HAND DELIVERED

Ms. Blanca S. Bayo, Director Division of Records and Reporting Florida Public Service Commission 2540 Shumard Oak Boulevard Tallahassee, FL 32399-0850

> Re: Docket Nos. 001148-EI, 010577-EI and 000824-EI

Dear Ms. Bayo:

Enclosed for filing on behalf of Florida Power & Light Company, Tampa Electric Company and Florida Power Corporation are the original and fifteen (15) copies of each of the following:

- 10012-01 Direct Testimony and Exhibit (WRA-2) of William R. Ashburn. 1.
- 2. GridFlorida Companies Witness Naeve Exhibit No. (CMN-1) containing GridFlorida Formation Documents (Volume 6 – separately bound). 100 13-01

Please acknowledge receipt and filing of the above by stamping the duplicate copy of this letter and returning same to this writer.

Thank you for your assistance in connection with this matter.

Sincerely,

ames D. Beasley

FPSC-COMMISSION CLERK

TAMPA ELECTRIC COMPANY FLORIDA POWER & LIGHT FLORIDA POWER CORPORATION ĐOCKET NOS. 010577-EI, 001148-EI, 000824-EI FILED: AUGUST 15, 2001

1		FILED: AUGUST 15, 2001
1		BEFORE THE FLORIDA PUBLIC SERVICE COMMISSION
2		PREPARED JOINT TESTIMONY
3		OF
4		WILLIAM R. ASHBURN
5		
6	Q.	Please state your name, address, occupation and employer.
7		
8	Α.	My name is William R. Ashburn. My business address is
9		702 North Franklin Street, Tampa, Florida 33602. I am
10		Regulatory Affairs Director, Rates and Financial Analysis
11		for Tampa Electric Company ("TEC").
12		
13	Q.	Please provide a brief outline of your educational
14		background and business experience.
15		
16	А.	I received a Bachelor of Science degree in Business
17		Administration with a concentration in economics from
1.8		Creighton University. Upon graduation, I joined Ebasco
19		Business Consulting Company where my consulting
20		assignments included the areas of cost allocation,
21		computer software development, electric system inventory
22		and mapping, cost of service filings and property record
23		development.
24		
25		
	l	

In 1983, I joined TEC and have held various positions with responsibility for embedded cost and marginal cost of service studies, rate filings, marketing, planning, rate design, implementation of new conservation and marketing programs, customer survey and various state and federal regulatory filings. In March 2001, Ι was promoted to my current position of Director, Rates and Financial Analysis in TEC's Regulatory Affairs department. I am responsible for rate design, cost of service analysis, and financial analysis. I am a member of the Economic Regulation and Competition Committee of the Edison Electric Institute and the Rate Committee of the Southeastern Electric Exchange.

16

Q. What is the purpose of your testimony in this proceeding?

I am presenting testimony on behalf of TEC, Florida Power 17 Α. and Light Company ("FPL"), and Florida Power Corporation 18 ("FPC") (collectively referred to as 19 the "GridFlorida Companies") in support of their position 20 that it is for them to participate prudent in 21 the GridFlorida 22 regional transmission organization, or RTO, as they have proposed to the Federal Energy Regulatory Commission 23 ("FERC"). Specifically, I address Issues 2, 3 and 4 as 24 set forth in the Prehearing Order 25 issued in this

proceeding by providing the Florida Public Service Commission ("Commission" or "FPSC") with an overview of the features and benefits of GridFlorida's transmission pricing protocol and rate design. In so doing, I will also describe salient features of FERC's RTO pricing policy under Order No. 2000; the extensive collaborative process through which the GridFlorida participants and stakeholders designed the pricing protocol in order to comply with FERC's Order No. 2000 requirements; and FERC orders wherein FERC found that the pricing protocol meets Order No. 2000's transmission pricing requirements.

14

Q. Are you sponsoring an Exhibit as part of your testimony?

15 Α. Yes. Ι am sponsoring Exhibit (WRA-2), which 16 consists of four pages presenting the development of 17 estimated start-up cost revenue requirements, including the five-year amortization and net cost responsibility to 18 19 the retail ratepayers of each of the GridFlorida Companies. of Exhibit 20 Paqe One this reflects the estimated total net 21 cost responsibility to the GridFlorida Companies' retail 22 users and represents a summary of the following three pages. 23 Pages Two through Four present the estimated impact 24 to the retail ratepayers of each of 25 the GridFlorida Companies

individually.

3

4

5

18

Q. Please summarize the central features of FERC's RTO transmission pricing policy.

As FERC explained in Order No. 2000, the elimination of Α. 6 rate pancaking for large regions is a central goal of 7 policy. Rate pancaking FERC's RTO occurs when а 8 transmission customer is charged separate access charges 9 utility service territory the customer's each for 10 contract path crosses. Under Order No. 2000. FERC 11 mandates that RTO tariffs cannot result in transmission 12 customers paying multiple access charges to recover 13 capital costs over facilities that the RTO controls. 14Without the elimination of pancaked rates, transmission 15 customers would be faced with additional access charges 16 for every utility border they cross. 17

of the main reasons that an RTO One can increase 19 opportunities for economical purchases and sales is that 20 implement non-pancaked rates for each RTO can 21 an transaction. A wider area served by a single rate means 22 economically available generation is to 23 more any The reason this is economical is that there customer. 24 are no significant incremental facility costs to access 25

more than one owner's transmission lines, *i.e.*, if there were more than one owner, there would be only one access charge nonetheless.

