BEFORE THE
FLORIDA PUBLIC SERVICE COMMISSION

In the Matter of:

DOCKET NO. 20230023-GU

Petition for rate increase by Peoples
Gas Systems, Inc.

_____/_____
DOCKET NO. 20220219-GU

Petition for approval of 2022 depreciation
study by Peoples Gas Systems, Inc.

_____/_____
DOCKET NO. 20220212-GU

Petition for approval of depreciation rate
and subaccount for renewable natural gas
facilities leased to others by Peoples
Gas Systems, Inc.

VOLUME 6 - PAGES 842 - 1087

PROCEEDINGS: HEARING

COMMISSIONERS
PARTICIPATING: CHAIRMAN ANDREW GILES FAY
COMMISSIONER ART GRAHAM
COMMISSIONER GARY F. CLARK
COMMISSIONER MIKE LA ROSA
COMMISSIONER GABRIELLA PASSIDOMO

DATE: Thursday, September 14, 2023

TIME: Commenced: 9:00 a.m.
Concluded: 9:22 p.m.

PLACE: Betty Easley Conference Center
Room 148
4075 Esplanade Way
Tallahassee, Florida

REPORTED BY: DEBRA R. KRICK
Court Reporter

APPEARANCES: (As heretofore noted.)

1 PROCEEDINGS

2 (Transcript follows in sequence from Volume
3 5.)

4 CHAIRMAN FAY: All right, everyone, welcome
5 back this morning. Just a quick update as to how
6 we will proceed for today.

7 We will continue with Mr. O'Connor's
8 testimony, and then move into Mr. Garrett. And I
9 think logistics-wise, after that, we would go into
10 Richard and then Bluestone potentially, but if we
11 have recommendations on any of those changes,
12 knowing that we have witnesses in certain orders
13 that we would like to take up, just speak up and I
14 will make sure that legal knows and we will move
15 them accordingly. I don't think we will have an
16 issue getting everybody moving forward, but if
17 something comes up, please let me know sooner than
18 later to try to make it work.

19 With that said, we will probably work on the
20 same schedule that we worked through yesterday,
21 with the exception maybe, depending on the timing,
22 we might go later tonight to get through with
23 additional witnesses to make sure we have some time
24 for Friday's hearing.

25 So with that, any questions? Ms. Wessling,

1 yes.

2 MS. WESSLING: I guess, I am not sure how
3 widely shared this was, but the parties, and I
4 think staff, we discussed this morning a potential
5 order of witnesses that makes sense, given our
6 estimates on the remaining cross-examination that
7 we have.

8 CHAIRMAN FAY: Okay. So we have O'Connor that
9 we would finish and then witness Garrett, and then
10 after that?

11 MS. WESSLING: I believe Mr. McOnie has some
12 travel obligations on Friday, so we were thinking
13 collectively that it will go O'Connor, Garrett,
14 McOnie, Kollen and potentially Bluestone, if there
15 is time today, leaving Richard and Parsons for
16 potentially tomorrow. Who I believe it would be
17 the remaining two witnesses.

18 CHAIRMAN FAY: Okay. Great. And I think
19 that's consistent with what legal had mentioned to
20 me, is that correct? Okay.

21 All right. So seeing that that works for
22 everybody. Yes, Mr. Moyle?

23 Okay. All right. With that, then, we will
24 get going back into our cross on Mr. O'Connor.

25 Mr. Rehwinkel, whenever you are ready.

1 MR. REHWINKEL: I am ready. Good morning, Mr.
2 Chairman and Commissioners. Thank you.

3 EXAMINATION continued

4 BY MR. REHWINKEL:

5 Q Good morning, Mr. O'Connor.

6 A Good morning.

7 Q I want to ask you to turn to page five --
8 actually, I think I gave you a note that said five, but
9 let's go to page three, if we can, of your rebuttal
10 testimony.

11 At the bottom of the page there, you start to
12 explain the types of tasks or activities that your
13 operations deals with on a regular basis, is that
14 correct?

15 A Yes.

16 Q Okay. Now, I think we covered a little bit
17 yesterday, but in regards to all of these tasks, Peoples
18 is not finding itself in a deficient situation as far as
19 the quality of service, is that correct?

20 A No, we -- no, we are not. We are not
21 deficient in the quality of our service from a safety
22 compliance, from a customer service perspective. We are
23 very happy with our performance. However, when we look
24 into the future, we do see that certain aspects of that
25 is not sustainable because of our resourcing levels and,

1 hence, the resource request in 2024 for increased team
2 members.

3 Q Okay. And going to E2-29 or just the next
4 page, four, of your testimony, we see a little bit more
5 explication starting on line five. You talk about your
6 compliance and maintenance activities, such as
7 atmospherance -- atmospheric inspections and main and
8 service line leak surveying, right?

9 A Yes.

10 Q Those are areas that you are not deficient in
11 at this time, right?

12 A No, we are not. As we look at all of our
13 compliance requirements, we remain in compliance with
14 all activities. And again, resourcing into the future
15 is needed to continue to maintain our strong performance
16 in that area.

17 Q Line 14, locates, I think your testimony is
18 that you have had an upsurge in locate requests through
19 the 811 system, but, again, you are meeting the
20 requirements today, right?

21 A We are meeting the two-day requirement for all
22 locate tickets that do come to Peoples Gas. This is an
23 area, due to Florida's overall growth, where we are
24 seeing profound increases in volumes. With that two-day
25 requirement to respond and mark a gas line, it is

1 putting a heavy burden on our teams to be able to meet
2 that requirement while continuing to do customer service
3 and compliance work, and maintain proper safety.

4 **Q Line four, the same question, just yes or no,**
5 **leak and damage response, isn't it true you are in**
6 **compliance with respect to those?**

7 A I know you asked for a yes or no. We are
8 compliant, or performing adequately on damage prevention
9 and emergency response, but I will share a specific data
10 point with you that is concerning from our perspective.

11 An industry average for leak response within
12 60 minutes is 98-and-a-half percent of the time, meaning
13 as we get a leak call into our customer service area, we
14 like to respond within 60 minutes of that leak. It
15 could be very minor, it could be quite significant, and
16 we want to be there within an hour.

17 For the past two years, '21 and '22, we have
18 not achieved that 98-and-a-half percent response. We
19 are approximately at 98 percent, and we are struggling
20 to meet that 98-and-a-half percent again this year in
21 2023.

22 And to give you just a little more color on
23 that, I will use an example with our Ft. Myers division.
24 You know, our Ft. Myers division extends from the north
25 in Port Charlotte all the way down to Marco Island. You

1 know, it's almost 100 miles north to south. We extend
2 east to Immokalee. And to have roughly a team of 21, 22
3 team members cover that geography and be able to respond
4 to a leak call in 60 minutes is getting harder and
5 harder to do. Population growth, traffic issues, road
6 construction all sort of issues are constraining our
7 team. And so in this area, to your question, we are
8 seeing a deterioration of that response rate, and that
9 is concerning to Peoples.

10 **Q On E2-32, which is page seven. I think we had**
11 **discussed yesterday that you have no quantified metrics**
12 **as far as so many tasks means you need to have so many**
13 **people added, correct?**

14 A That is correct, and I am glad you mentioned
15 that again. I would love it if we had some sort of
16 formulaic approach where we could say, you know, X
17 amount of job activity equates to X number of team
18 members. The simple reality is it doesn't work that
19 way. So as much as we would like an objective metric,
20 or series of metrics to dictate how we staff, the
21 reality is we need to look at our experience levels, the
22 workload, training requirements, a number of different
23 factors to determine what a staffing level would be
24 within a service area.

25 **Q But just to be clear, you are here before the**

1 Commission askings for them to authorize revenues from
2 the customers to add people, right, in the future?

3 A Yes.

4 Q Okay. And it -- they have to make a decision
5 about whether what you are asking for is reasonable
6 under the circumstances, right?

7 A Yes.

8 Q And so your obligation to the Commission, if
9 you want to get those -- if you want the customers to
10 pay for that, is to justify the new adds, correct?

11 A Yes.

12 Q Okay. So let's go to page seven, line --
13 starting on line 18, I think there is a string of -- I
14 think -- it's been a while since I have taken English
15 grammar, but I think these are adjectives. On line 19,
16 we see growing. On line 20, we see larger system. On
17 line 21, more customer service compliance, maintenance,
18 meter reading and other such activities. Line 22,
19 strong economic and population growth. Those are the
20 adjectives you use, but there is no quantification that
21 links those numbers to what you are asking for in terms
22 of adds, right?

23 A No, there is some quantification. I
24 understand what you are trying to get at, but when we
25 look at, for example, locates, we can see for the past

1 number of years significant increase in actual locate
2 volume. We can also understand population growth. We
3 have information from the Department of Transportation
4 in terms of expected capital investment in road
5 widenings and new road projects, and so we can draw some
6 conclusions based on data around future projections of
7 strong growth in the areas of our business.

8 **Q Okay. And then if we look on the next page, I**
9 **think page E2-33, looking at line 16, you reference FDOT**
10 **road projects, and you use the word "potentially" lead**
11 **to higher locate requests and higher damage to our**
12 **system, do you see that?**

13 A Yes.

14 **Q But beyond saying the word "potentially",**
15 **there is no quantification there that says what it will**
16 **be, right?**

17 A The quantification is on page nine in the
18 expected Department of Transportation spending levels in
19 the state of Florida. Road widenings, road projects
20 typically drive locate volumes, the use of potentially
21 is, you know, they are already driving some volumes. We
22 expect that to increase in the future.

23 **Q Okay. But what I am saying is potentially is**
24 **somewhat an amorphous term. It doesn't have any exact**
25 **quantification, right?**

1 A That's correct, but I --

2 **Q Okay.**

3 A -- but we feel confident that this continued
4 growth within the state of Florida will continue to
5 drive locate increased volumes.

6 **Q In your testimony talking about, you know, the**
7 **string of adjectives and the use of the word**
8 **"potentially" here, nowhere in your testimony in this**
9 **regard do you discuss efficiencies or efficient systems**
10 **that you have put in to tamp -- to dampen the increase**
11 **in manpower needed to meet these tasks, is that correct?**

12 A We do talk about efficiency. In the service
13 area breakdowns, I provided our overall labor costs in
14 the form of internal labor and external labor. We use
15 this as a comparative metric. It's not a perfect
16 metric. But when you look at our total labor costs per
17 team member, you do see in many service areas a flat
18 line, a somewhat declining line in areas that show that
19 we are getting more from our team members per O&M labor
20 dollar. I do think part of the story within those trend
21 lines is efficiency.

22 The second point I would make is the
23 discussion we started yesterday around the Work and
24 Asset Management system. Although we have not -- we do
25 not expect to see immediate efficiencies because we do

1 need to get that system working efficiently on behalf of
2 our team members, it is the right thing to do for our
3 customer, and we fully anticipate efficiencies in terms
4 of productivity gains into the future beyond 2024.

5 **Q Okay. But it's true, is it, that WAM is not,**
6 **in your projections in your supporting testimony, WAM is**
7 **not damping the employee adds that you are asking for,**
8 **correct?**

9 A In the 2024 -- no. In the 2024 test year, we
10 did not include an efficiency gain, a cost reduction
11 from the WAM implementation. In subsequent
12 conversations with your office and staff, we did talk
13 about bringing in some savings in the level of \$750,000
14 to reduce our revenue requirement to be reasonable and
15 understand that customers are looking for some
16 efficiency gains.

17 The reality is, there is not efficiency gains
18 to be realized in 2024. As I mentioned, it will take us
19 some time to digest and really get WAM working the way
20 it is intended to.

21 **Q So while you are seeking to hire new team**
22 **members, is what you call your employees, there really**
23 **isn't a material dropoff in contractor resources**
24 **associated with the bringing those, or onboarding those**
25 **employees in the test year, right?**

1 A There is a drop in resources. I will leave it
2 to the Commission to decide what is material.

3 The way this works, when we hire new team
4 members -- and, you know, this is just, I will call,
5 normal business, we cannot release a contractor just
6 because we hired someone. First of all, we need to make
7 sure we have coverage for all the work that is going on.
8 As I mentioned, there are training requirements to get
9 new team members up to speed and able to perform our
10 tasks.

11 The other is the commercial reality of
12 engaging a contractor. You know, we could cancel a
13 contract with a contractor tomorrow, if we need them
14 next month, they may not be so willing to work for us.
15 We may have contractual terms that we can't cancel the
16 contract tomorrow. And so there is expected to be
17 overlap between team member hires and contractors.
18 However, you do see within field operations a decline in
19 contractor costs, outside service costs in 2024 compared
20 to 2022.

21 Q Is that about \$1 million?

22 A Yes, it is.

23 Q Okay. Am I mistaken, or isn't it true that
24 the adds that you talked about yesterday, some of the
25 vacancies that you filled, I think 33 -- is that -- did

1 **I get that number right?**

2 A We have hired, in 2023, 29 of those
3 replacement positions --

4 **Q Okay.**

5 A -- that were a total of 34.

6 **Q Okay. I still got it wrong.**

7 A Close.

8 **Q Isn't it true that some of those hires came
9 from the contractor workforce?**

10 A They may have.

11 **Q Okay. So now you bring those resources on,
12 and now your contractors have less resources, is that
13 how it works?**

14 A It could work that way. You know, we have a
15 very proactive constructive relationship with our
16 contractors. We try not just to take their worker and
17 bring them in-house and leave them holding the bag, so
18 to speak, in terms of their responsibilities and
19 obligations to Peoples Gas.

20 There are instances when we do post positions
21 and there are contracted workforce that do find -- that
22 are interested in working for Peoples Gas, and we do
23 work through that process with our contractors as
24 constructively as we can.

25 **Q Okay. Let's go to E2-39, if we can.**

1 A What page is that?

2 Q Oh, I apologize. It's 14 of your paper
3 testimony. And this is the beginning of some graphs
4 that show some achieved metrics, correct?

5 A Yes.

6 Q I guess achieved and forecast metrics, right?

7 A Yes.

8 Q Okay. So headcount compared to labor and
9 outside services O&M, I stand fully ready to be
10 corrected, as I have already several times in your
11 testimony, but looking at the executive documents that I
12 have seen so far, I don't see these metrics as part of
13 the report card for gas ops when you report to Tampa
14 Electric or Peoples board or Emera board, am I mistaken
15 in that?

16 A No, you are not mistaken. This is a level of
17 detail within field operations that probably is a little
18 too detailed for board level material.

19 Q Okay. But this is not what you manage to in
20 terms of your scorecard with the board, right?

21 A No, it is not. These are metrics that help
22 us, on a comparative basis, to look at trending within
23 each service area, allow us, to some extent, to compare
24 different service areas in terms of their labor costs
25 per headcount and their labor costs per work order.

1 These are not perfect data points. They are
2 indicative. They inform us somewhat on some of these,
3 but these are not complete data points that can be, you
4 know, used from a goal setting and a metric perspective.

5 **Q** Okay. Thank you.

6 So let's go to E2-41, or page 16, and I want
7 to go right down to lines 21 and 22.

8 Now, above this area here, lines 21 and 22,
9 you talked about sort of favorable trends in these
10 metrics that you put in your charge, right?

11 A Yes.

12 **Q** But when we get to line 21 and 22, it says:
13 Although this trend shows a slight increase, this is
14 justified given broader market conditions.

15 So am I to think, when I read this, that this
16 is all good unless it's not, and then you just explain
17 it away with vague term like that, is that how it works?

18 A No, that's not how it works.

19 So when we look at these stats, you know, we
20 are being very transparent with here are our labor
21 costs, here are our expected team members. In the
22 instances you are referencing on lines 19 through 22, we
23 actually show an increasing cost per work order, from
24 \$4.87 to \$5.07, okay. We are not going to hide that.
25 That's an increasing profile.

1 We are a growing company. We have
2 inflationary pressures. We have a number of factors
3 that are making it more expensive to run, to operate and
4 maintain our system. I am not surprised that that stat
5 is increasing, and I am happy to share it with you.

6 **Q Thank you.**

7 **So on page E2-43, or 18 of your -- I think**
8 **that's right -- yeah, 18. The Q&A here starting on line**
9 **14 through line 22, this is really the introduction to**
10 **your TO-2, right, your Exhibit TO-2?**

11 A If I understand what you are saying, yes. So
12 TO-2 is a service area by service area breakdown of our
13 resource plans. The resource plan of each service area
14 supports the data within TO-2, and this answer that you
15 are referencing is showing how we arrived at our plan
16 team member additions.

17 **Q See if -- and I don't want to put words in**
18 **your mouth this time, but the core of the support that**
19 **you are offering the Commission in your rebuttal is**
20 **embedded in TO-2, right? This is -- this justifies the**
21 **headcount adds to the paths that they were projecting,**
22 **right?**

23 A Yes, it does.

24 **Q Okay. So let's go to Exhibit 26, which is --**
25 **I am still in the Case Center, but your TO-2, if we can.**

1 Let's go to that exhibit. And I would like to go to
2 page 14, if we could, which is the last page. And this
3 is the -- this is the summary by -- rolled up --
4 everybody rolled up for all your districts, right?

5 A Yes, it is.

6 Q Okay. So just how this is set up, we have
7 total headcount, in 2020 they start at number -- the
8 number is 332, and you are asking by the end of '24 to
9 have 430, or 98 additional employees, right?

10 A Yes.

11 Q Okay. And then I look at total orders, a
12 little more than halfway down, you know, it shows 6.192
13 million forecasted to grow to 7.527 million in '24,
14 2024 --

15 A Yes.

16 Q -- right?

17 Okay. So those would be tasks that these
18 employees would perform in the aggregate, right?

19 A Yes, they would be.

20 Q Okay. So what I would like to ask you, it
21 would be easy to do some kind of, I guess it's about
22 fourth grade math, and just take the employees and
23 divide them by the task and get an employees to task
24 number, right?

25 A Yes.

1 Q Okay. And that would generate a fairly simple
2 ratio of employees to task?

3 A Yes, you could do that math.

4 Q Okay. So would you agree that a decline in
5 the number of tasks per employees would, at some level,
6 show efficiency in terms of -- if your tasks per
7 employee decline, that would mean that you were able to
8 serve your customers better?

9 A Yes. Task per employee, if that was
10 declining --

11 Q Yes.

12 A -- so they are doing less tasks, that would
13 mean they are being less productive.

14 Q Well, so is -- is the goal to get -- so if --
15 when you have 98 employees, you are seeking to -- or 98
16 additional employees, and you are doing 7.5 million
17 tasks, you are saying that adding those employees and
18 driving down the task for employee number would be less
19 efficient?

20 A Yeah. So the way we can think about it -- I
21 understand you are trying to get to that metric.

22 So first, these tasks are not created equal.
23 Right now, it could take someone 30 minutes to do a
24 locate, it could take someone an hour-and-a-half to --
25 for a meter set, okay. Right now, our data only

1 supports our ability to look at number of tasks, and so
2 there is a level of subjectivity that is required by our
3 experienced leadership in ops to say, how much can a
4 team member perform to meet the workload required.

5 One of the exciting things about the Work and
6 Asset Management system is once fully implemented and
7 utilized, that data that I mentioned yesterday in my
8 testimony, is going to give us a lot more really strong
9 data to then provide better resource planning, because
10 we are go to be able to break down every job type by
11 minute. And so we can say, it takes you X amount of
12 time to drive to a job, it should take you 15 minutes to
13 do this job, and then we will be able to perform its
14 management -- perform its management afterwards.

15 We are not at that level right now. That's
16 one of the benefits of WAM once fully implemented. But
17 right now, these job types are really just job
18 activities, you know, one locate, one meter set. And so
19 to try to draw and efficiency conclusion from that, I
20 think, is difficult.

21 MR. REHWINKEL: So, Mr. Chairman, I am going
22 to pass an exhibit out. I guess our next number
23 is --

24 CHAIRMAN FAY: I believe we are at 188.

25 MR. REHWINKEL: 188. And it just says

1 rebuttal TO-2 analysis is the title.

2 (Whereupon, Exhibit No. 188 was marked for
3 identification.)

4 BY MR. REHWINKEL:

5 Q Do you have one yet? Do you have one?

6 A Yes, I have it.

7 Q Okay. All right. So on this document, I have
8 taken the data that's in -- that we just discussed, your
9 employee adds by each district and the total orders, and
10 I presented them in a table form with an accompanying
11 chart. Do you see that? Will you accept my math
12 subject to check?

13 A Yes.

14 Q Okay. So you see on page -- Bates page two of
15 this, in 2020, you have 6.192 million tasks, and you
16 project 7.527 million in 2024. I did a midpoint of
17 historic going from '20 to '22, and it showed there was
18 a 9.7 percent overall increase historically in the
19 increase in your headcount. And then through '24, you
20 would seek to increase that about another 10.8 percent,
21 with an overall change in headcount of 21.5 percent.
22 Does that look right to you?

23 A I don't see those percentages on that, but I
24 am going to trust your math --

25 Q You are not on --

1 A -- I just have totals here.

2 Q Are you on Bates 2 of Exhibit 42? Yes.

3 A I don't have any percentages on mine.

4 MR. REHWINKEL: Mr. Chairman, excuse us. We
5 have a logistical glitch here.

6 CHAIRMAN FAY: Okay. And I am the same as Mr.
7 O'Connor. I don't have percentages on mine.

8 MR. REHWINKEL: Mr. Chairman, could we have
9 five minutes to discuss how we might proceed? We
10 had a cross-up in our exhibit production.

11 CHAIRMAN FAY: Okay. Sure.

12 (Brief recess.)

13 BY MR. REHWINKEL:

14 Q So striking the last question about
15 percentages, would you agree that one could take -- do
16 the simple math of headcount change and order change
17 historically and projected and create a simple ratio
18 from your data in TO-2?

19 A Yes, you can create that ratio to headcount
20 over work orders.

21 Q Okay. And you create a graph using Excel to
22 do that, right?

23 A Yes.

24 Q Okay. So you accept, subject to check, that
25 we've done that with this exhibit?

1 A Yes.

2 Q Okay. So what I would like to do is just ask
3 you if we could go through and look at a couple of
4 examples of the changes that occur in certain of the
5 districts. And I think we discussed it a little bit
6 yesterday, but I just want to be clear, if you are
7 hiring new adds for districts, there is different
8 standards of living in certain areas. It might be more
9 expensive in Sarasota and Southwest Florida than Panama
10 City?

11 A Yes.

12 Q Okay. Do you have a pay differential?

13 A We do. For our south territory, which is
14 Sarasota, Ft. Myers, Jupiter and Dade/Broward, we have a
15 five-percent adder to base rates to account for the
16 differences in the standard of living --

17 Q Okay.

18 A -- in the southern part of our state.

19 Q In this pot of 98 new employees, if I can call
20 it that, they are not going to be fungible where you can
21 move them around in the test year to kind of meet
22 different demands? That -- the demand that you forecast
23 has already been baked into your projection, right?

24 A Yes. The demand for each service area is our
25 best estimate of what we can expect into 2024. It -- we

1 do have some employee movement from one service area to
2 another, it's somewhat infrequent. From a budgeting and
3 estimation perspective, we do our best to align, you
4 know, the specific positions to the work requirements in
5 each service area.

6 Q Okay. So when I look at orders per person on
7 Bates 2, it shows that -- that -- and per person here
8 means employee, do you understand it that way?

9 A Yes.

10 Q Okay. Not customer?

11 A Yes.

12 Q Okay. So in 2020, the math just yields 18,652
13 tasks, or orders were being processed -- I take that
14 back. Six million tasks were being processed by 332
15 employees, giving a ratio of 18,652 system-wide. Do I
16 have that right?

17 A Yes.

18 Q And by 2024, you are projecting that that
19 ratio will decrease to 17,504, meaning 430 employees
20 will be performing 7.5 million tasks; is that right?

21 A Yes.

22 Q Now, are you saying that this means that you
23 are falling farther and farther behind even though you
24 are adding 98 people?

25 A No, I don't think you can draw that

1 conclusion. It's a useful metric. It can be included
2 in a whole bunch of other metrics, but I think you have
3 to understand what is driving the headcount increase
4 and, of course, the work order increase. It's not a
5 simple, you know, numerator, denominator and draw a
6 conclusion. There is much more behind it.

7 Q Okay. Let's go to Bates 15, if we can.
8 Jacksonville. And if you are sys -- this --
9 Jacksonville's, in terms of orders per person, averages
10 look close to the overall picture, right? You can
11 compare Bates 2 and Bates 15. You start off with 17,651
12 orders per person, and by 2024, you are going to be at
13 18,595 per person. Do you see that?

14 A Yes, I do.

15 Q And there is some fluctuation over time, but
16 the adds here are 17. So 17 people kind of -- you
17 experience a little bit of increase in the orders per
18 person, right?

19 A Yes.

20 Q Okay. Let's go to Lakeland, if we can. I
21 don't know exactly, I lost my --

22 CHAIRMAN FAY: I believe it's the third page,
23 Mr. Rehwinkel.

24 MR. REHWINKEL: Okay. Yeah, Bates No. 3, OPC
25 Bates 3.

1 BY MR. REHWINKEL:

2 Q So we see Lakeland has nine employees in 2020
3 and is projected to go to 14. The orders per person
4 there were almost half of the system average in 2020,
5 right?

6 A Yes.

7 Q And these 14 people would be making that ratio
8 decline to 7.1 -- or 7,106 --

9 A Yes.

10 Q -- right?

11 So why would you -- why you would add -- how
12 do you explain that relative to Jacksonville and then
13 the overall system average?

14 A Yeah, this is a great example of this may be a
15 useful metric for comparative purposes to maybe generate
16 the need to dig deeper into the data. But the reality
17 is this metric is largely incomplete in terms of being
18 able to explain what is actually going on within any of
19 our service areas.

20 It might be useful if I -- you know, your
21 Jacksonville example, you know, think about it from an
22 emergency response perspective. Jacksonville represents
23 an area of parts of nine counties, you know, Duval
24 Counties, St. Johns, Clay, are growing very, very
25 quickly, that area, those nine counties is larger than

1 some U.S. states from a geography perspective. And so
2 to have adequate coverage throughout that area to serve
3 our customers, to do all of the required compliance
4 work, as well as to be prepared in an emergency
5 response, a leak response kind of scenario, we need team
6 members to be able to do that.

7 We also need those team members not to be
8 burnt out in terms of being on call all the time. We
9 try to have people on call one week per month, and
10 without adequate team members, we are not always able to
11 achieve that, and people do get burnt out from being on
12 call at times.

13 And so back to your question, Mr. Rehwinkel.
14 This metric, I understand what you are trying do with
15 it, but it's incomplete because you need more of the
16 story behind what is driving the team member increase,
17 as well as what's driving the work order increase as
18 well.

19 **Q So Dade/Broward, let's look at Dade/Broward,**
20 **which is on Bates 8. This shows, again, orders per**
21 **person in 2020 about the system average, right?**

22 **A Yes.**

23 **Q And you are adding, through the end of '24, 25**
24 **employees to take the number from 18 to 23, and the**
25 **orders per person goes to 20,414, right?**

1 A The orders per person for Dade/Broward is
2 12,224.

3 Q I am sorry. I was looking on the wrong page
4 again.

5 All right. Bates 10, OPC Bates 10, I
6 apologize. So in 2020, the orders per person were
7 14,488, do you see that?

8 A Yes, I do.

9 Q And then addition of 16 employees yields an
10 orders per person ratio of 12,210, right?

11 A Yes.

12 Q So how you would explain that in the context
13 of the others?

14 A Dade/Broward is a little different from the
15 rest of our service areas. It's the most urban service
16 area that we serve our customers, and we are not seeing
17 the same growth levels in terms of customer additions
18 that we do in some of the other areas of Florida.
19 However, the locate and leak response in Miami and
20 Dade/Broward is still at a high level. It is -- it
21 takes longer to drive throughout Miami and the
22 surrounding area, and we need team members to be able to
23 cover that system at a higher level than you might in
24 other areas.

25 As a quick comparative, you know, we have 78

1 team members in Dade/Broward. I believe that's the
2 highest number of team members we have in any of our
3 service areas. Tampa is a littlest than that, but has
4 more customers to serve. So this is a great example of
5 the kind of work operations has to perform based on the
6 conditions on the ground.

7 And just to give you a quick example of some
8 of the difficulties unique to Dade/Broward. We've had
9 some of our technicians get parking tickets responding
10 to leaks, okay. We are literally driving to respond to
11 a leak call, trying to find a place to park, trying to
12 figure out what's going on, we get the work done, and
13 part of the reward of doing that work is a parking
14 ticket.

15 So it's that kind of environment that we are
16 trying to be successful in, which requires, you know,
17 team members who can respond at appropriate levels.

18 **Q So let's look at Eustis on page 11. Eustis is**
19 **at 10,837 in 2020, and almost identical to Dade/Broward**
20 **in 2024, but no change in employees. How you would**
21 **contrast those two?**

22 A Eustis is, I believe, our -- well, maybe
23 second smallest service area. A team of eight that is
24 small but mighty. Not a lot of growth going on in that
25 area right now, and so we maintain our team members.

1 That team is truly utility technicians. It's
2 small enough where each of our team members there are
3 trained in all tasks and can perform in any scenario.
4 And like I said, the growth isn't as strong as it is in
5 some other areas of the state.

6 **Q So Panama City, if we can, on Bates 4 -- I**
7 **hope I have that right, which I don't.**

8 **CHAIRMAN FAY: Sarasota, Mr. Rehwinkel?**

9 BY MR. REHWINKEL:

10 **Q 14, I think. Ms. Wessling has corrected me.**
11 **It's page 14. Bates 14, do you see that?**

12 A Panama City?

13 **Q Yes.**

14 A Yes.

15 **Q So this is relatively flat in terms of the**
16 **ratio -- actually, it inclines from 13,142 to 14,667,**
17 **and the employees only increase one. What's going on**
18 **there compared to the others?**

19 A Panama City is another fairly stable service
20 area. Decent levels of growth, probably in the
21 neighborhood of about three percent annually. Continue
22 to see locate work. There is a Margaritaville that's
23 going in that is getting a lot of attention, and maybe
24 more so now, and you are seeing the increasing trend
25 line here.

1 Again, Mr. Rehwinkel, I appreciate the
2 statistician in you in putting some of this information
3 together. I think it's a data point that's useful but
4 not fully complete. In this case, in Panama City, it's
5 showing more orders per person over time, which means
6 they are doing more per team member, which would be a
7 positive trend.

8 **Q Okay. But you would agree that the numbers**
9 **and the employee adds, as we look at them, are kind of**
10 **all over the place, right, by district?**

11 A Yes. And that would be expected. Each
12 service area is different. There are different
13 dynamics. The conditions on the ground are different.
14 Our customer profiles may be different. For example,
15 Jacksonville includes a heavy industrial base. Ft.
16 Myers does not.

17 So they -- while comparing each service area
18 can be a useful exercise, there needs to be care taken
19 to understand that sometimes it's not always an apples
20 to apples comparison.

21 **Q On -- let's put this Exhibit 188 aside. And**
22 **you have your confidential book? If you could go to OPC**
23 **Exhibit 2C, which I think has already been given a**
24 **number.**

25 **CHAIRMAN FAY: Yep, 175, you are right, Mr.**

1 **Rehwinkel.**

2 MR. REHWINKEL: Thank you.

3 BY MR. REHWINKEL:

4 **Q** So this is Exhibit 175. It's in the book, and
5 it will be behind Tab 2. I don't know. Do you see
6 that? Did you find that Exhibit 2C, do you see that?

7 A Yes, I do.

8 **Q** Okay. And this is the 2022 refresh from June
9 27, 2022, an excerpt from it?

10 A Yes.

11 **Q** You are familiar with this document, right?

12 A Yes, I am.

13 **Q** Okay. You would have been at this meeting?

14 A Yes.

15 **Q** Okay. So I just want you to go to page four,
16 if you can, OPC Bates 4. And this is in 20 -- June of
17 2022, talking about potential opportunities, that's the
18 header on the right-hand side, do you see that? Look at
19 the Bates numbers in the lower right-hand corner. The
20 dec page is 50.

21 A Yeah.

22 **Q** Are you there?

23 A Page 50, I don't have any Bates on these pages

24 but --

25 **Q** Oh, really?

1 A -- page 50, challenges and opportunities?

2 Q Okay, yes.

3 A Yes.

4 Q Okay. Are you familiar with the opportunities
5 that are discussed in the bullets two -- I mean, three
6 and four?

7 A Yes.

8 Q Okay. Can you read those aloud? And I am not
9 asking to you if -- I am not asking you to declassify
10 them, but can they be read aloud?

11 A Yeah. The third bullet reads: Reduce
12 dependency on external labor as internal resources
13 become more available.

14 The fourth bullet reads: Further WAM
15 efficiencies.

16 Q Okay. Now, are -- do you agree that these are
17 opportunities for gas operations?

18 A Yes.

19 Q Okay. They just don't appear in the before
20 the test year, right?

21 A The third bullet, as I have shown in my
22 second exhibit in my rebuttal testimony, shows some
23 reduction in outside services relative to the increase
24 in team members, and so we begin to reflect that
25 opportunity in 2024.

1 As I mentioned earlier, the WAM efficiencies
2 in our original filing, we did not include any cost
3 reductions. Again, subsequent conversations, we have
4 discussed \$750,000 of O&M reduction related to WAM.

5 **Q Okay. And to be fair, the inclusion of the**
6 **\$750,000 that the company put forward, that would be a**
7 **surrogate, if you will, for labor costs that would be**
8 **offset, is that right?**

9 A Yeah, I think that's -- that's a fair
10 characterization. We do not have -- I do not have
11 750,000 right now that I feel I can cut from 2024. It
12 would be a challenge immediately to try to incorporate
13 that reduction. But to your point, it likely would
14 require us to look at our labor, internal and external,
15 costs to try to find some of those reductions.

16 **Q Okay. Given that you haven't hired the 2024**
17 **cadre other than the one you said you pulled into '23,**
18 **those employees could -- if you don't hire everybody,**
19 **for whatever reason, you had labor market issues in**
20 **bringing on resources, right?**

21 A We have had labor challenges. It's a tight
22 market.

23 **Q Right. And you could have vacancies occur in**
24 **'24, right?**

25 A Yes, we could.

1 Q And by the time you get into '25, if WAM
2 efficiencies start to come to the forefront, you might
3 decide not to hire or fill those positions because you
4 are -- as Mr. Richard mentioned before to me, you are
5 sweating the asset, you are trying to get efficiencies
6 out of it, right?

7 A That is true. We do need to sweat the asset.
8 To be frank, we are also sweating meeting our customer
9 needs.

10 Right now, the 2024 team member additions are
11 needed. These are not nice have positions. These are
12 positions that will allow us to continue to maintain our
13 safety standards, our compliance standards, our customer
14 service standards. There is a reason we are number one
15 in JD Power for 10 years. There is a reason that we are
16 very good on the compliance front.

17 And to bring it to life just a little bit
18 more. We've seen some of the strain. When we talk
19 about our staffing levels not always being sustainable.
20 In Sarasota, we've had lower levels, and we had poor
21 morale. We had some retention issues, and it was
22 because people were overworked. We had people on call
23 every other week, missing family events, missing
24 sporting events. And we've made some really strong
25 improvements by adding the 2023 hires to Sarasota, and

1 the 2024 hires will also help that.

