

BEFORE THE
FLORIDA PUBLIC SERVICE COMMISSION

DOCKET NO. 20220048-EI

**TAMPA ELECTRIC'S
2022-2031
STORM PROTECTION PLAN**

REBUTTAL TESTIMONY

OF

DAVID L. PLUSQUELLIC

FILED: June 21, 2022

BEFORE THE FLORIDA PUBLIC SERVICE COMMISSION

REBUTTAL TESTIMONY

OF

DAVID L. PLUSQUELLIC

TABLE OF CONTENTS:

INTRODUCTION.....	1
REBUTTAL TO DIRECT TESTIMONY OF LANE KOLLEN.....	3
REBUTTAL TO DIRECT TESTIMONY OF KEVIN J. MARA.....	5

INTRODUCTION:

Q. Please state your name, address, occupation, and employer.

A. My name is David L. Plusquellic. I am employed by Tampa Electric Company ("Tampa Electric" or "company") as Director Storm Protection and Support Services. My business address is 820 South 78th Street, Tampa, FL 33619.

Q. Are you the same David L. Plusquellic who filed direct testimony in this proceeding?

A. Yes, I am.

1 **Q.** What is the purpose of your rebuttal testimony in this
2 proceeding?

3
4 **A.** The purpose of my rebuttal testimony is to address the
5 deficiencies and misconceptions in the direct testimony
6 of Lane Kollen and Kevin J. Mara, both of whom are
7 testifying on behalf of the Office of Public Counsel.

8
9 **Q.** Do you have any general comments regarding the overall
10 direct testimony of Lane Kollen and Kevin J. Mara?

11
12 **A.** Yes. Both witnesses are critical of the processes utilized
13 by the Commission and the company and recommend
14 modifications to the company's proposed 2022-2031 Storm
15 Protection Plan ("SPP"). This criticism principally goes
16 unsupported, and I do not support any modifications to the
17 company's SPP as filed.

18
19 In addition, Mr. Mara proposes elimination of Tampa
20 Electric's Substation Program, Transmission Access
21 Enhancement Program, and the automation and software
22 components of the Overhead Feeder Hardening Program on the
23 grounds that they will not reduce both restoration costs
24 and outage times. He also proposes seemingly arbitrary
25 reductions in the proposed capital investment for the

1 Distribution Lateral Undergrounding Program. As I explain
2 below, Mr. Mara's proposed cuts are based on
3 misunderstandings of Tampa Electric's programs and, if
4 approved, would deprive our customers of storm resiliency
5 benefits.

6
7 The company's proposed SPP was prepared as a customer-
8 focused program using rigorous analytical tools and
9 engineering and operational judgment. It strikes a
10 reasonable balance between the costs of the Plan, the
11 restoration cost and outage benefits anticipated from the
12 Plan, the impact of the Plan on customers' bills and the
13 intangible benefits to Florida and its citizens associated
14 with mitigating the impact of extreme weather to our
15 electric grid. I will address the points raised by OPC's
16 witnesses and encourage the Commission to approve the
17 company's SPP as originally proposed.

18
19 **REBUTTAL TO THE DIRECT TESTIMONY OF LANE KOLLEN**

20 **Q.** On page 26 of his testimony, Mr. Kollen states that Tampa
21 Electric's SPP warehouse and SPP materials and supplies
22 "should not be included in any company's SPP." Do you
23 agree with this critique?

24
25 **A.** No. At the proposed investment levels, the company's SPP

1 group anticipates issuing \$30-\$40 million of materials on
2 an annual basis. None of the company's existing storage
3 locations has enough space to accommodate this volume of
4 materials. Spreading this volume of SPP materials between
5 multiple locations was impractical from a logistics and
6 operations standpoint. A single and separate physical
7 location promotes efficient and cost-effective
8 operations. Disallowing this standalone, dedicated
9 warehouse would likely result in a net cost increase to
10 customers, because the company would need to identify
11 multiple additional company locations and/or a new site
12 to be included for cost recovery in base rates. The
13 company believes that the cost of transporting materials
14 between multiple locations would be more expensive than
15 this more efficient, standalone site.