While elimination of pancaked charges is central 5 to 6 FERC's RTO transmission pricing policy in Order No. 2000, FERC nonetheless has chosen to balance the desire to 7 honor existing contractual arrangements with the need for 8 uniform approach for transmission pricing and 9 а the elimination of pancaked rates. 10 Thus, although certain existing contracts may contain pancaked rates, 11 FERC determined that it is not appropriate to order generic 12 existing transmission contracts 13 abrogation of that represent negotiated rights and obligations. 14 Rather, FERC encourages each RTO to address how and when it might 15 convert existing contracts and submit 16 а contract 17 transition plan that contains specific details about the procedures to be utilized involving the conversion from 18 existing contracts to RTO service. 19

20

1

2

3

4

21 FERC also adopted a flexible pricing approach with respect proposals to RTO for allocation of fixed 22 transmission cost recovery. For example, FERC will 23 permit RTO proposals to use zonal, or "license plate" 24 rates to recover their fixed transmission costs. 25 Ά

"license plate" rate provides access to the regional transmission system at a single, non-pancaked rate, although that rate may vary based on where the customer FERC will allow RTOs to utilize these is located. "license plate" rates, as long as the RTO clarifies how transmission expansion will be priced (i.e., whether license plate rates or some other mechanism will be applied to the cost of new transmission facilities, and incentives for efficient such pricing affects how In addition, FERC encouraged the mitigation expansion). of cost-shifts resulting from differences in access fees based on differences in per unit costs of the owners' transmission systems.

17

Q. Please describe the general goals behind GridFlorida's
 pricing policy and rate design.

The overall goal of GridFlorida's pricing policy and rate Α. 18 design is to comply with FERC's Order No. 2000 pricing 19 requirements while providing a balanced and reasoned 20 approach to the most difficult pricing issues faced by 21 These issues include cost shifting that arises RTOs. 22 from adoption of average system rates, providing revenue 23 credits for facilities owned by transmission dependent 24 utilities, and eliminating rate pancaking. These issues 25

historically have represented some of the most significant impediments to RTO/Independent System Operator ("ISO") formation, and the GridFlorida rate design addresses each of these matters in а manner intended to encourage broad participation in GridFlorida bv Florida transmission owners, while not imposing unreasonable additional costs on existing retail and wholesale customers.

13

Q. Did the GridFlorida Companies engage in any pricing
 discussions or negotiations with stakeholders and others
 in developing the GridFlorida pricing plan?

Yes. Prior to the time the GridFlorida Α. Companies 14 submitted their initial application to FERC on October 15 16, 2000, establish the GridFlorida to RTO, the 16 GridFlorida Companies developed the GridFlorida pricing 17 proposal through an extensive collaborative process with 18 all stakeholders. They engaged in a 19 process that involved all interested parties, including all non-FERC-20 jurisdictional municipal utilities, electric cooperatives 21 and other transmission dependent utilities, independent 2.2 developers, 23 power power marketers, the Florida Reliability Coordinating Counsel ("FRCC") and the Florida 24 Public Service Commission ("FPSC"). In addition, 25 the

FERC staff attended a number of stakeholder meetings. 1 2 Were there any specific committees dedicated solely to Q. 3 pricing issues? 4 5 As part of the GridFlorida planning process, the Yes. Α. б stakeholders established a number of committees, one of 7 which was the Pricing Committee. The Pricing Committee 8 addressed, at a conceptual level, the issues outlined in 9 pricing protocol in the GridFlorida included the 10 The 2000 filing. Pricing Companies' October 16, 11 Committee addressed such issues as how to provide for 12 non-pancaked rates, a transition plan to mitigate cost 13 transmission of existing shifting, the treatment 14 contracts, and how to provide for the recovery of the 15 cost of facilities constructed after GridFlorida begins 16 operations. 17 18

Membership in the Pricing Committee and other committees 19 any person or entity that wished to was open to 20 participate. A large number of persons took advantage of 21 this opportunity. The Pricing Committee met at least 22 once or twice a month, and more frequently than that when 23 necessary. Notes of meetings were taken and posted on 24 the GridFlorida web site. 25

Were there any other collaborative pricing initiatives ο, 1 prior to October 16, 2000? 2 3 Yes. In addition to the Pricing Committee meetings, the 4 Α. FPSC scheduled a number of RTO workshops that addressed 5 various aspects of RTO formation where pricing issues 6 were discussed. The GridFlorida Companies and other 7 parties appeared at these workshops, at which they were 8 able to explain the various aspects of the GridFlorida 9 proposal to the FPSC Staff and Commissioners. The FPSC's 10 scheduling of these workshops was in addition to the 11 participation of the FPSC Staff in all of the committees 12 responsible for developing the GridFlorida proposal, 13 including the Pricing Committee. 14 15 Prior to the October 16 filing, was there a consensus 16 Q. reached as а result of these collaborative pricing 17 committees, workshops and negotiations? 18 19 the negotiations reached Α. The parties to consensus on 20 certain, but not all, issues. After several months of 21 negotiations, the GridFlorida Companies, in coordination 22 with other stakeholders developed a pricing protocol that 23 represented a general consensus on three important 24 First, the cost of transmission facilities issues. 25

installed as of a date certain, December 31, 2000, or 1 Facilities, initially be should recovered Existing 2 through zonal charges (i.e., transmission access charges 3 of existing requirements based on the revenue 4 electrical pre-defined in а transmission facilities 5 area), rather than a single GridFlorida system charge. 6 Second, zonal charges should be phased out no later than 7 10 years after commencement of RTO operations. Third, 8 the cost of transmission investment made after December 9 31, 2000, (i.e., the cost of New Facilities) should be 1.0 recovered through a single system charge rather than 11 through zonal charges. 12

