Re: Load Research Report - Tampa Electric Company

Dear Ms. Bayo:

In compliance with Rule 25-6.0437, enclosed are five copies of Tampa Electric Company's Load Research Report.

Please acknowledge receipt and filing of the above by stamping the duplicate copy of this letter and returning same to this writer.

Thank you for your assistance in connection with this matter.

Sincerely,

James D. Beasley

TAMPA ELECTRIC COMPANY
LOAD RESEARCH REPORT
APRIL 2002

REPORTING PERIOD

The data summarized in this report was collected during the calendar year 2001. The two overlapping samples were selected in 1999 and 2000, and in most cases the recording equipment was installed prior to December 31 of the year during which the sample was selected. Some sample points in each of the classes were replaced for various reasons during the year resulting in partial years of data collection for these Customers.

SAMPLING PLAN

The plan for this load research project was formulated and filed with the Florida Public Service Commission in August of 2000.

RESIDENTIAL CLASS SAMPLE

The residential samples were pre-stratified by housing type. The three housing type categories are single-family-detached, multi-family, and mobile-home. The primary reasons for using this stratification are that the load patterns for the three housing types are dissimilar and the percentage of mobile homes in the population changes significantly with the seasons. The percentage of mobile homes ranged from a high of 12.6% in the winter to a low of 11.9% in the summer. Since the sample is stratified by housing type and since inter-strata migration is insignificant, changes can be made to the stratum weights on a month by month basis when estimating class demands. The estimated demands thus reflect the seasonal changes in the housing type mix. Initially, the sample points were allocated to the strata using Neyman allocation with stratum means and variances estimated from the previous sample results. A minimum sample size of 50 was used in the Multi Family and Mobile Home categories. The resulting sample allocation is shown below.

RESIDENTIAL SERVICE SAMPLE SIZES

Stratum	Sample Size 1999	Sample Size 2000	Total
Single Family Detached	87	88	175
Multi Family	25	25	50
Mobile Home	25	25	50
Total	137	138	275

GENERAL SERVICE NON-DEMAND CLASS SAMPLE

The stratification variable used for both of the overlapping General Service Non-Demand samples was annual kilowatt-hour consumption at the time of sample selection. The samples were selected in 1999 and 2000. Both samples were comprised of two strata; the stratum boundary for both was set at 15,000 kWh of annual usage. The sample points were allocated to the strata using Neyman allocation with stratum variances estimated from previous sample results. The allocation is shown on the next page.

GENERAL SERVICE NON-DEMAND SAMPLE SIZES

Stratum	Sample Size 1999	Sample Size 2000	Total
0 – 14,999	128	129	257
15,000 – infinity	121	122	243
Total	249	251	500

GENERAL SERVICE DEMAND CLASS SAMPLE

The stratification variable used for both of the General Service Demand overlapping samples was the highest billed demand in twelve months prior to sample selection. In cost of service study work, class demands must be split into voltage level totals. To facilitate this separation, a stratum of all Customers served at primary voltage and another stratum of Customers served at secondary voltage but metered at primary voltage were established. For secondary voltage Customers the stratum boundaries were 200 kW and 300 kW. All Customers over 300 kW were included in the sample in a 100% sampled stratum. Any Customers subsequently exceeding this threshold had recorders installed on their meters and were included in the sample as well. The sample points in the two sampled strata for the GSD Class were allocated using Neyman allocation. The allocation is shown below and reflects totals in the 100% sampled strata as of December 2001.

GENERAL SERVICE DEMAND SAMPLE SIZES

Stratum	Sample Size 1999	Sample Size 2000	Total
Primary Metered/Primary Served	72 (100%)		72
Primary Metered/Secondary Served	40 (100%)		40
Secondary under 300 kW			
0 – 199 kW	35	35	70
200 – 299 kW	35	35	70
Secondary over 299 kW	940 (100%)		940
Total	1192	1192	1192

GENERAL SERVICE LARGE DEMAND CLASS SAMPLE

The General Service Large Demand Class has recorders installed on each Customer. For cost of service study work the Customers are divided into voltage level categories. On a month by month basis, as Customers migrate into and out of the GSLD rate, the analysis population is changed accordingly. The population size as of December 2001 was 183.

