VOLUME 4

Pages 270 through 391

PROCEEDINGS: HEARING

BEFORE: CHAIRMAN LILA A. JABER  
COMMISSIONER J. TERRY DEASON  
COMMISSIONER BRAULIO L. BAEZ  
COMMISSIONER MICHAEL A. PALECKI  
COMMISSIONER RUDOLPH "RUDY" BRADLEY

DATE: Monday, February 25, 2002

TIME: Commenced at 9:30 a.m.

PLACE: Betty Easley Conference Center  
Room 148  
4075 Esplanade Way  
Tallahassee, Florida

REPORTED BY: JANE FAUROT, RPR  
Official Commission Reporter

APPEARANCES: (As heretofore noted.)

## P R O C E E D I N G S

1  
2 (Transcript follows in sequence from  
3 Volume 3.)

4 MR. MELSON: As Mr. Benore is returning to the stand,  
5 we are passing out a similar summary document for his rebuttal  
6 testimony.

7 CHAIRMAN JABER: And, Mr. Melson, clarify for me  
8 where these -- because I know Mr. McWhirter will ask the same  
9 question, it is a good one, which is where does this  
10 information originally derive from?

11 MR. MELSON: All right. Page 1 comes from the text  
12 of the testimony. Page 2 is his Schedule 12. Page 3 comes  
13 from his Schedule 12. Page 4 is one of his schedules, and I  
14 unfortunately don't have the reference on it. Page 5 -- the  
15 next page is Schedule 18, the following page is Schedule 20,  
16 and the final page is Schedule 21.

17 CHAIRMAN JABER: Okay. So all information from  
18 exhibits originally filed?

19 MR. MELSON: From exhibits. Or I think in one case  
20 the text on Page 2 is from the testimony itself.

21 CHAIRMAN JABER: Okay. Thank you.

22 - - - - -

23 CHARLES A. BENORE

24 was called as a rebuttal witness on behalf of Gulf Power and,  
25 having been duly sworn, testified as follows:

BY MR. MELSON:

Q Mr. Benore, you are still under oath. Have you -- I guess state your name one more time for the record.

A Yes. Charles Benore.

Q Have you prefiled rebuttal testimony consisting of 53 pages?

A Yes.

Q Do you have any changes or corrections to that testimony?

A No, sir, I do not.

Q And if I were to ask you the same questions today would your answers be the same?

A Yes.

MR. MELSON: Chairman, I would ask that Mr. Rothchild's -- I'm sorry, Mr. Benore's -- I'm going too fast here.

CHAIRMAN JABER: No, we're not.

MR. MELSON: Mr. Benore's rebuttal testimony be inserted into the record as though read.

## 1 GULF POWER COMPANY

2 Before the Florida Public Service Commission  
3 Rebuttal Testimony Of  
4 Charles A. Benore  
5 Docket No. 010949-EI  
6 Date of Filing: January 22, 2002

7 Q. Please state your name, address and occupation.

8 A. My name is Charles A. Benore and my business address is 125 West  
9 Street, Bar Harbor, Maine 04609. I am President of Benore Financial  
10 Consulting, Inc., a financial consulting company.

11 Q. Are you the same Charles A. Benore who provided direct testimony on  
12 Gulf Power's behalf in this docket?

13 A. Yes.

14  
15 Q. What is the purpose of this testimony?

16 A. The purpose of my testimony is to respond to the testimony of  
17 Mr. James A. Rothschild.

18  
19 Q. Have you prepared an exhibit that contains information to which you will  
20 refer in your rebuttal testimony?

21 A. Yes. I have prepared Exhibit (CAB-2) consisting of 24 schedules  
22 numbered Schedule 12 through Schedule 35.

23 Counsel: We ask that Mr. Benore's Exhibit (CAB-2) consisting  
24 of 24 schedules numbered 12 through 35 be marked  
25 for identification as Exhibit \_\_\_\_.

## 1 COMMENTS ON THE DIRECT TESTIMONY OF MR. ROTHSCHILD

2

3 Q. Do you have any fundamental concerns about the return on common  
4 stock equity recommended by Mr. Rothschild?

5 A. Yes, there are several.

6 1. Mr. Rothschild's return on common stock equity recommendation to  
7 the Commission will not produce the growth rate and return that he  
8 testifies investors require. By definition, therefore, his  
9 recommendation is contradictory and flawed.

10 2. He ignored the comparable earnings test, which shows the return  
11 on common stock equity expected by investors and embedded in  
12 their growth and return expectations.

13 3. He did not recognize the relatively small size of Gulf Power  
14 Company and its associated higher business risk in his  
15 recommended return on common stock equity.

16 4. He ignored flotation costs even though such costs are real and  
17 need to be recognized.

18 5. His schedules contain a number of errors, inconsistencies, and  
19 misrepresentations of reasonable investor expectations. These  
20 problems with his DCF and CAPM analyses are described in detail  
21 later in my rebuttal testimony.

22

23

24

25

## BROAD ISSUES

**Mr. Rothschild Made a Contradictory Recommendation to the Commission**

Q. Why is there a contradiction between Mr. Rothschild's recommended return on common stock equity for Gulf Power Company (or the investor required market return), and the return that his recommendation will produce for investors?

A. Mr. Rothschild used a definition of the cost of common stock which he does not fulfill in the return he recommends to the Commission. He notes on page 21 beginning on line 4 that the cost of common stock is "the rate of return that must be offered to a common equity investor in order for that investor to be willing to buy the common stock." Common sense and investment theory indicate that the return required by investors is the return available to them from other comparable risk investments. Moreover, as indicated by the DCF model, investors expect to have a reasonable opportunity to earn their required market return through a combination of growth in the common stock price that tracks the growth in earnings/dividends plus the dividend yield on the stock.

Mr. Rothschild's recommendation stops short of fulfilling investor expectations because he does not provide investors with an opportunity to earn the 10.0% market return he testifies they require. For example, the achievable market return for investors using Mr. Rothschild's 10.0% regulatory return recommendation is only 7.3%. Data supporting this calculation is shown on Schedule 12 of my rebuttal exhibit.

This is clearly an untenable outlook for investors. The achievable

1 market return of 7.3% is less than the yield on Moody's "A" rated utility  
2 bonds of 7.66% (1/10/02), which are lower in risk. Mr. Rothschild's  
3 recommendation of a regulatory return of 10.0% will produce a market  
4 return to investors (7.3%) that is lower than the market return (7.7%) on  
5 lower risk bonds with a rating comparable to Gulf Power Company. This  
6 is an untenable investment prospect for investors.

7

8 Q. What are the expected consequences of adopting Mr. Rothschild's 10.0%  
9 return on common stock equity recommendation for Gulf Power  
10 Company?

11 A. Mr. Rothschild's 10.0% return on common stock equity recommendation, if  
12 adopted by the Commission, would likely drive the stocks toward book  
13 value. Based on data shown in Mr. Rothschild's Exhibit JAR 3, the stock  
14 price of companies on the list of companies comparable to Gulf Power  
15 would need to drop by 39% to reach book value. His recommendation  
16 would therefore deprive investors of a reasonable return on their capital  
17 and, therefore, repel rather than attract investors. This would in turn  
18 jeopardize the ability of Gulf Power Company to attract capital and fulfill its  
19 customer responsibilities. Clearly such a result is contrary to the public  
20 interest.

21

22 Q. What regulatory return on common stock equity is necessary to fulfill  
23 Mr. Rothschild's 10.0% achievable market return for investors?

24 A. The necessary regulatory return in order for investors to have an  
25 opportunity to earn in the market the 10.0% return that Mr. Rothschild

1           testifies they require is 12.7%, before consideration of flotation costs, and  
2           12.9% with flotation costs. Data supporting this calculation is shown in the  
3           lower table on Schedule 12 of my rebuttal exhibit, and on Schedule 27 for  
4           flotation costs.

5

6           **Mr. Rothschild Wrongly Ignores the Comparable Earnings Test**

- 7           Q.     Please explain why you believe Mr. Rothschild erred by ignoring the  
8           comparable earnings analysis in determining his recommended return on  
9           common stock equity for Gulf Power Company.
- 10          A.     Mr. Rothschild employed the sustainable growth rate method for  
11          determining investor expected growth rates. In its simplest form, this  
12          consists of multiplying the expected return on common stock equity ("r")  
13          times the retention rate ("b"), which represents the earnings retained to  
14          support future growth. It should be clear from the sustainable growth rate  
15          formula (r times b) that one of the two elements necessary to determine  
16          the growth rate is the expected return on common stock equity.
- 17          Mr. Rothschild uses the expected return on common stock equity  
18          (comparable earnings) for determining the earnings growth of the  
19          comparable companies. Yet after concluding his DCF analysis, he  
20          ignores the fact that his DCF recommendation relies on comparable  
21          earnings to provide the rate of growth used in that analysis.

22                     From another perspective, there is a difference between book and  
23                     market returns. Book returns, such as the return on common stock equity,  
24                     are generally not the same as market returns (the sum of the growth rate  
25                     and yield produced by the DCF model) except when stock prices are

1 comparable to book value. Nonetheless, the growth rate in the DCF  
2 model is functionally related to the book return on common stock as  
3 shown by the sustainable growth rate formula used by Mr. Rothschild.  
4 The return allowed by regulators, which is represented by "r" (return on  
5 common stock equity) in the sustainable growth rate model, is also a book  
6 return. Therefore, the comparable earnings model provides an apple-to-  
7 apple method of determining the appropriate regulatory return. The return  
8 shown by the comparable earnings model is the return on common stock  
9 equity expected by investors and embedded in their expected market  
10 return (price growth that tracks "br" plus the yield on the stock).

11

12 Q. What are the strengths of the comparable earnings method?

13 A. The comparable earnings model provides a direct rather than indirect  
14 method for assessing the investor expected return on common stock  
15 equity. Market based models, such as the DCF model, calculate the  
16 investor expected market return, which is different from the book return on  
17 common stock equity (except when price and book value are comparable).  
18 When stock prices are different from book value, as they are under current  
19 market conditions, it is necessary to determine the appropriate book  
20 regulatory return on common stock equity to produce the expected rate of  
21 growth, and to provide investors with an opportunity to earn their required  
22 market return. The comparable earnings method provides this  
23 information.

24 From another perspective, the cost of common stock is not the  
25 market return shown by the DCF, ERP, and CAPM models, but is the

1 book return the firm must earn in order to produce the investor required  
2 market return. "Basic Financial Management," as cited on page 24 of my  
3 direct testimony, notes:

4 The cost of common stock: The rate of return the firm must  
5 earn in order for the common stockholders to receive their  
6 required return.

7

8 **Mr. Rothschild Failed to Recognize that Gulf Power Company's Small Size**  
9 **Increases Its Risk Relative to the Comparable Companies**

10 Q. Please explain why size is important in determining the cost of common  
11 stock for companies like Gulf Power Company.

12 A. Smaller companies generally lack the resources of larger companies and,  
13 therefore, are generally less able to cope with unforeseen events. Further,  
14 experience shows that investor returns are materially higher for smaller  
15 than larger companies, which is consistent with the proposition that their  
16 risk is higher.

17 Ibbotson Associates, which has developed size premiums based on  
18 market values, notes on page 107 of its "Valuation Edition, 2001  
19 Yearbook," that:

20 One of the most remarkable discoveries in modern finance is  
21 that of a relationship between firm size and return. The  
22 relationship cuts across the entire size spectrum but is most  
23 evident among smaller companies, which have higher returns  
24 on average than larger ones.

25

1 Q. What is an appropriate size premium for Gulf Power Company?

2 A. Gulf Power Company's common stock equity is equal to about 4% of that  
3 of its parent, Southern Company. Southern Company's market value  
4 according to Value Line is \$15.8 billion, and at 4% Gulf Power Company's  
5 is approximately \$630 million. The average market value of the  
6 companies on the list of companies comparable to Gulf Power is  
7 \$5.3 billion, as shown on Schedule 23 of my rebuttal exhibit. Based on  
8 the Ibbotson size premium study, the higher return indicated for Gulf  
9 Power Company is approximately 0.7%. It is my judgment, nonetheless,  
10 that the higher business risk associated with the Company's smaller size  
11 is mitigated to a substantial extent by constructive adjustment clauses for  
12 fuel, purchase power, capacity, and environmental costs provided by the  
13 Florida Public Service Commission. Consequently, the size premium for  
14 Gulf Power Company is probably closer to 0.25% than 0.75% in quarter  
15 point increments.

16 Although substantially mitigated by constructive regulatory policies,  
17 size is still an important consideration, especially since Mr. Rothschild  
18 suggests that his 10.0% recommended return would be closer to 9.75% if  
19 the Commission chooses to consider the risk mitigation impact of its  
20 adjustment clauses.

21

22 **Mr. Rothschild Ignored Flotation Costs Which Are Legitimate Costs That**  
23 **Should Be Recognized**

24 Q. Did Mr. Rothschild recognize and make an adjustment for flotation costs?

25 A. No. Because monies invested by investors are reduced by the amount of

1 issuance costs, the amount shown on the balance sheet of Gulf Power  
2 Company is less than the amount actually invested by investors.  
3 Therefore, a higher return on the reduced amount of investment is  
4 necessary in order for investors to have an opportunity to earn the return  
5 considered fair by the Commission on the full amount of their investment.

6 Justification for a flotation cost adjustment is provided, and its  
7 amount is shown, in Schedule 11 of the exhibit to my direct testimony, and  
8 in the lower table on Schedule 27 of my rebuttal exhibit. The adjustment  
9 is 0.19%, or 0.2% rounded.

10

11

#### SINGLE-STAGE DCF ISSUES

12

13 Q. Please describe the single-stage DCF model used by Mr. Rothschild.

14 A. The single-stage DCF model used by Mr. Rothschild employed a  
15 sustainable growth rate ( $br + sv$ ), with a yield based on the indicated  
16 dividend per share adjusted by one-half of the growth rate. Flotation costs  
17 and transformation were ignored. Using the average stock prices for the  
18 year ending 11/30/01, Mr. Rothschild's result for the comparable group of  
19 companies identified in my direct testimony was 8.86%, and his result for  
20 Southern Company was 9.60%. Using stock prices for 11/30/01, his  
21 results were 9.63% and 9.64% respectively.

22

23 Q. Please summarize the problems you found in Mr. Rothschild's single-  
24 stage DCF analysis.

25 A. I found three categories of problems: data errors, inconsistencies, and

1 misrepresentations of reasonable investor expectations.

2

3 Q. Please identify the data errors you found in his analysis.

4 A. Using the latest Value Line reports (9/7/01 and 10/5/01) before the  
5 11/30/01 prices shown in his study, I found the following data errors in  
6 Mr. Rothschild's single-stage DCF calculations:

- 7 1. JAR 3, Page 1: The average price to book value using average  
8 prices for the comparable group is 1.87 not 1.92.
- 9 2. JAR 3, Page 1: The 11/30/01 market to book value ratio for  
10 Southern is 1.45 times instead of 1.71 times.
- 11 3. JAR 3, Page 1: The market to book value ratio for Southern based  
12 on average for the year prices is 1.81 instead of 1.90.
- 13 4. JAR 8: The common shares outstanding are incorrect for Progress  
14 Energy and TECO Energy.
- 15 5. JAR 8: The growth rate for common shares is incorrect.
- 16 6. JAR 8: Footnote [A] states that 0.40 was used for "s" but footnote  
17 [J] on JAR 4 states that 0.30 was used for calculating the  
18 sustainable growth rate.

19

20 Q. What inconsistencies did you find in Mr. Rothschild's analysis?

21 A. I found the following inconsistencies:

- 22 1. Mr. Rothschild used Southern Company for this single-stage  
23 version of his DCF analysis, but not for his two-stage DCF model  
24 analysis.

25

1           2.     His two-stage DCF analysis used returns on common stock equity  
2                   of 12.0%, 13.0%, and 13.5% compared to 13.0% for his single-  
3                   stage, comparable company analysis.

4  
5     Q.     Why do you say that Mr. Rothschild's model contains misrepresentations  
6           of reasonable investor expectations?

7     A.     I say that because:

- 8           1.     Mr. Rothschild used a book value for Southern Company that  
9                   apparently includes Mirant, a company that was spun-off from  
10                  Southern Company in April 2001, well before the preparation of his  
11                  testimony.
- 12          2.     He based his analysis in part on an average of prices over the  
13                  twelve months ending 11/30/01, despite the efficient market theory  
14                  that indicates new information is reflected in stock prices almost  
15                  immediately.
- 16          3.     He ignored investor return on common stock equity expectations  
17                  based on Value Line (13.5%) and Zacks' (14.85%) information and  
18                  substituted his own lower numbers.
- 19          4.     He concluded that the investor required market return is 9.63%  
20                  based on 11/30/01 prices on JAR 4, page 1. This result cannot be  
21                  replicated using the DCF model with a sustainable growth rate,  
22                  which suggests that there may be errors or improper modeling on  
23                  JAR 4 page 1.

24  
25

1 Use of Southern Company

2 Q. The errors and inconsistencies that you identified are straightforward.

3 Would you be more specific in your comments about the

4 misrepresentations of reasonable investor expectations that you found in

5 Mr. Rothschild's analysis?

6 A. In light of the fact that Mr. Rothschild used Southern Company data which

7 preceded the spin-off of Mirant in performing his single-stage DCF

8 analysis, I did not review his analysis of Southern Company. Another

9 reason for not including Southern Company in my review is that

10 Mr. Rothschild did not include Southern Company in his two-stage DCF or

11 CAPM analyses.

12

13 Representative Stock Prices

14 Q. Please explain why you believe it is inappropriate to use stock prices that

15 go back as far as December 1, 2000 to measure the cost of common

16 stock for Gulf Power Company in 2002.

17 A. Mr. Rothschild used average prices for the year-ending 11/30/01 for one

18 of his single-stage DCF analyses. It is generally conceded in this

19 electronic age that investors reflect new information into stock prices

20 almost instantaneously with its release. To assume that average prices

21 over the year ending 11/30/01 are representative of current investor

22 expectations is unreasonable, especially as the electric utility industry

23 incurs distortions associated with the structural change from monopoly to

24 competition. It is my judgment that the 11/30/01 price is the only one of

25 the two he used that is representative of investor expectations for his

1 single-stage DCF analysis.

2 Furthermore, Mr. Rothschild used the price-to-book ratio of 1.7  
3 based on 11/30/01 prices for determining the investment cost of the cash  
4 flows in his two-stage DCF analysis. It is inconsistent to use average year  
5 prices in one part of the analysis and year-end prices in another part.

6

7 Use of Investor Expected Returns on Common Stock Equity Versus Those of  
8 Mr. Rothschild

9 Q. You expressed a concern that Mr. Rothschild ignored investor expectation  
10 data from Value Line and Zacks and substituted his own judgment about  
11 the investor expected return on common stock equity in his sustainable  
12 growth rate calculations. Please explain your concern.