2 And so it's a real thing. It's not just a
3 number of, you know, how much more costs can we -- can
4 we embed in 2024 and then, you know, maybe not use it
5 all. These are required team members to perform what we
6 need to perform in field operations.

7 **Q Okay. But as we discussed yesterday,**
8 **apprentices have a bit of a long lead time before they**
9 **are going to be fully up to speed, right?**

10 A Yes. It takes approximately 18 months for
11 them to be able to be on call. That doesn't mean they
12 can't do anything in those 18 months. There are job
13 tasks, atmospheric inspections, other job tasks that
14 they can do, but being on call, responding to a hit
15 line, takes approximately 18 months of training.

16 **Q Thank you, Mr. O'Connor.**

17 MR. REHWINKEL: Mr. Chairman, those are all
18 the questions I have.

19 And again, I apologize for the sputtering of
20 my presentation.

21 CHAIRMAN FAY: Okay. No worries, Mr.
22 Rehwinkel.

23 MR. REHWINKEL: Thank you.

24 CHAIRMAN FAY: We know we changed some things
25 up in this process, so --

1 MR. REHWINKEL: Thank you.

2 CHAIRMAN FAY: Mr. Moyle, you are recognized
3 within your ready.

4 MR. MOYLE: Thank you, Mr. Chairman.

5 EXAMINATION

6 BY MR. MOYLE:

7 Q Good morning, Mr. O'Connor.

8 A Good morning, Mr. Moyle.

9 Q I am going to have some questions for you on a
10 few topics, and let me start just by picking up the, I
11 call it the data-driven decision-making issue.

12 Would it be fair to say that the company
13 recognizes that improvements are needed with respect to
14 making operational decisions that can be enhanced by
15 obtaining and evaluating data?

16 A Yes, that is fair to say. That is one of the
17 benefits, intended benefits of the WAM implementation,
18 it will improve our data collection, aggregation and
19 analytic capabilities.

20 Q And the converse of that is, as we sit here
21 today, with respect to decisions that were made to hire
22 the additional FTEs that we are talking about, they were
23 not benefited by the WAM system, correct?

24 A No, they were not. WAM was just implemented
25 this year, 2023.

1 Q And the corollary of that is, is that the
2 decisions about how many people are needed, they were
3 made by people who, I am not saying they don't have
4 knowledge, but they don't have any metrics, as I think
5 OPC was making the point, there are no metrics, no
6 recommendation, PHMSA, PSC, or anything, about how many
7 people you need to safely run a gas company?

8 A The metrics that I believe you are referring
9 to will be enhanced with the WAM implementation and its
10 use. But there are metrics. You know, I have mentioned
11 a few already, 98-and-a-half percent of the time do we
12 respond within 60 minutes. If that is suffering, that's
13 a very good data point for our leadership to understand
14 that we may not have adequate team members to perform
15 those roles. If we had serious compliance issues, if we
16 are not able to serve our customers, those are all data
17 points that are important when considering our staffing
18 levels.

19 When you couple that information, and I grant
20 it can definitely be improved over time, and it will be
21 with the WAM implementation, but when you couple that
22 with the expertise of our field operations leadership,
23 we can make informed, and we do make informed decisions
24 around our staffing. And the results show that.

25 You know, we are number one in JD Power for

1 the past 10 years. We must be doing something right.
2 We are compliant. We keep our employees and the public
3 safe. Those are all metrics that indicate that our
4 resourcing levels are at, and are informed by sound
5 decision-making.

6 **Q And what's your -- what's a metric? What's**
7 **your understanding of a metric? Give us your definition**
8 **of it.**

9 A It can be a number of things. It can be a
10 formula. It can be a data point. It could be a
11 customer response, you know, a verbal complaint or
12 accolade. There is a lot of data points. And I think
13 part of our job is to collect as much data as we
14 possibly can, aggregate it, synthesize it, and then
15 determine what it is telling us.

16 **Q So the customer complaints, you wouldn't --**
17 **somebody calls up and raises problems, anecdotally, you**
18 **would agree that's not probably the best way to make a**
19 **decision. A better way to make a decision is to track**
20 **the number of customer complaints per thousand**
21 **customers, and you say, we have three customer**
22 **complaints per thousand, or whatever, that would be a**
23 **metric it?**

24 A Can be a metric, absolutely. But a single
25 customer complaint, if you understand the root cause of

1 it, can be very, very informative. And so, you know, it
2 is an opportunity to improve, and we can use that in
3 that way.

4 Q Right. You had given -- in that answer that
5 you provided just a minute ago, you had said -- let me
6 ask you this: Do you have, as we sit here today, is the
7 company having serious compliance issues?

8 A No.

9 Q Okay. As we sit here today, is the company
10 not able to serve its customers adequately?

11 A No, we are serving them adequately.

12 Q So when you talked about that metric, those
13 metrics are being met as we are here today?

14 A Yes, those metrics are being met as we are
15 here today, and they reflect sound resource planning --

16 Q Right.

17 A -- from the past number of years that have led
18 us to this point.

19 Q And those are pretty serious metrics for the
20 business you are in, are they not?

21 A Yes, they are.

22 Q And another metric that you measure yourself
23 by is safety. The company is able, as we sit here
24 today, to safely run its system, are they not?

25 A Yes, they are, but part of our --

1 **Q That's good. I am trying to do yes/no and**
2 **move through.**

3 MR. MEANS: Mr. Chairman, I would politely
4 direct Mr. Moyle to page three of the prehearing
5 order, which states that the witness may explain
6 his or her answer. I understand the need for
7 brevity and to keep things moving, but I would
8 appreciate if the witness is allowed to explain his
9 response.

10 CHAIRMAN FAY: Yeah, Mr. Moyle, I don't have
11 any issue with him providing clarification.

12 Mr. O'Connor, if you can just try to make that
13 clarification pinpointed specifically to Mr.
14 Moyle's question. I think you have established
15 some point repetitively, and so those are all in
16 the record, and we've got those, and if you can
17 address the question, then I am absolutely going to
18 allow clarification.

19 BY MR. MOYLE:

20 **Q We are shooting for a Friday checkered flag,**
21 **so I'm trying to move on. But go ahead, if you feel you**
22 **need to explain that further.**

23 A I will just say on the safety front, because
24 it is our number one priority, yes, you know, we are --
25 we have some really strong good safety stats right now,

1 but part of our safety culture is looking around the
2 corner, is understanding what's going on. Our team
3 drives 7,000 miles a year, we always have to be
4 vigilant, and so we are not resting on those laurels,
5 and so it does require thinking ahead in terms of what
6 else may be required from a resourcing perspective.

7 **Q Mr. Rehwinkel challenged you with some**
8 **mathematical equations, and you accepted his math. I**
9 **have a couple of follow-ups on the 98.5 metric that's**
10 **been mentioned a couple of times.**

11 **If you are at 98 percent of a 98.5 percent**
12 **metric, you are meeting that goal 98, 99 percent of the**
13 **time?**

14 **A** If we are at 98 percent, we are meeting it at
15 98 percent.

16 **Q The goal is 98.5, and you are meeting it at 98**
17 **percent, right?**

18 **A** The goal is for all leak response within --
19 responding to leaks within 60 minutes. We do that --
20 the goal is to do it 98.5 percent of the time. Right
21 now, we are doing it approximately 98 percent through
22 2022. And year-to-date through 2023, I believe we are
23 around 96 percent.

24 **Q So you are missing it by a little bit?**

25 **A** Yes.

1 Q And who's 98.5 percent, who -- is that an
2 internal company goal? Is that a PSC goal? Is that a
3 PHMSA goal? Where does that come from?

4 A That is an internal goal, but it is an
5 industry standard, if you will, around emergency
6 response. If you think about a leak, you want to get
7 there and understand what's going on in the name of
8 public safety.

9 Q And the way safety works in the natural gas
10 world is you do have regulatory bodies that oversee
11 safety, correct? PHMSA, which is the feds, the Florida
12 PSC, OSHA, you have a number of regulators that are
13 responsible for safety, is that correct?

14 A Yes.

15 Q Does the company maybe place more emphasis or
16 importance on regulatory compliance with these
17 governmental entities as compared to, you know, an
18 internal goal that may not have gone through as rigorous
19 a process as a governmental rule?

20 A Are you referring to safety goals?

21 Q Yes. The 98.5 specifically.

22 A I wouldn't say we put more emphasis on one
23 metric or goal over the other. You know, generally
24 speaking, we want each of our team members to go home
25 the way they arrived to work each day.

1 Q Do you know if other utilities with these
2 internal goals you mentioned, you think some of them do
3 this, do they have different metrics than PGS has, you
4 know, a 75-minute or 90 -- a 90-percent compliance rate,
5 down one way or the other?

6 A I don't know specifically what each other LDC
7 may have. I do know our 98.5 percent metric is an
8 industry metric and supported with -- through AGA, the
9 American Gas Association.

10 Q Okay. You have engineering training, correct?

11 A No, I do not.

12 Q Oh, you don't. I am sorry.

13 Do you know, from -- this is a safety related
14 question. Do you know if methane, that's the natural
15 gas that you use in your business, right?

16 A Yes.

17 Q Do you know, is it heavier or lighter than
18 air?

19 A It's lighter. It gets disbursed.

20 Q So from a safety standpoint, that means that
21 if you have a leak in a pipe, then it comes out, but it
22 goes up and disperses rapidly as compared to maybe
23 something like gasoline, gasoline is heavy -- is heavier
24 than air?

25 A Yes.

1 **Q** Okay. You would agree that just those facts
2 by themselves make the natural gas business, with
3 respect to leaks, not as dangerous as, say, a gasoline
4 leak?

5 A I wouldn't go that far, you know, because
6 leaks could occur. Natural gas will migrate along the
7 path of least resistance. If you have a leak in an
8 urban environment, that may be a sewer line. That may
9 be a water line, and not necessarily just into the
10 atmosphere. And so, yes, it will disperse into the air
11 eventually, but there is -- there can be quite a high
12 level of hazard associated with migrating of natural
13 gas.

14 **Q** Shared services, you all are making use of
15 shared services that are provided by another corporate
16 sibling, is that right?

17 A Yes, Peoples Gas uses -- has shared service
18 arrangements with Tampa Electric.

19 **Q** Okay. And there was a bit of a restructuring,
20 or review, or change with respect to shared services
21 given the 2023 Transaction; is that right?

22 A I believe Ms. Wesley spoke to this, that the
23 2023 Transaction was, unto itself, it didn't necessarily
24 drive significant changes in the shared service
25 arrangements that are in place. We'll look to Tampa

1 Electric for shared services as needed, depending on our
2 business need.

3 Q But part of that was your company, PGS picked
4 up some additional responsibilities that were previously
5 done by the entity providing the shared services, isn't
6 that right?

7 A Yes, I think in some areas of our business, we
8 have stood up certain functional areas that were
9 previously shared.

10 Q Like procurement, for example?

11 A Yes.

12 Q And as we sit here today, can you tell the
13 Commission whether -- that the result of the 2023
14 Transaction with respect to shared services, whether
15 that is saving PGS money or costing PGS money in terms
16 of its impact on the company?

17 MR. MEANS: Mr. Chairman, I have got to
18 object. This is not the witness who's covering the
19 2023 Transaction, so it's outside the scope of his
20 testimony.

21 CHAIRMAN FAY: Mr. Moyle?

22 MR. MOYLE: He is the VP for Operations and
23 responsible for all the operations. I would assume
24 that includes procurement and things like that. I
25 think this is, you know, one question I have of

1 him, whether it's costing them more money or less
2 money. He is here saying, we want you to raise
3 rates for operation, I think it's fair.

4 CHAIRMAN FAY: Yeah, I mean, I don't really
5 have an issue with the question, Mr. Means. You
6 said this is your only question on this line?

7 MR. MOYLE: That's right.

8 CHAIRMAN FAY: Okay. Go ahead.

9 THE WITNESS: I believe this is a question for
10 witness Richard. Procurement isn't in my area, as
11 much as I would love to answer you, Mr. Moyle, but
12 Mr. Richard would be able to handle that for you.

13 BY MR. MOYLE:

14 **Q Okay. We've had a little bit of a**
15 **conversation about risk, and we talked a little bit**
16 **about risk in your deposition previously. I want to**
17 **spend a few minutes on that topic.**

18 **You suggested that the relative risk of**
19 **natural gas companies, you weren't able to distinguish**
20 **greatly between natural gas companies and electric**
21 **companies, like who might have the greater risk, is that**
22 **fair?**

23 A Yes. In my -- in my deposition, you asked me,
24 you know, which was riskier, and I gave you a similar
25 answer as Ms. Wesley gave you yesterday, that it is

1 quite a complex question.

2 Q And one question that I didn't ask you
3 previously that I will ask you today is, if you focused
4 simply on the cost of repairing a system, electric
5 versus natural gas, wouldn't it be true that, like the
6 hurricane that just came through here a few weeks ago,
7 that the costs for repair are greater in the context of
8 an electric company as compared to a natural gas
9 company, given that your lines are underground and
10 protected as compared to a lot of the electric lines
11 being above ground and being subject to trees falling in
12 them, and other things like that?

13 A I am not an expert on costs for hurricane
14 recovery on the electric side. I understand what you
15 are saying, and somewhat agree that, you know, it could
16 be a lower cost given that our pipes are in the ground,
17 but every storm is different, and I don't know if you
18 can fully draw that conclusion.

19 Q Okay. Previously, there has been some
20 discussion about an affiliated company that's also in
21 the natural gas business that the PSC has jurisdiction
22 over, SeaCoast. You have been here throughout the
23 hearing and have heard mention of SeaCoast, correct?

24 A Yes, I have.

25 Q Yeah. Do you have any role with respect to

1 **SeaCoast?**

2 A The only role with respect to SeaCoast for our
3 gas operations is that we do perform some O&M work on
4 those transmission pipes. As Ms. Wesley mentioned,
5 there is four pipes. And to the extent that our team
6 members work on those, from an operational perspective,
7 we directly charge their time and materials to SeaCoast.

8 **Q So if one of those lines has an operational**
9 **issue, do you get that call, as VP of Operations, for**
10 **PGS?**

11 A I may get that call, or the local leadership
12 may get that call.

13 **Q So there are different ways in which to run a**
14 **company that provides natural gas. You can have**
15 **employees, like PGS has, or you can contract out or**
16 **charge back, like you described, like SeaCoast does; is**
17 **that right?**

18 A Yes.

19 **Q Okay. Have you done any analysis as to the**
20 **relative cost and benefits of having a contractual**
21 **relationship that SeaCoast has with PGS, how that**
22 **compares from a cost standpoint vis-a-vis having**
23 **full-time equivalent employees?**

24 A No, I have not done any analysis.

25 **Q You mentioned in response to a question from**

1 OPC, that you have in place differential payments for
2 your employees based on geographic location, is that
3 right?

4 A Yes.

5 Q And is that something that you all do
6 internally, or is that something that the Commission --
7 you ask the Commission to consider and take action and
8 say, well Miami-Dade real estate is higher, it's more
9 expensive, please provide a five-percent increase on
10 salary for our workers either working or living in
11 Miami-Dade, could you explain your understanding of
12 that, please?

13 A Yes. We did our -- we did a compensation
14 study to understand that the differential with our
15 southern Florida service areas partly because we were
16 having some retention and attraction issues for those
17 areas. We needed workers and we were having a really
18 hard time trying to attract and keep them. And so our
19 HR team led a compensation review of those areas, and
20 the result of that was a five-percent adjustment to the
21 base salaries that I mentioned previously.

22 Q Have you done it anywhere other than
23 Miami-Dade?

24 A We have not looked at other areas in terms of
25 a pay differential. Witness Bluestone will be able to

1 more completely talk about our compensation approach.

2 Q And just one quick question on the development
3 issue. You all are asking the Commission to award you
4 economic development funds, is that right?

5 A Yes.

6 Q Yeah. And we've talked about metrics, but as
7 we sit here today, there is no measurement as to kind of
8 a return on investment of those economic dollars that
9 the company makes with respect to its expenditures on
10 economic development, correct?

11 A Correct.

12 Q I want to ask you a couple of questions about
13 the 811 system. That's the locate program, right?

14 A Correct.

15 Q I think there is a more official name for it
16 than the locate program or 811, is there not?

17 A Sunshine 811, Call Before you Dig.

18 Q Okay. And that's a statutory provision that
19 directs people, before they start digging, to make a
20 call to an essential entity that then takes that
21 information and tries to locate or help locate where
22 lines are essentially, is that right?

23 A Yes. Someone will call 811, provide
24 information around excavation, digging activity. That
25 information will be provided to utilities so that we can

1 properly locate our lines and protect our system.

2 Q And you have referenced the 811 system a few
3 times in your testimony --

4 A Yes.

5 Q -- right?

6 And tell me the point you are making when you
7 reference the 811.

8 A When we think about the workload increase, now
9 and into the future, locates is a significant driver.
10 It is likely the primary driver. There is so much
11 growth in Florida, those volumes of locates are really
12 adding a heavy workload to our teams, where some team
13 members, you know, are complaining that, man, I miss gas
14 work because I do is locate lines. I paint the ground
15 and put flags on to make sure that no one is hitting our
16 system.

17 It is a heavy, heavy volume right now. We are
18 not complaining. Florida is growing. But it is a very
19 big increase and workload for our teams.

20 Q And part of that, Florida is growing and you
21 provided growth rates, but part of it also is, is that
22 not everybody complies with the obligation to call,
23 isn't that right?

24 A That's correct.

25 Q And indeed, the company has recognized that,

1 and has established certain goals to say, we got to get
2 more people on board with this calling, because a lot of
3 times they are not calling and they are damaging our
4 equipment, correct?

5 A That's correct. We had about 1,800 damages in
6 2022. About half of those were in instances where no
7 one called in.

8 MR. MOYLE: Can I just have a second to
9 consult with counsel? I have a document that I
10 would like to ask a question about, but it's
11 confidential, so I don't want to ask confidential
12 information in the question.

13 CHAIRMAN FAY: Okay, go ahead.

14 MR. MOYLE: Thank you, Mr. Chair.

15 I am going to ask the question, and then if I
16 need the exhibit, I will use the exhibit. It
17 depends on his answer.

18 CHAIRMAN FAY: Okay. Go ahead.

19 BY MR. MOYLE:

20 Q With respect to the number of locate tickets,
21 the trend for that is not that it's going up, but that
22 it's staying largely the same, correct?

23 A No. So the locate tickets, I believe it's
24 about a five-percent increase from '22 over 2021.

25 MR. MOYLE: So I would like to have the

1 witness look at a confidential document. It's a
2 OPC's Exhibit 71C, as in cat.

3 CHAIRMAN FAY: Okay. I have that as the last
4 exhibit.

5 MR. MOYLE: It's entitled, the description is
6 Gas Operations Scorecard.

7 CHAIRMAN FAY: Okay. And just to keep things
8 consistent, we are going to go ahead and mark this
9 189.

10 (Whereupon, Exhibit No. 189 was marked for
11 identification.)

12 BY MR. MOYLE:

13 Q You can tell me when you are there.

14 A I am there.

15 Q Okay. On page 02 -- well, let's just use the
16 OPC number. It's 02, there is also a 246 in the middle
17 of the page. The yellow metric that has two arrows
18 going sideways, there is also a green metrics that have
19 an arrow going up, and red metrics that have an arrow
20 going down. Do you have an understanding of what a
21 yellow metric with two arrows going sideways represents?

22 A Yes. This is a dashboard showing 2023 targets
23 on some key operational metrics. The yellow arrow is
24 pointing in both direction, would indicate that current
25 trends and expectations are consistent with that target.

1 The one you are referencing, on locates, was 675,000 in
2 2023.

3 Q And you all also had a program that you put in
4 place to say, we have a goal to contact 50 percent of
5 our contractors who we've had problems with, who have
6 caused damage to our system to get with them and meet
7 with them and say, hey, you got to do a better job on
8 your locate, isn't that true?

9 A That is true.

10 Q And just curious, given that they cause
11 problems, why was the goal 50 percent as compared to
12 75 percent or 100 percent?

13 A The goal was 50 percent because we needed to
14 get started. It's a heavy resource need, and so we
15 don't have enough resources to meet with every
16 contractor that hits us. That would be a list of
17 hundreds and hundreds of contractors, and so the goal
18 was to target those that most frequently hit us and have
19 those conversations.

20 The other part of it, some contractors don't
21 want to meet with us. They don't really want to hear
22 what we say about not hitting our line. They just want
23 to do their work.

24 Q Yeah. So with respect to the increase, I
25 mean, Florida is growing, but some of the increase in

1 the locate tickets, you would acknowledge, could be the
2 result of your goal to meet with 50 percent of the
3 contractors and kind of get them more on board with the
4 program, that's fair, isn't it?

5 A That is fair, and that would be an outstanding
6 outcome. If we had more -- if we could double the
7 number of locates, that would be great in terms of
8 people calling in.

9 We can't protect our pipe if we don't know
10 where they are. If they are calling in a ticket, at
11 least we can try to protect our type.

12 Q Do you have an idea -- we talked about this a
13 little bit in your deposition, but in terms of when
14 somebody does damage your pipe, you all go after them
15 and try to get repaid for that damage, is that right?

16 A That's right. If a contractor, a third-party,
17 hits our pipe without a locate ticket, we are able to
18 seek reimbursement.

19 MR. MOYLE: Mr. Chairman, those are all the
20 questions I have. Thank you.

21 CHAIRMAN FAY: Okay. Staff?

22 MR. SANDY: There is no questions from staff.

23 CHAIRMAN FAY: Okay. Commissioners?

24 Commissioner Clark and then Commissioner
25 Passidomo.

1 COMMISSIONER CLARK: Thank you.

2 Mr. O'Connor, I am following up on the line of
3 questioning from Mr. Moyle, and also from Mr.
4 Rehwinkel, regarding the 811 calls as well.

5 I am just doing simple math, and I see 618,000
6 calls. In your opening statement, I thought I
7 heard you say that that was a 31-percent increase.
8 You said you have been seeing a five-percent
9 increase, but didn't, your opening statement,
10 didn't you say a 31-percent increase?

11 THE WITNESS: I hope I didn't misspeak. It
12 was a 31,000 ticket increase.

13 COMMISSIONER CLARK: Okay. I am sorry.
14 That's what I heard, the 31,000 increase, okay.

15 At the same time, if you do the simple math,
16 that's 2,376 calls per day, and that's 297 calls
17 per hour. If you were able to do a resolve in a
18 half of an hour, you still have to have 150
19 employees per day dedicated to just taking 811
20 calls.

21 Can you tell me what the current ratio between
22 contractors that are performing this service for
23 you and in-house employees and how that is
24 trending?

25 THE WITNESS: It's a complicated item, just

1 because it depends on each service area.

2 We have moved to bring more -- more labor
3 in-house to do our locate work. We still utilize
4 some outside contractors, but it really depends on
5 each service area. And to your point on the
6 volume, we try to clear as many as we. Some aren't
7 anywhere near our pipe, and we are able to clear
8 those tickets without any, you know, visit to the
9 field. And then we need to prioritize those
10 tickets amongst dedicated locaters, internal or
11 external, or other our other technicians to pick up
12 the volume.

13 COMMISSIONER CLARK: Well, and I was -- my
14 thought process was, this is not a single person
15 performance. The person who is typically going to
16 do the locate isn't the one taking the call. They
17 are not the one scheduling the visit. They are not
18 the ones doing the work order. How does that
19 process work in terms of have you allocated a time
20 amount to each call that -- I am trying to get to
21 how much does this cost your company, and how much
22 of this are we passing on to the consumers?

23 I fully support the 811 system and the safety
24 aspect of it, but at a point in time, there has
25 object some cost allocation that's going to be laid

1 back out for the services that we are providing.
2 And maybe that needs to be the contractor, maybe
3 that he needs to be the developer, but not
4 necessarily all being consumed by the utility.

5 THE WITNESS: Yeah, I love that idea. And the
6 reality is we are not there right now.

7 I don't have a cost per locate for you right
8 now, and that goes to some of the limitations we
9 have with our data. We do have specific employees
10 that only do locate work, but then we also have
11 employees that do who calculate work as well as
12 other job activities.

13 But I agree with your point, that there are a
14 lot of costs that are incurred from locating.
15 Right now, the gas utility is expected to bear that
16 cost in full, and developers and contractors really
17 have the option to even call in to generate that
18 volume.

19 COMMISSIONER CLARK: And my last question, and
20 I am going to try to guard the sensitivity of the
21 confidential nature of the document as well, but as
22 I am looking at the last document that Mr. Moyle
23 had referred to, I am looking at how damage
24 assessments are broken out in terms of what would
25 be considered high risk damages versus -- how do

1 you -- how do you classify those different
2 categories? I just want to understand that better.

3 THE WITNESS: Very simply, a high risk locate
4 would be any locate where we know mechanized
5 equipment is being used. So they are drilling,
6 they are excavating. And the idea being that, you
7 know, if they are drilling, they may be in an urban
8 environment, gas migration underground could be at
9 risk. If they are excavating, you know, maybe it's
10 a larger pipe, that kind of thing. It's not
11 someone's back yard and they are putting in
12 irrigation system.

13 All damages are risky, but the higher risk
14 designation is for what we try to deem as more of a
15 bigger pipe or urban environment due to mechanized
16 equipment.

17 COMMISSIONER CLARK: Thank you, Mr. Chair.

18 CHAIRMAN FAY: Great.

19 Commissioner Passidomo.

20 COMMISSIONER PASSIDOMO: Thank you.

21 Thank you, Mr. O'Connor. My questions are
22 kind of more towards PHMSA requirements. I sit on
23 the NARUC Pipeline Safety Subcommittee, and so a
24 lot of things that we are discussing are new PHMSA
25 requirements, is a big topic of our conversation,

1 so I didn't know if you had mentioned yesterday if
2 there is a specific number of new employee hires,
3 when OPC was kind of going through that document
4 about new hires, if any of those you can say were
5 specifically required hires for the new PHMSA
6 requirement?

7 THE WITNESS: We have one additional employee
8 in 2024 within our pipeline compliance group, and
9 that is intended to assist with regulations that
10 are coming that require, you know, obviously
11 compliance from an engineering and construction, as
12 well as operational perspective, with the
13 recordkeeping and the management around auditing as
14 well.

15 COMMISSIONER PASSIDOMO: But no specific,
16 like, additional employees for responding to leaks
17 or things like that? There is not a specific
18 number that they are asking that you need to have
19 on hand?

20 THE WITNESS: No. So within the headcount
21 requested for field operations, they would be
22 handling leak calls and responses. There are no
23 specific headcount for only leak response, but more
24 the technician.

25 COMMISSIONER PASSIDOMO: Okay. Yeah, I mean,

1 just doing a quick search through the CFR, it looks
2 like subsection 191 of Title 49, it requires no
3 longer than one hour after confirmed discovery,
4 operators must give notice. I mean, to me, that
5 seems like pretty quick turnaround, that you would
6 need to have people on hand to respond quickly. I
7 mean, the risk is high.

8 And so kind of following up with that, I just
9 -- we kind of were talking -- Mr. Moyle was talking
10 about what are the requirements, but you said they
11 were more like industry standards, going beyond
12 regulations. Do you have -- you know, other than
13 the advantageous aspect towards the company and the
14 consumer, like potential liability concerns, is
15 that another thing where you would be on the hook
16 for going beyond that one-hour -- one-hour mark of
17 notice?

18 THE WITNESS: No, I don't believe we -- I
19 don't really have any liability concerns in terms
20 of not being able to be there in 60 minutes, but a
21 safety issue, and we want to be able to respond.

22 Oftentimes, Fire Departments will be there
23 before we are for a leak call, and may have already
24 addressed the issue. But it is our system, we need
25 to be there to make sure it's safe. I don't have

1 specific liability concerns around that metric.

2 COMMISSIONER PASSIDOMO: That's my questions,
3 Mr. Chairman.

4 CHAIRMAN FAY: Okay. Great.

5 I just got two quick questions for you, Mr.
6 O'Connor.

7 So on the 94.5 percent, which has been
8 discussed continuously, you stay at the 94 percent.
9 What's the real world sort of application of that?
10 So you have a certain amount that they actually get
11 out to that location within the 60 minutes, which
12 meets your requirement, I am presuming the others
13 get out there, just not within that 60 minutes,
14 correct?

15 THE WITNESS: That's correct. And just 98.5
16 percent.

17 CHAIRMAN FAY: 98, I apologize. Thank you.

18 THE WITNESS: But yes, I mean, our intent, and
19 our average is about 32 minutes on all calls, which
20 is really good. But the goal around within 60
21 minutes from a safety perspective, we may be there
22 in an hour and five minutes and, you know, we are
23 still addressing that leak.

24 CHAIRMAN FAY: Right. And your currently 2023
25 numbers are at 96 percent?

1 THE WITNESS: That's correct.

2 CHAIRMAN FAY: So the real application of that
3 is make it at the later time, you have a very broad
4 territory. I mean, isn't there just sort of a
5 reality from a percentage perspective that, you
6 know, unless geographically you change some things,
7 those numbers won't meet whatever this requirement
8 is?

9 THE WITNESS: That is an aspect of it, yes.
10 Some of our areas are just growing further and
11 further out, and so it's literally impossible to
12 drive to a leak within 60 minutes.

13 But to your point, we are looking at, are
14 there adjustments in terms of how we organize
15 ourselves so that we can respond within that
16 timeframe.

17 CHAIRMAN FAY: Go great.

18 And then the external affairs folks are under
19 you, under your purview?

20 THE WITNESS: Yes.

21 CHAIRMAN FAY: Okay. So in your testimony,
22 you just briefly mentioned some of the engagement
23 of that division and how they engage with political
24 office holders. I wanted to make sure I got
25 calculator on that. You are speaking to

1 specifically to individuals holding public office,
2 either local, state, whatever it may be, and not
3 political activity?

4 THE WITNESS: That's correct. There is no
5 political activity in external affairs.

6 CHAIRMAN FAY: Okay. That's all I have, Mr.
7 Means.

8 MR. MEANS: Thank you, Mr. Chairman. Just one
9 question.

10 FURTHER EXAMINATION

11 BY MR. MEANS:

12 Q Mr. O'Connor, I believe I heard you say
13 earlier that all of your team members collectively drive
14 7,000 miles per year, is that correct?

15 A No, that's not correct. In total, seven
16 million miles.

17 MR. MEANS: Thank you. That's all I have.

18 CHAIRMAN FAY: Okay. All right. Let's move
19 some exhibits in, Mr. Means?

20 MR. MEANS: Yes. Thank you.

21 I would like to move in Exhibits 14 and 27 on
22 the comprehensive exhibit list into the record.

23 CHAIRMAN FAY: Okay. I have Exhibits 14 and
24 27 without objection, show those entered.

25 (Whereupon, Exhibit Nos. 14 & 27 were received

1 into evidence.)

2 MR. REHWINKEL: OPC would move 188.

3 CHAIRMAN FAY: Okay. OPC 188 without
4 objection, Mr. Means?

5 MR. MEANS: No.

6 CHAIRMAN FAY: Okay. Show that entered.

7 (Whereupon, Exhibit No. 188 was received into
8 evidence.)

9 MR. MOYLE: FIPUG would move 189.

10 CHAIRMAN FAY: Okay. Any objection?

11 MR. MEANS: No.

12 CHAIRMAN FAY: No. Okay. With that, show 189
13 entered into the record.

14 (Whereupon, Exhibit No. 189 was received into
15 evidence.)

16 CHAIRMAN FAY: Mr. Means.

17 MR. MEANS: May Mr. O'Connor be excused?

18 CHAIRMAN FAY: Mr. O'Connor, you are excused.

19 THE WITNESS: Thank you.

20 (Witness excused.)

21 CHAIRMAN FAY: Great.

22 Now, Mr. Means, do we want taking ahead and
23 take up Mr. Rutkin's testimony before we move on to
24 Mr. Garrett?

25 MR. REHWINKEL: Mr. Chairman, I apologize, I

1 overlooked --

2 CHAIRMAN FAY: Go ahead, Mr. Rehwinkel.

3 MR. REHWINKEL: -- 187 from yesterday. I had
4 not gone back in time, so I forgot about that.

5 CHAIRMAN FAY: No. You are correct. Yeah.
6 Okay. So without objection, on 187, PGS?

7 MR. WAHLEN: Mr. Chairman, Peoples Gas would
8 move the --

9 CHAIRMAN FAY: One second, Mr. Wahlen, just
10 really quick. Showing no objection, show 187 also
11 entered.

12 That's it for you Mr. Rehwinkel?

13 MR. REHWINKEL: Yes.

14 (Whereupon, Exhibit No. 187 was received into
15 evidence.)

16 CHAIRMAN FAY: Okay. I am sorry, Mr. Wahlen,
17 go ahead.

18 MR. WAHLEN: Peoples would like to move the
19 prepared direct testimony of Lew Rutkin, Junior,
20 and Exhibit 15 into the record.

21 CHAIRMAN FAY: Okay. Without objection,
22 showing testimony as though read entered into the
23 record and Exhibit 15 entered into the record.

24 (Whereupon, prefiled direct testimony of Lew
25 Rutkin, Jr., was inserted.)

BEFORE THE
FLORIDA PUBLIC SERVICE COMMISSION

DOCKET NO. 20230023-GU

IN RE: PETITION FOR RATE INCREASE
BY PEOPLES GAS SYSTEM, INC.

1 **BEFORE THE FLORIDA PUBLIC SERVICE COMMISSION**2 **PREPARED DIRECT TESTIMONY**3 **OF**4 **LEW RUTKIN, JR.**5
6 **Q.** Please state your name, address, occupation and employer.7
8 **A.** My name is Lew Rutkin, Jr. My business address is 702 North
9 Franklin Street, Tampa, Florida 33602. I am employed by
10 Peoples Gas System, Inc. ("Peoples" or the "company"), as its
11 Vice President of Gas Supply and Development.12
13 **Q.** Please describe your duties and responsibilities in that
14 position.15
16 **A.** I lead our Gas Supply and Development team, which performs
17 several functions for Peoples. The team is responsible for
18 ensuring that the company has adequate gas supply and pipeline
19 transportation capacity to serve our growing system and
20 performs our natural gas commodity and transportation trading
21 activities. It manages the company's Natural Choice
22 Transportation Service and Individual Transportation Services
23 programs as approved by the Florida Public Service Commission
24 ("Commission"). It also coordinates the company's system
25 expansion activities for large commercial and industrial

1 customers, electric power generators, and customers who are
2 interested in using compressed natural gas ("CNG"), liquified
3 natural gas ("LNG"), and renewable natural gas ("RNG") as
4 part of their energy solutions. I will refer to these
5 customers collectively as "Large Customer(s)" in my direct
6 testimony.

7
8 **Q.** Please summarize your educational background and business
9 experience.

