

Residential Customer Count Forecast

Overall Residential Customers Forecast Analysis

In this section we will forecast the total monthly Residential Customers. Residential customers are filtered by Rate Class: 10,22,I0, and RS. We also include only customers that have greater than 0 reported volume usage for the month.

Customer Time-Series Decomposition

In this section we decompose the Residential Customer time-series using an Additive Decomposition Model. This model evaluates time-series' by extracting the Seasonal, Trending, and Random components.

Here we can clearly see a linear trend and seasonal component within the Residential customers.

Decomposition of additive time series

ARIMA Model: Expected Accuracy

In this section we evaluate the expected accuracy of a Seasonal ARIMA Model using cross-validation. ARIMA is an acronym for 'Autoregressive Integrated Moving Average' which is a widely used Time-Series forecasting model that utilizes the recent values to predict outward.

Here we evaluate model accuracy by using cross-validation and rolling forecasts throughout the time-series to determine our expected accuracy over a 24 Month period. Below we see that the ARIMA model is extremely accurate with a 1-Month Forecast Mean Absolute Error (MAE) of 162 clients, and a 24 MAE of 1,560 clients.

| | | ME | RMSE | MAE |
|------------------|---|-----|------|-----|
| Forecast Horizon | 1 | 104 | 221 | 162 |
| Forecast Horizon | 2 | 147 | 259 | 199 |