13 A. Mr. Rothschild's single-stage DCF model is not based on the investor  
14 expectations he shows on JAR 4, page 1. He developed his sustainable  
15 growth rate using a return on common stock equity of 13.0% for the  
16 comparable company group instead of using the 13.5%, 2004-06  
17 normalized level shown by Value Line, and the 14.85% shown by Zacks  
18 (footnote [A] on JAR 4, page 1). Presumably the 13.0% represents his  
19 judgment after considering the lower returns on average common stock  
20 equity for the comparable group in 1999 (12.4%) and 2000 (12.9%) that  
21 are also shown on JAR 4, page 1.

22 The problem with Mr. Rothschild's choice of 13.0% is that it is  
23 unrepresentative of investor expectations. Whatever informational value  
24 investors find in short-term historical data is already embedded in their  
25 projected returns on common stock equity. Therefore, weighing historical

1 and projected results essentially double-counts short-term historical  
2 guidance. Moreover, short-term historical data adds little value to  
3 determining longer-term expectations during abnormal conditions such as  
4 those which exist today when the industry is progressing from a monopoly  
5 to a more competitive industry structure, and material distortions to  
6 earning assets, earnings, and dividends occur.

7 Therefore, Mr. Rothschild should have used investor expected  
8 returns on common stock equity of 13.5% and 14.85% in his sustainable  
9 growth rate calculations.

10

11 Inability to Replicate Mr. Rothschild's Single-Stage DCF Model Results

12 Q. Using the "br+sv" DCF model, were you able to replicate the 9.63%  
13 investor required return shown for Mr. Rothschild's 11/30/01 single-stage  
14 DCF growth analysis?

15 A. No. The numbers don't add up. Using stock prices on 11/30/01,  
16 Mr. Rothschild claims that the investor required market return is 9.63%.  
17 However, when running the 13.0% return on common stock equity, with  
18 2001 book value of \$22.76, dividends per share (DPS) of \$1.85, and yield  
19 of 5.32% on the forward dividend with an external growth rate of 0.14%,  
20 the indicated investor required market return is 10.3%. The calculations  
21 supporting this result are shown in the upper table on Schedule 13 of my  
22 rebuttal exhibit. Of course, as I explained earlier, the 13.0% return that  
23 Mr. Rothschild inputs into his model is not representative of investor  
24 expectations in any event.

25

1 Alternative Measures of the Investor Required Return for Gulf Power Company's  
2 Comparable Companies

3 Q. If Mr. Rothschild had used the average of the Value Line and Zacks'  
4 projected returns on common stock equity of 14.2% (13.5% and 14.85%)  
5 for his sustainable growth rate approach, what would Mr. Rothschild's  
6 single-stage DCF analysis show as the investor expected market return?

7 A. Using a 14.2% return on common stock and the book value for 2001,  
8 which better corresponds with the 11/30/01 common stock prices than  
9 2000 book value, the indicated investor required market return is 11.5%  
10 before flotation costs and transformation. Supporting data is shown in the  
11 table at the bottom of Schedule 13 of my rebuttal exhibit.

12

13 Q. If Mr. Rothschild had used the average of the five-year earnings growth  
14 rates provided by four vendors, and recent, representative stock prices,  
15 what investor required market return is shown?

16 A. As noted in the response to Staff Production of Document Request Item  
17 No. 55, which requested updated information on the cost of equity, the  
18 indicated investor required market return using the most recent data is  
19 12.1%, before flotation costs and transformation. This calculation is  
20 shown in Schedule 27 of my rebuttal exhibit.

21

22

TWO-STAGE DCF MODEL ISSUES

23

24 Q. Please describe the two-stage DCF model used by Mr. Rothschild.

25 A. Mr. Rothschild's two-stage DCF model determined the present value of

1 investor cash flows, or dividends per share plus the terminal price  
2 40 years after initiating the investment. For the first five years, he used  
3 the dividends projected by Value Line, and for the next 35 years he  
4 essentially used the sustainable growth rate method (br+sv) employing  
5 returns on common stock equity of 12.0%, 13.0%, and 13.5%. He then  
6 determined the discount rate that equated the cash flows with the  
7 purchase price. The discount rate is the market rate of return required by  
8 investors.

9  
10 Q. Did you find any problems with his two-stage DCF analysis?

11 A. Yes. Again I have categorized the problems as data errors,  
12 inconsistencies, and misrepresentations of reasonable investor  
13 expectations.

14 Errors:

- 15 1. Mr. Rothschild did not use either the year-to-date average price, or  
16 the 11/30/01 price for his analysis, but instead used an artificial  
17 price (approximately the ratio of 1/30/01 prices to 2000 book value  
18 times 2001 book value).
- 19 2. He used an incorrect 2005 book value for Ameren which caused  
20 the average book value for that year to be incorrect.
- 21 3. The previously cited data errors on his Schedule JAR 8 also  
22 affected his second-stage DCF analysis.
- 23 4. He erroneously used the retention rate for the first year of the  
24 stage-one analysis (41.33%) rather than the retention rate for the  
25 last year of that analysis (47.39%) as the rate carried forward into

1 stage two.

2 Inconsistencies:

- 3 1. He used Southern Company for his single-stage version of his DCF  
4 analysis but not for his two-stage DCF model analysis.  
5 2. His two-stage DCF analysis used returns on common stock equity  
6 of 12.0%, 13.0%, and 13.5%, compared to 13.0% for his single-  
7 stage analysis.

8 Misrepresentation of Reasonable Investor Expectations:

- 9 1. He used his expected returns on common stock equity rather than  
10 those of investors.

11

12 Q. Please explain the fourth item that you identified in your list of errors.

13 A. The first stage portion of Mr. Rothschild's analysis used Value Line  
14 investor expected data inputs that resulted in a terminal retention rate of  
15 47.39% for 2005. In 2006, however, when Mr. Rothschild begins his  
16 second stage, he drops the retention rate to the 2001 level of 41.33%.  
17 This error effectively institutes a new dividend policy for the comparable  
18 companies.

19

20 Mr. Rothschild Used His Own Expected Returns on Common Stock Equity

21 Instead of Those of Investors

22 Q. Did Mr. Rothschild use his interpretation of investor expected returns on  
23 common stock equity instead of those provided by investors, as shown by  
24 Value Line and Zacks?

25 A. Yes. Mr. Rothschild used expected returns on common stock equity of

1 12.0%, 13.0%, and 13.5% in his analysis in lieu of those provided by  
2 investors of 13.5% by Value Line and 14.85% by Zacks. He notes that  
3 historical returns were lower and that analysts' estimates have an upward  
4 bias in justifying the write down of investor expectations. This is clearly  
5 wrong, because in concluding what future returns on common stock equity  
6 are expected to be, whatever guidance is provided by short-term historical  
7 results would already be embedded in investors' future expectations.  
8 Moreover, it is unlikely that investors would pay much heed to short-term  
9 historical results as the industry undergoes a structural change from  
10 monopoly to competition. Further, investors invest based on their  
11 expectations and not on after-the-fact results.

12

13 Q. If Mr. Rothschild had used the correct values for actual current stock  
14 prices, investor expected returns on common stock equity provided by  
15 Value Line and Zacks, and investor expected dividend policy, what would  
16 his two-stage DCF analysis show the investor expected market return to  
17 be?

18 A. Using the 13.5% investor expected return on common stock equity  
19 provided by Value Line, the indicated market return expectation by  
20 investors using a combined internal and external growth rate of 6.54% is  
21 11.4% before flotation costs and transformation. Supporting data is  
22 shown on Schedule 14 of my rebuttal exhibit.

23 Using Zack's 14.85% investor expected return on common stock  
24 equity indicates an investor required market return of 12.0%, using a  
25 combined internal and external growth rate of 7.18%. Supporting data is

1 shown on Schedule 15 of my rebuttal exhibit.

2

3

#### DCF MODEL CONCLUSIONS

4

5 Q. What are your conclusions about Mr. Rothschild's single-stage DCF  
6 analysis for the list of companies comparable to Gulf Power?

7 A. Mr. Rothschild's single-stage DCF analysis contained a number of factual  
8 errors, misrepresentations of investor expectations, and the numbers  
9 shown on his JAR 4, page 1 for 11/30/01 stock prices do not add up. This  
10 analysis is badly flawed, and I recommend it not be considered in  
11 determining the regulatory return on common stock equity for Gulf Power  
12 Company.

13 Using the average sustainable growth rate based on Value Line  
14 and Zacks' expected returns on common stock equity, the investor  
15 expected market return is 11.5% as shown on Schedule 13 of my rebuttal  
16 exhibit.

17 Using an alternative measure based on projected five-year growth  
18 rates and representative stock prices, Mr. Rothschild's single-stage DCF,  
19 based on the update to my DCF analysis, would show an investor  
20 expected market return of 12.1% (see Schedule 27 of my rebuttal exhibit).

21 The 11.5% (Schedule 13) to 12.1% (Schedule 27) investor market  
22 return expectations are substantially higher than the 9.63% shown on  
23 Mr. Rothschild's JAR 4, page 1, for the list of companies comparable to  
24 Gulf Power.

25

1 Q. What are your conclusions about Mr. Rothschild's two-stage DCF analysis  
2 for the list of companies comparable to Gulf Power?

3 A. Mr. Rothschild's two-stage DCF analysis contained a number of errors,  
4 and misrepresented investor expectations. The most serious of the  
5 problems with his analysis is the use of his judgment about expected  
6 returns on common stock equity rather than those of investors, artificial  
7 rather than actual stock prices for the comparable companies, and the use  
8 of an erroneous dividend policy for the second stage of the analysis rather  
9 than a continuation of one already in place determined by investors.

10 After correcting these problems, and using the appropriate investor  
11 expected returns on common stock of 13.5% from Value Line, and 14.85%  
12 from Zacks, the two-stage DCF model indicates an investor expected  
13 market return of 11.4% (Schedule 14) and 12.0% (Schedule 15)  
14 respectively, before flotation costs and transformation. These expected  
15 market returns that are representative of investor expectations are  
16 materially higher than the 9.80% shown by Mr. Rothschild on his Schedule  
17 JAR 2.

18  
19 Q. What is your overall conclusion about Mr. Rothschild's DCF analysis?

20 A. Mr. Rothschild's DCF analysis is badly flawed primarily because he chose  
21 to use his judgments about investor expected returns on common stock  
22 equity rather than those of investors. Had he used investor expected  
23 returns on common stock equity and several other assumptions consistent  
24 with reasonable investor expectations, he would have found that the  
25 required investor market return was considerably higher than shown in his

1 testimony.

2 Corrected for infirmities, his DCF analysis shows an investor  
3 required market return of 11.5% for his single-stage DCF, and a range of  
4 11.4% to 12.0% (with a midpoint of 11.7%) for his two-stage DCF  
5 analysis, before flotation costs and transformation.

6

7 Q. What regulatory return is necessary so that investors can earn the 11.7%  
8 market return indicated by the recalculated two-stage DCF analysis?

9 A. In order for investors to have a reasonable opportunity to earn the 11.7%  
10 market return, a regulatory return of 14.2% is necessary. Supporting data  
11 is shown on Schedule 16 of my rebuttal exhibit.

12

13

#### EQUITY RISK PREMIUM ISSUES

14

#### 15 CAPM, Version One

16 Q. Please explain the first of two versions of the CAPM used by  
17 Mr. Rothschild.

18 A. Mr. Rothschild's first version of the CAPM determined the investor  
19 expected rate of inflation (2.0%) to which he added the historic, real  
20 market return (6.6% to 7.2%) to determine the investor expected nominal  
21 market return of 8.9%, the midpoint of 8.6% to 9.2%.

22

23

24

25

Schedule JAR 9 extends the analysis beyond the stopping point in  
JAR 2 using the standard form of the CAPM. The real market return of  
6.6% to 7.2% (not the nominal market return of 8.9%) is reduced by the  
nominal debt return of 1.33% (not the real debt return of -0.67%) to

1 determine the market equity risk premiums of 5.27% to 5.87%. The  
2 5.27% to 5.87% market equity risk premiums were adjusted for the lower  
3 risk of the list of companies comparable to Gulf Power compared to the  
4 market by using the Value Line beta of 0.52, which indicated an equity risk  
5 premium of 2.75% to 3.06%, or what Mr. Rothschild describes as the risk  
6 adjusted equity premium. Normally this risk adjusted equity risk premium  
7 is added to the debt return to show the market return required by  
8 investors. Had this been done, his analysis would show a required market  
9 return for the list of companies comparable to Gulf Power of 4.08% to  
10 4.39% (2.75% plus 1.33% and 3.06% plus 1.33%), which is of course  
11 unreasonable on its face.

12 From another perspective, the last line on his Schedule JAR 9  
13 shows a midpoint risk premium applicable to electric companies of 6.23%.  
14 To this one would add the debt return, which he shows as 1.33%. The  
15 sum, or investor required market return, is 7.56%. In either event, the  
16 results are untenable since single A rated utility bonds, which are lower in  
17 risk, currently yield 7.66% (Moody's 01/10/02).

18  
19 Q. What problems did you observe on his Schedule JAR 9?

20 A. There are several.

21 1. Mr Rothschild was inconsistent on line 9 of his analysis on  
22 Schedule JAR 9 when he adjusted the *real* market return by the  
23 *nominal* interest rate. It is not appropriate to mix apples and  
24 oranges (real and nominal rates) in developing the investor  
25 expected, nominal equity risk premium.

1           2.     He shows a different conclusion on Schedule JAR 2 than on his  
2                     Schedule JAR 9.

3           3.     He produced untenable results using the standard version of the  
4                     CAPM.

5

6   Q.     What is your overall conclusion about Mr. Rothschild's inflation adjusted,  
7             real return method to determine the investor expected market return for  
8             the CAPM?

9   A.     The analysis is seriously flawed and, therefore, should not be used for  
10            determining the investor required market return for Gulf Power Company.

11

12   **CAPM, Version Two**

13   Q.     Please describe the second CAPM used by Mr. Rothschild.

14   A.     Mr. Rothschild's second CAPM method determined that the historical  
15             equity risk premium for common stocks versus long-term Treasury bonds  
16             was 4.0%, instead of the 7.3% shown by Ibbotson using the arithmetic  
17             average for 1926-2000. Using geometric average returns, he showed  
18             1926-1999 returns for various debt securities. He then adjusted these  
19             returns by subtracting the long-term Treasury bond return and another  
20             amount which he calculated was required to maintain consistency with his  
21             equity risk premium of 4% over long-term Treasury bonds.

22             Mr. Rothschild properly acknowledged the problems using Treasury  
23             bond yields (flight to quality and perhaps scarcity premiums in Treasury  
24             note and bond yields) and therefore used long-term corporate bonds for  
25             his analysis. His analysis showed an investor required market return for

1 the list of companies comparable to Gulf Power of 8.94%, before flotation  
2 costs and transformation, and a required return of 10.62% for the market.  
3 It is not clear why Mr. Rothschild uses the market return for the upper end  
4 of his analysis.

5

6 Q. Did you note any errors, inconsistencies, or misrepresentations of  
7 reasonable investor expectations, which you believe are present in  
8 Mr. Rothschild's CAPM analysis?

9 A. I did not note any errors in Mr. Rothschild's CAPM analysis, but there are  
10 some inconsistencies and misrepresentations of investor expectations  
11 which are noted below.

12 Inconsistencies:

- 13 1. Mr. Rothschild's yield on JAR 9 for Treasury bills is 1.33% versus  
14 1.60% on JAR 10.
- 15 2. He used short-term Treasury bills for his CAPM Version One  
16 versus long-term corporate bonds for his Version Two.

17 Misrepresentations of Reasonable Investor Expectations:

- 18 1. Mr. Rothschild inappropriately used the geometric average instead  
19 of the arithmetic average Ibbotson Associates' data to determine  
20 investor expectations.
- 21 2. He inappropriately used a 4 percentage point equity risk premium  
22 relative to long-term Treasury bonds to represent investor  
23 expectations.
- 24 3. He failed to recognize that empirical studies show the standard  
25 CAPM model understates the investor expected return for low beta

1 stocks and also for small stocks, both of which apply to Gulf Power  
2 Company.

3 4. He improperly represented data from the Credit Suisse First Boston  
4 (CSFB) study in supporting his analysis.

5

6 The Arithmetically Derived Equity Risk Premium Provides the Correct  
7 Assessment of Investor Expected Returns

8 Q. Why is it wrong to use geometric measures of historical returns to reflect  
9 investor future return expectations?

10 A. Ibbotson Associates, the source of Mr. Rothschild's data, states on  
11 page 61 of its "Valuation Edition 2001 Yearbook":

12 The equity risk premium data presented in this book are arithmetic  
13 average risk premia as opposed to geometric average risk premia.  
14 ***The arithmetic average equity risk premium can be***  
15 ***demonstrated to be most appropriate when discounting future***  
16 ***cash flows.*** For use as the expected equity risk premium in either  
17 the CAPM or the building block approach, ***the arithmetic mean or***  
18 ***the simple difference of the arithmetic means of stock market***  
19 ***returns and riskless rates is the relevant number.*** This is  
20 because both the CAPM and the building block approach are  
21 additive models, in which the cost of capital is the sum of its parts.  
22 The geometric average is more appropriate for reporting past  
23 performance, since it represents the compound average return.  
24 [Emphasis added.]

Morin in "Regulatory Finance," page 298, states:

This appendix shows why arithmetic rather than geometric means should be used for forecasting, discounting, and estimating the cost of capital. Similar treatments and demonstrations are available from Brealey and Myers (1991), Ibbotson Associates (1993), and Litzenberger (1984). This appendix draws from the three aforementioned sources, particularly the latter.

By definition, the cost of equity capital is the annual discount rate that equates the discounted value of expected future cash flows (from dividends and the sale of the stock at the end of the investor's investment horizon) to the current market price of a share in the firm. The discount rate that equates the discounted value of future expected dividends and the end of period expected stock price to the current stock price is ***a prospective arithmetic***, rather than a prospective geometric mean rate of return. Since future dividends and stock prices cannot be predicted with certainty, the "expected" annual rate of return that investors require is an average "target" percentage rate around which the actual, year-by-year returns will vary. ***This target rate is, in effect, an arithmetic average.***

[Emphasis added.]

From still another perspective, if the utility was expected to earn 10% on its common stock equity, after two years one would expect (assuming no dividends or external financing) that its common stock

1 equity would have grown by 21%. However, if the actual rate of growth  
2 were 0% in the first year and 20% in the second year, its common stock  
3 equity would have increased by only 20%, not 21%.