10
11 **A.** I began working for our affiliate, Tampa Electric Company
12 ("Tampa Electric"), as a cooperative education student in
13 2001, graduated from the University of South Florida with a
14 Bachelor of Arts degree in Mathematics in 2003, and then
15 joined Tampa Electric as a risk analyst. I left Tampa Electric
16 in 2005, and from 2005 to 2019 worked for three different
17 competitive energy companies where I performed a variety of
18 functions, including: (1) gas supply management; (2)
19 marketing and trading derivative and physical structures,
20 including exchange futures, fixed-price swaps, basis swaps,
21 swing swaps, storage spreads, exchange options, and forward
22 physical gas; and (3) developing and marketing two interstate
23 natural gas pipeline systems (Gulfstream Natural Gas System
24 and Sabal Trail Transmission pipeline) that serve the state
25 of Florida. I rejoined the TECO Energy family in 2019 as

1 Director of Gas Supply and Development for Peoples. I was
2 promoted to my current position in 2021.

3

4 **Q.** Please describe the company's Gas Supply and Development
5 team.

6

7 **A.** Peoples' Gas Supply and Development team consisted of 28 team
8 members as of December 31, 2022 and is expected to grow to 38
9 team members by December 31, 2024. I will discuss the addition
10 of 11 team members between 2023 and 2024 later in my direct
11 testimony, which includes the replacement of one team member
12 that left in January 2023. Approximately half of my team is
13 focused on gas supply, pipeline transportation capacity,
14 resource planning, and gas trading activities. Another
15 portion of my team manages relationships with existing and
16 new Large Customers and another portion is dedicated to
17 supporting customers pursuing LNG, CNG, or RNG options for
18 gas service. Our relationship managers stay alert for
19 opportunities to: (1) serve new customers by expanding our
20 system and (2) serve existing customers who plan to use more
21 gas by expanding our system. I will discuss the growth of the
22 Gas Supply and Development team later in my direct testimony.

23

24 **Q.** What are the purposes of your prepared direct testimony in
25 this proceeding?

1 **A.** The purposes of my direct testimony are to: (1) describe the
2 company's system of distribution pipeline, contracted
3 pipeline capacity, and supply arrangements, and how Peoples
4 manage and expand those system assets to serve our growing
5 small and Large Customer base; (2) describe how the company
6 developed our 2024 test year revenue forecast for the Large
7 Customer classes; (3) discuss the major capital projects
8 Peoples is undertaking to serve Large Customers from our last
9 general base rate proceeding to the 2024 test year, (4)
10 describe how the company is investing to support customers
11 who seek innovative CNG, LNG, and RNG energy solutions; and
12 (5) demonstrate that the level of Gas Supply and Development
13 area operations and maintenance ("O&M") expenses in the
14 company's 2024 test year is reasonable and prudent. I will
15 also explain the company's proposed Minimum Volume Commitment
16 Gas Transportation Agreement.

17
18 **Q.** Did you prepare an exhibit to support your prepared direct
19 testimony?

20
21 **A.** Yes. Exhibit No. LR-1, entitled "Exhibit of Lew Rutkin, Jr."
22 was prepared under my direction and supervision and
23 accompanies my prepared direct testimony. The contents of my
24 exhibit were derived from the business records of the company
25 and are true and correct to the best of my information and

1 belief. It consists of these four documents:

2

3 Document No. 1 List of Minimum Filing Requirement
4 Schedules Sponsored or Co-sponsored by
5 Lew Rutkin, Jr.

6 Document No. 2 Articles on benefits of CNG, LNG, and RNG

7 Document No. 3 Peoples' RNG Florida Trend Article

8 Document No. 4 Capital Projects Summary

9

10 **PEOPLES' DISTRIBUTION SYSTEM**

11 **Q.** Describe the system of distribution pipeline, contracted
12 transportation capacity, and supply arrangements used by
13 Peoples to serve its customers.

14

15 **A.** Peoples receives natural gas from the Florida Gas
16 Transmission ("FGT"), Gulfstream, Southern Natural Gas
17 Company ("SONAT"), Sabal Trail interstate, and SeaCoast
18 intrastate pipelines and distributes that gas to its
19 customers using a distribution system consisting of gas mains,
20 laterals, and service lines, and ancillary equipment such as
21 meters, regulators, and pressure monitoring equipment.
22 Peoples had approximately 14,900 miles of gas mains in service
23 as of December 31, 2022.

24

25 The company purchases gas (the commodity) at market prices

1 from dozens of suppliers, brokers, and marketers and ensures
2 that it has adequate interstate and intrastate transportation
3 capacity to deliver the gas it purchases to customers on its
4 system. Peoples ensures that it has enough distribution
5 pipeline capacity so customers that purchase gas commodity
6 directly from suppliers, brokers, or pool managers, and
7 transportation capacity from interstate or intrastate
8 pipelines, can receive the gas they buy at delivery points on
9 the company's distribution system. Ensuring that Peoples has
10 adequate gas supply and transportation capacity is an
11 important function of the Gas Supply and Development team.
12 The team works with the company's Operations and Engineering
13 teams to monitor projected and actual demand, pipeline
14 pressures and other operating information to ensure Peoples
15 can serve our customers.

16
17 **Q.** How does the company manage its gas supply and transportation
18 capacity arrangements to benefit customers?

19
20 **A.** The Gas Trading and Transportation group in Peoples' Gas
21 Supply and Development team develops and executes strategies
22 that: (1) lower the overall gas supply costs to our customers
23 and (2) optimize our pipeline transportation agreements to
24 manage risks related to extreme weather events and high gas
25 supply prices. The trading group continuously evaluates ways

1 to mitigate risk exposure to fuel supply, transportation, and
2 pricing changes that may adversely affect our customers. The
3 company's diverse pipeline transportation portfolio, and our
4 working relationships with large shippers, enable Peoples to
5 meet growing customer demand in a safe and reliable manner,
6 even during extreme weather events, periods of commodity
7 price volatility, and when operational challenges occur.

8
9 **Q.** How does the company identify the need to expand its
10 distribution system or pipeline transportation capacity?

11
12 **A.** In two primary ways. Peoples works with real estate developers
13 to ensure that the company install gas distribution
14 facilities to meet expected demand from residential and small
15 commercial customers and the Gas Supply and Development team
16 works with Large Customers and those seeking to use or develop
17 CNG, LNG, and RNG to plan for and meet the demand in these
18 market segments. Both teams collaborate with our engineering
19 team led by company witness Christian C. Richard to plan the
20 most efficient way to expand our system to meet customer
21 demand for supply and transportation arising from all
22 customer classes. I will discuss the expansion of our
23 facilities to meet Large Customer demand later in my direct
24 testimony. Witness Richard describes the company's planning
25 processes in his direct testimony.

1 Q. How many Large Customers does Peoples serve?

2

3 A. As of December 31, 2022, Peoples served 405 Large Customers
4 which includes 53 industrial and power generation customers.
5 By December 31, 2024, Peoples expect to serve approximately
6 415 Large Customers, including 61 industrial and power
7 generation customers. The company considers our Large
8 Customer group to include customers that take service under
9 our GS-4, GS-5, WHS, SIS, IS, ISLV, and CIS rate schedules or
10 pursuant to special contracts authorized by the Commission.

11

12 Q. Is Large Customer demand for natural gas growing in Florida?

13

14 A. Yes. As company witnesses Dr. Richard K. Harper and Helen J.
15 Wesley explain in their direct testimonies, Florida's
16 population growth and economic success has been remarkable,
17 especially over the past few years. Customer interest in
18 sustainable and renewable energy continues to grow and has
19 expanded beyond solar. Although natural gas prices recently
20 have been volatile, the abundant supply of domestic natural
21 gas has reduced the cost of natural gas well below levels a
22 decade ago and has made the United States a major exporter of
23 natural gas. The price of natural gas and its clean energy
24 attributes has made natural gas a cost-effective and
25 environmentally friendly alternative to coal, diesel, heavy

1 oil, and propane. As of February 28, 2023, as posted on the
2 CME Group's website, the average natural gas price for all
3 future contract months through December 2023 was \$3.27/MMBtu.
4 The price of crude oil and propane were \$12.96/MMBtu and
5 \$9.56/MMBtu respectively as posted on the CME Group's
6 website. In other words, natural gas is currently 65 percent
7 less expensive than the closest alternative. These factors
8 have increased demand for natural gas from Peoples' Large
9 Customers.

10
11 **LARGE CUSTOMER REVENUE FORECASTING**

12 **Q.** Please describe how Peoples forecasts therms and base revenue
13 for Large Customers.

14
15 **A.** Forecasting therms for base revenues for Large Customers is
16 a joint effort by the company's Gas Supply and Development
17 team and Finance department. This portion of the company's
18 overall revenue forecast does not require economic modeling
19 and regression techniques like those used by company witness
20 Eric Fox for residential and small commercial customers.

21
22 Rather, since a large volume of demand is concentrated in a
23 small number of Large Customers, the company develops its
24 Large Customer demand and revenue forecast by examining prior
25 and expected usage on a customer-by-customer basis. As part

1 of this process, members of our Gas Supply and Development
2 team communicate with our Large Customers about their planned
3 natural gas usage and transportation needs for the budget
4 period and beyond. Peoples uses customer-specific projected
5 usage and applicable rates and charges to forecast revenues
6 for the customers taking service under our GS-4, GS-5, WHS,
7 SIS, IS, ISLV and CIS rate schedules, or service pursuant to
8 a special contract.

9
10 The company includes terms and revenue projections for new
11 Large Customers in our financial forecasts based on the
12 specific service characteristics of the new customer,
13 including projected demand, and the in-service date of any
14 facilities being built to serve a new customer.

15
16 **Q.** Did Peoples use the process described above to forecast
17 revenues from Large Customers in the 2024 test year?

18
19 **A.** Yes. The projected revenues from Large Customers in 2024 are
20 shown on MFR schedule G-2, page 8, which I co-sponsor with
21 Peoples' witness Rachel B. Parsons.

22
23 **Q.** Describe how Peoples prepares the off-system sales forecast?

24
25 **A.** The amount of off-system sales ("OSS") net revenue budgeted

1 for 2024 at approximately \$2.5 million projection was based
2 on historical OSS net revenues. Although in 2022, Peoples had
3 experienced a significant increase in revenues due to
4 favorable natural gas price spreads and higher market demand
5 conditions. These factors resulted in a \$3.1 million increase
6 above the budgeted \$1.4 million margin to the bottom line.
7 OSS revenues for 2024 are expected to moderate due to lower
8 natural gas prices and less favorable market conditions.

9
10 **LARGE CUSTOMER SYSTEM EXPANSION AND CAPITAL PROJECTS**

11 **Q.** How does Peoples determine the need to expand its distribution
12 system to serve Large Customers?

13
14 **A.** The company's internal need determination process for Large
15 Customer expansions begins with communications between
16 members of our Gas Supply and Development team and existing
17 or potential new Large Customers. Our Gas Supply and
18 Development team members routinely communicate with existing
19 and potential new Large Customers to understand whether they
20 can benefit by: (1) building a new facility that uses natural
21 gas, (2) converting existing manufacturing and industrial
22 processes to utilize natural gas, or (3) expanding their
23 existing use of natural gas. Our Gas Supply and Development
24 team members often work with local economic development
25 organizations when they target new large commercial and

1 industrial businesses for location or relocation within a
2 local area.

3
4 Once Peoples understand what a Large Customer needs or wants,
5 the Gas Supply and Development team works with Peoples'
6 operations and engineering teams to determine whether the
7 increased customer demand can be served by existing capacity
8 of our distribution facilities or whether the company needs
9 to construct new distribution infrastructure (considering
10 sufficient upstream transportation capacity) to serve the
11 customer. It also considers the impact of residential and
12 small commercial growth in the area. The key issue in this
13 evaluation is whether the company's existing infrastructure
14 and transportation arrangements can safely and reliably
15 deliver the forecasted volumes and pressures of gas to the
16 customer without impairing safe and reliable service to our
17 existing customers.

18
19 If the company can serve the Large Customer's needs with
20 existing distribution infrastructure, Peoples will offer to
21 serve the customer pursuant to the applicable rate schedule
22 and regulations in our tariff. If Peoples must build new
23 distribution infrastructure to serve the Large Customer,
24 members of our Gas Supply and Development team collaborate
25 with the company's engineering team to evaluate the options

1 for building new infrastructure, identify the most cost-
2 effective way to meet the demand, and develop cost estimates
3 to determine whether the company should offer service under
4 an existing rate schedule or standard contract, or
5 alternatively, enter a special contract with the Large
6 Customer.

7
8 The processes described above occurs in concert with the
9 company's overall process of monitoring its distribution
10 system for changes in volumes and pressures, planning to serve
11 forecasted peak demand, complying with new safety
12 requirements, and identifying projects to improve overall
13 system reliability, resiliency, and efficiency ("RRE"). This
14 overall planning process is detailed by witness Richard in
15 his prepared direct testimony.

16
17 **Q.** How does the general body of ratepayers benefit from the
18 addition of Large Customer loads?

19
20 **A.** Large Customers generate annual throughput of at least
21 250,000 therms, which is equivalent to the annual throughput
22 of approximately 1,000 residential customers. This additional
23 load broadly results in increased system utilization, thus
24 bringing scale benefits to every capital dollar spent by
25 spreading capital costs over larger billing determinants and

1 thus lowering fixed costs for all rate payers.

2

3 **Q.** What major capital projects has the company constructed to
4 serve Large Customers since its last general base rate
5 proceeding?

6

7 **A.** Peoples has constructed several major capital projects for
8 Large Customers since its last general base rate proceeding,
9 including the FGT to Big Bend Lateral. As part of this
10 project, the company constructed approximately nine miles of
11 transmission pipeline to provide additional gas
12 transportation capacity to Tampa Electric at its Big Bend
13 Power Station. The total cost of the project is being
14 recovered by Peoples from Tampa Electric using a distribution
15 rate that recovers Peoples' revenue requirement on a
16 levelized basis over the life of the contract. This rate base
17 addition was prudent, because it was needed by our customer,
18 was constructed in a cost-effective manner, and is supported
19 by customer specific revenues.

20

21 **Q.** Is the company planning major projects to Large Customers for
22 periods beyond the 2024 test year?

23

24 **A.** Yes. The company is planning to construct pipeline
25 infrastructure facilities to enable the transportation of

1 capacity from the FGT pipeline in northeast Florida to an LNG
2 facility in the Jacksonville area, that serves the marine
3 industry and others. This project, which Peoples call the FGT
4 to the Jacksonville Export Facility ("JEF") Project, is
5 expected to be under contract by the end of the second quarter
6 of 2023, under construction by the third quarter of 2024, and
7 in-service by the third quarter of 2025, which is later than
8 the company projected in our 2023 and 2024 capital budgets.
9 In addition, the cost estimates for the project in the initial
10 budgets have changed. However, due to its size and the length
11 of time it will take to build, the project will be eligible
12 to accrue an Allowance for Funds Used During Construction
13 ("AFUDC") and the capital cost will not be included in the
14 company's rate base calculation for the 2024 test year. This
15 project is a clear example of how our natural gas
16 infrastructure can enable the cost-effective and carbon-
17 friendly use of natural gas to fuel the marine industry for
18 years to come.

19
20 **INVESTING IN INNOVATION AND CLEAN ENERGY SOLUTIONS**

21 **Q.** Is the way customers think about and use natural gas evolving?
22

23 **A.** Yes, natural gas has essentially replaced coal, diesel, and
24 heavy oil as the fuel choice for electric generators in
25 Florida. CNG and LNG have become increasingly popular as

1 alternative ways to fuel motor vehicle fleets and marine
2 vessels. The abundant, low cost of domestic natural gas and
3 existing natural gas infrastructure have helped position the
4 United States as a significant exporter of natural gas to
5 countries around the world.

6
7 In addition, environmental concerns have driven corporate
8 commitments to reduce greenhouse gas emissions across their
9 value chain and increased customer interest in innovative,
10 Florida-sourced, carbon-friendly renewable energy solutions
11 like RNG. As explained in witness Wesley's direct testimony,
12 Peoples is committed to advancing the growth of RNG, LNG, and
13 CNG because: (1) our customers value sustainability and
14 environmental stewardship, (2) sustainable natural gas
15 service is important to the future of Florida, and (3) it is
16 simply the right thing to do. Offering service to support
17 LNG, CNG, and RNG enables Peoples to lead and participate in
18 a cleaner energy future for Florida. These solutions are cost
19 effective and make an immediate impact on emission levels.

20
21 **Q.** What are the environmental benefits of CNG, LNG, and RNG?
22

23 **A.** LNG and CNG use for transportation, results in lower emissions
24 (SO_x, NO_x, and greenhouse gases) compared to fuel oil or
25 diesel. RNG facilities capture and clean methane that would

1 have ordinarily been emitted to the atmosphere from
2 landfills, wastewater treatment facilities or livestock
3 farms, and conditions this potentially environmentally
4 hazardous waste product into pipeline quality natural gas and
5 transports it for end-use via a pipeline system. Document No.
6 3 in my exhibit contains a collection of articles explaining
7 the environmental benefits of CNG, LNG, and RNG.

8
9 **COMPRESSED NATURAL GAS**

10 **Q.** What role does CNG play in Florida?

11
12 **A.** CNG is growing in popularity as a safe, alternative fuel for
13 fleets of vehicles. Owners and operators of large motor
14 vehicle fleets in Florida are turning to CNG as an affordable
15 and sustainable way to power their vehicles - especially mass
16 transit buses, garbage collection trucks and large trucks.
17 The Jacksonville Transportation Authority plans to convert a
18 large portion of its fleet to CNG by 2023. Major metropolitan
19 transit agencies are expanding their use of CNG. Growth in
20 the CNG market is being driven by the affordability of natural
21 gas, the reliability of natural gas via underground
22 pipelines, the availability of proven gas compression and
23 natural gas engines, and the attractiveness of CNG to entities
24 that seek cost-effective ways to achieve sustainability and
25 carbon reduction goals. The company's sales to CNG filling

1 stations measured in therms grew 2.1 percent from 2020 to
2 2021, and 7.7 percent from 2021 to 2022.

3
4 **Q.** How does Peoples serve customers who seek CNG?

5
6 **A.** Peoples currently serves approximately 60 CNG filling
7 stations in Florida. The company owns and operates one CNG
8 facility that provides CNG services for the City of Orlando's
9 refuse trucks. Projects to serve new CNG customers benefit
10 the company and its customers by increasing the throughput of
11 natural gas through the company's system, which in turn
12 increases the volume of gas over which the company's fixed
13 costs can be recovered when setting rates. The company
14 invested about \$1.0 million dollars in 2022 to serve new CNG
15 stations and expects to add new CNG customers in 2023 and
16 2024. It is difficult to predict when CNG customers will seek
17 service from Peoples, and most of them can be served with
18 existing infrastructure, so the company's 2023 and 2024
19 financial forecasts do not include any capital expenditures
20 specifically for serving new CNG customers. Peoples intends
21 to continue to support local governments, motor vehicle fleet
22 owners, and CNG providers as they seek to develop CNG stations
23 and convert vehicle fleets from gasoline or diesel to CNG.

24
25 **LIQUIFIED NATURAL GAS**

1 Q. What role does LNG serve in Florida?

2

3 A. LNG is quickly becoming very important to Florida's maritime
4 industry for powering vessels (including container ships and
5 the cruise ship industry) and as a cost-effective way to
6 export natural gas around the world. Nine cruise ships that
7 will be fueled by LNG are expected to be served from Florida
8 ports by 2027, and five of those are already in service and
9 operate out of Florida ports. This represents a substantial
10 capital investment in the order of approximately \$1.0 billion
11 per vessel by the maritime industry to allow for the
12 conversion of these vessels to use LNG. The peninsular shape
13 of Florida, its geographic location, and the significant and
14 growing water-borne shipping activities operating from
15 Florida's numerous deep-water, high-volume ports make our
16 state attractive for LNG providers.

17

18 The aerospace industry is shifting to more sustainable fuels
19 and LNG represents an excellent choice. Space Florida is at
20 the center point for the use of LNG as an aerospace fuel. The
21 space industry has plans to power launch vehicles with LNG
22 for space missions due to its high energy content. With the
23 increase in launches from the space industry, fuel sources
24 are needed nearby to support efficient refueling at launch
25 sites.

1 Consequently, because LNG is a carbon friendly alternative
2 and provides environmental and economic benefits to customers
3 using it, demand for pipeline infrastructure and LNG
4 facilities to support the economic development of Florida's
5 LNG market is growing. LNG export, marine, aerospace, and
6 rail sectors are developing markets for Florida and LNG.

7
8 **Q.** How does Peoples serve customers who operate LNG facilities?

9
10 **A.** Peoples currently provides natural gas to two operating LNG
11 facilities in Jacksonville, and both facilities plan to
12 expand over the next few years. The company supports these
13 customers by providing gas distribution facilities that
14 deliver industrial quantities of natural gas. Peoples has an
15 LNG service tariff, but the LNG tariff excludes liquefaction
16 services. In most instances, Peoples will be a distribution
17 infrastructure provider to LNG and the company is not
18 proposing to change the liquefaction restriction in its LNG
19 tariff in this proceeding. LNG creates long-term
20 infrastructure for the State of Florida resulting in direct
21 investment in Florida, high-paying local jobs, and promoting
22 economic development in the state. Peoples will continue to
23 support the growing demand for LNG to supply marine and other
24 industries, including natural gas exports to other parts of
25 the world. The availability and expansion of natural gas

1 distribution systems in Florida, including Peoples, enables
2 the market development of LNG which produces further economic
3 opportunities for our State.

4
5 **RENEWABLE NATURAL GAS**

6 **Q.** What is renewable natural gas?

7
8 **A.** RNG is a natural by-product of above-ground decomposing
9 waste, and contrasts with traditional natural gas that was
10 formed underground from decomposing materials over long
11 periods of time. When organic waste from farms, landfills,
12 and wastewater facilities decomposes, it releases methane, a
13 powerful greenhouse gas, into the atmosphere. Naturally
14 occurring methane (CH₄) and carbon dioxide (CO₂) emissions
15 from energy and anthropogenic waste are two of the largest
16 contributors to climate change in the United States.
17 According to the United States Environmental Protection
18 Agency, methane emissions make up about 10.9 percent of the
19 human-caused greenhouse gas (GHG) emissions in the United
20 States.

21
22 **Q.** How do RNG projects work?

23
24 **A.** RNG projects: capture methane from landfills, livestock
25 farms, and wastewater treatment plants; remove the harmful

1 constituents; condition the natural gas to gas pipeline
2 quality specifications; and inject it into a pipeline system
3 for consumption by natural gas customers. These projects can
4 be considered carbon neutral or carbon negative because they
5 take methane that otherwise would have been emitted into the
6 atmosphere and create clean natural gas which can be injected
7 into Florida's pipeline system. RNG is unique as a fuel source
8 because it simultaneously reduces greenhouse gas (GHG)
9 emissions from both methane and carbon dioxide on a net basis.

10

11 **Q.** What role can RNG play in the energy future for Florida?

12

13 **A.** RNG can be an important part of a sustainable, reliable, and
14 affordable energy future for Florida and can provide real
15 benefits.

16

17 Rather than generating out-of-state jobs to extract
18 traditional natural gas and deliver it to Florida, RNG
19 projects developed in Florida are local investments that
20 create local jobs and promote economic development in
21 Florida, not elsewhere.

22

23 RNG can contribute diversity to the state's fuel portfolio,
24 providing Floridians with a local fuel source that displaces
25 natural gas that would otherwise be supplied from outside the

1 state. Having localized and distributed RNG supply increases
2 the resiliency of Florida's natural gas distribution system
3 and mitigates the risks associated with potential pipeline or
4 upstream supply disruptions.

5
6 RNG is a natural complement to solar and other renewable
7 energy options like wind. These renewable options are
8 intermittent energy sources dependent upon weather
9 conditions, so RNG can be used to generate electricity and
10 maintain the reliability of the electric supply system when
11 the weather or time of day is not favorable for other
12 renewable options.

13
14 RNG can also bring added reliability and resiliency to
15 underserved or hard-to-serve rural areas because it can be
16 sourced and produced locally.

17
18 **Q.** How will Peoples support the development of RNG in Florida?

19
20 **A.** Peoples' size, the resources available to it, the expertise
21 of its team members, and the size and reach of its
22 distribution system uniquely position Peoples to support the
23 growth of RNG in Florida. The statewide reach of the company's
24 existing gas distribution system is near landfills,
25 wastewater treatment plants, and livestock farms that are

1 potential RNG production sites. Peoples is actively working
2 with RNG developers and facility owners to evaluate RNG
3 potential at sites throughout the state. The company is making
4 investments to support RNG using our renewable natural gas
5 tariff Rate Schedule Renewable Natural Gas Services ("RNGS").
6

7 **Q.** What investments has Peoples made in RNG?
8

9 **A.** Peoples is investing approximately \$62.0 million to support
10 or construct three of the first operating RNG facilities in
11 Florida, namely New River RNG, Brightmark RNG and Alliance
12 Dairies RNG. A general description and illustration of the
13 company's RNG activities are included in Document No. 4 of my
14 exhibit.
15

16 **Q.** When will these three RNG projects be in-service?
17

18 **A.** Absent unforeseen circumstances, Peoples expects these three
19 projects to be in service by the time this rate proceeding
20 goes to final hearing. Once in service, these projects will
21 generate enough RNG to serve approximately 40,000 residential
22 customers, or approximately ten percent of the company's
23 residential customers.
24

25 **Q.** Are the three RNG projects the same?

1 **A.** No. The projects are different and reflect the suite of
2 services Peoples can provide to support RNG development. Two
3 of the projects, Brightmark and New River, which I discuss
4 later, use the company's Rate Schedule RNGS and cost of
5 service pricing to support the efforts of two RNG developers.

6
7 Alliance Dairies is a unique project between a dairy owner
8 and Peoples, under which Peoples has made rate base
9 investments in RNG facilities and will recover its capital
10 investment through a revenue-sharing arrangement with the
11 farmer that monetizes the environmental attributes arising
12 from the project. I will explain each of these projects in
13 more detail.

14
15 **NEW RIVER RNG PROJECT**

16 **Q.** Please describe the New River project.

17
18 **A.** The New River RNG project was developed under the company's
19 RNG tariff and provides cost of service-based recovery to
20 Peoples for the facilities required to transport RNG produced
21 and conditioned at the New River landfill into Peoples'
22 pipeline system. Peoples will test the RNG to be produced by
23 the landfill to ensure that it meets pipeline quality
24 standards before it is injected into our gas distribution
25 system and then on to the FGT interstate pipeline. Peoples

1 expects the peak daily amount of RNG to be transported through
2 our system from New River will be equivalent to the daily
3 natural gas demand of approximately 30,000 residential
4 customers.

5
6 **Q.** Please describe the contract that governs the New River
7 project.

8
9 **A.** The Renewable Natural Gas Services Agreement ("RNGSA") that
10 governs the relationship between the operator of the New River
11 RNG conditioning facility, Opal Fuels, is a cost-of-service
12 agreement which fully recovers the investment by Peoples over
13 a 20-year term. The agreement includes guarantees and firm
14 commitments by Opal Fuels to meet the full revenue
15 requirements of the project. Peoples will not own the
16 environmental attributes generated by the project; they will
17 be owned by the developer, who can market the environmental
18 attributes at its discretion. Opal Fuels will own the title
19 to the gas produced at the facility and will sell it in the
20 open market.

21
22 **Q.** What is the projected in-service date for the New River
23 project?

24
25 **A.** The total capital investment made by Peoples for the New River

1 project is approximately \$8.2 million. The project is in-
2 service, operating and transporting RNG.

3

4 **Q.** Is the company's investment in facilities to serve the New
5 River RNG facility prudent?

6

7 **A.** Yes. The company's New River Project RNG is prudent. It was
8 constructed to meet a specific customer need and the revenue
9 requirement associated with the project will be recovered
10 over the life of the contract via payments from the customer.
11 Although the RNG generated by the project will not be owned
12 by Peoples, the New River RNG project will generate the
13 environmental, resiliency, and other RNG benefits previously
14 described in my direct testimony.

15

16 **BRIGHTMARK RNG PROJECT**

17 **Q.** Please describe the Brightmark RNG project.

18

19 **A.** The Brightmark RNG project was developed under Peoples' RNG
20 tariff and is composed of RNG collection, conditioning, and
21 transportation facilities required to transport RNG produced
22 and conditioned at the Larson Dairy Farm into the FGT and
23 Florida Southeast Connection interstate pipeline systems.
24 Peoples will test the RNG produced by the project to ensure
25 the gas specifications meet the requirements of each

1 respective interstate pipeline system before injection.
2 Peoples expects the peak daily amount of RNG to be transported
3 through our system from Brightmark will be equivalent to the
4 daily natural gas demand from about 8,000 residential
5 customers. Peoples will not own the environmental attributes
6 created by the project; they will be owned by the developer,
7 who can market them at their own discretion. Brightmark will
8 own title to the gas produced at the facility and will sell
9 it in the open market.

10
11 **Q.** Please describe the contract that governs the Brightmark RNG
12 project.

13
14 **A.** The RNGSA between Peoples and Brightmark, a Chevron-backed
15 developer, is a cost-of-service agreement that fully recovers
16 the revenue requirement associated with the company's
17 investment in the project over a 15-year term. Under the
18 contract, Brightmark will construct, and Peoples will
19 purchase, the digester, biogas conditioning equipment, and
20 RNG transportation facilities necessary to collect,
21 condition, transport and inject the RNG from the project and
22 Peoples will charge Brightmark a levelized, cost of service-
23 based rate over the life of the contract. Brightmark is
24 responsible for the operation and maintenance of the
25 digester, biogas collection line and biogas conditioning

1 equipment. Peoples will retain ownership and be responsible
2 for the O&M expense of the RNG transportation facilities
3 associated with the project during and after the term of the
4 agreement. The agreement includes guarantees and a firm
5 commitment by Brightmark to pay the full revenue requirements
6 of the project.

7
8 **Q.** What is the total capital investment and projected in-service
9 date for the Brightmark RNG project?

10
11 **A.** Including spend from 2021, the total capital investment made
12 by Peoples for the Brightmark project is expected to be
13 approximately \$42.7 million. Absent unforeseen circumstances,
14 the project is estimated to be in service during the second
15 quarter of 2023.

16
17 **Q.** Has Peoples proposed a special depreciation rate for the RNG
18 facilities associated with the Brightmark project?

19
20 **A.** Yes. Peoples filed a petition with the Commission on December
21 15, 2022, seeking approval of a depreciation rate with a 15-
22 year life for use with the Brightmark RNG assets. The petition
23 was assigned Docket No. 20220212-GU and appears to be on a
24 procedural schedule that will run parallel to this case.

25

1 Q. Why did the company propose a 15-year life for depreciation
2 of the Brightmark RNG assets?

3
4 A. The company proposed using a 15-year life for these assets to
5 match depreciation cost recovery with the company's revenue
6 stream under the contract, and so the net book value of the
7 Brightmark RNG assets will be zero when the contract expires
8 and title to the RNG assets will be transferred to Brightmark.
9 This proposal honors the matching principle for ratemaking
10 and will prevent the company from recording a loss on the
11 disposition of the assets or having a depreciation reserve
12 deficiency at the end of the term of the agreement. Company
13 witness Dane A. Watson discusses the proposed depreciation
14 rate for the Brightmark RNG assets further in his prepared
15 direct testimony.

16
17 Q. Is the company's investment in the Brightmark RNG project
18 prudent?

19
20 A. Yes. The company's Brightmark RNG project is prudent. The
21 company's involvement in the project meets a specific
22 customer need and the revenue requirement associated with the
23 project will be recovered over the life of the contract via
24 monthly service charge payments for the Brightmark RNG assets
25 and related RNG transportation facilities. Although the RNG

1 generated by the project will not be owned by Peoples or
2 provided by Peoples to its customers, the Brightmark project
3 will generate the environmental, resiliency, and other RNG
4 benefits previously described in my testimony.

5
6 **ALLIANCE DAIRIES RNG PROJECT**

7 **Q.** Please describe the Alliance Dairies RNG project.

8
9 **A.** As part of the Alliance Dairies RNG project, Peoples has
10 constructed and will own the RNG conditioning, and
11 transportation facilities required to transport RNG produced
12 at the Alliance Dairies Farm into the FGT interstate pipeline
13 system. The RNG produced by the project will be tested by
14 Peoples to ensure the gas specifications meet the
15 requirements of FGT's interstate pipeline system before
16 injection into the pipeline system. Peoples expects the peak
17 daily amount of RNG to be transported through our system from
18 the Alliance Dairies Farm to be equivalent to the daily
19 natural gas demand of about 6,000 residential customers.

20
21 **Q.** Who will own the RNG facilities associated with the project?

22
23 **A.** Alliance Dairies will own the digester and all facilities on
24 the farm side of the digester. Peoples will own the RNG
25 conditioning, and transportation facilities on the pipeline

1 side of the digester and has included that investment in its
2 proposed rate base for the 2024 test year. However, as
3 mentioned above, Peoples will recover its capital investment
4 through a revenue sharing arrangement with the farmer that
5 monetizes the environmental attributes of the project.

6
7 **Q.** Who will own the RNG created by the project?

8
9 **A.** Peoples will own the RNG arising from the project and will
10 market the environmental attributes associated with the RNG
11 through a relationship the company has with an environmental
12 attribute broker. The environmental attributes associated
13 with the Alliance Dairies RNG project will essentially be
14 stripped from the "green" RNG and monetized by selling the
15 attributes in an environmental credit market. Peoples will
16 own the resulting "brown gas" for use by its customers.

17
18 **Q.** What does the company propose to do with the brown gas arising
19 from the Alliance Dairies RNG project?

20
21 **A.** The company proposes that the brown gas remaining after the
22 environmental attributes are monetized, be provided to
23 Peoples' gas supply customers through the Purchased Gas
24 Adjustment Cost Recovery Clause ("PGA") at a zero-commodity
25 price resulting in immediate savings to all gas supply

1 customers.

2

3 **Q.** What impact will the Alliance Dairies RNG project have on the
4 company's revenue requirement for the 2024 test year?

5

6 **A.** Even though the investments and expenses of the Alliance
7 Dairies RNG project will be included "above-the-line" for
8 ratemaking in the 2024 test year, the value of environmental
9 attributes expected from the project will support the overall
10 revenue requirement of the project in the 2024 test year and
11 beyond. Peoples' witness Parsons will explain this further in
12 her prepared direct testimony.

13

14 **Q.** Please describe the contract that governs the Alliance
15 Dairies RNG project and the structure of payments to Alliance
16 Dairies.

17

18 **A.** Peoples has entered into a Biogas Incentives agreement with
19 Alliance Dairies under which Peoples will own the RNG
20 generated by the project as well as the environmental
21 attributes associated with the Alliance Dairies RNG project.
22 Peoples will make monthly payments to Alliance Dairies based
23 on the monetized value of the environmental attributes
24 associated with the RNG.