13

14

15

16

Q. How does GridFlorida propose to assess customers for the cost of transmission facilities under its control?

The GridFlorida proposal has a two part rate. Part I Α. 17 consists of the existing transmission facilities in each 18 zone as of December 31, 2000 and will be assessed only to 19 the load in that zone for years 1-5. Beginning in year 6 20 and ending in year 10, 20% of the Part I rates for each 21 zone will be added annually to the Part II rates such 22 that at year 10, there would no longer be a Part I rate. 23 24

25

The Part II rate reflects the costs of all New Facilities built after December 31, 2000 and will be assessed to all RTO load.

- 5 Q. What were the issues on which the parties did not reach 6 consensus?
- There were four principal matters on which there was a 8 Α. lack of consensus among all stakeholders. They were (i) 9 definition of transmission rate the zones, (ii) 10 the timing of the phase-in to single system rates, (iii) the 11 timing of the phase-out of pancaked charges 12 under Existing Contracts, and (iv) the of 13 treatment Transmission Dependent Utility ("TDU") 14 transmission facilities within a zone. 15
- Q. Beginning with the first of the three matters on which 17 18 there was consensus, why did the GridFlorida Companies 19 and stakeholders agree that а zonal approach to recovering the cost of existing transmission facilities 20 21 was preferable to а GridFlorida system-wide charge 22 approach?
- 23

16

1

2

3

4

7

A. A zonal, or "license plate" approach was preferable to an
 immediate implementation of a system-wide approach

because problems associated with cost-shifting are largely resolved by the use of "license plate" rates. Immediate use of a single average system-wide access rate would have meant that customers of relatively low-cost transmission providers would have seen an instant rate increase.

1

2

З

4

5

6

7

12

If zonal charges are equitable, why did the GridFlorida Q. 8 Companies and stakeholders agree to phase out zonal 9 charges (Part I) later no than 10 years after 10 commencement of RTO operations? 11

Zonal charges are equitable in the short-term for the Α. 13 reasons I stated previously. Nonetheless, the parties 14concluded that, over time, zonal charges would not follow 15 the rules of RTO-wide cost causation, would not promote 16 17 needed RTO-wide enhancements that would benefit all customers, and would not promote RTO price comparability 18 in rates between customers in different areas. Thus, the 19 parties agreed that, in the long term, a phase out of the 20 Part I rate would be the most equitable manner for RTO 21 customers to share common benefit costs. 22 In addition, FERC Order No. 2000 required RTO proponents to file with 23 FERC their recommendations with respect to transitioning 24 from zonal rates to single system rates. 25

Q. As to the last consensus issue, why did the GridFlorida Companies and stakeholders agree to recover the cost of New Facilities through a single system charge (Part II) rather than through zonal charges?

1

2

3

4

5

Α. By adopting a system averaqe rate for all New 6 Facilities, the 7 transition from zonal to system average rates, and thus more equitable treatment of 8 all ratepayers would be hastened. 9 Moreover, the 10 single system charge does not require that all new investment be rolled in to RTO rates; 11 rather, it 12 provides that, if а transmission investment is 13 determined to provide grid-wide benefits and is appropriate for rolled in treatment, all 14 network customers will pay their load ratio share of the new 15 investment through a single system charge (the New 16 Transmission Investment Revenue Requirement), and not 17 18 through their zonal charge (Part I). The single system charge for new transmission facilities (Part 19 II) also will reduce the potential for inter-zonal 20 conflicts that can arise when 21 an expansion plan identifies alternatives 22 to enhancing regional reliability that have differing impacts on customers 23 24 in each zone. This is consistent with FERC precedent and was viewed as the fairest means of recovering from 25

all GridFlorida customers the costs for New Facilities 1 that will benefit all GridFlorida customers. 2 3 What transmission services will be offered under Q. the 4 GridFlorida tariff? 5 6 The major services offered under the GridFlorida tariff Α. 7 will be Network Integration Transmission Service 8 ("NITS"), ("PTP") 9 Point-to-Point Transmission Service, ancillary services, including Scheduling Service, and 10 generation interconnection service. NITS allows 11 а network customer to integrate, economically dispatch and 12 regulate its current and planned resources to serve its 13 PTP service is for the receipt of capacity and load. 14 at designated point(s) of receipt and the 15 energy transmission of such capacity and energy to designated 16 point(s) of delivery, on either a firm or non-firm basis. 17 Ancillary services are services that facilitate energy 18 delivery operations, and generation interconnection 19 service facilitates the interconnection and operation of 20 21 generation. 22 Q. How would NITS be priced under a zonal or system-wide 23 approach? 24