4 The geometric rate of growth in the second outcome (0% and 20%)  
5 is 9.54%. Had one wanted the utility to earn 9.54%, therefore, one would  
6 have had to allow a return of 10.0%. Therefore, it is essential that  
7 arithmetic returns be used to set returns on common stock equity. Use of  
8 the geometric mean return will produce a downward bias in the return on  
9 equity necessary to fulfill investor expectations.

10

11 Q. Nonetheless, Mr. Rothschild's position is that the arithmetic mean  
12 overstates actual returns received by investors (page 82, lines 4-5), and  
13 cites numerous examples (page 83 - 85) that he alleges support the use of  
14 the geometric mean to measure the cost of common stock for Gulf Power  
15 Company. Please comment.

16 A. Mr. Rothschild is right as far as his supporting evidence goes, but all that  
17 evidence relates to the use of geometric returns for presenting historical  
18 results, not for estimating expected future results.

19 In my three decades of experience in working with individual and  
20 institutional investors, I have never talked to an individual investor who  
21 asked me about geometric averages on either a historic or prospective  
22 basis. I cannot recall an institutional investor that looked at historical  
23 returns calculated with the geometric mean to determine expected future  
24 returns. This experience is supported by Value Line which shows even  
25 historic returns based on the arithmetic mean.

1 Value Line shows the arithmetic and not the geometric total return  
2 in its reports to investors. Value Line notes:

3 We are adding a new box to show "Total Return." On every report,  
4 in a box in the lower right hand corner of the stock price chart, we  
5 will now show total return for each stock (appreciation or  
6 depreciation of the stock plus cash dividends) for the past 1 year,  
7 3 years, and 5 years. We will also show the total return of the stock  
8 market for the same time periods. The market measure used will  
9 be the **Value Line Arithmetic Index**, which is representative of the  
10 stock market as a whole, and is an equally weighted price index of  
11 all stocks covered in The Value Line Investment Survey.

12 [Emphasis added.]

13  
14 Mr. Rothschild Erred by Selecting the Lowest, Round Number Equity Risk  
15 Premium Possible Over 1926-2000

16 Q. Mr. Rothschild determined that the equity risk premium was declining  
17 based on a 30 year moving average of historic equity risk premiums, and  
18 provided alleged supporting citations from Federal Reserve Chairman  
19 Greenspan and a Credit Suisse First Boston report to investors. Please  
20 explain why you believe he erred in using a 4% equity risk premium.

21 A. A review of arithmetic, historical equity risk premiums shown in Ibbotson's  
22 "Valuation Edition 2001 Yearbook," pages 208-209, for long-term  
23 government bond total returns, and pages 198-199, for large company  
24 stocks total returns, shown on Schedule 17 of my rebuttal exhibit,  
25 indicates that the time period used by Mr. Rothschild for his equity risk

1 premium is the lowest, using the 30 year moving average, for 1926-2000.

2 It is clear that a 4% geometric average return (the chart shows  
3 higher equity risk premiums based on arithmetic returns) is not  
4 representative of the thirty year moving average over 1926-2000, and  
5 Mr. Rothschild should not expect investors to make a similar conclusion.  
6 The range of equity risk premiums is 3% to 13% with a range midpoint of  
7 8%. The range midpoint of about 8% is a more reasonable investor  
8 expectation. It is also reasonably close to the average of the arithmetic  
9 equity risk premiums for 1926-2000 of 7.3% based on total return, and  
10 7.8% based on the income return.

11

12 Mr. Rothschild Failed to Observe that Empirical Studies Show that the Standard  
13 CAPM Understates Investor Required Returns for Low Beta Stocks and Small  
14 Companies Like Gulf Power Company

15 Q. Why do you conclude that the standard CAPM understates investor  
16 required returns for companies like Gulf Power?

17 A. Virtually all empirical studies of standard CAPM model results show that  
18 the CAPM understates the investor required market return for low beta  
19 stocks like Gulf Power Company. Additionally, empirical research  
20 indicates that the standard CAPM understates expected market returns for  
21 small company stocks, which also includes Gulf Power Company. Please  
22 see citations on Schedule 9, pages 3 and 4, of the exhibit to my direct  
23 testimony.

24 Additionally, electric utility stocks have detached themselves from  
25 the market since regulatory restructuring concerns surfaced in 1993.

1 Electric utility stocks have moved sideways as selling pressures  
2 overwhelmed buying and caused the stocks to dramatically under-perform  
3 the market on a risk adjusted basis. The resulting lower beta does not  
4 reflect lower risk, but the adjustment for higher risk. This can be viewed  
5 on Schedule 22 to my rebuttal exhibit. This is confirmed by the rising risk  
6 assessment for single A utility bonds shown on Schedule 3, page 2 of the  
7 exhibit to my direct testimony.

8 Therefore, the beta used by Mr. Rothschild understates the relative  
9 risk of the list of companies comparable to Gulf Power compared to the  
10 market, and therefore understates the indicated investor required market  
11 return.

12

13 The Credit Suisse First Boston Report Does Not Support Mr. Rothschild's Claim  
14 that the Market's Expected Equity Risk Premium is 3.7%.

15 Q. Mr. Rothschild cites a Credit Suisse First Boston (CSFB) report to  
16 investors that shows an equity risk premium relative to government bonds  
17 of 3.7%. Please comment.

18 A. The CSFB report identifies a current market risk premium of 5.3%. The  
19 3.7% figure cited by Mr. Rothschild is based on a CSFB "stress test"  
20 which assumes that earnings per share growth returns to the post 1948  
21 trend, which is described as a conservative assumption. CSFB does not  
22 state whether or not it has adjusted for the flight to quality and Treasury  
23 buy-back premiums in the yields for Treasury securities at this time, or the  
24 unprecedented efforts by the Federal Reserve to mitigate the recession in  
25 the U.S. economy through lower interest rates.

1           Accordingly, insufficient information is available from the study to  
2           assess whether or not the 5.3% market equity risk premium is  
3           representative of reasonable investor expectations. Other issues that are  
4           important to assessing the reasonableness of the 5.3% estimate is  
5           CSFB's use of the earnings yield as part of the estimation process, an  
6           input that CSFB describes in another section of its report as a flawed  
7           model, and their assumption that earnings per share will grow after five  
8           years at only a 5% rate. This is roughly one-half the rate over the last  
9           economic cycle, and investor expectations for the next five years.

10  
11    Q.    Mr. Rothschild also notes that Federal Reserve Chairman Greenspan  
12           expects the equity risk premium to decline. Please comment.

13    A.    Because the equity risk premium is volatile from year to year, it is  
14           reasonable to consider that Chairman Greenspan may have been thinking  
15           of an average of several years. For example, if one thought of the equity  
16           risk premium as the average over the last five years, and then moved  
17           backward in time adding one year to each new measurement period  
18           (5 years, then 6 years, etc.), the results show an equity risk premium for  
19           the last five years of about 11%. This method of measurement gives the  
20           most recent data more weight than earlier data. It is also clear from the  
21           chart showing this method for calculating the equity risk premium that the  
22           equity risk premium has been sharply increasing in the 1990s. Perhaps  
23           Chairman Greenspan's reference was to these equity risk premiums.  
24           Supporting data is shown in Schedule 18 of my rebuttal exhibit.

25           Nonetheless, had he been referring to the equity risk premiums for

1 1998 or 1999 (his comments were made in 1999 according to  
2 Mr. Rothschild), the Ibbotson equity risk premium for 1999 was 30.0% and  
3 for 1998 was 15.5%. I agree that equity risk premiums were likely to  
4 decline, and that is why I have used a much lower level to reflect  
5 reasonable investor expectations in my testimony.

6

7 Q. What equity risk premium do you believe investors are using at this time?

8 A. Based on Value Line projections for the Value Line Composite of about  
9 1,700 common stocks, the projected total return is 16.9%. Using three  
10 different investor growth rate estimates, the expected total return for the  
11 S&P 500 is 14.4%. The normalized yield on long-term governments is  
12 currently 6.2%. These inputs indicate an expected equity risk premium  
13 that averages 9.5%. Supporting data is shown on Schedules 31 and 33 of  
14 my rebuttal exhibit.

15

16 Q. If Mr. Rothschild had used Ibbotson's long-term, arithmetic equity risk  
17 premiums using both the total return and income return, as well as the  
18 projected market returns you noted, what would his CAPM test show the  
19 investor required return to be for the list of companies comparable to Gulf  
20 Power Company?

21 A. The standard CAPM result would be 10.6% before flotation costs and  
22 transformation. It would also be necessary to consider the disconnect of  
23 electric stocks from the market which I referenced earlier, and the  
24 empirical research that shows beta understates risk for low beta stocks  
25 and stocks of small companies.

1                   Accordingly, it is appropriate to use the empirical CAPM shown in  
2 my testimony that indicates a required market return by investors of  
3 11.6%, before flotation costs and transformation. Supporting data for the  
4 CAPM results are shown on Schedule 33 of my rebuttal exhibit.

#### 6                   CAPM CONCLUSIONS

- 7
- 8 Q. Please state your conclusions about Mr. Rothschild's CAPM analyses.
- 9 A. As stated earlier, Mr. Rothschild's CAPM Version One is seriously flawed  
10 and, as presented, does not provide useful guidance for determining the  
11 investor required return for Gulf Power Company. His CAPM Version Two  
12 is biased downward for the reasons previously stated. When corrected to  
13 show representative investor expectations, the standard CAPM shows an  
14 investor required market return of 10.6% before consideration of the  
15 understatement by beta of risk for low beta stocks and stocks of small  
16 companies, both of which apply to Gulf Power Company. The empirical  
17 CAPM, which partially adjusts for the beta understatement, shows an  
18 investor required return of 11.6% before consideration of flotation costs  
19 and transformation.
- 20
- 21 Q. What regulatory return is necessary to produce the average return of  
22 11.1% shown by the standard and empirical CAPMs in your updated  
23 testimony?
- 24 A. The necessary regulatory return to yield or produce an 11.1% market  
25 return to investors is 13.5%. Supporting data is shown in Schedule 19 of

1 my rebuttal exhibit.

2

3

OVERALL CONCLUSIONS ABOUT THE RESULTS

4

OF MR. ROTHSCHILD'S DCF AND CAPM RESULTS

5

6 Q. What are your overall conclusions about the results of Mr. Rothschild's  
7 DCF and CAPM analyses for Gulf Power Company?

8

9 **DCF and CAPM Conclusion**

10 A. Mr. Rothschild's DCF and CAPM analyses are flawed from an investor  
11 perspective for the reasons noted in the foregoing analysis. Using  
12 investor expected returns on common stock equity, his single-stage DCF  
13 analysis shows an investor required market return of 11.5%. His two-  
14 stage DCF model, with appropriate modifications, shows the investor  
15 required market return using Value Line's expected return on common  
16 stock equity is 11.4%, and Zacks' 12.0%. My updated DCF analysis for  
17 Gulf Power Company using the investor projected five-year growth rate  
18 shows an investor required market return of 12.1%. These estimates are  
19 before flotation costs and transformation.

20 In order for investors to have a reasonable opportunity to earn the  
21 range midpoint of his two DCF model results shown above, or 11.7%, the  
22 necessary regulatory return is 14.2%, as shown on Schedule 16 of my  
23 rebuttal exhibit.

24 Mr. Rothschild's CAPM Version One has serious fundamental  
25 flaws. Therefore, I recommend it not be considered for determining the

1 cost of common stock for Gulf Power Company. His CAPM Version Two  
2 when corrected for its infirmities shows an investor required market return  
3 of 11.1% before flotation costs and transformation. The necessary  
4 regulatory return to produce an 11.1% market return for investors is 13.5%  
5 as shown on Schedule 19 of my rebuttal exhibit.

6 Overall, Mr. Rothschild's testimony when amended to reflect  
7 reasonable investor expectations, supports an allowed regulatory return  
8 for Gulf Power Company of 13.5% to 14.2%, or an average of 13.9%.

9  
10 **RESPONSE TO MR. ROTHSCHILD'S COMMENTS ON MY DIRECT TESTIMONY**

11

12 **Transformation, or the Process of Providing Investors with an Opportunity**  
13 **to Earn Their Required Return so that Capital Attraction and Reliable**  
14 **Customer Service Can Reasonably Occur**

15 Q. Do you agree with the rationale stated in FERC and FCC decisions cited  
16 by Mr. Rothschild at page 17 of his testimony for rejecting the use of  
17 transformation in setting regulatory returns?

18 A. No. FERC's argument assumes an ability to control the price-to-book  
19 value ratio, and that doing so is in the customers' interest. Controlling the  
20 price-to-book ratio would be difficult, and would require frequent rate  
21 adjustments and administrative costs.

22 More importantly with respect to capital access, when interest rates  
23 decline, it reduces the cost of capital not only for electric power companies  
24 like Gulf Power Company, but for all securities. This causes prices for all  
25 securities to rise. If investors were confronted with two investment

1 opportunities -- one that was going to rise because interest rates are  
2 declining, while the other would not because the return and earnings  
3 would be reduced in response to the lower cost of capital - - it is clear  
4 what the investors' response would be. They would buy the stock  
5 expected to rise and reject the stock that is expected to decline in price to  
6 its book value. Since declines in interest rates can span several years,  
7 capital attraction for regulated utilities could be jeopardized for a  
8 considerable period of time.

9 From an investor perspective, this is not an attractive investment  
10 proposition. If interest rates are flat, the investor can earn the expected  
11 return and is not disadvantaged relative to other stocks. However, interest  
12 rates are seldom flat. If interest rates decline, the utility can seek rate  
13 relief, and after regulatory lag, presumably increase rates to compensate  
14 for the increase in the cost of common stock. Conversely, non-regulated  
15 companies can presumably raise prices to offset capital cost increases.  
16 On the other hand, if the cost of capital declines, the utility investor will  
17 suffer an opportunity cost loss because other common stocks benefit from  
18 the decline in interest rates, while it is taken away from investors in utility  
19 stocks. Utility stock investors could even experience negative returns if the  
20 price decline to book value exceeds the stock's yield.

21 Therefore, there is a serious capital attraction issue with FERC's  
22 argument. Because of the indispensable nature of electric service to  
23 commerce, jobs, and the quality of life for Gulf Power Company's  
24 customers, I believe it is important for the utility to have continuing access  
25 to the capital markets in both easy and difficult conditions. This is, I

1 believe, a prerequisite for reliable customer service at reasonable rates in  
2 the future. Setting rates at levels that would potentially repel rather than  
3 attract investor capital does not in my view serve the public interest.

4

5 Q. Mr. Rothschild's testimony indicates that when stocks are trading above  
6 book value, it is reasonable to drive the stocks downward in price to book  
7 value? Do you agree?

8 A. Definitely not. He notes on page 19 of his testimony that "If the stock price  
9 exceeds book value, a reasonable result of the new rate determination  
10 could be for the stock price to decline." Based on three decades of  
11 working with investors, I can safely report that investors will not buy a  
12 stock that is expected to decline in price.

13

14 Q. Do investors expect regulated utility stock prices to drop in price or to their  
15 book values?

16 A. No. If they did, the stocks would already be selling at the lower expected  
17 price, or at a price-to-book ratio of 1.0 times.

18

19 Q. Mr. Rothschild also cites a FCC decision on the same issue. Please  
20 comment.

21 A. The FCC decision cited by Mr. Rothschild essentially makes the same  
22 argument as FERC, and concludes that even though the price of the stock  
23 declines, that the Bluefield/Hope criteria are still met. Since interest rates  
24 can decline over a considerable period of time when investors would be  
25 attracted to stocks other than regulated companies, capital access could

1 be jeopardized which would be adverse to customer interests.

2 As noted in my response to the FERC order, denying investors an  
3 opportunity to earn a prospective return comparable to companies of  
4 similar risk will repel rather than attract investors, and jeopardize the ability  
5 of Gulf Power Company to attract capital and fulfill its customer  
6 responsibilities.

7

8 Q. Mr. Rothschild also quotes from the U.S. Supreme Court's Hope decision  
9 and notes that the common stock price is the end product of the rate  
10 making process, not the front end, and therefore, a reduction in value  
11 does not invalidate regulation. Please comment.

12 A. I do not believe the U.S. Supreme Court would sanction a method that  
13 would deprive investors on a prospective basis of a reasonable  
14 opportunity to earn their required return. To do so would impede the  
15 utility's ability to attract capital, ultimately harming the customers it serves.

16

17 Q. What has been the response of regulators to the argument presented by  
18 Mr. Rothschild?

19 A. As price-to-book value ratios have risen from about parity in 1985,  
20 regulators have been allowing higher returns on common stock equity  
21 than indicated by strict application of market-based models, as shown in  
22 Schedule 5 of the exhibit to my direct testimony. Over the last several  
23 years, the allowed regulatory returns have exceeded the DCF indicated  
24 return by 1 to 3 percentage points using the earnings-per-share growth  
25 rate version of the model. Regulatory commissions, by allowing higher

1 returns than indicated by market based models, do not appear to have  
2 followed Mr. Rothschild's recommendation to deny investors an  
3 opportunity to earn a fair market return on their investment by setting rates  
4 designed to drive stock prices down toward book value.

5

6 Q. Mr. Rothschild's remaining comments on your testimony begin with a  
7 summary on page 63. There he notes that your DCF analysis using the  
8 investor expected five-year growth rate is valid only if the growth rate for  
9 book value, earnings and dividends are constant. Please comment.

10 A. Mr. Rothschild assumes a degree of specificity that is beyond the normal  
11 scope of investor practice. Based on my experience, investors typically  
12 use a five-year earnings growth rate in assessing expected market  
13 returns.

14 The use of earnings versus dividends is confirmed by a survey of  
15 investor practices cited on page 6 of Schedule 7 of the exhibit to my direct  
16 testimony. The survey shows that earnings was the top choice among  
17 cash flow, book value, earnings, and dividends for the most important  
18 variable in valuing a security. Of 297 respondents, only three respondents  
19 chose dividends, and only five chose book value. Both dividends and  
20 book value were at the bottom of the list among the four choices. If  
21 constancy of book value and dividend growth was important to investors in  
22 their valuation process one would expect them to be as important as  
23 earnings to investors.

24 Moreover, if investors ignored the five-year earnings growth rate  
25 because of the lack of growth constancy, and relied instead on the

1 sustainable growth rate favored by Mr. Rothschild, one would reasonably  
2 expect that First Call, I/B/E/S, Value Line, and Zacks would all provide  
3 sustainable rates of growth. The fact of the matter is that they all supply  
4 five-year earnings growth rates. Only Value Line provides a sustainable  
5 growth rate, which is based on year-to-year data, and is, therefore, not  
6 meant to be applicable to the long-term future.

7 Based on my experience, the sustainable growth rate method,  
8 which in its simplest form, consists of just two variables, does not provide  
9 investors with the detail they require for making investment decisions.

