FPSC-COMMISSION CLERK

**IN RE: PETITION FOR DETERMINATION OF NEED FOR EXPANSION OF  
AN ELECTRICAL POWER PLANT, FOR EXEMPTION FROM RULE 25-22.082,  
F.A.C., AND FOR COST RECOVERY THROUGH THE FUEL CLAUSE**

**BY PROGRESS ENERGY FLORIDA**

**FPSC DOCKET NO. \_\_\_\_\_**

**DIRECT TESTIMONY OF DANIEL L. RODERICK**

**I. INTRODUCTION AND QUALIFICATIONS**

1 **Q. Please state your name and business address.**

2 A. My name is Daniel L. Roderick. My business address is Crystal River  
3 Energy Complex, Nuclear Administration 2C, 15760 West Power Line  
4 Street, Crystal River, Florida 34428.

5  
6 **Q. By whom are you employed and in what capacity?**

7 A. I am employed by Progress Energy Florida (“PEF” or the “Company”) in  
8 the Nuclear Generation Group and serve as the Director of Site Operations  
9 at Crystal River Unit 3 (“CR3”), PEF’s nuclear plant.

10  
11 **Q. What are your responsibilities as the Director of Site Operations?**

12 A. I am responsible for the safe, efficient, and reliable generation of  
13 electricity from the Company’s nuclear plant. All plant functions,  
14 including the Plant General Manager, Engineering Manager, Training  
15 Manager, and Licensing, report to me and are under my supervision.

1 **Q. Please summarize your educational background and work experience.**

2 **A.** I have a Bachelor of Science and Master of Science degree in Industrial  
3 Engineering from the University of Arkansas and a Senior Reactor  
4 Operator License. I have been at CR3 since 1996, serving in my current  
5 position of Director Site Operations and, prior to that position, Plant  
6 General Manager, Engineering Manager, and Outage Manager,  
7 respectively. Prior to my employment with the Company, I was employed  
8 for twelve years with Entergy Corporation at its Arkansas Nuclear One  
9 plant in Russellville, Arkansas with responsibilities in Plant Operations  
10 and Engineering.

11  
12 **II. PURPOSE AND SUMMARY OF TESTIMONY**

13  
14 **Q. What is the purpose of your testimony?**

15 **A.** The purpose of my testimony is to support the Company's request for a  
16 determination of need for the expansion of power capacity at CR3, for  
17 exemption from the bid rule, Rule 25-22.082, F.A.C., and for cost  
18 recovery through the fuel clause for the replacement and modification of  
19 equipment at CR3 to support an increase in reactor power from the nuclear  
20 plant.

21 Specifically, I will generally describe the current Crystal River site  
22 and CR 3. I will further explain the planned changes to the nuclear plant  
23 that are necessary to support the power uprate project. I will also

1 transmission system and thermal limits on the discharged cooling water  
2 that must be addressed to obtain the full benefits of the power uprate  
3 project at CR3. I will further present the Company's current cost  
4 estimates for the project, explain the procedures in place to ensure the  
5 costs incurred for the project are reasonable and prudent, and explain the  
6 economic need for the project because the project will provide additional,  
7 reliable base load capacity to customers while generating substantial fuel  
8 savings. Finally, I will explain the adverse consequences to the Company  
9 and its customers if the CR3 uprate project is delayed.

10  
11 **Q. Why is the Company considering the CR3 power uprate project?**

12 **A.** The primary reason for this project is to reduce total fuel costs to  
13 customers over the extended life of CR3 by increasing low cost nuclear  
14 fuel generation and reducing or replacing generation from higher cost fuel  
15 power plants or purchased power obligations. The Company has  
16 performed studies to find innovative ways to reduce the total fuel cost to  
17 the customer by expanding existing nuclear generation and implementing  
18 new technological innovations. To illustrate, in preparing for the steam  
19 generator replacement and related work during the Company's upcoming  
20 2009 nuclear refueling outages necessary to extend the remaining life of  
21 the nuclear unit, the Company determined that additional power can be  
22 generated through increased efficiencies from technological advancements  
23 and additional modifications to accommodate nuclear fuel enrichment at

1 the unit. The result of a power uprate at the nuclear unit from these  
2 additional technological efficiencies and fuel enrichment modifications  
3 will be increased generation capacity from the Company's lowest cost fuel  
4 source. This will allow PEF to replace or reduce higher cost generation  
5 from alternative fuel sources. The Company's need for the CR3 power  
6 uprate project is, therefore, economic because of the significant fuel  
7 savings for customers that will be realized from the project.  
8

9 **Q. Do you have any exhibits to your testimony?**

10 **A.** Yes, I have supervised the preparation of or prepared the following  
11 exhibits to my direct testimony.

