

Robert C. Williams Director of Engineering

VIA FEDERAL EXPRESS

March 31, 2003

Ms. Blanca S. Bayo, Director Florida Public Service Commission Division of the Commission Clerk and Administrative Services 2540 Shumard Oak Blvd. Tallahassee, FL 32399-0850

Dear Ms. Bayo,

Enclosed are 25 copies of Florida Municipal Power Agency's April 2003 Ten-Year Site Plan.

The Ten-Year Site Plan information is provided in accordance with Florida Public Service Commission rules 25-22.070, 25-22.071, and 25-22.072, which require certain electric utilities in the State of Florida to submit a Ten-Year Site Plan. The plan is required to describe the estimated electric power generating needs and to identify the general location of any proposed near-term power plant sites as of 12/31/2002.

If you should have any questions, please feel free to contact either Rick Casey or me.

Sincerely.

Robert C. Williams
Director of Engineering

Executive Summary

EXECUTIVE SUMMARY

The following information is provided in accordance with Florida Public Service Commission rules 25-22.070, 25-22.071, and 25-22.072, which require certain electric utilities in the State of Florida to submit a Ten-Year Site Plan. The plan is required to describe the estimated electric power generating needs and to identify the general location of any proposed near-term power plant sites.

The Florida Municipal Power Agency (FMPA) is a project-oriented, joint-action agency where each project is, in essence, a separate utility. The aggregate FMPA winter and summer generating capabilities for the year 2003 are 1,711 MW and 1,656 MW, respectively. In January 2002, FMPA and Kissimmee Utility Authority (50/50 joint owners) placed into commercial operation the Cane Island #3 Unit, a 250 MW Combined Cycle Plant.

Future FMPA generation construction plans for serving its municipal systems included in this report are as follows:

2003 Stanton Combined Cycle Unit A (20% of Unit Capacity)	99 MW
2006 Key West Combustion Turbine Unit	22 MW
2007 Combined Cycle Unit	250 MW
2011 Combustion Turbine Unit	165 MW

FMPA's direct responsibility for power supply planning can be separated into two parts. First, for the All-Requirements Project (ARP), where the Agency has committed to supplying all of the power requirements of fifteen cities, the Agency is solely responsible for power supply planning. Second, for member systems that are not in the ARP, the Agency's role has been to evaluate joint action opportunities and make the findings available to the membership where each member can elect whether or not to participate. This report presents information on the aggregate of the existing and planned generation for all of the established Agency projects. The specific descriptions of existing and

planned facilities include the current status of the aggregate of all the Agency projects. The sections on load forecasts and conservation programs provide information on the ARP participants only.

FMPA added two members, Kissimmee Utility Authority and Lake Worth Utilities, to the ARP in 2002, bringing the total ARP membership to fifteen members. All of the firm power purchases and generating resources owned and purchased by Kissimmee Utility Authority and Lake Worth Utilities have been incorporated into the ARP as purchased capacity-and-energy contracts. As is done for ARP members, FMPA will collectively plan for and provide all of the power requirements (above certain excluded resources) for Kissimmee Utility Authority and Lake Worth Utilities.

Section I

Description of FMPA

DESCRIPTION OF FMPA

General

The Florida Municipal Power Agency (FMPA) was created on February 24, 1978, by the signing of the Interlocal Agreement among its 29 members, which agreement specified the purposes and authority of FMPA. FMPA was formed under the provisions of Article VII, Section 10 of the Florida Constitution; the Joint Power Act, which constitutes Chapter 361, Part II, as amended; and the Florida Interlocal Cooperation Act of 1969, which begins at Section 163.01 of the Florida Statutes, as amended. The Florida Constitution and the Joint Power Act provide the authority for municipal electric utilities to join together for the joint financing, construction, acquiring, managing, operating, utilizing, and owning of electric power plants. The Interlocal Cooperation Act authorizes municipal electric utilities to cooperate with each other on a basis of mutual advantage to provide services and facilities in a manner and in a form of governmental organization that will accord best with geographic, economic, population, and other factors influencing the needs and development of local communities.