10 Nonetheless, the difference between using the investor practice, or  
11 five-year earnings growth rate, versus the sustainable growth rate  
12 preferred by Mr. Rothschild using investor expected returns on common  
13 stock equity, is not substantial enough in my view to justify his objection to  
14 investor practice.

15

16 Q. If Mr. Rothschild had used the same method as investors for determining  
17 expected total return, or investor five-year earnings growth expectations  
18 plus the yield, what would the analysis show the investor required market  
19 return to be?

20 A. The indicated investor required return would be 12.1%, as shown in my  
21 updated DCF analysis on Schedule 27 of my rebuttal exhibit. This result  
22 is not substantially different from the 11.5% shown by Mr. Rothschild's  
23 single-stage DCF analysis using investor expected returns on common  
24 stock equity rather than his, and 11.4% to 12.0% for his two-stage DCF  
25 analysis when again using investor return on common stock equity

1 expectations.

2

3 Q. Mr. Rothschild states that use of the five-year growth rate can lead to ever  
4 increasing returns on common stock equity. Please comment.

5 A. Mr. Rothschild states that if the earnings per share grow more rapidly than  
6 book value, the return on common stock equity will increase. This is true,  
7 but the reverse is also true. Further, after determining the investor  
8 expected market return, I have used the sustainable growth rate method  
9 for the transformation process. Therefore, Mr. Rothschild's concern that  
10 the return on common stock equity would continually rise if earnings grow  
11 more rapidly than book value, and fall when earnings grow less rapidly  
12 than book value is not relevant. Moreover, when using a number of  
13 companies instead of just one, as Mr. Rothschild did, there is a chance for  
14 offsetting outcomes regarding this issue, since more rapid growth in  
15 earnings than book value by one company may be offset by the reverse in  
16 another company.

17 From still another perspective, the DCF model results using either  
18 the investor return on common stock equity expectation (11.5% using his  
19 single-stage DCF, and 11.4% to 12.0% using his two-stage DCF results),  
20 or the investor five year earnings growth rate expectation (12.1% shown in  
21 the update on Schedule 27 to my rebuttal exhibit) are similar.

22

23 Q. Mr. Rothschild alleges that you failed to take into account a downward  
24 trend in risk premiums. Please comment.

25 A. Whether or not one finds a downward trend in risk premiums depends on

1 the data one chooses to examine. The 1926-2000 Ibbotson data shows  
2 that equity risk premiums have been rising from about 4 percentage points  
3 in the early 1970s to about 11% for the most recent five years ending in  
4 2000. Supporting data is charted in Schedule 18 of my rebuttal exhibit.  
5 Mr. Rothschild, on the other hand, uses a 30-year moving average as  
6 shown in Schedule 17 of my rebuttal exhibit. The latter shows for the  
7 most recent 30 years an equity risk premium about 4% in the mid-1990s.

8 Overall, it is best to use the long-term, arithmetic equity risk  
9 premium results for the stock market versus long-term governments,  
10 which is 7.3% using total returns, and 7.8% using income returns. This is a  
11 less arbitrary method than Mr. Rothschild uses. The data go back in time  
12 as far as quality inputs are available, and includes many event types that  
13 could be considered by investors to the extent that they use long-term,  
14 historical data to determine expected equity risk premiums.

15

16 Q. Please respond to Mr. Rothschild's comments on the process that you call  
17 transformation in your testimony.

18 A. The problem with Mr. Rothschild's objection is that he does not recognize  
19 the difference between book and market returns and improperly equates  
20 the investor required market return to the return that the Commission  
21 should allow for regulatory purposes. The investor return is a market  
22 return and the regulatory return is a book return. When stock prices are  
23 materially above book value, as they now are, using the investor required  
24 market return as the book regulatory return will not produce the investor  
25 required market return. Accordingly, investor expectations will not be

1 fulfilled, and knowledgeable investors will invest their capital elsewhere.  
2 This in turn will jeopardize the ability of Gulf Power Company to attract  
3 capital and fulfill its customer responsibilities.

4 In fact, Mr. Rothschild is not true to his own analysis of investor  
5 required returns. For example, he determined that the investor required  
6 market return was 10.0%, but as shown on Schedule 12 of my rebuttal  
7 exhibit, a 10.0% return on common stock equity will produce only a 7.3%  
8 achievable market return to investors. Therefore, his recommendation  
9 contradicts his analysis, since the return he recommends for Gulf Power  
10 Company will not enable investors to have an opportunity to earn the  
11 return he testifies they require. This is explained in greater detail along  
12 with a mathematical example on pages 13-20 of my direct testimony.

13  
14 Q. Do you agree with Mr. Rothschild's claim that when transformation is used  
15 the higher the stock price, the higher the return on common stock equity  
16 that would be recommended?

17 A. No. Mr. Rothschild's claim is wrong, and illustrates that he either does not  
18 understand the transformation process, or is unwilling to provide investors  
19 with an opportunity to earn their required market return. This is clearly  
20 shown in the side-by-side example on Schedule 20 of my rebuttal exhibit,  
21 which shows why transformation is necessary. In the first of two  
22 examples, or "Price Up-Constant ROE," the expected market return is  
23 10.7% based on a return on common stock equity expectation of 13.0%, a  
24 price of \$35 for the stock, and a book value of \$25, as shown in Column A.

25 If the price of the stock rises from \$35 to \$40, the investor required

1 market return declines to 10.0% as shown in Column B. The investor  
2 expected return on common stock equity in this example does not change,  
3 and the required regulatory return continues at 13.0%, instead of  
4 increasing as indicated by Mr. Rothschild.

5 Concurrently, if the investor expected return on common stock  
6 equity declines to 12.5% from 13.0% in the second example in Column F,  
7 while the price also rises from \$35 to \$40, the investor expected market  
8 return becomes 9.5% and is consistent with the lower expected return on  
9 common stock equity of 12.5% as shown in Column H.

10

11 Q. Are earnings necessarily excessive when prices are above book value?

12 A. No. Mr. Rothschild assumes that earnings are excessive when prices are  
13 above book value, and that transformation perpetuates excessive  
14 earnings. Mr. Rothschild may think that earnings are excessive, but  
15 investors do not, or they would not pay more than book value for regulated  
16 utility stocks. Based on investor expectations, the stocks are fairly valued  
17 and fairly reflect future cash flows. Cutting the return and earning power,  
18 such that common stock prices are driven down to book value would  
19 damage investor confidence, repel rather than attract investors, and hurt  
20 Gulf Power Company's financial integrity and ability to serve its  
21 customers.

22

23 Q. Does transformation protect investors from stock price declines?

24 A. No, transformation does not insulate investors from market risks, but  
25 simply provides them with an opportunity to earn their required return.

1 Transformation avoids driving stock prices to book value, thereby  
2 enhancing the ability of investors to earn their required return, so that Gulf  
3 Power can attract the capital necessary to continue providing reliable  
4 electric service in the future.

5

6 **CAPM Analysis**

7 Q. On page 79, Mr. Rothschild raises five objections to your CAPM analysis.  
8 Please respond.

9 A. I have previously responded to all but one of these objections earlier in  
10 this rebuttal testimony. With regard to the appropriate bond return to use  
11 in the CAPM, Mr. Rothschild prefers to use Treasury bills rather than  
12 Treasury bonds. However, his CAPM analysis using the Treasury bill  
13 results in a return below that of single A utility bonds, which is an  
14 untenable conclusion. Investors favor the use of long-term not short-term  
15 debt for investment purposes. In my judgment, this is because the long-  
16 term Treasury bond better matches the perpetuity term of common stocks,  
17 is much more stable than Treasury bill yields, and is much less controlled  
18 by the Federal Reserve. The latter point is particularly relevant at this  
19 time. Treasury bill yields are very low at this time because of  
20 unprecedented rate reductions by the Federal Reserve to mitigate the  
21 recession underway in the U.S. economy.

22

23 Q. Mr. Rothschild objects to the use of a five year growth rate in the CAPM  
24 because he claims that the base year for establishing the growth rate was  
25 a recession year when earnings would be depressed. Please comment.

1 A. Mr. Rothschild fails to recognize that the year 2000 was not a recession  
2 year.

3

4 Q. Mr. Rothschild on page 90 reiterates his position that equity risk premiums  
5 have been declining using the 30 moving average of Ibbotson's 1926-  
6 1999 returns, and that your historic equity risk premium is too high.  
7 Please comment.

8 A. Equity risk premiums have been rising as previously noted in my  
9 testimony. Comparisons of one method versus that used by  
10 Mr. Rothschild are provided on Schedules 17 and 18 of my rebuttal  
11 exhibit, both of which employ the same data. Relevant to this issue is the  
12 investor expected, market equity risk premiums shown in the update to my  
13 testimony on Schedule 33. Investor expected equity risk premiums based  
14 on projected market returns for the Value Line Composite and S&P 500  
15 (using three different growth rate estimates) average 9.5%, which is  
16 almost double the equity risk premium that Mr. Rothschild believes  
17 investors expect.

18

19 Q. On page 91, Mr. Rothschild states that Treasury bonds are not risk free  
20 since they do not have a zero beta. Do you agree?

21 A. Mr. Rothschild is correct that longer-term investments such as Treasury  
22 bonds have more risk than Treasury bills, or higher than a zero beta -- that  
23 is, if one can believe that there is no reinvestment risk for Treasury bill  
24 investors. Bill versus bond investors must continually roll over their  
25 investments, and when interest rates are declining so are bill rates.

1           Meanwhile, the value of the bond is rising as investor required returns  
2           decline. The reverse is also true.

3                       Even if one assumes that Treasury bonds have more risk than  
4           Treasury bills, it is long-term bonds not short-term Treasury bills that  
5           investors primarily use. This is because investors prefer comparisons with  
6           long-term not short-term bonds because they better match the duration  
7           risk of stocks than short-term investments such as Treasury bills.  
8           Treasury bill yields are primarily controlled by the Federal Reserve and not  
9           investors, and therefore, are not always indicative of investor  
10          expectations. For example, not many months ago bill yields were 6%  
11          compared to less than 2% currently. Bill yields are also much more  
12          volatile than Treasury bond yields. From an investor perspective,  
13          therefore, Mr. Rothschild's criticism is without merit.

14  
15       Q.    Mr. Rothschild's next concern is that your CAPM analysis using a 5.4%  
16            yield on long-term Treasury bonds would show an investor expected  
17            market return of 9.3% to 10.2%. Do you agree?

18       A.    I do not agree that the 9.3% to 10.2% is representative of investor  
19            expectations because of the flight to quality and scarcity premiums now  
20            present in long-term Treasury bond yields. This is covered in Schedule 8,  
21            pages 3 to 6 of the exhibit to my direct testimony.

22                       Mr. Rothschild appears to agree. He notes on page 14 and 15 of  
23            his testimony:

24                       While I normally have made a specific adjustment to the lower the  
25            indicated cost of equity for risk specific reasons, in the current

1 marketplace the yields on long-term bonds already reflect the flight  
2 to quality caused by uncertain economic times and stimulating  
3 effects of the Federal Reserve Board.

4 Again, due to current economic conditions, there are temporarily  
5 problems with using treasury securities in a risk premium analysis  
6 based upon historic risk premium relationships. Therefore, I have  
7 only summarized the results of a risk premium analysis based upon  
8 long-term corporate bonds.

9

#### 10 **Comparable Earnings**

11 Q. Mr. Rothschild states that you used higher risk industrial companies for  
12 your comparable earnings analysis. Do you agree?

13 A. No. Schedule 10, page 6, of the exhibit to my direct testimony clearly  
14 shows that this is not so.

15

16 Q. Please respond to Mr. Rothschild's suggestion that the comparable  
17 earnings method does not provide useful information to the Commission.

18 A. As previously noted in Schedule 10 of my direct testimony, and in my  
19 comments about transformation in this testimony, the growth rate used by  
20 investors is fundamentally tied to their return on common stock equity  
21 expectation. When denying the validity of comparable earnings, therefore,  
22 one is also denying the growth rate in the DCF model, or the results of the  
23 DCF model. Mr. Rothschild should not expect to have it both ways –  
24 using the investor expected return on common stock equity, or “r” in his  
25 “br+sv” method for his DCF analysis while denying its validity in the

1 comparable earnings method. It is necessary for Gulf Power Company to  
2 have a regulatory return comparable to investor expectations so that its  
3 common stock can provide investors with the market return they require.

4  
5 Q. Does your comparable earnings method overlook the capital attraction  
6 standard?

7 A. No. Mr. Rothschild argues that capital is raised at the price of common  
8 stock and not its book value, which is correct. However, the price of the  
9 stock reflects investor expectations of the cash flows (using the DCF  
10 model) they expect to receive. As Mr. Rothschild's testimony clearly  
11 shows, these cash flow expectations are driven by the return on common  
12 stock equity and the retention rate in the simple form of the sustainable  
13 growth rate model. This is clearly shown on Mr. Rothschild's Exhibit  
14 JAR 5.

15  
16 Q. What is the linkage between the return on common stock equity and the  
17 growth rate in the DCF model?

18 A. Each of the transformation schedules accompanying my market based  
19 models show the relationship between the return on common stock equity  
20 and the growth rate ("br" growth rate, where "b" is the retention rate and "r"  
21 the return on common stock equity). The connection or interrelationship is  
22 also shown on Mr. Rothschild's JAR 5. Mr. Rothschild states that in  
23 implementing his two-stage DCF model on page 46 of his testimony, he  
24 "determined future earnings in the second stage of the non-constant DCF  
25 model by multiplying the future book value per share by the future

1 expected earned return on book equity.” This statement is itself evidence  
2 of the linkage that he later claims does not exist.

3

4 **Flotation Costs**

5 Q. Mr. Rothschild states that any flotation costs are more than offset by the  
6 accretion to book value from the sale of common stock above book value.

7 Do you agree?

8 A. No. The companies on the list of Gulf Power's comparable companies  
9 have not always sold above book value. Furthermore, the accretion to  
10 book value is part of the growth rate expected by investors according to  
11 the testimony of Mr. Rothschild, who uses the “br+sv” form of the  
12 sustainable growth rate method. Clearly, if it is part of growth rate  
13 expectations it cannot also be flotation costs.

14

15 Q. Do you agree that a 0.2% allowance for flotation cost must be excessive?

16 A. No. Mr. Rothschild develops an exaggerated example in an attempt to  
17 show that financing costs are almost 50% of the new equity raised. His  
18 example is flawed because his \$984,000 relates to all previous stock  
19 issuances. The flotation cost for a \$2 million new issuance at 3% would  
20 be only \$60,000.

21

22

**MODEL UPDATE**

23

24 Q. Mr. Rothschild's testimony makes reference to a number of reports and  
25 sources of data that are more recent than those you relied on in your

1 direct testimony. Have you updated your analysis?

2 A. Yes. In response to Staff's Production of Documents Request No. 55,  
3 I have updated my DCF results, equity risk premium analysis, CAPM  
4 model and comparative earnings model using the most recent information  
5 on stock prices, bond yields, Value Line earnings and dividends  
6 projections and other data. Updated schedules reflecting this information  
7 are attached as Schedules 21 through 35 of my rebuttal exhibit.

8

9 Q. Did you make any other changes when you updated your schedules?

10 A. Yes. It came to my attention that the bond ratings provided by C.A.Turner  
11 in two instances were incorrect at the time my testimony was prepared.  
12 The senior, utility debt rating for Progress Energy by S&P is "BBB+" and  
13 for TECO Energy "A." The relevance of the incorrect bond ratings is that  
14 Progress Energy with a "BBB+" bond rating would not have met the  
15 selection criteria noted on Schedule 6, page 6, of the exhibit to my direct  
16 testimony for inclusion on the list of comparable companies. Further, the  
17 indicated risk of the comparable companies relative to Gulf Power  
18 Company, based on the bond rating comparison, would have been  
19 understated. My updated exhibits, therefore, exclude Progress Energy  
20 from the comparable company group.

21

22 Q. What was the impact of the change to your analysis?

23 A. There was a slight increase in the indicated cost of common stock when  
24 deleting Progress Energy from the comparable company group. This  
25 increase would be mitigated by the higher than previously acknowledged

1 risk of the comparable companies relative to Gulf Power Company based  
2 on a bond rating comparison.

3

4 Q. Do you believe that the change to your comparable group of companies,  
5 therefore, would have a meaningful impact on the cost of common stock  
6 estimate for Gulf Power Company?

7 A. No.

8

9 Q. What are the updated results of your recommended return on common  
10 stock equity for Gulf Power Company?

11 A. The updated results show a moderate increase in the cost of common  
12 stock for Gulf Power Company. The average of the four tests used show  
13 an average cost of common stock of 13.6%, and the midpoint of the  
14 13.2% to 14.2% range is 13.7%. Supporting data is summarized on  
15 Schedule 21 and detailed supporting data appears on Schedules 22-35 of  
16 the exhibit to my rebuttal testimony. Recognizing the slightly higher risk  
17 difference between Gulf Power Company and its comparable companies  
18 than apparent in my direct testimony, its lower financial risk, all electric  
19 revenue derivation, higher regulatory ranking, and its relatively small size,  
20 it is my judgment that Gulf Power's cost of common stock is slightly higher  
21 than the 13.0% previously recommended. Nonetheless, basing my  
22 recommendation on the nearest one-quarter of a percentage point, the  
23 updated cost of common stock for Gulf Power Company continues to be at  
24 least 13.0%.

25

1 Q. Does that conclude your rebuttal testimony?

2 A. Yes, it does.

3

22

23

24

25

1           CHAIRMAN JABER: Yes. The prefilled rebuttal  
2 testimony of Mr. Benore shall be inserted into the record as  
3 though read.

4           MR. MELSON: And, Commissioner, there was a corrected  
5 version of the testimony that was filed several days after the  
6 original. I believe for the testimony it involved changes on  
7 several pages that are indicated as revised. It was filed on  
8 January 28th, so it is the revised rebuttal that we would want  
9 to have inserted.

10           CHAIRMAN JABER: Okay. It is the revised rebuttal  
11 testimony of Mr. Benore that was filed January 28th shall be  
12 inserted into the record as though read. I'm assuming you all  
13 are in agreement on this, and there are no objections.

14           MR. BURGESS: Madam Chairman, on a separate note you  
15 are correct in your assumption with regard to me on what you  
16 just said. I have just looked through this exhibit, and I  
17 would object to it being used. The agreement that I had was  
18 that each of our witnesses would provide a summary and would  
19 offer the testimony, and there would be no cross. And I  
20 realize this is excerpts from it, but nevertheless it is a  
21 document that I had not anticipated, and I had not agreed to,  
22 and it is a tool that was used that I think is something that  
23 is not part of the agreement. So I would object to it being  
24 used as he explains his summary.

25           CHAIRMAN JABER: Okay. Well, we are not there. Hold

1 onto that thought, but I have noted your objection.

