Subject: Hydrochloric Acid Relocation and Sodium Hypochlorite Tank Installation
Date: February 10, 2020

Domenic,

Bu251102

HYDROCHLORIC ACID TANK RELOCATION WITH NEW SODIUM HYPOCHLORITE TANK

Utilities Inc. of Fl. Has decided to relocate the existing hydrochloric acid tank outside and install a new Assmann tank in the place of the hydrochloric acid tank inside for sodium hypochlorite. The existing hydrochloric tank can be relocated outside to the new pad and a new sodium hypochlorite tank installed in place of the current acid tank. This will require several hours of the system being offline while the tank is being relocated. The hydrochloric acid tank will need to be transferred to a temporary holding tank. Odyssey shall supply a 500-gallon single wall temp tank and an air diaphragm transfer pump to pump the existing tank out. Odyssey personnel shall filter the acid during the transfer to help remove any contaminants before transferring the acid back to the relocated tank. Once the tank is empty, Odyssey will inspect the inside of the tank and rinse and clean the tank if necessary. While the tank is down, Odyssey will also inspect the bottom fitting to make sure there isn't any degradation to the Hastelloy-C fitting before transferring the acid back to the tank. The suction piping shall be ran with accordance to the drawing the piping shall be ½" x 2" double wall PVC pipe from the pad to the building. Once its above ground the pipe shall transition back to single wall pipe and enter the pipe trench inside the building.

Sodium Hypochlorite Tank Installation

Once the hydrochloric acid tank has been relocated outside and the installation has been completed, Odyssey shall install a new Assmann DW 550 Gallon tank for sodium hypochlorite. This will require replacing all the suction and fill lines. Odyssey shall run a new PVC SCH 80 2" fill line to the loading station just outside the north wall in place of the hydrochloric acid fill line. The fill line shall have an Asahi true union isolation valve and a polypropylene male camlock with cap. These lines can not be repurposed as there are to many voids and crevasses the acid can hide in and are extremely difficult to fully rinse out. Additionally, the PH difference of the chemicals would most likely shock the pipe and hyper-oxidize it. The vent however can be reused as it hasn't actually been in contact with the acid. Odyssey shall then run a new ½" suction pipe from the tank

into the pipe trench and tie it into the existing sodium hypochlorite suction line feeding the inductors. All this work can be done in advance of taking the existing sodium hypochlorite feed line out.

Roof

Odyssey proposes to build a roof over the new slab to provide shelter and shade to the new tank. The roof will have a pitch of 1.2 or 12 inches over 10ft. the roof will slope from the west to the east allowing maximum head space for tank maintenance. The west side faces the chlorine dioxide building and will be shaded most of the day from it. The west side will be 9ft high the east side will be 8ft. each 4x4 PT post shall be buried a minimum of 24in into the ground at each corner of the slab and in the middle of the three walled sides there shall be PT 2x4 supports. Each post will also have anchors tying each post into the slab. The roof frame shall be made from 2x8 PT lumber anchored to each post with 2x4 PT rafters every 24in in between. The roof itself will be plywood with shingles outside there shall be a drip edge surrounding the perimeter. For added protection Odyssey shall build half walls which will extend down from the roof to 2ft from the ground. These walls will be made of composite deck boards, providing the maximum reinforcement to the roof structure, and will never need painting. These walls will be on the north, east, and south sides to add additional shade. The added shade will also help protect the tank and hydrochloric acid from excessive UV exposure thus improving the longevity of the acid.

In addition to the listed work, Odyssey shall reconfigure the fill connection to the sodium chlorite tanks. Odyssey shall connect the two chlorite fill lines together into a common manifold and replace the male camlock with a female camlock.