14

The access charge for NITS, which is the service the Α. 1 GridFlorida Companies will take for their retail load, 2 would be the product of (a) the applicable monthly zonal 3 I), which is based on the revenue charge (Part 4 requirements for the facilities within that zone, plus 5 the monthly system charge (Part II) multiplied by (b) the 6 Network Customer's Network Service billing determinants 7 The network customer's network service for the month. 8 billing determinants for a month would be its hourly load 9 coincident with the monthly transmission system peak. 10 Zonal billing determinants are based on peaks within each 11 while system billing determinants are based on zone, 12 peaks coincident with the GridFlorida system for that 13 In addition, customers will be assessed a Grid month. 14 Management Charge. 15

16

17

18

Q. How would PTP service within GridFlorida be priced?

charge for firm PTPservice within Α. The access 19 GridFlorida would be a charge up to the sum of the 20 zonal charges plus the New Facilities 21 applicable charge, multiplied by the transmission customer's 22 reserved transmission capacity. Non-firm PTP service 23 would be charged up to the firm PTP rate. Customers 24 also would be assessed a grid management charge, and 25

1 would be responsible for any applicable ancillary service charges. Finally, the GridFlorida 2 tariff includes charges for "through" and "out" service, 3 which are developed on a system average basis. 4 5 For the four issues on which there was a Q. 6 lack of consensus, generally, could the parties 7 why, not 8 completely agree on these issues? 9 Α. For some issues, the process simply ran out of time in 10 order for the GridFlorida Companies to file the RTO 11 application in compliance with the FERC established 12 deadline. The definition of transmission rate zones 13 and timing issues fell 14 into this category. The 15 treatment of TDU facilities, however, was more 16 complicated and, frankly, the parties simply could not reach agreement on the treatment for these facilities. 17 18 19 Q. What was done in light of the lack of consensus on the four pricing issues? 20 21 Α. Given the lack of complete 22 consensus amonq the stakeholders on 23 these four issues, the GridFlorida Companies developed a compromise position on each issue. 24 The GridFlorida Companies included these compromises in 25

the pricing protocol that they submitted with the October 1 filinq. The pricing protocol addresses the four 16 2 integrated, comprehensive manner that issues in an is intended preserve existing customers' to uses and benefits, maximize participation in the RTO, and create a 5 viable RTO pricing structure consistent with FERC's RTO б standards. 7

Briefly describe how the pricing protocol addresses the Q. 9 definition of a transmission rate zone, the first of the 10 four areas where there was no consensus. 11

Α. The pricing protocol provides that each transmission 13 owner/participant, with the exception of TDUs, shall form 14 Zonal charges would be based on the its own rate zone. 15facilities requirement of the transmission revenue 16 forming the zone. 17

What are the revenue requirements for a zone? Q. 19

20

18

3

4

8

12

The revenue requirements to be recovered in zonal Α. 21 charges includes (i) the revenue requirements of the 22 Existing Facilities that form the zone, plus (ii) the 23 revenue requirements of the Existing Facilities of any 24 participating TDU within that zone, subject to a TDU 25

facility phase-in plan, which I will discuss later. Each transmission owner is responsible for obtaining FERC approval of its proposed revenue requirement. To the extent a TDU or other non-jurisdictional owner participates in GridFlorida, FERC also would review each such owner's proposed revenue requirement--which ordinarily would fall beyond FERC's jurisdiction--in the context of approving GridFlorida's zonal rates. Nothing in the pricing protocol limits a transmission owner's discretion in proposing a revenue requirement for its facilities.

1

2

3

4

5

6

7

8

9

10

11

12

15

Q. Why did the GridFlorida Companies choose to define a
 transmission rate zone in the way that they did?

Defining a rate zone as a pre-existing electrical 16 Α. service area minimizes cost shifts that would arise 17 when combining transmission systems. The proposal is 18 delicately balanced plan that extends the cost 19 а shifts equitably to all participants over a 10-year 20 As cost responsibility for the GridFlorida period. 21 transmission facilities moves from today's bifurcated 22 approach toward a single system charge priced on load 23 ratio share over time, some entities will experience a 24 a rise, in the portion decline, and others of 25

1 transmission costs for which they are responsible. This ten-year evolvement, in turn, makes it palatable 2 for transmission owners to participate in GridFlorida, 3 thereby maximizing RTO participation. 4 Moreover, 5 defining zones in this manner is consistent with the 6 approach taken by every FERC-approved ISO to date. 7 Q. Were there objections to this definition? 8 9 Certain stakeholders argued that this definition 10 Α. Yes. 11 may produce too many zones and suggested instead that all 12 systems in Florida should be combined into only two 13 zones. 14 Why did the GridFlorida Companies reject the two-zone 15 Q. 16 approach at the outset? 17 Α. 18 The two-zone approach would not have enhanced RTO participation. Forcing all participating transmission 19 owners in Florida (there could be more than ten) 20 to collapse their systems into two zones in year one would 21 22 cause abrupt shifts, cost thereby discouraging RTO 23 participation. The better course, and the one supported by FERC precedent, was to define zones and to phase them 24 into a single regional rate. 25

Q. How did the pricing protocol deal with the second issue
 of establishing a timetable for phasing out transmission
 rate zones?

4

14

18

The timetable for phasing out transmission rate zones is Α. 5 an issue that would exist regardless of the number of 6 The pricing protocol provides that zonal charges zones. 7 will be phased out in years 6-10 of RTO operations. This 8 gradual phase-out is important to entities with low-cost 9 transmission systems. 10 Ιt also is consistent with Commission precedent. In every ISO proceeding to date, 11 12 FERC has approved zonal charges and has not, in any case, required that they be eliminated prior to the fifth year. 13

Q. How does the pricing protocol deal with the third non consensus issue of eliminating pancaked rates
 contained in existing contracts?

