Re: Alafaya Utilities, Inc.; Application for Rate Increase in Seminole County, Florida;  
Docket No. 020408-SU  
Audit Control No. 02-309-3-1  
Our File No. 30057.46

Dear Ms. Bayo:

We enclose for filing in this docket the original and one copy of the Response of Alafaya Utilities, Inc. To Staff Inquiries Relating to Used and Useful Calculations.

Should you have any questions concerning the enclosed, please do not hesitate to give me a call.

Very truly yours,

  
VALERIE L. LORD  
Of Counsel

DOCUMENT NUMBER: 04447

04447 MAY 19 2003

FPSC-COMMISSION CLERK

ALAFAYA UTILITIES, INC.  
USED and USEFUL  
RESPONSE TO PSC STAFF INQUIRIES AT MAY 13, 2003 INFORMAL MEETING

The Staff called an informal meeting on May 13, to discuss the used and useful methodology for the wastewater treatment plant. Specifically, Staff was concerned with how to address the fact that the permitted capacity was 2.4 MGD, but the flows were limited to 1.535 MGD, the capacity of the disposal system. Since the disposal capacity was the limiting factor, the Utility had used it, rather than the permitted capacity, as the basis for calculating used and useful.

PSC Rule 25-30.432, Wastewater Treatment Plant Used and Useful Calculation, effective December 26, 2002 states in part:

The DEP permitted capacity shall be used in the denominator of the equation. In determining the used and useful amount the Commission will also consider other factors such as ... whether permitted capacity differs from the design capacity, whether there are differences between the actual capacities of the individual components of the wastewater treatment plant and the permitted capacity of the plant . . . This rule does not apply to reuse projects pursuant to section 367.0817(3), F.S., or investment for environmental compliance pursuant to 367.081(2)(a)2.c., F.S.

PSC Rule 25-30.431, Used and Useful Considerations, effective December 14, 1999, states in part:

In determining whether property is needed to serve customers more than five full years after the end of the test period ... the Commission shall consider ... the technical and economic options available for sizing increments of plant expansion.

From the comments at the meeting, it is the Utility's understanding that, based on these rules, Staff is requesting that the Utility revisit used and useful and consider the following: (1) separate out the portions of investment in treatment and disposal facilities that are related to reuse projects and environmental compliance, (2) evaluate differences between design and permitted capacity and the capacity of individual components to determine whether there is support for utilizing other than the permitted capacity in calculating used and useful. Included in this evaluation should be the consideration of economies of scale and the effect that designing the plant to treat for reuse had on component capacities.

It is the Utility's general conclusion from the meeting that, unless special circumstances can be shown, as allowed by Commission rules, Staff will evaluate used & useful on the basis of the 2.4 MGD permitted capacity rather than the 1.535 MGD permitted flow capacity of the disposal system. Assuming the Utility's test year flows, as shown on MFR Schedule F-6, are correct, the effect of such a change would be to reduce used and useful from 77% to 49% for treatment and disposal related plant.

RESPONSE:

A. General

The Utility has reviewed the plant and plant accounts to which the used and useful calculation in question would be applicable. The plant in question can be divided into two parts - that portion placed in service prior to and at the time of acquisition (1994) by Utilities, Inc. and that portion placed in service after acquisition (1995 forward). To the best of the Utility's knowledge, the major additions and/or modifications made to the plant after the acquisition are specifically for the purpose of meeting reuse requirements. In the MFR, amounts totaling \$1.17 million are shown as a pro forma adjustment to Account 354.4. They are considered by the Utility to be 100% used and useful in accordance with section 367.0817(3), F.S., and should continue to be treated that way.

For the purpose of this response, the Utility concentrated on reviewing treatment and disposal plant placed in service prior to acquisition. These are plant assets identified in Accounts 354, 355 and 380 in the Original Cost Study<sup>1</sup> submitted as a part of this filing. To facilitate the used and useful analysis, the various assets were classified into four functional groups: (1) costs related to the first three phases of the plant, which brought its permitted capacity up to 1.2 MGD; (2) costs related to the fourth phase of the plant, which added 1.2 MGD of capacity, and brought its permitted capacity up to 2.4 MGD; (3) costs related to the plant in general, that are system and not capacity related (master planning, on-site equipment buildings, etc.); and (4) costs that are specifically related to the reuse function. The reason that these groupings facilitate the used and useful analysis is because it allows one to isolate those portions of investment that are capacity related from those that are not. The first two groupings are clearly related to providing treatment capacity. Used and useful analysis is necessary for these. The third group consists of treatment plant expenditures that are general in nature such as master planning, on-site equipment, etc. These costs are related to infrastructure, are not capacity related and do not require used and useful analysis. They would be required regardless of the size of the plant and are, therefore, 100% used and useful. The fourth group relates directly to the disposal of effluent through reuse and is, therefore, 100% used and useful, in accordance with section 367.0817(3), F.S.

Table A is a restatement of the cost of the acquired assets by function and account. Table B provides the detail supporting the classification of asset components by function. It is the "Supporting Documentation for Plant Additions" table from the Original Cost Study with line items highlighted for each function group in accounts 354, 355 and 380.