Organization and Governance

Each city commission, utility commission, or authority which is a signatory to the Interlocal Agreement has the right to appoint one member to FMPA's Board of Directors, the governing body of FMPA. The Board has the responsibility of developing and approving FMPA's budget, approving and financing projects, hiring a General Manager, and establishing bylaws that govern how FMPA operates and policies that implement such bylaws. At its annual meeting, the Board elects a Chairman, Vice Chairman, Secretary, Treasurer and an Executive Committee. The Executive Committee consists of thirteen representatives, nine elected by the Board plus the current Chairman of the Board, Vice Chairman, Secretary and Treasurer. The Executive Committee meets regularly to control FMPA's day-to-day operations and approve expenditures and contracts. The Executive Committee is also responsible for monitoring budgeted expenditure levels and assuring that authorized work is completed in a timely manner.

FMPA Projects

FMPA currently has five power supply projects in operation: (i) the St. Lucie Project; (ii) the Stanton Project; (iii) the Tri-City Project; (iv) the Stanton II Project and (v) the All-Requirements Project.

St. Lucie Project: On May 12, 1983, FMPA purchased from Florida Power & Light Company (FPL) an 8.806 percent undivided ownership interest in St. Lucie Unit No. 2 (the St. Lucie Project), a nuclear generating unit with a summer Seasonal Net Capability of approximately 839 MW and a winter Seasonal Net Capability of approximately 853 MW. St. Lucie Unit No. 2 was declared in commercial operation on August 8, 1983, and in Firm Operation, as defined in the participation agreement, on August 14, 1983. Fifteen of FMPA's members are participants in the St. Lucie Project.

Stanton Project: On August 13, 1984, FMPA purchased from the Orlando Utilities Commission (OUC) a 14.8193 percent undivided ownership interest in Stanton Unit No. 1, a coal-fired electric generation unit with a nominally-rated net high dispatch capacity of 428 MW. Stanton Unit No. 1 went into commercial operation July 1, 1987. Six of FMPA's members are participants in the Stanton Project.

Tri-City Project: On March 22, 1985, the FMPA Board approved the agreements associated with the Tri-City Project. The Tri-City Project involves the purchase from OUC of an additional 5.3012 percent undivided ownership interest in Stanton Unit No. 1. Three of FMPA's members are participants in the Tri-City Project.

Stanton II Project: On June 6, 1991, FMPA, under the Stanton II Project structure, purchased from OUC a 23.2 percent undivided ownership interest in OUC's Stanton Unit No. 2, a coal-fired unit virtually identical to Stanton Unit No. 1. The unit commenced commercial operation in June 1996. Seven of FMPA's members are participants in the

Stanton II Project. Table I-1 gives a summary of member participation by Project as of April 1, 2003.

All-Requirements Project: Under the All-Requirements Project, FMPA currently serves all the power requirements (above certain excluded resources) for fifteen of its members. In 1997, the cities of Vero Beach and Starke joined the All-Requirements Project. In 1998, Fort Pierce Utilities Authority and Key West joined the Project. The City of Ft. Meade, the Town of Havana, and the City of Newberry joined in 2000. In 2002, Kissimmee Utility Authority and Lake Worth joined the All-Requirements Project.