16
17 **Q.** Mr. Kollen argues on pages 10 and 23 of his testimony
18 that the Commission should require a credit for avoided
19 O&M expenses due to the SPP to plant investments and SPP
20 O&M expenses. Do you agree?

21
22 **A.** The Commission should not adopt Mr. Kollen's proposal to
23 credit the SPP clause to reflect the impact SPP
24 expenditures may have on base rates. Although there may
25 be some savings in the future, the company does not have

1 enough experience with the SPP or the data needed to
2 prepare a reasonable estimate and any effort to do so now
3 would be speculative. Tampa Electric and certain parties
4 are operating under a base rate settlement agreement that
5 extends until the end of 2024. A mechanism like the one
6 proposed by Mr. Kollen potentially could have been
7 negotiated into the settlement, but it was not. In any
8 event, the Commission will have full authority to assess
9 the level of O&M expenses recoverable through base rates
10 when the company files its next general request for base
11 rate relief.

12
13 **REBUTTAL TO DIRECT TESTIMONY OF KEVIN J. MARA:**

14 **Q.** On page 6 of his testimony, Mr. Mara offers an
15 interpretation of Rule 25-6.030 (the "SPP Rule") under
16 which a proposed program must reduce both restoration
17 costs and outage times to be eligible for inclusion in a
18 company's SPP. Do you agree with this proposed two-prong
19 test?

20
21 **A.** No. Although I am not an attorney, I do not read Section
22 366.96 (the "SPP Statute") or the SPP Rule as setting out
23 this strict two-prong test and I think the Commission
24 should decline to adopt it. Reducing restoration costs
25 and outage times benefit customers, so either type of

1 benefit should be sufficient to justify a SPP project.
2 Even if the Commission does adopt this test, however, the
3 company's proposed SPP programs would all pass this test
4 since they are all expected to provide both restoration
5 cost reductions and outage time reductions. The company
6 provided these reductions as listed in the table on bates
7 stamped page 103 of the company's proposed 2022-2031 SPP.
8

9 **Q.** On page 8 of his testimony, Mr. Mara uses sectionalizing
10 equipment and replacement of bridges on transmission
11 access roads as examples of projects that would fail his
12 two-pronged test. Do you agree that these types of
13 projects fail Mr. Mara's test?
14

15 **A.** No. First, the company demonstrated both restoration cost
16 and outage time reductions for all of its proposed SPP
17 programs in the table on bates stamped page 103 of the
18 company's 2022-2031 SPP. Second, the company's
19 automation and sectionalizing program will result in both
20 reduced restoration times and restoration costs, as I will
21 explain further below in my rebuttal testimony. Third,
22 Mr. Mara misunderstands the access enhancement program
23 proposed by the company. The company is not replacing
24 bridges "like for like" as stated by witness Mara. As
25 explained on bates stamped page 81 of the company's 2022-

1 2031 SPP, the company is replacing old bridges that were
2 rated/sized for smaller vehicles with higher rated and
3 bigger bridges that can support the movement of the more
4 current larger trucks and heavy equipment. In addition,
5 the company is installing new bridges for additional
6 access points and more permanent rock roads. The bigger
7 bridges and more permanent roads will withstand nature
8 for a much longer duration than the company's current
9 practices or bridges and access points, so the company's
10 access enhancement program is in effect "hardening" or
11 "strengthening" as contemplated in the SPP statute.

12
13 **Q.** On page 9 of his testimony, Mr. Mara asserts that the
14 company is attempting to include "aging infrastructure"
15 programs in Tampa Electric's 2022-2031 SPP. He considers
16 deployment of automation equipment, reclosers, trip
17 savers, vegetation contact detection software, locational
18 awareness software, access roads, and access bridges to
19 be aging infrastructure programs. Do you concur?

20
21 **A.** Not at all. These are new programs or significant
22 expansions of existing programs, and all provide
23 significant storm protection benefits for customers. As
24 OPC's witness Mr. Kollen concedes on page 11 of his
25 testimony, it is appropriate for the company to include

1 "new programs and projects or the expansion of existing
2 programs and projects that are not within the scope of
3 its existing base rate programs and cost recoveries in
4 the normal course of business". All of the programs that
5 witness Mara proposes to cut meet one or both of those
6 criteria.

