Q. Please state your name, business address and occupation.

A. My name is M. W. Howell, and my business address is 500 Bayfront Parkway, Pensacola, Florida 32501. I am Manager of Transmission and System Control for Gulf Power Company.

Q. Have you previously testified before this Commission?

A. Yes. I have testified in various congeneration, territorial dispute, planning hearing, and fuel clause adjustment dockets.

Q. Please summarize your educational and professional background.

A. I graduated from the University of Florida in 1966 with a Bachelor of Science Degree in Electrical Engineering. I received my Masters Degree in Electrical Engineering from the University of Florida in 1967, and then joined Gulf Power Company as a Distribution Engineer. I have since served as Relay

1 Engineer, Manager of Transmission, Manager of System
2 Planning, Manager of Fuel and System Planning, and
3 Manager of Transmission and System Control. My
4 experience with the Company has included all areas of
5 distribution operation, maintenance, and construction;
6 transmission operation, maintenance, and construction;
7 relaying and protection of the generation,
8 transmission, and distribution systems; planning the
9 generation, transmission, and distribution system
10 additions in the future; bulk power interchange
11 administration; overall management of fuel planning
12 and procurement; and operation of the system dispatch
13 center. I have served as a member of the Engineering
14 Committee and the Operating Committee of the
15 Southeastern Electric Reliability Council, chairman of
16 the Generation Subcommittee and member of the Edison
17 Electric Institute System Planning Committee, and
18 chairman or member of a number of various technical
19 committees and task forces within the Southern
20 electric system and the Florida Electric Power
21 Coordinating Group, regarding a variety of technical
22 issues including generation expansion, transmission
23 expansion, transmission interconnection requirements,
24 central dispatch, transmission system operation,
25 transient stability, underfrequency operation,

1 generator underfrequency protection, system production
2 costing, computer modeling, and others.

3

4 Q. Have you prepared an exhibit that contains information
5 to which you will refer in your testimony.

6 A. Yes. My exhibit consists of two schedules to which I
7 will refer. Each schedule of this exhibit was
8 prepared under my supervision and direction.

9 Counsel: We ask that Mr. Howell's
10 Exhibit, comprised of two
11 Schedules, be marked for
12 identification as Exhibit___(MWH-1).

13

14 Q. Are you the sponsor of certain Minimum Filing
15 Requirements (MFRs)?

16 A. Yes. Those which I am sponsoring are listed on
17 Schedule 2 of my exhibit. To the best of my
18 knowledge, the information in all of the listed MFRs
19 is true and correct.

20

21 Q. What is the purpose of your testimony in this
22 proceeding?

23 A. I will address the Company's participation in the
24 Intercompany Interchange Contract (IIC), the benefits
25 it provides to Gulf's customers, the Company's

1 off-system sales, transmission line rentals,
2 transmission operation and maintenance (O & M)
3 expenses, the transmission construction program, and
4 services provided by Southern Company Services, Inc.,
5 (SCS) for the transmission and interchange functions.
6

7 Q. What is the function of the IIC?

8 A. The contract is a mechanism wherein the operating
9 companies of the Southern electric system - Alabama
10 Power Company, Georgia Power Company, Gulf Power
11 Company, Mississippi Power Company, and Savannah
12 Electric and Power Company - agree to operate an
13 integrated electric system or power pool. The IIC is
14 dynamic in nature in that it is reviewed annually and
15 updated as required to reflect changing conditions.
16 The contract is prepared under direction of the system
17 Operating Committee, which consists of one
18 representative from each operating company and one
19 representative from SCS. The transactions involved in
20 system operations and the sharing of benefits and
21 burdens of pooling among member companies are
22 specified in the IIC. Under terms of the IIC, the
23 generating resources of all member companies are
24 economically dispatched to serve the total system load
25 requirements. This concept insures that multiple

1 benefits accrue to the customers of each operating
2 company.