2 MR. BURGESS: Thank you.

3 CHAIRMAN JABER: Okay. We have handled inserting the  
4 testimony. Mr. Melson.

5 BY MR. MELSON:

6 Q Mr. Benore, you had one exhibit identified as CAB-2  
7 consisting of schedules numbered 12 to 15, is that correct?

8 A I'm sorry, 12 to --

9 Q I'm sorry, 12 to 35.

10 A Yes.

11 Q And, again, a revised set of exhibits was filed with  
12 the revised testimony on January 28th. Do you have any changes  
13 or corrections to the January 28th version of that exhibit?

14 A No, sir.

15 MR. MELSON: Chairman, I would ask that Exhibit CAB-2  
16 be identified as Exhibit 29.

17 CHAIRMAN JABER: The Revised Composite Exhibit CAB-2  
18 shall be identified as Composite Exhibit 29.

19 (Composite Exhibit 29 marked for identification.)

20 BY MR. MELSON:

21 Q Mr. Benore, would you please summarize your rebuttal  
22 testimony.

23 CHAIRMAN JABER: Okay. Before we do that, Mr.  
24 Melson, there has been an objection to the use, even the use of  
25 the handout that you passed out to the Commissioners. Why

1 don't you go ahead and address that objection.

2 MR. MELSON: Commissioner Jaber, Mr. Burgess is  
3 correct insofar as we did not discuss specifically the use of a  
4 handout. We did discuss a summary of testimony. Mr. Benore  
5 would essentially use this as notes to present his summary.  
6 Every page in the document can be referenced directly back to a  
7 page in his testimony or as an existing schedule to his  
8 testimony. We just thought the summary would be easier to  
9 follow along if the Commissioners and the other parties had in  
10 front of them the specific pieces of the testimony that were  
11 being summarized.

12 CHAIRMAN JABER: Mr. Burgess.

13 MR. BURGESS: Commissioners, again, I just think it  
14 is improper, it is counter to the agreement. We didn't put  
15 together anything, we didn't agree on it. We had a specific  
16 agreement and it did not include an additional exhibit with an  
17 exhibit number that is going to be brought in. I just think it  
18 is something that was not contemplated, and I do not consider  
19 it to be part of our agreement.

20 CHAIRMAN JABER: Mr. Melson, I'm going to go ahead  
21 and sustain the objection, recognizing I'm not really sure what  
22 the objection is, other than you all didn't have a meeting of  
23 the minds on the use of the exhibit. So we are not going to  
24 refer to the exhibit. And to the degree that puts Mr. Benore  
25 in the position of pointing out to us in testimony and on his

1 prefiled exhibits where he would like us to look, I will allow  
2 that leeway.

3 MR. MELSON: All right.

4 BY MR. MELSON:

5 Q Mr. Benore, can you summarize your rebuttal  
6 testimony, please.

7 A Yes, I would be pleased to. I found a number of  
8 concerns about Mr. Rothchild's recommended 10 percent return on  
9 common stock equity. Among the very most important of these is  
10 that he ignored investor return on equity expectations. They  
11 range from 13.5 to 14.85 percent, but he employed 12 to 13.5  
12 percent in his DCF models. The rationale he used is that  
13 investors are too optimistic. They overestimate. And  
14 furthermore historical returns on equity in recent years were  
15 not as high as those that investors now expect.

16 There are two problems, I believe, with that  
17 analysis. One, investors invest on the basis of expectations,  
18 not on after-the-fact results. And the second problem that I  
19 have is that whatever historical guidance can be found in  
20 historical data is already imparted into or part of their  
21 expectations for the future. So I think he made a serious  
22 fundamental mistake when he abandoned investor expectations of  
23 13.5 to 14.85 percent on common stock equity and instead used  
24 his own.

25 Fundamentally, neither I nor Mr. Rothchild have the

1 capital to sustain the electric power industry or Gulf Power's  
2 necessary investments. Therefore, I do not think that rate of  
3 return experts like myself, and I would include others as well,  
4 should impart their own expectations in their analysis when  
5 there are very clear and obvious investor expectations about  
6 the issues that they are overwriting.

7           A second major problem, and it is a serious one, I  
8 calculated, amounts to about three-quarters to a full  
9 percentage point error in his approach, is that in his  
10 two-stage DCF model he starts the second stage with the  
11 dividend policy in the first stage. I think it was a 41.33  
12 percent retention rate.

13           What he should have done, in light of progression in  
14 time and investor expectations, is to use a terminal rate that  
15 investors had put in place for the year 2005, which was 47.39  
16 percent. Using the 41.33 percent instead of the 47.39 percent  
17 and a simple sustainable growth rate model, the return on  
18 equity times the retention rate and the various runs that he  
19 made generally fallout to diminish or reduce the investor  
20 expected return by three-quarters to one percentage point.  
21 That is a haircut that clearly should not be pushed onto  
22 investors.

23           The very latest data shows what the dividend policy  
24 expectations are that run through the year 2005. He should not  
25 go back in time and find some other lower number that gives the

1 growth rate, gives a lower growth rate. I don't think that is  
2 proper, and I would seriously, from an investor perspective,  
3 object to that.

4 He also ignored the very small size of Gulf Power.  
5 And I don't mean that in a demeaning way for the people of Gulf  
6 Power in any sense, it is just a fact. And we think in the  
7 marketplace and have credible evidence to show that smaller  
8 companies don't have the same resources to work with to guide  
9 their company as do larger companies. And that imparts more  
10 uncertainty and more volatility to their results. That means  
11 to the investment community that business risk is higher.

12 And this factor in and of itself according to  
13 Ibbotson Associates' study on size premia would increase the  
14 cost of common stock equity based on their data by  
15 three-quarters of a percentage point. I believe that to be  
16 inappropriate in light of the constructive regulatory  
17 environment in this state, especially the use of adjustment  
18 clauses. And on a net basis, factoring in the constructive  
19 nature of regulatory policy in Florida, I have allowed only a  
20 quarter for that in my judgment, but it is something I still  
21 think should not be ignored.

22 He also ignored flotation costs. And I think I heard  
23 Mr. Rothchild say that they are small. FERC calculates them to  
24 be 2/100ths of a percentage point, if I have that correct.  
25 Therefore, they are inconsequential. I don't think they are

1 inconsequential at all, and I think they are on the order of  
2 about 20 basis points. He explains when stocks are selling  
3 above book value, you can sort of ignore it. But what he does  
4 is to incorporate that into the growth rate, and he shouldn't  
5 double count it by using it in the growth rate as well as  
6 saying, well, because of it I can also ignore flotation costs.  
7 It just doesn't add up and make sense to me.

8           But most importantly, most importantly, Mr.  
9 Rothchild's recommendation of 10.0 percent will only yield a  
10 7.3 percent market return to investors. This is less than the  
11 yield of 7.7 percent on Moody's Single A utility bonds, which  
12 is the same rating of Gulf Power Company.

13           And turning to the exhibits now that I need to  
14 progress in that way, I show on my Schedule 12 the mathematics  
15 where a 10 percent regulatory return will only produce a 7.3  
16 percent return to the investor. And I show in the lower table  
17 on that very same exhibit that in order for investors to have  
18 an opportunity to earn the 10.0 percent that he recommends,  
19 that a 12.7 percent return on common stock equity is necessary.

20           I also found it very interesting in Mr. Rothchild's  
21 comments on my testimony, which I respect, and they were  
22 delivered in a constructive way for which I am grateful, but I  
23 do politely disagree. For him to say that I'm trying to  
24 overthrow Hope Bluefield, Permian, Basin and Duquesne is simply  
25 certainly not meant, and I believe to be fallacious. What

1 transformation does simply, and please note, he did not refute  
2 the example. He mentioned the example, and it is on Page 5 of  
3 the original handout, if that is still an exhibit and available  
4 to you. If it was not allowed, it is in my direct testimony.  
5 And perhaps someone will help me find the citation of that so  
6 that I don't waste your time. But please note that he did not  
7 refute that if this Commission allows 10 percent on common  
8 stock equity, that the return that the investor can reasonably  
9 expect to achieve in the marketplace will be substantially  
10 less.

11           And the example that was shown on Page 5 of the  
12 original handout, which is close to what the market looks like  
13 today, shows that when a 10 percent return is allowed only a  
14 7.0 percent will be realized. So I would have to say I don't  
15 believe that Hope Bluefield really said you should not provide  
16 investors with an opportunity to earn their realized return.  
17 And that is all, in fact, that transformation attempts to do.

18           Moving further along in my summary to his CAPM, it is  
19 based effectively on a 4 percent equity risk premium or a  
20 market return over the return on long-term U.S. Government  
21 Bonds. That is very, very low. In fact, you will find in my  
22 rebuttal testimony on page -- you will find a graph there. And  
23 what the graph shows is that if you plot the 30-year moving  
24 average of equity risk premiums from 1926 to the year 2000 for  
25 the Ibbotson data, the 4 percentage points is about as low a

1 number as you will be able to find for that entire period of  
2 time. And I believe that on its face it is unrepresentative of  
3 reasonable investor expectations. I finally found that, it is  
4 Schedule 17. If you just run your eye there you will see that  
5 the range has been from about 14 to 3 percent, and 4 is about  
6 as low as you can go. And I think that is unrepresentative.

7           And if you turn to Schedule 18 of the same exhibit,  
8 this shows the equity risk premium formatted in a different way.  
9 It starts off in the year 2000 with the last five years, which  
10 was an average of about 11 percent. And for each successive  
11 year that you go backward in time it adds a year. So the first  
12 data point in 2000 is five years, the next one in 1999 is six  
13 years, seven years, eight years, et cetera.

14           And what you can see there is that the equity risk  
15 premium recently has certainly been much higher than 4  
16 percentage points. Again, 4 is about as low as it has ever  
17 been in history by this measure. And, in fact, the equity risk  
18 premium has been rising, not falling. So I believe Mr.  
19 Rothchild has erred in terms of using a equity risk premium for  
20 his CAPM model that is severely low and unrepresentative of  
21 investor expectations.

22           One last thing, if I may, that I would like to refer  
23 to is that Mr. Rothchild said in his testimony that the error  
24 with transformation, and this isn't a pure quote, but it's  
25 pretty close, the error with transformation is at best

1 illustrated -- I take that to mean his best shot -- by noting  
2 that the higher the stock price, the higher the ROE that Benore  
3 would recommend. This is not true as shown in the two examples  
4 on this page, which is in your documents a table that is shown  
5 on Page 20. And that table really has two parts. And the  
6 first part shows that when the price goes up, presumably  
7 because interest rates have declined, the ROE can remain  
8 constant.

9           What happens here, contrary to what Mr. Rothchild  
10 said and apparently believes, is that the ROE doesn't have to  
11 go up. What happens is that the investor return goes down.  
12 That is shown in Column B, Line 10, where it dropped to 10  
13 percent when the price went to 40 from 35. That is shown in A  
14 and B, row one. The investor required return dropped from  
15 10.71, in Column A, row 10, to 10.0 percent.

16           And, furthermore, I have tried to make a more complex  
17 example to incorporate another objection that Mr. Rothchild  
18 presumably could have made, and that is that when the price  
19 goes up there is no way the ROE can go down. Well, this shows  
20 that that would be not true, as well. Here in the next example  
21 to the right of the long vertical line, the price goes up from  
22 35 to 40 and the investor expected return goes down from 13 to  
23 12.5 percent. And, again, the investor required return is the  
24 adjustment process, not the return on common stock equity. So  
25 when prices go up, it doesn't necessarily follow as he says

1 that the ROE that transformation would suggest would go up. I  
2 think this demonstrates that that is not true.

3 And, finally, I would like to thank you for your  
4 patience, and for your patience especially as I stumbled around  
5 here trying to find these exhibits which I had not anticipated  
6 the need to do. And for the opportunity, again, to express my  
7 views about the cost of common stock for Gulf Power Company,  
8 which I continue to believe is 13.0 percent. Thank you. If  
9 you have any questions, I would be pleased to try to respond to  
10 them.

11 CHAIRMAN JABER: Thank you, Mr. Benore. I have one.  
12 We have heard a lot about the Hope case with your testimony and  
13 with Mr. Rothchild's testimony. Is it your position that your  
14 recommendation is consistent with the Hope case, or is it your  
15 position that Hope is inapplicable to what you recommend?

16 THE WITNESS: I believe it is applicable and that my  
17 testimony is consistent for this very fundamental reason.  
18 Investors, as even Mr. Rothchild notes in his testimony, should  
19 have an opportunity to earn their cost of capital. He defines  
20 the cost of capital differently than I do, but I think the  
21 point is still a valid one; that is that investors should have  
22 an opportunity to earn their cost of capital. And as I showed  
23 in, I believe it was on Page 5 of the first handout, that is a  
24 practical impossibility to do under current market  
25 circumstances. And that is an example that neither Mr.

1 Rothchild, or any other intervenor, or staff, or Commission to  
2 the best of my knowledge has refuted.

3 I am aware of no refutation of that mathematical  
4 example that I also believe is representative of today's  
5 situation in the marketplace. So I believe my testimony to be  
6 compliant with Hope and Bluefield, that is, to give a company  
7 financial integrity, which I think presumes the ability to  
8 provide investors with their required return so that in turn  
9 they can attract capital and be in a position to provide  
10 reliable and continued service to their customers.

11 CHAIRMAN JABER: Commissioners, any questions?

12 COMMISSIONER DEASON: Yes, I have just a few  
13 questions. You indicated that you consider there needs to be a  
14 25 basis point -- I believe it is 25 basis points --

15 THE WITNESS: No, 20.

16 COMMISSIONER DEASON: No, 25. You're anticipating my  
17 question again.

18 THE WITNESS: I'm sorry.

19 COMMISSIONER DEASON: 25 basis point adjustment for  
20 the size of Gulf Power, is that correct?

21 THE WITNESS: Yes.

22 COMMISSIONER DEASON: Okay. I suppose Gulf is a  
23 small company in relation to other Florida investor-owned  
24 utilities, but Gulf is also part of a much larger company,  
25 being the Southern System. And it is, in fact, Southern which

1 actually issues the stock. So why is it that Gulf needs a  
2 small company premium?

3 THE WITNESS: Yes. I believe that each company  
4 should stand on its own feet, and there should be no  
5 cross-subsidization. And because small companies do have  
6 higher returns that have been returned in the marketplace over  
7 time, it is evident that investors require of them higher  
8 returns. This would be applicable based on the Ibbotson risk  
9 premia studies, and I believe that it is an appropriate cost  
10 attributable to Gulf Power Company because of its small size.

11 It would be my judgment that that is a cost that is a  
12 real cost, but one that should not be passed on to the other  
13 customers of the Southern Company system, that is Alabama  
14 Power, Georgia Power, Savannah. That cost should be  
15 recognized, I believe, and borne by its source or the cost  
16 should follow causation. And I believe in this case because of  
17 the small size of Gulf Power, that higher return should be  
18 borne by this company.

19 COMMISSIONER DEASON: I don't follow when you say  
20 that we should not have Alabama or Georgia subsidizing Gulf.  
21 You recommend that they --

22 THE WITNESS: Well, if you --

23 COMMISSIONER DEASON: Let me ask my question.

24 THE WITNESS: I'm sorry.

25 COMMISSIONER DEASON: If you were testifying on

1 behalf of Georgia Power, would then you indicate that they need  
2 a lower ROE than what you recommend for Gulf Power?

3 THE WITNESS: They were at a sufficient size where  
4 the risk premia study would show that they don't require a  
5 higher return.

6 COMMISSIONER DEASON: You're playing games. They  
7 don't require higher, does that mean that they require a lower  
8 ROE than Gulf Power?

9 THE WITNESS: All other things being equal, yes, they  
10 would require a lower ROE than Gulf Power.

11 COMMISSIONER DEASON: Have you testified on behalf of  
12 Georgia Power?

13 THE WITNESS: I did.

14 COMMISSIONER DEASON: And did you testify to that to  
15 the Georgia Commission?

16 THE WITNESS: It was certainly part of my testimony  
17 that a risk premia was not required of them.

18 COMMISSIONER DEASON: Not a risk premium, but a risk  
19 negative adjustment. In other words, they should have a lower  
20 ROE because they are larger.

21 THE WITNESS: Right. There are risk differences  
22 between Georgia and Gulf, and when I made my recommendation I  
23 was mindful of those differences. In making a judgmental  
24 difference between their cost of capital and that of the  
25 comparable companies, I did consider the size. Their size was

1 such that a premia, or an additional compensation or addition  
2 to their return was unnecessary. When I made that same  
3 analysis for Gulf Power Company and compared them -- I think it  
4 is 640 or 630 million of market capitalization versus  
5 approximately 5 billion for its comparable companies, it was  
6 obvious that this was a much smaller company relative to the  
7 comparable group against which its costs was being measured.  
8 Because of that, an increase in the return of Gulf relative to  
9 its comparable companies was required, and I am recommending  
10 that that be a quarter of a percentage point.

11 COMMISSIONER DEASON: Is that the same as saying that  
12 we should deny Florida ratepayers the efficiencies and benefits  
13 of Gulf being part of a larger company?

14 THE WITNESS: I'm not addressing that issue at all,  
15 sir. I am just addressing the cost of common stock equity as  
16 it relates to the size of the company.

17 COMMISSIONER DEASON: Okay. I have a question. And  
18 just for ease of reference, I don't know if this is going to be  
19 an exhibit or not, but it was your handout, which is Page 3 of  
20 that handout.

21 THE WITNESS: Yes.

22 COMMISSIONER DEASON: And here you are indicating  
23 that the actual return of a -- a regulatory return of 10  
24 percent is actually 7.33 percent.

25 CHAIRMAN JABER: Commissioner Deason, let me

1 interrupt you for just a minute, because I think actually the  
2 objection went to even using this, but Mr. Melson represented  
3 that this same page could be found in an exhibit, so --

4 MR. MELSON: Schedule 12.

5 MR. BURGESS: Commissioner, my comments went to the  
6 first page of the bullets that set out -- changed language a  
7 little bit and set out -- otherwise I have no problems at all  
8 with it. That was the only concern I had.

9 CHAIRMAN JABER: Then for the sake of ease, we are  
10 going to look at Page 3 of the handout.

11 COMMISSIONER DEASON: Very good. I'm trying to  
12 understand the dynamics of this analysis, and tell me if I'm  
13 wrong. It appears to me that if for purposes of this  
14 calculation, if the price of 34.80 were actually \$22.76, that  
15 the investor return and the regulatory return would be the  
16 same?

17 THE WITNESS: Yes, sir.

18 COMMISSIONER DEASON: Okay. So why is it that  
19 because investors are willing to bid up the price of the stock  
20 above its book value, that that means that they require a  
21 higher return?