- 12 • Exhibit No. \_\_\_ (DLR-1), an aerial view of the Crystal River complex,  
13 including CR3.
- 14 • Exhibit No. \_\_\_ (DLR-2), a picture of the primary plant configuration for  
15 the pressurized water reactor nuclear plant at CR3 that shows the major  
16 components of the nuclear reactor and primary coolant system.
- 17 • Exhibit No. \_\_\_ (DLR-3), a schematic of the major components in the  
18 primary system and the balance of the nuclear plant that shows the major  
19 components in the secondary systems, including the main turbine and  
20 main generator.

21 All of these exhibits are true and accurate.  
22

1           **Q.    Please give an overview of the Company's presentation in this**  
2           **proceeding.**

3           **A.**    In addition to my own testimony, the Company will present the testimony  
4           of the following witnesses:

- 5           • Mr. Samuel Waters, who will explain the economic need for the CR3  
6           power uprate by providing testimony regarding the significant fuel savings  
7           that will be realized from the project. Mr. Waters will explain how the  
8           project will increase the supply of adequate, reliable electricity at a  
9           reasonable cost and why the project is the most cost-effective alternative  
10          to the Company because it will result in a lower cost supply of electricity  
11          to the Company's customers. Mr. Waters will further generally describe  
12          the Company's existing facilities and other supply resources and the  
13          Company's Demand-Side Management resources (DSM), and explain  
14          why DSM resources cannot mitigate the economic need for the project.
- 15          • Mr. Javier Portuondo, who will generally discuss the costs of the CR3  
16          power uprate project and the anticipated fuel savings including the net  
17          present value of the benefit to customers. Mr. Portuondo will further  
18          explain that the CR3 power uprate project costs were not anticipated in the  
19          Company's last base rate proceeding and are not recognized in the  
20          Company's base rates. Finally, Mr. Portuondo will explain that the  
21          significant fuel savings the Company's customers will realize from the  
22          project justify recovery of the power uprate project costs by the Company

1 through the Fuel and Purchase Power Cost Recovery Clause (“Fuel  
2 Clause”).

3  
4 **Q. Please summarize your testimony.**

5 **A.** The CR3 power uprate project is an innovative application of  
6 technological advancements and efficiencies during existing planned  
7 outages at CR3 to obtain increased nuclear fuel generation capacity. The  
8 result of this increased production with low cost nuclear fuel will be the  
9 reduction in or replacement of higher cost fossil fuel and purchased power  
10 generation resources, yielding substantial fuel savings at a net savings to  
11 the cost of the project for customers. No alternative generation option  
12 exists that can supply the benefits of additional, reliable, base load, nuclear  
13 generation at a net savings to PEF’s customers. Also, the power uprate  
14 will increase the level of nuclear production in the fuel supply mix on  
15 PEF’s system, increasing fuel diversity for PEF and the State of Florida.  
16 The CR3 power uprate project represents a unique opportunity to increase  
17 fuel diversity and reduce the reliance on fossil fuel generation at no net  
18 cost to customers, but rather at a net savings to customers.

19 To obtain the full benefit of the fuel savings generated by the  
20 power uprate project, however, PEF must timely commence material and  
21 equipment orders to meet the window of opportunity to perform the power  
22 uprate during the planned refueling outages at CR3. Any delay in the  
23 approval of PEF’s Petition will delay and reduce the substantial fuel

1 savings benefits PEF's customers will receive as a result of the power  
2 uprate project.

3  
4 **III. THE CRYSTAL RIVER SITE AND CR3 UNIT**

5  
6 **Q. Please describe the Crystal River site.**

7 **A.** The Crystal River site is a 4,700 acre site located in Citrus County, Florida  
8 that contains four coal-fired generating units, one nuclear generating unit,  
9 and related support facilities, such as fuel transportation and storage  
10 facilities. The site generators are connected to a transmission substation.  
11 The Crystal River substation contains both 230 kv and 500 kv  
12 transmission lines that supply power generated at the site to the  
13 Company's transmission system. The four coal-fired and one nuclear  
14 power units at the site generate approximately 3,200 MWe. Exhibit No.  
15 \_\_\_\_ (DLR-1) is an aerial photograph that accurately depicts the Crystal  
16 River site, including CR3.