The issue of pancaked rates embedded in existing Α. 19 contracts was of critical economic 20 significance to many Florida transmission owners. In the pricing 21 protocol, GridFlorida Companies attempted 22 the to strike a reasonable balance between the competing 23 of out 24 objectives phasing pancaked rates under existing contracts and mitigating cost shifts in order 25

to encourage broader participation in GridFlorida. 1 2 How does the pricing protocol achieve this balance? Q. 3 4 The pricing protocol provides for a phase-out of Α. 5 pancaked rates ending by year 10 of RTO operations. 6 short-term wheeling revenue will 7 The loss of be through five and charges addressed in years one 8 recovered under long-term contracts for "through" and 9 "out" service will be phased-out in years six through 10 This phase out was designed to encourage the ten. 11 participation of transmission owners that face the 12 dilemma of having lower-than-average-cost systems 13 higher-than-average-cost today, but systems once 14 pancaked rates are eliminated. These owners objected 15 to phasing out pancaking under a more accelerated 16 schedule than the phase out of zonal charges, given 17 that such an approach would cause their unit costs to 18 increase above the RTO-wide average, only later to be 19 phased-down to the average. The Pricing Proposal 20 addresses this concern by matching the phase-out of 21 all pancaked rates with the phase-out of all zonal 22 charges. 23 24

21

Q. How did the GridFlorida Companies deal with the termination of existing contracts prior to the date the contract expires?

1

2

3

4

17

20

Under the pricing protocol, if, during the first 10 5 Α. years of GridFlorida operations, a customer terminates 6 an existing contract prior to the date the contract 7 8 expires, GridFlorida will provide service to that 9 customer at the zonal PTP charge of the participant that provided transmission service under the contract, 10 11 in addition to then-applicable system and grid management charges. This zonal charge would be 12 phased-out in equal increments over years six through 13 10. This proposal provides comparability by phasing 14 out pancaked charges under all existing contracts on 15 the same schedule. 16

18 Q. How does the pricing protocol address phasing out19 pancaked rates for short term wheeling?

The protocol provides cost-shift mitigation for the 21 Α. loss of short-term wheeling revenues. 22 Under the 23 protocol, GridFlorida compensates participants that lose short-term wheeling revenue due 24 to the elimination of pancaked rates for such loss through 25

payments out of revenues received by the RTO for 1 "through" and "out" PTP service. The loss of revenue 2 for each participant is calculated using a base year 3 amount of revenues from short-term wheeling. 4 GridFlorida will allocate its through and out revenues 5 each participant for its base year amount to б in declining increments (by 20 percent per year) over the 7 8 first five years of GridFlorida operations.

Q. The fourth and final non-consensus issue deals with the
 crediting of TDU transmission facilities. Please explain
 which entities are considered TDUs.

Attachment V to the GridFlorida tariff lists each of the Α. 14 15 existing transmission rate zones for entities that have 16 committed to joining GridFlorida, as well as for other 17 potential participating owners. TDUs are those transmission owners whose facilities are included within 18 other owners' transmission rate zones. 19

20

23

9

13

- Q. Please explain why the parties could not reach consensus
 on the treatment of TDU facilities.
- A. Transmission-owning TDUs, understandably, were interested
 in maximizing the value of the facilities that they owned

and were, therefore, interested in merging the revenue 1 requirements for their facilities into the costs shared 2 by other participants in the shortest period of time 3 The possible. GridFlorida Companies and other 4 the other hand, GridFlorida participants, were on 5 interested in participants extending the period for such 6 alternatively, cost-shifts as long as possible or, 7 limiting the scope of TDU facilities to be incorporated 8 the GridFlorida integrated transmission system. into 9 Thus, while benefits would eventually accrue to all 10 from more robust and GridFlorida participants а 11 geographically diverse transmission network as TDU-owned 12 facilities become integrated into the grid, the 13 difficulty was to devise a method of incorporating such 14 facilities without unduly and adversely affecting other 15 GridFlorida participants' existing customers. In 16 addition, incorporating the TDU facility costs had 17 differing, even disparate, degrees of impact on each of 18 the three GridFlorida Companies, which could not simply 19 ignore this issue due to FERC's mandate in Order No. 2000 20 RTO should include all that а properly formed 21 transmission owners in a specific region, including those 22 municipals, cooperatives and other public owned by 23 entities. The GridFlorida Companies resolved this issue 24 by devising the TDU crediting mechanism. 25

Please describe the TDU crediting mechanism. 1 ο. 2 The GridFlorida Companies addressed the TDU crediting Α. 3 issue by providing TDUs the option of, either, (i) an 4 automatic phase-in of their facilities into zonal charges 5 without a requirement that they demonstrate that those б facilities meet FERC's integration standard, or (ii) an 7 immediate roll-in of certain of their facilities into 8 demonstrate that the if TDU can charges the 9 zonal standard. The integration facilities the meet 10 GridFlorida Companies believed that this approach was a 11 compromise that provided reasonable and prudent 12 significant incentives for TDUs to join the RTO, which is 13 consistent with the GridFlorida Companies' obligations 14 under Order No. 2000, while not being unduly burdensome 15 to existing customers. 16 17

18 Q. Did the GridFlorida Companies and stakeholders engage in 19 any discussions subsequent to submitting the October 16 20 application, but prior to FERC issuing its initial order 21 on these issues in March 2001?

