant Energy Power Generation, Inc (Reliant Energy), Florida Industrial Power Users Group (FIPUG), PG&E Generating Company (PG&E), the Legal Environmental Assistance Foundation, Inc. (LEAF), and Duke Energy North America, LLC, and Duke Energy New Smyrna Beach Power Company, Ltd., LLP (Duke Energy), (hereinafter referred to as Intervenors), filed Petitions to Intervene in which they alleged the actions contemplated by the Commission in this docket would affect their substantial interests; and

WHEREAS, the Commission granted Intervenors' petitions to intervene, and Intervenors have participated as full parties to the proceeding; and

WHEREAS, on October 29, 1999, FPC, acting on behalf of the IOUs, submitted to the Commission Staff a proposal for the resolution of the issues in this proceeding; and

WHEREAS, upon receipt of the proposal the Commission continued the hearing scheduled for November 2, 1999 and convened on that date a conference of all parties for the purpose of discussing the proposal of the IOUs; and

WHEREAS, upon consideration of the IOUs' proposal, without waiving their respective litigation positions and for the purposes of compromise and settlement, the undersigned, representing all of the parties to this proceeding that have been identified by the Commission or allowed by Commission to intervene, have decided to prepare this Stipulation, and present it to the Commission for the purpose of concluding this docket.

NOW, THEREFORE, the parties stipulate and agree as follows:

1. The IOUs will each voluntarily adopt a minimum reserve margin planning criterion of twenty percent (20%).

2. The twenty percent (20%) reserve margin planning criterion will be a minimum; no maximum or cap will be represented or implied by this criterion.

3. No utility other than the three IOUs identified hereinabove is agreeing to adopt a twenty percent (20%) reserve margin planning criterion by virtue of this Stipulation.

4. The IOUs will calculate the minimum twenty percent (20%) reserve margin by employing their current methodology; i.e., Reserve Margin (%) = [(Total Firm Capacity - Peak Firm Demand)/Peak Firm Demand] x 100, where Total Firm Capacity will be based on generating capacity owned by the IOUs or capacity for which there is a firm commitment to these IOUs and

where Peak Firm Demand means total demand reduced by demand side resources.

5. The IOUs will undertake to implement the twenty percent reserve margin criterion over a transition period of four years, meaning that they will plan to achieve a twenty percent (20%) reserve margin by the Summer of 2004.

6. The IOUs agree to adopt the twenty percent (20%) reserve margin planning criterion with the good faith intention of maintaining that planning criterion for the indefinite future, but each IOU must reserve the prerogative individually to modify its planning criteria to adapt to relevant circumstances. By the same token, it is understood that the Commission remains free to initiate an investigation or to take other appropriate action to review and to respond to any changes that the IOUs may make in the future regarding their planning criteria.

7. Should any IOU exercise its prerogative to change its twenty percent (20%) minimum reserve margin planning criterion discussed herein, such IOU will make a good faith effort to provide notice of the change to the Commission.

8. Neither the adoption by the IOUs of the minimum twenty percent (20%) planning criterion nor the approval of this Stipulation by the Commission shall be deemed to create any presumption that capacity additions must be through any particular mix of generation and/or demand-side resources. Nor shall said adoption or approval be deemed to create any presumption with respect to any proposals for adding generating capacity or create a presumption that a generating capacity addition proposed by any entity is not needed. All current and future proceedings under the Electrical Power Plant Siting Act, including those for the consideration of merchant plants, and all statutes, rules, regulations, and policies bearing on the Commission's determination of need for new generation (including the need determination criteria in § 403.519, Florida Statutes); the IOUs' obligation to solicit proposals for generating capacity; and the

obligations of the IOUs to otherwise prudently avail themselves of reasonably available conservation alternatives and cost-effective resource options; and the obligations of the IOUs to best serve their retail customers through their respective resource planning processes, are unaffected by this Stipulation and the approval thereof.

9. The parties acknowledge that for all regulatory purposes, the Commission shall retain the ability and discretion to consider all facts and circumstances applicable to a given utility and/or peninsular Florida. Further, with respect to the evaluation of the adequacy of reserves in peninsular Florida, the Commission may employ any methodology and may consider any facts and circumstances it deems appropriate, subject to applicable legal requirements.

10. The Commission is encouraged to take the following actions in conjunction with the approval of this Stipulation:

A. Convene a workshop, with the participation and the assistance of the Regulatory Assistance Project, to receive and consider information regarding how distributed resources, both demand and supply-side, may be used to meet Florida's energy service reliability needs, to be followed by any additional proceedings and/or actions relative to this matter that the Commission deems appropriate.

B. Convene a workshop for the consideration of the appropriate relationship between the non-firm load of an individual utility and the total reserves required to maintain the utility's appropriate minimum reserve margin, to be followed by any additional proceedings and/or actions relative to this matter that the Commission deems appropriate.

11. The parties enter into this Stipulation for the purpose of effecting a compromise and of achieving closure of this docket. By its participation in this Stipulation, no party expresses its endorsement of any individual provision included by any other party.

12. By entering this Stipulation, no party waives any position it has taken with respect to any aspect of this proceeding or any of the issues identified in this proceeding or any other proceeding. Further, no party waives the right and opportunity to petition the Commission to institute any action designed to provide any relief deemed appropriate or desirable by that party at any time.

13. The parties to this Stipulation agree that, by approving this Stipulation, the Commission does not waive its right and ability, pursuant to governing law, to initiate any proceeding or take any action for which it has requisite jurisdiction and authority.

14. In the event the Commission declines to approve this Stipulation in its entirety, it shall become null and void.

AGREED this 14th day of December 1999.

Driving energy efficiency too slow

October 22nd, 2011 › Energy Efficiency, Utilities › John D. Wilson ›

Florida energy regulators have been in the slow lane, dragging out the implementation of a 2009 law mandating stronger energy efficiency programs.