22 THE WITNESS: The \$34.80 is the average price for the  
23 comparable companies from Mr. Rothchild's testimony. That  
24 price represents investor risk and return valuations relative  
25 to other investment opportunities in the marketplace. So when

1 they look forward and estimate what they expect this company  
2 will be, or these companies, the comparable companies will be  
3 able to earn in the future, and place a value on those  
4 earnings, they believe their worth of \$34.80 a share, and that  
5 is what they are willing to pay for them in the marketplace  
6 today. So that is how that valuation gets to be what it is.

7 COMMISSIONER DEASON: So explain to me again what the  
8 34.80 represents? That is the price of comparable companies?

9 THE WITNESS: The average price, yes, sir.

10 COMMISSIONER DEASON: And then what relation does  
11 that have, then, to the -- the book value of 22.76, is that  
12 also the book value of the comparable companies?

13 THE WITNESS: Yes, sir.

14 COMMISSIONER DEASON: And what are the comparable  
15 companies, are they regulated or unregulated?

16 THE WITNESS: They are regulated electric power  
17 companies, and they are the same -- Mr. Rothchild used the same  
18 comparable companies that I did in my testimony, and he -- I'm  
19 just opening his testimony JAR-5, Page 7. They are Allegheny  
20 Energy, Alliant --

21 COMMISSIONER DEASON: That's fine. There is a list  
22 within your testimony?

23 THE WITNESS: Yes, I think you will find a list in  
24 both of our testimonies. The only difference that I would note  
25 for your consideration is that in one of his DCF tests he also

1 used Southern Company. I did not use Southern Company in any  
2 of the analyses in my testimony.

3 COMMISSIONER DEASON: Well, I guess what I'm trying  
4 to understand is it appears that the dynamics of this is that  
5 if investors are willing to bid up the price of a company or a  
6 group of comparable companies higher than its book value, that  
7 the more they bid that up they are saying they are demanding a  
8 higher return than what the regulatory return would be.

9 THE WITNESS: I guess I can't follow the logic, if I  
10 may put it that way, of relating it to the regulatory  
11 environment and the like. What it does represent is their  
12 valuation of the future earnings of the company. And as Mr.  
13 Rothchild points out, investors expect a 13.5 to 14.85 percent  
14 return on equity for those comparable companies. So that  
15 expectation to a large extent is what is driving the price that  
16 they are willing to pay for that stock.

17 CHAIRMAN JABER: Commissioners, any other questions?

18 Mr. Benore, on the other side of the equation, if we  
19 were to consider the size of Gulf Power, shouldn't we also  
20 consider the fact that the customer base will increase  
21 according to Mr. Bowden's testimony, number one; and, number  
22 two, shouldn't we factor in the fact that electric companies  
23 can take advantage of various clauses?

24 THE WITNESS: I believe growth is important to the  
25 investment community, and there is probably more growth for

1 this company than there is for the typical electric power  
2 company. But I believe that that is something that would  
3 already be factored into their expectations.

4           Furthermore, with regard to the adjustment clauses,  
5 as I previously indicated, and I apologize if I have overlooked  
6 it, the risk premia studies using Ibbotson data would indicate  
7 a cost of common stock equity higher than the comparable  
8 companies by about three-quarters of a percentage point. I  
9 firmly believe that because of the fuel, the purchased power,  
10 the environmental and capacity clauses that is afforded to Gulf  
11 Power Company by this constructive regulatory jurisdiction  
12 mitigates that risk. And, therefore, I would recommend with  
13 respect to the size issue or higher risk caused by the  
14 company's smaller size to be substantially mitigated by these  
15 constructive practices, and use only a quarter instead of a  
16 three-quarter point higher return increment.

17           CHAIRMAN JABER: Thank you.

18           Redirect, Mr. Melson.

19           MR. MELSON: No redirect. And we would move Exhibit  
20 29.

21           CHAIRMAN JABER: Okay. Composite Exhibit 29 is  
22 admitted into the record without objection.

23           (Composite Exhibit 29 admitted into evidence.)

24           CHAIRMAN JABER: Thank you, Mr. Benore.

25           THE WITNESS: You're welcome.

1 MR. MELSON: And may Mr. Benore now be excused?

2 CHAIRMAN JABER: Yes. And that brings us, Gulf  
3 Power, to Mr. Saxon.

4 MR. BADDERS: Yes, ma'am. He is taking the stand at  
5 this time. We are ready to proceed.

6 CHAIRMAN JABER: Okay.

7 - - - - -

8 R. MICHAEL SAXON

9 was called as a witness on behalf of Gulf Power and, having  
10 been duly sworn, testified as follows:

11 DIRECT EXAMINATION

12 BY MR. BADDERS:

13 Q Mr. Saxon, have you been sworn this morning?

14 A Yes, I have.

15 Q Would you please state your name and business address  
16 for the record?

17 A Yes. My name is Michael Saxon, my address is One  
18 Energy Place, Pensacola, Florida.

19 Q And by whom are you employed and in what capacity?

20 A I'm employed by Gulf Power Company as Manager of  
21 Corporate Planning.

22 Q Have you prefiled direct testimony consisting of 16  
23 pages?

24 A I have.

25 Q Do you have any changes or corrections to that

1 testimony?

2 A I do. On Page 7, Lines 4 and 5, and on Page 16, Line  
3 8 --

4 CHAIRMAN JABER: Let's take them one at a time.

5 THE WITNESS: I'm sorry. Okay.

6 CHAIRMAN JABER: That's okay. Page 7.

7 THE WITNESS: Page 7, Lines 4 and 5, change 2.1  
8 million to 1.8 million. Page 16, Line 8, change 2.1 million to  
9 1.8 million.

10 BY MR. BADDERS:

11 Q And with those changes, if I were to ask you the same  
12 questions today would your answers be the same?

13 A Yes, they would.

14 MR. BADDERS: We ask that the prefiled direct  
15 testimony of Michael Saxon be inserted into the record as  
16 though read.

17 CHAIRMAN JABER: Yes. The prefiled direct testimony  
18 of Mr. Saxon shall be inserted into the record as though read.

19 BY MR. BADDERS:

20 Q Mr. Saxon, do you have one exhibit labeled RMS-1  
21 attached to your testimony consisting of seven schedules?

22 A Yes, I do.

23 Q Are you also sponsoring a section of the MFRs which  
24 are identified on Schedule 7 of that exhibit?

25 A Yes, I do.

1 Q Do you have any changes or corrections to that  
2 exhibit, or to your portion of the MFRs?

3 A I do not.

4 MR. BADDERS: We ask that that exhibit, RMS-1 be  
5 identified as the next exhibit.

6 CHAIRMAN JABER: Yes. Exhibit 30 shall be RMS-1.  
7 (Exhibit 30 marked for identification.)

## 1 GULF POWER COMPANY

3 Before the Florida Public Service Commission  
4 Prepared Direct Testimony & Exhibit of  
5 R. Michael Saxon  
6 Docket No. 010949-EI  
7 In Support of Rate Relief  
8 Date of Filing: September 10, 2001

9 Q. Please state your name and business address.

10 A. My name is R. Michael Saxon, and my business address is One Energy  
11 Place, Pensacola FL 32520-0761. I am the Manager of Corporate  
12 Planning for Gulf Power Company.

13 Q. Please describe your educational and professional background.

14 A. I have a Master of Science Degree in Management from Troy State  
15 University and a Bachelor of Science Degree in Marketing from the  
16 University of West Florida. My employment with Gulf Power began in  
17 1976. I have served in various capacities of increasing responsibility  
18 including the Pensacola District Manager. In that position, I was  
19 responsible for the daily customer and field service activities of the  
20 Pensacola District. I have been in my position as Manager of Corporate  
21 Planning since March of 2001.

22 Q. Please describe your responsibilities and duties as the Manager of  
23 Corporate Planning.

24 A. My primary responsibility is to ensure that Gulf's budgeting, forecasting,  
25 and performance measurements are effective and consistent. I

1 coordinate the overall planning effort, and I am responsible for the  
2 production of the Company's financial forecast. My responsibilities also  
3 include the ongoing development and maintenance of the Operation and  
4 Maintenance (O & M) and Construction Budgeting System and the  
5 development of the O & M and Construction budgets and forecasts. I am  
6 responsible for coordinating the Strategic Business Plan and the  
7 development of goals and measurements for the Company. The  
8 Corporate Planning Department provides financial analysis and maintains  
9 expertise in the use of available support tools for decision making.

10

11 Q. Have you prepared an exhibit that contains information to which you will  
12 refer in your testimony?

13 A. Yes.

14 Counsel: We ask that Mr. Saxon's Exhibit (RMS-1), comprised of  
15 seven schedules, be marked for identification as  
16 Exhibit\_\_\_\_\_.

17

18 Q. Were all of the schedules in this exhibit prepared under your supervision?

19 A. Yes. Each schedule of this exhibit was prepared under my supervision  
20 and direction.

21

22 Q. Are you the sponsor of certain minimum filing requirements (MFRs)?

23 A. Yes. The MFRs that I am sponsoring, in part or in whole, are listed on  
24 Schedule 7 of my exhibit. To the best of my knowledge, the information in  
25 all of the listed MFRs is true and correct.

1 Q. What is the purpose of your testimony?

2 A. The purpose of my testimony is to provide an overview of the planning  
3 process that results in the production of Gulf's financial forecast. The  
4 financial forecast is the basis for Gulf's projected data for the test year  
5 used in this rate case. Specifically, I will present an overview of Gulf's  
6 planning and budgeting process, outline the assumptions used in  
7 developing Gulf's financial forecast, and describe both the Construction  
8 Budget process and the O & M budget process. I will also sponsor a  
9 portion of Gulf's Construction Budget related to General Plant. Because  
10 of my prior position with the Company, I will also support the service fees  
11 requested by the Company and the level of Customer Accounts dollars  
12 requested in the test year. My testimony will also address the Customer  
13 Accounts expenses in the O & M Benchmark analysis.

14  
15 Q. Please describe Schedule 1 of your exhibit.

16 A. Schedule 1 is a flow chart of Gulf's annual planning and budgeting  
17 process. This is an ongoing process intended to develop a financial  
18 forecast for use by management as a tool for making decisions affecting  
19 the future direction of the Company. There are eight component budgets  
20 that are incorporated into Gulf's financial forecast. The Company's  
21 Leadership Team, consisting of Gulf's executive officers, reviews and  
22 approves these budgets.

23  
24 Q. Who will testify on the preparation of the eight component budgets in  
25 Gulf's financial forecast?

1 A. The Customer, Energy, Peak Demand, and Revenue Budgets are the  
2 responsibility of Mr. McGee; the Fuel Budget is the responsibility of  
3 Mr. Moore; the Interchange Budget is the responsibility of Mr. Howell; and  
4 the Construction Budget is the responsibility of Mr. Moore, Mr. Howell,  
5 Mr. Fisher, and me. Mr. Moore, Mr. Fisher, Mr. McMillan, Ms. Neyman,  
6 Mr. Howell, and I will discuss the O & M Budget. Mr. Labrato addresses  
7 the interface of the component budgets with the financial model in his  
8 testimony.

9

10 Q. Has Gulf Power filed a list of the assumptions used in developing Gulf's  
11 financial forecast?

12 A. Yes. MFR F-17 lists the assumptions used in developing Gulf's financial  
13 forecast and the supporting basis for each assumption. Gulf's  
14 management believes the assumptions used in this financial forecast, as  
15 outlined on MFR F-17, to be reasonable in light of our experiences and  
16 the circumstances known at the time the assumptions were developed.

17

18 Q. Who administers the financial planning process?

19 A. As the Manager of Corporate Planning, I ensure that all involved with the  
20 process are kept informed of the key assumptions, goals, and any  
21 strategic issues facing the Company. Our Chief Financial Officer,  
22 Mr. Labrato, is responsible for ensuring the Company's Leadership Team  
23 reviews and approves the eight component budgets of the planning  
24 process.

25

1 Q. Schedule 1 shows Corporate Planning's involvement in producing Gulf's  
2 financial forecast. Would you describe your department's involvement?

3 A. Primarily, Corporate Planning is responsible for coordinating the  
4 Construction Budget and O & M Budget processes. The department is  
5 also responsible for assimilating the information that is produced in the  
6 approved Revenue, Fuel, Interchange, Construction and O & M Budgets  
7 for use in the financial model. Corporate Planning is responsible for the  
8 ongoing process of analyzing and updating the financial model logic to  
9 ensure accurate forecasts of the Company's financial performance.

10

11 Q. Please describe Gulf's Construction Budget.

12 A. The Construction Budget consists of Plant Expenditures (PE's) for  
13 additional property covering a period of ten years. PE's are categorized  
14 as Major Generation, Other Production, Transmission, Distribution, and  
15 General Plant. The PE's are further identified as Specific PE's and  
16 Blanket PE's. Specific PE's are generally individual projects costing  
17 \$50,000 or more that may require expenditures in one or more years.  
18 Blanket PE's include repetitive type plant additions that are not easily  
19 defined or distinguished as individual or separate projects at the time the  
20 budget is prepared.

21

22 Q. Who is responsible for developing PE's?

23 A. Individuals within the functional operating area are responsible for  
24 developing the PE's in that area. The appropriate Vice President reviews  
25 and approves the PE's prior to their being submitted to Corporate

1 Planning. The majority of the PE's are prepared under the direction of  
2 Mr. Moore, Mr. Fisher, and Mr. Howell.

3

4 Q. Who is responsible for reviewing and approving the overall Construction  
5 Budget?

6 A. Gulf's Leadership Team reviews all Construction Budget requests.  
7 Corporate Planning provides the Leadership Team with any necessary  
8 summaries, comparisons, or other information that may be requested.  
9 After review and approval by the Leadership Team, the Construction  
10 Budget is approved annually by the Company's Board of Directors.

11

12 Q. Does Gulf monitor the actual construction expenditures against its  
13 approved budget?

14 A. Yes. Quarterly, Corporate Planning does a comparison of Actual to  
15 Budget expenditures. Any variance over or under a set threshold is  
16 researched and explained by the appropriate functional area. Variance  
17 explanations, by project, are prepared and an estimate of the budget  
18 status at year-end or at completion of the project is shared with the Chief  
19 Financial Officer. Supervision of this control mechanism is the  
20 responsibility of Corporate Planning.

21

22 Q. What is the amount of Gulf's test year Construction Budget?

23 A. Gulf's June 2002 through May 2003 Construction Budget is \$64.9 million.  
24 Schedule 2 of my exhibit shows Gulf's test year Construction Budget by  
25 category.

1 Q. Are you sponsoring a portion of the General Plant Construction Budget for  
2 the test year?

3 A. Yes. I am testifying to the portion of General Plant that relates to  
4 telecommunications, computer, and other equipment, which is ~~\$24~~<sup>\$1.8</sup> million  
5 in the test year. This ~~\$24~~<sup>\$1.8</sup> million is well within the range of normal  
6 expenditures for what Gulf has been spending for this portion of General  
7 Plant for the last three years and for the period January 1, 2001 through  
8 May 31, 2002.

9  
10 Q. Would you please state the purpose of your testimony as it relates to the  
11 O & M Budget?

12 A. I will describe the preparation process and provide an overview of the  
13 assumptions used to prepare the test year O & M Budget. The following  
14 individuals are responsible for and are prepared to address the specific  
15 assumptions, details, and explanations related to the test year O & M  
16 Budget for the indicated functions: Production is the responsibility of  
17 Mr. Moore; Transmission is the responsibility of Mr. Howell; Distribution  
18 will be addressed by Mr. Fisher; I will sponsor Customer Accounts;  
19 Customer Service & Information, Sales, and Advertising is the  
20 responsibility of Ms. Neyman; and Administrative & General expenses will  
21 be addressed by Mr. McMillan. The assumptions and their supporting  
22 basis for the test year O & M Budget are outlined in MFR F-17.

23  
24 Q. What is the amount of Gulf's test year O & M Budget?

25 A. The test year O & M Budget exclusive of all related Net Operating Income

1 (NOI) adjustments is \$186.4 million. Schedule 3 of my exhibit  
2 summarizes the test year O & M Budget by major functional category.  
3 This schedule ties with Mr. Labrato's Schedule 8 and the adjusted 2000  
4 actual O & M that is shown in MFR C-2. The witnesses responsible for  
5 O & M expenses by function will be addressing the increases from the  
6 adjusted 2000 O & M to the test year O & M.

7  
8 Q. Please describe Corporate Planning's role in preparing Gulf's O & M  
9 Budget.

10 A. Corporate Planning is responsible for establishing a logical process for the  
11 preparation of the budget; for administering the process under the  
12 direction of the Chief Financial Officer; and for preparing the necessary  
13 summaries, comparisons, or other information that may be requested.  
14 The Leadership Team reviews and approves the O & M Budget.  
15 Schedule 4 of my exhibit is a flow chart outlining the O & M Budget  
16 process.

17  
18 Q. Would you describe the process of preparing Gulf's O & M budget?

19 A. Referring to my Schedule 4, the first step in Gulf's O & M Budget process  
20 is to develop a list of strategic issues facing the Company. These issues  
21 are then integrated into the Company's Strategic Business Plan. Each  
22 Planning Unit within the Company prepares objectives and goals that  
23 address its direction and major emphasis for the coming year. These  
24 goals and objectives support specific issues identified in the Company's  
25 Strategic Business Plan. The Chief Financial Officer then reviews the

1 budgeted revenues forecasted for the period and communicates a Budget  
2 Message that outlines the goals and objectives of the Company and gives  
3 specific guidelines to the Planning Units for development of their budgets  
4 and forecasts.

5

6 Q. Please describe the O & M Budget process after the issuance of the  
7 Budget Message.

8 A. Upon receipt of the Budget Message each Planning Unit prepares a  
9 detailed budget that supports its approved goals and objectives for the  
10 budget year. The budget represents the funds required to accomplish its  
11 goals and objectives. The Vice President for each function approves the  
12 function's budget prior to its submission to Corporate Planning. Corporate  
13 Planning reviews submittals for compliance with the Budget Message and  
14 compiles the data for review by the Chief Financial Officer and the  
15 Leadership Team. Any changes are documented and the approved  
16 budget is then sent to the Planning Units. A signature page is maintained  
17 with the Chief Financial Officer and the President signifying final approval  
18 of the O & M Budget.

