RE: Water System Analysis and Future System Requirements,  
St. George Island Utility Company, Ltd.  
St. George Island, Florida

Dear Mr. Brown,

Please find enclosed our final report. This report presents our findings and conclusions of the capabilities of the St. George Island Water System. Included are various hydraulic analysis, a fire protection analysis and recommendations for the system. This report also includes previous comments by the Department of Environmental Protection.

If you have any questions, or if we may be of further assistance, please feel free to call.

Sincerely,

Les M. Thomas, P.E., C.V.S.  
President

## CONCLUSIONS

The St. George Island Utility Company's Water System now has the capacity to physically serve up to 1,853 ERCs. The system presently serves 1,307 ERCs and has obligations to serve an additional 130 ERCs. The FDEP has limited the system to only serving 1,346 ERCs. The Northwest Florida Water Management District will allow the system to withdraw up to 809,000 gpd for three consecutive days with an annual withdrawal limit of 414,000 gpd average. The FDEP methodology of relating gallons of water available to ERCs would allow the System to serve up to 1,555 ERCs. The projected system growth when added to the existing committed service would estimate that the system will be serving 1,555 ERCs by mid 1996. The systems physical capacities could provide service to 1,853 ERCs which is estimated to occur during the year 2000. The system is in compliance with current DEP fire protection requirements. It is also in compliance with Franklin County Regulations. Note: the county effected a fire protection ordinance in 1989 (the SGIU system is exempt from this ordinance as the system was constructed prior to that ordinance) which requires all future systems constructed in the county to provide fire protection consisting of a hydrant capable of delivering 500 gpm to be within 500 feet of every structure.

## RECOMMENDATIONS

1. The SGIU should begin preparation of an application to the Northwest Florida Water Management District for an increase in withdrawal allocation up to 964,000 gpd for a FDEP allocation of 1,853 ERCs which would give the utility 2 years to design, permit and construct improvements to increase the system capacity to serve the project growth of the 2000 to 2005 period - 2,340 ERCs. It is recommended that the Utility immediately proceed with identifying a site for the next water well and that preliminary planning be implemented for permitting.
2. It is recommended that the 6" lines and the 8" line buried by DOT be paralleled.
3. If the Utility desired or if a governmental agency having jurisdiction changes its present requirements to now require the system to meet the Franklin County Fire Protection Ordinance; Then 103 fire hydrants would be installed as shown on the attached plans to provide a fire hydrant within 500 feet of every building. Additionally, it is recommended that 36,400 feet of 6" water mains be constructed to ensure delivery of fire flows. 1

**St. George Island Utility Company, Ltd.  
Water System Analysis**

**General Analysis Parameters and Definitions**

The capacity of a water system is based upon its ability to obtain, treat, and deliver water to its users. The factors which dictate the capacity/requirements of the St. George Island Water System are:

**A. Consumption Demands -**

The consumption demands are the various quantities of water that the consumers have typically required or used at different times of the day or year. The quantities are expressed as follows:

**Annual Average Day Flow (ADF) or Demand -**

The total quantity of water used during a year divided by 365. The norm is 100 gallons per day per person or 350 gallons per day per single family residence. This quantity is also the definition of the Florida Department of Environmental Protection Equivalent Residential Connection or ERC - 350 gpd.

**Maximum Day Demand -**

The total water used on the day of highest usage. This is typically 150% of the annual average day consumption. This is the quantity of water that a system's supply (well field and treatment plant) must be capable of providing.

**Peak Demand -**

The average water used in terms of gallons per minute during the peak hour. Typically this is equivalent to 350% of the Average Day Demand.

**Storage Demand -**

DEP requires that 50% of the Maximum Day Demand Volume be provided by any, or by a combination of: Elevated Storage Volume, Ground Storage Volume with Emergency Power, or wells with emergency power pumping directly into the distribution system.

(The State of Florida Department of Environmental Protection has established these points over many years of data collection and has accordingly set minimum requirements for water systems which are related to the number and types of users proposed. The Department has granted or established variances to these standards when a system has shown itself to be unique. The Department has established a individual classification for this system and it is reflected herein.)