22

A. Yes. The GridFlorida Companies supplemented their
 October 16 application by submitting a December 15, 2000
 supplemental filing with FERC. Prior to submitting the

December 15 supplemental filing, the GridFlorida 1 continued 2 Companies collaborative discussions with stakeholders. 3 4 Q. Please discuss how the December 15, 2000 filing 5 supplemented the rate and pricing issues contained in the 6 7 October 16 initial application. 8 The December 15 supplemental filing modified the pricing Α. 9 plan in various ways, not all of which are relevant to 10 this testimony. For purposes of my testimony, however, 11 the December 15 filinq further addressed three 12 13 significant matters. First, the GridFlorida Companies explained the classification and treatment of Existing 14 Transmission Agreements, or "ETAs," including those that 15 16 represent rate pancakes. Second, the GridFlorida Companies added the methods by which transmission rates 17 will be determined under the GridFlorida tariff. 18 Third. the filing established a grid management charge to be 19 20 used to recover costs not provided for under the GridFlorida tariff, including RTO start-up costs. 21

Q. Please describe the classification of ETAs in the
December 15 filing.

22

25

ETAs fall into three categories: (i) Existing agreements Α. 1 between a participating owner or divesting owner and 2 another party that govern the allocation of transmission 3 capacity associated with an interface between two or more 4 systems ("Interface Agreements"); (ii) transmission 5 Existing agreements between a participating owner or 6 another party that govern the divesting owner and 7 interconnection of facilities, including interchange 8 agreements between control areas, agreements governing 9 interconnection of transmission facilities, and the 10 agreements governing the interconnection of transmission 11 and generation facilities ("Interconnection Agreements"); 12 and (iii) Existing agreements between a participating 13 owner or divesting owner and another party or itself that 14 transmission service, including bundled and provide 15 unbundled transmission service ("Transmission Service 16 Agreements"). 17

18

21

Q. How are existing "Transmission Service Agreements"
 treated under the GridFlorida Tariff?

A. An existing Transmission Service Agreement can either be
 converted to service under the GridFlorida tariff, or
 automatically be phased out in years six through 10, as I
 described previously. If an existing Transmission

Service Agreement is converted to the GridFlorida tariff, the customer will take and pay for service under the tariff and the provider of service under the Transmission Service Agreement will cease collecting revenues under that agreement and no longer will bear any responsibility with respect to that agreement. Ιf an existing Transmission Service Agreement is not converted to GridFlorida tariff service, the transmission provider under the agreement will be responsible for procuring and paying for the necessary services from GridFlorida to perform its obligations under the grandfathered Transmission Service Agreement. The transmission provider will have the rights and obligations associated GridFlorida tariff with the service, and will be reconciling the differences responsible for in the 15 services under the Transmission Service Agreement and the GridFlorida tariff. 17

7

8

9

10

11

12

13

14

16

Please describe the main exceptions to this rule. Q.

20

Α. One exception relates to the phase out of multiple access 21 (i.e., rate pancakes) for inter-zonal service, 22 charges which is transmission service from one transmission rate 23 another. where the same customer bears zone to 24 transmission charges on both systems. The transmission 25

charges levied under an existing Transmission Service Agreement that provides for inter-zonal service will remain in effect during years one through five of operations, phased GridFlorida and out in equal increments (20 percent per year) during years six through the existing Transmission Service Agreement 10. Ιf includes bundled transmission charges, the phase-out of charges will be calculated by reference to the zonal charge in effect in year five for the transmission rate zone that applied to the inter-zonal service prior to GridFlorida formation.

4

5

б

7

8

9

10

11

12

Another exception is designed to prevent gaming prior to 13 GridFlorida operations, the date commences i.e., to 14 entities from entering into ETAS prior prevent to 15 GridFlorida operations for the sole purpose of obtaining 16 If, after December 15, 2000, a participating ETA status. 17 owner or divesting owner enters into a new Transmission 18 Service Agreement, or agrees to purchase or provide long-19 term transmission service (i.e., service for a term that 20 is greater than one year) under a Transmission Service 21 Agreement executed prior to that date, the new service 22 provided under such ETA will be converted to GridFlorida 23 service upon the commencement of GridFlorida operations. 24 Also, if a participating owner or divesting owner agrees 25

to provide, or to purchase, short-term firm or non-firm service that has a term that extends beyond the date of GridFlorida operations, that service will convert to GridFlorida service upon the commencement of GridFlorida operations. All parties were placed on notice as of December 15, 2000 that this would be the treatment for new transmission service.

