Subject: Docket #20200226-SU

Commissioners Clark, Passidomo and LaRosa and Esquires Crawford, Helton and Sandy,

I wanted to thank all of you once again for traveling to our corner of the state to conduct hearings and to listen to affected residents. As I was first up to the podium last night, I did not see the protocol for this so I asked after the meeting. I wanted to share the reference materials for my comments on Docket #20200226-SU. As a nervous speaker, I typed out my comments as my husband warned I've never said something in 3 minutes if I could take 20. My reference data is attached as well as a copy of my comments as I hate to see anyone transcribing what I can just provide. (Apologies as one of the FL DEP charts was also included in my letter submitted to the docket.)

Hello commissioners, thank you for the opportunity to speak. I am full-time Don Pedro Island resident, Candyce Cohen. The EU proposal falls far short of the PSC's focus to ensure our services are delivered in a **safe, reasonable** and **reliable** manner. I am requesting their application be **DENIED**. I will focus my remarks on one fact: **sewage happens** – and it all flows downhill into our very special Lemon Bay.

Charlotte County has a third of the population density of the counties to our north and south. Our islands do not support high-rise, multifamily nor commercial developments. Our delicate environment is at much greater risk of pollution from centralized sewage spills like the 50,000 gallons spilled 3 weeks ago just off island than any low-density septic tank issues. This was not a single, nor uncommon event – a few days later there was a 100k gallon spill in the county and last March a million gallon spill. DEP Pollution Notices show more than 120 spills in Charlotte County alone totaling nearly 6.6 million gallons since 2019. The counties north and south acknowledge sewage spills happen and have focused on protecting sensitive estuaries by implementing Advanced Wastewater Treatment to reduce excess nitrogen and nutrients in reclaimed water. Charlotte County Utilities should prioritize upgrading to AWT standards removing red-tide fueling nutrient from wastewater before dismantling functioning low-density tanks (OSTDS).

Another fact of island life is power outages happen, often and predictably during hurricane season, but even one 19 hour outage across much of the island just weeks ago. The Low Pressure solution proposed by EU invites disaster on an island without power. I don't believe EU have adequate resources to pump non-powered tanks and I don't find it environmentally sound on our island to follow one County's advice to "pop the top on the clean out and let the sewage flow into the yard so it [does] not back up into the house." More thought is needed in providing a SAFE, RELIABLE and environmentally sound solution.

Central sewer provided NOT by a qualified, municipal utility but rather an inexperienced, private, for-profit entity is not REASONABLE environmentally or economically. The nature of a Limited Liability Corporation providing this service provides no recourse to the public or the county for any costly mistakes and does not meet criteria for Clean Water grants or other financing alternatives.

