HAND DELIVERED

IN REPLY REFER TO

Tallahassee

Ms. Blanca S. Bayo, Director
Division of Records and Reporting
Florida Public Service Commission
101 East Gaines Street
Tallahassee, Florida 32399-0850

Re: Conservation Cost Recovery Clause
EPSC Docket No. 950002-EG

Dear Ms. Bayo:

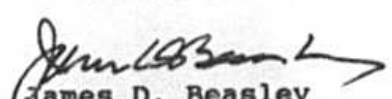

Enclosed for filing in the above docket, on behalf of Tampa Electric Company, are the original and fifteen (15) copies of each of the following:

- 02053-95 1. Prepared Rebuttal Testimony of John E. Currier.
- 02054-95 2. Prepared Rebuttal Testimony of Raymond E. Patenaude.
- 02055-95 3. Prepared Rebuttal Testimony of John T. Putnam.

Please acknowledge receipt and filing of the above by stamping the duplicate copy of this letter and returning same to this writer.

Thank you for your assistance in connection with this matter.

Sincerely,

James D. Beasley

CERTIFICATE OF SERVICE

I HEREBY CERTIFY that a true copy of the foregoing Testimony, filed on behalf of Tampa Electric Company, has been furnished by U. S. Mail or hand delivery (*) on this 21st day of February, 1995 to the following:

Mr. Robert Elias*
Ms. Sheila L. Erstling*
Staff Counsel
Division of Legal Services
Florida Public Service Commission
101 East Gaines Street
Tallahassee, FL 32301

Mr. Jeffrey A. Stone
Beggs & Lane
Post Office Box 12950
Pensacola, FL 32576

Mr. Charles A. Guyton
Steel Hector & Davis
215 S. Monroe Street
Suite 601
Tallahassee, FL 32301

Mr. Joseph A. McGlothlin
Ms. Vicki Gordon Kaufman
McWhirter, Reeves, McGlothlin,
Davidson & Bakas
315 S. Calhoun Street, Suite 716
Tallahassee, FL 32301

Mr. James A. McGee
Senior Counsel
Florida Power Corporation
Post Office Box 14042
St. Petersburg, FL 33733

Mr. Jack Shreve
Office of Public Counsel
Room 812
111 West Madison Street
Tallahassee, FL 32399-1400

Mr. John W. McWhirter, Jr.
McWhirter, Reeves, McGlothlin,
Davidson & Bakas
Post Office Box 3350
Tampa, Florida 33601-3350

Mr. Wayne L. Schiefelbein
Gatlin, Woods, Carlson & Cowdery
1709-D Mahan Drive
Tallahassee, FL 32308

Ms. Debbie K. Stitt

Q. Please state your name and business address.

A. My name is Raymond E. Patenaude and my business address is
702 North Franklin Street, Tampa, Florida 33602.

Q. By whom are you employed and in what capacity?

A. I am employed by Tampa Electric Company as a Consulting
Engineer.

Q. Please summarize your educational background and business
experience.

A. I received a Bachelor of Science degree in Engineering from
the University of Florida in 1976. I have worked as a
consulting engineer for 19 years. I have attended numerous
seminars and courses on mechanical engineering as it
relates to building design, air conditioning, heating,
ventilation, refrigeration, plumbing and process piping
design. I have designed numerous facilities throughout the

- 7 Q. Mr. Patenaude, what are your duties and responsibilities as
8 a consulting engineer for Tampa Electric?
9
- 10 A. My duties and responsibilities are to analyze various
11 mechanical systems as they relate to energy usage.
12
- 13 Q. Mr. Patenaude, what is the purpose of your testimony in
14 this proceeding?
15
- 16 A. The purpose of my testimony is to respond to certain
17 statements made by Maury J. Blalock on behalf of Peoples
18 Gas System, Inc. in his Supplemental Direct/Intervenor
19 Testimony filed on February 17, 1995. I will address Mr.
20 Blalock's testimony on the subject matter of areas of my
21 responsibility within Tampa Electric.
22
- 23 Q. What general areas of Mr. Blalock's supplemental testimony
24 do you wish to address?
25

2

- 1 A. I would like to address the questions and answers that Mr.
2 Blalock posed regarding water heating and the use of the
3 EPRI software program HOTCALC.
4
- 5 Q. Please proceed with the first item on your list.
6
- 7 A. On page 3, in item 1, Mr. Blalock indicates that there were
8 two different numbers used in the annual electric
9 consumption for resistance water heating. One number is
10 3,017 KWh and another number of 2,788 KWh. The difference
11 between the two numbers is that the 2,788 KWh was developed
12 in the SRC study and reflects a average family size of 2.8
13 persons. The 3,017 KWh was used in our water heating
14 brochure and is based on three people in the family as
15 indicated on the footnotes for the charts. The difference
16 between the two, of course, being .2 people and a little
17 bit more hot water used per day (4 gallons/day).
18
- 19 In addition to that Mr. Blalock asked the question of why
20 we did not use a number of 365 KWh per day or 4,380 KWh per
21 year as published in a brochure that is furnished to new
22 homeowners and he references an exhibit in his testimony.
23 This "brochure" is actually a reference sheet and it is not
24 published for customer circulation. It is used internally
25 by customer service employees in trying to resolve customer

3

1 high bill complaints. The usage levels listed are high,
2 representing high energy usage lifestyles or inefficient
3 water heaters.