3

4 Q. What are the benefits Gulf customers derive from this
5 type of pooling arrangement?

6 A. Gulf's customers benefit tremendously from Gulf
7 participating in this pooling arrangement. This
8 Commission has consistently recognized these benefits
9 in past proceedings and rate orders. Our analyses
10 over the years have consistently shown that Gulf's
11 customers receive millions of dollars of benefits
12 annually as a result of Gulf's participation in the
13 pool, as opposed to operating separately. These
14 benefits include, but are not limited to, the
15 following:

16

- 17 1. Economic dispatch production cost savings.
- 18 2. Economic sharing of generating reserve
19 capacity.
- 20 3. Ability to install large, efficient
21 generating units.
- 22 4. Reduced requirements for operating reserves.
- 23 5. Pool market for temporary surpluses of
24 capacity and energy on Gulf's system.

25

- 1 6. Ready supply of energy for purchase when Gulf
- 2 is short.
- 3 7. Long-term power sale revenues.
- 4 8. Unit power sale benefits.
- 5 9. Peak-hour load diversity.
- 6 10. Economy energy transaction benefits.
- 7

8 These multiple benefits that accrue to Gulf and
9 the other system operating companies result from the
10 coordinated planning and operation of the power pool.
11 Certainly, increased reliability is a major factor in
12 pool operation. In the event of the loss of
13 generation or transmission ties within Gulf's system,
14 the pool responds instantly with replacement capacity
15 and energy from the most economical source available
16 at the time. Southern's many transmission
17 interconnections with neighboring utilities also allow
18 us to purchase power for the system in an emergency;
19 therefore, the multiple transmission ties to other
20 regional utilities ensure that we can buy the cheapest
21 energy available at all times.

22 Certainly, a major benefit of the pool to Gulf
23 Power has been the selection of generating unit size
24 in the Southern system. Because of the capacity

25

1 equalization process under the IIC, we have been able
2 to completely own or purchase shares of 500 mw and
3 800 mw state-of-the-art generating units. This
4 capacity has been purchased at lower cost per kw and
5 is more efficient generation than otherwise would have
6 been available to a relatively small company such as
7 Gulf. We could not support a sufficient spinning
8 reserve for such large units without participating in
9 the Southern electric power pool. Thus, it is our
10 participation in the pool and the IIC that enables
11 Gulf's customers to achieve the savings associated
12 with these large units.

13 Coordination of major maintenance periods for
14 turbine inspections can be a major problem for a
15 company of Gulf's size. However, with the coordinated
16 maintenance planning that takes place within the
17 Southern system, we are able to accomplish major
18 maintenance on our large generating units and purchase
19 economical replacement power at the same time.

20 Gulf is also able to share in the diversity of
21 power needs resulting from the system providing
22 service to such a large geographical region. The
23 territories of the system companies have weather, time
24 zone, and customer mix differences. These differences
25 result in variations in load patterns because the

1 operating companies do not all reach their annual peak
2 demand at the same time. This improves overall system
3 load factor and means that fewer generating units have
4 to be constructed and committed to service at a given
5 time, thus creating lower system production costs.
6

7 Q. How will the Plant Daniel and Plant Scherer capacity
8 that was previously committed to Unit Power Sales be
9 treated in the IIC?

10 A. Now that this power is no longer committed to Unit
11 Power Sales, it is a generating capacity resource for
12 the territorial customer, and is treated like any of
13 the Company's other territorial generating capacity
14 resources.
15

16 Q. How is the IIC budget determined?

17 A. The IIC budget is determined on an annual basis. The
18 two components are the capacity and energy portions of
19 the budget. Capacity determinations are made on a
20 monthly basis, driven by each Company's forecasted
21 peak hour monthly load and expected generating
22 capacity. Sales from a surplus company to a deficit
23 company are based on average embedded fossil
24 generation costs. The energy budget is prepared
25 utilizing a probabilistic dispatch model which

1 determines the most economical generation sources each
2 hour to provide for the entire Southern system load.
3 When it is more economical to buy from another pool
4 member, rather than generate, the model captures this
5 in the dispatch simulation. All the energy
6 transactions for a year are aggregated by the model,
7 and this information is represented in our pool
8 budget.

9
10 Q. Does membership in the Southern electric system power
11 pool enable Gulf to participate in multiple off-system
12 power sales agreements?