Just a brief update for those who are interested in why Florida is moving so slowly on energy efficiency. As recently noted by the American Council for an Energy Efficient Economy, "regulators in Florida … took actions to render their energy savings target ineffective." Similarly in response, the Southern Alliance for Clean Energy is protesting the regulatory decision to effectively eviscerate the energy efficiency goals set by the Florida Public Service Commission for Florida Power and Light and Progress Energy Florida.

Yesterday, we filed our brief protesting the rollback decision. Essentially, we are asking the Commission to reconsider its decision under a corrected interpretation of Florida law. Here's the crux of our legal argument:

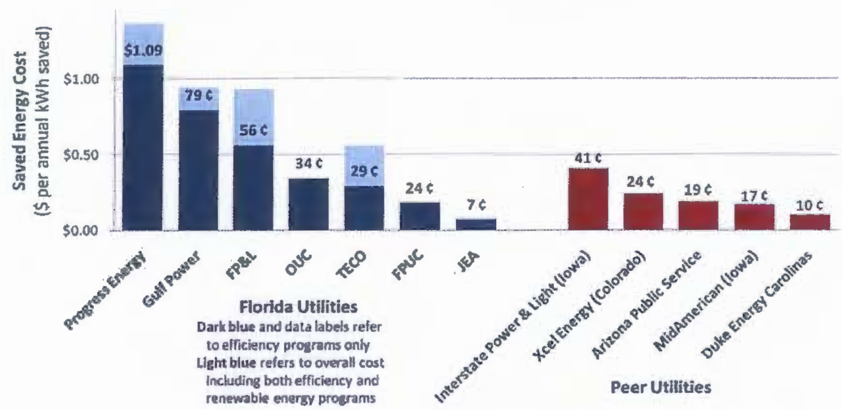
> The Commission violated Fla. Stat. §366.82(7) … by relying on this statutory provision as authority to effectuate a change in FPL's and PEF's applicable conservation goals. This is a clear procedural violation as §366.82(7) only allows the Commission to, following the adoption of goals pursuant to the goal setting provisions of the statute, approve, modify, or deny DSM plans submitted by utilities to ensure the plans meet applicable goals. The Commission simply cannot adopt or change goals pursuant to §366.82(7); rather, the statute is clear and unambiguous in that goals can only be adopted or changed pursuant to §§366.82(2), (3) and (6), Fla. Stat.
>
> … the legislative history of the 2008 amendments to the statute is clear that the Legislature intended for more robust conservation goals to be set, and that the

Commission must find ways to meet the goals in the most efficient and cost-effective manner. Thus, the Commission's orders are in direct contravention to legislative intent.

The brief asks the Commission to either approve the plans submitted earlier this year by the utilities (which the utilities believe will achieve the goals), or to approve the parts of the plans that the Commission believes are reasonable. If the commission only approves part of the plans, it should direct the utilities to file improved plans.

The process for reviewing these plans has now stretched to over a year and a half. During that time, SACE has continuously argued that Florida's utilities have proposed energy efficiency plans with bloated costs. (See our comments filed here, here, here, here, and hear. Hear! Hear!) Then, Florida utilities have argued that those bloated costs are the reason that the programs should be rolled back. The Florida Public Service Commission's responsibility is to direct the utilities to develop cost-effective plans that reflect industry best practices, as Susan Glickman recently reminded us.

In their Original Plan Filings, Some Florida Utilities Proposed Energy Efficiency Programs with Bloated Costs



Notes: "Saved Energy Cost" is calculated as the total cost to the utility (program costs plus incentives) per total annual energy savings attributed to those programs, irrespective of measure life. A program with a saved energy cost of 40 ¢ per kWh with an expected measure life of ten years would cost about 4 ¢ per kilowatt hour per year. See tables 2 and 3 of our findings for the data illustrated above.

Ironically, on the same day that the Florida Public Service Commission argued that helping customer save energy was too expensive, it also approved a program that will require existing customers to subsidize the energy bills of new businesses, but the Commission did not examine the costs and rate impacts of *that* program. Deeply hypocritical and misguided, as energy efficiency promotes job growth and helps existing businesses manage their bottom line.

PUBLIC SERVICE COMMISSION

DOCKET NO. 981890-EU
FLORIDA POWER & LIGHT COMPANY

GENERIC INVESTIGATION INTO
THE AGGREGATE UTILITY RESERVE MARGINS
PLANNED FOR PENINSULAR FLORIDA

REBUTTAL TESTIMONY & EXHIBITS OF:

ROBERTO R. DENIS

BEFORE THE FLORIDA PUBLIC SERVICE COMMISSION

FLORIDA POWER & LIGHT COMPANY

SECOND REBUTTAL TESTIMONY OF ROBERTO R. DENIS

DOCKET NO. 981890-EU

SEPTEMBER 27, 1999

Q. Please state your name and business address.

A. My name is Roberto Denis and my business address is 9250 West Flagler Street, Miami, Florida 33174.

Q. Have you previously testified in this docket?

A. Yes.

Q. What is the purpose of your rebuttal testimony?

A. I have previously filed testimony in rebuttal of Mr. Slater, the witness for the Duke entities, in accordance with the pre-hearing order in this docket. This rebuttal testimony responds to the testimony of the Staff witnesses, Mr. Ballinger and Mr. Trapp. While I address a number of specific observations of their testimony, my rebuttal testimony has six major points.

First, Staff's exercise of looking at historic projections of reserve margins over time rather than looking at reliability criteria used for planning is misleading. It ignores the historic reasons that past projections of reserve margins have been above reserve margin criteria, and it fails to recognize years of Commission practice that have approved reliability criteria that are consistent with the 15% minimum reserve margin criterion that the Florida Reliability Coordinating Council (FRCC) has employed for the last two years.