25

1 The agreement was structured so that revenues from the sale
2 of the environmental attributes associated with the RNG
3 created by the project will be Peoples' primary source of
4 cost recovery for its capital investment in the project. The
5 payments by Peoples to Alliance Dairies were structured to
6 ensure Peoples retains a greater percentage of project
7 revenues until the company's project costs are fully
8 recovered. Based on current projections, Peoples expects to
9 recover the full cost of its investment in RNG facilities for
10 the Alliance Dairies RNG project by 2030. The parties adopted
11 this approach to accelerate cost recovery for Peoples and to
12 mitigate any financial risks the project may have on the
13 company's general body of ratepayers.

14
15 **Q.** What is the total capital investment and projected in-service
16 date for the Alliance Dairies RNG project?

17
18 **A.** The total capital investment made by Peoples for the Alliance
19 Dairies RNG project is approximately \$11.0 million, which
20 includes spending in 2021. Absent unforeseen circumstances,
21 the company expects the Alliance Dairies RNG project to be in
22 service by the end of the second quarter of 2023.

23
24 **Q.** Does the Alliance Dairies RNG project benefit the company's
25 customers?

1 A. Yes. The project is prudent and benefits the company's
2 customers in several ways.

3
4 First, as previously mentioned, Peoples proposes that the
5 brown gas remaining after the environmental attributes of the
6 RNG generated by the project have been sold will be provided
7 to Peoples' customers through the PGA at a zero-commodity
8 price. Since the cost of the Alliance Dairies RNG facilities
9 owned by Peoples will be recovered via revenue from the sale
10 of environmental attributes, Peoples' customers will
11 essentially receive the brown gas from the project for free.
12 The company expects the annual commodity value of the Alliance
13 Dairies brown gas to be approximately \$396,000 every year
14 assuming the market value of traditional natural gas is
15 \$3.00/MMBtu.

16
17 Second, the projected revenue stream from the sale of the
18 environmental attributes will support the revenue requirement
19 for the project in the 2024 test year and beyond. This is
20 forecasted to be true even though the investments and expenses
21 of the Alliance Dairies RNG project will be included "above
22 the line" for ratemaking in the 2024 test year.

23
24 Third, the project will allow the company's customers to
25 participate in an RNG project that will deliver sustainable,

1 carbon-negative, pipeline-quality gas produced and
2 distributed in Florida, that can be used in homes and
3 businesses.

4
5 Fourth, because the RNG from Alliance Dairies will be produced
6 in Florida, it can be delivered to customers in Florida
7 without paying the interstate transportation charges needed
8 to deliver traditional natural gas purchased out of state
9 into Florida. If the company had to purchase interstate
10 transportation capacity to deliver an equivalent amount of
11 traditional natural gas from out-of-state to Peoples' system,
12 the annual cost would be approximately \$93,000, which
13 represents an avoided cost benefit to Peoples' customers.

14
15 Fifth, the company's customers will benefit because Peoples'
16 involvement in the project will provide the company with
17 valuable experience operating an RNG facility for the
18 purposes of potentially offering add-on renewable products to
19 all customers in the future.

20
21 **Q.** How does the Alliance Dairies RNG project mitigate risks to
22 the company's general body of ratepayers?

23
24 **A.** Whenever the company builds facilities to serve new Large
25 Customers or greater demand from an existing Large Customer,

1 it faces a risk that the customer will go out of business
2 before the company gets full cost recovery of its investment
3 to serve the customer. The significance of this risk is a
4 function of numerous factors, including general business
5 conditions, market forces impacting the specific industry in
6 which the customer operates, and the long lives used to
7 calculate depreciation rates for public gas utilities like
8 Peoples.

9
10 The risks associated with the Alliance Dairies RNG project
11 are modest and have been mitigated by the design of the
12 transaction.

13
14 First, the company's total investment in the project is
15 approximately \$11.0 million, which is modest by utility
16 project standards.

17
18 Second, the company is not constructing or owning the
19 digester, which is one of the more expensive components of
20 the project.

21
22 Third, the company has performed due diligence on Alliance
23 Dairies and has found it to be one of the most professionally
24 operated dairies in Florida, and if the growing base of
25 Florida consumers continue to drink milk, the risk of major

1 market changes that would put the dairy out of business seems
2 remote.

3
4 Fourth, the revenue payments under the contract have been
5 designed in favor of Peoples in the early years of the
6 contract to promote full cost recovery by Peoples in
7 approximately seven years, which is a short period by
8 traditional utility standards.

9
10 **TEST YEAR OPERATIONS AND MAINTENANCE EXPENSES**

11 **Q.** What amount of Gas Supply and Development O&M expense was
12 incurred in 2022?

13
14 **A.** The total O&M expenses attributable to base rates in 2022 was
15 \$2.6 million. This total amount is primarily reflected in the
16 amounts for FERC Accounts 920 and 921 shown on MFR schedule
17 G-2, page 17.

18
19 **Q.** What are the projected O&M expenses for your area in 2023 and
20 2024?

21
22 **A.** The totals in 2023 and 2024 are \$2.8 million and \$3.6 million,
23 respectively. The distribution of these amounts is primarily
24 within the amounts for FERC Accounts 920 and 921 shown on MFR
25 schedule G-2, page 17.

1 Q. Why is the total projected amount of 2024 O&M expenses for
2 your area higher than the actual amount in 2022?

3
4 A. The total in 2024 is \$1.0 million higher than in 2022.
5 Approximately \$600,000 of this increase is labor costs that
6 were budgeted on a trended basis as described by company
7 witness Donna L. Bluestone in her direct testimony. The
8 remainder of the increase is not trended labor costs.

9
10 Q. Why are not trended labor costs increasing from 2022 to 2024?

11
12 A. Most of the O&M expenses incurred in the Gas Supply and
13 Development area are labor related, so our O&M expense levels
14 have been influenced by the need to add personnel to meet
15 Florida's significant growth, and by upward market pressures
16 on labor and wage rates.

17
18 The company has expanded Gas Supply and Development's
19 responsibilities to include: (1) enhancing the trading and
20 transportation group to manage our system of gas supply and
21 transportation; (2) meet increased gas demand across multiple
22 gas markets, including new pipeline development to serve end
23 users in RNG, industrials and LNG; and (3) development of a
24 resource planning team to provide forecasting and analytical
25 support to expand our system efficiently and effectively.

1 Q. Why does the company need to add personnel in the Gas Supply
2 and Development Area?

3
4 A. Peoples intends to add new Gas Supply and Development
5 positions in the next couple years, equivalent to six
6 replacement positions in 2023 and two replacement positions
7 and three new positions in 2024, exclusive of any allocations.
8 These positions are listed on MFR G-2, page 19e and are needed
9 so the Gas Supply and Development team can perform its
10 enhanced responsibilities described above, and to help the
11 company respond to the growth of Florida and changing market
12 conditions and customer expectations. Finding qualified
13 persons to fill these positions has been a challenge in the
14 current labor market but Peoples has been pleased with our
15 ability to hire talented people so far. The challenges of the
16 current labor market are explained in witness Bluestone's
17 direct testimony and have been experienced in the Gas Supply
18 and Development area.

19
20 Q. Why is the level of Gas Supply and Development O&M expenses
21 in the 2024 test year reasonable?

22
23 A. The projected O&M expenses are based on current market costs
24 with reasonable inflationary adjustments and represent best
25 estimates of anticipated O&M expenses in 2024. The additional

1 team members to be hired in 2023 and 2024 are needed so the
2 Gas Supply and Development team can continue to support
3 Peoples' efforts to provide safe and reliable gas system to
4 its growing customer base.

5
6 **MINIMUM VOLUME COMMITMENT GAS TRANSPORTATION AGREEMENT**

7 **Q.** What new form of agreement is Peoples proposing to add to its
8 tariff?

9
10 **A.** As discussed in company witness Karen L. Bramley's direct
11 testimony, Peoples is proposing to add a new minimum volume
12 commitment gas transportation form agreement to ensure that
13 certain industrial and large commercial customers requesting
14 gas transportation service that need construction of new
15 mains and/or additional facilities are bound by contract to
16 use and pay for the transportation service requested. The
17 proposed changes will protect the general body of ratepayers
18 and should be approved.

19
20 **SUMMARY**

21 **Q.** Please summarize your prepared direct testimony.

22
23 **A.** Peoples' customers have the choice to use natural gas or other
24 alternatives for their energy needs. Our focus on meeting
25 customer expectations and understanding their daily

1 operational and future needs through regular interactions has
2 placed us in a position to be the preferred choice for
3 providing affordable and reliable energy. As a result, Large
4 Customers are increasingly seeking natural gas as an
5 environmentally beneficial option for power generation,
6 transportation and other direct end-uses. Further, Peoples'
7 Gas Supply and Development activities and costs are
8 reasonable and appropriately position Peoples to meet future
9 Large Customer demand while prudently managing its costs.
10 Peoples is committed to providing safe and reliable service
11 and have reinforced our ability to mitigate the effect of
12 peak pricing on our customers during volatile energy market
13 events, evidenced by the outcome of a significant supply
14 disruption event, Storm Uri in 2021. Our system integrity was
15 maintained throughout the event and did not result in a single
16 service interruption to our customers.

17
18 Peoples is proud of the work the company is doing to support
19 the development of Florida's economy by making low-cost and
20 clean natural gas accessible to more customers as well as
21 supporting the development of sustainable energy solutions
22 including CNG, LNG, and RNG.

23
24 **Q.** Does this conclude your prepared direct testimony?
25

1 **A.** Yes.

24

25

1 (Whereupon, Exhibit No. 15 was received into
2 evidence.)

3 CHAIRMAN FAY: All right. Next what we will
4 do is we will just take a quick break for our IT
5 folks to make sure we've got Mr. Garrett set up. I
6 think we have tested him multiple times this
7 morning, so let's do 10:45, which is seven minutes
8 from now, we will start back with Mr. Garrett.

9 (Brief recess.)

10 CHAIRMAN FAY: All right. Let's get started
11 back.

12 We'll have -- PGS, call your next witness.

13 MR. WAHLEN: I think this is --

14 MS. CHRISTENSEN: Chairman, that's OPC's
15 witness.

16 CHAIRMAN FAY: Oh, I apologize. OPC your next
17 -- your first witness, I should say.

18 MS. CHRISTENSEN: We would call David Garrett
19 to the stand. I would ask that the Chair have him
20 sworn in.

21 CHAIRMAN FAY: Yep.

22 Mr. Garrett, if you can just I raise your
23 right hand.

24 Whereupon,

25 DAVID J. GARRETT

1 was called as a witness, having been first duly sworn to
2 speak the truth, the whole truth, and nothing but the
3 truth, was examined and testified as follows:

4 THE WITNESS: I do.

5 CHAIRMAN FAY: Okay.

6 MS. CHRISTENSEN: Okay. And I believe Mr.
7 Garrett, while he can hear us, I don't know if he
8 can see the live stream, so --

9 CHAIRMAN FAY: He doesn't have a visual.

10 MS. CHRISTENSEN: Right, but he has audio, so
11 we will just go through the best we can.

12 CHAIRMAN FAY: Perfect.

13 MS. CHRISTENSEN: Okay.

14 EXAMINATION

15 BY MS. CHRISTENSEN:

16 Q Mr. Garrett, can you please state your full
17 name and your business address for the record, please?

18 A My name is David Garrett. My address is 101
19 Park Avenue, Suite 1125, Oklahoma City, Oklahoma, 73102.

20 Q And did you cause to be filed prefiled direct
21 testimony consisting of 98 pages in this docket?

22 A Yes.

23 Q And do you have any corrections to your
24 testimony at this time?

25 A No.

1 Q And if I were to ask you the same questions
2 today, would your answers be the same?

3 A Yes.

4 MS. CHRISTENSEN: Commissioner, I would ask
5 that the testimony be entered into the record as
6 though read.

7 CHAIRMAN FAY: Okay. Show it entered.

8 (Whereupon, prefiled direct testimony of David
9 J. Garrett was inserted.)

1 **I. INTRODUCTION**

2 **Q. Please state your name and occupation.**

3 A. My name is David J. Garrett. I am a consultant specializing in public utility regulation.
4 I am the managing member of Resolve Utility Consulting PLLC.

5 **Q. Please summarize your educational background and professional experience.**

6 A. I received a B.B.A. with a major in Finance, an M.B.A., and a Juris Doctor from the
7 University of Oklahoma. I worked in private legal practice for several years before
8 accepting a position as assistant general counsel at the Oklahoma Corporation
9 Commission in 2011. At the Oklahoma commission, I worked in the Office of General
10 Counsel in regulatory proceedings. In 2012, I began working for the Public Utility
11 Division as a regulatory analyst providing testimony in regulatory proceedings. After
12 leaving the Oklahoma commission, I formed Resolve Utility Consulting PLLC, where
13 I have represented various consumer groups and state agencies in utility regulatory
14 proceedings, primarily in the areas of cost of capital and depreciation. I am a Certified
15 Depreciation Professional with the Society of Depreciation Professionals. I am also a
16 Certified Rate of Return Analyst with the Society of Utility and Regulatory Financial
17 Analysts. I am a member of the Oklahoma Bar, but I am not providing legal advice in
18 this proceeding or the State of Florida. A more complete description of my
19 qualifications and regulatory experience is included in my curriculum vitae.¹

¹ Exhibit DJG-1.

1 **Q. Describe the purpose and scope of your testimony in this proceeding.**

2 A. I am testifying on behalf of the Florida Office of Public Counsel (“OPC”) in response
3 to the petitions for rate increase and approval of the depreciation study and depreciation
4 rates by Peoples Gas System (“PGS” or the “Company”). Specifically, I address the
5 cost of capital and fair rate of return for PGS in response to the direct testimony of
6 Company witness Dylan D’Ascendis. I also address the Company’s proposed
7 depreciation rates in response to the direct testimony of Company witness Dane A.
8 Watson, who conducted the Company’s depreciation study.

9 **II. EXECUTIVE SUMMARY**

10 **A. Part One: Cost of Capital**

11 **Q. Describe PGS’s position regarding the awarded rate of return in this case.**

12 A. PGS proposes an awarded ROE of 11.0%.² PGS also proposes a capital structure
13 consisting of approximately 55% equity and 45% debt.³ Mr. D’Ascendis relies on the
14 Discounted Cash Flow Model (“DCF Model”), the Capital Asset Pricing Model
15 (“CAPM”), and other risk premium models as part of his recommendation.

16 **Q. Please summarize your analyses and conclusions regarding PGS’s cost of equity.**

17 A. PGS has proposed an excessive awarded ROE in this case. Analysis of an appropriate
18 awarded ROE for a utility should begin with a reasonable estimation of the utility’s

² Direct Testimony of Dylan W. D’Ascendis, p. 5, lines 1-12.

³ *Id.* PGS is proposing a capital structure consisting of 40.48% long-term debt, 4.84% short-term debt, and 54.68% equity. Throughout my testimony, I refer to these figures in rounded numbers, and I refer to the Company’s proposed total debt ratio as 45% and equity ratio as 55% from investor-supplied sources.

1 cost of equity. In estimating PGS’s cost of equity, I performed a cost of equity analysis
 2 on a proxy group of utility companies with relatively similar risk profiles. Based on
 3 this proxy group, I evaluated the results of the two most widely used and widely
 4 accepted financial models for calculating cost of equity in utility rate proceedings: the
 5 CAPM and DCF Model. I conducted two variations of both the CAPM and DCF
 6 Model. The results are shown in the figure below.

7 **Figure 1:**
 8 **Cost of Equity Model Results**

Model	Cost of Equity
CAPM (at Proxy Debt Ratio)	8.5%
Hamada CAPM (at Company-Proposed Debt Ratio)	8.1%
DCF Model (Analyst Growth)	8.3%
DCF Model (Sustainable Growth)	7.5%
Average	8.1%
Range	7.5% - 8.5%

9 As shown in this figure, the results of my modeling range from 7.5% - 8.5%.⁴

10 **Q. Please provide further explanation about your cost of equity range.**

11 A. The range of cost of equity estimates is relatively wide in this case because of the
 12 discrepancy between PGS’s proposed debt and equity ratios and the proxy group’s
 13 average debt and equity ratios. PGS’s proposed debt ratio of 45% is notably lower than

⁴ Exhibit DJG-13.

1 the average debt ratio of the proxy group, which is 51%, and conversely the Company's
2 requested equity ratio of 55% is higher than the average equity ratio of the proxy group
3 of 49%. This means that PGS has less financial risk relative to the proxy group. Thus,
4 in order for the indicated cost of equity under the CAPM to be correct, we must adjust
5 the result based on PGS's lower risk profile. We can accomplish this through a
6 mathematical model called the Hamada model (described below in more detail in
7 Section IX. B). Application of the Hamada model shows that PGS's cost of equity
8 under its equity-rich capital structure is only 8.1%. However, if we impute a
9 ratemaking capital structure for PGS that is equal to the proxy group average, then
10 PGS's cost of equity estimate is 8.5%.

11 **Q. Based on the results of your cost of equity analyses, what is your recommendation**
12 **to the Commission PGS's authorized rate of return.**

13 A. I recommend the Commission adopt a 9.0% awarded ROE for PGS. I also recommend
14 the Commission adopt a ratemaking capital structure for PGS consisting of a total
15 equity ratio that is equal to the average debt ratio of the proxy group – 49%. Despite
16 the fact that the indicated cost of equity for PGS under my CAPM analyses is only
17 8.5%, it is my opinion that a 9.0% awarded ROE for PGS could be considered
18 reasonable under the circumstances. This is primarily due to the fact that PGS's current
19 awarded ROE of 9.9% significantly exceeds any reasonable estimate of the Company's
20 market-based cost of equity. One could argue that it is preferable for awarded ROEs
21 to gradually change, rather than abruptly. An awarded ROE of 9.0% would partially
22 mitigate the excess transfer of wealth from Florida customers to shareholders while

1 gradually moving the Company toward an actual market based ROE. My
2 recommendations are presented in the following figure.⁵

3 **Figure 2:**
4 **Awarded Return Recommendation**

Capital Component	Proposed Ratio	Cost Rate	Weighted Cost
Long-Term Debt	46.0%	5.54%	2.55%
Short-Term Debt	4.8%	4.85%	0.23%
Common Equity	49.2%	9.00%	4.43%
Total	100.0%		7.21%

5 As shown in this figure, adopting my proposed ROE and capital structure (and adopting
6 the Company’s proposed cost of equity) results in an authorized rate of return of 7.21%.

7 ***B. Part Two: Depreciation***

8 **Q. Summarize the key points of your testimony regarding depreciation.**

9 A. In this case, Mr. Watson is proposing depreciation rates based on projected plant and
10 reserve balances as of December 31, 2024. The depreciation rates proposed by Mr.
11 Watson result in a proposed annual depreciation accrual increase of \$9.0 million.⁶ In
12 addition, Mr. Watson calculates a reserve surplus of \$120 million as of this depreciation

⁵ Exhibit DJG-2. This weighted average cost of capital is based on investor-supplied sources of capital and reflects PGS’s requested costs of short-term and long-term debt. For OPC’s recommended cost of debt and consolidation of all OPC cost of capital adjustments, please see the direct testimony of OPC witness Lane Kollen, who presents a recommended weighted average cost of capital based on all capital components..

⁶ Direct Testimony of Dane A. Watson, p. 10, lines 12-17.

1 study date.⁷ I analyzed Mr. Watson’s depreciation study as of December 31, 2024 (the
2 “2024 Study”), and I recommend service life adjustments for several accounts.
3 Including OPC’s service life adjustments, OPC’s primary recommendation for
4 depreciation rates and the reserve surplus are based on plant and reserve balances as of
5 December 31, 2023 (the “2023 Study”).

6 **Q. Please summarize the results of your analyses under the 2023 Study and 2024**
7 **Study.**

8 A. Adopting my proposed service life adjustments under the 2023 Study results in an
9 annual depreciation accrual of \$77.9 million and equates to an adjustment reducing the
10 Company’s proposed annual depreciation accrual by \$16 million, as summarized in the
11 table below.

12 **Figure 3:**
13 **Primary Recommendation – Adjusted 2023 Study Results**

Plant Function	Company Proposal (2024)		OPC Proposal (2023)		OPC Adjustment	
	Rate	Accrual	Rate	Proposal	Rate	Adjustment
Intangible	6.60%	\$ 8,287,773	6.39%	\$ 7,119,431	-0.20%	\$ (1,168,342)
Distribution	2.50%	79,497,074	2.23%	65,901,840	-0.26%	(13,595,235)
General	6.85%	5,520,935	6.35%	4,261,768	-0.50%	(1,259,167)
RNG/LNG	3.44%	605,050	3.45%	606,895	0.01%	1,845
Total Plant Studied	2.76%	\$ 93,910,832	2.47%	\$ 77,889,934	-0.28%	\$ (16,020,898)

⁷ I calculate a substantially similar reserve surplus of \$120 million - see Exhibit DJG-23; see also Exhibit DJG-36 for reserve development.

1 This approach results in an adjustment reducing the Company's proposed depreciation
2 accrual by \$16 million.⁸ In addition, my adjusted service life parameters under the
3 2023 Study results in a calculated depreciation surplus of \$221 million.⁹ It is OPC's
4 recommendation to amortize the reserve surplus adopted by the Commission over 10
5 years, as explained in more detail in the direct testimony of OPC witness Lane Kollen.
6 The depreciation rates and reserve surplus based on my adjustments under the 2023
7 Study represent OPC's primary recommendation to the Commission.

8 **Q. Are you also proposing to the Commission any alternative recommendations**
9 **regarding these issues?**

10 A. Yes. It is OPC's position that the most reasonable approach to take regarding these
11 issues is outlined in our primary recommendation. However, in the event the
12 Commission does not adopt my primary recommendation, the Commission can
13 consider two alternative approaches. The first alternative approach would be to adopt
14 all of Mr. Watson's proposed service lives and net salvage rates, but still have the
15 depreciation rate and reserve surplus calculations based on plant and reserve balances
16 at December 31, 2023. The results of this first alternative approach are summarized in
17 the following figure.

⁸ See Exhibit DJG-18; see also Exhibits DJG-24 for rate calculations; see also DJG-40 for 2023 adjusted remaining life development.

⁹ Exhibit DJG-27. This amount assumes that the Dade City Connector Project will be in-service pursuant to Paragraph 4(c)(ii) of the 2020 Settlement Agreement approved in Order No. PSC-2020-0485-FOF-GU. To the extent that PGS fails to demonstrate that it will be in-service before December 31, 2023, I reserve the right to amend my testimony accordingly.

1
2

**Figure 4:
First Alternative Recommendation – Unadjusted 2023 Study Results**

Plant Function	Company Proposal (2024)		OPC Proposal (2023)		OPC Adjustment	
	Rate	Accrual	Rate	Proposal	Rate	Adjustment
Intangible	6.60%	\$ 8,287,773	6.39%	\$ 7,119,431	-0.20%	\$ (1,168,342)
Distribution	2.50%	79,497,074	2.46%	72,749,052	-0.03%	(6,748,022)
General	6.85%	5,520,935	6.35%	4,261,768	-0.50%	(1,259,167)
RNG/LNG	3.44%	605,050	3.45%	606,895	0.01%	1,845
Total Plant Studied	2.76%	\$ 93,910,832	2.69%	\$ 84,737,146	-0.06%	\$ (9,173,686)

3 This approach results in an adjustment reducing the Company’s proposed depreciation
4 accrual by \$9.2 million.¹⁰ In addition, adopting the Company’s unadjusted service lives
5 and net salvage rates based on 2023 plant and reserve balances results in a calculated
6 depreciation surplus of \$159 million.¹¹

7 OPC’s second alternative for consideration is to apply my service life
8 adjustments to calculate the depreciation rate and reserve surplus to 2024 plant and
9 reserve balances. The results of this approach are summarized in the following table.

¹⁰ See Exhibit DJG-26; see also Exhibit DJG-41 for 2023 unadjusted remaining life development.

¹¹ Exhibit DJG-28.

1
2

**Figure 5:
Second Alternative Recommendation – Adjusted 2024 Study Results**

Plant Function	Company Proposal		OPC Proposal		OPC Adjustment	
	Rate	Accrual	Rate	Proposal	Rate	Adjustment
Intangible	6.60%	\$ 8,287,773	6.60%	\$ 8,287,773	0.00%	\$ -
Distribution	2.50%	79,497,074	2.26%	71,968,327	-0.24%	(7,528,747)
General	6.85%	5,520,935	6.85%	5,520,935	0.00%	-
RNG/LNG	3.44%	605,050	3.44%	605,050	0.00%	-
Total Plant Studied	2.76%	\$ 93,910,832	2.53%	\$ 86,382,085	-0.22%	\$ (7,528,747)

3 This approach results in an adjustment reducing the Company’s proposed depreciation
4 accrual by \$7.5 million.¹² In addition, this approach results in a calculated depreciation
5 surplus of \$187 million.¹³

6 My primary recommendation and the alternative recommendations are
7 summarized in the following table.

¹² See also Exhibits DJG-18, DJG-19, and DJG-20 for rate calculations and adjustments; see also Exhibit DJG-37 for remaining life development.

¹³ Exhibit DJG-22; see also Exhibit DJG-35 for reserve development.

1
2

**Figure 6:
OPC’s Primary Recommendation and Alternatives**

	Recommendation and Alternatives	Accrual Adjustment	Reserve Surplus
1	<ul style="list-style-type: none"> • Adopt depreciation rates based on plant at 12-31-23 • Adopt OPC's proposed service life adjustments 	\$ (16,020,898)	\$ 221,024,192
2	<ul style="list-style-type: none"> • Adopt depreciation rates based on plant at 12-31-23 • Adopt PGS's proposed service lives 	\$ (9,173,686)	\$ 159,474,313
3	<ul style="list-style-type: none"> • Adopt depreciation rates based on plant at 12-31-24 • Adopt OPC's proposed service lives 	\$ (7,528,747)	\$ 186,552,361

3 My service life adjustments are discussed in more detail in the depreciation section of
4 my testimony.

5 **Q. Please explain why it is OPC’s primary recommendation to use year-end 2023**
6 **plant and reserve balances to determine the appropriate depreciation rates.**

7 A. As explained in the direct testimony of OPC witness Lane Kollen, it is not appropriate
8 to use a depreciation study date of December 31, 2024 to develop depreciation rates
9 that will be effective on January 1, 2024. Doing so creates a mismatch in plant that
10 effectively results in excessive depreciation expense in the test year. As discussed
11 above, the difference in the annual accrual amount between the 2024 Study and 2023
12 Study using unadjusted parameters is more than \$9 million.¹⁴

¹⁴ Please see the direct testimony of OPC witness Lane Kollen for further discussion.

PART ONE: COST OF CAPITAL

1

III. REGULATORY STANDARDS

2 **Q. Discuss the legal standards governing the awarded rate of return on capital**
3 **investments for regulated utilities.**

4 A. In *Wilcox v. Consolidated Gas Co. of New York*,¹⁵ the United States Supreme Court
5 first addressed the meaning of a fair rate of return for public utilities. The Court found
6 that “the amount of risk in the business is a most important factor” in determining the
7 appropriate allowed rate of return.¹⁶ Later in two landmark cases, the Court set forth
8 the standards by which public utilities are allowed to earn a return on capital
9 investments. In *Bluefield Water Works & Improvement Co. v. Public Service*
10 *Commission of West Virginia*,¹⁷ the Court held:

11 A public utility is entitled to such rates as will permit it to earn a return
12 on the value of the property which it employs for the convenience of the
13 public . . . but it has no constitutional right to profits such as are realized
14 or anticipated in highly profitable enterprises or speculative ventures.
15 The return should be reasonably sufficient to assure confidence in the
16 financial soundness of the utility and should be adequate, under efficient
17 and economical management, to maintain and support its credit and
18 enable it to raise the money necessary for the proper discharge of its
19 public duties.

20 In *Federal Power Commission v. Hope Natural Gas Company*,¹⁸ the Court expanded
21 on the guidelines set forth in *Bluefield* and stated:

¹⁵ *Wilcox v. Consolidated Gas Co. of New York*, 212 U.S. 19 (1909).

¹⁶ *Id.* at 48.

¹⁷ *Bluefield Water Works & Improvement Co. v. Public Service Commission of West Virginia*, 262 U.S. 679, 692-93 (1923).

¹⁸ *Federal Power Commission v. Hope Natural Gas Co.*, 320 U.S. 591, 603 (1944) (emphasis added).

1 From the investor or company point of view it is important that there be
2 enough revenue not only for operating expenses *but also for the capital*
3 *costs of the business*. These include service on the debt and dividends
4 on the stock. By that standard the return to the equity owner should be
5 commensurate with returns on investments in other enterprises having
6 corresponding risks. That return, moreover, should be sufficient to
7 assure confidence in the financial integrity of the enterprise, so as to
8 maintain its credit and to attract capital.

9 The cost of capital models I have employed in this case are in accordance with the
10 foregoing legal standards.

11 **Q. Is it important that the awarded rate of return be based on the Company's actual**
12 **cost of capital?**

13 A. Yes. The *Hope* Court makes it clear that the allowed return should be based on the
14 actual cost of capital. Under the rate base, rate of return model, a utility should be
15 allowed to recover all its reasonable expenses, its capital investments through
16 depreciation, and a return on its capital investments sufficient to satisfy the required
17 return of its investors. The "required return" from the investors' perspective is
18 synonymous with the "cost of capital" from the utility's perspective. Scholars agree
19 that the allowed rate of return should be based on the actual cost of capital:

20 Since by definition the cost of capital of a regulated firm represents
21 precisely the expected return that investors could anticipate from other
22 investments while bearing no more or less risk, and since investors will
23 not provide capital unless the investment is expected to yield its
24 opportunity cost of capital, the correspondence of the definition of the
25 cost of capital with the court's definition of legally required earnings
26 appears clear.¹⁹

¹⁹ A. Lawrence Kolbe, James A. Read, Jr. & George R. Hall, *The Cost of Capital: Estimating the Rate of Return for Public Utilities* 21 (The MIT Press 1984).

1 The models I have employed in this case closely estimate the Company's true cost of
2 equity. If the Commission sets the awarded return based on my lower, and more
3 reasonable rate of return, it will comply with the U.S. Supreme Court's standards, allow
4 the Company to maintain its financial integrity, and satisfy the claims of its investors.
5 On the other hand, if the Commission sets the allowed rate of return much *higher* than
6 the true cost of capital, it arguably results in an inappropriate transfer of wealth from
7 ratepayers to shareholders. As Dr. Morin notes:

8 [I]f the allowed rate of return is greater than the cost of capital, capital
9 investments are undertaken and investors' opportunity costs are more
10 than achieved. Any excess earnings over and above those required to
11 service debt capital accrue to the equity holders, and the stock price
12 increases. In this case, the wealth transfer occurs from ratepayers to
13 shareholders.²⁰

14 Thus, it is important to understand that the *awarded* return and the *cost* of capital are
15 different but related concepts. The two concepts are related in that the legal and
16 technical standards encompassing this issue require that the awarded return reflect the
17 true cost of capital. On the other hand, the two concepts are different in that the legal
18 standards do not mandate that awarded returns exactly match the cost of capital.
19 Awarded returns are set through the regulatory process and may be influenced by
20 factors other than objective market drivers. The cost of capital, on the other hand,
21 should be evaluated objectively and be closely tied to economic realities. In other
22 words, the cost of capital is driven by stock prices, dividends, growth rates, and — most
23 importantly — it is driven by risk. The cost of capital can be estimated by financial

²⁰ Roger A. Morin, *New Regulatory Finance* 23-24 (Public Utilities Reports, Inc. 2006) (1994).

1 models used by firms, investors, and academics around the world for decades. The
2 problem is, with respect to regulated utilities, there has been a trend in which awarded
3 returns fail to closely track with actual market-based cost of capital as further discussed
4 below. To the extent this occurs, the results are detrimental to ratepayers and the state's
5 economy.

6 **Q. Describe the economic impact that occurs when the awarded return strays too far**
7 **from the U.S. Supreme Court's cost of equity standard.**

8 A. As discussed further in the sections below, Mr. D'Ascendis's recommended awarded
9 ROE is much higher than the Company's actual cost of capital based on objective
10 market data. When the awarded ROE is set far above the *cost* of equity, it is contrary
11 to the U.S. Supreme Court's standards that the awarded return should be *based on the*
12 *cost of capital*. If the Commission were to adopt the Company's position in this case,
13 it would be permitting an excess transfer of wealth from Florida customers to Company
14 shareholders. Moreover, establishing an awarded return that far exceeds the true cost
15 of capital effectively prevents the awarded returns from changing along with economic
16 conditions. This is especially true given the fact that regulators tend to be influenced
17 by the awarded returns in other jurisdictions, regardless of the various unknown factors
18 influencing those awarded returns. This is yet another reason why it is crucial for
19 regulators to focus on the target utility's actual *cost* of equity, rather than awarded
20 returns from other jurisdictions which may be higher and slow to adapt to lower ROEs
21 based on market conditions. Moreover, awarded returns may be influenced by
22 settlements and other political factors not based on true market conditions. In contrast,
23 the true cost of equity as estimated through objective models is not influenced by these

1 factors but is instead driven by market-based factors. If regulators rely too heavily on
2 the awarded returns from other jurisdictions, it can create a cycle over time that bears
3 little relation to the market-based cost of equity. In fact, this is exactly what we have
4 observed since 1990.