The current supply resources of the Project include: (i) the purchase of 122 MW interest in Stanton Unit No. 1 from OUC; (ii) the purchase of 98 MW interest in OUC's Stanton Unit No. 2; (iii) the purchase of 45 MW from two combustion turbines (Units A and B) at the OUC Indian River Plant; (iv) the purchase of 54 MW from two combustion turbines (Units C and D) at the OUC Indian River Plant; (v) capacity and energy from a 30 MW combustion turbine (Cane Island Unit 1), a 120 MW combined cycle (Cane Island Unit 2), and a 250 MW combined cycle unit (Cane Island #3) at Kissimmee Utility Authority's (KUA) Cane Island Power Park; (vi) capacity and energy from two reconditioned combustion turbines located in the Key West City Electric System (17.5 MW each); (vii) capacity and energy purchases from other utilities including OUC (127 MW), Florida Power & Light Company (120 MW), Florida Power Corporation (40 MW), the City of Lakeland (100 MW), the City of Vero Beach (155 MW), Ft. Pierce Utilities Authority (118 MW), Key West City Electric System (50 MW), Lake Worth Utilities (97 MW), KUA Hansel Plant (61 MW); (viii) necessary transmission arrangements; and (ix) required dispatching services. With the addition of several cities that joined the All-Requirements Project between 1997 and 2002, the supply resources of the All-Requirements Project include capacity and energy purchases from several of these cities for city-owned generation and/or the assumption of cities firm purchaser power resources. FMPA serves capacity and energy requirements of the City of Ft. Meade, via the full-requirements Tampa Electric agreement currently in place. When the Ft. Meade/Tampa Electric

agreement terminates, FMPA will serve Ft. Meade from the Project's portfolio of power-supply resources. Similarly, the Town of Havana and the City of Newberry are currently served by full-requirements agreements with Progress Energy. FMPA will assume power supply responsibilities for these two cities when their current agreements expire.

Note 1: Stanton Unit 1 has the ability to supplement primary fuel with landfill methane gas on an as-available basis. Note2: See List of Tables, Exhibits and Forms Section for a list of abbreviations.

Section III

Forecast of Demand and Energy for the All-Requirements Power Supply Project

FORECAST OF DEMAND AND ENERGY FOR THE ALL-REQUIREMENTS POWER SUPPLY PROJECT

Introduction

An important element for the determination of additional capacity commitments is the load forecast. This necessitates that great care be exercised when projecting future demand and energy requirements. FMPA is responsible for preparing load and energy projections for each of the All-Requirements Project (ARP) participants. The forecast process includes existing ARP member cities and may identify future cities that may become Project members. Forecasts are prepared on an individual city basis and then aggregated into projections of FMPA demand and energy requirements.

Compared to more simplistic linear trend forecasting models, statistical models, such as those used by FMPA are more costly to implement but allow the analyst greater insight into the factors that actually drive the demand for electricity. The type of forecasting processes used by FMPA strikes an appropriate balance between cost and the level of sophistication required to adequately plan for future power supply requirements. The tools utilized by FMPA allow great flexibility in assessing the impact of numerous driving factors on electric load growth and provide the ability to assess alternative growth scenarios.

Methodology

In preparing forecasts, FMPA analyzes and projects the major driving factors that are related to the demand for electricity by its members. These factors include demographic factors (population and customer growth), weather impacts on loads, economic factors (per capita income, unemployment rate, and taxable sales), conservation programs and significant incremental changes (new cities) which may impact the forecast. FMPA projects energy required for load using recognized modeling techniques and then estimates winter and summer peak demands using load factor and coincidance factor analysis.

To estimate All-Requirements Project member energy requirements, several relatively standardized techniques are utilized including: statistical analysis techniques (time series, multiple regression, autoregression, Box Jenkins), econometric modeling of member customer class requirements, aggregate econometric modeling of system requirements, incremental load analysis, informed judgement.

In analyzing the relationship between energy requirements and driving variables, FMPA utilizes a commercially available software package to perform statistical analysis and prepare standardized tests of statistical significance to evaluate alternative forecast models. Once a model is selected, energy forecasts are prepared using the selected model and forecast assumptions for driving variables used by the model (customers, weather,

economics, etc.). Forecasted energy is then reviewed for reasonableness, compared to historical patterns and modified as appropriate using informed judgement and appropriate incremental load additions or reductions.