17  
18 **Q. Please describe the nuclear generating unit at the Crystal River site.**

19 **A.** CR3, the nuclear generating unit, is a B&W pressurized water reactor that  
20 includes a Primary and Secondary System. The Primary System is located  
21 within the containment building and includes the reactor vessel,  
22 pressurizer, steam generators, primary coolant system, and related  
23 equipment. Exhibit No. \_\_\_\_ (DLR-2) is a picture of the major components

1 of the Primary System, including the nuclear reactor and the primary  
2 reactor coolant system.

3 The Primary System is a closed loop system. The nuclear reactor  
4 produces heat that eventually is turned into steam then into electricity.  
5 The heat is removed from the reactor by water in the primary coolant  
6 system that is continuously pumped around the Primary System. Heat  
7 transfers from the fuel cells to the surrounding metal fuel cladding which  
8 in turn heats the water flowing between and around the fuel rods. The  
9 heated water then travels from the core through pipes to the steam  
10 generators. In the steam generators, heat is transferred from the reactor  
11 primary coolant system to the physically separated secondary coolant  
12 system producing steam in the secondary system. The Primary System  
13 operates at about 600 degrees F and 2150 PSI. The high pressure prevents  
14 the water in the primary system from turning to steam.

15 The secondary water coolant system is under less pressure,  
16 operating at over 450 degrees F and 850 PSI, and when the water in the  
17 secondary coolant system is heated it turns to steam, which turns the  
18 turbine that powers the generator. The steam exiting the turbine is then  
19 condensed to water. The water is pumped back to the steam generators by  
20 a series of pumps and heat exchangers where it is once again converted to  
21 steam, thereby completing the cycle. Exhibit No. \_\_\_ (DLR-3) is a  
22 schematic of the major components of the Primary and Secondary  
23 Systems, including the main turbine and main generator. It also shows the

1 electricity produced in the generator passes through some transformers  
2 before being passed on to the switchyard at Crystal River, and then onto  
3 the transmission grid. The Company's transmission system is part of the  
4 peninsular Florida interconnected electrical grid of all transmission-  
5 owning electric utilities in the State and also part of the interface with the  
6 transmission facilities of utilities in the Southeastern United States at the  
7 Florida border.

8 CR3 was the third generating unit constructed at the site and it  
9 currently produces about 900 MWe. CR3 provides power into the 500 kv  
10 transmission system connected to the Crystal River site and uses the 230  
11 kv system at the site for on-site backup power. CR3 supplies its own  
12 power needs during normal operation.

#### 13 14 **IV. THE CR3 POWER UPRATE PROJECT**

15  
16 **Q. What is the CR3 power uprate project?**

17 **A.** The power uprate project for CR3 increases the electrical power output  
18 from the plant from about 900 MWe by approximately 180 MWe to 1,080  
19 MWe. The total cost for the uprate project is estimated at \$381.8 million.  
20 Of this amount, approximately \$250 million is for the power uprate itself.  
21 The additional costs address anticipated modifications to the transmission  
22 system to handle the additional power, estimated at \$89 million, and  
23 anticipated modifications to address Point of Discharge ("POD") issues

1 caused by the additional heat generated by the power increase, which are  
2 preliminarily estimated at \$43 million.

3 The power uprate project involves increasing the power or thermal  
4 MWs produced in the reactor core by making modifications to the design  
5 to allow for use of more highly enriched fuel. The costs associated with  
6 this are for making the physical changes needed to allow for use of this  
7 more highly enriched uranium in a safe and economical fashion, not the  
8 fuel itself. In addition, some modifications to supporting equipment are  
9 necessary to support the additional heat from the power increase to  
10 accommodate all designed accident conditions in the plant. The additional  
11 heat will raise the temperature exchange between the Primary and  
12 Secondary Systems and create more steam to turn the turbines.