13 A. Yes. The Southern electric system is in a regional
14 position that allows the interchange and sale of power
15 directly to thirteen other utility systems. Gulf has
16 actual transmission line connections to only two of
17 these systems. The IIC, which governs the operation
18 of the Southern system power pool, provides for the
19 equitable distribution of these sales among system
20 companies, and this allows Gulf to be a party to
21 thirteen different interchange contracts with regional
22 utilities. Some of these neighboring utilities are
23 heavily dependent upon oil and natural gas for
24 electric generation. Because Gulf Power and the
25 Southern system have an excellent mix of generation

1 resources with a high percentage of economical coal
2 capacity, a market for sales of electricity off the
3 Southern system has resulted. The coordination and
4 economic dispatch of these generation resources make
5 the Southern system a reliable source of economically
6 priced energy for the entire region.

7 These off-system sales fall into three
8 categories: (1) Economy energy sales, (2) Long-Term
9 Non-Firm capacity and energy sales, and (3) Unit Power
10 Sales (UPS). Economy energy sales occur when
11 Southern's incremental energy price is below that of
12 purchasing utilities. These sales have no associated
13 capacity, and the energy is priced on a
14 split-the-savings basis such that the customers of
15 both the selling and purchasing utilities benefit.
16 Currently, the Southern electric system sells economy
17 energy to ten neighboring utilities. In the future,
18 the system will continue to market this service to the
19 extent that it remains beneficial to the territorial
20 customers of the Southern electric system.

21 Long-Term Non-Firm sales consist of capacity
22 which is supplied out of the mix of fossil units on
23 the Southern system with energy sold at incremental
24 cost. Contracts for these sales allow the system's
25 operating companies to recall this capacity whenever

1 needed for its own territorial customers. Currently,
2 the system has one Long-Term Non-Firm customer who has
3 contracted sales until May, 2000.

4 UPS are sales of capacity and energy
5 entitlements, based on specific generating units.
6 These sales provide for capacity based on
7 unit-specific costs. Currently, the generation
8 contracted in the 1982 UPS agreements ("old" UPS) is
9 being provided by generating units at Plants Miller
10 and Scherer to two customers until May, 1995. The
11 Southern system recently executed new UPS ("new" UPS)
12 contracts which cover sales to three utilities within
13 the state of Florida for the period 1993 through 2010.
14 The new UPS contracts are basically identical to those
15 executed in 1982 and are the product of comprehensive
16 and extended negotiation between representatives of
17 the Southern operating companies and representatives
18 of the three purchasing utilities. In the period from
19 January 1, 1993, to June 1, 1995, these new contracts
20 provide options which would allow the full contract
21 amount to be purchased by the UPS customers. These
22 sales will be made out of Units 1 through 4 of the
23 Miller Plant owned by Alabama Power and Unit 3 of the
24 Scherer Plant jointly owned by Georgia Power and Gulf
25 Power. New UPS will allow the Southern operating

1 companies to substitute peaking capacity for coal
2 base-load generating units at a lower total cost to
3 the territorial customer. Schedule 1 of my exhibit
4 summarizes the off-system sales now contracted by
5 Southern.

6 The Southern operating companies are continually
7 evaluating new markets for off-system sales, including
8 Unit Power Sales. This action will continue to be an
9 alternative for future generation needs if the
10 Southern system companies can sell base capacity,
11 replace it with combustion turbines or other capacity,
12 and thereby save money for their territorial
13 customers.

14
15 Q. What has been the impact of off-system sales on Gulf's
16 retail customers?

17 A. These sales have provided revenues from short-term
18 surplus energy and capacity which have substantially
19 reduced the revenue required from the retail customer
20 to provide long-term reliable electric service.

21 The capability to participate in regional power
22 sales provided by its membership in the Southern
23 electric system pool has enabled Gulf Power to
24 purchase a share of Plants Daniel and Scherer at
25 tremendous savings to our customers.

1 During the early 1990's time frame, the
2 off-system sales outlook shows that the Southern
3 system may have additional capacity to sell if a
4 potential purchaser can be located, including our
5 63 mw of Plant Scherer Unit 3. Beyond the mid 1990's,
6 the system's reserves are projected to be within the
7 target range.

8
9 Q. Does Gulf have transmission facility agreements which
10 are related to its ownership in Plants Daniel and
11 Scherer?