As part of the forecasting process, FMPA evaluates standardized statistical measurements to assess:

- □ The overall significance of each members' forecast model
- □ The relative explanatory performance of the model
- ☐ The validation of model structure for complexity and dynamics
- The utilization of these types of tests to permit the development of forecast models which are statistically valid and appropriate for use in forecasting.

It is important to note that no matter how sophisticated and reliable a model appears to be that is based upon historical relationships and statistical validation, a model is a simplification of the actual process and cannot capture every nuance of cause and effect relationships. Thus, differences between load forecasts and actual realized loads will always be present. Additionally, since we live in a dynamic world, forecasting error is unavoidable. However, every effort is made to minimize error through the use of sensitivity or uncertainty analysis.

The primary method for dealing with load forecast uncertainty is to prepare alternative forecasts by assuming different scenarios of events that will impact the forecast. FMPA has chosen to capture the potential levels of forecast uncertainty by establishing bandwidths around the base case demand and energy forecasts. This procedure corresponds with statistical theory that indicates that, in absolute terms, the level of forecast uncertainty will increase as the forecast progresses into future years. For example, in 2003 the one standard deviation uncertainty range for the FMPA/ARP summer peak load is 118 MW (from high to low). By 2012 the uncertainty range has grown to 650 MW.

Results

FMPA forecasts continued population growth for the service territory based largely on the projected growth in the county population as determined by the University of Florida Bureau of Economic and Business Research, and published in the Florida Statistical Abstract, 2002. Inflation is projected to remain at low levels and the price of electricity is expected to remain constant throughout the forecast period. Normal weather conditions are assumed for this forecast. Final forecast results give the All-Requirements Project an average annual compounded growth of 2.4% (2003 to 2012) for Net Energy for Load and 2.5% for Summer Peak Demand [including the addition of Havana (2003), Newberry (2006) and Ft. Meade (2009)].

Note: On October 1, 2002, FMPA began providing service to the cities of Kissimmee and Lake Worth through its All-Requirements Project. Service to the Town of Havana is scheduled to begin on May 1, 2003.

Section IV

Conservation Programs

CONSERVATION PROGRAMS

Introduction

FMPA's demand side programs are designed to improve efficiency, implement direct control of residential appliances, encourage time-of-use rates, and achieve additional conservation through commercial and industrial audits.

FMPA's members have promoted their conservation programs by providing speakers on energy conservation matters to radio talk shows, civic clubs, churches, schools, and so forth. These presentations are given both in person and on videotape. Additionally, bill inserts have been utilized to keep customers aware of available conservation programs. FMPA will continue to offer services as needed to assist members in increasing the promotion and use of conservation programs to retail customers and will assist all of its members in the evaluation of any new programs to ensure their cost effectiveness.

FMPA is also assisting in the development of renewable energy resources by participating in the Utility Photovoltaic Group (UPG). UPG is a non-profit organization formed to accelerate the commercialization of photovoltaic systems for the benefit of electric utilities and their customers.

Existing Conservation Programs

FMPA's All-Requirements Participants have offered some or all of the following conservation programs:

- 1) Residential Energy Audits Program: This Program offers a walk-through audit to identify energy savings opportunities. Energy Star program has been offered since October 1999.
- 2) High-Pressure Sodium Outdoor Lighting Conversion: This program replaces mercury-vapor street lights with high-pressure sodium lights.

- 3) Assistance for Commercial/Industrial Audits: Free on-site audits are conducted for all interested customers and recommendations are made for energy efficiency improvements. ESCO referral is also provided upon request.
- 4) Commercial Time-of-Use Program: Time-of-use rates are offered to commercial and industrial customers with the intention of shifting demand from peak to off-peak periods.
- 5) Natural Gas Promotion: During Energy Audits, recommend the conversion of old, inefficient electric heat and water heaters to natural gas when the conversion would benefit the customer.
- 6) Residential Load Management Program: This program has been offered to customers with central electric heating, central air conditioning and electric water heating. The utility is allowed to control some or all of these appliances during periods of peak demand and the customer will receive a fixed monthly credit on their bill for each device under control.
- 7) Fix-Up Program for the Elderly and Handicapped: Weatherization measures that target low-income housing.