INTERRUPTIBLE SERVICE CLASS SAMPLE

The Interruptible Service Class has recorders installed on each Customer. For cost of service study work the Customers are divided into voltage level categories. On a month by month basis, as Customers migrate into and out of the IS rate, the analysis population is changed accordingly. The population size as of December 2001 was 70.

STUDY METHODOLOGY

Following sample design, the load research study consists of four phases: data collection, editing, storage and analysis. The methodology used in these phases for this study is basically the same as has been used in the past at Tampa Electric Company.

DATA COLLECTION

Once sample sizes, stratum definitions, and sample allocations have been determined, sample selection is ready to begin. In general, for the sampled classes, random numbers are assigned to the members of the class, and the list of Customers is sorted in ascending order by the assigned random number. The first group of Customers on the list is the prime sample, while the following group is used as a source of replacement Customers. The replacement list is maintained in random order and is used in that order on an as-needed basis. For Customers selected, the standard billing watt-hour meter is replaced with a pulse-initiating type meter, and a recording device is installed to collect and retain the pulse information in fifteen minute intervals. The recorded information is collected, usually on a monthly basis, and processed through a translation system located in the Meter Department. Periodically the translation system produces transfer files which are uploaded to the company's mainframe computer and subsequently input into the LODESTAR System. Data entered into LODESTAR goes through a preliminary screening to determine its acceptability. Unacceptable data is examined by analysts to see if any portion of the data is useable and if any data editing is required. The data is flagged to indicate whether it is suitable for analysis purposes and is then stored permanently on magnetic tape.

DATA ANALYSIS

The data flagged as acceptable in the LODESTAR System is then processed through software modules capable of performing stratified or un-stratified mean-per-unit, combined ratio or separate ratio analysis. The analyses are run on a calendar month basis and produce statistics at the class level and at the per-Customer level. For Tampa Electric Company the best results for sampled classes are obtained through the use of combined ratio expansion. Since the 100% sampled classes do not require statistical expansion, the results for these classes are tabulated with the mean-per-unit module.

SAMPLE POINT REPLACEMENT

Initially and during the course of the load research study, sample points must be replaced. To minimize the amount of replacement necessary, Tampa Electric's policy is not to request permission from Customers before recorders are installed. During the sampling period, 78 replacements were required and were done for the following reasons: Rate Changes (15), demolitions (2), extended periods of suspense (17), Customer dissatisfaction or installation problems (29), fire at premise (2), meter/service removed (7), and Customers moved to 100% Sample (6). In all cases the replacements were selected randomly from Customers in the same stratum. The assumption necessitated as a result

of making these replacements is that no significant bias is introduced into the results in the process. Particularly since the combined ratio expansion technique was used for the analysis phase in the sampled classes, the assumption is reasonable.

RESULTS

The following tables report the class coincident and non-coincident demands and their related precision for the calendar year 2001. The precision values reported are calculated at the 90% confidence level. The hourly demands for the Residential Class for the entire year of 2001 are reported in the Appendix. Although the data for the Residential class came from two independent samples, the sample estimates were computed as if they came from a single sample. Since both samples were stratified by housing type, this approach is valid. The results shown in the tables for the General Service Non-Demand and General Service Demand classes are computed by combining the estimates developed from the two independent, overlapping samples with weighting factors of 0.5.

The winter system coincident peak occurred on January 5, 2001 at 08:00, and the summer coincident peak occurred on August 29, 2001 at 17:00. Estimates for the RS, GS and GSD classes were more accurate than the target accuracy specified by the Load Research Rule for summer and winter coincident peak and for the average of twelve coincident peaks.