4
5 Q. Please proceed with the next item that you wish to respond
6 to from Mr. Blalock's testimony.

7
8 A. On page 6, in item 6, Mr. Blalock asked the question why
9 TECO did not include a \$50 per year or \$4.17 per month
10 maintenance cost in the analysis of the electric heat pump
11 water heater. He indicates that this cost of maintenance
12 is well established in the industry and provides an exhibit
13 that was written by Arthur D. Little. In the Arthur D.
14 Little Exhibit, page E-6, it is stated that the maintenance
15 of \$50 per year was based upon an old model of the E-Tech
16 unit which is Model No. B108. Our analysis is based on the
17 new unit, the WH6B which Arthur D. Little states on page E-
18 6 was developed with the expectation of simple air filter
19 washing or replacement being the only required maintenance
20 activity. Our research program will help validate this
21 development.

22
23 Q. Please proceed with the next item that you wish to respond
24 to from Mr. Blalock's testimony.

25

1 A. On page 6, in item 7, Mr. Blalock asked the question of why
2 TECO used 1,866 KWh/year for resistance water heating with
3 heat recovery in the comparative analysis and 2,238
4 KWh/year for the same electric application in the cost of
5 service analysis. The 2,238 KWh/year was determined in the
6 early 1980's in the FEO/SRC Florida DSM potential study.
7 This data does not reflect advances that have occurred
8 since that period of time. The 1,866 KWh/year represents
9 advanced technology and is based on actual weather
10 conditions within the Tampa Electric service area, as
11 modeled by the EPRI HOTCALC software program. In our
12 research program we anticipate to validate the 1,866
13 KWh/year in actual field testing.

14
15 Q. Please proceed with the next item that you wish to respond
16 to from Mr. Blalock's testimony.

17
18 A. On page 7, in item 8, Mr. Blalock asks two questions in
19 this item. He states that TECO used 1,159 KWh/year for
20 electric heat pump water heating in the comparative
21 analysis and 1,776 KWh/year for the same electric
22 application in a cost of service analysis provided to the
23 Public Service Commission. The 1,776 KWh was based on the
24 old unit, the E-Tech B108, and the 1,159 KWh is based on
25 the new WH6B which is the advanced model and has a higher

1 efficiency.

11

12

13

14

15

16

17

18

19

20

21

22

23

24

25

In addition to that, Mr. Blalock asked the question of why TECO used either of these values when its representative to the Arthur D. Little study reported an annual energy usage of 2,853 KWh for heat pump water heaters and again references the Arthur D. Little study, Table 2-6 as an exhibit. In actuality, Table 2-6 represents the energy usage for electric resistance and not for an electric heat pump water heater.

Q. Please proceed with the next item that you wish to respond to from Mr. Blalock's testimony.

A. On page 7, in item 9, Mr. Blalock indicates that TECO attributed a 3.0 COP to the heat pump water heater when the manufacture's specification for the appliance is a 2.61 COP. This is an incorrect statement. The 2.61 COP that the manufacturer specifies is actually a 2.61 energy factor as tested and rated by the Gas Appliance Manufacturers Association. The energy factor 2.61 is actually a seasonal COP and the 3.0 that Mr. Blalock refers to is a steady state environment, so the two are distinctly different.

Q. Please proceed with the next item that you wish to respond

1 to from Mr. Blalock's testimony.

2

3 A. I would like to respond to page 7, item number 10,
4 regarding the EPRI Commercial Water Heating System
5 Performance Analysis. Mr. Blalock indicates that the "Hour
6 of Coincident Demand" is inconsistent in the water heating
7 analysis. This inconsistency in the water heating usage
8 profile, as Mr. Blalock states, will significantly alter
9 the electric system benefits which are derived from the
10 program. In actuality, the Hour of Coincident Demand is
11 used as a cost factor in determining operating costs of the
12 appliance and not the electric system benefits which Mr.
13 Blalock refers to.

14

15 Q. Please continue on with the other areas of Mr. Blalock's
16 testimony that you wish to respond to.

17

18 A. On page 8, in item number 11, Mr. Blalock indicates a
19 disparity between the instantaneous hot water consumption
20 values that are used in both the TECO and EPRI assessment
21 of hot water usage. These values do not affect the
22 corresponding energy usage for cost of operating the
23 appliances since the total water consumption is the same.