Second, Staff's analysis and conclusions regarding the FRCC's 15% reserve margin are flawed. The analysis fails to demonstrate either that the 15% minimum reserve margin proposed for Peninsular Florida by the FRCC is inappropriate or why a 20% reserve margin criterion proposed by Staff is appropriate.

Third, Staff's testimony and focus on reserve margin fails to acknowledge the reliability of Peninsular Florida system as measured by Loss-of-Load Probability (LOLP). Staff's dismissal of LOLP appears to be based solely on disagreement with the outcome of recent LOLP analyses performed for Peninsular Florida. While Staff questions projected unit availability rates, the rates used are consistent with recent experience. Staff's rejection of the LOLP studies is therefore arbitrary and unreasonable. The Commission has long recognized use of LOLP to measure supply adequacy for Peninsular Florida, and Staff's suggestion that the Commission adopt a reserve margin criterion without consideration of LOLP fails to recognize the reliability of the Peninsular Florida system.

Fourth, Staff's suggestion that reliance upon non-committed capacity to achieve reserve margin criteria is a departure from years of Commission practice that would damage rather than enhance reliability. The Commission has never required utilities to replace firm resources with non-firm resources, though the state has had these resources available for many years.

Fifth, Staff's suggestion that a one-size-fits-all reliability standard should be adopted for Peninsular Florida and individual utilities fails to recognize the varying degrees of reliability among the numerous systems that comprise Peninsular Florida and advances a concept of central planning that the Commission should reject. If there are reliability problems within the State of Florida, they are first and foremost individual utility problems that must be addressed at an individual utility level. For much the same reason a single standard should not be applied in judging individual utilities' Ten-Year Site Plans.

Sixth, it is inappropriate for the Commission to adopt in this proceeding a policy, creation of a 20% reserve margin criterion, and apply it retroactively to assess the suitability of Ten-Year Site Plans filed when there was no such policy in place and when prior Commission practice was consistent with the use of planning criteria utilized by individual utilities. The unfairness of Staff's recommendation should be readily apparent to the Commission.

Q. Are you sponsoring any exhibits?

A. Yes. My exhibit consists of the following document:

Document No. RRD-2: Commission Approved Reliability Criteria

Q. Before continuing, do you have any general concerns with this proceeding?

A. Yes. The testimony presented by Staff's witnesses reinforces FPL's concerns about the type of proceeding we are involved in and whether or not the results will have any binding impact on FPL and its customers. FPL has stated its concerns on several occasions about these issues. What began as a generic investigation into reserve margin methodology has become a proceeding to determine and enforce a new reserve margin standard.

Let me be clear in stating FPL's position one more time. FPL does not question the Commission's authority to investigate these issues, nor do we seek to limit or impede the Staff's ability to carry out any directive from the Commission.

However, a generic investigation, such as this docket, is not intended in my opinion, to determine guilt or innocence, but rather to educate the Commission on issues the Commission has identified to be of interest. What concerns us here is process, not authority. If the Commission wishes, after considering all of the information presented, to initiate a rulemaking to establish a reserve margin standard, that is certainly within the Commission's discretion.

Aside from the general process concerns, I am also disturbed by the introduction of issues which are only peripherally related to reserve margin methodology, and the participation in this proceeding by entities which are not regulated utilities who will be required to comply with the outcome, nor will be substantially affected in any way. The issues related to merchant plants, which were supposed to be the subject of a separate investigation as I understand it, have not only been reintroduced in this proceeding, but seem to be influencing some of the recommendations. This generic investigation has expanded in scope well beyond what is necessary to fill the Commission's needs for information.

In summary, I believe this investigation is inappropriately directed at enforcing a yet-to-be identified standard, overly broad in its scope, and I would go so far to say that what we have here is a solution in search of a problem. Nevertheless, I will address the specific factual allegations raised in Staff's testimony.

I. Staff's Misleading Failure to Distinguish Historic Projections of Reserve Margin Levels from Reserve Margin Criteria, Their Failure to Acknowledge Improved System Reliability and the Reliability Standards That Have Withstood the Test of Time.

Q. On pages 4 and 5 of his direct testimony, Mr. Ballinger reports a decline in utility "planned reserve margins for Peninsular Florida", discusses his perception of the driving forces behind the trend, and then concludes with the observation that "caution should be taken before adopting any reliability standard that has not withstood the rigors of time testing." What is your response?

A. I have two points I would like to make. First, Mr. Ballinger fails to explore the reasons underlying the apparent "decline" in planned reserve margins. Had he done so, he would have discovered that historic projections of reserve margins did not result solely from reliability standards used in resource planning. Other considerations, well known to the Commission, influenced projected reserves. Second, when one considers the Commission's decisions over the period 1984 through 1999, particularly the 1989 through 1999 period Mr. Ballinger addresses in his testimony, it is clear that a 15% reserve margin criterion and a LOLP criterion of 0.1 day/year have not only withstood the rigors of time testing, but also have been repeatedly approved by the Commission as reasonable planning criteria.

Q. Please explain your observation that Mr. Ballinger fails to explore the reasons underlying the apparent "decline" in planned reserve margins.

A. On page 4 of his testimony, Mr. Ballinger reports what he calls "planned reserve margins" for Peninsular Florida. He goes on to recount his opinion as to why the "planned" reserve margins have declined and then concludes that "caution should be taken before adopting any reliability standard that has not withstood the rigors of time testing". He is confusing reserve margins projections resulting from a reliability planning process with historic projections of reserve margins which may have resulted from other considerations in addition to reliability planning.