5 **Q. Please illustrate and compare the relationship between awarded utility returns**
6 **and market cost of equity since 1990.**

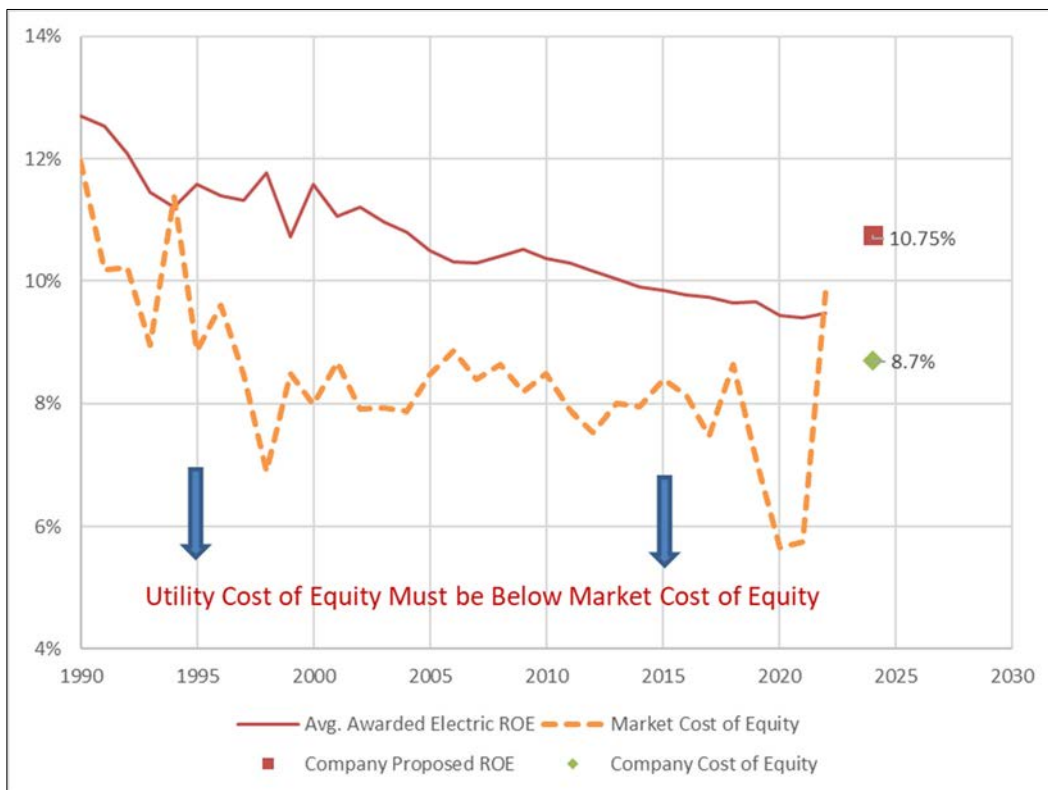

7 A. As shown in the figure below, awarded returns for public utilities have been above the
8 average required market return since 1990.²¹ Because utility stocks are consistently far
9 less risky than the average stock in the marketplace, the cost of equity for utility
10 companies is *less* than the market cost of equity. This is a fact, not an opinion. The
11 graph below shows two trend lines. The top line is the average annual awarded returns
12 since 1990 for U.S. regulated utilities. The bottom line is the required market return
13 over the same period. As discussed in more detail later in my testimony, the required
14 market return is essentially the return that investors would require if they invested in
15 the entire market. In other words, the required market return is essentially the entire
16 market's cost of equity. Since it is undisputed (even by utility witnesses) that utility
17 stocks are less risky than the average stock in the market, then the utilities' cost of
18 equity must be less than the market cost of equity.²² Thus, awarded returns (the solid
19 line) should generally be *below* the market cost of equity (the dotted line), since
20 awarded returns are supposed to be based on the actual market cost of equity.

²¹ See Exhibit DJG-14.

²² This fact can be objectively measured through a term called "beta," as discussed later in the testimony. Utility betas are less than one, which means utility stocks are less risky than the "average" stock in the market.

1
2

**Figure 7:
Awarded ROEs vs. Market Cost of Equity**

3 Because utility stocks are less risky than the average stock in the market, utility cost of
 4 equity is below market cost of equity (the dotted line in this graph). However, as shown
 5 in this graph, awarded ROEs have been consistently above the market cost of equity
 6 for many years. The recent increase in the year-end market cost of equity estimate for
 7 2022 resulted in the average awarded ROEs for 2022 to fall slightly below the market
 8 cost of equity. As discussed in more detail later in my testimony, my current estimate
 9 for the market cost of equity is 9.3%.²³ Thus, PGS’s cost of equity estimate should be
 10 lower than 9.3%. Regardless, it is important for the Commission to focus primarily on

²³ See Exhibit DJG-10.

1 the results of the cost of equity models when considering a fair awarded ROE, even
2 when considering the average of past awarded ROEs.

3 **Q. Have other analysts commented on this national phenomenon of awarded ROEs**
4 **exceeding the market-based cost equity for utilities?**

5 A. Yes. In his article published in Public Utilities Fortnightly in 2016, Steve Huntoon
6 observed that even though utility stocks are less risky than the stocks of competitive
7 industries, utility stocks have nonetheless outperformed the broader market.²⁴
8 Specifically, Huntoon notes the following three points which lead to a problematic
9 conclusion:

- 10 1. Jack Bogle, the founder of Vanguard Group and a Wall Street
11 legend, provides rigorous analysis that the long-term total return
12 for the broader market will be around 7 percent going forward.
13 Another Wall Street legend, Professor Burton Malkiel,
14 corroborates that 7 percent in the latest edition of his seminal
15 work, *A Random Walk Down Wall Street*.
- 16 2. Institutions like pension funds are validating [the first point] by
17 piling on risky investments to try and get to a 7.5 percent total
18 return, as reported by the Wall Street Journal.
- 19 3. Utilities are being granted returns on equity around 10 percent.²⁵

20 In a follow-up article analyzing and agreeing with Mr. Huntoon's findings, Leonard
21 Hyman and William Tilles found that utility equity investors expect about a 7.5%
22 annual return.²⁶

²⁴ Steve Huntoon, "Nice Work If You Can Get It," Public Utilities Fortnightly (Aug. 2016).

²⁵ *Id.*

²⁶ Leonard Hyman & William Tilles, "Don't Cry for Utility Shareholders, America," Public Utilities Fortnightly (October 2016).

1 **Q. Summarize the legal standards governing the awarded ROE issue.**

2 A. The Commission should strive to move the awarded return to a level more closely
3 aligned with the Company's actual, market-derived cost of capital while keeping in
4 mind the following legal principles discussed below.

5 **1. Risk is the most important factor when determining the awarded return.**
6 **The awarded return should be commensurate with those on investments of**
7 **corresponding risk.**

8 The legal standards articulated in *Hope* and *Bluefield* demonstrate that the Court
9 understands one of the most basic, fundamental concepts in financial theory: the more
10 (less) risk an investor assumes, the more (less) return the investor requires. Since utility
11 stocks are very low risk, the return required by equity investors should be relatively
12 low. I have used financial models in this case to closely estimate PGS's cost of equity,
13 and these financial models account for risk. The public utility industry is one of the
14 least risky industries in the entire country. The cost of equity models confirm this fact
15 in that they produce relatively low cost of equity results. In turn, the awarded ROE in
16 this case should reflect the fact that PGS is a relatively low-risk company.

17 **2. The awarded return should be sufficient to assure financial soundness**
18 **under efficient management.**

19 Because awarded returns in the regulatory environment have not closely tracked
20 market-based trends and commensurate risk, utility companies have been able to
21 remain more than financially sound, perhaps despite management inefficiencies. In
22 fact, the transfer of wealth from ratepayers to shareholders has been so far removed
23 from actual cost-based drivers that even under relatively inefficient management a
24 utility could remain financially sound. Therefore, regulatory commissions should

1 strive to set the awarded return to a regulated utility at a level based on accurate market
2 conditions to promote prudent and efficient management and minimize economic
3 waste.

4 **IV. GENERAL CONCEPTS AND METHODOLOGY**

5 **Q. Discuss your approach to estimating the cost of equity in this case.**

6 A. While a competitive firm must estimate its own cost of capital to assess the profitability
7 of competing capital projects, regulators determine a utility's cost of capital to establish
8 a fair rate of return. The legal standards set forth above do not include specific
9 guidelines regarding the models that must be used to estimate the cost of equity. Over
10 the years, however, regulatory commissions have consistently relied on several models.
11 The models I have employed in this case have been the two most widely used and
12 accepted in regulatory proceedings for many years. These models are the DCF Model
13 and the CAPM. The specific inputs and calculations for these models are described in
14 more detail below.

15 **Q. Please explain why multiple models are used to estimate the cost of equity.**

16 A. The models used to estimate the cost of equity attempt to measure the return on equity
17 required by investors by estimating several different inputs. It is preferable to use
18 multiple models because the results of any one model may contain a degree of
19 imprecision, especially depending on the reliability of the inputs used at the time of
20 running the model. By using multiple models, the analyst can compare the results of
21 the models and look for outlying results and inconsistencies. Likewise, if multiple

1 models produce a similar result, it may indicate a narrower range for the cost of equity
2 estimate.

3 **Q. Please discuss the benefits of choosing a proxy group of companies in conducting**
4 **cost of capital analyses.**

5 A. The cost of equity models in this case can be used to estimate the cost of capital of any
6 individual, publicly traded company. There are advantages, however, to conducting
7 cost of capital analysis on a “proxy group” of companies that are comparable to the
8 target company. First, it is better to assess the financial soundness of a utility by
9 comparing it to a group of other financially sound utilities. Second, using a proxy
10 group provides more reliability and confidence in the overall results because there is a
11 larger sample size. Finally, the use of a proxy group is often a pure necessity when the
12 target company is a subsidiary that is not publicly traded. This is because the financial
13 models used to estimate the cost of equity require information from publicly traded
14 firms, such as stock prices and dividends.

15 **Q. Describe the proxy group you selected in this case.**

16 A. In this case, I chose to use the same proxy group used by Mr. D’Ascendis. There could
17 be reasonable arguments made for the inclusion or exclusion of a particular company
18 in a proxy group; however, the cost of equity results are influenced far more by the
19 underlying assumptions and inputs to the various financial models than the composition
20 of the proxy groups.²⁷ By using the same proxy group, we can remove a relatively

²⁷ See Exhibit DJG-3.

1 insignificant variable from the equation and focus on the primary factors driving the
2 Company's excessive cost of equity estimate in this case.

3 **V. RISK AND RETURN CONCEPTS**

4 **Q. Discuss the general relationship between risk and return.**

5 A. As discussed above, risk is the most important factor for the Commission to consider
6 when determining the allowed return and there is a direct relationship between risk and
7 return: the more (or less) risk an investor assumes, the larger (or smaller) return the
8 investor will demand. There are two primary types of risk: firm-specific risk and
9 market risk. Firm-specific risk affects individual companies, while market risk affects
10 all companies in the market to varying degrees.

11 **Q. Discuss the differences between firm-specific risk and market risk.**

12 A. Firm-specific risk affects individual companies, rather than the entire market. For
13 example, a competitive firm might overestimate customer demand for a new product,
14 resulting in reduced sales revenue. This is an example of a firm-specific risk called
15 "project risk."²⁸ There are several other types of firm-specific risks, including: (1)
16 "financial risk" — the risk that equity investors of leveraged firms face as residual
17 claimants on earnings; (2) "default risk" — the risk that a firm will default on its debt
18 securities; and (3) "business risk" — which encompasses all other operating and
19 managerial factors that may result in investors realizing less than their expected return

²⁸ Aswath Damodaran, *Investment Valuation: Tools and Techniques for Determining the Value of Any Asset* 62-63 (3rd ed., John Wiley & Sons, Inc. 2012).

1 in that particular company. While firm-specific risk affects individual companies,
2 market risk affects all companies in the market to varying degrees. Examples of market
3 risk include interest rate risk, inflation risk, and the risk of major socio-economic
4 events. When there are changes in these risk factors, they affect all firms in the market
5 to some extent.²⁹

6 Analysis of the U.S. market in 2001 provides a good example for contrasting
7 firm-specific risk and market risk. During 2001, Enron Corp.'s stock fell from \$80 per
8 share to less than \$1 per share, and the company filed for bankruptcy at the end of the
9 year. If an investor's portfolio had held only Enron stock at the beginning of 2001, this
10 irrational investor would have lost the entire investment by the end of the year due to
11 assuming the full exposure of Enron's firm-specific risk (in that case, imprudent
12 management). On the other hand, a rational, diversified investor who invested the same
13 amount of capital in a portfolio holding every stock in the S&P 500 would have had a
14 much different result that year. The rational investor would have been relatively
15 unaffected by the fall of Enron because her portfolio included about 499 other stocks.
16 Each of those stocks, however, would have been affected by various *market* risk factors
17 that occurred that year, including the terrorist attacks on September 11th, which
18 affected all stocks in the market. Thus, the rational investor would have incurred a
19 relatively minor loss due to market risk factors, while the irrational investor would have
20 lost everything due to firm-specific risk factors.

²⁹ See Zvi Bodie, Alex Kane & Alan J. Marcus, *Essentials of Investments* 149 (9th ed., McGraw-Hill/Irwin 2013).

1 **Q. Can investors minimize firm-specific risk?**

2 A. Yes. A fundamental concept in finance is that firm-specific risk can be eliminated
3 through diversification.³⁰ If someone irrationally invested all their funds in one firm
4 (such as Enron), they would be exposed to all the firm-specific risk *and* the market risk
5 inherent in that single firm. Rational investors, however, are risk-averse and seek to
6 eliminate risk they can control. Investors can essentially eliminate firm-specific risk
7 by adding more stocks to their portfolio through a process called “diversification.”
8 There are two reasons why diversification eliminates firm-specific risk. First, each
9 stock in a diversified portfolio represents a much smaller percentage of the overall
10 portfolio than it would in a portfolio of just one or a few stocks. Thus, any firm-specific
11 action that changes the stock price of one stock in the diversified portfolio will have
12 only a small impact on the entire portfolio.³¹

13 The second reason why diversification eliminates firm-specific risk is that the
14 effects of firm-specific actions on stock prices can be either positive or negative for
15 each stock. Thus, in large, diversified portfolios, the net effect of these positive and
16 negative firm-specific risk factors will be essentially zero and will not affect the value
17 of the overall portfolio.³² Firm-specific risk is also called “diversifiable risk” because
18 it can be easily eliminated through diversification.

³⁰ See John R. Graham, Scott B. Smart & William L. Megginson, *Corporate Finance: Linking Theory to What Companies Do* 179-80 (3rd ed., South Western Cengage Learning 2010).

³¹ See Aswath Damodaran, *Investment Valuation: Tools and Techniques for Determining the Value of Any Asset* 64 (3rd ed., John Wiley & Sons, Inc. 2012).

³² *Id.*

1 **Q. Is it well-known and accepted that, because firm-specific risk can be easily**
2 **eliminated through diversification, the market does not reward such risk through**
3 **higher returns?**

4 A. Yes. Because investors eliminate firm-specific risk through diversification, they know
5 they cannot expect a higher return for assuming the firm-specific risk in any one
6 company. Thus, the risks associated with an individual firm's operations are not
7 rewarded by the market. In fact, firm-specific risk is also called "unrewarded" risk for
8 this reason. Market risk, on the other hand, cannot be eliminated through
9 diversification. Because market risk cannot be eliminated through diversification,
10 investors expect a return for assuming this type of risk. Market risk is also called
11 "systematic risk." Scholars recognize the fact that market risk, or "systematic risk," is
12 the only type of risk for which investors expect a return for bearing:

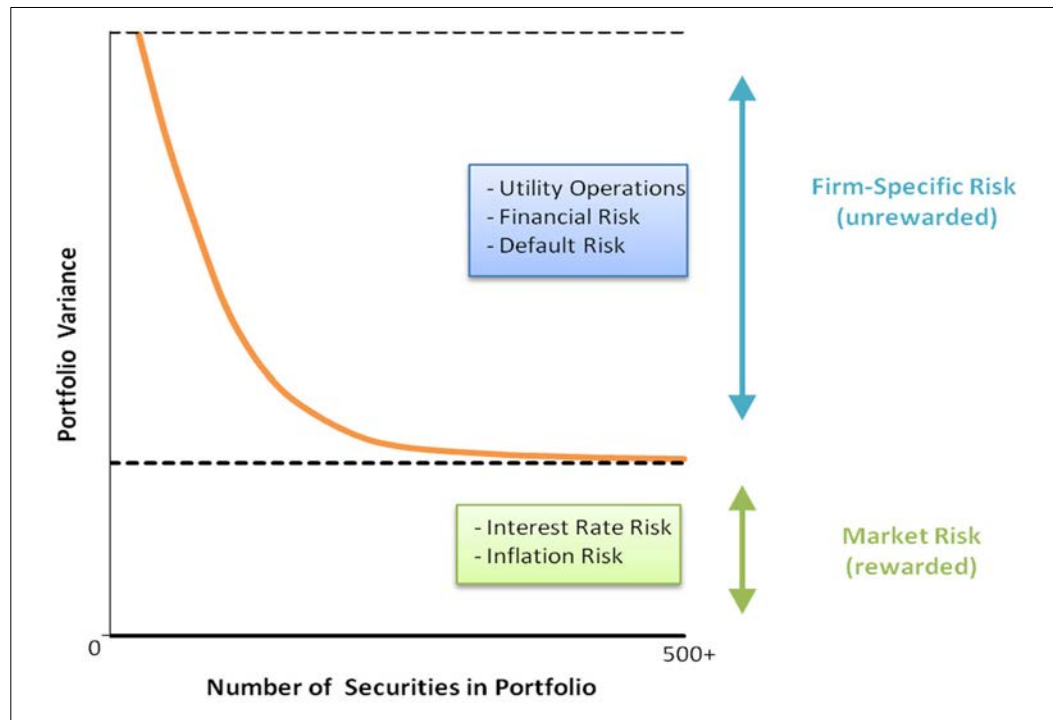

13 If investors can cheaply eliminate some risks through diversification,
14 then we should not expect a security to earn higher returns for risks that
15 can be eliminated through diversification. Investors can expect
16 compensation *only* for bearing systematic risk (i.e., risk that cannot be
17 diversified away).³³

18 These important concepts are illustrated in the figure below. Some form of this figure
19 is found in many financial textbooks.

³³ See John R. Graham, Scott B. Smart & William L. Megginson, *Corporate Finance: Linking Theory to What Companies Do* 180 (3rd ed., South Western Cengage Learning 2010).

1
2

**Figure 8:
Effects of Portfolio Diversification**

3 This figure shows that as stocks are added to a portfolio, the amount of firm-specific
 4 risk is reduced until it is essentially eliminated. No matter how many stocks are added,
 5 however, there remains a certain level of fixed market risk. The level of market risk
 6 will vary from firm to firm. Market risk is the only type of risk that is rewarded by the
 7 market and is thus the type of risk the Commission should consider when determining
 8 the allowed return.

9 **Q. Describe how market risk is measured.**

10 A. Investors who want to eliminate firm-specific risk must hold a fully diversified
 11 portfolio. To determine the amount of risk that a single stock adds to the overall market
 12 portfolio, investors measure the covariance between a single stock and the market

1 portfolio. The result of this calculation is called “beta.”³⁴ Beta represents the
2 sensitivity of a given security to the market as a whole. The market portfolio of all
3 stocks has a beta equal to one. Stocks with betas greater than one are relatively more
4 sensitive to market risk than the average stock. For example, if the market increases
5 (decreases) by 1.0%, a stock with a beta of 1.5 will, on average, increase (decrease) by
6 1.5%. In contrast, stocks with betas of less than one are less sensitive to market risk,
7 such that if the market increases (decreases) by 1.0%, a stock with a beta of 0.5% will,
8 on average, only increase (decrease) by 0.5%. Thus, stocks with low betas are
9 relatively insulated from market conditions. The beta term is used in the CAPM to
10 estimate the cost of equity, which is discussed in more detail later.³⁵

11 **Q. Are public utilities characterized as defensive firms that have low betas, low**
12 **market risk, and are relatively insulated from overall market conditions?**

13 A. Yes. Although market risk affects all firms in the market, it affects different firms to
14 varying degrees. Firms with high betas are affected more than firms with low betas,
15 which is why firms with high betas are riskier. Stocks with betas greater than one are
16 generally known as “cyclical stocks.” Firms in cyclical industries are sensitive to
17 recurring patterns of recession and recovery known as the “business cycle.”³⁶ Thus,
18 cyclical firms are exposed to a greater level of market risk. Securities with betas less
19 than one, on the other hand, are known as “defensive stocks.” Companies in defensive

³⁴ *Id.* at 180-81.

³⁵ Though it will be discussed in more detail later, Exhibit DJG-9 shows that the average beta of the proxy group was less than 1.0. This confirms the well-known concept that utilities are relatively low-risk firms.

³⁶ See Zvi Bodie, Alex Kane & Alan J. Marcus, *Essentials of Investments* 382 (9th ed., McGraw-Hill/Irwin 2013).

1 industries, such as public utility companies, “will have low betas and performance that
2 is comparatively unaffected by overall market conditions.”³⁷ In fact, financial
3 textbooks often use utility companies as prime examples of low-risk, defensive firms.
4 The figure below compares the betas of several industries and illustrates that the utility
5 industry is one of the least risky industries in the U.S. market.³⁸

6
7

**Figure 9:
Beta by Industry**

8 The fact that utilities are defensive firms that are exposed to little market risk is
9 beneficial to society. When the business cycle enters a recession, consumers can be

³⁷ *Id.* at 383.

³⁸ See Betas by Sector (US) available at <http://pages.stern.nyu.edu/~adamodar/> (2018). (After clicking the link, click “Data” then “Current Data” then “Risk / Discount Rate” from the drop down menu, then “Total Beta by Industry Sector”). The exact beta calculations are not as important as illustrating the well-known fact that utilities are very low-risk companies. The fact that the utility industry is one of the lowest risk industries in the country should not change from year to year.

1 assured that their utility companies will be able to maintain normal business operations
2 and provide safe and reliable service under prudent management. Likewise, utility
3 investors can be confident that utility stock prices will not widely fluctuate. So, while
4 it is recognized and accepted that utilities are defensive firms that experience little
5 market risk and are relatively insulated from market conditions, this fact should also be
6 appropriately reflected in the Company's awarded return.

7 **VI. DISCOUNTED CASH FLOW ANALYSIS**

8 **Q. Describe the DCF Model.**

9 A. The DCF Model is based on a fundamental financial model called the "dividend
10 discount model," which maintains that the value of a security is equal to the present
11 value of the future cash flows it generates. Cash flows from common stock are paid to
12 investors in the form of dividends. There are several variations of the DCF Model.
13 These versions, along with other formulas and theories related to the DCF Model are
14 discussed in more detail in Appendix A.³⁹

15 **Q. Describe the inputs to the DCF Model.**

16 A. There are three primary inputs in the DCF Model: (1) stock price; (2) dividend; and (3)
17 the long-term growth rate. The stock prices and dividends are known inputs based on
18 recorded data, while the growth rate projection must be estimated. I discuss each of
19 these inputs separately below.

³⁹ See Exhibit DJG-42 for all appendices.

A. Stock Price

1
2 **Q. How did you determine the stock price input of the DCF Model?**

3 A. For the stock price (P_0), I used a 30-day average of stock prices for each company in
4 the proxy group.⁴⁰ Analysts sometimes rely on average stock prices for longer periods
5 (e.g., 60, 90, or 180 days). According to the efficient market hypothesis, however,
6 markets reflect all relevant information available at a particular time, and prices adjust
7 instantaneously to the arrival of new information.⁴¹ Past stock prices, in essence, reflect
8 outdated information. The DCF Model used in utility rate cases is a derivation of the
9 dividend discount model, which is used to determine the current value of an asset.
10 Thus, according to the dividend discount model and the efficient market hypothesis,
11 the value for the “ P_0 ” term in the DCF Model should technically be the current stock
12 price, rather than an average.

13 **Q. Why did you use a 30-day average for the current stock price input?**

14 A. Using a short-term average of stock prices for the current stock price input adheres to
15 market efficiency principles while avoiding any irregularities that may arise from using
16 a single current stock price. In the context of a utility rate proceeding, there is a
17 significant length of time from when an application is filed, and testimony is due.
18 Choosing a current stock price for one particular day could raise a separate issue

⁴⁰ Exhibit DJG-4.

⁴¹ See Eugene F. Fama, *Efficient Capital Markets: A Review of Theory and Empirical Work*, Vol. 25, No. 2 *The Journal of Finance* 383 (1970); see also John R. Graham, Scott B. Smart & William L. Megginson, *Corporate Finance: Linking Theory to What Companies Do* 357 (3rd ed., South Western Cengage Learning 2010). The efficient market hypothesis was formally presented by Eugene Fama in 1970 and is a cornerstone of modern financial theory and practice.

1 concerning which day was chosen to be used in the analysis. In addition, a single stock
2 price on a particular day may be unusually high or low. It is arguably ill-advised to use
3 a single stock price in a model that is ultimately used to set rates for several years,
4 especially if a stock is experiencing some volatility. Thus, it is preferable to use a short-
5 term average of stock prices, which represents a good balance between adhering to
6 well-established principles of market efficiency while avoiding any unnecessary
7 contentions that may arise from using a single stock price on a given day. The stock
8 prices I used in my DCF analysis are based on 30-day averages of adjusted closing
9 stock prices for each company in the proxy group.⁴²

10 **B. Dividend**

11 **Q. Describe how you determined the dividend input of the DCF Model.**

12 A. The dividend term in the DCF Model represents dividends per share (d₀). I used
13 forward-looking annualized dividends published by Yahoo! Finance for the dividend
14 input to my constant growth DCF Model.⁴³ Dividing these dividends by the stock
15 prices for each proxy company results in the dividend yield for each company.⁴⁴

16 **Q. Are the stock price and dividend inputs for each proxy company a significant issue**
17 **in this case?**

18 A. No. Although my stock price and dividend inputs are more recent than those used by
19 Mr. D'Ascendis, there is not a statistically significant difference between them because

⁴² Exhibit DJG-4. Adjusted closing prices, rather than actual closing prices, are ideal for analyzing historical stock prices. The adjusted price provides an accurate representation of the firm's equity value beyond the mere market price because it accounts for stock splits and dividends.

⁴³ Exhibit DJG-5.

⁴⁴ *Id.*

1 utility stock prices and dividends are generally quite stable. This is another reason that
2 cost of capital models such as the CAPM and the DCF Model are well-suited to be
3 conducted on utilities. The differences between my DCF Model and Mr. D'Ascendis's
4 DCF Model are primarily driven by differences in our growth rate estimates, which are
5 further discussed below.

6 **C. Growth Rate**

7 **Q. Please summarize the growth rate input in the DCF Model.**

8 A. The most critical input in the DCF Model is the growth rate. Unlike the stock price
9 and dividend inputs, the growth rate input (g) must be estimated. As a result, the growth
10 rate is often the most contentious issue related to DCF Model inputs in utility rate cases.
11 The DCF Model used in this case is based on the sustainable growth valuation model.
12 Under this model, a stock is valued by the present value of its future cash flows in the
13 form of dividends. Before future cash flows are discounted by the cost of equity,
14 however, they must be "grown" into the future by a sustainable growth rate. As stated
15 above, one of the inherent assumptions of this model is that these cash flows in the
16 form of dividends grow at a sustainable rate forever. For young, high-growth firms,
17 estimating the growth rate to be used in the model can be especially difficult, and may
18 require the use of multi-stage growth models. For mature, low-growth firms such as
19 utilities, however, estimating the sustainable growth rate is more transparent. The
20 growth term of the DCF Model is one of the most important, yet least understood,
21 aspects of cost of equity estimations in utility regulatory proceedings. Therefore, I will
22 provide a more detailed explanation on the various determinants of growth below.

1 **Q. Describe the various determinants of growth that can be considered for the**
2 **growth rate input in the DCF Model.**

3 A. Although the DCF Model directly considers the growth of dividends, there are a variety
4 of growth determinants that should be considered when estimating growth rates. It
5 should be noted that these various growth determinants are used primarily to determine
6 the short-term growth rates in multi-stage DCF models. For utility companies, it is
7 necessary to focus primarily on a long-term growth rate in dividends. This is also
8 known as a “sustainable” growth rate, since this is the growth rate assumed for the
9 company’s dividends in perpetuity. That is not to say that these growth determinants
10 cannot be considered when estimating sustainable growth; however, as discussed
11 below, sustainable growth must be constrained much more than short-term growth for
12 young firms with high growth opportunities. Additionally, I briefly discuss these
13 growth determinants here because it may reveal some of the source of confusion in this
14 area.

15 **1. Historical Growth**

16 Looking at a firm’s actual historical experience may theoretically provide a
17 good starting point for estimating short-term growth. However, past growth is not
18 always a good indicator of future growth. Some metrics that might be considered here
19 are a historical growth in revenues, operating income, and net income. Since dividends
20 are paid from earnings, estimating historical earnings growth may provide an indication
21 of future earnings and dividend growth. In general, however, revenue growth tends to

1 be more consistent and predictable than earnings growth because it is less likely to be
2 influenced by accounting adjustments.⁴⁵

3 **2. Analyst Growth Rates**

4 Analyst growth rates refer to short-term projections of earnings growth
5 published by institutional research analysts such as Value Line and Bloomberg.
6 Analyst growth rates, including the limitations with using them in the DCF Model to
7 estimate utility cost of equity, are discussed in more detail below.

8 **3. Sustainable Growth Rates**

9 To make the DCF Model a viable, practical model, an infinite stream of future
10 cash flows must be estimated and then discounted back to the present. Otherwise, each
11 annual cash flow would have to be estimated separately. Some analysts use “multi-
12 stage” DCF Models to estimate the value of high-growth firms through two or more
13 stages of growth, with the final stage of growth being sustainable. However, it is not
14 necessary to use multi-stage DCF Models to analyze the cost of equity of regulated
15 utility companies. This is because regulated utilities are already in their “sustainable,”
16 low growth stage. Unlike most competitive firms, the growth of regulated utilities is
17 constrained by physical service territories and limited primarily by ratepayer and load
18 growth within those territories. The figure below illustrates the well-known
19 business/industry life-cycle pattern.

⁴⁵ See Aswath Damodaran, *Investment Valuation: Tools and Techniques for Determining the Value of Any Asset*, p. 279 (3rd ed., John Wiley & Sons, Inc. 2012).

1
2**Figure 10:
Industry Life Cycle**

3 In an industry's early stages, there are ample opportunities for growth and profitable
4 reinvestment. In the maturity stage however, growth opportunities diminish, and firms
5 choose to pay out a larger portion of their earnings in the form of dividends instead of
6 reinvesting them in operations to pursue further growth opportunities. Once a firm is
7 in the maturity stage, it is not necessary to consider higher short-term growth metrics
8 in multi-stage DCF Models; rather, it is sufficient to analyze the cost of equity using a
9 stable growth DCF Model with one sustainable growth rate.

1 **Q. Should the annual sustainable growth rate used in the DCF Model exceed the**
2 **annual growth rate of the aggregate economy?**

3 A. No. A fundamental concept in finance is that no firm can grow forever at a rate higher
4 than the growth rate of the economy in which it operates.⁴⁶ Thus, the sustainable
5 growth rate used in the DCF Model should not exceed the aggregate economic growth
6 rate. This is especially true when the DCF Model is conducted on public utilities
7 because these firms have defined service territories. As stated by Dr. Damodaran: “[i]f
8 a firm is a purely domestic company, either because of internal constraints . . . or
9 external constraints (such as those imposed by a government), the growth rate in the
10 domestic economy will be the limiting value.”⁴⁷

11 In fact, it is reasonable to assume that a regulated utility would grow at a rate
12 that is less than the U.S. economic growth rate. Unlike competitive firms, which might
13 increase their growth by launching a new product line, franchising, or expanding into
14 new and developing markets, utility operating companies with defined service
15 territories cannot do any of these things to grow. Gross Domestic Product (“GDP”) is
16 one of the most widely used measures of economic production and is used to measure
17 aggregate economic growth. According to the Congressional Budget Office’s 2022
18 Long-Term Budget Outlook, the long-term forecast for nominal U.S. GDP growth is
19 3.9%.⁴⁸

⁴⁶ *See Id.* at p. 306.

⁴⁷ *Id.*

⁴⁸ Congressional Budget Office, The 2022 Long-Term Budget Outlook, <https://www.cbo.gov/system/files/2022-07/57971-LTBO.pdf>.

1 **Q. Please illustrate the sustainable growth rate determinants you considered for your**
2 **DCF Models.**

3 A. The following figure compares the growth rate determinants I considered in my DCF
4 analysis in this case.⁴⁹

5 **Figure 11:**
6 **Sustainable Growth Rate Determinants**

Terminal Growth Determinants	Rate
Nominal GDP	3.9%
Real GDP	1.7%
Long-Term Growth Ceiling	3.9%

7 Each of these growth determinants avoids the circular reference problem inherent in
8 other growth determinants such as dividends and earnings growth when conducting a
9 DCF Model on a regulated utility for purposes of setting a fair awarded ROE (because
10 the awarded ROE more directly impacts earnings and dividends).

11 **Q. Please describe the growth rates you used in your DCF Models.**

12 A. For my “sustainable growth” variation of the DCF Model, I used the projected long-
13 term GDP growth rate of 3.9%. As discussed above, it is reasonable to conclude that
14 the long-term growth of a domestic firm cannot outpace the growth rate of the
15 aggregate economy in which it operates (as measured by U.S. GDP in this case). For
16 the “analyst growth” variation of the DCF Model, I considered projected short-term
17 dividend growth rate estimates published by Value Line.⁵⁰ I show this variation of the

⁴⁹ Exhibit DJG-6.

⁵⁰ Exhibit DJG-7.

1 DCF Model because it is often presented in rate cases by ROE witnesses and considered
2 by regulators when assessing the awarded ROE.

3 **Q. What are the final results of your DCF Models?**

4 A. For my DCF Models, I considered two variations: one using a sustainable growth rate
5 and one using analysts' growth rates. The sustainable growth rate DCF Model
6 produced a cost of equity indication of 7.5%. The analyst growth variation of the DCF
7 produced a result of 8.3%.⁵¹

8 **Q. Why do analyst growth variations of the DCF Model not reflect an accurate**
9 **estimate of PGS's cost of equity?**

10 A. To understand why analyst growth rates unreasonably inflate cost of equity estimates
11 in the DCF Model, it is important to understand the difference between "quantitative"
12 and "qualitative" growth determinants. Assessing "quantitative" growth simply
13 involves mathematically calculating a historic metric for growth (such as revenues or
14 earnings) or calculating various fundamental growth determinants using various figures
15 from a firm's financial statements (such as ROE and the retention ratio). However, any
16 thorough assessment of company growth should also be based upon a "qualitative"
17 analysis. Such an analysis would consider specific strategies that company
18 management will implement to achieve sustainable growth in earnings. Therefore, it
19 is important to begin the analysis of PGS's growth rate with this simple, qualitative
20 question: how is this regulated utility going to achieve a sustained growth in earnings?
21 If this question were asked of a competitive firm, there could be several answers

⁵¹ Exhibit DJG-7.

1 depending on the type of business model, such as launching a new product line,
2 franchising, rebranding to target a new demographic, or expanding into a developing
3 market. Regulated utilities, however, cannot effectively and sustainably engage in
4 these types of potential growth opportunities.

5 **Q. Why is it important to emphasize real, qualitative growth determinants when**
6 **analyzing the growth rates of regulated utilities?**

7 A. While qualitative growth analysis is important regardless of the entity being analyzed,
8 it is especially important in the context of utility ratemaking. This is because the “return
9 on rate base” model inherently possesses two factors that can contribute to distorted
10 views of utility growth when considered exclusively from a quantitative perspective.
11 These two factors are (1) rate base, and (2) the awarded ROE.

12 **Q. How does rate base distort growth projections for utilities?**

13 A. Under the return on rate base model, a utility’s rate base is multiplied by its awarded
14 rate of return to produce the required level of operating income. Therefore, increases
15 to rate base generally result in increased earnings. Thus, utilities have a natural
16 financial incentive to increase rate base regardless of whether such increases are driven
17 by a corresponding increase in demand. In other words, utilities can “grow” their
18 earnings by simply retiring old assets and replacing them with new assets. Likewise,
19 if a competitive, unregulated firm announced plans to close production plants and
20 replace them with new plants, it would not be considered a real determinant of growth
21 unless analysts believed this decision would directly result in increased market share
22 for the company and a real opportunity for sustained increases in revenues and
23 earnings. In the case of utilities, the mere replacement of old plant with new plant does

1 not increase market share, attract new customers, create franchising opportunities, or
2 allow utilities to penetrate developing markets, but may result in short-term,
3 quantitative earnings growth. However, this growth in earnings was merely the
4 quantitative byproduct of the return on rate base model, and not an indication of real,
5 fair, or qualitative growth. Of course, utilities might sometimes add new plant to meet
6 a modest growth in customer demand. However, as the foregoing discussion
7 demonstrates, it would be more appropriate to consider load growth projections and
8 other qualitative indicators, rather than mere increases to rate base or earnings, to attain
9 a fair assessment of growth.