24

25 On page 8, in item number 12, Mr. Blalock indicates a

1 disparity between the flow rate in the recirculating system
2 for the electric resistance analysis versus the gas
3 analysis. In the EPRI HOTCALC program the flow analysis in
4 a circulation system is used for commercial recirculating
5 systems. In a residential analysis there is no
6 recirculation system and the length of the pipe and the
7 corresponding energy usage would be zero. The flow numbers
8 that are indicated are just to get the program to operate
9 because the program uses this number to divide, and if you
10 divide by zero you would get infinity. The gallon per
11 minute usage in both the electric resistance and the gas
12 analysis does not affect the operating cost.

13
14 On page 8, in item number 13, Mr. Blalock questions why the
15 HOTCALC analysis uses a tank heat loss factor of .5% in the
16 electric resistance example and 3.5% in the gas example.
17 He states that the tank insulation factor is identical for
18 the two hot water tanks and that this is an unrealistic
19 heat loss factor. In actuality, the heat loss is different
20 on both tanks because the gas tank does not have insulation
21 on the bottom of the tank. If it did the heat from the
22 fire would not be able to enter into the tank. In addition
23 to that, the gas tank has a flue, which is not insulated
24 and carries heat away from the water storage area.
25 Actually the percentage losses in the gas is much higher

1 than in the electric and the percentages used in HOTCALC
2 reflect that.

3
4 On page 8, in item number 14, Mr. Blalock indicates that
5 the heat recovery system as shown by the HOTCALC output
6 operates only seven months or 58% of the time. This is an
7 incorrect statement and it undermines the validity of the
8 conclusions reached by Mr. Blalock in this item.

9
10 On page 9, in item 15, Mr. Blalock indicates that the
11 refrigerant heat recovery analysis accumulates more run
12 time in the winter months than in the summertime, but the
13 heat recovery system is supplying no water heating energy
14 during the winter months. This statement is incorrect.
15 The unit is operating during the winter months when air
16 conditioning is needed and this error undermines the
17 validity of the conclusion reached by Mr. Blalock.

18
19 On page 9, in item 16, Mr. Blalock indicates that the
20 refrigerant heat recovery analysis consumed more electric
21 energy during the winter months when the refrigerant heat
22 recovery system isn't operating. Again, this statement is
23 incorrect and because of this error the conclusion Mr.
24 Blalock draws in this item is invalid.

25

1 On page 9, in item 17, Mr. Blalock asks the questions of
2 why the heat recovery analysis hourly load fraction
3 operating schedule does not coincide with the water heating
4 energy usage profile. The hourly load fraction operating
5 schedule is when the air conditioner would be operating.
6 The water heating energy usage profile is when the water
7 heating usage is needed and, in fact, they do not coincide
8 with each other and should not coincide in a typical home.
9 He indicates that the result is that the system is
10 supplying 100% of the hourly demand for hot water when
11 there is zero demand for hot water. What actually occurs
12 is that the heat recovery unit will be supplying energy to
13 the water heater when the water heater is not providing hot
14 water to the home. In fact, the water heater has a 40
15 gallon storage device called the tank and this is where the
16 energy is stored for later use when the hot water load is
17 required within the home.

18
19 On page 10, in item number 18, Mr. Blalock states that the
20 HOTCALC analysis shows a 0% annual cooling load met by the
21 heat pump water heater and a \$75 value attributed to the
22 cooling by the heat pump water heater. This is correct in
23 that the heat pump water heater will perform cooling.
24 However, in this analysis the cooling numbers were not used
25 to deduct from the operating costs indicating a savings for

1 cooling. The analysis correctly states that the heat pump
2 water heater is not used for cooling, hence the 0% cooling.
3 However, if the heat pump water heater was used for
4 cooling, that value would be \$75. The analysis does not
5 generate false benefits and savings associated with the
6 heat pump water heater as Mr. Blalock indicates. In fact,
7 as may be determined in our research program, we may be
8 able to use the benefits of this cooling from the
9 residential heat pump water heater.

10
11 On page 10, in item 19, Mr. Blalock again states that the
12 HOTCALC analysis indicates a value for cooling during the
13 winter months and that the value is different than in the
14 summer months. He states this generates false benefits in
15 savings. Again, the heat pump water heater does provide a
16 cooling effect, but the cooling effect in this analysis was
17 not used to determine the annual operating costs of the
18 appliance. Again, during our research, we are going to
19 determine whether we can use this cooling benefit and it
20 may actually reduce the operating costs of the heat pump
21 water heater.

22
23 Q. Does that conclude your rebuttal testimony?
24

25 A. Yes it does.