7
8 **Q.** On page 10 of his testimony, Mr. Mara states that Tampa
9 Electric has increased the company's planned capital
10 expenditures by \$109 million (or 7 percent) over the new
11 10-year period when compared to the company's first Plan.
12 Is this an accurate characterization?

13
14 **A.** On the surface the math is correct, but it fails to
15 recognize that the first year of the Plan (2020) was both
16 a partial year (April to December) and it was the first
17 year of the Distribution Lateral Undergrounding Program,
18 which was still ramping up. It also fails to acknowledge
19 that despite unprecedented inflation in both material and
20 labor, the company is projecting essentially flat
21 spending over 10 years. The company anticipates continued
22 efficiency in the execution of the programs and has
23 incorporated that into the 10-year Plan by not escalating
24 costs annually to account for anything more than normal
25 inflation.

1 **Q.** On page 12 of his testimony, Mr. Mara states: "In my
2 opinion, the only practical limit to the magnitude of the
3 SPP budgets was the limitation of resources in terms of
4 engineers and construction personnel realistically
5 available to complete the annual goals of the program."
6 Do you agree with this statement?

7
8 **A.** No. While Mr. Mara is correct that the company did
9 consider the ability to obtain and retain labor resources
10 in determining the investment levels that were possible
11 for each program. That was just one of many variables
12 that were included in the discussion on the program and
13 total Plan investment levels. In addition to labor market
14 constraints, the company was also acutely aware of the
15 potential rate impacts of various investment levels. With
16 potential rate impacts in mind, 1898 & Co. ran multiple
17 scenarios to determine the point at which additional
18 levels of investment, and their associated rate impacts,
19 do not result in materially greater benefits. The company
20 then evaluated scenarios for each program that resulted
21 in total investment levels within the ranges identified
22 by the budget optimization analysis. While the exact
23 rate impact was not known at the outset of the budgeting
24 process, the company was aware of estimated rate impacts
25 throughout the entirety of the planning process. The

1 company's proposed SPP strikes a reasonable balance
2 between storm protection and customer bill impacts. In
3 fact, according to page 6 of Mr. Kollen's testimony, Tampa
4 Electric's proposed Plan has the lowest ten-year
5 investment per customer of the plans being considered by
6 the Commission.

7
8 **Q.** On page 12 of his testimony, Mr. Mara argues that 1898's
9 budget optimization analysis "ignored the rate impact to
10 customers" associated with its proposed SPP investments.
11 Do you agree with this statement?

12
13 **A.** No. This statement is misleading. As Mr. Mara appears to
14 concede, the purpose of 1898's budget optimization
15 analysis was to quantify the expected restoration cost
16 and outage time reduction benefits associated with
17 various levels of investment and to determine the point
18 at which additional levels of investment do not result in
19 materially greater restoration cost and outage time
20 benefits. The company was acutely aware of the potential
21 rate impacts throughout the planning process even though
22 rate impacts were considered separately. It also
23 recognized that reducing outage time provides intangible
24 benefits to customers that are often difficult to quantify
25 in a financial model. Once the proposed budget level was

1 set, the company calculated the actual rate impact of the
2 Plan to determine whether those rate impacts were
3 reasonable as compared to the expected benefits. The
4 company believes that the rate impacts are reasonable
5 given the benefits anticipated from the proposed Plan.
6

7 **Q.** On pages 13 and 14 of his testimony, Mr. Mara asserts
8 that the company should reduce its proposed investment
9 level in part because the company did not prioritize the
10 equipment "that is the most vulnerable to extreme
11 storms...in the early stages of the program..." Do you agree
12 with this statement?
13

14 **A.** No, this statement is inaccurate. Projects were
15 prioritized based on the highest resiliency benefit cost
16 ratio, where resilience benefits are the sum of the
17 avoided restoration costs and monetized avoided customer
18 outages. Tampa Electric witness Jason De Stigter
19 describes this approach on pages 11-12 of his direct
20 testimony. It should be noted that the company prepared
21 the business justification in alignment with the statute,
22 or in terms of decrease in restoration costs in dollars
23 and decrease in customer outages in customer minutes
24 interrupted ("CMI"). For the purpose of prioritization
25 and establishing levels of total investment, the company

1 monetized the CMI to calculate the resiliency benefit in
2 dollars to produce a benefit cost ratio.