ARIMA Model: Diagnostics

In this section we evaluate the diagnostics of the ARIMA Model. Below we see that the model fails the Ljung-Box Test and therefore we can determine the data is independently distributed. In addition, we see from the graphs that the lagged values are not auto-correlated with one another, and the residuals are normally distributed.

```

Model df: 1. Total lags used: 24

ARIMA Model: 5 Year Forecast

Below we fit & forecast 60 months into the future using an ARIMA (0,1,0)(0,1,1) model. This model only uses 1 difference, 1 Seasonal Moving Average, 1 Seasonal Difference, and is expected to be extremely accurate as previously shown. In the graph below we see the 80% and 95% Prediction Intervals bounding our forecast.

Forecasts from ARIMA(0,1,0)(0,1,1)[12]

2020-2021 Forecast Comparison

In this section we will evaluate the accuracy of our ARIMA(0,1,0)(2,1,0) model on data from January, 2020 through December 2021 by training on the previous data and forecasting the next 24 months. In particular we are interested on how close the forecasted accuracy follows our cross-validated results shown previously. Also, an area of interest is how well the model performs during the 2020 pandemic.

Forecasts from ARIMA(0,1,0)(2,1,0)[12]

Test Results

Below we see that the model performs roughly as expected for a “normal” year of 2019, and continues to have a high degree of accuracy in 2020 and 2021.

ARIMA Model: 5 Year Forecast

Below we fit & forecast 60 months into the future using an ARIMA(0,1,2)(0,1,1) model.

2020-2021 Back-Testing Evaluation

In this section we will evaluate the accuracy of our ARIMA(0,1,2)(0,1,1) model on data from January, 2020 through December 2021 by training on the previous data and forecasting the next 24 months. In particular we are interested on how close the forecasted accuracy follows our cross-validated results shown previously. Also, an area of interest is how well the model performs during the 2020 pandemic.

Residential Client Backtesting: 2020-2021

Back-Test Results

Below we see that the model performs roughly as expected for a “normal” year of 2019, and continues to have a high degree of accuracy in 2020 and 2021.

Ft. Meade Residential Service (FT-RS)

In this section we will forecast monthly client counts for FT-RS. From the data given, these numbers are calculated by filtering for Rate Class 22.

Customer Time-Series Decomposition

Here we see a downward sloping trend line for FT-RS. This tells us that this rate is gradually losing customers every month/year. This rate is also unique in that it begins in December 2013, whereas the previous rates have start dates in January 2012.

Decomposition of additive time series

ARIMA Model: Expected Accuracy

Here we evaluate model accuracy by using cross-validation and rolling forecasts throughout the time-series to determine our expected accuracy over a 12 Month period.

Below we see that the ARIMA model is consistently accurate with a 1-Month Forecast MAE of 10, and a 12-Month Forecast MAE of 8.

Indiantown Transportation Service 1 (IGC-TS1)

In this section we will forecast monthly client counts for IGC-TS1. From the data given, these numbers are calculated by filtering for Tariff Schedule 'TS-1' or Rate Class I0.

Customer Time-Series Decomposition

In the time-series decomposition below we see that there is a large drop off in customers for December 2019. This is likely due to an error when inputting the data. Therefore, we will calculate the average customers from the previous years in December and input this new value for December 2019. Another explanation may be due to the Covid-19 pandemic. However, this was ruled out since there was no significant drop in volume usage during this time.

Considering there is not much a trend this process is perfectly reasonable in order to generate a proper forecasting model.

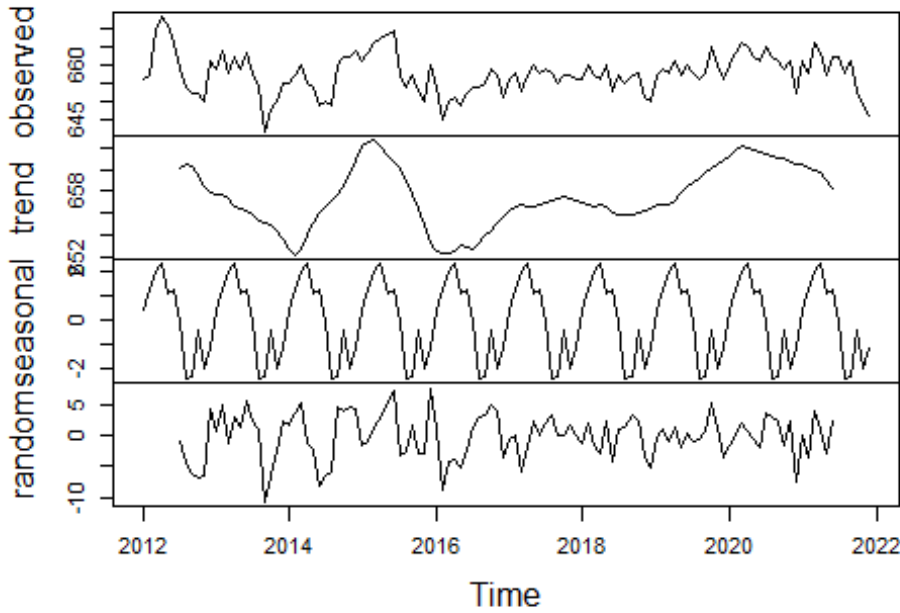

Decomposition of additive time series

New Time Series Decomposition

See below the updated time series decomposition by inputting 656 as the new value for December 2019.

Inverse AR roots

ARIMA Model: 5 Year Forecast

Below we fit & forecast 60 months into the future using an ARIMA(2,1,0)(2,0,0) model.

2020-2021 Back-Testing Evaluation

In this section we will evaluate the accuracy of our ARIMA(2,1,0)(2,0,0) model on data from January, 2020 through December 2021 by training on the previous data and forecasting the next 24 months. In particular we are interested on how close the forecasted accuracy follows our cross-validated results shown previously. Also, an area of interest is how well the model performs during the 2020 pandemic.

Residential Client Backtesting: 2020-2021

Back-Test Results

Below we see that the model performs roughly as expected for a “normal” year of 2019 with a high degree in accuracy. However, there is a large error in the beginning of 2020 likely due to the pandemic. Although, in the later months of 2020 customers started returning and we see the accuracy go back to expected levels.

FPUC Residential Standby Generator Service (FPU-RSGS)

In this section we will forecast monthly client counts for FPU-RSGS. From the data given, these numbers are calculated by filtering for Tariff Schedule 'RS-GS'.

Customer Time-Series Decomposition

Below we have the time-series decomposition where we can see a linear upward trend at the start of 2018.

Decomposition of additive time series

ARIMA Model: Expected Accuracy

Here we evaluate model accuracy by using cross-validation and rolling forecasts throughout the time-series to determine our expected accuracy over a 24 Month period.

Below we see that the ARIMA model is consistently accurate with a 1-Month Forecast MAE of 15, and a 24-Month Forecast MAE of 68. It's worth noting that the Mean Error (ME) is also consistently positive, meaning the models under-predict the actual values.

| | ME | RMSE | MAE |
|--------------------|----|------|-----|
| Forecast Horizon 1 | 4 | 21 | 15 |
| Forecast Horizon 2 | 6 | 23 | 17 |
| Forecast Horizon 3 | 9 | 23 | 18 |
| Forecast Horizon 4 | 10 | 26 | 21 |
| Forecast Horizon 5 | 13 | 27 | 22 |
| Forecast Horizon 6 | 16 | 28 | 23 |
| Forecast Horizon 7 | 17 | 30 | 24 |

| | | | | |
|------------------|----|----|----|----|

| Forecast Horizon | 24 | 68 | 73 | 68 |

ARIMA Model: Diagnostics

Below we see that the model fails the Ljung-Box Test and therefore we can determine the data is independently distributed. In addition, we see from the graphs that the lagged values are not auto-correlated with one another, and the residuals are normally distributed. The unit circle below also showcases that we have a stationary model.