12 A. Yes. Gulf has such agreements with Alabama Power
13 Company, Mississippi Power Company, and Georgia Power
14 Company. These agreements, sometimes referred to as
15 transmission rental agreements, compensate these
16 companies for their transmission facilities used by
17 Gulf to deliver our capacity and energy from the
18 jointly owned plants in Mississippi and Georgia to our
19 service territory. The charge to Gulf from
20 Mississippi Power is related to the Daniel-Wade-Barry
21 230 kilovolt transmission line which begins at Plant
22 Daniel in Mississippi, runs to the Wade Substation in
23 Mississippi, and terminates at Plant Barry in Alabama.

24 The charge to Gulf from Alabama Power is related
25 to the Barry-Crist 230 kv line which begins at Plant

1 Barry in Alabama and interconnects with the Gulf Power
2 system at the Florida state line.

3 These charges to Gulf from Alabama Power and
4 Mississippi Power are based on the cost of these
5 transmission facilities, and are a small fraction of
6 what a fully embedded transmission service charge or
7 alternative transmission construction would cost Gulf.

8 The charge to Gulf from Georgia Power is related
9 to transmission facilities owned by Georgia Power
10 which are utilized to deliver capacity and energy from
11 Plant Scherer Unit 3. This charge is significantly
12 less in 1990 than what a fully embedded transmission
13 service charge or alternative transmission
14 construction would cost Gulf. In all cases, the
15 available alternatives of a fully embedded
16 transmission service charge or construction of new
17 facilities were evaluated prior to our decision.

18

19 Q. Please summarize transmission O & M expenses for 1990
20 as compared to the benchmark level for transmission.

21 A. Total transmission O & M expenses consist of two major
22 categories: transmission line rents, and other
23 transmission expenses. Total transmission line rents
24 for 1990 are budgeted to be \$3,017,839. While

25

1 Mr. Scarbrough has discussed the accounting treatment
2 related to transmission line rental benchmarks, I want
3 to emphasize that the benchmark philosophy really is
4 inadequate to determine a reasonable level of expenses
5 in this area. Earlier, I discussed the manner in
6 which the transmission line rental charges were
7 determined and stated that they represented
8 significantly less cost to Gulf's customers than the
9 other alternative of utilizing the standard embedded
10 cost of transmission facilities as a basis for
11 transmission service charges. Thus, not only will our
12 customers realize millions of dollars in savings over
13 the life of the associated shared plants through
14 generation cost savings, but they also receive
15 additional savings through the lower transmission
16 service costs which we have been able to secure.
17 Because of this, it is simply inappropriate to apply a
18 benchmark philosophy to this class of expenses without
19 making the adjustments set forth in Mr. Scarborough's
20 testimony.

21 The remaining transmission O & M expenses for
22 1990 are budgeted to be \$4,279,584, while the 1990
23 benchmark amount for this area is \$3,602,137. These
24 expenses are over their benchmark by \$677,447. This
25 difference is due to the need for new funds to conduct

1 groundwater testing at Gulf's substation sites in
2 order to comply with the State of Florida, Department
3 of Environmental Regulations' Consent Order #88-0471.
4 A justification of this variance appears in MFR C-57.

5 As discussed in Mr. Gilbert's testimony, each
6 department at Gulf Power Company which charges to
7 transmission accounts goes through a detailed review
8 during each budget cycle regarding expenses for the
9 budget year which are necessary to maintain a
10 dependable and reliable transmission system. These
11 expenses are reviewed on a departmental and
12 company-wide basis before being recommended for
13 approval by the budget committee. Thus, these
14 expenses receive several levels of review prior to
15 being included in the budget.

16

17 Q. What transmission efficiency improvements has Gulf
18 implemented since 1984?

19 A. In 1985, Gulf purchased a second mobile substation
20 unit and located it in Panama City. This unit
21 provides transformer overload relief, reduces
22 construction costs, and allows facility maintenance
23 and testing to be performed without service
24 interruption. Also in 1985, a program was initiated
25 to bid out the reclearing of transmission line

1 rights-of-way. Bids are received from several
2 contractors early in the year in which reclearing is
3 required so as to insure the lowest possible cost for
4 the work required.