B. Aquifer Capacity -

The Quantity of water which can be taken from the aquifer without creating adverse affects to either the aquifer, such as salt water intrusion; or to existing users, such as lowering the water table below their wells or well pumps. The Northwest Florida Water Management District is the agency which establishes and permits the quantity to be withdrawn. It is expressed in terms relating to the maximum day demand.

C. System Withdrawal Capacity -

The quantity of water which can be physically pumped from the aquifer. This is the 24 hour quantity of water which the pumps can deliver to the water plant with the largest pump out of service. Its capacity is rated in terms of maximum day demand.

D. Raw Water Transmission Capacity -

The quantity of water which can be transferred to the Island. Its capacity will be rated in terms of maximum day demand as it must be able to deliver all the water needed for the maximum day.

E. Treatment Capacity -

The quantity of water which can be treated in 24 hours. Its capacity is also rated in terms of maximum day capacity.

F. Distribution Capacity -

The quantity of water in gallons per minute which can be delivered throughout the system without allowing the pressure to drop below 20 psi anywhere in the system. It is rated in terms of gallons/minute and relates to the peak and fire flow demands.

G. Fire Flow -

The State of Florida Department of Environmental Protection does not require a system to provide "fire flow". The department does, by reference, incorporate the "RECOMMENDED STANDARDS FOR WATER WORKS (commonly known as the 10 states standards). These standards do not require a system to provide fire protection/flows either. They do state that "When fire protection is to be provided, the system design should be such that fire flows and facilities are in accordance with the requirements of the state Insurance Services Office". The State of Florida ISO office does not require fire protection. The Department of Environmental Protection does require that a fire hydrant be installed on no less than a six (6) inch line if provided.

G. Fire Flow (continued) -

Franklin County passed an ordinance in 1989 which requires that all new subdivisions provide fire hydrants and that they be within 500 feet of any structure and no more than 1,000 feet apart. Subdivisions which were in existence prior to 1989 are exempt from this ordinance. Any new subdivisions (an area of land 5 acres or less subdivided into three or more lots) would have to have fire hydrants. (The St. George Island Utility Company, Ltd.'s system is therefore exempt from this regulation.)

**CURRENT SITUATION**

The following presents the system's existing user demands and the system's capacities:

A. Consumption Demand

The St. George Island Utility Company, Ltd. has contracted to provide water service as follows:

As of 1/1/95, the system serves 1176 customers (not ERC's) and is obligated to serve an additional 130 customers (or ERC's) for a total of 1306. Its customers are primarily residential, however, the system does serve commercial establishments, motels and a state park facility. These users have a higher demand for water.

To establish a common base for determining system capacities and requirements, the Florida Department of Environmental Protection (FDEP) has established a methodology to equate commercial and residential users known as an ERC. The FDEP, during the period 5/93 to 2/94 established a specific relationship between consumption and an ERC for the St. George Island Utility Company Water System. They determined that an ERC represents the usage 520 gallons on the maximum day of the year. The FDEP currently has approved the system to serve 1,346 ERCs .

Using this definition of an ERC, the system as of 1/1/95 serves 1,307 ERCs. The SGIU is obligated to serve another 130 ERCs, for a total of 1,437 ERCs.

On an annual average day basis, the system delivered 112,725,000 gallons, or 308,835 gpd to its users for the year 1994. The system served an average of 1,233 ERCs during that year. This equates to an avg. day demand of 250 gpd per ERC.

In summary the current system demand characteristics and DEP requirements (actual and obligated users were connected) are:

A. Consumption Demand (continued)

Average Day Demand  $1437 \times 250 = 359,250$  gpd  
Maximum Day Demand  $1437 \times 520 = 747,240$  gpd  
Storage/Emerg. Power  $50\% \times 747,070 = 373,620$  gal. or 270 gpm  
Peak Hourly Flow Rate  $= 236\% \times 747,240/1440 = 1,222$  gpm

B.1. Aquifer Capacity (permitted) -

The St. George Island Water System is presently permitted by the Northwest Florida Water Management District to withdraw water from its well field as follows:

Average Daily Rate of Withdrawal (ADR) 414,000 gallons per day  
Maximum Daily Rate of Withdrawal (MDR) 809,000 gallons per day  
Number of Consecutive Days/ Year MDR is to be pumped- 3 days.