13 In the design of these plants in the 1960's, the analytical modeling  
14 that exists today was not available, and the result was that the best designs  
15 of the time over-compensated for the available computer modeling with  
16 built-in assumptions having very large safety margins to ensure adequate  
17 protection was in place to accomplish all intended functions. Many of  
18 these initial safety margins, given today's analytical engineering tools and  
19 advanced testing capabilities, allow for an increase in reactor power with  
20 limited physical primary plant changes. Most of these primary system  
21 changes involve increasing Emergency Cooling Pump flow rates and the  
22 setpoints for actuation of safety systems.

1           The major modifications resulting from the power uprate involve  
2 the secondary system specifically, the turbine generator set, which has  
3 three parts, two low pressure and one high pressure rotors, and the  
4 generator, plus their supporting systems and equipment. The secondary  
5 system must be modified to accept the additional heat produced by the  
6 reactor core. This is accomplished by increasing the secondary system  
7 water flow to the steam generators. Increasing the flow requires larger  
8 pumping capacity than currently exists, which requires modification or  
9 replacement of some existing pumps and heat exchangers. A detailed  
10 pinch point study for these flows will define which pumps and motors will  
11 need to be upgraded or replaced based on the lowest cost required to  
12 achieve the necessary secondary system water flow.

13           In addition to the reactor power increase, design improvements to  
14 some major system components will allow for increased efficiencies,  
15 providing additional steam power beyond that obtained from the more  
16 enriched fuel. These design improvements to obtain the steam efficiencies  
17 are factored into the CR3 power uprate costs. For example, when the  
18 steam turbine high pressure rotor was designed in 1962, a multi-piece  
19 assembly was made. These multi-piece assemblies cause drag on the  
20 system, but better technology did not exist at the time. Since then, in the  
21 late 1990's, technological advancements have resulted in a single piece  
22 rotor blade that has less drag and, therefore, provides increased megawatt  
23 output for the same steam input.

1                   The CR3 power uprate project, including all modifications and  
2 technological advancements, will generate an additional 180 MWe by the  
3 end of 2011. The power uprate project will make CR3 the largest single  
4 generating unit in Florida at 1,080 MWe. CR3 is currently licensed by the  
5 Nuclear Regulatory Commission (“NRC”). The Company plans to submit  
6 a licensed power change to the NRC for the CR3 uprate project in 2009  
7 and NRC approval is expected in 2011.  
8

9       **Q.       Has a power uprate of this kind ever been performed on a B&W**  
10       **pressurized water reactor?**

11       **A.**       While the innovative power uprate planned for CR3 has not been  
12       undertaken at any other B&W designed plant, similar power uprates have  
13       been accomplished and approved by the NRC at other nuclear plants  
14       designed by Westinghouse and General Electric. Initial discussions with  
15       the NRC indicate that a similar process to the one used for licensing power  
16       uprates at Westinghouse and General Electric designed plants would be  
17       used to license CR3 to the additional power level.  
18

19       **Q.       What is the likelihood that the NRC will approve the license extension**  
20       **for CR3?**

21       **A.**       The power uprate project assumes that the ongoing activities to renew the  
22       license of CR3 will be successful and that the license now due to expire in  
23       2016 will be extended to 2036. License renewal of nuclear power plants is

1 an ongoing nuclear industry process that requires technical information  
2 submitted by the applicant and approval by the NRC for the operating  
3 license to be extended for 20 years. License renewals have been granted  
4 for Progress Energy's Robinson and Brunswick Units 1 and 2 plants. In  
5 addition, four of the seven plants of a similar design to CR3 have already  
6 received approval for license renewal. No license extensions for plants  
7 have been rejected after a detailed NRC review and no utility has been  
8 told that it would not be able to renew its license. As a result, there is a  
9 high likelihood that the license renewal for CR3 will be granted by the  
10 NRC and therefore the 2036 date used in the economic model for the  
11 power uprate can be achieved.

12  
13 **Q. Are there any environmental benefits from the CR3 power uprate**  
14 **project?**

15 **A.** Yes, there are. The CR3 power uprate will use nuclear fuel, which is the  
16 cleanest fuel source on PEF's system. During normal operations, there are  
17 no greenhouse gas emissions and no emissions of other pollutants  
18 common to other fuel sources for power production such as carbon  
19 monoxide, sulphur dioxide, aerosols, mercury, nitrogen oxides, and  
20 particulates or photochemical smog. Further, because the CR3 power  
21 uprate will displace higher cost fossil fuels with nuclear fuel there likely  
22 will also be a reduction in the greenhouse gas and other emissions from  
23 fossil fuel resources. From an environmental viewpoint, the CR3 power

1 uprate project is an attractive means of obtaining cost-effective generating  
2 capacity.