```
Series: x
ARIMA(0,1,1)(0,0,2)[12] with drift

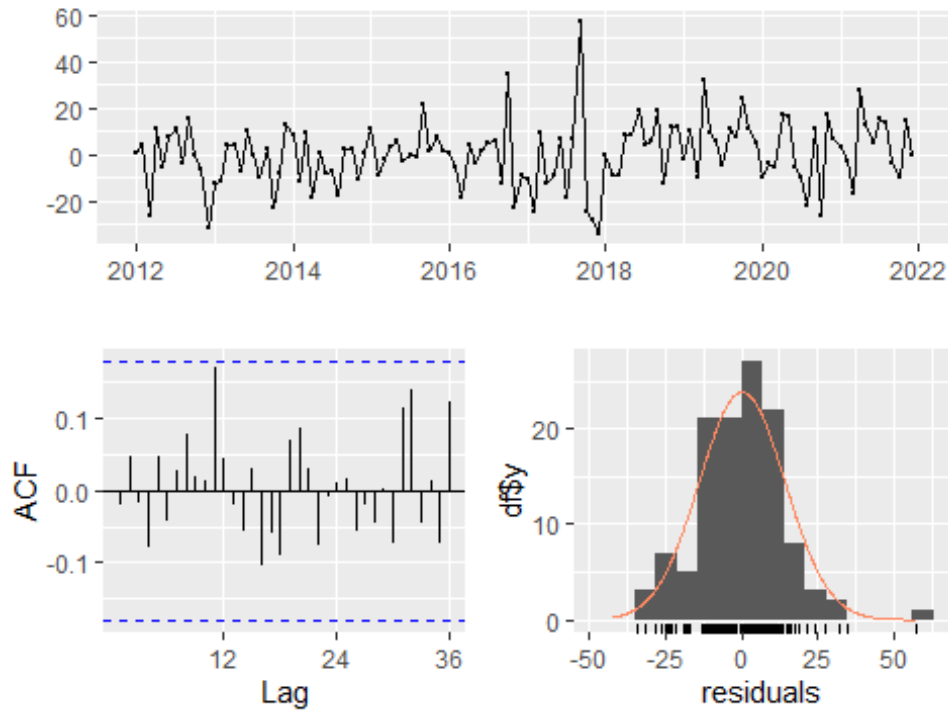

Coefficients:
      ma1      sma1      sma2      drift

Inverse MA roots

ARIMA Model: 5 Year Forecast

Below we fit & forecast 60 months into the future using an ARIMA(0,1,1)(2,0,0) model.

2020-2021 Back-Testing Evaluation

In this section we will evaluate the accuracy of our ARIMA(0,1,1)(0,0,2) model on data from January, 2020 through December 2021 by training on the previous data and forecasting the next 24 months. In particular we are interested on how close the forecasted accuracy follows our cross-validated results shown previously. Also, an area of interest is how well the model performs during the 2020 pandemic.

Residential Client Backtesting: 2020-2021

Backtest Results

Below we see that the model performs well at first but then the accuracy deteriorates due to the explosion of customers that begins roughly at the start of our forecast.