19

20 Q. What rate of inflation is used by Gulf in the preparation of its O & M  
21 Budget?

22 A. The Budget Message issued by the Chief Financial Officer includes the  
23 inflation rate to be used by the Planning Units in preparing the O & M  
24 Budget. The rate of inflation for 2002 and 2003 used in preparing the  
25 O & M Budget was 2.43 percent and 2.40 percent, respectively. These

1 rates of inflation are developed by Southern Company Services utilizing  
2 forecast data obtained from Regional Financial Associates (RFA), now  
3 known as Economy.com, Inc.  
4

5 Q. How are salary increases budgeted?

6 A. Corporate Planning sends a letter to the Planning Unit Managers with an  
7 appropriate rate, furnished annually by Human Resources, to be used for  
8 salary increases. A suggested amount for promotions is also stated.  
9

10 Q. What is the value of the O & M budgeting process used by Gulf Power  
11 Company?

12 A. Gulf uses the budgeting process as a comprehensive management tool  
13 both to plan and to control the Company's operations. Goals, objectives,  
14 priorities, and appropriate expenditure levels are established through the  
15 budgeting process.  
16

17 Q. How do Planning Unit Managers monitor monthly budget variances?

18 A. Our on-line accounting and reporting system allows each user to produce  
19 monthly budget to actual comparison reports. Each quarter, the  
20 departments are required to submit reports that include explanations of  
21 variances that are plus or minus 10 percent and greater than \$25,000.  
22 Any variance amount that exceeds plus or minus \$500,000, regardless of  
23 the percentage, must be explained. Projections for year-end expenditures  
24 are also submitted quarterly. The Chief Financial Officer reviews these  
25 reports and year-end projections and informs the Leadership Team as the

1 need arises.

2

3 Q. Please describe any new initiatives Gulf has undertaken to improve the  
4 Construction and O & M budget process.

5 A. Gulf is using a proprietary budget system called BUDWORKS for  
6 electronic submittal of Construction and O & M budgets and forecasts.  
7 This system, developed in 1997 and enhanced each year, has greatly  
8 reduced the time spent in the development, reporting and submittal of  
9 budget requests.

10

11 Q. Mr. Saxon, are you familiar with the development of the costs for Gulf's  
12 service fees?

13 A. Yes. Because of my experience in district operations, I am familiar with  
14 the job functions associated with providing these services. I am also  
15 familiar with the cost components of these job functions.

16

17 Q. Does the Company propose any changes to these fees?

18 A. Yes. Based on our analysis of current costs, Gulf has developed new  
19 fees for the connection of initial service, existing service, and temporary  
20 service; restoration of service (after violation of rules); premise visit;  
21 investigation of unauthorized use; and returned item charges.

22

23 Q. How have these fees changed?

24 A. My Schedule 5 shows a summary of the proposed changes to the service  
25 fees. Supporting details are included in MFR E-10.

1 Q. How long have these service fees been in effect?

2 A. The fees for connection of existing service, restoration of service (after  
3 violation of rules) and premise visit have been in effect since 1983. The  
4 fees for connection of initial service, connection of temporary service, and  
5 investigation of unauthorized use became effective with Gulf's last rate  
6 case in 1990. The Company proposes to increase these fees to more  
7 closely reflect the cost of providing these customer-requested or  
8 customer-driven services. The returned item fee has been in effect since  
9 1993 and the proposed increase is in accordance with Florida law.

10

11 Q. Please describe the methodology used to calculate the proposed level  
12 requested for these service fees.

13 A. The steps required to provide each service were identified, and the cost  
14 associated with each step was determined. Gulf then adjusted these fees  
15 in \$5.00 increments for ease of administration. The total cost for each  
16 service, prior to being adjusted, is listed in column 2 of my Schedule 5. All  
17 of the proposed fees are cost-based, except for the returned item charge.  
18 Gulf proposes a returned item charge that varies by item amount in  
19 accordance with Florida law.

20

21 Q. Are any of the requested service fees new to the customers?

22 A. No. Gulf currently has a fee for each of these services. However, Gulf is  
23 subdividing the fee for restoration of service (after violation of rules) into  
24 three different categories. The three categories are restoration of service,  
25 restoration of service after hours, and restoration of service at the pole.

1 Each category has different cost components that justify a different  
2 charge.

3

4 Q. Are you sponsoring the level of Customer Accounts O & M expenses in  
5 the test year?

6 A. Yes. In my previous position as Pensacola District Manager, I was  
7 involved in the day-to-day activities of our customer accounting function.  
8 The Company's request of \$16.6 million dollars for the test year Customer  
9 Accounts expense is reasonable, prudent, and necessary. Since the  
10 addition of Gulf's CSS system, Customer Accounts expenses have  
11 averaged \$15.8 million dollars per year. Customer Accounts expenses  
12 have increased since 2000 by \$1.3 million. This increase is due to  
13 postage expenses, uncollectible expenses, and Automated Resource  
14 Management System (ARMS) expenses. The remaining increase is  
15 primarily related to the normal increases in labor and programs due to  
16 inflation and customer growth.

17

18 Q. Are you sponsoring the Customer Accounts Benchmark analysis variance  
19 information?

20 A. Yes. The total Company O & M expenses are under the Benchmark by  
21 \$3.7 million; however, the Customer Accounts Benchmark variance is  
22 over by \$2.5 million. As shown on my Schedule 6, this variance is related  
23 to four areas. The first is Information Technology (IT) in the amount of  
24 \$1.1 million; second is the Customer Service System (CSS) in the amount  
25 of \$940,000; next is Uncollectible Accounts of \$607,000; and ARMS

1 makes up the remainder.

2

3 Q. Please discuss the expense changes that have caused IT costs to exceed  
4 the Benchmark.

5 A. In 1990, the majority of all IT costs were in the A & G function. These IT  
6 costs are now charged directly to the Planning Unit wherever it is feasible  
7 to do so. With the evolution of computer technology within the workforce  
8 over the past 10-12 years, there has been a decrease in the need for  
9 support personnel to handle correspondence, presentations, reports, etc.,  
10 for other professional job classifications. Computer technology has  
11 enabled the general workforce to do more with automated processes, thus  
12 increasing productivity.

13

14 Q. Please discuss CSS and why this is an increase over the Benchmark in  
15 Customer Accounts.

16 A. Mr. Fisher's testimony includes a discussion of the reasons why Gulf  
17 implemented CSS. As described in Mr. Fisher's testimony, CSS is a  
18 powerful tool that is critical to Gulf's future. In 1997, this system replaced  
19 the General On-line System (GOLS) which had been in use since 1972.  
20 CSS helps Gulf meet the expectations of our customers for outstanding  
21 service while controlling costs and providing the flexibility to respond to  
22 opportunities that arise in the marketplace. Purchasing a standard system  
23 and making enhancements was the most cost-effective way to satisfy  
24 Southern Company's need for a state-of-the-art customer information  
25 system across all five operating companies.

1 Q. Please discuss the Benchmark variance for Uncollectible Accounts.

2 A. The Benchmark for uncollectibles was established by applying the rate of  
3 inflation and customer growth to the 1990 budget of \$511,000. Actual  
4 uncollectible expense for 1990 was \$1,267,283. The average  
5 uncollectible expense for 1997, 1998, 1999, and 2000, with the current  
6 year-end projection for 2001, is \$1,408,000. This supports the  
7 reasonableness of Gulf's test year request of \$1,543,000. Some of the  
8 factors impacting uncollectible expense include national economic  
9 conditions, local economic conditions, and weather. During extreme  
10 weather conditions, Gulf does not disconnect electric service for non-  
11 payment. Gulf's policy is not to disconnect for non-payment when  
12 temperatures are forecasted to be 32 degrees or less, 95 degrees or  
13 greater, or when the heat index is forecasted to be 105 degrees or  
14 greater. These extreme weather conditions, in effect, increase arrears  
15 and, consequently, uncollectibles.

16

17 Q. Please discuss the Benchmark variance for ARMS.

18 A. Mr. Fisher's testimony includes a summary of the benefits of ARMS.  
19 ARMS is a very valuable tool for managing the daily work schedules of  
20 Field Service Representatives and Service Technicians engaged in  
21 service work orders. This new system has increased productivity and  
22 efficiency.

23

24 Q. Mr. Saxon, would you please summarize your testimony?

25 A. Gulf utilizes a very straightforward, logical, and comprehensive process in

1 developing the eight component budgets that are incorporated into the  
2 model, which results in Gulf's financial forecast. This budgeting process  
3 is performed annually and results in a forecast that management uses as  
4 a tool in planning and decision making. We believe the assumptions  
5 contained in each budget are reasonable and that they have been  
6 obtained from the best sources available at the time the budgets were  
7 developed.

8 The ~~\$2.1~~<sup>\$1.8</sup> million of General Plant expenditures in the test year that  
9 relate to telecommunications, computer, and other equipment are  
10 reasonable and well within the range of normal expenditures for the last  
11 three years. The requested level of O & M Customer Accounts expenses  
12 in the test year are reasonable, prudent, and necessary. Our current  
13 service fees have been in effect for over ten years, some as long as  
14 18 years, and do not adequately recover our costs of performing these  
15 activities. The proposed changes to these fees more closely reflect the  
16 current cost of these activities.

17  
18  
19  
20  
21  
22  
23  
24  
25

Q. Does this conclude your testimony?

A. Yes, it does.

1 BY MR. BADDERS:

2 Q Mr. Saxon, would you please summarize your testimony.

3 A Yes, I will. Thank you. I will provide an overview  
4 of the planning and budgeting process which results in the  
5 development of a financial forecast which is comprised of eight  
6 component budgets. These budgets are reviewed and approved by  
7 Gulf's leadership team, which is comprised of Gulf's executive  
8 officers. I will address the involvement of corporate planning  
9 in producing Gulf's financial forecast.

10 An overview of the construction budget process is  
11 also provided in my direct testimony. The construction budget  
12 consists of plant expenditures referred to as PEs for  
13 additional assets covering a period of ten years. These  
14 budgeted PEs are reviewed and approved by the appropriate  
15 vice-president prior to being submitted to corporate planning.  
16 Final approval is given by the leadership team and subsequently  
17 ratified annually by the company's board of directors.

18 Of the 64.9 million construction budget being  
19 requested in this case, I am directly supporting \$1.8 million  
20 of general plant PEs which relate to telecommunications,  
21 computer, and other equipment. I have described the  
22 preparation process and provided an overview of the assumptions  
23 used in preparing the operation and maintenance budget.  
24 Corporate planning is responsible for administering the process  
25 and providing reports as requested by our chief financial

1 officer and Gulf's leadership team.

2           The leadership team reviews and approves the O&M  
3 budget. Instructions were given to the planning units to zero  
4 base budget years 2002 and 2003. Gulf's planning units utilize  
5 their experience, knowledge, and expertise to develop their  
6 budgets each year. Input from external sources and expected  
7 increases or decreases to expenses are taken into account when  
8 making these projections. The resulting budget is  
9 representative of the needs of the company to provide safe  
10 reliable service to our customers in the test year and in the  
11 future.

12           I am also supporting the increase of customer  
13 accounting O&M expenses in this case. The costs are over the  
14 benchmark which this Commission has used as a guide in prior  
15 cases by \$2.5 million. This variance is due primarily to the  
16 increase in four areas. Information technology costs have  
17 increased by \$1.1 million. In 1990 these costs were in the A&G  
18 function, they are now directly charged to the business unit  
19 incurring the costs whenever it is feasible to do so.

20           The customer service system was put into service in  
21 October of 1997. This system accounts for \$940,000 of the  
22 increase in customer accounting. It is a valuable tool that  
23 helps us meet the expectations of our customers for outstanding  
24 customer service. Our automated resource management system  
25 accounts for \$58,000, and ARMS is a very valuable tool for

1 managing the daily work schedules of field service  
2 representatives and service technicians engaged in service  
3 work. Uncollectible accounts increased by \$607,000 over the  
4 1990 benchmark.

5 In conclusion, the budget submitted in this case is  
6 Gulf's plan of operation for the test year period. I believe  
7 this budget process along with management's commitment to keep  
8 cost low is what has allowed Gulf to historically maintain our  
9 operating cost per kilowatt hour as one of the lowest in the  
10 southeast.

11 Thank you for allowing me to summarize my testimony.

12 MR. BADDERS: We tender Mr. Saxon for cross  
13 examination.

14 CHAIRMAN JABER: Thank you. FEA?

15 MR. ERICKSON: No questions.

16 CHAIRMAN JABER: FIPUG?

17 MR. PERRY: No questions.

18 MR. BURGESS: No questions.

19 CHAIRMAN JABER: Staff.

20 MR. HARRIS: Yes, we have a few questions. Thank  
21 you.

22 CROSS EXAMINATION

23 BY MR. HARRIS:

24 Q Mr. Saxon, I have several questions that are of a  
25 clarification nature.

1 A Sure.

2 Q I'm referring to your deposition exhibit, which I  
3 think had been admitted as Exhibit 21. Do you have a copy of  
4 that?

5 A Yes, sir, I believe I do. All right, sir.

6 Q I wanted to refer to beginning with Page 1 of 5,  
7 which is the first page of your late-filed exhibit to your  
8 deposition.

9 A Yes, sir.

10 Q And the first line lists an average salary of 24,434.  
11 What year is that average salary computed on?

12 A That is based on 2001 salaries escalated by 4 percent  
13 to bring it up to the 2002 level.

14 Q So that is a 2002 level salary?

15 A Yes, sir, that is correct.

16 Q Do you know what that number would be if it was  
17 escalated to the test year ending in 2003?

18 A Yes, sir, that number would go to approximately  
19 \$24,600.

20 Q And is that the same number that is contained in your  
21 minimum filing requirements Schedule C-33, Line 3, do you know?

22 A No, sir, it is not.

23 Q Can you explain the difference?

24 A Yes. The number in MFR C-33 is the average which  
25 includes all senior level management, which obviously we don't

1 have a lot of turnover there in senior level management. And  
2 typically we would not include that number and those higher  
3 salaries in that number for calculating our hiring lag.

4 Q So the difference is based on hiring lag?

5 A The difference would be typically, as I said, there  
6 is very little turnover in those higher level positions in the  
7 company. And when that occurs, or when there is a vacancy  
8 typically there is promotions where someone in the company  
9 currently moves up to those positions so that ultimately the  
10 vacancy that stays vacant for a period of time is an entry  
11 level salary which is reflected in the \$24,000, or I guess that  
12 adjusted number would be the \$24,600 average salary.

13 Q Thank you. On that same page you list an unbudgeted  
14 O&M temporary employee salary of, I believe, \$224,065. Could  
15 you explain why that amount is so large?

16 A Those are dollars that are expended by the planning  
17 units when they do have a vacancy to cover that vacancy while  
18 they are in the process of getting a person hired.

19 Q Immediately following that you have a \$100,000  
20 budgeted hiring lag. Could you explain that number to me?

21 A Yes, sir. In one of our planning units, and that is  
22 specifically customer services where there is a reasonable  
23 amount of turnover, in recognition of that turnover that  
24 planning unit takes that into account in their budgeting  
25 process. And, in essence, reduces their budget by \$100,000 in

1 recognition of that hiring lag each year.

2 Q On Page 2 of 5, the next page of your exhibit, you  
3 show an other category. Could you explain what that is?

4 A Yes, sir. That is a clearing account. It does  
5 include some appliance sales in our stores area, meaning  
6 warehousing, et cetera.

7 Q And then the next line is ENS/capital, could you  
8 explain that account?

9 A Yes, sir. That is engineering and supervision  
10 direct, that is capital expenditures.

11 Q What does that mean?

12 A Those are dollars that are expended or payroll that  
13 is contributed to capital projects as opposed to O&M projects.

14 Q Are the percentage allocations among the various  
15 categories in the test year budget consistent with previous  
16 year's allocations?

17 A Yes, sir, they are.

18 Q On Page 3 of 5, the third page?

19 A Yes, sir.

20 Q You have at the bottom, 11 earned progression  
21 vacancies. Could you explain what those are?

22 A Yes, sir, I can. Those were vacancies in 2001, and  
23 Mr. Fisher will expand on these in his testimony, but that is  
24 11 vacancies that will be filled as a class. So these  
25 individuals will be hired together, they will come in and train

1 together in what we refer to as an earned progression program.

2 Q And on Pages 4 and 5, which I believe are excerpted  
3 from your Schedule C-33, I notice that there is a difference in  
4 gross payroll from 1998 through the 2003 test year. Could you  
5 explain the cause of those differences?

6 A I'm sorry, Mr. Harris, would you repeat your  
7 question.

8 Q Sure. On Pages 4 and 5 --

9 A Yes.

10 Q -- which I think are Schedule C-33 of your MFRs?

11 A Yes, sir.

12 Q My understanding is that in gross payroll there is a  
13 difference, and I'm wondering if you can explain what the  
14 differences in gross payroll for each of those years '98  
15 through the projected test year 2003 are?

16 A Mr. Harris, are you talking about the changes from  
17 one year to next, the actual increases?

18 Q Yes.

19 A Okay. Yes, sir. I don't have a complete analysis,  
20 but in most cases that would be primarily due to merit  
21 increases and promotions, et cetera.

22 Q Thank you. I wanted to ask you about fringe  
23 benefits, which starts with Line Number 4, and my understanding  
24 is that the fringe benefits are based on the number of actual  
25 employees that are employed at any one time, is that correct?

1 A That is correct.

2 Q Is any account taken for employee hiring lag when  
3 calculating the fringe benefits amounts?

4 A Oftentimes the fringe benefits are applied to a  
5 number of employees in a year prior to the budget year, so  
6 typically in our view you would not consider that in a hiring  
7 lag.

8 Q Would it be appropriate to make an adjustment to the  
9 fringe benefits accounts to take account of that hiring lag?

10 A Yes, sir. I think we could consider an adjustment  
11 for fringe benefits.

12 Q Has Gulf Power Company made any calculations or  
13 adjustments for fringe benefits based on that hiring lag?

14 A Yes, sir. I believe if we were going to make an  
15 adjustment to benefits for hiring lag, the appropriate rate of  
16 that would be 21.9 percent would be the appropriate rate to  
17 apply.

18 MR. HARRIS: I believe that is all the questions we  
19 have. Thank you.

20 THE WITNESS: Thank you, sir.

21 CHAIRMAN JABER: Thank you, Mr. Harris.

22 Commissioners, do you have any questions?

23 CHAIRMAN JABER: Just a couple for you. I'm trying  
24 to understand your allegation that some of these costs have  
25 gone up because of the information technology aspect and

1 because of uncollectible accounts, in particular. I know you  
2 brought out four points, but I am concerned with those two.

3 THE WITNESS: Yes, ma'am.

4 CHAIRMAN JABER: Information technology, several  
5 places in your testimony you say that -- you make it a point to  
6 say that those used to be included in the A&G function, and now  
7 the company is charging them directly to where the department  
8 is that is causing the costs to be incurred, which is the  
9 business unit.

10 THE WITNESS: Yes, ma'am.

11 CHAIRMAN JABER: It's not your testimony that  
12 removing it from A&G and putting it into the business unit is  
13 actually creating an increase in the expense?

14 THE WITNESS: No, ma'am, not at all. That is an  
15 explanation of the increase in the benchmark for that business  
16 unit itself.