3  
4 **Q. What is the schedule for the CR3 uprate project?**

5 **A.** The CR3 power uprate project is planned for the scheduled refueling  
6 outages for CR3 in 2009 and 2011. The plant currently has a steam  
7 generator replacement scheduled for the 2009 refueling outage. The  
8 duration for the steam generator replacement outage is currently estimated  
9 at approximately 75 days. To meet this schedule and ensure that the  
10 power uprate project is performed during the scheduled outages, PEF must  
11 begin ordering equipment and material.

12 Most of the physical modifications will be complete by 2009  
13 during the scheduled steam generator replacement outage. The Company  
14 currently anticipates, for example, that all or at least part of the turbine and  
15 generator replacement can be completed during the 2009 outage. Other  
16 modifications and replacements will be evaluated for inclusion in the 2009  
17 outage if the outage is not extended, appropriate resources are available to  
18 support the changes, and the impact of further modifications or  
19 replacements for the power uprate project on the duration of the scheduled  
20 2011 refueling outage can be minimized.

21 The full power uprate is scheduled for 2011, when the remaining  
22 work necessary to provide the full 180 MWe power uprate will be  
23 completed. The CR3 power uprate project is expected to generate 40

1 additional MWe by the end of 2009 and then an additional 140 MWe by  
2 the end of 2011. The modifications and equipment changes necessary to  
3 support the uprate will be scheduled to minimize any plant outage time  
4 while assuring that appropriate resources are available to support the  
5 changes.

6  
7 **Q. Will the CR3 uprate project require changes to other units or the**  
8 **Crystal River site?**

9 **A.** No. All changes necessary to generate the full power uprate are internal to  
10 the CR3 power block and switchyard. No changes to the Company's  
11 current plant siting are required. However, modifications to the  
12 transmission system and to address POD issues to accommodate the full  
13 180 MWe power uprate may be necessary.

14  
15 **Q. Why may changes to the current transmission system be necessary as**  
16 **part of the CR3 power uprate project?**

17 **A.** After the power uprate project is complete, CR3 will become the largest  
18 power generator on the Company's system. Changes may be necessary to  
19 the transmission system to accommodate the 1,080 MWe CR3 will  
20 generate following the uprate project. The Company is studying and will  
21 continue to study the impacts of this additional power to the transmission  
22 system and what modifications, if any, are necessary. The final study will  
23 not be completed until closer to the time that the power uprate project

1 commences because the transmission system changes periodically with  
2 transmission additions or modifications that are occasioned by other  
3 generators and users on the interconnected transmission grid, particularly  
4 within peninsular Florida, but also extending to the interface with the  
5 southeastern United States utility transmission systems. Current cost  
6 estimates of \$89 million are preliminary, based on the existing  
7 transmission system and known transmission projects that are underway.  
8 The Company believes these cost estimates are reasonable and sufficient  
9 for the Company to proceed with the project. Refinements to the cost  
10 estimates, however, will be made over time to account for any changes to  
11 the transmission system or changes in labor, commodity, and land market  
12 conditions.

13  
14 **Q. What changes are anticipated to address the POD issues?**

15 **A.** The power uprate from the project will generate additional heat and steam  
16 thereby increasing the water temperature of the cooling water for the CR3  
17 unit. This additional heat will likely cause the Company to exceed the  
18 thermal permit requirements for the cooling water discharge. An optimal  
19 solution has not yet been identified but we have preliminarily assumed an  
20 estimated cost of \$43 million to address the POD issues at the discharge  
21 canal associated with the uprate project. The Company will evaluate all  
22 reasonable options before making a final determination of how to address  
23 the POD issue. Whatever modifications are necessary to address the

1 thermal cooling water discharge limit, however, will accommodate the full  
2 power generated by CR3.