3
4 **Q.** On page 14 of his testimony, Mr. Mara recommends cutting
5 the company's proposed spending level in half. Do you
6 agree with this analysis and this proposal?

7
8 **A.** No, first the analysis basis is inappropriate. The
9 benefits assessment for the company's proposed 2022-2031
10 SPP is in alignment with the statute since it calculates
11 the benefits in terms of decrease in restoration costs
12 and customer outages. As described in the Plan, for the
13 purpose of project prioritization and establishing the
14 overall investment level the customer outages were
15 monetized. Mr. Mara uses the budget optimization
16 assessment as the overall benefits for the Plan which is
17 inappropriate and not aligned with the statute. Second,
18 Mr. Mara's analysis and approach isn't wholly customer
19 centric over the arc of time. The company's Plan
20 prioritizes the most beneficial investment early in the
21 period but takes a long-term view to harden the system
22 for as many customers as possible. Mr. Mara's approach
23 would limit the number of customers that could be hardened
24 leaving many customers exposed to major events over the
25 next 50 years.

1 **Q.** On page 16 of his testimony, Mr. Mara compares Tampa
2 Electric's historical storm restoration costs of \$111
3 million over the last five years with what he refers to
4 as the "annual avoided restoration costs for the 10-year
5 SPP ranges from \$380-\$531 million." Is this comparison
6 accurate?

7
8 **A.** No. Mr. Mara incorrectly asserts that the \$380-\$531
9 million figure is the projected annual avoided costs.
10 What he is actually comparing is the company's total
11 restoration costs over the last five years with the
12 projected 50-year restoration cost savings resulting from
13 the Plan, which is a mismatched comparison. This is
14 depicted in Figure 7-1 on bates stamped page 204 of the
15 company's 2022-2031 SPP. As Mr. Mara admits, the
16 company's projection estimates restoration costs of \$963-
17 \$1,313 million over the next 50 years, which would average
18 out to about \$19.26-\$26.26 million per year. A more
19 reasonable comparison would be the company's actual
20 restoration costs of \$111 million over the last five years
21 with the company's projected average restoration costs
22 over five years of \$96.3-\$131.3 million. This comparison
23 shows that the company's projected amounts are reasonable
24 compared to its historical amounts.

1 **Substation Hardening Program**

2 **Q.** On pages 18-19 of his testimony, Mr. Mara asserts that
3 the company should have designed all its substations
4 constructed or upgraded after 1973 to meet Standard ASCE-
5 24-14 Flood Resistant Design and Construction and that
6 any substation that is not designed to meet those
7 standards were imprudently designed and should be
8 excluded from the SPP. Does Tampa Electric design its
9 substations to meet this standard?

10
11 **A.** Tampa Electric designs all assets to meet or exceed
12 standards that are in place at the time. Tampa Electric's
13 substations would have been designed to the standard in
14 effect at the time they were constructed. When equipment
15 is replaced or upgraded at a substation, the company
16 brings it up to the current standard at the time when the
17 investment is made. The company does not upgrade the
18 remainder of the substation at that time to keep control
19 of costs. Furthermore, the referenced flooding standard
20 was not developed to address storm surge. One of the
21 purposes of the Substation Hardening program is to
22 mitigate potential outages caused by storm surge. Tampa
23 Electric evaluated storm surge potential using the Sea,
24 Land, and Overland Surges from Hurricanes ("SLOSH") Model
25 and determined that the substations included in this

1 program have risk over and above the flooding risk that
2 the company must design to under ASCE-24-14. Substations
3 are vital components of the company's distribution
4 system, so protecting the ones that are subject to storm
5 surge risk should be included in the company's SPP.

6
7 **Q.** Do you agree with Mr. Mara's proposed change to this
8 program on pages 19-20 which would exclude any substation
9 with an alternate feed that would allow load to be
10 transferred to an alternative substation?