The "planned reserve margins" of approximately 50% he reports were not reserve margins that were the product of reliability standards. At no time during the period 1984 through present has any Peninsular Florida utility or the FRCC or its predecessor had a 50% or even a 40% reserve margin criterion. The historically high reserve margins in the mid-to-late 1980s reported by Mr. Ballinger were due to other well documented factors that Mr. Ballinger has ignored or overlooked. A comparison of "planned reserve margins" with current reserve margin planning standards or criteria is, at best, misleading when the "planned reserve margins" resulted from considerations other than reliability. It makes it appear that there has been a dramatic decline in the reserve margin planning standard, and that is not the case.

Q. You stated that there were well documented factors that explain the historically high reserve margins in the mid-to-late 1980s, other than the factors cited by Mr. Ballinger. Please explain?

A Mr. Ballinger overlooks the fact that the high reserve margin levels of the mid-to-late 1980s and early 1990s are readily attributable to two Commission actions associated with the implementation of the Florida Energy Efficiency and Conservation Act (FEECA): i) adoption of very aggressive, mandatory conservation goals, and ii) the approval of oil backout projects. I will address each, in turn.

In its implementation of FEECA in 1981, the Commission approved mandatory conservation goals that required utilities to reduce demand and energy by certain Commission prescribed percentages. When these Commission-approved goals were factored into utilities' load forecasts, there was an immediate increase in the resulting reserve margins, simply due to lowered projections of firm load.

The introduction of these conservation goals resulted in some initial reluctance to cancel or defer new generating units that were already planned but not yet under construction. In some cases, these units remained in individual electric utility plans (and were subsequently built) for reasons other than reliability, with the utility's resulting reserve margin increasing.

The impact of the Commission's conservation goals on reserve margins is perhaps most easily seen in two determination of need cases decided by the Commission in 1981. Prior to the Commission's adoption of conservation goals, both Tampa Electric Company (TECO) and Orlando Utilities Commission (OUC) had been planning major coal unit additions for the mid-1980s. After the Commission adopted its mandatory conservation goals, the need for these plants could no longer be based on a reliability standard alone. The Commission noted in TECO's Big Bend 4 decision, "achievement of the conservation goals would obviate Peninsular system's need for Big Bend 4 from an adequacy viewpoint." In the OUC Stanton Unit 1 case the Commission noted that with the recently approved FEECA goals the unit was not needed to meet a Peninsular Florida reserve margin criteria until 1992, six years after its scheduled in-service date. Ultimately, the Commission justified the need for these units on an immediate oil backout and fuel savings rationale as well as longer term reliability needs (needs in the early 1990s). That leads me to the other factor that explains the high reserve margin levels of the mid-to-late 1980s.

This other factor was based on another aspect of FEECA. It concerned an intent to reduce reliance on foreign oil - oil backout. As a result, the Commission made a concerted effort to reduce the reliance of Florida utilities on foreign oil by promulgating an oil backout rule, approving a major oil backout project, and approving power plant construction that was based upon economic savings associated with displacing oil-generated power. This policy, which promoted power plant additions not based on meeting reliability criteria, also contributed to Peninsular Florida reserve margins increasing dramatically to the levels reported in Mr. Ballinger's testimony.

In 1982, for example, the Commission approved the St. John's River Power Park Units 1 and 2 based on oil backout. In addition, in 1982 the Commission approved the construction of two 500 kV transmission lines and associated coal-by-wire purchases as an oil backout project under the Commission's recently adopted oil backout rule. The Commission acknowledged that the projects would increase reliability but stated that their primary purpose was oil backout.

When the combined capacity of these four coal units, 2,200 MW and the coal-by-wire purchases of approximately 2,600 MW, were reflected in Peninsular Florida's reserve margins (reserve margins that were already inflated by Commission mandated conservation goals) in the mid-to-late 1980s, the resulting reserve margins were quite large. However, it would be misleading to suggest that these resulting reserve margins were the product of reserve margin or planning standards which were then in place.

For FPL, planning criteria have not declined in the 1989-to-present period Mr. Ballinger discusses. In fact, FPL bolstered its planning criteria in 1997 when it began using a 15% Winter reserve margin in addition to its 15% Summer reserve margin criterion and its 0.1 day/year LOLP criterion.

Q. On Page 4 of his testimony, Mr. Ballinger suggests that reevaluated maintenance procedures have led to the emergence of unprecedented generating unit availabilities. He then suggests that such improved availabilities have not stood the test of time and should be discounted for their effect resulting in lower planned reserve margins. What is your response?

A. I can only speak for FPL, but improved generating performance has been a management objective, a conscious effort by FPL. Of course, that is also exactly what the Commission intended when it proposed for investor-owned utilities a Generating Performance Incentive Factor (GPIF) almost twenty years ago. It was adopted to provide utilities an incentive to improve their generating performance, including their unit availabilities. Not surprisingly, that is exactly what has happened and continues to happen. The factor is designed to provide a reward for improved unit performance and to penalize unit performance that does not exceed prior performance.

Because FPL has higher unit availability in 1999 than in 1989, FPL's system and Peninsular Florida's systems are more reliable. Fewer outages of shorter duration mean that units are available more of the time to meet system requirements. The impact of improved unit availability is directly captured in FPL's other reliability methodology: LOLP. Its impact on the LOLP factor has been dramatic, driving the value well below the standard of 0.1 days/year. Ignoring the favorable impact of improved unit availabilities on system reliability, as Mr. Ballinger and Mr. Trapp suggest in promoting a higher reserve margin standard, in effect denies FPL's customers the savings that result from that improvement.

Q. Mr. Ballinger cautions about adopting a reliability standard that has not withstood the rigors of time testing. What reliability criteria have withstood the rigors of time testing since 1989?

A. Looking to Commission orders where the Commission has had occasion to review and approve reliability criteria since 1989, I conclude that there are two reliability criteria that have withstood the rigors of time testing and Commission review: a minimum reserve margin of 15% and a Loss of Load Probability of 0.1 days/year.