3  
4 **Q. Is the POD impact the only environmental issue associated with the**  
5 **CR3 power uprate?**

6 **A.** Yes, we believe it is. CR3 is located at the Crystal River Energy Complex  
7 and is currently being operated under license from the NRC and necessary  
8 federal and state permits. The environmental issues associated with the  
9 Crystal River site have therefore been addressed and resolved under the  
10 prior license and permits. Because the CR3 power uprate project is  
11 limited to the CR3 power block and switchyard the project's impact on the  
12 site is minimal and most if not all of the current permit requirements for  
13 the operation of CR3 will not be affected by the power uprate project. The  
14 potential impact to the environment that we see from the project is the  
15 effect of the additional heat from the power uprate on the temperature of  
16 the discharge water.

17  
18 **V. NEED FOR THE CR3 POWER UPRATE PROJECT**

19  
20 **Q. Is there a need for the CR3 power uprate project?**

21 **A.** Yes, but it is an economic need. Although the power uprate project will  
22 provide the Company and its customers with additional, reliable base load  
23 power there is no reliability need for the project. The power uprate project

1 is not required to meet the Company's twenty percent Reserve Margin  
2 requirement or Loss of Load probability analysis. As discussed more fully  
3 in Messrs. Waters' and Portuondo's testimony, there are, however, clear  
4 economic benefits from the project. The power uprate for CR3 will  
5 provide additional base load generation from the lowest cost fuel currently  
6 on the Company's system, thereby displacing generation with higher  
7 priced fuel or higher cost purchased power. The result will be significant  
8 fuel savings to the Company's customers that far exceed the cost of the  
9 project. The fuel savings and net present value of the fuel savings are  
10 described in the testimony of Mr. Waters.

11  
12 **Q. Are the costs of the power uprate project reasonable and prudent?**

13 **A.** Yes. The Company will conduct competitive bids for the purchase of  
14 major components for the power uprate project. This process involves a  
15 detailed review of designs and pricing to make sure the best quality for the  
16 price is obtained. In addition, benchmark comparison to power uprates  
17 performed at other plants in Progress Energy's system will be made to  
18 factor in the latest experience gained from those uprates. By incorporating  
19 a competitive bidding process and relying on efficiencies achieved from  
20 experience, the Company will ensure that the power uprate costs are  
21 reasonable and prudent.

**VI. BENEFIT TO THE STATE**

**Q. Will the State benefit from the power uprate project?**

**A.** Yes, it will. As discussed above, the power uprate provides the customers of Florida more electric power with the lowest cost fuel available for their electric consumption, at significant fuel savings. The power uprate project will also increase the Company's fuel diversity and fuel supply reliability with additional generation capacity from nuclear as opposed to fossil fuels. The reduction in the reliance on more expensive fossil fuels that are subject to supply interruptions and significant price volatility is a benefit not only to PEF's customers but also to the State economy as a whole. Finally, nuclear generation is environmentally friendly and it is a proven and safe technology, so the additional power comes at no additional environmental cost. All of these benefits demonstrate that the CR3 power uprate project serves the public welfare.

**VII. CONSEQUENCES OF DELAY**

**Q. Are there any adverse consequences if the power uprate project is delayed?**

**A.** Yes. The steam generator replacement scheduled for 2009 provides a unique window of opportunity for the large power uprate modifications to be made. If that window is missed, performing the power uprate later will

1 require another unplanned outage or an outage extension. That will  
2 require production of power during that additional outage time with higher  
3 priced fuels, reducing the benefits of the project.

4 In addition, the costs of construction and commodities are  
5 increasing, which will increase the cost of the uprate project if it is delayed  
6 beyond the 2009 outage. As the costs of the project rise over time the fuel  
7 savings will be delayed and reduced by the higher costs of the project.

8 Finally, delaying the power uprate project means delaying the fuel  
9 savings benefits to customers. While the project is delayed the power that  
10 would have been produced with low-cost nuclear fuel will be produced  
11 by higher priced fuel generation resources.