11
12 **A.** No. I do not. The nine substations included in this
13 program were selected in part because they serve critical
14 load. The Hookers Point, South Gibsonton, and Jackson
15 Road substations tie various components of the
16 transmission system together. Loss of one of these
17 substations could also trigger the loss of interconnected
18 transmission lines. Several of the other substations
19 selected serve critical loads such as downtown Tampa,
20 Tampa International Airport, MacDill Air Force Base, Big
21 Bend Generating Station, and the Port of Tampa.
22 Continuity of service to this critical load is even more
23 important in extreme weather. Mr. Mara's proposal would
24 do nothing to address the risk of a loss of service to
25 critical facilities if that load could not be switched to

1 another substation. Tampa Electric's proposal addresses
2 this by hardening the primary source of power to these
3 critical interconnection points and critical facilities.
4

5 **Distribution Overhead Feeder Hardening**

6 **Q.** What is Mr. Mara's recommendation for the Tampa Electric's
7 Distribution Overhead Feeder Hardening Program?
8

9 **A.** Mr. Mara has separate recommendations for the feeder
10 strengthening, automation, and software components of
11 this Program. All three recommendations should be
12 rejected.
13

14 **Q.** What are his recommendations for the feeder strengthening
15 component of the program?
16

17 **A.** Mr. Mara concedes on page 21 of his testimony that the
18 strengthening component, or building to Grade B with
19 extreme wind loading, will reduce restoration costs and
20 outage times. He nevertheless then goes on to recommend
21 reducing the planned spending for this program to the
22 2020-2029 SPP level of \$10 million per year.
23

24 **Q.** Do you agree with this recommendation for the feeder
25 strengthening component of the Program?

1 **A.** No. First, the investment level proposed by Mr. Mara is
2 arbitrary and appears to be based solely on his personal
3 judgment. He has not identified specific projects to be
4 delayed or justified why delaying them would be consistent
5 with the policy goals in the SPP statute.

6
7 Second, reducing the investment levels of this or any
8 program will only delay the realization of the benefits
9 anticipated from the company's SPP. For the company's
10 SPP to have the greatest impact for all customers by
11 reducing restoration costs and outage times, a
12 significant portion of the company's system needs to be
13 protected. Limiting the company's proposed spending on
14 this program might still allow all customers to benefit
15 from some restoration cost reductions but would also allow
16 a much smaller number of customers to benefit from reduced
17 outage times. The company has sufficiently demonstrated
18 the benefits of the proposed programs and the investment
19 levels proposed in all Plan filings to date.

20
21 **Q.** Do you agree with Mr. Mara's recommendation on page 21 of
22 his testimony to exclude all sectionalizing and switching
23 projects from the SPP and his assertion that these
24 projects will not reduce restoration costs and outage
25 times?

1 **A.** No. I disagree with this assertion for several reasons.
2 First, the company has sufficiently demonstrated that
3 this component of the program will prevent outages for
4 customers. This analysis is contained on bates stamped
5 pages 195-197 of the 1898 report. In addition to
6 preventing outages altogether, these technologies will
7 enable faster identification and isolation of outages.
8 This reduces the amount of patrolling necessary to
9 identify damage thereby reducing restoration time and
10 customer outages. Faster identification and restoration
11 of damage will allow the company to release foreign crews
12 faster, which also means lower overall restoration costs.

13
14 Second, Mr. Mara assumes on page 23 that adjacent feeders
15 will not be available for transfer in an extreme weather
16 event due to catastrophic damage and that the company has
17 accordingly overstated the outage reductions by 50-60
18 percent but presents no analysis or data to support his
19 position. Mr. Mara's unsupported assumption should not
20 be given more weight than the significant analysis and
21 modelling the company performed to support this program.

22
23 Finally, Mr. Mara concedes on page 22 that the
24 sectionalizing and automation equipment will "be very
25 effective in reducing outage times" outside of extreme

1 weather. Tampa Electric did not attempt to quantify these
2 benefits in the SPP but does agree that these benefits
3 are further support for the company's proposed 2022-2031
4 SPP. Inclusion of these benefits in the analysis would
5 demonstrate even greater benefits for customers from this
6 investment.