In the last decade the Commission, in a variety of cases, has reviewed and based some aspect of its decision on reliability criteria on at least twenty-two occasions. Attached to my testimony is Document No. RRD-2, which summarizes those decisions. As you can see, in nineteen of the twenty-two decisions the Commission approved or relied upon a reserve margin criterion. In fifteen of those nineteen decisions the Commission approved a reserve margin criterion of 15% (and in one case the Commission approved a reserve margin criterion as low as 10%). Indeed, in 1996 the Commission even adopted a rule that embraces a 15% reserve margin criterion. <u>The Commission's most recent approval of a 15% reserve margin criterion was in May of this year</u>.

In addition to addressing reserve margin, in eleven of those decisions, the Commission also approved a LOLP of 0.1 day/year as an appropriate reliability criterion. Not once in the last ten years has the Commission approved a LOLP standard of other than 0.1 day/year.

Adopting a reserve margin standard of 20% would deviate significantly from prior Commission practice in the majority of cases decided in the last ten years. A 20% standard has been approved only four times in the last decade, and in each instance it was for a relatively small utility compared to the size of Peninsular Florida. In fact, on at least one occasion the Commission observed that its approval of the 20% reserve margin was related to the size of the utility. In TECO's 1992 IGCC need case the Commission noted that its 20% "winter reserve margin is a reasonable one for a utility of Tampa Electric's size."

II. Staff's Analysis of the FRCC's Reserve Margin Assessment Is Flawed.

Q. What conclusions did Staff's draw from their analysis of the FRCC's assessment of its 15% reserve margin last year?

A. In response to the 1998 FRCC's Assessment of the 15% reserve margin, the Staff performed an analysis to assess the adequacy of the FRCC 15% reliability standard.

Staff arrived at the following conclusions from its analysis:

The FRCC Load and Resource Plan summer reserves were found to be adequate for the entire 10-year horizon.

Generating capacity may be inadequate during the 1999/2000 and 2000/2001 Winter seasons.

In fact, Staff suggested there was only a 6% probability that Peninsular Florida could be short by 955 MW for the Winter of 1999/2000. For the Winter of 2000/2001 there was an 8.3% probability the Peninsular Florida could be short as much as 1041 MW.

Q. What conclusions do you draw from your review of the Staff's critique of the FRCC's assessment of its 15% reserve margin criterion in 1998?

A. First, Staff's conclusions last year bear remembering. The only problem that Staff identified was a near-term Winter-only problem in two specific years. No problem was identified with Summer reserve margins. There was no long-term reliability problem, and there was no proposed 20% reserve margin standard.

Second, even the above-mentioned conclusion of only a two-year Winter potential problem is overstated, since Staff's analysis of the FRCC's assessment of its 15% reserve margin standard was flawed in a manner that made its results too pessimistic. (Mr. Villar's rebuttal testimony addresses the studies performed by FRCC in an attempt to correct the flaws in Staff's analysis.)

As flawed as it was, Staff's analysis still shows that there is a greater than 90% probability that no problem will occur even in those two Winters. When Staff's analysis is corrected to account for its flaws, there was not even a short term reliability problem based upon the 1998 Ten-Year Site Plans.

Third, Staff did not recommend a new reliability standard as a result of its analysis last year. Even though it had concerns about the Ten-Year Site Plans submitted as well as the FRCC's 15% reserve margin criterion, the concerns were not serious enough to warrant the adoption of a new and different reliability standard.

Q. In his testimony Mr. Ballinger has offered an entirely new critique of the FRCC's assessment of its 15% reserve margin criterion. Please explain why you think his critique is flawed?

A. Mr. Ballinger begins his critique (starting on page 6 of his testimony) with three "shortcomings" about the FRCC's assessment: load diversity, off-peak periods, and load forecast error rates. I will address each in turn.

Mr. Ballinger takes the position that instead of using coincident load data to measure reserve margin the FRCC should use non-coincident load data is unsound.

Peninsular Florida is comprised of numerous utilities which have different customer mixes and are geographically spread over 400 miles. These individual systems do not experience their peak demand at the same time. It would be illogical to expect that weather patterns, a large driver of peak load, would drive utility loads over such a large area to simultaneous peaks. The FRCC's refinement in 1999 of applying a diversity factor in its testing of the suitability of its 15% reserve margin standard is appropriate. It reflects reality and proper planning.

Q. Mr. Ballinger also takes issue with the FRCC using peak periods to measure reserve margins and advocates, on page 7 of his testimony, that the FRCC should also measure reserve margins in off-peak periods. Please respond.

A. In Florida, the Winter peak typically occurs in December or January. Summer peaks generally occur in the June through September period. The remaining six months, generally considered to be "shoulder" or off-peak months, are typically when utilities plan outages of their units for maintenance. Since maintenance scheduling is a manageable activity with a short-term (less than 1 year) horizon, it is a short-term or operational concern not a long-term planning concern. It would make no sense to project or consider reserve margins for off-peak months beyond one year in the future, and even for the near-term, utilities can manage the reserve margins at any point in time by managing maintenance schedules. When the FRCC analyzed the reasonableness of 15% reserve margin criterion, it appropriately ignored system peaks occurring in off-peak months when a number of units were on maintenance, because these "peaks" resulted from mild weather. If a problem occurs in an off-peak month, it is more appropriately addressed by short-term planning, e.g. managing planned outages, not as part of a long-term planning process intended to identify the need for new capacity.

Q. Mr. Ballinger's third observation regarding the FRCC's reserve margin assessment is found on page 8 of his testimony and states that the FRCC used a simple average of load forecast error rates and that allowing over-and under-forecast rates to net out each other understates the load forecast error. Please respond.