10 **Q. How does the awarded ROE often distort growth projections for utilities?**

11 A. If we give undue weight to analysts' projections for utilities' earnings growth, it will
12 not provide an accurate reflection of real, qualitative growth because a utility's earnings
13 are heavily influenced by the ultimate figure that all this analysis is supposed to help
14 us estimate: the awarded return on equity. This creates a circular reference problem or
15 feedback loop. In other words, if a regulator awards an ROE that is above market-
16 based cost of capital (which is often the case, as discussed above), this could lead to
17 higher short-term growth rate projections from analysts. If these same inflated, short-
18 term growth rate estimates are used in the DCF Model (as they often are by utility
19 witnesses), it could lead to higher awarded ROEs; and the cycle of inflated awarded
20 ROE continues. Therefore, it is not advisable to simply consider the quantitative
21 growth projections published by analysts, as this practice will not necessarily provide
22 fair indications of real utility growth.

1 **Q. Are there any other problems with relying on analyst growth projections?**

2 A. Yes. While the foregoing discussion shows two reasons why we cannot rely on
3 analysts' growth rate projections to provide fair, qualitative indicators of utility growth
4 in a stable growth DCF Model, the third reason is perhaps the most obvious and
5 undisputable. Various institutional analysts, such as Zacks, Value Line, and
6 Bloomberg, publish estimated projections of earnings growth for utilities. These
7 estimates are short-term growth rate projections, ranging from 3–10 years. However,
8 many utility ROE analysts (including Mr. D'Ascendis here) inappropriately insert these
9 short-term growth projections into the DCF Model as if they were long-term growth
10 rate projections. For example, assume that an analyst at Bloomberg estimates that a
11 utility's earnings will grow by 7% per year over the next three years. This analyst may
12 have based this short-term forecast on a utility's plans to replace depreciated rate base
13 or on an anticipated awarded return that is above market-based cost of equity (*i.e.*, the
14 "circular reference" problem). When a utility witness uses this figure in a DCF Model,
15 however, it is the witness, not the Bloomberg analyst, that is testifying to the regulator
16 that the utility's earnings will qualitatively grow by 7% per year over the long-term,
17 which is an unrealistic assumption and a fundamentally different conclusion from that
18 of the analyst.

A. Response to Mr. D'Ascendis's DCF Model

1 **Q. Please summarize the results of Mr. D'Ascendis's DCF analyses.**

2 A. Mr. D'Ascendis's DCF analyses produced several results. His traditional constant
3 growth DCF Model produced an average result of 10.12%,⁵² which is notably higher
4 than my estimate.

5 **Q. Do you agree with Mr. D'Ascendis's DCF results?**

6 A. No. A cost of equity above 10% is significantly higher than any reasonable estimate
7 for a low-beta security under current market conditions (discussed in more detail in the
8 CAPM section). Mr. D'Ascendis's DCF Model incorporates numerous growth rates
9 that are unreasonably high and are not sustainable. For example, Mr. D'Ascendis
10 assumes a long-term growth of 7.7% for Atmos Energy Corp., which is about two times
11 greater than the projected, long-term nominal U.S. GDP growth. This means Mr.
12 D'Ascendis's growth rate assumption violates the basic principle that no company can
13 grow at a greater rate than the economy in which it operates over the long term,
14 especially a regulated utility company with a defined service territory. Furthermore,
15 Mr. D'Ascendis used short-term, quantitative growth estimates published by analysts.
16 As discussed above, these analysts' estimates are inappropriate to use in the DCF
17 Model as long-term growth rates because they are estimates for short-term growth.
18 While an analyst at Value Line might believe that Atmos's earnings will grow by more
19 than 7% each year over the next *several* years, it is Mr. D'Ascendis, not the Value Line
20 analyst, who is suggesting to the Commission that Atmos's earnings will grow by more

⁵² Direct Testimony of Dylan W. D'Ascendis, Exhibit DWD-1, Document No. 3.

1 than 7.5% each year, every year, for many decades into the future.⁵³ This assumption
2 is simply not realistic, and it contradicts fundamental concepts of long-term growth.
3 Further, it is unreasonable to use short-term growth estimates from third party analyst
4 in a long-term analysis which should use long-term growth rate assumptions.
5 Essentially, Mr. D'Ascendis used the incorrect inputs for his DCF Model. Short-term
6 growth rates published by analysts are not long-term growth rates by definition. The
7 growth rate assumptions used by Mr. D'Ascendis for many of the proxy companies
8 suffer from the same unrealistic assumptions, and they are not sustainable.⁵⁴ As a
9 result, his DCF cost of equity estimates are generally overstated. Therefore, if his DCF
10 cost of equity estimates are accepted and relied on to establish the award ROE, it
11 produces an unreasonable result and, thus, would result in customers paying
12 unnecessarily high rates.

13 **VII. CAPITAL ASSET PRICING MODEL ANALYSIS**

14 **Q. Describe the Capital Asset Pricing Model.**

15 A. The CAPM is a market-based model founded on the principle that investors expect
16 higher returns for incurring additional risk.⁵⁵ The CAPM estimates this expected
17 return. The various assumptions, theories, and equations involved in the CAPM are

⁵³ *Id.* Technically, the constant growth rate in the DCF Model grows dividends each year to “infinity.” Yet, even if we assumed that the growth rate applied to only a few decades, the annual growth rate would still be too high to be considered realistic.

⁵⁴ *Id.*

⁵⁵ William F. Sharpe, *A Simplified Model for Portfolio Analysis* 277-93 (Management Science IX 1963); see also John R. Graham, Scott B. Smart & William L. Megginson, *Corporate Finance: Linking Theory to What Companies Do* 208 (3rd ed., South Western Cengage Learning 2010).

1 discussed further in Appendix B. Using the CAPM to estimate the cost of equity of a
2 regulated utility is consistent with the legal standards governing the fair rate of return.
3 The U.S. Supreme Court has recognized that “the amount of *risk* in the business is a
4 most important factor” in determining the allowed rate of return,⁵⁶ and that “the return
5 to the equity owner should be commensurate with returns on investments in other
6 enterprises having corresponding *risks*.”⁵⁷ The CAPM is a useful model because it
7 directly considers the amount of risk inherent in a business and directly measures the
8 most important component of a fair rate of return analysis: Risk.

9 **Q. Describe the inputs for the CAPM.**

10 A. The basic CAPM equation requires only three inputs to estimate the cost of equity: (1)
11 the risk-free rate; (2) the beta coefficient; and (3) the equity risk premium. Each input
12 is discussed separately below.

13 **A. The Risk-Free Rate**

14 **Q. Please explain the risk-free rate.**

15 A. The first term in the CAPM is the risk-free rate (R_F). The risk-free rate is simply the
16 level of return investors can achieve without assuming any risk. The risk-free rate
17 represents the bare minimum return that any investor would require on a risky asset.
18 Even though no investment is technically void of risk, investors often use U.S. Treasury
19 securities to represent the risk-free rate because they accept that those securities

⁵⁶ *Wilcox*, 212 U.S. at 48 (emphasis added).

⁵⁷ *Hope Natural Gas Co.*, 320 U.S. at 603 (emphasis added).

1 essentially contain no default risk. The Treasury issues securities with different
2 maturities, including short-term Treasury Bills, intermediate-term Treasury Notes, and
3 long-term Treasury Bonds.

4 **Q. Is it preferable to use the yield on long-term Treasury bonds for the risk-free rate**
5 **in the CAPM?**

6 A. Yes. In valuing an asset, investors estimate cash flows over long periods of time.
7 Common stock is viewed as a long-term investment, and the cash flows from dividends
8 are assumed to last indefinitely. As a result, short-term Treasury bill yields are rarely
9 used in the CAPM to represent the risk-free rate. Short-term rates are subject to greater
10 volatility and thus can lead to unreliable estimates. Instead, long-term Treasury bonds
11 are usually used to represent the risk-free rate in the CAPM. I considered a 30-day
12 average of daily Treasury yield curve rates on 30-year Treasury bonds in my risk-free
13 rate estimate, which resulted in a risk-free rate of 3.81%.⁵⁸

14 **B. The Beta Coefficient**

15 **Q. How is the beta coefficient used in this model?**

16 A. As discussed above, beta represents the sensitivity of a given security to movements in
17 the overall market. The CAPM states that in efficient capital markets, the expected risk
18 premium on each investment is proportional to its beta. Recall that a security with a
19 beta greater (less) than one is more (less) risky than the market portfolio. An index
20 such as the S&P 500 Index is used as a proxy for the market portfolio. The historical
21 betas for publicly traded firms are published by various institutional analysts. Beta

⁵⁸ Exhibit DJG-8.

1 may also be calculated through a linear regression analysis, which provides additional
2 statistical information about the relationship between a single stock and the market
3 portfolio. The market portfolio of all stocks has a beta equal to one. Stocks with betas
4 greater than one are relatively more sensitive to market risk than the average stock. In
5 contrast, stocks with betas of less than one are less sensitive to market risk.

6 **Q. Describe the source for the betas you used in your CAPM analysis.**

7 A. I used betas recently published by Value Line Investment Survey. The beta for each
8 proxy company is less than 1.0, and the average beta for the proxy group is only 0.84.⁵⁹
9 Thus, we have an objective measure to prove the well-known concept that utility stocks
10 are less risky than the average stock in the market. While there is evidence suggesting
11 that betas published by sources such as Value Line may actually overestimate the risk
12 of utilities (and thus overestimate the CAPM), I used the betas published by Value Line
13 in the interest of minimizing controversy.⁶⁰

14 **C. The Equity Risk Premium**

15 **Q. Describe the equity risk premium.**

16 A. The final term of the CAPM is the equity risk premium (“ERP”), which is the required
17 return on the market portfolio less the risk-free rate ($R_M - R_F$). In other words, the ERP
18 is the level of return investors expect above the risk-free rate in exchange for investing
19 in risky securities. Many experts agree that “the single most important variable for

⁵⁹ Exhibit DJG-9.

⁶⁰ See Appendix B for a more detailed discussion of raw beta calculations and adjustments.

1 making investment decisions is the equity risk premium.”⁶¹ Likewise, the ERP is
2 arguably the single most important factor in estimating the cost of capital in this matter.
3 There are three basic methods that can be used to estimate the ERP: (1) calculating a
4 historical average; (2) taking a survey of experts; and (3) calculating the implied ERP.
5 I will discuss each method in turn, noting advantages and disadvantages of these
6 methods.

7 **1. Historical Average**

8 **Q. Describe the historical equity risk premium.**

9 A. The historical ERP may be calculated by simply taking the difference between returns
10 on stocks and returns on government bonds over a certain period of time. Many
11 practitioners rely on the historical ERP as an estimate for the forward-looking ERP
12 because it is easy to obtain. However, there are disadvantages to relying on the
13 historical ERP.

14 **Q. What are the limitations of relying solely on a historical average to estimate the**
15 **current or forward-looking ERP?**

16 A. As I mentioned, many investors use the historic ERP because it is convenient and easy
17 to calculate. But what matters in the CAPM model is the current and forward-looking
18 risk premium.⁶² Some investors may think that a historic ERP provides some indication
19 of what the prospective risk premium is; however, there is empirical evidence to

⁶¹ Elroy Dimson, Paul Marsh & Mike Staunton, *Triumph of the Optimists: 101 Years of Global Investment Returns* 4 (Princeton University Press 2002).

⁶² John R. Graham, Scott B. Smart & William L. Megginson, *Corporate Finance: Linking Theory to What Companies Do* 330 (3rd ed., South Western Cengage Learning 2010).

1 suggest the prospective, forward-looking ERP is actually *lower* than the historical ERP.
2 In a landmark publication on risk premiums around the world, *Triumph of the*
3 *Optimists*, the authors suggest through extensive empirical research that the prospective
4 ERP is lower than the historical ERP.⁶³ This is due in large part to what is known as
5 “survivorship bias” or “success bias” — a tendency for failed companies to be excluded
6 from historical indices.⁶⁴ From their extensive analysis, the authors make the following
7 conclusion regarding the prospective ERP:

8 The result is a forward-looking, geometric mean risk premium for the
9 United States . . . of around 2½ to 4 percent and an arithmetic mean risk
10 premium . . . that falls within a range from a little below 4 to a little
11 above 5 percent.⁶⁵

12 Indeed, these results are lower than many reported historical risk premiums. Other
13 noted experts agree:

14 The historical risk premium obtained by looking at U.S. data is biased
15 upwards because of survivor bias. . . . The true premium, it is argued,
16 is much lower. This view is backed up by a study of large equity
17 markets over the twentieth century (*Triumph of the Optimists*), which
18 concluded that the historical risk premium is closer to 4%.⁶⁶

19 Regardless of the variations in historic ERP estimates, many leading scholars and
20 practitioners agree that simply relying on a historic ERP to estimate the risk premium

⁶³ Elroy Dimson, Paul Marsh & Mike Staunton, *Triumph of the Optimists: 101 Years of Global Investment Returns* 194 (Princeton University Press 2002).

⁶⁴ *Id.* at 34.

⁶⁵ *Id.* at 194.

⁶⁶ Aswath Damodaran, *Equity Risk Premiums: Determinants, Estimation and Implications – The 2015 Edition* 17 (New York University 2015).

1 going forward is not ideal. Fortunately, “a naïve reliance on long-run historical
2 averages is not the only approach for estimating the expected risk premium.”⁶⁷

3 **Q. Did you rely on the historical ERP as part of your CAPM analysis in this case?**

4 A. No. Due to the limitations of this approach, I primarily relied on the ERP reported in
5 expert surveys and the implied ERP method discussed below.

6 **2. Expert Surveys**

7 **Q. Describe the expert survey approach to estimating the ERP.**

8 A. As its name implies, the expert survey approach to estimating the ERP involves
9 conducting a survey of experts including professors, analysts, chief financial officers,
10 and other executives around the country and asking them what they think the ERP is.
11 The IESE Business School conducts such a survey each year. Their 2023 expert survey
12 reported an average ERP of 5.7%.⁶⁸

13 **3. Implied Equity Risk Premium**

14 **Q. Describe the implied equity risk premium approach.**

15 A. The third method of estimating the ERP is arguably the best. The implied ERP relies
16 on the stable growth model proposed by Gordon, often called the “Gordon Growth
17 Model,” which is a basic stock valuation model widely used in finance for many

⁶⁷ John R. Graham, Scott B. Smart & William L. Megginson, *Corporate Finance: Linking Theory to What Companies Do* 330 (3rd ed., South Western Cengage Learning 2010).

⁶⁸ Pablo Fernandez, et al., *Survey: market Risk Premium and Risk-Free Rate used for 80 countries in 2023* (IESE Business School 2020), copy available at https://papers.ssrn.com/sol3/papers.cfm?abstract_id=4407839 IESE Business School is the graduate business school of the University of Navarra. IESE offers Master of Business Administration (MBA), Executive MBA and Executive Education programs. IESE is consistently ranked among the leading business schools in the world.

1 years.⁶⁹ This model is a mathematical derivation of the DCF Model. In fact, the
2 underlying concept in both models is the same: The current value of an asset is equal
3 to the present value of its future cash flows. Instead of using this model to determine
4 the discount rate of one company, we can use it to determine the discount rate for the
5 entire market by substituting the inputs of the model. Specifically, instead of using the
6 current stock price (P_0), we will use the current value of the S&P 500 (V_{500}). Instead
7 of using the dividends of a single firm, we will consider the dividends paid by the entire
8 market. Additionally, we should consider potential dividends. In other words, stock
9 buybacks should be considered in addition to paid dividends, as stock buybacks
10 represent another way for the firm to transfer free cash flow to shareholders. Focusing
11 on dividends alone without considering stock buybacks could understate the cash flow
12 component of the model, and ultimately understate the implied ERP. The market
13 dividend yield plus the market buyback yield gives us the gross cash yield to use as our
14 cash flow in the numerator of the discount model. This gross cash yield is increased
15 each year over the next five years by the growth rate. These cash flows must be
16 discounted to determine their present value. The discount rate in each denominator is
17 the risk-free rate (R_F) plus the discount rate (K). Equation 1 below shows how the
18 implied return is calculated. Since the current value of the S&P is known, we can solve
19 for K : The implied market return.⁷⁰

⁶⁹ Myron J. Gordon and Eli Shapiro, *Capital Equipment Analysis: The Required Rate of Profit* 102-110 (Management Science Vol. 3, No. 1 Oct. 1956).

⁷⁰ See Exhibit DJG-10 for detailed calculation.

**Equation 1:
Implied Market Return**

$$V_{500} = \frac{CY_1(1+g)^1}{(1+R_F+K)^1} + \frac{CY_2(1+g)^2}{(1+R_F+K)^2} + \dots + \frac{CY_5(1+g)^5 + TV}{(1+R_F+K)^5}$$

where: V_{500} = current value of index (S&P 500)
 CY_{1-5} = average cash yield over last five years (includes dividends and buybacks)
 g = compound growth rate in earnings over last five years
 R_F = risk-free rate
 K = implied market return (this is what we are solving for)
 TV = terminal value = $CY_5(1+R_F)/K$

The discount rate is called the “implied” return because it is based on the current value of the index as well as the value of free cash flow to investors projected over the next five years. Thus, based on these inputs, the market is “implying” the expected return; or in other words, based on the current value of all stocks (the index price) and the projected value of future cash flows, the market is telling us the return expected by investors for investing in the market portfolio. After solving for the implied market return (K), we simply subtract the risk-free rate from it to arrive at the implied ERP as shown in Equation 2.

**Equation 2:
Implied Equity Risk Premium**

$$\text{Implied Expected Market Return} - R_F = \text{Implied ERP}$$

Q. Discuss the results of your implied ERP calculation.

A. After collecting data for the index value, operating earnings, dividends, and buybacks for the S&P 500 over the past six years, I calculated the dividend yield, buyback yield, and gross cash yield for each year. I also calculated the compound annual growth rate (g) from operating earnings. I used these inputs, along with the risk-free rate and current value of the index to calculate a current expected return on the entire market of

1 9.3%. I subtracted the risk-free rate of 3.81% to arrive at the implied equity risk
2 premium of 5.5%.⁷¹ Dr. Damodaran, one of the world's leading experts on the ERP,
3 promotes the implied ERP method discussed above. He calculates monthly and annual
4 implied ERPs with this method and publishes his results. Dr. Damodaran's average
5 ERP estimate for May 2023 using several implied ERP variations was 5.1%.⁷²
6 Similarly, Kroll (formerly Duff & Phelps) publishes estimates of ERP, the most recent
7 of which was 6.0%.⁷³

8 **Q. What are the results of your final ERP estimate?**

9 A. For the final ERP estimate I used in my CAPM analysis, I considered the results of the
10 ERP surveys, the estimated ERP reported by Kroll, the estimated ERP calculated by
11 Dr. Damodaran, and the implied ERP based on my calculations.⁷⁴ The results are
12 presented in the following figure:

⁷¹ *Id.*

⁷² <http://pages.stern.nyu.edu/~adamodar/>.

⁷³ Kroll, Kroll Recommended U.S. Equity Risk Premium and Corresponding Risk-Free Rates to be Used in Computing Cost of Capital: January 2008 – Present (Oct. 2022).

Average	5.6%

3 I used the average ERP result of 5.6% in my CAPM.⁷⁵

4 **Q. Please explain the final results of your CAPM analysis.**

5 A. Using the inputs for the risk-free rate, beta coefficient, and equity risk premium
6 discussed above, I estimate that the Company's CAPM cost of equity is 8.5% (but only
7 if imputing the average capital structure of the proxy group for PGS).⁷⁶ The CAPM
8 can be displayed graphically through what is known as the Security Market Line
9 ("SML"). The figure below shows the expected return (cost of equity) on the y-axis,
10 and the average beta for the proxy group on the x-axis. The SML intercepts the y-axis
11 at the level of the risk-free rate. The slope of the SML is the equity risk premium.

⁷⁵ Exhibit DJG-11.

⁷⁶ Exhibit DJG-12.

1
2

**Figure 13:
CAPM Graph**

3 The SML provides the rate of return that will compensate investors for the beta risk of
4 that investment. Thus, at an average beta of 0.84 for the proxy group, the estimated
5 CAPM cost of equity for the Company is 8.5%.

6 **D. Response to Mr. D'Ascendis's CAPM Analysis and Other Issues**

7 **Q. Please summarize the results of Mr. D'Ascendis's CAPM analysis.**

8 A. Mr. D'Ascendis's CAPM returned an average result of 11.5%.⁷⁷

⁷⁷ Direct Testimony of Dylan W. D'Ascendis, p. 55, lines 12-21.

1 **Q. Do you believe the results of Mr. D’Ascendis’s CAPM indicate a reasonable cost**
2 **of equity estimate for PGS?**

3 A. No. The main problem with Mr. D’Ascendis’s CAPM cost of equity result stems
4 primarily from his estimate of the ERP. In my response to Mr. D’Ascendis’s CAPM
5 results, I also address his other risk premium model and his empirical CAPM analysis.

6 **1. Equity Risk Premium**

7 **Q. Did Mr. D’Ascendis rely on a reasonable measure for the ERP?**

8 A. No. Mr. D’Ascendis used an ERP of 9.75% in his CAPM, which is significantly higher
9 than the estimates reported in expert surveys and estimated by other analysts. As part
10 of Mr. D’Ascendis’s EPR analysis, he considered market data as old as 1926.⁷⁸
11 Treasury yields nearly a century old have no bearing on the current and forward-
12 looking ERP, which is what matters when conducting an accurate CAPM analysis. The
13 ERP is one of three inputs in the CAPM equation, and it is one of the most single
14 important factors for estimating the cost of equity in this case. As discussed above, I
15 used three widely accepted methods for estimating the ERP, including consulting
16 expert surveys, calculating the implied ERP based on aggregate market data, and
17 considering the ERPs published by reputable analysts. The average ERP produced
18 from my various sources is only 5.6%.⁷⁹ This means that Mr. D’Ascendis’s ERP
19 estimate is nearly twice as high as the average ERP from reputable sources.

⁷⁸ Direct Testimony of Dylan W. D’Ascendis, Exhibit DWD-1, Document No. 5.

⁷⁹ Exhibit DJG-11.

1 **Q. Please discuss and illustrate how Mr. D'Ascendis's ERP compares with other**
2 **estimates for the ERP.**

3 A. As discussed above, the 2022 IESE Business School expert survey reports an average
4 ERP of 5.6%. Similarly, Kroll recently estimated an ERP of 6.0%. The following
5 figure illustrates that Mr. D'Ascendis's ERP estimate is far out of line with industry
6 norms.⁸⁰

7 **Figure 14:**
8 **Equity Risk Premium Comparison**

9 When compared with other independent sources for the ERP (as well as my estimate),
10 which do not have a wide variance, Mr. D'Ascendis's ERP estimate is clearly not
11 within the range of reasonableness. As a result, his CAPM cost of equity estimate is
12 overstated and unreliable.

⁸⁰ The ERP estimated by Dr. Damodaran is the average of several ERP estimates under slightly differing assumptions.

1 **2. Other Risk Premium Analyses**2 **Q. Did you review Mr. D'Ascendis's other risk premium analyses?**3 A. Yes. I am addressing Mr. D'Ascendis's other risk premium analyses in this section
4 because the CAPM itself is a risk premium model. In this case, Mr. D'Ascendis
5 conducted his own "risk premium model," which includes several variations with
6 different assumptions.⁸¹7 **Q. Do you agree with the results of Mr. D'Ascendis's risk premium analysis?**8 A. No. Mr. D'Ascendis's risk premium models rely in part on Utility bond yields dating
9 back to 1928.⁸² However, data that old is of questionable relevance because cost of
10 equity estimation is essentially a forward-looking process. Analysts can look to the
11 recent past in order to arrive at reasonable forward-looking projections. For example,
12 I use a recent 30-day average of stock prices and Treasury bond yields in my CAPM
13 and DCF models. In contrast, it is unreasonable to consider data nearly 100 years old
14 as having any meaningful impact on the current and forward-looking cost of equity for
15 PGS. In addition, another one of Mr. D'Ascendis's risk premium model variations
16 considers authorized ROEs from other jurisdictions dating back to 1980. As discussed
17 earlier in my testimony, awarded ROEs are consistently higher than market-based cost
18 of equity, and they have been for many years. Thus, these types of risk premium
19 "models" effectively perpetuate the discrepancy between awarded ROEs and market-
20 based cost of equity. Since awarded ROEs are consistently higher than market-based

⁸¹ Direct Testimony of Dylan W. D'Ascendis, pp. 28-48.

⁸² Id. at p. 40, lines 1-6.

1 cost, a model that simply compares the discrepancy between awarded ROEs and any
2 market-based factor (such as bond yields) will simply ensure that the discrepancy
3 continues.

4 Furthermore, the risk premium analysis offered by Mr. D’Ascendis is
5 completely unnecessary when we already have a real risk premium model to use: the
6 CAPM. The CAPM itself is a “risk premium” model; it takes the bare minimum return
7 any investor would require for assuming no risk (the risk-free rate), then adds a
8 *premium* to compensate the investor for the extra risk he or she assumes by buying a
9 stock rather than a riskless U.S. Treasury security. The CAPM has been utilized by
10 companies around the world for decades for the same purpose we are using it in this
11 case – to estimate cost of equity.

12 Unlike the CAPM, which is found in almost every comprehensive financial
13 textbook, the types of risk premium models used by Mr. D’Ascendis in this case are
14 almost exclusively found in the texts and testimonies of utility witnesses. Specifically,
15 these risk premium models attempt to create an inappropriate link between market-
16 based factors, such as interest rates, with awarded returns on equity. Inevitably, this
17 type of model is used to justify a cost of equity that is much higher than one that would
18 be dictated by market forces.

19 **3. Empirical CAPM**

20 **Q. Please summarize Mr. D’Ascendis’s Empirical CAPM (“ECAPM”) analysis.**

21 A. Mr. D’Ascendis offers another version of the CAPM called ECAPM. The premise of
22 the ECAPM is that the standard CAPM underestimates the return required from low-

1 beta securities, such as those of the proxy group. Mr. D'Ascendis's ECAPM produced
2 an average result of 11.8%.⁸³

3 **Q. Do you agree with Mr. D'Ascendis's ECAPM results?**

4 A. No. The premise of Mr. D'Ascendis's ECAPM is that the standard CAPM
5 underestimates the return required from low-beta securities. There are several
6 problems with this concept, however. First, the Value Line betas both Mr. D'Ascendis
7 and I used in the real CAPM have already been adjusted upward to account for the
8 theory that low-beta stocks might have a tendency to be underestimated. Second, there
9 is empirical evidence suggesting that the type of beta-adjustment method used by Value
10 Line actually overstates betas from consistently low-beta industries like utilities.
11 According to this research, it is better to employ an adjustment method that adjusts raw
12 betas toward an industry average, rather than the market average, which ultimately
13 results in betas that are lower than those published in Value Line.⁸⁴ Finally (and most
14 pertinent), Mr. D'Ascendis's ECAPM still suffers from the same overestimated ERP
15 input discussed above. Regardless of the differing theories regarding the mean
16 reversion tendencies of low-beta securities, Mr. D'Ascendis's ECAPM should be
17 disregarded for its ERP inputs alone which were based on old, out-of-date data resulting
18 in unreasonable ERP twice that of industry experts.

⁸³ Direct Testimony of Dylan W. D'Ascendis, Exhibit DWD-1, Document No. 5.

⁸⁴ See Appendix B for further discussion on these theories.

1

VIII. OTHER ISSUES

2 **Q. Are there other issues raised by Mr. D’Ascendis in his testimony that you would**
3 **like to respond to.**

4 A. Yes. In his testimony, Mr. D’Ascendis suggests that several other factors should have
5 increasing effects on the cost of equity estimate, including business risks, PGS’s
6 relative size, and flotation costs. Mr. D’Ascendis also conducted a cost of equity
7 analysis on a group of non-utility companies.

8 **A. Firm-Specific Business Risks**

9 **Q. Please describe Mr. D’Ascendis’s testimony regarding business risks.**

10 A. In his direct testimony, Mr. D’Ascendis suggests that various firm-specific risk factors
11 should have an increasing effect on PGS’s cost of equity, including the risks associated
12 with the regulatory environment, environmental compliance, and other business risks.⁸⁵

13 **Q. Do you agree with Mr. D’Ascendis that these firm-specific risk factors should**
14 **influence PGS’s cost of equity or awarded ROE?**

15 A. No. The Commission should not consider these firm-specific business risk factors in
16 making their decision on a fair awarded ROE for PGS. As discussed above, it is a well-
17 known concept in finance that firm-specific risks are unrewarded by the market.
18 Scholars widely recognize the fact that market risk, or “systematic risk,” is the only
19 type of risk for which investors expect a return for bearing.⁸⁶ Unlike interest rate risk,
20 inflation risk, and other market risks that affect all companies in the stock market, the

⁸⁵ See Direct Testimony of Dylan W. D’Ascendis, pp. 13-15.

⁸⁶ See John R. Graham, Scott B. Smart & William L. Megginson, *Corporate Finance: Linking Theory to What Companies Do* 180 (3rd ed., South Western Cengage Learning 2010).

1 risk factors discussed by Mr. D’Ascendis are merely business risks specific to PGS.
2 Investors do not require additional compensation for assuming these firm-specific
3 business risks. Moreover, the financial models themselves do not include inputs for
4 business risk.

5 **B. Small Size Effect**

6 **Q. Please describe Mr. D’Ascendis’s position regarding the size effect.**

7 A. Mr. D’Ascendis suggests that PGS’s size should somehow have an increasing effect on
8 its cost of equity estimate.⁸⁷ Mr. D’Ascendis proposes an upward adjustment of 20
9 basis points basis points to account for the size effect (as well as other business risks).⁸⁸

10 **Q. Do you agree with Mr. D’Ascendis regarding the size effect?**

11 A. No. The “size effect” phenomenon arose from a 1981 study conducted by Banz, which
12 found that “in the 1936 – 1975 period, the common stock of small firms had, on
13 average, higher risk-adjusted returns than the common stock of large firms.”⁸⁹
14 According to Ibbotson, Banz’s size effect study was “[o]ne of the most remarkable
15 discoveries of modern finance.”⁹⁰ Perhaps there was some merit to this idea at the
16 time, but the size effect phenomenon was short lived. Banz’s 1981 publication
17 generated much interest in the size effect and spurred the launch of significant new
18 small cap investment funds. However, this “honeymoon period lasted for

⁸⁷ See Direct Testimony of Dylan W. D’Ascendis, pp. 65-70.

⁸⁸ *Id.* at Exhibit DWD-1, Document No. 1.

⁸⁹ Rolf W. Banz, *The Relationship Between Return and Market Value of Common Stocks* 3-18 (Journal of Financial Economics 9 (1981)).

⁹⁰ 2015 Ibbotson Stocks, Bonds, Bills, and Inflation Classic Yearbook 99 (Morningstar 2015).

1 approximately two years. . . .”⁹¹ After 1983, U.S. small-cap stocks actually
2 underperformed relative to large cap stocks. In other words, the size effect essentially
3 reversed. In *Triumph of the Optimists*, the authors conducted an extensive empirical
4 study of the size effect phenomenon around the world. They found that after the size
5 effect phenomenon was discovered in 1981, it disappeared within a few years:

6 It is clear . . . that there was a global reversal of the size effect in virtually
7 every country, with the size premium not just disappearing but going
8 into reverse. Researchers around the world universally fell victim to
9 Murphy’s Law, with the very effect they were documenting – and
10 inventing explanations for – promptly reversing itself shortly after their
11 studies were published.⁹²

12 In other words, the authors assert that the very discovery of the size effect phenomenon
13 likely caused its own demise. The authors ultimately concluded that it is “inappropriate
14 to use the term ‘size effect’ to imply that we should automatically expect there to be a
15 small-cap premium,” yet, this is exactly what utility witnesses often do in attempting
16 to artificially inflate the cost of equity with a size premium. Other prominent sources
17 have agreed that the size premium is a dead phenomenon. According to Ibbotson:

⁹¹ Elroy Dimson, Paul Marsh & Mike Staunton, *Triumph of the Optimists: 101 Years of Global Investment Returns* 131 (Princeton University Press 2002).

⁹² *Id.* at 133.

1 The unpredictability of small-cap returns has given rise to another
2 argument against the existence of a size premium: that markets have
3 changed so that the size premium no longer exists. As evidence, one
4 might observe the last 20 years of market data to see that the
5 performance of large-cap stocks was basically equal to that of small cap
6 stocks. In fact, large-cap stocks have outperformed small-cap stocks in
7 five of the last 10 years.⁹³

8 In addition to the studies discussed above, other scholars have concluded similar
9 results. According to Kalesnik and Beck:

10 Today, more than 30 years after the initial publication of Banz's paper,
11 the empirical evidence is extremely weak even before adjusting for
12 possible biases. . . . The U.S. long-term size premium is driven by the
13 extreme outliers, which occurred three-quarters of a century ago. . . .
14 Finally, adjusting for biases . . . makes the size premium vanish. If the
15 size premium were discovered today, rather than in the 1980s, it would
16 be challenging to even publish a paper documenting that small stocks
17 outperform large ones.⁹⁴

18 For all of these reasons, the Commission should reject the arbitrary size premium
19 proposed by the Company.

20 C. Non-Regulated Cost of Equity Model

21 **Q. Please describe Mr. D'Ascendis's cost of equity model conducted on non-price**
22 **regulated companies.**

23 In addition to conducting a cost of equity analysis on the utility proxy group, Mr.
24 D'Ascendis also conducted a similar type of analysis on a group of non-utility

⁹³ 2015 Ibbotson Stocks, Bonds, Bills, and Inflation Classic Yearbook 112 (Morningstar 2015).

⁹⁴ Vitali Kalesnik and Noah Beck, *Busting the Myth About Size* (Research Affiliates 2014), available at https://www.google.com/url?sa=t&rct=j&q=&esrc=s&source=web&cd=&ved=2ahUKEwic84ykqNL_AhWmmWoFHbwzCpcQFnoECAsQAQ&url=https%3A%2F%2Fwww.researchaffiliates.com%2Fcontent%2Fdam%2Fra%2Fpublications%2Fpdf%2F284-busting-the-myth-about-size.pdf&usg=AOvVaw3Yw7SggIT0R8KvzGmYkuAp&opi=89978449 (emphasis added).

