7.2.3 PBX Trunk Service ^[1]

[N]

a. General

Trunk lines connect the central office with a customer-premises PBX system or other customer-provided equipment and systems that select and seize a vacant line for incoming and outgoing calls at its premises. Trunk lines do not terminate directly on a phone set. They terminate in either the attendant position, or in the PBX common equipment. The customer's system can be programmed to eliminate the need to go through the attendant by routing calls directly to or from individual numbers.

Dial-type PBXs may terminate inward, outward, or two-way trunk lines. Manual PBXs terminate only two-way trunk lines.

Trunks can be configured for three types of service, based on the direction that calls are transported between the central office and customer-premises:

Inward-only service provides for one-way calling from the central office switch to the customer-premises equipment. Depending on how the customer programs its system to route calls, an inward call can terminate at either the dialed number (called DID, for Direct Inward Dialing) or at the attendant position (called non-DID). Outgoing calls cannot be made over a trunk with inward-only service.

It consists of digital switching equipment in the Company's switches connected to station lines on the customer's premises. Centrex-type Service enables the customer to originate and receive local calls within its system at no additional charge. Local measured usage charges apply to all other local calls. Local calling areas are as specified in Section 11.

Centrex-type Service is offered on a contracted basis with four terms: 24, 36, 60 and 84 months. 7.2.7 Integrated Services Digital Network-Primary Rate Interface (ISDN-PRI) ^[1] [N]

(1) Description

ISDN is a single integrated digital telecommunications network architecture which provides for the simultaneous access, transmission and switching of voice data and image services via channelized transport facilities over a set of standard multipurpose user-network interfaces. PRI governs the connectivity between switching equipment (network or customer) and customer equipment and allows voice and data services, simultaneously while supporting circuit-switched and packet-switched connections.

The ISDN-PRI feature supports a 64 kbps D-channel path between customer digital PBX equipment and the protocol handler in a PSU of the 5ESS(R) switch. This path is made up of a dedicated time slot between channel 24 on a digital facility interface (DFI) and the assigned protocol handler. This feature also provides the administration software for up to 23 B-channels associated with a D-channel in the same T1 facility (1.544 Mbps for domestic). This interface supports both ISDN PBXs and host computers.

(i) Features

Call-by-Call Service - Provides the ability for the Dedicated B-channel(s) to be configured to access multiple tariffed services on a per-call basis. The customer premises equipment signals the local central office as to what type of services to access for each call.

Remote NXX - Collects calls to an ISP from a large geographical area, concentrates these calls at one ABS switch, then routes them to the ISP's PRI trunk group for delivery to the ISP's router. All traffic is one-way inbound. All calls are intraLATA. Remote NXX is available only to ISPs.