A. Mr. Ballinger's observation was based on only a selected portion of the FRCC's work. In both its 1998 and 1999 analyses of the suitability of its 15% reserve margin standard, the FRCC used both a simple averaging approach recognized by Mr. Ballinger and a "worst case" approach which Mr. Ballinger did not recognize. The simple averaging approach to load forecast errors did allow over- and under- forecasts to net out against each other. This was not done to understate the load forecast error, but rather to give a true picture of what actual loads, on average, were being experienced. This approach properly balances system reliability vs. cost by recognizing that over forecasting can lead to overbuilding, and thus higher costs, as surely as under forecasting can have an effect on ratepayers.

The FRCC's use of the worst case load forecast was designed to give the FRCC a projection of "needed" reserves if the worst accuracy levels of recent load forecasts were to recur. Use of the worst case forecast resulted in a finding that, even in the very unlikely case in which the recent historical worst forecast accuracy levels occur every year for the next 10 years, no action by Peninsular Florida utilities is now necessary.

Q. Mr. Trapp states that his 20% reserve margin criterion is based upon the analyses performed by Mr. Ballinger. What is your response?

A. Mr. Trapp's 20% reserve margin recommendation and Mr. Ballinger's supporting analyses are flawed. Mr. Villar is addressing the flaws with Mr. Ballinger's Exhibit ____(TEB-3), so I will focus on Mr. Ballinger's Exhibit____(TEB-2).

First, it should be noted that not even Mr. Ballinger suggests that his analysis supports on (TEB-2) a 20% reserve margin standard as proposed by Mr. Trapp. Second, the analysis confuses operating reserves with reserve margins. Third, the simple response is that if utilities had reserve margins as low as 15%, they would plan their maintenance differently to be able to meet their operating reserve margin requirement. I do not believe this analysis shows the Commission that more than a 15% reserve margin standard is reasonable or necessary.

Consider Mr. Ballinger's starting point – he examines capacity advisories issued during 1998 and 1999. Under the extreme weather plan implemented pursuant to the Commission's extreme weather rule, capacity advisories are the first of three reactions available to Peninsula Florida utilities to meet extreme weather conditions. The other two more elevated status situations are alerts and emergencies. In 1998 Mr. Ballinger shows 12 capacity advisories. In 1999 year to date Mr. Ballinger shows 9 capacity advisories. Now, consider that the triggers for advisories are either <u>forecasted</u> extreme temperatures or any individual utility making a public appeal for its customers to conserve. This is the lowest level of notice in the current emergency plan, and it does not equate to a capacity shortfall in Peninsular Florida. Dealing with advisories merely means an efficient management of available resources when extreme weather threatens.

What Mr. Ballinger's exhibit shows is that Peninsula Florida, despite a very hot 1998 and an unprecedented natural gas pipeline interruption, has experienced the mildest status of notice only 21 days during the course of the roughly 630 days during the period examined. That is a low incidence of advisories.

Only once does Mr. Ballinger show that the operating reserve margin was not met. Once again, that is an extremely low level of incidence during the period examined. Even in that one instance, that does not mean there was a service interruption. That means the operating reserve was slightly below the prescribed level. That does not even mean that there would have been service interruptions if the largest unit on the system had tripped. There were other resources available that could have been implemented before a service interruption occurred.

Mr. Ballinger then lowers actual operating reserves by the difference between the planned reserve margin and either a 15% or 16% reserve margin to determine how often the operating reserve margin would have been violated. I have several observations. First, even then there would have been a low incidence of the operating reserve margin having been violated – 2 to 5 times in 630 days. Second, nothing can be concluded from the exhibit, because it is unreasonable to assume that utilities would plan their maintenance the same way they did with a 15 or 16% reserve margin as they did with a 17-19% reserve margin. Third, it fails to show the operational measures available to avoid service interruptions if the largest unit tripped off-line. Fourth, it fails to address the probability of the largest unit tripping off-line coincident with the other extremes Mr. Ballinger posits. Finally, it shows that the extreme weather operational plan developed at the instruction of the Commission to address extreme weather circumstances is working as intended. There is not now, as there was not when the Commission decided to require a plan, a need to build new capacity to address weather extremes.

III. Staff Fails to Acknowledge the Reliability of the Peninsular Florida System as Measured by Loss Of Load Probability.

Q. Please explain your earlier observation that Staff's testimony fails to acknowledge the reliability of Peninsular Florida as measured by Loss of Load Probability?

A. I am quite concerned that Staff's testimony and recommendations fail to meaningfully discuss reliability as measured by Loss of Load Probability. Mr. Ballinger makes a few passing references to LOLP, but quickly moves beyond it after mentioning the impact of generating unit availability on LOLP, leaving the erroneous impression that LOLP is no longer a valid measure of reliability. Mr. Trapp, in making a recommendation of a 20% reserve margin criterion, appears to ignore LOLP and the reliability of the Peninsular Florida system as measured by LOLP.

In 1997, and again in 1998, the FRCC performed LOLP reliability assessments for Peninsular Florida. The LOLP analyses show that Peninsular Florida is a most reliable system and that it would continue to be reliable with the resource plan developed while utilizing the 15% reserve margin standard adopted by the FRCC.

Q. Please explain the LOLP approach and how it is used to measure reliability?

A. LOLP analyses are probabilistic analyses performed on computer models that measure the probability that load will exceed available generation on an electric system. The analyses are far more refined than reserve margin analyses. LOLP analyses take into account a number of factors that reserve margin calculations cannot reflect, such as: scheduled and forced outages, assistance from interconnected utilities, hourly peak demands, seasonal capabilities of generating units, and seasonal capabilities of DSM.

The end product of a LOLP assessment is an expected value of the number of times that load will exceed available generation in a given system over a time horizon. The generally accepted standard of LOLP reliability within the industry is 0.1 days/year. LOLP values lower than this suggest that a system is reliable, and values above this level suggest that a closer look needs to be taken at reliability.