This allocation allows the utility to serve water based on DEP guidelines to:

$$\frac{809,000 \text{ gpd}}{520 \text{ gal/ERC}} = \underline{1,555 \text{ ERCs MDR}}$$

$$\frac{414,000}{250 \text{ gal/ERC}} = \underline{1,656 \text{ ERCs ADR.}}$$

B.2. Aquifer Capacity (physical) -

An analysis of the existing well field performed by Jim Stidham & Associates, demonstrated that the three wells could reasonably withdraw up to 670 gpm or 964,000 gpd without adversely impacting the aquifer or other existing users.

This equates to 964,000 gallons/ 520 gpd/ERC = 1,853 ERCs

C. System Withdrawal Capacity -

There are now three wells at the SGIU East Point Well Field. Operation of the three well has demonstrated that they can consistently deliver 670 gpm with either the No. 1 or No. 2 well inactive. Therefore, the system withdrawal capacity is

$$\frac{964,000 \text{ gpd}}{520 \text{ gal/ERC}} = \underline{1,853 \text{ ERCs}}$$

D. Raw Water Transmission Capacity - 3,323 ERCs

There is an eight (8") inch water main connecting the wells to the water plant on the Island. The line has demonstrated that it transports 670 gpm, or 964,000 gallons per day to the island (measured). If either the well pumps or the pumping system were upgraded, the line itself (at a discharge pressure of under 100 psi), can hydraulically deliver up to 1,200 gpm to the island, or 1,728,000 gallons per day , or service for

$$\frac{1,728,000 \text{ gallons}}{520 \text{ gpd/ERC}} = 3,323 \text{ ERCs}$$

E. Treatment Capacity -

The water treatment plant provides for the removal of Hydrogen Sulfide and adds chlorine to the system. The plant's aerator is capable of handling raw water at a rate of 670 gallons per minute or 1,855 ERC's.

F. Distribution Capacity -

The pumping system which delivers water to the distribution system has been recently upgraded by the addition of a new 50 HP pump which operates in parallel with the existing 50 HP high service pump. Additionally, both the pumps were modified to operate at a variable speed - dependent on maintaining the system pressure. The result of these modifications allows the system to have a relatively high pressure - consistently.

A computer calculated hydraulic analysis of the entire system has been completed and is enclosed herein.

The analysis shows that the distribution system can deliver peak flow rates of 1,225 gpm while maintaining system pressures above the DEP required. Specifically the pressure at the Bob Sikes Cut was calculated to be 57 psi and 51 psi at the state park. See analysis No. 3.

The analysis also shows that the water system can deliver up to 1,570 gpm with a pressure at the Park of 24 psi and 31 psi at the Bob Sike's Cut. This equates to delivering the peak flow rate for 1,873 ERCs.

G. Fire Flow -

An analysis of the systems ability to deliver a fire flow demand was also performed. The analysis was performed with the system demand set at 1/2 its calculated maximum day demand. To maximize the conditions a 500 gpm fire demand was placed at the Bob Sike's Cut. The system delivered the demands while maintaining a pressure of 34.7 psi at the point of fire flow (85 psi at the Park). See analysis # 4.

An analysis was also performed with a 500 gpm fire demand at the state park. This analysis showed that the pressure at the Park would be -27 psi.(86 psi at Sike's) See analysis #6. An analysis was also performed with a 350 gpm fire demand at the park. This showed that the system could deliver 350 gpm with a residual pressure of 22.6 psi (see last analysis)

An analysis was also performed with a 1,000 gpm fire in the commercial area. The system delivered the flow with pressures at the Sikes Cut of 81 psi and 79 psi at the Park.

An analysis of the distribution system was also performed to determine what modifications would be necessary to upgrade the system to meet the current Franklin County Regulations. That analysis indicated that 103 fire hydrants would be necessary at this time to comply with the requirement for having a fire hydrant within 500 feet of every building. Additionally, it would be necessary to construct 36,400 feet of 6" water main to comply with regulations for minimum line size for hydrants, as well as hydraulic requirements to deliver 500 gpm. The system has the pumping and storage capacities to meet these requirements at this time.