7
8 **Q.** Do you agree with Mr. Mara's recommendation to exclude
9 the three software programs from the SPP on the grounds
10 that they will have a "very limited impact on reduction
11 in outages times or restoration costs"?

12
13 **A.** No. Mr. Mara appears to discount the value and
14 application of the information that will be collected from
15 the installation of the software programs. The Vegetation
16 Contact Detection application will identify potential
17 problem vegetation and allow the company to remove it
18 before a storm creates an outage. The Locational
19 Awareness application, used in conjunction with other
20 applications, will allow the company to identify and
21 replace "at risk" equipment. These features will allow
22 the company to proactively mitigate restoration costs and
23 outage times. The Locational Awareness and Storm Mode
24 applications will allow the company to identify embedded
25 outages, or outages downstream of the last protection

1 device on a lateral. These embedded outages are very
2 hard to identify during a storm event and often go
3 unreported for hours or even days depending on the
4 severity of the storm and restoration efforts. These two
5 applications will also increase the accuracy of the
6 company's Geographic Information System model and ensure
7 the company's Automated Distribution Management System
8 operates more effectively and with more accurate data.

9
10 **Distribution Lateral Undergrounding**

11 **Q.** Does Mr. Mara dispute that that Tampa Electric's
12 Distribution Lateral Undergrounding Program will reduce
13 restoration costs and outage times?

14
15 **A.** No. On page 24 of his testimony, Mr. Mara concedes that
16 the program will reduce outage times and restoration
17 costs.

18
19 **Q.** If he does not dispute the benefits of the Distribution
20 Lateral Undergrounding Program, then what is Mr. Mara's
21 critique of that program?

22
23 **A.** Mr. Mara recommends that the Program should be capped at
24 an investment level of \$50 million per year. This
25 reduction appears to be based on his opinion, listed on

1 pages 25-26, that this lower level of spending "better
2 balances the rate impact of the spending with the
3 benefits."

4
5 **Q.** Do you agree with Mr. Mara's recommendation?
6

7 **A.** No. Mr. Mara does not point to any data in the record
8 that would support this judgment. His proposed reduction
9 has no reasoned basis, does not identify specific projects
10 to be denied or delayed, and is arbitrary.
11

12 Furthermore, to meaningfully reduce the risk of lateral
13 outages, the company must invest in this program at or
14 above the proposed funding levels. The company was both
15 thoughtful and analytical in determining the proposed
16 funding levels for each program. All customers will
17 benefit from a dollar of avoided restoration costs, so
18 reducing the investment in this program will delay this
19 benefit of the program. Reducing investment levels will
20 also delay the additional benefit of reduced outage times
21 for some customers since fewer laterals will be
22 undergrounded.
23

24 **Q.** On page 12 of his testimony, Mr. Mara states that Tampa
25 Electric determined annual funding levels based on a

1 "constrained labor market." In addition to the evaluation
2 of the labor market, what other factors did the company
3 consider when establishing funding levels for the lateral
4 underground program?

5
6 **A.** While Mr. Mara correctly states that Tampa Electric
7 considered a constrained labor market, Mr. Mara's
8 statement oversimplifies the work that was done to attempt
9 to identify the investment levels proposed by the company
10 for lateral undergrounding. As is customary when trying
11 to determine appropriate funding levels, the company
12 started with a wide range of potential outcomes. These
13 outcomes were considered for both the proposed total Plan
14 investment levels as well as for the investment levels of
15 each program. That process started with known variables
16 (e.g., the number of overhead distribution lateral miles
17 in the company's service area) and reasonable assumptions
18 (e.g., estimated rate impact at each investment level).
19 While total Plan level ranges were identified using the
20 company's Budget Optimization Tool, investment ranges
21 were identified for each program, including the lateral
22 underground program. In determining the appropriate
23 range of investment levels for this program, the company
24 considered things like the estimated proportion of the
25 system that would likely need to be converted to make an