Q. Do you believe the Commission should continue to recognize LOLP as one measure of system reliability?

A. Yes. LOLP is still a valid method of measuring system reliability. That is why FPL continues to use dual reliability criteria of 15% Summer and Winter minimum reserve margins and an LOLP of 0.1 day/year. Moreover, what the Commission said in 1981 about the value of analyzing Peninsular Florida reliability through LOLP remains true today:

> In addition to capacity sufficient to meet system peak demand, an electric utility must maintain reserve capacity sufficient to cover scheduled and forced outages. The amount of reserve capacity required by an electric utility is a function of many factors, including but not limited to system generation mix, unit forced outage rates, unit sizes, maintenance cycles, peak and off peak demands, and transmission tie dependency. On a complex system such as Peninsular Florida, which has over two hundred generating units ranging from 0.1 megawatts to over 800 megawatts, generation adequacy must be evaluated by probabilistic loss of load probability (LOLP techniques which take into account numerous factors. An LOLP index of 0.1 days per year for firm load has generally been accepted by the electric utility industry as the goal of generation expansion planning. (Order No. 9749).

Staff's failure to acknowledge either the continuing value of LOLP analysis or the reliability of Peninsular Florida as measured by LOLP makes Mr. Trapp's recommendation of a 20% reserve margin criterion inappropriate, as Florida's electric system is highly reliable at a 15% reserve margin.

IV. Mr. Trapp's Recommendation that Non-Committed Capacity be Recognized in the Computation of Reserve Margins is Inconsistent with Prior Commission Practice and Would Damage Rather than Enhance Reliability.

Q. What do you understand Mr. Trapp's position to be regarding whether non-committed capacity should be recognized in the calculation of reserve margins?

A. On page 19 of his testimony, Mr. Trapp suggests that the potential contribution of non-committed capacity should be considered in the calculation of individual utility reserve margins if the FRCC and individual utilities credibly quantify the availability of merchant plant capacity being developed in Florida.

He also states that he is not troubled by recognizing merchant capacity that is "planned and certified." However, he then has a discussion of 2500 MW of merchant capacity that is scheduled to be placed in-service and is not subject to a determination of need. Since there is no listing of the projects comprising Mr. Trapp's 2500 MW and Mr. Trapp has testified the projects require no determination of need, it is difficult to discern whether these projects fit his criteria of "planned and certified."

Q. Why do you believe that Mr. Trapp's observations regarding the recognition of non-committed capacity in reserve margin are inconsistent with prior Commission practice?

A. For years the Commission has dealt with the issue of utility reliance upon non-committed capacity and related issues. The Commission has consistently determined that non-committed capacity should not be treated as firm capacity, declining to recognize non-committed capacity in the computation of reserve margins and declining to require utilities to make capacity payments to Qualifying Facilities (QFs) for as-available energy.

Three prior Commission decisions evidence the Commission's prior practice of not recognizing non-committed capacity in reserve margin calculations. Those three cases are the Dade County Resource Facility expansion determination of need, the Commission's reserve margin rulemaking, and the recent Duke New Smyrna determination of need proceeding.

Q. What did the Commission have to say about the contribution of non-firm generating resources to system reliability and the proper calculation of reserve margins in the Dade County case?

A. In the Dade County Resource Recovery Facility's determination of need, the facility did not have a firm contract to sell its output, making it an uncommitted capacity resource; the Commission had this to say about its potential contribution to reliability:

We find that Dade County's expanded solid waste facility will not contribute to the reliability and integrity of the state's electric system. Dade County has not committed to sell firm capacity pursuant to a Commission-approved contract. Dade County has only stated that it might sell as-available energy from its expanded facility. Because there are no plans to sell firm capacity, there is no way to analyze any effect on the state's reliability and integrity due to Dade County's energy sales. (Order No. PSC-93-1715-FOF-EQ).

The Commission went on to state the following about the proper calculation of reserve margins:

Because there is no firm capacity commitment, the only consequence to FPL is that its customers will not receive any as-available energy from Dade County if the facility expansion is not complete. A utility's reserve margin is calculated using only firm capacity sources. (Order No. PSC-93-1715-FOF-EQ).

Q. What did the Commission say about the recognition of uncommitted capacity resources in reserve margin calculations in the reserve margin rulemaking docket?

A. In the Commission's reserve margin rulemaking proceeding, the Commission adopted a reserve margin standard of 15% ("to achieve an equitable sharing of energy reserves, Peninsular Florida utilities shall be required to maintain, at a minimum, a 15% planned reserve margin") and adopted a rule provision that only firm power purchases were to be recognized in calculating reserve margins absent a waiver. (Order No. PSC-96-1076-FOF-EU). That rule provision provides:

> (2) Treatment of Purchased Power. Only firm purchase power agreements may be included as a resource for purposes of calculating a planned or operating reserve. A utility may petition for a waiver of this requirement based on a very high availability of specific non-firm purchases. Rule 25-6.035(2).

Q. What did the Commission have to say about the recognition of uncommitted generating resources in long-term reserve margin calculations in the recent Duke New Smyrna need case?

A. In the recent Duke New Smyrna need determination case, the Commission found that absent a contract for its output the unit could not be counted for long-term reserve margins: "The capacity should be considered for hourly and short term operating reserves, but not for long term planning reserve margins, unless contracted for." (Order No. PSC-99-0535-FOF-EM).

Q. Are there other Commission decisions in which the Commission has indicated that non-committed generating resources should not be treated as firm capacity?

A. Yes. Beginning with its cogeneration rules, and continuing well into the implementation of those rules, the Commission had to address the issue of whether as-available energy provided by QFs should be treated as a capacity resource by purchasing utilities or just as energy. The Commission consistently chose to price as-available energy without recognizing any capacity contribution to the purchasing utility.