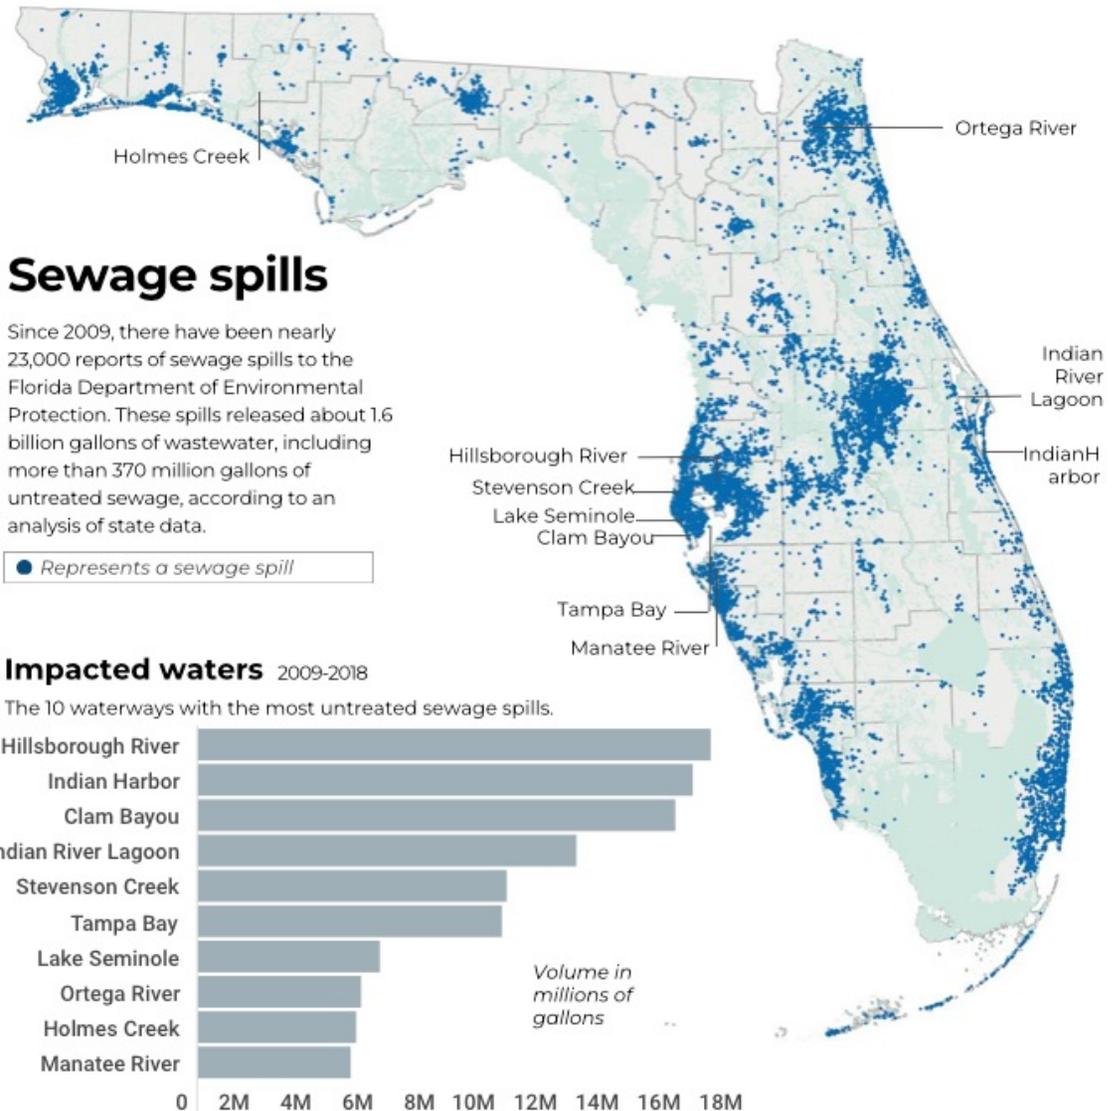

EU offers neither a SAFE, REASONABLE nor RELIABLE solution for our community.

Thank you.

Sewage Spills Happen in Volumes Devastating to our Waterways

EU circulated a study conducted by Florida Atlantic University in the Indian River waterways to justify their contention that septic tanks are significant contributors to water quality issues for our islands.

1. No studies on local waters have been presented showing septic tanks are damaging waters surrounding the island.
2. Per Florida DEP (right), Indian River waters are the 4th most impacted waterway in the state by untreated sewage spills. The FAU study did not distinguish between septic leaching and these untreated sewage spills.
3. Sewage spills impact our water quality many multiples of any impact from low density septic tank usage.
4. FL DEP Pollution Notices in Charlotte County alone have recorded since 2019 more than 120 spills with nearly 6.6 million gallons of wastewater ranging from raw to partially treated including:
 - 11 spills in excess of 100k gallons
 - 100k gallons just 2-1/2 weeks ago
 - 50k gallons just off island 3 weeks ago
 - 1 million gallons last March
 - 2.76 million gallons in December 2020

8675 Placida RD main break 01192022

Incident # 2022355

Incident Name: 8675 Placida RD main break 01192022

Incident Report: Reclaim Main break, possible fitting failure. Isolated section of pipe. Awaiting parts for repair. Estimated repair time 1 week. Estimated 50,000 gallons of reclaim water spilled.