1 companies. The indicated cost of equity produced by this model is 12.36% - the highest
2 of all of Mr. D'Ascendis's models.⁹⁵

3 **Q. Do you agree with the results of Mr. D'Ascendis's non-utility cost of equity model?**

4 No. In fact, I disagree with the entire premise of the model. Non-utility companies are
5 relatively incomparable to PGS compared with the utility proxy group. Thus, the
6 results obtained from this model will be inferior to the results obtained from any model
7 (conducted properly) on the utility proxy group. The risk profiles of competitive firms
8 will tend to be higher than those of low-risk utilities; thus, their cost of equity estimates
9 will generally be higher. Not surprisingly, the results of Mr. D'Ascendis's non-utility
10 model produce the highest cost of equity out of all of his various models.⁹⁶ There is
11 simply no marginal value added to the process of estimating utility cost of equity by
12 using non-utility, non-regulated firms in a proxy group instead of firms with relatively
13 similar risk profiles to the regulated utility being analyzed.

14 **D. Flotation Costs**

15 **Q. Please summarize Mr. D'Ascendis's flotation cost adjustment.**

16 A. Mr. D'Ascendis adds an additional 12 basis points to his overall cost of equity estimate
17 to account for flotation costs.⁹⁷

⁹⁵ Direct Testimony of Dylan W. D'Ascendis, Exhibit DWD-1, Document No. 1.

⁹⁶ *Id.*

⁹⁷ *Id.*

1 **Q. Do you agree with Mr. D’Ascendis’s flotation cost adjustment?**

2 A. No. When companies issue equity securities, they typically hire at least one investment
3 bank as an underwriter for the securities. “Flotation costs” generally refer to the
4 underwriter’s compensation for the services it provides in connection with the
5 securities offering. However, Mr. D’Ascendis’s flotation cost allowance is
6 inappropriate for several reasons, as discussed further below.

1. Flotation costs are not actual “out-of-pocket” costs.

7 The Company has not experienced any out-of-pocket costs for flotation.
8 Underwriters are not compensated in this fashion. Instead, underwriters are
9 compensated through an “underwriting spread.” An underwriting spread is the
10 difference between the price at which the underwriter purchases the shares from the
11 firm, and the price at which the underwriter sells the shares to investors.⁹⁸ Accordingly,
12 the Company has not experienced any out-of-pocket flotation costs, and if it has, those
13 costs should be included in the Company’s expense schedules.

2. The market already accounts for flotation costs.

14 When an underwriter markets a firm’s securities to investors, the investors are
15 aware of the underwriter’s fees. The investors know that a portion of the price they are
16 paying for the shares does not go directly to the company, but instead goes to
17 compensate the underwriter for its services. In fact, federal law requires that the

⁹⁸ See John R. Graham, Scott B. Smart & William L. Megginson, *Corporate Finance: Linking Theory to What Companies Do*, p. 509 (3rd ed., South Western Cengage Learning 2010).

1 underwriter's compensation be disclosed on the front page of the prospectus.⁹⁹ Thus,
2 investors have already considered and accounted for flotation costs when making their
3 decision to purchase shares at the quoted price. As a result, there is no need for
4 shareholders to receive additional compensation to account for costs they have already
5 considered and agreed to. Similar compensation structures are in other kinds of
6 business transactions. For example, a homeowner may hire a realtor and sell a home
7 for \$100,000. After the realtor takes a six percent commission, the seller nets \$94,000.
8 The buyer and seller agreed to the transaction notwithstanding the realtor's
9 commission. Obviously, it would be unreasonable for the buyer or seller to demand
10 additional funds from anyone after the deal is completed to reimburse them for the
11 realtor's fees. Likewise, investors of competitive firms do not expect additional
12 compensation for flotation costs. Thus, it would not be appropriate for a commission
13 standing in the place of competition to award a utility's investors with this additional
14 compensation.

3. It is inappropriate to add any additional basis points to an awarded ROE proposal that is already far above the Company's cost of equity.

15 For the reasons discussed above, flotation costs should be disallowed from a
16 technical standpoint; they should also be disallowed from a policy standpoint. The
17 Company is asking this Commission to award it a cost of equity that is more than 150
18 basis points above its market-based cost of equity. Under these circumstances, it is

⁹⁹ See Regulation S-K, 17 C.F.R. § 229.501(b)(3) (requiring that the underwriter's discounts and commissions be disclosed on the outside cover page of the prospectus). A prospectus is a legal document that provides details about an investment offering.

1 especially inappropriate to suggest that flotation costs should be considered in any way
2 to increase an already inflated ROE proposal.

3 **IX. CAPITAL STRUCTURE**

4 **Q. Describe in general the concept of a company's capital structure.**

5 A. "Capital structure" refers to the way a company finances its overall operations through
6 external financing. The primary sources of long-term, external financing are debt
7 capital and equity capital. Debt capital usually comes in the form of contractual bond
8 issuances that require the firm to make payments, while equity capital represents an
9 ownership interest in the form of stock. Because a firm cannot pay dividends on
10 common stock until it satisfies its debt obligations to bondholders, stockholders are
11 referred to as "residual claimants." The fact that stockholders have a lower priority to
12 claims on company assets increases their risk and the required return relative to
13 bondholders. Thus, equity capital has a higher cost than debt capital. Firms can reduce
14 their weighted average cost of capital ("WACC") by recapitalizing and increasing their
15 debt financing. In addition, because interest expense is deductible, increasing debt also
16 adds value to the firm by reducing the firm's tax obligation.

17 **Q. Is it true that, by increasing debt, competitive firms can add value and reduce**
18 **their WACC?**

19 A. Yes, it is. A competitive firm can add value by increasing debt. After a certain point,
20 however, the marginal cost of additional debt outweighs its marginal benefit. This is
21 because the more debt the firm uses, the higher interest expense it must pay, and the
22 likelihood of loss increases. This also increases the risk of non-recovery for both
23 bondholders and shareholders, causing both groups of investors to demand a greater

1 return on their investment. Thus, if debt financing is too high, the firm's WACC will
2 increase instead of decrease. The following figure illustrates these concepts.

3
4

**Figure 15:
Optimal Debt Ratio**

5 As shown in this figure, a competitive firm's value is maximized when the WACC is
6 minimized. In both graphs, the debt ratio is shown on the x-axis. By increasing its
7 debt ratio, a competitive firm can minimize its WACC and maximize its value. At a
8 certain point, however, the benefits of increasing debt do not outweigh the costs of the

1 additional risks to both bondholders and shareholders, as each type of investor will
2 demand higher returns for the additional risk they have assumed.¹⁰⁰

3 **Q. Does the rate base rate of return model effectively incentivize utilities to operate**
4 **at the optimal capital structure?**

5 A. No. While it is true that competitive firms maximize their value by minimizing their
6 WACC, this is not the case for regulated utilities. Under the rate base, rate of return
7 model, a higher WACC results in higher rates, all else held constant. The basic revenue
8 requirement equation is as follows:

9 **Equation 3:**
10 **Revenue Requirement for Regulated Utilities**

11
$$RR = O + d + T + r(A - D)$$

where: RR = revenue requirement
 O = operating expenses
 d = depreciation expense
 T = corporate tax
 r = **weighted average cost of capital (WACC)**
 A = plant investments
 D = accumulated depreciation

12 As shown in Equation 3, utilities can increase their revenue requirement by increasing
13 their WACC, not by minimizing it. Thus, because there is no incentive for a regulated
14 utility to minimize its WACC, a commission standing in the place of competition must
15 ensure that the regulated utility is operating at the lowest reasonable WACC.

¹⁰⁰ See John R. Graham, Scott B. Smart & William L. Megginson, *Corporate Finance: Linking Theory to What Companies Do* 440-41 (3rd ed., South Western Cengage Learning 2010).

1 **Q. Can utilities generally afford to have higher debt levels than other industries?**

2 A. Yes. Because regulated utilities have large amounts of fixed assets, stable earnings,
3 and low risk relative to other industries, they can afford to have relatively higher debt
4 ratios (or “leverage”). As aptly stated by Dr. Damodaran:

5 Since financial leverage multiplies the underlying business risk, it
6 stands to reason that firms that have high business risk should be
7 reluctant to take on financial leverage. It also stands to reason that firms
8 that operate in stable businesses should be much more willing to take on
9 financial leverage. Utilities, for instance, have historically had high
10 debt ratios but have not had high betas, mostly because their underlying
11 businesses have been stable and fairly predictable.¹⁰¹

12 Note that the author explicitly contrasts utilities with firms that have high underlying
13 business risk. Because utilities have low levels of risk and operate a stable business,
14 they should generally operate with relatively high levels of debt to achieve their optimal
15 capital structure.

16 **Q. Describe the approach you used to assess the reasonableness of PGS’s capital**
17 **structure for ratemaking purposes?**

18 A. To assess a reasonable capital structure for PGS, I examined the capital structures of
19 the proxy group. The cost of equity indicated under the CAPM is inseparable from the
20 proxy group capital structures. For comparative purposes, I also looked at debt ratios
21 observed in other industries. I discuss each of these approaches in more detail below.

¹⁰¹ Aswath Damodaran, *Investment Valuation: Tools and Techniques for Determining the Value of Any Asset* 196 (3rd ed., John Wiley & Sons, Inc. 2012).

1 **A. Proxy and Industry Debt Ratios**

2 **Q. Please describe the debt and equity ratios of the proxy group.**

3 A. According to the debt ratios recently reported in Value Line for the utility proxy group
4 (the same proxy group used by Mr. D'Ascendis), the average debt ratio of the proxy
5 group is 51%.¹⁰² This is notably higher than PGS's proposed debt ratio of only 45%.
6 Conversely, the equity ratio of the proxy group is 49% and PGS's proposed equity ratio
7 is considerably higher at 55%.

8 **Q. Why is it critical to consider the capital structures of the proxy group when**
9 **assessing a fair capital structure for PGS?**

10 A. The cost of equity of any particular company is necessarily connected with its capital
11 structure. This is because there is a direct relationship between risk and return. That
12 is, the higher (lower) risk, the higher (lower) expected return. All else held constant,
13 companies with higher amounts of leverage have higher levels of financial risk. Since
14 we are using a proxy group of companies to assess a fair cost of equity estimate for
15 PGS, we must also factor in the capital structures of those companies into the analysis
16 – failing to do so is an analytical error. Since PGS's debt ratio is lower and the equity
17 ratio is higher than the proxy group average, it has less financial risk than the proxy
18 group. This discrepancy in debt ratio and equity ratio must be accounted for. This
19 issue will be discussed in more detail below in my Hamada model analysis.

¹⁰² Exhibit DJG-15.

1 **Q. Please describe the debt ratios recently observed in competitive U.S. industries.**

2 A: There are nearly 2,000 companies in the U.S. with debt ratios higher than 50% and
3 equity ratios lower than 50%.¹⁰³ The following figure shows a sample of these
4 industries with debt ratios higher than 56% and equity ratios lower than 44%.

¹⁰³ Exhibit DJG-16.

1
2

Figure 16:
Industries with Debt Ratios Greater than 56%

Industry	# Firms	Debt Ratio
Air Transport	21	84%
Hotel/Gaming	69	82%
Hospitals/Healthcare Facilities	34	82%

Trucking	35	61%
Packaging & Container	25	61%
Power	48	60%
Telecom. Services	49	60%
Telecom (Wireless)	16	60%
R.E.I.T.	223	60%
Auto & Truck	31	59%
Utility (General)	15	59%
Household Products	127	58%
Office Equipment & Services	16	58%
Environmental & Waste Services	62	57%
Utility (Water)	16	57%
Retail (Distributors)	69	57%
Transportation	18	57%
Green & Renewable Energy	19	57%
Total / Average	1,349	65%

3 Many of the industries shown here, like public utilities, are generally well-established
4 industries with large amounts of capital assets. The shareholders of these industries

1 generally prefer these higher debt ratios to maximize their profits. There are several
 2 notable industries that are relatively comparable to public utilities. For example, the
 3 Cable TV, Telecom, Power, and Water Utility industries have debt ratios of at least
 4 60% and equity ratios of 40% or lower.

5 **Q. Please summarize the results of your capital structure analyses and your**
 6 **recommendation regarding capital structure.**

7 A. The results of my analyses are summarized in the following figure:

8 **Figure 17:**
 9 **Capital Structure Analysis – Summary of Results**

Source	Debt Ratio	Equity Ratio
Cable TV	68%	32%
Power	60%	40%
Telecom (Wireless)	60%	40%
Proxy Group of Utilities	51%	49%
PGS Proposed	45%	55%

10 As shown in this figure, PGS’s proposed debt ratio is clearly too low (and its equity
 11 ratio is too high). This results in excessively high capital costs and utility rates. My
 12 analysis indicates that PGS’s total debt ratio for ratemaking should be 51%, and the
 13 equity ratio should be no more than 49%.

14 **B. The Hamada Model: Capital Structure’s Effect on ROE**

15 **Q. Have you considered the impact that your capital structure recommendation**
 16 **could have on the company’s indicated cost of equity?**

17 A. Yes. I assessed the impact of my capital structure proposal on the Company’s cost of
 18 equity estimate by using the Hamada model.

1 **Q. What is the premise of the Hamada model?**

2 A. The Hamada formula can be used to analyze changes in a firm's cost of capital as it
3 adds or reduces financial leverage, or debt, in its capital structure by starting with an
4 "unlevered" beta and then "relevering" the beta at different debt ratios. As leverage
5 increases, equity investors bear increasing amounts of risk, leading to higher betas.
6 Before the effects of financial leverage can be accounted for, however, the effects of
7 leverage must first be removed, which is accomplished through the Hamada formula.
8 The Hamada formula for unlevering beta is stated as follows:¹⁰⁴

9 **Equation 4:**
10 **Hamada Formula**

$$\beta_U = \frac{\beta_L}{\left[1 + (1 - T_c) \left(\frac{D}{E}\right)\right]}$$

where: β_U = unlevered beta (or "asset" beta)
 β_L = average levered beta of proxy group
 T_c = corporate tax rate
 D = book value of debt
 E = book value of equity

11 Using Equation 4, the beta for the firm can be unlevered, and then "relevered" based
12 on various debt ratios (by rearranging this equation to solve for β_L).

13 **Q. Please summarize the results of the Hamada formula based on your proposed**
14 **capital structure for the company.**

15 A. The average capital structure of the proxy group consists of 51% debt and 49% equity.
16 Because PGS's debt ratio is so much lower than that of the proxy group, when we
17 "relever" PGS relative to the proxy group, it results in a much lower ROE than if PGS

¹⁰⁴ Damodaran *supra* n. 18, at 197. This formula was originally developed by Hamada in 1972.

1 had been operating with a capital structure equal to that of the proxy group. This makes
 2 sense because PGS is much less risky relative to the proxy group due to the decreased
 3 amount of debt in its capital structure. The results of my Hamada model are presented
 4 in the figure below.¹⁰⁵

5 **Figure 18:**
 6 **Hamada Model ROE**

Unlevering Beta			
Proxy Debt Ratio	51%	[1]	
Proxy Equity Ratio	49%	[2]	
Proxy Debt / Equity Ratio	1.0	[3]	
Tax Rate	25%	[4]	
Equity Risk Premium	5.6%	[5]	
Risk-free Rate	3.8%	[6]	
Proxy Group Beta	0.84	[7]	
Unlevered Beta	0.47	[8]	
[9]	[10]	[11]	[12]
Relevered Betas and Cost of Equity Estimates			
Debt Ratio	D/E Ratio	Levered Beta	Cost of Equity
0%	0.0	0.47	6.4%
20%	0.3	0.56	6.9%
30%	0.4	0.63	7.3%
40%	0.7	0.71	7.8%
45%	0.8	0.77	8.1%
51%	1.0	0.84	8.5%
60%	1.5	1.01	9.4%

¹⁰⁵ Exhibit DJG-17.

1 According to the results of the Hamada model, if the Commission adopts my capital
2 structure recommendation, PGS's indicated cost of equity estimate (under the CAPM)
3 would be 8.5%. However, if the Commission accepts PGS's proposed capital structure,
4 the Company's cost of equity estimate would be 8.1%.

PART TWO: DEPRECIATION

5 **X. DEPRECIATION STANDARDS AND SYSTEMS**

6 **Q. Discuss the standard by which regulated utilities are allowed to recover**
7 **depreciation expense.**

8 A. In *Lindheimer v. Illinois Bell Telephone Co.*, the U.S. Supreme Court stated that
9 “depreciation is the loss, not restored by current maintenance, which is due to all the
10 factors causing the ultimate retirement of the property. These factors embrace wear
11 and tear, decay, inadequacy, and obsolescence.”¹⁰⁶ The *Lindheimer* Court also
12 recognized that the original cost of plant assets, rather than present value or some other
13 measure, is the proper basis for calculating depreciation expense.¹⁰⁷ Moreover, the
14 *Lindheimer* Court found:

¹⁰⁶ *Lindheimer v. Illinois Bell Tel. Co.*, 292 U.S. 151, 167 (1934).

¹⁰⁷ *Id.* (Referring to the straight-line method, the *Lindheimer* Court stated that “[a]ccording to the principle of this accounting practice, the loss is computed upon the actual cost of the property as entered upon the books, less the expected salvage, and the amount charged each year is one year’s pro rata share of the total amount.”). The original cost standard was reaffirmed by the Court in *Federal Power Commission v. Hope Natural Gas Co.*, 320 U.S. 591, 606 (1944). The *Hope* Court stated: “Moreover, this Court recognized in [*Lindheimer*], *supra*, the propriety of basing annual depreciation on cost. By such a procedure the utility is made whole and the integrity of its investment maintained. No more is required.”

1 [T]he company has the burden of making a convincing showing that the
2 amounts it has charged to operating expenses for depreciation have not
3 been excessive. That burden is not sustained by proof that its general
4 accounting system has been correct. The calculations are mathematical,
5 but the predictions underlying them are essentially matters of opinion.¹⁰⁸

6 Thus, the Commission must ultimately determine if the Company has met its burden
7 of proof by making a convincing showing that its proposed depreciation rates are not
8 excessive.

9 **Q. Should depreciation represent an allocated cost of capital to operation, rather**
10 **than a mechanism to determine loss of value?**

11 A. Yes. While the *Lindheimer* case and other early literature recognized depreciation as
12 a necessary expense, the language indicated that depreciation was primarily a
13 mechanism to determine loss of value.¹⁰⁹ Adoption of this “value concept” would
14 require annual appraisals of extensive utility plant, and thus, is not practical in this
15 context. Rather, the “cost allocation concept” recognizes that depreciation is a cost of
16 providing service, and that in addition to receiving a “return on” invested capital
17 through the allowed rate of return, a utility should also receive a “return of” its invested
18 capital in the form of recovered depreciation expense. The cost allocation concept also
19 satisfies several fundamental accounting principles, including verifiability, neutrality,
20 and the matching principle.¹¹⁰ The definition of “depreciation accounting” published
21 by (a predecessor to) the American Institute of Certified Public Accountants
22 (“AICPA”) properly reflects the cost allocation concept:

¹⁰⁸ *Id.* at 169.

¹⁰⁹ See Frank K. Wolf & W. Chester Fitch, *Depreciation Systems* 71 (Iowa State University Press 1994).

¹¹⁰ National Association of Regulatory Utility Commissioners, *Public Utility Depreciation Practices* 12 (NARUC 1996).

1 Depreciation accounting is a system of accounting that aims to distribute
2 cost or other basic value of tangible capital assets, less salvage (if any),
3 over the estimated useful life of the unit (which may be a group of
4 assets) in a systematic and rational manner. It is a process of allocation,
5 not of valuation.¹¹¹

6 Thus, the concept of depreciation as “the allocation of cost has proven to be the most
7 useful and most widely used concept.”¹¹²

8 **Q. Discuss the definition and purpose of a depreciation system, as well as the**
9 **depreciation system you employed in this case.**

10 A. The legal standards set forth above do not mandate a specific procedure for conducting
11 a depreciation analysis. These standards, however, direct that analysts use a system for
12 estimating depreciation rates that will result in the “systematic and rational” allocation
13 of capital recovery for the utility. Over the years, analysts have developed
14 “depreciation systems” designed to analyze grouped property in accordance with this
15 standard. A depreciation system may be defined by several primary parameters: 1) a
16 *method* of allocation; 2) a *procedure* for applying the method of allocation; 3) a
17 *technique* of applying the depreciation rate; and 4) a *model* for analyzing the
18 characteristics of vintage property groups.¹¹³ In this case, I used the straight line
19 method, the average life procedure, the remaining life technique, and the broad group
20 model to analyze the Company’s actuarial data; this system would be denoted as an
21 “SL-AL-RL-BG” system. This depreciation system conforms to the legal standards set
22 forth above and is commonly used by depreciation analysts in regulatory proceedings.

¹¹¹ American Institute of Accountants, *Accounting Terminology Bulletins Number 1: Review and Résumé* 25 (American Institute of Accountants 1953).

¹¹² Frank K. Wolf & W. Chester Fitch, *Depreciation Systems* 73 (Iowa State University Press 1994).

¹¹³ Frank K. Wolf & W. Chester Fitch, *Depreciation Systems* 70 (Iowa State University Press 1994).

1 I provide a more detailed discussion of depreciation system parameters, theories, and
2 equations in Appendix C.

3 **XI. SERVICE LIFE ANALYSIS**

4 **Q. Describe the process you used to estimate service lives for the Company's**
5 **accounts.**

6 A. The study of retirement patterns of industrial property is derived from the actuarial
7 process used to study human mortality. Just as actuarial analysts study historical
8 human mortality data in order to predict how long a group of people will live,
9 depreciation analysts study historical plant data in order to estimate the average lives
10 of property groups. The most common actuarial method used by depreciation analysts
11 is called the “retirement rate method.” In the retirement rate method, original property
12 data, including additions, retirements, transfers, and other transactions, are organized
13 by vintage and transaction year.¹¹⁴ The retirement rate method is ultimately used to
14 develop an “observed life table,” (“OLT”) which shows the percentage of property
15 surviving at each age interval.

16 An OLT curve by itself, however, is rarely a smooth curve, and is often not a
17 “complete” curve (i.e., it does not end at zero percent surviving). To calculate average
18 life (the area under a curve), a complete survivor curve is needed. The Iowa curves are
19 empirically derived curves based on the extensive studies of the actual mortality
20 patterns of many different types of industrial property. The curve-fitting process

¹¹⁴ The “vintage” year refers to the year that a group of property was placed in service (aka “placement” year). The “transaction” year refers to the accounting year in which a property transaction occurred, such as an addition, retirement, or transfer (aka “experience” year).

1 involves selecting the best Iowa curve to fit the OLT curve. This can be accomplished
2 through a combination of visual and mathematical curve-fitting techniques, as well as
3 professional judgment. The first step of my approach to curve-fitting involves visually
4 inspecting the OLT curve for any irregularities. For example, if the “tail” end of the
5 curve is erratic and shows a sharp decline over a short period of time, it may indicate
6 that this portion of the data is less reliable, as further discussed below. After inspecting
7 the OLT curve, I use a mathematical curve-fitting technique which essentially involves
8 measuring the distance between the OLT curve and the selected Iowa curve in order to
9 get an objective, mathematical assessment of how well the curve fits. After selecting
10 an Iowa curve, I observe the OLT curve along with the Iowa curve on the same graph
11 to determine how well the curve fits. I may repeat this process several times for any
12 given account to ensure that the most reasonable Iowa curve is selected.¹¹⁵

13 **Q. Do you always select the mathematically best-fitting curve?**

14 A. No. Mathematical curve fitting is an important part of the curve-fitting process because
15 it promotes objective, unbiased results. While mathematical curve fitting is important,
16 however, it may not always yield the optimum result; therefore, it should not
17 necessarily be adopted without further analysis.

18 **Q. Should every portion of the OLT curve be given equal weight?**

19 A. Not necessarily. Many analysts have observed that the points comprising the “tail end”
20 of the OLT curve may often have less analytical value than other portions of the curve.

¹¹⁵ See Appendix D for a more detailed discussion of Iowa curves; see Appendix E for a more detailed discussion of actuarial analysis.

1 In fact, “[p]oints at the end of the curve are often based on fewer exposures and may
2 be given less weight than points based on larger samples. The weight placed on those
3 points will depend on the size of the exposures.”¹¹⁶ In accordance with this standard,
4 an analyst may decide to truncate the tail end of the OLT curve at a certain percent of
5 initial exposures, such as one percent. Using this approach puts a greater emphasis on
6 the most valuable portions of the curve. For my analysis in this case, I not only
7 considered the entirety of the OLT curve, but I also conducted further analyses that
8 involved fitting Iowa curves to the most significant part of the OLT curve for certain
9 accounts. In other words, to verify the accuracy of my curve selection, I narrowed the
10 focus of my additional calculation to consider the top 99% of the “exposures” (*i.e.*,
11 dollars exposed to retirement) and to eliminate the tail end of the curve representing
12 the bottom 1% of exposures.

13 **Q. Please describe the data bands you considered in your service life analysis.**

14 A. In service life analysis, data “bands” refer to the period of placement and experience
15 years being analyzed. According to Mr. Watson, “[p]lacement bands were used to
16 illustrate the composite history over a specific era, and experience bands were used to
17 focus on retirement history for all vintages during a set period.”¹¹⁷ In his workpapers,
18 Mr. Watson presents the results of several different banding periods for each account
19 in the depreciation studies as part of his service life analysis. Generally, I reviewed
20 and considered all of this information, as well as the other information presented in the

¹¹⁶ Frank K. Wolf & W. Chester Fitch, *Depreciation Systems* 46 (Iowa State University Press 1994).

¹¹⁷ Direct Testimony of Dane A. Watson, Exhibit No. DAW-1, Document No. 2.

1 depreciation studies and Mr. Watson's testimony. In the account-specific graphs
2 below, I present OLT curves that are comprised of placement and experience years
3 from 1983-2021, which is also one of the banding periods Mr. Watson apparently
4 considered.¹¹⁸ While I also considered the other banding periods Mr. Watson
5 presented, I focused on OLT curves under the 1983-2021 placement and experience
6 bands because this time period strikes a good balance between considering a sufficient
7 amount of data for analysis and considering relatively newer data. In this particular
8 case, most of the accounts discussed below have been affected by asset replacement
9 programs in which relatively newer assets may have different life characteristics than
10 older assets. Thus, it can be instructive to focus on relatively newer vintage years when
11 conducting analyses.

12 **Q. Is there a trade-off from an analytical perspective from focusing on relatively**
13 **newer vintage years?**

14 A. Yes. While analyzing relatively newer vintages may give better indications of
15 remaining life for a group of assets, the trade-off is that the OLT curves derived from
16 the data are relatively shorter. This means that a wider range of Iowa curves may
17 provide relatively close fits to the OLT curve.

¹¹⁸ See Exhibit DJG-34 for OLTs considered from the depreciation study workpapers and used in the following graphs to compare Iowa curves.

1

A. Account 376.00 – Steel Mains

2

Q. Describe your service life estimate for this account and compare it with the Company's estimate.

3

4 A.

The observed survivor curve is derived from the OLT calculated from the Company's aged plant data. Thus, as set forth above, the OLT curve is not an estimate; rather, it represents actual data and retirement experience. The OLT curve is represented by the black triangles in each of the following figures. Mr. Watson selected the R1.5-65 Iowa curve for this account, and I selected the R1.5-70 Iowa curve. Both Iowa curves are displayed in the graph below, along with the OLT curve.

10

Figure 19:

11

Account 376 – Steel Mains

1 As shown in the graph, both Iowa curves provide relatively close fits throughout the
2 OLT curve. As discussed in the depreciation study, a cast iron and bare steel
3 replacement program “ramped up” beginning in 2013, and the assets retired came from
4 vintages from the 1930s – 1960s.¹¹⁹ Thus, it can be instructive to focus on relatively
5 newer vintages in this account for statistical analyses.

6 **Q. Does the Iowa curve you selected provide a better mathematical fit to the OLT**
7 **curve for this account?**

8 A. Yes. While it is sometimes clear from a visual perspective which Iowa curve provides
9 a closer fit to the observed data, the results can also be verified mathematically.
10 Mathematical curve fitting essentially involves measuring the distance between the
11 OLT curve and the selected Iowa curve. The best mathematically-fitted curve is the
12 one that minimizes the distance between the OLT curve and the Iowa curve, thus
13 providing the closest fit. The “distance” between the curves is calculated using the
14 “sum-of-squared differences” (“SSD”) technique. Specifically, the SSD between the
15 Company’s curve and the OLT curve is 0.0047, and the SSD between the R1.5-70 curve
16 I selected and the OLT curve is 0.0008, which means it results in a closer mathematical
17 fit to the OLT curve.¹²⁰

¹¹⁹ Direct Testimony of Dane A. Watson, Exhibit DAW-1, Document 2, p. 34.

¹²⁰ Exhibit DJG-29.

B. Account 376.02 – Plastic Mains

2 **Q. Describe your service life estimate for this account and compare it with the**
3 **Company’s estimate.**

4 A. For this account, Mr. Watson selected the R2-75 curve, and I selected the R2-82 curve.
5 Both curves are shown in the graph below, along with the OLT curve.

6 **Figure 20:**
7 **Account 376.02 – Plastic Mains**

8 As shown in this graph, both Iowa curves provide relatively close fits to the OLT curve.
9 According to the depreciation study, the Company’s Problematic Plastic Pipe
10 replacement program that began around since 2015 focused on early 1970s vintage

1 pipe.¹²¹ Thus, it can be instructive to focus on relatively newer vintages in this account
2 for statistical analyses.

3 **Q. Does the Iowa curve you selected provide a better mathematical fit to the OLT**
4 **curve for this account?**

5 A. Yes. The SSD between the Company's Iowa curve and the OLT curve is 0.0039, and
6 the SSD between the R2-82 Iowa curve I selected and the OLT curve is 0.0032, which
7 means it results in a slightly closer fit.¹²²

8 **C. Account 379 – Measuring and Regulating Station Equipment – City Gate**

9 **Q. Describe your service life estimate for this account and compare it with the**
10 **Company's estimate.**

11 A. For this account, Mr. Watson selected the R2-52 curve, and I selected the R2-60 curve.
12 Both Iowa curves are shown in the graph below, along with the OLT curve.

¹²¹ Direct Testimony of Dane A. Watson, Exhibit DAW-1, Document 2, p. 37.

¹²² Exhibit DJG-30.

1
2

Figure 21:
Account 379 – M&R Station Equipment – City Gate

3 Due to the shape of the OLT curve for Account 379, selecting an Iowa curve that results
4 in a very close fit (as with the two accounts discussed above) results in an unreasonably
5 long service life estimate for this account. Thus, both Iowa curves do not give much
6 statistical weight to the data towards the end of the OLT curve. However, the Iowa
7 curve selected by Mr. Watson is notably shorter than the curve shape the data points
8 otherwise indicate throughout the majority of this OLT curve. According to the
9 depreciation study, the Company is beginning to build new city gates and is doing more
10 capital improvements than in the past. In addition, the depreciation study
11 acknowledges that newer stations are expected to last longer than older ones, and that

1 “[a]ctuarial analysis also shows a longer life for this account ¹²³ While I agree with
2 Mr. Watson that the service life should be longer for this account, I do not believe that
3 his proposed average life of 52 years is long enough given the data presented at this
4 time.

5 **Q. Does the Iowa curve you selected provide a better mathematical fit to the OLT**
6 **curve for this account?**

7 A. Yes. The SSD between the Company’s Iowa curve and the OLT curve is 0.1242, and
8 the SSD between the R2-60 Iowa curve I selected and the OLT curve is 0.0417, which
9 means it results in a slightly closer fit.¹²⁴

10 **D. Account 380.02 – Plastic Services**

11 **Q. Describe your service life estimate for this account and compare it with the**
12 **Company’s estimate.**

13 A. For this account, Mr. Watson selected the R2.5-55 curve, and I selected the R2-62
14 curve. Both Iowa curves are shown in the graph below, along with the OLT curve.

¹²³ Direct Testimony of Dane A. Watson, Exhibit DAW-1, Document 2, pp. 42-43.

¹²⁴ Exhibit DJG-31.

1
2

Figure 22:
Account 380.02 – Plastic Services

3 As shown in this graph, both Iowa curves result in relatively close fits to this OLT
 4 curve. According to the depreciation study, when steel mains are replaced, where there
 5 is a plastic service, they will replace with a plastic service. Mr. Watson also believes
 6 that the actuarial analysis for this account supports a 55-year average life, but the graph
 7 presented in the depreciation study for this account considers placement years dating
 8 back to 1959. The more recent placement band used in my graph above indicates a
 9 slightly longer service life (albeit based on a shorter OLT curve).

1 **Q. Does the Iowa curve you selected provide a better mathematical fit to the OLT**
2 **curve for this account?**

3 A. Yes. The SSD between the Company's Iowa curve and the OLT curve is 0.0028, and
4 the SSD between the R2-62 Iowa curve I selected and the OLT curve is 0.0012, which
5 means it results in a slightly closer fit.¹²⁵

6 **E. Account 382 – Meter Installations**

7 **Q. Describe your service life estimate for this account and compare it with the**
8 **Company's estimate.**

9 A. For this account, Mr. Watson selected the R1.5-45 curve, and I selected the R0.5-55
10 curve. Both of these Iowa curves are shown in the graph below, along with the OLT
11 curve.

¹²⁵ Exhibit DJG-32.

1
2

**Figure 23:
Account 382 – Meter Installations**

3 The unusual shape of the OLT curve for this account makes it impractical to find an
 4 Iowa curve that provides as close a fit compared with the other accounts presented
 5 above. Nonetheless, the relevant retirement data comprising the OLT curve should be
 6 considered in the curve-fitting process to a greater extent than what is suggested by Mr.
 7 Watson’s Iowa curve selection. The R1.5 curve-type does not have a sufficiently flat
 8 shape and trajectory to reflect the retirement pattern displayed in the OLT curve (albeit
 9 an unusual one).

1 **Q. Does the Iowa curve you selected provide a better mathematical fit to the OLT**
2 **curve for this account?**

3 A. Yes. The SSD between the Company's Iowa curve and the OLT curve is 0.0892, and
4 the SSD between the R0.5-55 Iowa curve I selected and the OLT curve is 0.0345, which
5 means it results in a slightly closer fit.¹²⁶

6 **XII. THEORETICAL RESERVE SURPLUS**

7 **Q. Please describe the theoretical reserve.**

8 A. In contrast to the book reserve, the theoretical reserve represents the accumulated
9 depreciation balance that would currently exist, in theory, if the currently-approved
10 depreciation parameters (i.e. life and net salvage) had been implemented throughout
11 the life of the assets being studied. There is almost always a difference between the
12 book reserve and theoretical reserve, particularly because both calculations are always
13 changing. If the book reserve exceeds the theoretical reserve, this imbalance is called
14 a reserve deficiency (since, in theory, the utility should have a higher accumulated
15 depreciation balance). In contrast, if the theoretical reserve exceeds the book reserve,
16 it creates a reserve surplus.

17 **Q. Do remaining life depreciation rates allocate the reserve imbalance over the**
18 **remaining life o plant?**

19 A. Yes. The key feature of remaining life depreciation rates (as opposed to whole life
20 depreciation rates), is that the perpetual imbalance between the book and theoretical
21 reserve is mathematically allocated over the remaining life of plant. Thus, in most

¹²⁶ Exhibit DJG-33.