Section V

Forecast of Facilities Requirements

FORECAST OF FACILITIES REQUIREMENTS

For member cities not involved in the All-Requirements Project, the responsibility for planning their future generation and transmission requirements lies ultimately with the individual utility. For the FMPA St. Lucie, Stanton, Stanton II and Tri-City Projects, FMPA has no power supply planning responsibility. However, FMPA periodically reviews the supply plans that might be worthwhile for FMPA or the cities to consider.

FMPA's planning process involves evaluating new generating capacity, along with new purchased power options, if appropriate, and conservation measures that are planned and implemented by the All-Requirements Project participants. The planning process has also included periodic Requests for Proposals in an effort to consider all possible options. FMPA normally performs its generation expansion planning on a least-cost basis considering both new purchased-power options, as well as, options on construction of generating capacity and demand-side resources when cost effective. The generation expansion plan optimizes the planned mix of possible supply-side resources by simulating their dispatch for each year of the study period while considering variables including fixed and variable resource costs, fuel costs, planned maintenance outages, terms of purchase contracts, minimum reserve requirements and options for future resources. FMPA plans on an annual reserve level of approximately 18% of the summer peak, which is in compliance with the reserve margin criteria of the Florida Public Service Commission.

Currently, the Agency on behalf of the All-Requirements Project, is planning to add additional capacity in 2003 (98 MW CC), 2006 (22 MW CT), 2007 (250 MW CC) and 2011 (165 MW CT). FMPA is actively working with OUC, KUA and Southern on the construction of a 633 MW gas-fired combined cycle unit being built on OUC's Stanton Energy Center site from which FMPA and KUA will receive 126 MW. The unit is expected to be on line by the fall of 2003. FMPA is also beginning the process to add a 22 MW combustion turbine to the Key West Site in the summer of 2006. A 250 MW unsited Combined Cycle Unit as well as a 165 MW un-sited Combustion Turbine Unit is planned for the 2007 and 2011 timeframe, respectively. Additionally generation can be added at the Cane Island Power Park, at Fort Pierce Utilities Authority's Power Plant, at Lake Worth Utilities, at Vero Beach's Power Plant and at Key West's Stock Island Plant.

Additionally, reciprocating engines or small combustion turbine generation can be installed on all fifteen Project Member Systems.

FMPA is continually reviewing its options, seeking joint participation when feasible, and may change the megawatts required, the year of installment, the type of generation, and/or the site as conditions change.

⁽²⁾ Includes member owned capacity, an 22 MW CT at Key West in 2006, an unsited 250 MW combined cycle unit in 2007 and an unsited 165 MW combustion turbine in 2011.

⁽³⁾ Includes no undesignated power purchases

⁽⁴⁾ Includes Net Firm Demand and system losses.

Section VI

Site and Facility Descriptions

SITE AND FACILITY DESCRIPTIONS

Stanton Combined Cycle Unit A

Stanton A will be located at the existing Stanton Energy Center site located on the eastern side of the service territory of the Orlando Utilities Commission. This plant will utilize a 2x1 combined cycle configuration with two General Electric PG-7231 FA combustion turbines, two heat recovery steam generators, and a steam turbine. The projected output is 633 MW with a heat rate of 7,230 Btu/kWh. Stanton A will be equipped with evaporative inlet cooling, duct firing, and power augmentation to increase output. Natural gas is the primary fuel and number 2 oil will be the backup fuel. The plant will not be equipped with bypass stacks and dampers, but will have the condenser sized such that both combustion turbines can be operated at full load with the steam turbine out of service.