17 CHAIRMAN JABER: Okay. And with respect to the cost  
18 itself, correct me if I'm wrong, but I'm assuming that you have  
19 had to purchase the computers, you have had to do the training  
20 on the computers. Is there anything else?

21 THE WITNESS: No, ma'am, that would predominately be  
22 it for IT.

23 CHAIRMAN JABER: Do you have a website?

24 THE WITNESS: Yes, we do.

25 CHAIRMAN JABER: So that is where the costs

1 associated with the website would be?

2 THE WITNESS: I'm not certain that that is where all  
3 the costs of that would be. I do know that part of our new  
4 system that our customers have electronic access to billing  
5 information and their account information, and that is where  
6 that piece of technology would be in there. The website may be  
7 in a different part in the company, it may be in corporate  
8 communications or what have you. But as far as all the  
9 opportunities that customers have to access us electronically  
10 for reviewing their accounts, it would be housed here.

11 CHAIRMAN JABER: Okay. So they can access you  
12 electronically via the website. Are you doing on-line billing?

13 THE WITNESS: Yes, ma'am, we are. On-line billing,  
14 it's called e-bill. Customers can view the bill and mail the  
15 check, or they can view the bill and actually mail the check or  
16 pay electronically through the Internet.

17 CHAIRMAN JABER: Okay. So all the costs associated  
18 with that would be in that expense, too?

19 THE WITNESS: That is correct.

20 CHAIRMAN JABER: Okay. Now, you also make the point  
21 on that topic that that has created a situation where you don't  
22 need as many personnel because so much can be done on-line now,  
23 and so much is made more efficient through the use of  
24 computers. Should we see the corresponding reduction in your  
25 filing to personnel and salaries?

1 THE WITNESS: I don't think you can, and I will tell  
2 you why. Obviously there has been some efficiencies. That  
3 particular piece of the business continues to grow, but I'm not  
4 sure it has gotten to the size yet where we can really  
5 recognize that large a reduction. However, I think it  
6 ultimately will allow for some cost containment that maybe then  
7 those resources could be more effectively used elsewhere.

8 CHAIRMAN JABER: So you think long-term there should  
9 be a corresponding reduction to salaries and personnel  
10 associated expenses?

11 THE WITNESS: I think over time if we could  
12 specifically identify those associated with that, that you  
13 would see that.

14 CHAIRMAN JABER: Okay. On the customer  
15 uncollectibles, I had a hard time following why you have such  
16 an issue with the uncollectible amounts. I know you cite to  
17 weather and your policy of not disconnecting customers during  
18 certain situations, but if I am reading your testimony  
19 correctly, there is a high percentage and, therefore, a high  
20 revenue amount associated with customer uncollectibles. Can  
21 you elaborate?

22 THE WITNESS: Commissioner, over the last five years  
23 our uncollectible amount has averaged about \$1.6 million. And  
24 the amount that I think has been stipulated to in this case for  
25 the test year is 1.5 million. With respect to the benchmark,

1 however, in 1990 the budgeted amount for uncollectibles was  
2 511,000, and actuals for that year were 1.3 million. So we  
3 missed the budget in 1990, which has caused it to have an  
4 impact on the benchmark calculation.

5 CHAIRMAN JABER: Well, big picture, though, are you  
6 looking at ways to get that amount closer to zero?

7 THE WITNESS: Yes, ma'am. We work diligently to do  
8 that. You have alluded to our policy with respect to weather,  
9 however, and we want to stay sensitive to that, because  
10 oftentimes weather-related issues are going to impact probably  
11 the most vulnerable population within our community, that being  
12 the elderly. So we want to say tentative to that issue. But  
13 we work diligently to control uncollectibles. We have  
14 shortened are collection cycle significantly in order to try to  
15 curb uncollectibles. And I think the fact that it was 1.3  
16 million actual in 1990 and averaged only 1.6 million over the  
17 last five years is indicative of our ability to at least hold  
18 the line on it as revenues have increased.

19 CHAIRMAN JABER: Thank you, Mr. Saxon.

20 Redirect.

21 MR. BADDERS: No redirect.

22 CHAIRMAN JABER: You're excused. Thank you.

23 Exhibit 30.

24 MR. BADDERS: Yes, we would like to move the exhibit.

25 CHAIRMAN JABER: Is admitted into the record without

1 objection.

2 (Exhibit 30 admitted into the record.)

3 CHAIRMAN JABER: That brings us to Mr. McGee. And,  
4 staff, you acknowledge that there is no need to put Mr. McGee  
5 on the stand, so let's go ahead and insert the prefiled direct  
6 testimony of R.L. McGee --

7 MR. MELSON: Consisting of 11 pages.

8 CHAIRMAN JABER: -- consisting of 11 pages into the  
9 record as though read. And, Mr. Melson, he has an exhibit?

10 MR. MELSON: One exhibit, RLM-1, consisting of  
11 Schedules 1 through 7.

12 CHAIRMAN JABER: Okay. Composite Exhibit RLM-1 shall  
13 be identified as Composite Exhibit 31, and shall be admitted  
14 into the record without objection.

15 MR. MELSON: Thank you.

16 (Exhibit 31 marked for identification and admitted  
17 into the record.)

## 1 GULF POWER COMPANY

2 Before the Florida Public Service Commission  
3 Prepared Direct Testimony and Exhibit of  
4 Robert L. McGee  
5 Docket No. 010949-EI  
6 In Support of Rate Relief  
7 Date of Filing: September 10, 2001

8 Q. Please state your name, business address, employer and position.

9 A. My name is Robert L. McGee and my business address is One Energy  
10 Place, Pensacola, Florida, 32520. I am employed by Gulf Power  
11 Company as the Marketing Services Manager.

12 Q. Mr. McGee, please summarize your educational background and  
13 professional experience.

14 A. I attended the University of Maryland and graduated with a B.S. degree in  
15 Electrical Engineering in 1984. In 1993, I earned a Masters degree in  
16 Business Administration from the University of West Florida. I was a  
17 United States Naval Flight Officer until 1994 when I began my career in  
18 the electric utility industry at Gulf Power Company. I have held various  
19 positions within the company in Marketing and Power Generation. In my  
20 present position, I am responsible for Energy Conservation Cost Recovery  
21 (ECCR) filings, pricing, economic evaluations, market research, load  
22 research, forecasting and marketing services activities.

23 Q. What is the purpose of your testimony in this proceeding?

24 A. The purpose of my testimony is to present the approach, methods and  
25 results associated with Gulf's forecast of customers, energy sales, peak

1 demands and base rate revenues. The forecast is provided to Corporate  
2 Planning for use in the budgeting and planning process as discussed by  
3 Mr. Saxon. I will also address the Company's cost of service load  
4 research results.

5

6 Q. Have you prepared an exhibit that contains information to which you will  
7 refer in your testimony?

8 A. Yes. Exhibit (RLM-1) consisting of seven schedules was prepared under  
9 my supervision and direction.

10 Counsel: We ask that Mr. McGee's Exhibit (RLM-1) consisting of  
11 seven schedules be marked as Exhibit No. \_\_\_\_.

12

13 Q. Are you the sponsor of certain Minimum Filing Requirements (MFR's)?

14 A. Yes. These are listed on Schedule 7 at the end of my exhibit. To the best  
15 of my knowledge, the information contained in these MFRs is true and  
16 correct.

17

18 Q. Mr. McGee, you indicated you are responsible for the forecasts of Gulf's  
19 customers, energy sales, peak demands and base rate revenues. What  
20 tabulations have you provided detailing your retail projections for the test  
21 year?

22 A. I have provided four tabulations of test year forecast data: Schedule 1  
23 details retail customers by rate; Schedule 2 details retail energy sales by  
24 rate; Schedule 3 details territorial system peak demand by month; and  
25 Schedule 4 details retail base rate revenue by rate. Schedules 1, 2 and 4

1 also provide totals by customer classification.

2

3 Q. Please summarize your Schedule 1.

4 A. Gulf projects that it will have a total of 389,181 retail customers by May  
5 2003, an increase of 7,737 customers over projections for May 2002.

6 This represents an anticipated annual growth rate of 2.0 percent for the  
7 test year. By comparison, historical growth rates of 2.5 percent,  
8 2.7 percent and 1.8 percent were experienced in 1998, 1999 and 2000,  
9 respectively. Current projections for year-end 2001 and 12 months ended  
10 May 2002 indicate annual growth rates of 2.0 percent and 2.1 percent  
11 respectively.

12

13 Q. Please summarize your Schedule 2.

14 A. Retail energy sales are expected to total 10,282,958 megawatthours in  
15 the test year, representing an increase of 1.4 percent over projections for  
16 the twelve months ended May 2002. The retail megawatthour sales  
17 forecast by class consists of the following: Residential: 4,778,953 MWH,  
18 comprising 46.5 percent of retail; Commercial: 3,309,615 MWH,  
19 comprising 32.2 percent; Industrial: 2,173,005 MWH, comprising  
20 21.1 percent; and Street Lighting: 21,315 MWH, comprising 0.2 percent.

21

22 Q. Please summarize your Schedule 3.

23 A. Gulf's territorial system peak demand is projected to be 2,224 MW in the  
24 test year, representing an increase of 57 MW or 2.6 percent over  
25 projections for the twelve months ended May 2002. This peak is expected

1 to occur in the summer month of July 2002.

2

3 Q. Please summarize your Schedule 4.

4 A. Retail base rate revenues are expected to total \$343,750,000 in the test  
5 year. Using current rates, the base rate revenue forecast by class  
6 consists of the following: Residential: \$196,535,000; Commercial:  
7 \$104,114,000; Industrial: \$41,097,000; and Street Lighting: \$2,002,000.

8

9 Q. What are the objectives of your forecasting efforts?

10 A. Gulf has adopted two primary objectives in preparing forecasts:  
11 (1) comprehensive coverage of major issues and trends that may impact  
12 Gulf and its customers, and (2) effective communication to management  
13 and planning functions of the underlying causes and potential  
14 implications.

15 Since the primary focus in this proceeding is on the test year, the  
16 short-term forecast will serve as the basis for discussion of forecast  
17 results.

18

19 Q. What level of accuracy has been achieved in your recent short-term  
20 forecasts of retail customers, energy sales and base rate revenues?

21 A. Employing the same basic methods and approach used for this  
22 proceeding, our forecast accuracy has consistently exceeded the  
23 standards which we consider appropriate for planning purposes.  
24 Schedule 5 provides a summary of our short-term forecast accuracy for  
25 the last four budget forecasts issued prior to the test year forecast.

1 Q. What rate schedules are included in the residential class forecast of  
2 customers and energy sales?

3 A. Gulf's residential class is currently comprised of four rate schedules: RS  
4 (residential service) which represents the majority of class energy sales,  
5 rate schedule RST (residential service, time-of-use conservation), rate  
6 schedule RSVP (residential service variable pricing), and finally rate  
7 schedule OS (outdoor service – lighting).

8

9 Q. Please describe the methods used to prepare the forecast of residential  
10 customers.

11 A. The short-term forecast (0-2 years) of customers is based primarily on  
12 projections prepared by Gulf's district Marketing personnel based upon  
13 recent historical trends in customer gains and their knowledge of locally  
14 planned construction projects from which they are able to estimate the  
15 near-term anticipated customer gains. These projections are then  
16 analyzed for consistency and the incorporation of major construction  
17 projects and business developments, and reviewed for completeness and  
18 accuracy. The end result is a near-term forecast of residential customers.

19

20 Q. Please describe the methods used to prepare the residential class energy  
21 sales forecast.

22 A. The short-term (0-2 years) residential energy sales forecast is statistically  
23 modeled utilizing multiple regression analyses. Monthly class energy  
24 purchases per customer per billing day, the dependent variable, is  
25 estimated based upon the following independent variables: recent

1 historical energy sales, expected normal weather (heating and cooling  
2 degree hours), seasonal variations and projected price of electricity. The  
3 model output is then multiplied by the projected number of customers and  
4 billing days by month to expand to the total residential class. The  
5 residential class energy projections are then adjusted to reflect the  
6 anticipated incremental impacts of Gulf's Demand Side Management  
7 (DSM) plan.

8

9 Q. What rate schedules are included in the commercial class forecast of  
10 customers and energy sales?

11 A. Gulf's commercial class represents the most heterogeneous market  
12 served by Gulf. Included in this class are customers from the following  
13 current rate schedules: GS (general service), GST (general service, time-  
14 of-use conservation), GSD (general service demand), GSDT (general  
15 service demand, time-of-use conservation), LP (large power service), LPT  
16 (large power service, time-of-use conservation), RTP (real time pricing)  
17 and OS (outdoor service).

18

19 Q. Please describe the method used to prepare the commercial class  
20 customer forecast.

21 A. As in the residential sector, the short-term forecast (0-2 years) of  
22 commercial customers is prepared by Gulf's district Marketing personnel  
23 utilizing recent historical information concerning increases in the number  
24 of customers, knowledge of the local area economies and upcoming  
25 construction projects. A review for completeness and accuracy of the

1 assumptions, techniques and results for each district is undertaken with  
2 special attention given to the incorporation of major commercial  
3 development projects. The end result is a near-term forecast of  
4 commercial customers.

5  
6 Q. Please describe the methods used to prepare the commercial class  
7 energy sales forecast.

8 A. The short-term (0-2 years) commercial energy sales forecast is also  
9 developed utilizing multiple regression analyses. Monthly class energy  
10 purchases per customer per billing day are estimated based upon recent  
11 historical data, expected normal weather (heating and cooling degree  
12 hours), seasonal variations and projected price of electricity. The model  
13 output is then multiplied by the projected number of customers and billing  
14 days by month to expand to the total commercial class. The commercial  
15 class energy projections are then adjusted to reflect the anticipated  
16 incremental impacts of Gulf's DSM plan.

17  
18 Q. What rate schedules are included in the industrial class forecast of  
19 customers and energy sales?

20 A. Gulf's industrial customer class consists of customers billed under the  
21 following current rate schedules: GS (general service), GSD (general  
22 service demand), GSDT (general service demand, time-of-use  
23 conservation), LP (large power service), LPT (large power service, time-  
24 of-use conservation), PX (large high load factor power service), SBS  
25 (standby and supplementary service), RTP (real time pricing), CIS

1 (commercial/industrial service optional rider) and OS (outdoor service).

2

3 Q. Describe the methods used to prepare the industrial class energy sales  
4 forecast.

5 A. The short-term industrial energy sales forecast is developed using a  
6 combination of on-site surveys of major industrial customers, trending  
7 techniques, and multiple regression analyses.

8 Fifty-one of Gulf's largest industrial customers, representing over  
9 91 percent of the industrial class sales, are interviewed to identify load  
10 changes due to equipment additions and replacements, or changes in  
11 operating characteristics. The short-term forecast of monthly sales to  
12 these major industrial customers is a synthesis of this detailed survey  
13 information and historical monthly load factor trends.

14 The forecast of short-term sales to the remaining smaller industrial  
15 customers is developed using a combination of trending techniques and  
16 multiple regression analysis by rate, as appropriate. The resulting  
17 estimates of energy purchases per customer per day are multiplied by the  
18 expected number of customers and billing days by month to expand to the  
19 rate level totals. These projections are then added to the results for the  
20 major industrial customers to sum to the industrial class totals.

21

22 Q. How is Gulf's forecast of territorial wholesale energy prepared?

23 A. The forecast of energy sales to wholesale customers is developed utilizing  
24 multiple regression analyses. Monthly energy purchases per day for each  
25 of Gulf's wholesale customers are estimated based upon recent historical

1 data, expected normal weather (heating and cooling degree hours) and  
2 seasonal variations. The model output is then multiplied by the projected  
3 number of days by month to expand to the customer totals, which are then  
4 summed to develop the class totals.

5

6 Q. Please describe the methods used to prepare your peak demand  
7 forecast.

8 A. The short-term (0-2 years) peak demand forecast is prepared using  
9 average historical monthly territorial load factors and projected monthly  
10 territorial supply.

11 The summer peak month demand projections are based upon the  
12 average of the historical summer peak month territorial load factors for the  
13 period from 1980 through the summer peak of 2000, excluding the  
14 extreme high load factor and extreme low load factor experienced during  
15 that period. Gulf's summer peak demand typically occurs in the month of  
16 July.

17 Similarly, the winter peak month demand projections are based  
18 upon the average of the historical winter peak month territorial load factors  
19 for the period from 1980 through the winter peak of 2000/2001, excluding  
20 the extreme high load factor and extreme low load factor experienced  
21 during that period. Gulf's winter peak demand typically occurs in the  
22 month of January.

23 The remaining monthly demand projections are developed in  
24 similar fashion utilizing the respective historical average monthly load  
25 factors, excluding the monthly extreme high and extreme low load factors.

1           The resulting monthly demand projections are then further refined  
2           by taking into account the impact of Gulf's DSM programs.

3

4    Q.    Please describe the procedure used to develop the test year retail base  
5           rate revenue forecast.

6    A.    Appropriate rate schedules are applied to monthly projections of  
7           customers, energy sales and billing demands for each customer rate  
8           classification. The revenue forecast is based upon rates currently  
9           reflected in Gulf's tariff.

10

11   Q.    You indicated earlier that you were responsible for Gulf's load research  
12          activities. What load research data is being used in these proceedings?

13   A.    Gulf's 1999 Cost of Service Load Research Study, filed with the  
14          Commission in May 2000 pursuant to Order No. 13026 in Docket No.  
15          820491-EU, is the basis of the cost of service study in this proceeding.

16

17   Q.    Does Gulf's 1999 Cost of Service Load Research sample design meet the  
18          requirements of the Cost of Service Load Research Rule, Docket No.  
19          820491-EU, Order No. 13026?

20   A.    Yes. The sample design does meet the requirements of the referenced  
21          rule.

22

23   Q.    What tabulation have you provided detailing the results of Gulf's 1999  
24          Load Research Study?

25   A.    Schedule 6 provides a summary tabulation of Gulf's 1999 Load Research

1 Study results.

2

3 Q: Does this conclude your testimony?

4 A: Yes, it does.

COUNTY OF LEON )

CERTIFICATE OF REPORTER

I, JANE FAUROT, RPR, Chief, Office of Hearing Reporter Services, FPSC Division of Commission Clerk and Administrative Services, do hereby certify that the foregoing proceeding was heard at the time and place herein stated.

IT IS FURTHER CERTIFIED that I stenographically reported the said proceedings; that the same has been transcribed under my direct supervision; and that this transcript constitutes a true transcription of my notes of said proceedings.

I FURTHER CERTIFY that I am not a relative, employee, attorney or counsel of any of the parties, nor am I a relative or employee of any of the parties' attorney or counsel connected with the action, nor am I financially interested in the action.

DATED THIS 25TH DAY OF FEBRUARY, 2002.