1 impact; the speed of those conversions; the ability to
2 execute and manage; the availability of resources; and
3 the willingness of contractor partners to commit to and
4 invest in Tampa Electric. The final proposed investment
5 levels call for reaching approximately 100 miles per year
6 of conversions, which the company believes is reasonable.
7

8 As I have previously testified, one of the factors
9 considered was the willingness of contractor partners to
10 commit to Tampa Electric's undergrounding program in the
11 years ahead. The company's proposed level of investment
12 provides sufficient work for 400-500 new jobs added to
13 the Tampa Electric service area, which is sizeable enough
14 for contractor partners to make a long-term commitment to
15 the work. Based on this investment level, nearly all of
16 the company's partners have made commitments to the area
17 by entering into multi-year leases for both office space
18 and operations yards.
19

20 Furthermore, none of these economic benefits have been
21 included in the company's cost-benefit analysis. If
22 investment levels for this program in particular are
23 reduced, the company and the Tampa Electric service
24 territory would lose these additional economic benefits.
25 There would also be risk that one or more of our

1 contractor partners would pull out altogether in favor of
2 other programs in the southeast or large new programs
3 that have been announced in other parts of the country.
4

5 **Q.** What is Tampa Electric's practice for establishing an
6 inventory of designed and permitted undergrounding
7 projects, and what is Mr. Mara's concern with that
8 practice?
9

10 **A.** The company's Plan calls for reaching a steady state
11 operation of designing projects sufficiently ahead of
12 projected construction start in order to accommodate
13 design delays, delays in securing land rights, the
14 application and receipt of permits, materials and other
15 activities that can cause delays in construction starts.
16 One of the lessons the company learned from the
17 implementation of the 2020-2029 SPP was that having an
18 inventory of projects ready to go helps mitigate these
19 delays and promotes a more efficient overall deployment
20 of materials held in inventory and contract labor. At a
21 steady state of operation, the company will have adequate
22 resources to design 75-100 miles of projects in a calendar
23 year while simultaneously constructing the same amount
24 annually.
25

1 Mr. Mara's concern is that the completed and approved
2 designs will become outdated and will require re-design
3 after the project and recovery of the initial design costs
4 is approved. The reality is that it is common practice to
5 design projects with an appropriate lag between design
6 and construction starts. The company is confident the time
7 between design and construction is appropriate, aligned
8 with industry standards and will not cause unnecessary or
9 imprudent costs from design changes.

10
11 **Transmission Access Enhancement Program**

12 **Q.** Mr. Mara suggests that Tampa Electric could use
13 specialized equipment as an alternative to the company's
14 Transmission Access Enhancement Program. Did you
15 consider this alternative?

16
17 **A.** No. Tampa Electric owns some specialized equipment such
18 as track vehicles and large tire vehicles. The company
19 did not formally evaluate the use of specialized equipment
20 as an alternative to the Transmission Access Program
21 because this equipment does not resolve all access issues.

22
23 **Q.** On page 28 of his testimony, Mr. Mara asserts that
24 maintenance of existing roads and bridges will not reduce
25 restoration costs or outage times in extreme weather. Do

1 you agree with this assertion?

2

3 **A.** No. The company has provided the value of reduced
4 restoration cost and outage time values for all programs
5 in the table on bates stamped page 103 of the company's
6 proposed 2022-2031 SPP. Mr. Mara misunderstands the
7 access enhancement program proposed by the company. The
8 company is not replacing bridges "like for like" as stated
9 by Mr. Mara. All road projects included in this program
10 involve construction of new roads at points where a
11 permanent road did not exist before. All bridge projects
12 included in this program involve construction of new
13 bridges or upgraded bridges. The company is replacing
14 old bridges rated/sized for smaller vehicles with higher
15 rated and bigger bridges that can support the movement of
16 current larger trucks and heavy equipment. In addition,
17 the company is installing new bridges for additional
18 access points and more permanent rock roads. The bigger
19 bridges and the new permanent roads will withstand nature
20 for a much longer duration than current bridges and access
21 points, so they are in effect being "protected,"
22 "hardened," and or "strengthened" as contemplated in the
23 SPP statute.

24

25 **Q.** Does this conclude your rebuttal testimony?

1 **A.** Yes.