H. Summary of System Capacities or regulated limitations are:

Well Field - 1,853 ERCs (physical)  
Well Field - 1,555 ERCs (legal) NWFWM regulated \*  
Transmission Line - 3,323 ERCs (physical)  
Water Plant - 1,855 ERCs (physical)  
Distribution System - 1,873 ERCs (physical)

## FUTURE SITUATION

Consumption Demand - The St. George Island Water System, as of 1/1/95 serves 1,307 ERCs. The SGIU is obligated to serve another 130 ERCs, for a total of 1,437 ERCs. It is anticipated to increase at a rate of 5% per year. Therefore it is estimated that the system will serve users as follows:

1998	3 years: total = 1,663 ERCs Max. Day Demand = 873,075 gpd Peak Hourly Flow Rate = 1,414 gpm
2000	5 years: total = 1,834 ERCs Max. Day Demand = 962,850 gpd Peak Hourly Flow Rate = 1,559 gpm
2003	8 years: total = 2,123 ERCs Max. Day Demand = 1,114,575 gpd Peak Hourly Flow Rate = 1,805 gpm
2010	15 years: total = 2,987 ERCs Max. Day Demand = 1,568,175 gpd Peak Hourly Flow Rate = 2,539 gpm
2020	25 years: total = 4,000 ERCs (Note: The apparent build-out at this time is approximately 4,000 ERCs which should occur in 2016.) Max. Day Demand = 2,100,000 gpd Peak Hourly Flow Rate = 3,400 gpm

PHASE I SGIU System Improvement Program for the period 1995 through 2003:

The objective of this program is to provide the additional raw water and distribution system improvements to meet the SGIU Projected System Demands of 2003 - average day, maximum day, and peak hourly. This point in time is selected to allow adequate time for planning, design, permitting and construction prior to being in a crisis situation and also in recognition that any modification to the system will significantly increase its capabilities.

**Well Field** - A new 300 to 500 gpm well will need to be constructed. [The system well field will have to produce an additional [1,114,575 GPD - 940,000 GPD) 174,575 gallons per day (121 gpm - 774 gpm total). Well No. 1 should also be up-graded with additional impellers and a new motor to maintain capacity at a higher discharge pressure.

**Transmission Main** - The existing 6" lines on the mainland should be paralleled with an 8" line. The existing 8" line which was buried by DOT on the causeway should be paralleled to enable repair in case of emergency.

**Water Treatment Plant** - The existing aerator should be modified as necessary to handle 1,000 gpm which is the next reasonable size and which will carry it through 2010. The high service pumping system and/or the distribution system must be modified to increase output to meet the peak hourly flow demand of 1,805 gpm. The chlorination system should be modified to allow for flow proportional operation. The distribution system should have a remote pressure monitoring and reporting device installed at each end from which the system should be controlled.

**Water Distribution System** - The system may need to be strengthened to deliver the additional demands as they become apparent. The modifications shown on the enclosed maps indicate the overall distribution line improvements necessary to meet ultimate peak flow demands. These would also meet current Franklin County Fire Protection Requirements. These should be implemented coincident with growth demands. (Note: the ultimate system demands will require supplemental pressure booster stations strategically located in the distribution network.)

**PHASE II**

**SGIU System Improvement Program for the period 2003 through 2010 - for implementation between 2000 and 2003:**

**Well Field -** A new 300 to 500 gpm well (No. 5) will need to be constructed. [ The system well field will have to produce an additional [1,568,175 GPD - 1,372,000 GPD - assumes 300 gpm added phase I) 196,175 gallons per day (136 gpm - 1089 gpm total). Well No. 2 should also be up-graded with additional impellers and a new motor to maintain capacity at a higher discharge pressure.

**Transmission Main -** Partial Paralleling of the existing 8" lines on the causeway should be commenced with an objective of paralleling the line by 2016.

**Water Treatment Plant -** The aerator should not need modifying. The high service pumping system and the distribution system must be modified to increase output to meet the peak hourly flow demand of 2,539 gpm. This will probably require the addition of intermediate booster pump stations and or outlying storage facilities. The chlorination system should be adequate.

**Water Distribution System -** The system should be modified to deliver the additional demands.