## 12 **VIII. BID RULE EXEMPTION**

13  
14  
15 **Q. Can the Company also use a competitive bid process to determine if**  
16 **the power uprate project is the most cost effective alternative**  
17 **available to the Company?**

18 **A.** No, it cannot. The power uprate project at CR3 will result in the lowest  
19 cost supply of electricity on PEF's system to the people of Florida.  
20 Specifically, the power uprate results in net savings to the Company's  
21 customers. The bid rule was established as a tool to determine the most  
22 cost-effective alternative to the Company's generation proposal. No  
23 power generation alternative is available that will provide base load

1 generating capacity at a net savings to customers comparable to the  
2 benefits of the CR3 power uprate project. All other potential suppliers of  
3 generation capacity would likely provide the additional capacity of the  
4 CR3 power uprate project – 180MWe – at a net cost to the Company's  
5 customers and without the environmental and fuel diversity benefits of  
6 nuclear power. Because the power uprate project provides customers with  
7 additional nuclear generation at a net savings, not a net cost, it is by  
8 definition the lowest cost supply of reliable electricity to customers and,  
9 therefore, the most cost effective alternative for the Company.  
10

11 **Q. Will the issuance of a Request For Proposals (RFP) for generation**  
12 **alternatives to the CR3 power uprate project have an adverse effect**  
13 **on the project?**

14 **A.** Yes. An RFP process will take months from preparation of the RFP to the  
15 solicitation of bids, review and analysis of any responses, and making a  
16 final decision. To meet the current schedule to begin work on the CR3  
17 project uprate during the 2009 CR3 outage PEF must commence ordering  
18 equipment and material now. Engaging in an RFP process, therefore, will  
19 delay equipment and material orders for the project and the Company will  
20 miss the window of opportunity to perform power uprate work during the  
21 2009 outage. Such a delay, as I have already explained, will require a  
22 separate outage time for the power uprate project and result in increased  
23 equipment and material costs for the project reducing the fuel savings

1 benefits. Further, any remaining fuel savings benefits for customers  
2 would be delayed to the disadvantage of the customer.

3 There also is no benefit to PEF's customers from an RFP process.  
4 The CR3 power uprate project will take advantage of the cheapest fuel the  
5 Company has and a fuel that is not available in other supply side  
6 alternatives. Any potential bidder in an RFP necessarily must propose a  
7 different, higher price fuel source for the alternative generation. It  
8 necessarily follows that any alternative generation source will not generate  
9 the same fuel savings and other benefits of the CR3 power uprate on  
10 PEF's system. PEF, therefore, does not need to conduct an RFP process to  
11 know that the CR3 power uprate project will increase the reliable supply  
12 of electricity to PEF's customers at the lowest cost to and most benefit for  
13 PEF's customers.

14  
15 **Q. Does an RFP process for the CR3 power uprate project present a**  
16 **substantial hardship to PEF or its customers?**

17 **A.** Yes, an RFP process to test an alternative generation option would be  
18 a substantial hardship to both PEF and its customers. Remember, the need  
19 for the CR3 project is an economic, not a reliability need. PEF has enough  
20 capacity to meet its customers' needs for reliable generation without the  
21 CR3 power uprate project, just at a higher total cost to the customer. The  
22 hardship to PEF's customers, then, if PEF is required to engage in an RFP  
23 process for potential alternative generation to the CR3 power uprate

1 project, is that they will lose the fuel savings benefits of the project. With  
2 fuel savings estimated at over \$2.6 billion, as explained by Mr. Waters in  
3 his testimony, the hardship of the loss would be substantial.

4 PEF would also suffer a substantial hardship. PEF likewise has an  
5 interest in lowering the total costs of energy to its customers and PEF  
6 certainly has an interest in increasing fuel diversity on its system. Further,  
7 an RFP process imposes substantial technical requirements and cost on  
8 PEF to conduct the RFP process, all for a futile effort in the case of the  
9 CR3 power uprate project.

## 10 IX. CONCLUSION

11 **Q. Please summarize the benefits of the CR3 power uprate project.**

12  
13 **A.** There is an economic need for the CR3 power uprate project. By  
14 undertaking and completing the project PEF will generate substantial fuel  
15 savings for its customers that will be a significant benefit to them and the  
16 Company. The Company will also increase fuel diversity to its benefit  
17 and the benefit of the state, all by providing additional, reliable base load  
18 generation from an environmentally friendly source. No additional base  
19 load generation source can provide additional, reliable electrical power at  
20 a net fuel savings to customers comparable to that provided by the CR3  
21 power uprate project. We urge the Commission to approve the need for

the CR3 power uprate project, to waive all of the bid rule requirements,  
and to provide for cost recovery of the project through the Fuel Clause.

**Q. Does this conclude your testimony?**

**A. Yes, it does.**