Report Date/Time: 1/20/2022, 5:17 AM

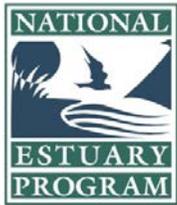

Facility Name: Charlotte County Utilities

Facility Address: 2550 Harborview RD Suite 3 Line 1

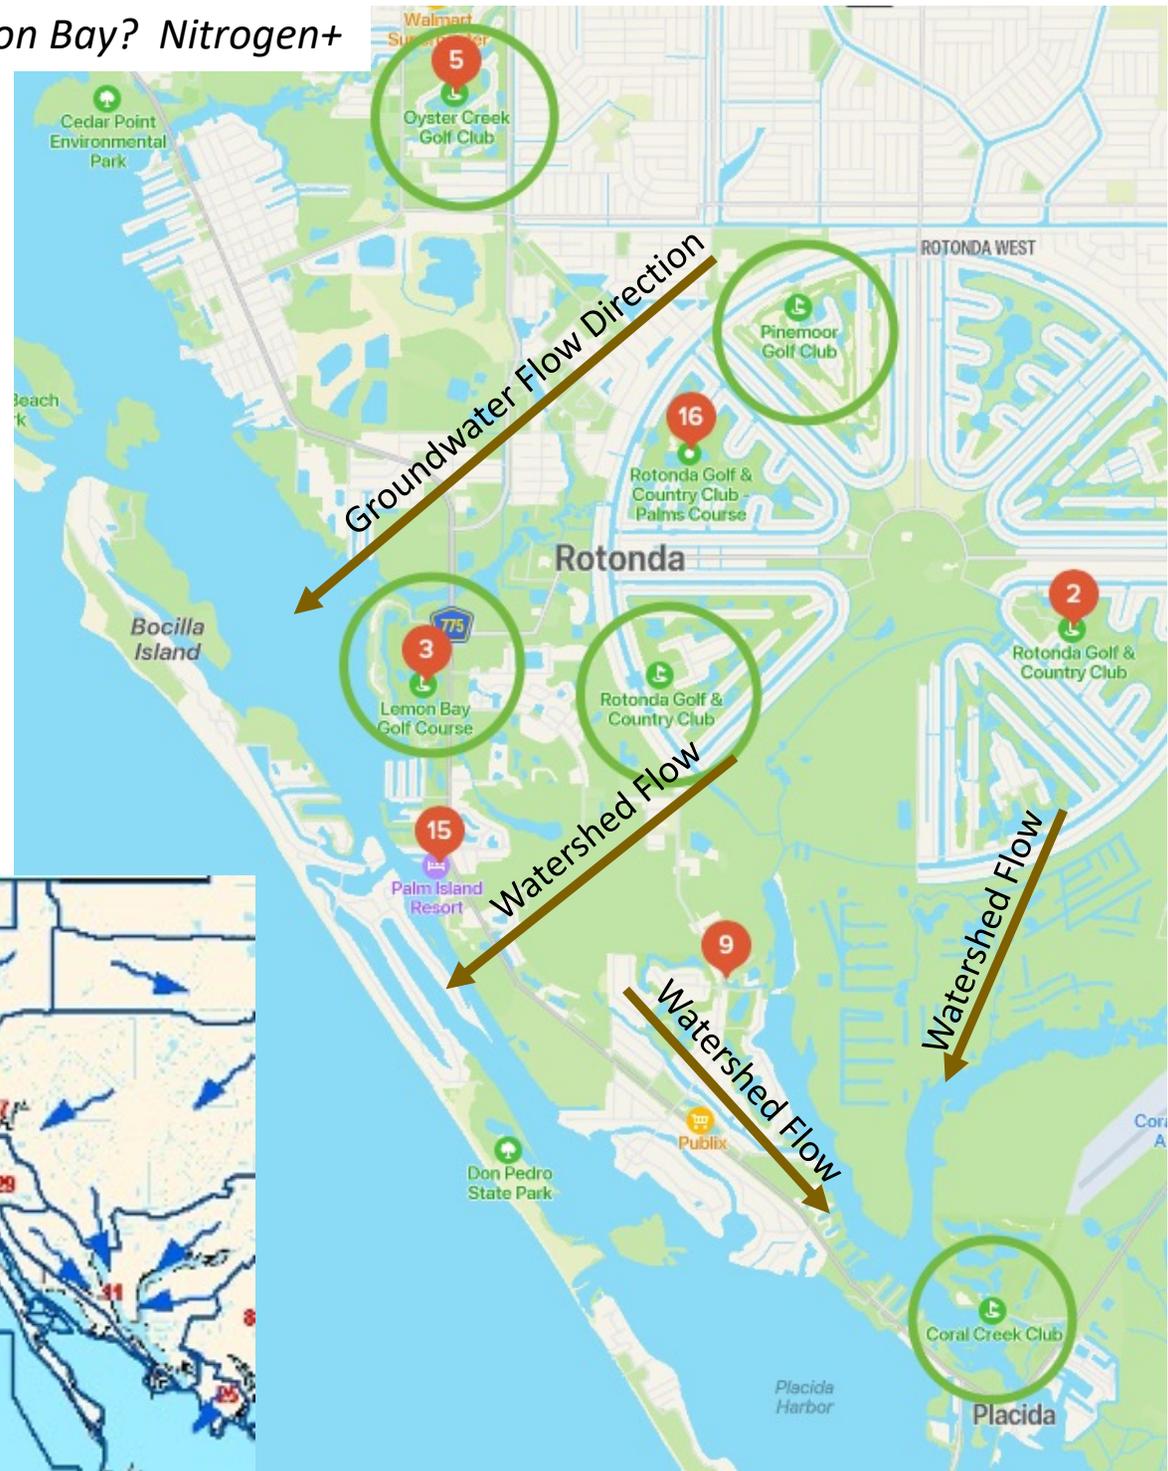

What's in the Groundwater Flowing into Lemon Bay? Nitrogen+

No local water studies have shown that septic tanks are damaging island waters— but CCU's own Sewer Master Plan shows groundwater and watershed flows. Higher nitrogen levels are found in both fertilizer and reclaimed wastewater used to irrigate the several golf courses that flow directly into Lemon Bay. This nitrogen-rich runoff also exacerbates any red tide issues.

If focused on local water quality, CCU would follow the lead of neighboring Sarasota, Manatee and Lee counties and prioritize work with Charlotte Harbor's National Estuary Program (CHNEP) to upgrade wastewater treatment to Advanced Wastewater Treatment (AWT) standards reducing excess nutrient in reclaimed wastewater – again which all flow into Lemon Bay.

EU LLC as a private, for-profit limited liability "utility" has no standing to garner Clean Water / Clean Waterways funds. Limited liability limits funding opportunities.

Evaluation of Standards for Low Pressure Sewer Systems

Sarasota County – ESBC Utilities

Section 6 - Survey of Florida Communities Using Low Pressure Grinder Pumps Systems

Their units do not have an emergency power receptacle. In the event of a power outage, if they need to perform an emergency pump down, they would hardwire the system.

During the last three hurricane seasons, there were instances where the power was out for up to three days. For the commercial properties, it was the property owner's responsibility to pump down their own system. For the single family homeowners, it was the County's responsibility to pump down the systems. However, the County advised the residents to pop the top on the clean out and let the sewage flow in the yard so that it would not back up into the house. The county did not go out to pump down the units with a generator.

The pumps had some maintenance issues as well. After about 6-8 years, the pumps began to have problems. They found that the ABS Piranha 09 model had fewer problems than the E-one. The E-one pumps had some manufacturer defects that the manufacturer replaced. The source of the problem was a defect that allowed water to enter the section of the station lid where the electrical components were housed, resulting in electrical failures.