B. Analysis of Capacity Related Used and Useful

The DEP permitted capacity of 2.4 MGD AADF is based on the combine hydraulic capacity of two extended aeration ring tanks of 1.2 MGD, each. The DEP permit limitation of 1.535 MGD AADF is based on the capacity of the disposal system. However, the Utility has determined that there are

---

<sup>1</sup> The term "Original Cost Study" includes the Original Cost Study, December, 2002, the Supplement to Original Cost Study, March, 2003 and the May 9, 2003 letter to the Commission Clerk relating to the original cost study.

several reasons why the wastewater facility, in total, cannot handle 2.4 MGD in flows at present.

1. Based on preliminary engineering analysis, the facility would require approximately 480,000 gallons of surge tank storage volume and approximately 400-500,000 gallons of digester storage capacity to handle 2.4 MGD AADF. At present, the system has 211,000 gallons of surge tank storage volume and approximately 250,430 gallons of digester storage capacity. On the basis of surge tank storage volume, the system could presently treat 1.055 MGD of flows. On the basis of digester storage capacity, the system could treat approximately 1.336 MGD of flows. To treat greater flows will require additional investment in surge tank and digester storage capacity. Both of these limitations are less than the 1.535 MGD capacity used by the Utility in its used and useful calculations in the MFR at Schedule F-6.
2. DEP Rule 62-610, F.A.C., Reuse of Reclaimed Water and Land Application, relies on standards on standards and criteria in several technical publications in determining whether permits to construct or modify reuse facilities will be issued or denied. One of those is a publication of the Environmental Protection Agency (EPA) that requires that domestic wastewater facilities meet certain component reliability requirements. In general, the EPA criterion is that unit operations in the main wastewater system shall be designed such that, with the largest flow capacity unit out of service, the hydraulic capacity of the remaining units shall be sufficient to handle the peak wastewater flow. For the Alafaya system, that this means that with one of the 1.2 MGD tanks out of service, the remaining 1.2 MGD tank must be capable of handling peak flows. The utility has indicated at MFR Schedule F-6, that the AADF test year flows plus flows for the allowed post- test year period will be approximately 1.18 MGD. On this basis, the second 1.2 MGD tank is necessary to provide the required redundancy.

Since the Utility disposes of its effluent through public access irrigation, it must also meet additional EPA component reliability requirements for Reliability Class I. Under Reliability Class I, there are additional redundancy requirements for certain individual system components. However, the general redundancy requirement discussed above is controlling with regard to evaluation of used and useful.

The Utility has indicated a 77% used and useful factor in the MFR, based on the effluent disposal capacity limitations only. When evaluated on a reliability requirement basis, the wastewater treatment and disposal facilities should be considered 100% used and useful.

#### C. Economies of Scale Considerations

The Utility also reviewed used and useful as presented in the MFR, but taking into consideration economies of scale. That is, if one ignores the redundancy requirement, and assuming plant capacity is limited to 1.535 MGD because of effluent disposal limitations, was there any economic benefit to adding a second 1.2 MGD tank rather than a 0.335 MGD tank, which is all that would have been required to have permitted treatment capacity equal disposal capacity (existing 1.2 MGD capacity + 0.335 MGD = 1.535 MGD)?

Generally speaking, in today's economy, a .400 MGD ring tank can be built for about \$4.00/GPD compared to \$3.35/GPD for a 1.2 MGD ring tank, or a difference of approximately 19%. Because of standardization in tank size, it would be difficult to get a tank sized for 0.335 MGD. Since the Utility would have to buy a 0.400 MGD tank when it only need needs 0.335 MGD, the effective unit cost would become \$4.47/GPD or a difference of approximately 33%. These unit costs assume the tanks provide simple extended aeration treatment and the costs and other considerations associated with advanced treatment for reuse are not factors.

However, the costs and other considerations associated with advanced treatment for reuse are factors, as is the availability of space at the site. When these factors are considered, the economies in favor of the single larger tank are heightened.

In order to consider adding capacity in smaller steps, it would have been necessary to modify all of the piping to and from the surge tanks and digesters, then relocate the existing surge tanks and digesters, in order to eke out the additional space necessary for additional tank(s). Even then, there would still only be room for, at the most, one more tank. So, the logical sequence of events in consideration of small incremental capacity additions would have included: relocating the surge tanks and digesters, modifying all of the internal plant piping , then adding of a 0.400 MGD tank, followed in short order by the addition of another 0.800 MGD tank. All of these steps would have added to the unit cost differential.

Finally, this scenario would have been rendered moot by the inability of the remaining plant components to provide redundant capacity sufficient for treating peak flows with the largest unit, the existing 1.2 MGD tank, out of service.

#### D. Conclusions

After further analysis, the Utility believes that, regarding wastewater treatment and disposal related plant, used and useful analysis is only appropriate for the limited portion of the assets that are capacity related. For those assets, the percent used and useful should be 100% rather than the 77% indicated in the MFR. The remaining treatment and disposal plant assets, which are general in nature or directly related to reuse, as previously discussed, should be considered 100% used and useful.