1 cases a separate or manual reserve imbalance allocation or amortization is not
2 conducted. However, the greater the reserve imbalance is, the more appropriate it
3 arguably becomes to consider a manual reserve amortization over a period of time that
4 is shorter than the composite remaining life of plant in order to rectify the imbalance
5 more quickly.

6 **Q. Is the reserve imbalance significant in this case?**

7 A. Yes. To be clear, the amount of the reserve imbalance will depend on the depreciation
8 parameters authorized by the Commission. However, even if the Commission adopts
9 Mr. Watson's proposed depreciation parameters without any adjustment, it will still
10 result in a reserve surplus of about \$120 million.¹²⁷ This represents a reserve variation
11 percentage of 15% (which is calculated by dividing the total reserve variation by the
12 total theoretical reserve). In this case, the amount of the reserve imbalance will also
13 depend on whether the Commission adopts OPC's primary recommendation to
14 authorize depreciation rates based on plant and reserve balances at year-end 2023
15 instead of year-end 2024.

16 **Q. How many reserve imbalance calculations are available depending on the**
17 **Commission's decisions?**

18 A. There are at least four reserve surplus calculations the Commission can consider,
19 depending on its findings regarding the appropriate depreciation study date and

¹²⁷ Mr. Watson and I calculated a substantially similar reserve surplus under the Company's proposed depreciation parameters. See Direct Testimony of Dane A. Watson, p. 24, line 9 (in which he calculates a reserve surplus of \$119.6 million); see also Exhibit DJG-23 (which shows my calculated reserve surplus of \$120.2 million).

1 depreciation parameters.¹²⁸ The total reserve surplus calculations are presented in the
2 following figure:¹²⁹

3 **Figure 24:**
4 **Reserve Surplus Amount by Scenario**

	Recommendation and Alternatives	Reserve Surplus
1	<ul style="list-style-type: none"> • Adopt depreciation rates based on plant at 12-31-23 • Adopt OPC's proposed service life adjustments 	\$ 221,024,192
2	<ul style="list-style-type: none"> • Adopt depreciation rates based on plant at 12-31-23 • Adopt PGS's proposed service lives 	\$ 159,474,313
3	<ul style="list-style-type: none"> • Adopt depreciation rates based on plant at 12-31-24 • Adopt OPC's proposed service lives 	\$ 186,552,361

5 The fourth outcome would be based on adopting Mr. Watson's proposed depreciation
6 parameters without adjustment (resulting in a reserve surplus of about \$120 million).

7 **Q. Regardless of the ultimate amount of the reserve surplus, what is OPC's position**
8 **regarding the amortization period?**

9 A. As discussed in the direct testimony of OPC witness Lane Kollen, it is OPC's
10 recommendation that the reserve imbalance be amortized over a period of 10 years.

¹²⁸ Since other intervenors may recommend various service life and net salvage adjustments, and the Commission may adopt such adjustments on an account-by account basis, there are many possible reserve surplus outcomes. However, the different scenarios presented in my testimony essentially result in four primary outcomes.

¹²⁹ See Exhibits DJG-22, DJG-27, and DJG-28; see also Exhibits DJG-38 and DJG-39 for 2023 adjusted and unadjusted reserve development, respectively.

1 **Q. Have you also presented depreciation rates based on using your adjusted**
2 **theoretical reserve balances instead of the book reserve?**

3 A. Yes. I have calculated two additional scenarios which use my theoretical reserve
4 surplus calculations as the reserve balances used to calculate remaining life
5 depreciation rates (one for the 2023 Study, and one for the 2024 study.¹³⁰ Under these
6 scenarios, the reserve surplus itself would not be used to directly reduce the annual
7 depreciation rate accrual, but instead could be treated entirely separate from the annual
8 accrual amount.¹³¹

9 **Q. Does this conclude your testimony?**

10 A. Yes. To the extent I have not addressed an issue, method, calculation, account, or other
11 matter relevant to the Company's proposals in this proceeding, it should not be
12 construed that I agree with the same.

¹³⁰ See Exhibit DJG-21 and Exhibit DJG-25.

¹³¹ See the direct testimony of OPC witness Lane Kollen for further discussion.

1 BY MS. CHRISTENSEN:

2 Q Mr. Garrett, did you prefile with your
3 testimony 42 exhibits attached to it, labeled DJG-1
4 through DJG-42?

5 A Yes.

6 Q And do you have any corrections to your
7 exhibits?

8 A No.

9 Q I would ask at this time that you present your
10 summary of your testimony?

11 A All right.

12 My direct testimony in this case addressed the
13 cost of capital and fair rate of return for PGS in
14 response to the direct testimony of company witness
15 Dylan D'Ascendis. I also address the company's proposed
16 depreciation rates in response to the direct testimony
17 of company witness Dane Watson, who conducted PGS's
18 depreciation study.

19 Regarding the cost of capital issues, PGS
20 proposes an awarded ROE of 11 percent, PGS also proposes
21 a capital structure consisting of approximately 55
22 percent equity and 45 percent total debt.

23 PGS has proposed an excessive awarded ROE in
24 this case in that it greatly exceeds a reasonable
25 estimate of its cost of equity. Analysis of an

1 appropriate awarded ROE for a utility should begin with
2 a reasonable estimate of a utility's cost of equity. In
3 estimating PGS's cost of equity, I analyzed proxy group
4 of utility companies with relatively similar risk
5 profiles. Based on this proxy group, I evaluated the
6 results of the two most widely used model for of
7 calculating -- for estimating cost of equity in utility
8 rate proceedings, the Capital Asset Pricing Model and
9 Discounted Cash Flow Model, or CAPM and DCF models.

10 The results of my cost of equity models
11 indicate a range for PGS's cost of equity from 7.5
12 percent to 8.5 percent. The range of cost of equity
13 estimates is relatively wide in this case because of the
14 discrepancy between PGS's proposed capital structure and
15 the proxy group's average capital structure.

16 PGS's proposed debt ratio of 45 percent is
17 notably lower than the average debt ratio of the proxy
18 group, which is 51 percent. This means that PGS has
19 less financial risk relative to the proxy group. Thus,
20 in order for the indicated cost of equity under the CAPM
21 to be accurate, we must adjust the result based on PGS's
22 lower risk profile. We can accomplish this through a
23 mathematical model called the Hamada Model.

24 Application of the Hamada Model shows that
25 PGS's cost of equity under its equity rich capital

1 structure is only 8.1 percent. However, if we impute a
2 ratemaking capital structure for PGS that is equal to
3 the proxy group average, then PGS's cost of equity is
4 8.5 percent.

5 I recommend the Commission adopt a 9.0 percent
6 awarded ROE for PGS. I also recommend the Commission
7 adopt a ratemaking capital structure for PGS consisting
8 of an equity ratio that is equal to the average equity
9 ratio of the proxy group, which is 49 percent.

10 Despite the fact that the indicated cost of
11 equity for PGS under my CAPM analysis is only 8.5
12 percent, it is my opinion that a nine-percent awarded
13 ROE for PGS is reasonable under the circumstances. This
14 is primarily due to the fact that PGS's current awarded
15 ROE of 9.9 percent is significantly higher than a
16 reasonable estimate of the company's market-based cost
17 of equity.

18 One could argue that it is preferable for
19 awarded ROEs to gradually change rather than abruptly.
20 An awarded ROE of 9.0 percent would partially mitigate
21 the excess wealth transfer from Florida customers to
22 shareholders, while gradually moving the company toward
23 actual market-based cost of equity.

24 Regarding depreciation issues, company witness
25 Mr. Watson proposed depreciation rates based on

1 projected plant and reserve balances as of December
2 31st, 2024. The depreciation rates proposed by Mr.
3 Watson result in a proposed annual depreciation increase
4 of \$9 million. In addition, Mr. Watson calculates a
5 reserve surplus of \$120 million as of this depreciation
6 study date.

7 I analyzed Mr. Watson's depreciation study as
8 of December 31st, 2024, which we referred to as the 2024
9 study, and I recommend service life adjustments for
10 several accounts, including OPC's service life
11 adjustments, OPC's primary recommendation for
12 depreciation rates and the reserve surplus are based on
13 plant and reserve balances based on December 31st, 2023,
14 for the 2023 study.

15 Adopting my proposed service life adjustments
16 under the 2023 study results in an annual depreciation
17 accrual of 77.9 million, and equates to an adjustment
18 reducing the company's proposed annual depreciation
19 accrual by 16 million. In addition, my adjusted service
20 life parameters under the 2023 study results in a
21 calculated depreciation surplus of \$221 million.

22 It is OPC's recommendation to amortize the
23 reserve surplus adopted by the Commission over 10 years.
24 In the event the Commission does not adopt our primary
25 recommendation, I also presented alternative

1 recommendations.

2 The first alternative approach would be to
3 adopt all of Mr. Watson's proposed service lives and net
4 salvage rates, but still have a depreciation rate and
5 reserve surplus calculations based on plant and reserve
6 balances at December 31st, 2023. This approach results
7 in an adjustment reducing the company's proposed
8 depreciation accrual by \$9.2 million, and it results in
9 a reserve surplus of \$159 million.

10 OPC's second alternative for consideration is
11 to apply my service life adjustments to calculate the
12 depreciation rate and reserve surplus to the 2024
13 depreciation study. This approach results in an
14 adjustment reducing the company's proposed depreciation
15 accrual by \$7.5 million, and it results in a reserve
16 surplus of \$187 million.

17 This concludes my testimony summary.

18 MS. CHRISTENSEN: We tender the witness for
19 cross.

20 CHAIRMAN FAY: Okay. Thank you, Ms.
21 Christensen.

22 Mr. Garrett, just real quick before I tender
23 you for cross. I am not sure if you followed any
24 of the previous witnesses for this docket, but what
25 we ask witnesses to do are answer a yes or no. If

1 Q Is it correct that based on this number, you
2 calculated a theoretical reserve surplus in the amount
3 of \$221 million? That would be found in Exhibit DJG-27
4 on page two.

5 A DJG-27 on page two? Yes.

6 Q And OPC witness Kollen recommended to amortize
7 this amount of surplus over 10 years in his direct
8 testimony, correct?

9 A Yes. That's right.

10 Q Please look at the footnotes of Exhibit
11 DJG-25, specifically footnotes six through nine. Let me
12 know when you are back there.

13 A Okay.

14 Q Is it correct that your proposed depreciation
15 rates shown on column nine were determined by
16 subtracting theoretical reserve in column five from
17 depreciable base in column four, and then dividing that
18 result by the remaining life in years in column seven?

19 A Yes.

20 Q I would now like to direct your attention to
21 Commission Rule 25-7.045, Florida Administrative Code,
22 you should have gotten a copy of that earlier. Do you
23 see that rule?

24 A I don't believe I have that.

25 Q You would have gotten a copy of it this

1 **morning.**

2 A I did receive a document this morning that's
3 dealing with treasury yields.

4 MS. CHRISTENSEN: Correct. We did not receive
5 that exhibit that you are talking about, the copy
6 of the rule.

7 CHAIRMAN FAY: I will just give you a moment
8 and make sure we've got it. If not, we can email
9 it to you, Mr. Garrett, so just -- can we do that?

10 Mr. Garrett. I know you can't see us, but
11 just bear with us for one second. We want to make
12 sure we've got it in front of you before this line
13 of questioning.

14 BY MR. DOSE:

15 Q **All right. We just sent you an email of a**
16 **copy of it.**

17 A Okay. I don't see it yet. I am also in the
18 case -- the on-line case portal, the case assignment --
19 I forgot what you call it now, but --

20 Q **Case Center.**

21 A Right. I -- for some reason, I don't have the
22 pending emails, but.

23 MR. DOSE: Did you get an email of it yet?

24 MS. CHRISTENSEN: We received --

25 THE WITNESS: Not yet.

1 MS. CHRISTENSEN: Yeah, I was going to say, we
2 received the earlier email regarding the 30-year
3 treasury lives, but we haven't seen this email come
4 through yet.

5 MR. SANDY: I'm sending a copy to all the
6 parties again to make sure everybody's got it.

7 CHAIRMAN FAY: Okay. We will give it a
8 second. And I say this only half jokingly, Mr.
9 Garrett, but make sure you didn't put us in spam or
10 junk mail maybe.

11 THE WITNESS: I did double check that, and I
12 don't see anything there either.

13 CHAIRMAN FAY: Okay. The other option, at
14 least, Mr. Dose, I mean, we can obviously refer him
15 to the administrative code and the rules, but we
16 will give it a second, Mr. Garrett, because there
17 is really no reason, if you received the treasury
18 exhibit of that same email, that you wouldn't have
19 received this.

20 And are you -- Ms. Christensen, are you
21 receiving either of these?

22 MS. CHRISTENSEN: I received a copy of the
23 first email that was sent by Mr. Sandy this morning
24 at 9:08, along with Mr. Garrett. And that's the
25 only email we've received regarding staff exhibits.

1 CHAIRMAN FAY: Okay. So the one that was just
2 sent, you don't have yet?

3 MS. CHRISTENSEN: It's not coming through yet.

4 CHAIRMAN FAY: Okay.

5 MS. CHRISTENSEN: He does have access to the
6 case management system. If the rule has been
7 uploaded there, we might be able to access it
8 through that.

9 CHAIRMAN FAY: Yeah. I am not sure if it's on
10 Case Center. We will wait.

11 MR. DOSE: It should be available on Case
12 Center now.

13 CHAIRMAN FAY: Okay. Can you help get him
14 there?

15 THE WITNESS: I am on Case Center. The page I
16 see says, case assignment and scheduling record.

17 CHAIRMAN FAY: No, that wouldn't be it.

18 MR. REHWINKEL: The email just showed up.

19 CHAIRMAN FAY: That's good news.

20 THE WITNESS: Is there somewhere else I need
21 to go on Case Center?

22 CHAIRMAN FAY: Do we know where it's uploaded?
23 And it does seem like, Mr. Garrett, that Mr.
24 Rehwinkel just received the email that Mr. Sandy
25 sent out, so you still don't see anything on your

1 end?

2 MS. CHRISTENSEN: It looks like the email came
3 through. Is it coming through on you your end?

4 THE WITNESS: It's not yet.

5 MS. CHRISTENSEN: Okay. If you can check case
6 management, do you have your -- your ability to
7 have the little tickers on for auto follow and auto
8 direction under present? Do you have those on?

9 THE WITNESS: No, I don't yet, but I am
10 turning them on right now. Auto follow. Auto
11 direction. They are on now.

12 MR. SANDY: And I would encourage Mr. Garrett
13 to refresh, that may also assist, but if need be,
14 we can resend it.

15 THE WITNESS: I did get --

16 CHAIRMAN FAY: He just got your email.

17 THE WITNESS: I did get the email now, yeah.

18 MS. CHRISTENSEN: Okay. Wonderful.

19 CHAIRMAN FAY: We will give you a second to go
20 ahead and open up that exhibit.

21 THE WITNESS: Okay.

22 CHAIRMAN FAY: And I know for purposes of the
23 record, this is our rule, but we will go ahead and
24 number this 190.

25 (Whereupon, Exhibit No. 190 was marked for

1 identification.)

2 BY MR. DOSE:

3 Q All right. Mr. Garrett, do you have that rule
4 pulled up now?

5 A I do.

6 Q Okay. Would you please look at rule Section
7 (1)(e), which contains the Commission's formula for
8 remaining life rate. Let me know when you see that.

9 A Okay.

10 Q Is it the correct that the rule's prescribed
11 way to determine to the remaining life rate is by
12 subtracting book reserve for depreciable base, and then
13 dividing that result by the average remaining life in
14 years?

15 A In addition to net salvage, yes.

16 Q Okay. So is it correct that you subtracted
17 theoretical reserve from depreciable base in your
18 calculation of depreciation rather than book reserve, as
19 the rule prescribes?

20 A I think for just the purposes of this
21 calculation, I was working with Lane Kollen on this, and
22 we wanted to present a set of depreciation rates that
23 considered the theoretical reserve. It's not our
24 primary recommendation, but in this particular set of
25 rates, we are subtracting the theoretical reserve in

1 that numerator.

2 Q Okay. So you are subtracting theoretical
3 reserve instead of book reserve?

4 A Yes, in Exhibit DJG-25, for this set of rates.

5 Q Okay. So moving on to your ROE calculations.
6 You recommended an allowed return on equity of 9.0
7 percent, is that correct?

8 A Yes.

9 Q And would you agree that PGS's current allowed
10 ROE is 9.9 percent?

11 A Yes.

12 Q So you are recommending that the Commission
13 reduce PGS's allowed ROE by 90 basis points, correct?

14 A Yes.

15 Q And in your testimony, you said that this will
16 allow PGS to maintain its financial integrity with the
17 ROE of 9.0 percent, is that accurate?

18 A Yes.

19 Q Did you perform any quantitative analysis to
20 determine what affect or a reduction of 90 basis points
21 to PGS's allowed ROE would have in its financial
22 integrity, or financial metrics?

23 A Well, the analysis I performed is the cost of
24 equity analysis. And with the awarded ROE being set
25 higher than the company's cost of equity, that should,

1 under efficient, prudent and economical management,
2 allow PGS an opportunity to remain financially healthy.

3 Q Okay. But you didn't perform any quantitative
4 analysis on what effect this reduction would have?

5 A Not outside of the -- all of the analysis
6 presented in my testimony and exhibits.

7 Q Did you perform any separate analysis?

8 A There is no analysis that I performed that I
9 did not present in my testimony and workpapers.

10 Q And did you testify in PGS's rate case in
11 2020?

12 A Yes.

13 Q Okay. To clarify for the record, that was
14 Docket No. 20200051-GU. And in the 2020 rate case, you
15 recommended an allowed ROE of 9.5 percent, is that
16 correct?

17 A Yes.

18 Q And in that same 2020 rate case, you testified
19 that based on your quantitative analysis of the market
20 cost of equity, you testified that the market cost of
21 equity for PGS was 6.9 percent, correct?

22 A Yes. That's right.

23 Q And in this rate case, you have testified that
24 based on your quantitative analysis, the market cost of
25 equity for PGS is 8.1 percent if PGS uses an equity

1 **ratio of 54.7 percent, correct?**

2 A Yes. That's right.

3 **Q Okay. So you would agree, then, that your**
4 **financial modeling in your testimony indicates that the**
5 **market-based cost of equity has increased by at least**
6 **120 basis points, or 1.2 percent, since the 2020 rate**
7 **case?**

8 A Yes, from 6.9 percent -- if you are using the
9 8.1 percent number in this case and the 6.9 percent
10 number in the previous case, then that's accurate and
11 shouldn't be too big of a surprise given the increases
12 in the -- well, essentially the risk rate, which is
13 driven by interest rates.

14 **Q And did you use the same financial modeling**
15 **techniques and assumptions in this case as you did in**
16 **the 2020 case to determine your market-based cost of**
17 **equity for PGS?**

18 A Essentially, yes, I would have conducted a
19 CAPM and DCF model in those -- in the 2020 case as well.

20 **Q And did you make any adjustments to the**
21 **results of your financial models in this case to reflect**
22 **PGS's separation from Tampa Electric into its own**
23 **stand-alone corporation?**

24 A I made no separate quantitative adjustment for
25 that.

1 Q Okay. So no?

2 A No. I mean, when you -- yeah, I have not done
3 that.

4 Q Would you agree that your recommended ROE of
5 9.0 percent is 50 basis points lower than the ROE of 9.5
6 percent that you recommended in 2020, even though your
7 analysis indicates the cost of equity has increased?

8 A Yes, both of my recommendations in each case
9 were based on gradualism, and necessarily gradualism has
10 to depend on your starting point and your ending point.
11 The starting point being the current authorized ROE, and
12 the ending point ideally moving toward market-based cost
13 of equity. So in that regard, the recommendations are
14 consistent, but you are correct about the numbers, the
15 9.5 percent and the 9.0 percent.

16 Q And on pages 14 and 15 of your direct
17 testimony, you cited the U.S. Supreme Court's Hope
18 decision. You of stated that the Hope decision makes it
19 clear that the allowed return on equity should be based
20 on the actual cost of capital, is that correct?

21 A Yes.

22 Q Is there any definitive statement in the
23 Supreme Court's Hope decision that states the allowed
24 ROE should be based on the actual cost of capital?

25 A Those exact words aren't stated in the

1 decision. I think that's my interpretation of it, and I
2 don't think it's one that is controversial or really
3 disputed. I don't think I have ever really heard, like,
4 an opposing witness or a utility witness dispute that
5 point, so I think it's fairly well agreed on.

6 **Q But there is no definitive statement in the**
7 **actual decision?**

8 A Right. That -- those words exactly don't
9 appear in the opinion.

10 **Q Okay. Moving onto your DCF model. You used**
11 **the Constant Growth Rate Discounted Cash Flow Model in**
12 **your cost of equity analysis, correct?**

13 A Yes. I relied on two different variations of
14 the DCF model, and one I do refer to as a sustainable
15 growth rate model, if that's what you are referring to.
16 I guess they are both constant growth rate models, but
17 one is using analyst growth rates for the growth rate
18 input, and the other one is using -- is considering the
19 growth rate on U.S. GDP as kind of a cap for long-term
20 growth.

21 **Q And in your DCF model, you use a sustainable**
22 **growth rate of 3.9 percent, correct?**

23 A Yes, in that variation of the DCF model.

24 **Q And this 3.9 percent is the nominal gross**
25 **domestic product as reported by the Congressional Budget**

1 **Office's 2022 long-term budget outlook, correct?**

2 A Yes.

3 **Q You used the GDP as the growth rate in your**
4 **DCF model because you believed that the long-term growth**
5 **of a utility such as PGS can't exceed the growth of the**
6 **aggregate economy, correct?**

7 A I think when conducting the DCF as a cost of
8 equity model, that GDP growth can be considered as a
9 cap. Quantitatively, utilities earnings, of course, can
10 grow by more than that. A lot of that would depend on,
11 you know, the rates set by commissions and other things.
12 But when we are trying to estimate cost of equity, I
13 think fundamentally, we should consider, at least
14 consider and see the results of this model that uses GDP
15 as a cap on long-term growth.

16 **Q But you would agree that it's possible for a**
17 **utility, including a utility like PGS, to grow at a rate**
18 **greater than the GDP of 3.9 percent for an extended**
19 **period of time?**

20 A For an extended period, yeah, theoretically it
21 could grow, I mean, if you had a commission that was
22 awarding go -- just to make this is a very simple
23 hypothetical, but if they wanted a 10-percent rate
24 increase every year, and the Commission awarded that,
25 perhaps earnings would grow by 10 percent per year

1 forever -- well, not forever, but for a long time. But
2 eventually if, you know, an earnings growth rate is
3 higher than GDP, that company's earnings would he
4 eventually surpass GDP.

5 So I don't think it's disputed that that is an
6 impossibility. I realize that could be many -- that
7 could be quite a bit in the future, but mathematically
8 that is what would occur. And so that's why -- this is
9 not an idea I came up with, of course, but many analysts
10 would say you have got to be careful on your constant
11 growth rate input not being too high.

12 **Q Could you please turn to Exhibit DJG-14, and**
13 **let me know when you are there.**

14 A Okay. I am there.

15 **Q In column two, you list the average annualized**
16 **-- average annual authorized ROE for gas utilities. For**
17 **2022, what is the average authorized ROE?**

18 A In this exhibit, showing 9.53 percent.

19 **Q And where did you obtain that information?**

20 A I believe I obtained that from other cases
21 that were reporting that based on the EEI data, or
22 perhaps from the RRA regulatory focus. One of those
23 two.

24 **Q Okay. Does RRA regulatory focus sound more**
25 **accurate?**

1 A It's possible that it -- that that number did
2 come from there. And I can't recall, as I sit here,
3 whether that was all cases, or litigated cases, or what.
4 But I am kind of presenting this number as just a
5 general example to show a trend, of course, not basing
6 my recommendation on that number.

7 Q **Would the RRA major rate case decisions sound**
8 **right?**

9 A Yes. Yes.

10 Q **Now, if you could please turn to Exhibit**
11 **DJG-12, and let me know when you are there.**

12 A Okay. I am there.

13 Q **This page summarizes the results of your CAPM**
14 **analysis, is that correct?**

15 A Yes.

16 Q **And to derive the CAPM result of 8.5 percent,**
17 **you used the risk-free rate of 3.8 percent, is that**
18 **correct?**

19 A Yes.

20 Q **And on Exhibit DJG-8, you calculated the**
21 **risk-free rate, is that correct?**

22 A Yes.

23 Q **And you used the daily treasury yield curves**
24 **on 30-year U.S. Treasury bonds from April 14th, 2023,**
25 **through May 25th, 2023; is that correct?**

1 A Yes.

2 Q And the average daily rate you calculated was
3 3.81 percent, correct?

4 A Yes.

5 Q Are you aware of what the current 30-year U.S.
6 Treasury bond yield is today?

7 A Oh, today, or for yesterday.

8 Q Yesterday.

9 A Yes.

10 Q And what is that?

11 A I have that --

12 Q And what is that as of September 13th?

13 A It's 4.34 percent.

14 Q And if you used 4.34 percent in your CAPM
15 analysis, the updated result would be 9.05 percent,
16 would you degree, subject to check?

17 A If we just changed that one number?

18 Q Yes.

19 A If you just changed the one number, it would
20 have an increasing effect. Of course, you know, that's
21 not how the modeling -- it's, you know, not advisable to
22 do that with the modeling. You would want to conduct
23 the full -- the full modeling to reflect any other
24 market changes. But if you wanted to cherrypick that
25 one -- that one metric and just increase it, it would

1 have an increasing affect on the results.

2 And another example of that is, like, the
3 equity risk premium, since I filed this testimony, Kroll
4 has downgraded their equity risk premium estimate from
5 six to five-and-a-half percent. So that would have a
6 decreasing affect on the results. So, you know, it just
7 highlights that you wouldn't want to just change one
8 metric.

9 But the answer to your question is, yes, if
10 you just increased the risk-free rate based on the
11 treasury yield, it would have an increasing affect on
12 the CAPM results.

13 **Q Okay. But would you agree that interest rates**
14 **have gone up significantly since you did your analysis?**

15 A They've gone up. They could go back down, you
16 know. They are always -- they are always changing.

17 **Q Okay. And again, just one more time, subject**
18 **to check, would you say that 9.05 percent would be**
19 **accurate based on the current treasury bond yield?**

20 A If you just want to change that one metric.
21 Yes, if you just changed that, it would be about nine
22 percent, which is equal to my recommendation,
23 interestingly enough.

24 MR. DOSE: Okay. No further questions. Thank
25 you.

1 CHAIRMAN FAY: Okay. Commissioners? No.
2 Redirect?

3 FURTHER EXAMINATION

4 BY MS. CHRISTENSEN:

5 Q Mr. Garrett, have you ever been involved in a
6 case where an ROE witness has provided a quantitative
7 analysis of the impact of a recommended change in the
8 ROE on a -- on the financial health of a utility?

9 A No, I have never seen that, and I think I
10 asked it in discovery too, and, you know, the responses
11 aren't very fruitful from the utility, because, I mean,
12 it would involve assuming, I mean, every single
13 financial decision the company is going to make going
14 forward, you know, it's basically entire financial
15 picture in all of its decisions it's going to make, and
16 how that could impact cash flow and credit ratings. So
17 any model that I represent is, of course, going to be
18 picked apart, it could be by anybody, because I am
19 having to assume all the decisions a company is going to
20 make going forward.

21 What the Commission should focus on is setting
22 a fair awarded ROE that should be based on, at least the
23 starting place, the cost of equity. And then at that
24 point, when it's built into the revenue requirement, you
25 are essentially turning it over to the company then to

1 manage the company in an efficient and economical
2 manner. But the Commission can know that at that point
3 it's given the company the opportunity to do that.
4 There is no predict whether it whether or not. I don't
5 have any reason to believe that company management is
6 not capable of doing that. I am sure they are. But at
7 that point, the onus is on them to do that.

8 **Q And would it ever be appropriate for an ROE**
9 **witness to give such an opinion?**

10 A Well, I don't know if it would be
11 inappropriate, but it would be unusual. As I said to
12 your previous question, I don't think I have ever seen
13 -- if I have understanding the analysis that was being
14 asked about, I don't think I have ever seen an analysis
15 quiet like that.

16 **Q Okay. And if the cost of equity is**
17 **established lawfully and accurately by the Commission,**
18 **and is lower than previously lawfully and accurately**
19 **established cost of equity, can the utility claim that**
20 **its financial health has been degraded by the**
21 **Commission?**

22 A Can you repeat that one more time?

23 **Q Sure.**

24 **If the cost of equity is established lawfully**
25 **and accurately by the Commission, and then is lower --**

1 and is lower than a previously lawfully and accurately
2 established cost of equity, can the utility claim that
3 its financial health has been degraded by the
4 Commission?

5 A I don't think so. I mean, under a certain
6 hypothetical, if an awarded ROE, which I have never even
7 scene, I don't, think proposed in any case, if is it was
8 just so punitively low, five percent -- I don't know
9 what it would be -- I am sure at some point the utility
10 could say, hey, even under the greatest management, you
11 are putting us in financial trouble, Commission. But in
12 the United States, in the history of regulation, I have
13 never seen an ROE, awarded ROE that low.

14 Q And do you recall being asked by staff counsel
15 regarding your opinion that the Hope decision requires
16 that you base the awarded ROE on the actual cost of
17 capital, do you recall that testimony?

18 A Yes.

19 Q And, Mr. Garrett, you have testified in
20 numerous jurisdiction across the country, correct?

21 A Yes, in about half the states.

22 Q Okay. In those jurisdictions, do they require
23 for an ROE to be established that a market-based
24 analysis be presented to establish that ROE?

25 A I am not aware of a Commission rule that

1 specifically requires that, if that's what you are
2 asking.

3 Q I am not asking about a rule. But as a matter
4 of course, when you present ROE testimony in the other
5 jurisdictions, do -- is it generally accepted and
6 generally presented, you use a discounted cash flow
7 model and a CAPM model to establish what the ROE would
8 be?

9 A Yes. That's what I was trying to explain on
10 cross, is that I have never seen that -- I mean, I make
11 this point in every testimony, you know, this part of my
12 testimony is generally repeated in all of my testimony
13 when I am talking about the basic standards, and utility
14 witnesses like Mr. D'Ascendis generally do the same
15 thing.

16 And that point that I have made about my kind
17 of interpretation of Hope, I don't recall that that's
18 ever been disputed or a contentious issue. And kind of
19 to your question, every witness is presenting the CAPM
20 and DCF, because what they are essentially saying is
21 this is my estimate for the company's cost of equity.
22 And sometimes the cost of equity estimate lines up
23 exactly with the witness' awarded ROE recommendation.
24 But in this particular case, and in the 2020 PGS case,
25 my awarded ROE recommendation is higher than my cost of

1 equity estimate based on gradualism.

2 Q And I believe you talked a little bit about
3 gradualism. Were you -- are you aware of what the
4 awarded ROE was in the prior case in 2008, 2009
5 timeframe for PGS, as compared to what you recommended
6 in the 2020 case?

7 A I believe at the time, PGS's current
8 authorized ROE was 10.75 percent. So we were
9 historically low interest rates at the time, so it's not
10 surprising that if you are really running the CAPM model
11 in an objective, you know, academically sound way, it's
12 going to be a low result during that very low interest
13 rate environment.

14 So when I was talking earlier about the
15 starting place and ending place, PGS's current
16 authorized ROE at the time was 10.75 percent, and I am
17 estimating a seven-percent cost of equity. Well, that's
18 a pretty big gap that would, when you are applying
19 gradualism to, that's where I got to the 9.5 percent,
20 because in my judgment, I felt like that was a
21 substantial move, but still one that was fair at the
22 time.

23 And in this case, our starting point and
24 ending point is different. We are starting at 9.9
25 percent. The ending point I am saying, let's say

1 ideally, if you are moving toward market-based cost of
2 equity, which is about 8.5 percent, in my opinion, with
3 the capital structure adjustment, then nine percent
4 represents a similar type of gradual move, a meaningful
5 but still a gradual one.

6 **Q Okay. Thank you.**

7 MS. CHRISTENSEN: I have no further questions.

8 CHAIRMAN FAY: Okay. Let's see here. You
9 have exhibits, Ms. Christensen?

10 MR. SANDY: Excuse me, Mr. Chair, I believe we
11 have a very limited recross that is within the
12 scope of the redirect, if the Chair will permit it.

13 CHAIRMAN FAY: Yes. I mean, I will allow some
14 fairly -- that redirect got a little bit broad, but
15 if you could make sure you keep your questioning
16 narrow to that redistrict, then.

17 MR. DOSE: Just one question.

18 FURTHER EXAMINATION

19 BY MR. DOSE:

20 **Q Mr. Garrett, would you agree that credit**
21 **rating agencies consider awarded ROEs in setting a**
22 **credit rating?**

23 A I believe they do -- they do consider it. I
24 think they are primarily concerned with cash flow
25 metrics, but, yes, I mean, they do consider that, is my

1 understanding.

2 MR. DOSE: Nothing further. Thank you.

3 CHAIRMAN FAY: Okay.

4 All right. Ms. Christensen, exhibits?

5 MS. CHRISTENSEN: Yes. I would move Mr.
6 Garrett's exhibits, I think it's 63 through 104.

7 CHAIRMAN FAY: That is what I have also.

8 Staff, does that sound right, 63 through 104
9 on the CEL? All right. Without objection show
10 those entered.

11 (Whereupon, Exhibit Nos. 63-104 were received
12 into evidence.)

13 CHAIRMAN FAY: All right. And then, staff, we
14 have Exhibit 190, which was the rule, I believe.

15 MR. DOSE: I think that's right.

16 CHAIRMAN FAY: Yeah. We will go ahead and
17 just enter that just to keep everything organized,
18 without objection? All right. So show that rule
19 entered.

20 (Whereupon, Exhibit No. 190 was received into
21 evidence.)

22 CHAIRMAN FAY: All right. With that, Ms.
23 Christensen.

24 MS. CHRISTENSEN: Yes, I would ask that Mr.
25 Garrett be excused.

1 CHAIRMAN FAY: Okay. Mr. Garrett, thank you
2 for your time this morning.

3 THE WITNESS: Thank you all.

4 (Witness excused.)

5 (Transcript continues in sequence in Volume
6 7.)

CERTIFICATE OF REPORTER

STATE OF FLORIDA)
COUNTY OF LEON)

I, DEBRA KRICK, Court Reporter, do hereby certify that the foregoing proceeding was heard at the time and place herein stated.

IT IS FURTHER CERTIFIED that I stenographically reported the said proceedings; that the same has been transcribed under my direct supervision; and that this transcript constitutes a true transcription of my notes of said proceedings.

I FURTHER CERTIFY that I am not a relative, employee, attorney or counsel of any of the parties, nor am I a relative or employee of any of the parties' attorney or counsel connected with the action, nor am I financially interested in the action.

DATED this 18th day of September, 2023.

DEBRA R. KRICK
NOTARY PUBLIC
COMMISSION #HH31926
EXPIRES AUGUST 13, 2024