For instance, in 1983 when adopting cogeneration rules the Commission had this to say about the uncommitted resource of as-available energy: "[b]ecause as-available energy carries with it no enforceable assurances as to quantity, time or reliability of delivery, the rule provides that no capacity payments shall be made to a QF for the delivery of as-available energy." (Order No. 12634). In response to a proposal that as-available energy be given capacity payments, the Commission stated, "there was no showing that what, in essence, is an interruptible source of supply, not controlled by the utility, would be able to permit a prudent utility to defer any capacity related costs." (Order 12634).

Similarly, the Commission promulgated rules for identifying avoided units for pricing cogeneration, and those rules required utilities not to include non-contracted-for QF capacity when determining the avoided unit. The

Commission noted that this decision not to recognize non-committed capacity in generation expansion plans was intentional. (Order No. 13247).

Looking back at Commission practice over time, Mr. Trapp's suggestion that non-committed capacity and as-available energy should be recognized in the calculation of reserve margins if its impact can be credibly quantified is surprising. His suggestion is inconsistent with prior Commission practice and a Commission rule. Indeed, the Commission has stated that the impact on reliability of an uncommitted resource cannot be analyzed absent a firm contract.

Q. How could reliance on uncommitted capacity damage reliability?

A. If utilities begin to count upon resources that are uncommitted instead of their own plants upon which they have first claim or instead of entering into firm contracts for capacity, then utilities would be counting upon non-firm capacity to meet firm load. This results in a less reliable system than a system that relies solely upon firm capacity resources.

V. Staff's Uniform Approach to Measuring Reliability for Peninsular Florida and Individual Utilities Ignores System Differences and May Mask Underlying Reliability Problems.

Q. Does a single reliability criterion of a reserve margin of 20% make good planning sense for both Peninsular Florida and Individual Utilities?

A. No. As I pointed out in my direct testimony, there are fundamental differences among the various utility systems that comprise Peninsular Florida. I will not repeat those distinctions, but they do affect the reliability of systems differently. FPL has found that measuring reliability on its large system is best done through dual reliability criteria. Criteria applicable to a large system such as FPL's or Peninsular Florida's are not necessarily equally applicable to smaller utilities. It is not uncommon for smaller utilities to have reserve margin criteria which are larger than those of large utilities, and that practice simply recognizes one of the many differences among systems.

Staff has abandoned LOLP without any explanation or justification, and is encouraging the Commission to adopt a single reserve margin standard for every utility in the state, without regard for size or any other distinguishing characteristics. Staff suggests no other standard for judging Ten-Year Site Plan suitability other than the very simple approach of whether in every year every plan shows a reserve margin of 20%. If it is 20% or above, it is suitable. If it is below 20% for any given year out of a ten year horizon, then the plan is to be judged unsuitable.

The problem with the criterion is that it does not really address whether Ten-Year Site Plans are suitable or serve as a general measure of whether electric systems are reliable. That judgement has to be made after extensive reviews of the various elements comprising and underlying each plan. That judgement is not made by the simplistic assessment of whether in every year for a ten-year horizon the reserve margin meets arbitrary standard.

VI. Mr. Trapp's Recommendation that a New 20% Reserve Margin Criterion be Applied Retroactively to Judge the Suitability of Ten-Year Site Plans Is Unreasonable and Unfair.

Q. Starting on page 3 of his testimony Mr. Trapp urges the Commission to adopt a 20% reserve margin criterion and to use the criterion to judge the suitability of Ten-Year Site Plans. What is your response?

A. I have two responses. First, I am surprised by the recommendation. I did not know that the suitability of Ten-Year Site Plans was contested in this case. If I had, I would have submitted FPL's Ten-Year Site Plan in my direct testimony as an exhibit and discussed why it should be found suitable.

Second, the site plans pending before the Commission were submitted in April of this year, five months before Mr. Trapp made his recommendation, and the underlying planning work was conducted almost a year ago. I think it is most unreasonable for the Commission to apply any standard it may adopt in this case retroactively to judge the suitability of any Ten-Year Site Plans. The plans should be judged on their individual merit, not on an arbitrary standard suggested five months after they were filed. While I could elaborate upon the basic unfairness of Mr. Trapp's recommendation that his more demanding standard be applied retroactively to judge plans developed well before a hint of a new standard was issued, I trust the Commission to see the readily apparent unfairness of Mr. Trapp's recommendation.

V. Other General Observations

Q. What other observations do you have regarding the Staff's testimony?

A. I have a number of other concerns regarding Mr. Trapp's testimony. First, I agree with his conclusion on page 11 of his testimony that there should not be a limit on the ratio of non-firm load to MW reserves, but his suggestion that more study is needed is surprising and troubling. Mr. Trapp suggests, but does not document, that there is a problem requiring further study.

Second, Mr. Trapp makes an observation on page 12 of his testimony that it is not clear whether lost revenues associated with avoided off-system sales that would have been made in the absence of the DSM program have been considered in the program cost-effectiveness, and suggests that perhaps the Commission may want to revisit this in conservation program approval dockets or ECCR. To my knowledge no attempt has been made by the Commission in any proceeding using avoided cost to measure cost-effectiveness, whether conservation dockets or cogeneration pricing dockets, to quantify the avoided off-system sales that would have been made by the avoided unit. As a practical matter, the analysis that he suggests should be done, cannot reasonably be performed. This refinement of conservation cost-effectiveness is not warranted, not practical nor possible, and the Commission should not address this issue in any docket.

Third, on page 13 of Mr. Trapp's testimony there is another suggestion that should be critically reviewed. He would recognize the non-committed capacity, in the Southern Company and in other regions, that is consistently available in Florida. Of course, he does not explain how such a probabilistic analysis would be performed or considered in the non-probabilistic reserve margin analysis. He just makes the observation without explanation or justification. I find this unsupported suggestion troubling. There is no basis for the Commission to judge its validity.

Q. Does this complete your rebuttal testimony?

A. Yes.