23

24

25

9 Q. How did the December 15 filing expand on the explanation 10 of zonal and system-wide rates?

The supplemental filing expanded on the descriptions of Α. 12 these and other rates by including them in the 13 GridFlorida tariff, which contains formulas that will be 14 used to calculate the rates. The supplemental filing did 15 not, however, include the actual rates for transmission 16 service that GridFlorida will charge because actual 17 revenue requirements and rates will be filed no later 18 than 60 days prior to the date that GridFlorida commences 19 operations. 20

Q. Please describe how the zonal rate will be calculated according to the December 15 Supplemental Filing.

1 Α. Τo calculate the zonal-based charge, annual zonal transmission costs will be calculated for 2 each transmission rate zone. The zonal rate will ٦ be calculated by dividing the annual zonal transmission Δ costs for the transmission rate zone by the average for 5 the year of the monthly zonal peaks. That rate will 6 apply to service to a point of delivery or network load 7 within a transmission rate zone. 8

For service to a point of delivery or network load 10 outside of GridFlorida (i.e., for "Through 11 and Out Service"), the transmission customer will 12 pay the "Through And Out" rate. The "Through And Out" rate will 13 be calculated by dividing the sum of the annual zonal 14 transmission costs by the average for the year of the 15 monthly transmission system peaks. 16

9

17

20

Q. Please describe how the Part II rate is to be calculated
according to the December 15 supplemental filing.

The monthly system-wide rate will be 21 Α. calculated by dividing the annual system transmission costs by the 22 23 average for the year of the monthly transmission system 24 peaks. Annual system transmission costs will consist of of 25 new transmission investment GridFlorida and

participating owners and the revenue requirements of Existing Facilities that are phased-out of zonal rates and phased in to the grid-wide rate. All transmission service, whether it is to load outside of GridFlorida or within the GridFlorida system, will pay the same systemwide rate.

Q. Please explain the Grid Management Charge included in the December 15 filing.

11 Α. The GridFlorida Companies included a Grid Management Charge ("GMC") in the GridFlorida tariff to recover all 12 reasonably incurred costs necessary for GridFlorida to 13 carry out its business that are not separately charged in 14 the Tariff. The GMC 15 includes start-up costs of establishing the RTO, 16 GridFlorida's payments to the market monitor, and the FERC annual assessment charge. 17 At the same time, the GMC will be reduced by revenues 18 GridFlorida received by for 1.9 conducting certain administrative activities that are charged to 20 specific 21 customers, such as conducting system impact studies and facilities studies, and providing security coordination 22 services to non-RTO participants in the FRCC. 23

24 25

1

2

3

4

5

6

7

8

9

10

Why did the GridFlorida Companies propose to recover ο. 1 start-up costs through the GMC? 2 3 Α. Recovery of start up costs through a mechanism such as a 4 with FERC's policy to GMC is consistent allow the 5 recovery of start up costs. Departure from such a policy 6 would significantly impede the development of RTOs on a 7 timely basis. As has been the case in other regions of R the United States, the GridFlorida Companies' proposal g provided that GridFlorida must reimburse the participants 10 start up costs as soon as practicable. This is for 11 12 consistent with the FERC's objective to make RTOs independent 13 financially as quickly as possible. GridFlorida would then recover these costs from its 14 transmission customers through the GMC. 15 16 17 Q. What types of costs constitute start up costs that would be recovered through the GMC? 18 19 Under Schedule 10 of the GridFlorida Tariff, 20 Α. start up costs would include costs incurred by entities that are 21 participating owners and divesting owners up to the date 22 of the RTO's initial operations and costs incurred by the

RTO (or any interim entity formed to establish the RTO). Start up costs would include a variety of activities

23

24

25

relating to RTO formation. The projected cost of the preliminary start-up plan for implementation of the business functions of GridFlorida is addressed in the direct testimony of Bradford L. Holcombe, on behalf of the GridFlorida Companies. In addition, a discussion of certain formation activities relating to the development of GridFlorida is contained in the direct testimony of Henry I. Southwick.

3

4

5

6

7

8

9

12

- Q. Have the GridFlorida Companies quantified these start upcosts?
- A preliminary estimate of such costs has been provided in Α. 13 consultation with Accenture, which was hired to estimate 14 15 the cost to implement GridFlorida operations, and is discussed in Mr. Holcombe's direct testimony. 16 While the 17 GridFlorida Companies have consulted with each other as to the recovery of costs on as consistent a basis as 18 19 possible, and each company has obtained FERC approval to defer such for accounting purposes, 20 costs no final calculation of total costs has been made to date. 21 The GridFlorida Companies 22 anticipate making а filing accounting for total start up costs at FERC commensurate 23 with, or shortly following, commencement of GridFlorida 24 operations. 25

Have the GridFlorida Companies quantified these costs Ο. 1 with respect to retail load? 2 3 The grid management cost consists of two parts--4 Α. Yes. operating costs and start-up costs. Mr. Holcombe's 5 Tables 1 and 2 show the costs (in Exhibit (BLH-3) 6 thousands of dollars) with respect to wholesale and 7 Columns 11-14 of Table 2 show the retail customers. 8 incremental operating cost, with a total of \$51,618 shown 9 on column 14, line 30. Of the \$51,618, \$5,868 is not 10 retail jurisdictional and would not be recovered from 11 remaining \$45,750, retail customers. Of the the 12 estimated assessments to the three utilities (based on 13 load ratio shares) are shown on line 29 of columns 11-13. 14 These values will be discussed in each of the company 's 15 specific testimonies. 16

The start-up costs are shown on Table 1 of Mr. Holcombe's 18 Exhibit, showing a total of \$136, 402 on line 23 of 19 \$16,367 is not retail jurisdictional and column 14. 20 would not be recovered from retail customers. Columns 21 11-13, line 22 shows the estimated assessments to the 22 three utilities (based on load ratio shares). These 23 amounts are lump sum and proposed to be amortized over 24 I show an estimate of the amortization of five years. 25