Environmental Considerations:

Stanton A is required to comply with the Clean Air Act and current Florida air quality requirements stemming from the Act. One aspect of the permitting process is the determination of Best Available Control Technology (BACT). Major criteria pollutants included in the BACT analysis are NO_x, SO₂, VOC, CO and PM/PM₁₀.

Stanton A is also subject to the New Source Performance Standards (NSPS) requirements for a stationary gas turbine used for electric generation as defined in 40 CFR Part 60, Subpart GG. NSPS Subpart GG places restrictions on emission of NO_x and SO₂ from combustion turbines. NO_x concentrations in the flue gas for combustion turbines with heat inputs greater than 100 MBtu/h are limited to a nominal value of 75 ppmvd (corrected to 15 percent O₂). Upward corrections to NO_x emissions limits are allowed for fuel bound nitrogen content and thermal efficiencies greater than 25 percent.

For further details regarding Stanton A's expected compliance with the Clean Air Act and New Source Performance Standards, please refer to the "Need for Power Application" and "Site Certification" for Stanton A previously submitted to the FPSC by Southern, OUC, FMPA and KUA.

Cane Island

Cane Island Power Park is located south and west of the Kissimmee Utility Authority's (KUA) service area and contains 239.6 MW of gas turbine and combined cycle capacity. The Cane Island Power Park is a possible site for the planned 2007 Combined Cycle Plant (250 MW). The 2007 Combined Cycle Plant is planned to be very similar, to Cane Island #3.

Key West Combustion Turbine 4

The planned Key West combustion turbine unit (22 MW) will most likely be located at the Key West Stock Island Plant in Monroe County with a commercial in-service date of summer 2006. The unit is planned to be similar to Stock Island Units CT2&3 which were placed in operation during 1999.

Ft. Pierce, Vero Beach and Lake Worth Power Plants

The Ft. Pierce Power Plant Site located in the City of Ft. Pierce's service area in St. Lucie County currently has 118 MW of existing steam, combined cycle and reciprocating engine generation and is suitable for possible future repowering or addition of new combustion turbines or combined-cycle units.

The Vero Beach Power Plant Site located in the City of Vero Beach's service area in Indian River County currently has 155 MW of existing steam, combined cycle and reciprocating engine generation and is suitable for possible future repowering or addition of new combustion turbines or combined-cycle units.

The Lake Worth Power Plant Site located in the City of Lake Worth's service area in Palm Beach County currently has 97 MW of existing steam, combined cycle and reciprocating engine generation and is suitable for possible future repowering or addition of new combustion turbines or combined-cycle units.

The State map on page 9 indicates the approximate location of the Ft. Pierce, Vero Beach, and Lake Worth service areas.

Schedule 10 Status Report and Specifications of Proposed Directly Associated Transmission Lines All-Requirements Project

(1)	Point of Origin and Termination:	FMPA has no Proposed Lines for Schedule 10
(2)	Number of Lines:	
(3)	Right-of-Way:	
(4)	Line Length:	
(5)	Voltage:	
(6)	Anticipated Construction Timing:	
(7)	Anticipated Capital Investment:	
(8)	Substations:	
(9)	Participation with Other Utilities:	

Appendix I

Planned and Proposed Transmission Additions

The table on the following page contains a list of planned and proposed transmission line additions for member cities of the Florida Municipal Power Agency who participate in the All-Requirements Project as well as other (non-ARP) member cities who are not required to file a Ten-Year Site Plan. In view of current efforts to form the new Florida RTO Grid Florida, it was considered necessary to document these plans in the public record.

Planned and Proposed Transmission Additions for FMPA Members 2003 through 2013 (69 kV and above)

City	From	То	Voltage	Circuit	Estimated In-Service Date
t. Pierce	King	Garden City	69 kV	2	12/2007
	Hartman Auto-Xfmr1Up	grade	138/69		9/2007