5 Also, the use of computer equipment has been
6 significantly expanded since 1984 to relieve
7 departmental personnel of many tasks now more easily
8 and efficiently done via computer. The production of
9 many vital reports, which were previously generated by
10 hand, are now produced by computer.

11

12 Q. Please give a summary of your transmission
13 construction program.

14 A. At the end of 1990, our total transmission
15 plant-in-service is projected to be \$189 million. Our
16 current estimate for 1990 indicates that we expect to
17 spend approximately \$10.3 million for new
18 construction. These transmission expenditures are
19 necessary to serve new customers, to strengthen the
20 transmission system to meet additional demand
21 resulting from load growth, and to replace damaged,
22 worn-out, or obsolete facilities. All of these
23 transmission construction items are necessary to serve
24 the customer's current and future electric needs.

25

1 All transmission capital projects are reviewed
2 each year before they are either added to or retained
3 in the budgeting process. Long-range transmission
4 planning studies are performed annually which
5 determine future transmission system improvements
6 which will be needed in the coming ten-year period.
7 When future deficiencies are expected, alternative
8 improvements are determined, and the most
9 cost-effective solution is recommended for inclusion
10 in the budget. Several departments within the company
11 review these recommendations to ensure that these are
12 the most cost-effective and practical solutions
13 available. Additionally, all projects, including
14 transmission and other functional areas, are subjected
15 to a comprehensive review by a corporate task force
16 prior to being recommended to the budget committee for
17 inclusion in the budget. Generically, a project is
18 included in the budget at least four years before
19 expenditures will be required. Once a project is in
20 the budget, it is subjected to the same rigorous
21 review on an annual basis as any new project; thus, a
22 transmission capital project will generally have a
23 number of reviews prior to dollars actually being
24 spent on the improvement.

25

- 1 Q. What is Gulf doing to minimize new construction
2 expenditures?
- 3 A. Transmission system improvements are evaluated on an
4 alternative economic basis before being included in
5 the budget. Construction for major transmission lines
6 is awarded on the basis of competitive bids from
7 qualified contractors. Transmission equipment and
8 material requirements are also awarded on the basis of
9 competitive bids. This process ensures the lowest
10 installed cost to Gulf's customers.
- 11
- 12 Q. Please describe the services provided to your
13 department by Southern Company Services.
- 14 A. Transmission and System Control takes advantage of the
15 pool of specialized professionals at Southern Company
16 Services, Inc. (SCS) who utilize highly developed
17 computer facilities to assist in the evaluation,
18 design, and operation of Gulf's transmission
19 facilities. These services are not only economical
20 because of the sharing of these pooled resources with
21 other operating companies in the system, but also
22 because they are provided at cost to Gulf Power.
- 23 These services provided by SCS include
24 transmission system equipment evaluations,
25 transmission line and substation design, coordination

1 of Gulf's transmission system operations through the
2 Power Coordination Center in Birmingham, processing of
3 system operations data, system security, power
4 marketing activities, and Interchange Contract
5 budgeting and billing.
6

7 Q. Please summarize your testimony.

8 A. Because of Gulf's participation in the Southern system
9 power pool and the IIC, there are tremendous monetary
10 benefits which are provided to Gulf's customers. The
11 low cost, shared capacity which Gulf was able to
12 purchase at Plants Daniel and Scherer are examples of
13 how our participation in the IIC has benefited our
14 customers. Because Gulf is affiliated through the
15 contract with an extremely large power system, there
16 are opportunities for off-system sales which result
17 from the other system companies and their
18 interconnections with outside utilities. These
19 opportunities for additional sales have provided
20 significant additional monetary benefits to our retail
21 customers. Our transmission construction and O & M
22 costs are carefully controlled, and we are within the
23 Commission's benchmark levels except for the
24 groundwater testing program which is required as a new
25 area of expense by the State of Florida. Our efforts

1 in securing transmission facility agreements related
2 to our shared ownership of capacity at Plants Daniel
3 and Scherer have resulted in significant savings over
4 standard transmission arrangements, thus significantly
5 reducing the long-term cost to customers. In all our
6 activities in the transmission and interconnection
7 area, Gulf has consistently acted prudently and
8 devised contracts and procedures which will serve to
9 minimize our customer's long-term cost.

10

11 Q. Does this conclude your testimony?

12 A. Yes.