17

the total retail amount, and each of the company's retail 1. amounts, in my Exhibit (WRA-2). 2 3 Briefly summarize FERC's March 28, Q. 2001 order 4 as it relates to the GridFlorida pricing and rate design issues 5 vou have discussed. 6 7 In its March 28, 2001 order, FERC generally approved Α. 8 GridFlorida's transmission 9 rate desiqn proposal as compliant with FERC Order No. 2000. 10 Specifically, FERC 11 approved the proposals to: 1. 12 Retain zonal rates for Existing Facilities for the first five years of operations and then phase them out 13 over the next five years; 14 Include the costs of all new transmission facilities 2. 15 16 in the GridFlorida system-wide rate; Encourage participation in the RTO by transmission-3. 17 dependent wholesale customers by providing them certainty 18 that the costs of their facilities will be rolled into 19 GridFlorida's rates through a crediting mechanism, either 20 21 through a "phase-in" option or an "integration standard" option; and 22 23 4. Recover, through a GMC all reasonably incurred costs necessary for GridFlorida to carry out its business that 24 are not separately accounted for in the tariff, including 25

start-up and administrative costs, payments to the market 1 monitor, and the FERC annual assessment charge. 2 Start up costs would be amortized on a monthly basis for five ٦ years. 4 5 Did FERC require any clarifications on the GridFlorida Q. 6 Companies' pricing protocol? 7 8 9 Α. Yes. With respect to the issues Т have discussed previously, FERC required the GridFlorida Companies to 1.0 file the GMC formula. 11 12 Did the GridFlorida 13 ο. Companies comply with FERC's requirements in the March 28, 2001 order? 14 15 Α. Yes. On May 29, 2001, the GridFlorida Companies 16 submitted compliance filing with FERC that, among other 17 things, revised the tariff to include a formula for the 18 GMC. Consistent with base transmission rates, the GMC 19 20 will be calculated based on projected costs and billing determinants and trued-up at the end of each year. 21 The GridFlorida Companies included 22 also а formula for GridFlorida's Transmission 23 New Investment Revenue Requirement ("NTIRR"), discussed above, because the NTIRR 24formula and the GMC formula work together. 25 That is, the

allocations of administrative & general costs and operations & maintenance costs within the formulas operate together to ensure that there is no double recovery of costs. The GMC and NTIRR include loaders and return on common equity components that will be filed with FERC in the future.

1

2

٦

4

5

6

7

10

Q. How does the GridFlorida pricing protocol treat non participating owners?

GridFlorida 11 Α. As proposed by the Companies, nonparticipating transmission owners, consistent with FERC 12 Order No. 2000 would continue to pay pancaked rates. 13 When the customer uses two or more transmission rate 14 zones, its charges would be 15 based on the charges applicable to the zone in which the source or point of 16 receipt is located and the charges applicable to the zone 17 in which the sink or point of delivery is located. 18 As FERC indicated in Order NO. 2000, maintaining 19 rate 20 pancaking for non-participants is reasonable. Further, with regard to the number of transmission access charges 21 it is subject to, a non-participant will be no worse off 22 than it was prior to the establishment of GridFlorida, 23 and may even be better off. 24 If a non-participant is utilizing facilities that today would result in more than 25

two transmission charges, that entity will be subject only to two such charges under the participants' proposal, which is less than it would have paid in the absence of GridFlorida.

1

2

٦

4

5

8

16

22

Q. How does the pricing protocol treat existing retail
transmission services?

The pricing protocol requires that load-serving entities, 9 Α. such as each of the GridFlorida Companies, pay RTO 10 transmission rates, including zonal access charges, 11 for their bundled retail load. This treatment is required by 12 Order No. 2000, as discussed by Mike Naeve in his 13 testimony filed on behalf of the GridFlorida Companies in 14 this proceeding. 15

In your opinion, given the requirements of FERC Order No. 17 Q. 2000, GridFlorida Companies' was the decision to 18 participate in GridFlorida in the best interests of 19 retail ratepayers and prudent from a transmission pricing 20 21 perspective?

23 Α. Yes. The GridFlorida pricing protocol is designed to reduce transmission costs by, among other 24 means, eliminating pancaked rates, and will induce 25 greater

savings than would be generation cost the if 1 case GridFlorida was not able to function as an RTO. 2 The only 3 additional costs that arise from the formation of GridFlorida are the aforementioned 4 start-up and grid But, the pricing protocol amortizes management costs. 5 6 the start up costs over a five-year period in order to minimize the impact consumer rates. 7 on Given the parameters established by FERC Order No. 2000, and the 8 disparate interests among Florida's many constituents, 9 the GridFlorida transmission pricing protocol reflects a 10 reasonable, prudent balanced 11 and approach to restructuring most of Florida's electric grid for the 12 foreseeable future. 13

14

15

16

17

24

Q. Couldn't these benefits be realized by Florida customers in the absence of the RTO?

Α. Probably not in a manner that otherwise could be agreed 18 19 to among the GridFlorida Companies and/or other Florida stakeholders. While efforts could be made to reduce 20 21 pancaked charges, it would be difficult, if not impossible, to devise a system that would operate as 22 efficiently as GridFlorida will operate. 23

25 Q. Does this conclude your testimony?

1	A.	Yes,	it	does.
