PROCEEDINGS: HEARING

BEFORE: CHAIRMAN LISA POLAK EDGAR
COMMISSIONER MATTHEW M. CARTER, II
COMMISSIONER KATRINA J. MCMURRIAN

DATE: Wednesday, April 25, 2007

TIME: Commenced at 9:45 a.m.

PLACE: Betty Easley Conference Center
Room 148
4075 Esplanade Way
Tallahassee, Florida

REPORTED BY: LINDA BOLES, RPR, CRR
JANE FAUROT, RPR
Official FPSC Reporters
(850) 413-6734/(850) 413-6732

P R O C E E D I N G S

(Transcript continues in sequence from Volume 5.)

CHAIRMAN EDGAR: Good morning. We will get started here in just a moment. And I will call this hearing to order, continuation of the hearing.

Before I ask for preliminary matters, I see that we do have some new faces that are joining us since, since we were all gathered together last week. It was last week. It seems like only yesterday. Okay. So let's go ahead, if we can, and start by taking appearances again. That will be a duplicate for some of you and maybe some new names so I can help keep track, and for the court reporter as well. We will begin with you.

MR. ANDERSON: Good morning. My name is Bryan Anderson. I'd like to enter the appearances, please, of Wade Litchfield, Natalie Smith and myself on behalf of Florida Power & Light Company, 700 Universe Boulevard, Juno Beach, Florida 33408.

CHAIRMAN EDGAR: Thank you.

MS. PERDUE: Tamela Ivey Perdue with the law firm of Stiles, Taylor & Grace on behalf of Intervenor Associated Industries of Florida.

CHAIRMAN EDGAR: Thank you.

MR. GUEST: David Guest and Monica Reimer, R-E-I-M-E-R, representing the environmental intervenors. Our

1 law firm's address is 111 South Martin Luther King Boulevard,
2 Tallahassee, 32301.

3 CHAIRMAN EDGAR: Thank you.

4 MR. BECK: Good morning, Madam Chairman and
5 Commissioners. Charlie Beck and Steve Burgess, Office of
6 Public Counsel, on behalf of Florida's citizens.

7 CHAIRMAN EDGAR: Thank you.

8 MR. KRASOWSKI: Good morning, Commissioners. My name
9 is Bob Krasowski. I'm here representing myself and my wife Jan
10 as ratepayers and customers of FP&L, and also as interested
11 people who have an interest in the environmental economic
12 aspect of this hearing.

13 CHAIRMAN EDGAR: Thank you. And staff.

14 MS. BRUBAKER: And for the Commission, Jennifer
15 Brubaker, Katherine Fleming, Lorena Holley and Larry Harris.

16 CHAIRMAN EDGAR: Thank you all.

17 And, Ms. Brubaker, preliminary matters.

18 MS. BRUBAKER: Staff is aware of really none to speak
19 of. I would note that there was discussion since the
20 continuation of the last hearing date about witnesses, and my
21 understanding is that everybody is in agreement that we will
22 simply resume examination of witnesses in the order in which
23 they appear on the prehearing order beginning on Page 4. By my
24 count we would begin with Mr. Hicks this morning. It's also my
25 understanding that FPL Witness Mr. Yeager can be taken, his

1 rebuttal and direct together. And to the extent FPL is able to
2 make that accommodation with any other witnesses, we'll simply
3 let them address it as they're able to make that accommodation.
4 And with that, staff --

5 CHAIRMAN EDGAR: No other matters?

6 MS. BRUBAKER: -- has no further matters.

7 CHAIRMAN EDGAR: Okay. Before we call the next
8 witness, any matters to be raised by any of the parties? No?
9 Ready to get started.

10 Okay. Just a very few brief comments. As you
11 recall, because we have, because the hearing has covered a
12 number of days and travel schedules and all we did not swear
13 the witnesses in as a group. So if your witness has been
14 sworn, let me know that, please. And remind your witnesses
15 that they have been sworn. And for those who have not, we will
16 do that individually as they get settled in.

17 And as always, would ask that we recognize the time
18 frames that we have and that we cooperate together to get
19 through everything that we need to do. And with that, it is
20 your witness.

21 MR. ANDERSON: Thank you. If the Chair wishes, there
22 are three witnesses you could swear at once, the next three
23 people.

24 CHAIRMAN EDGAR: Okay. We can do that. And that
25 would be Mr. Hicks, Mr. Jenkins and Mr. Kosky?

1 MR. ANDERSON: That's exactly right.

2 CHAIRMAN EDGAR: Okay. If the three of you gentlemen
3 will stand with me, raise your right hand, and we will do this,
4 the three, together.

5 (Witnesses collectively sworn.)

6 DAVID HICKS
7 was called as a witness on behalf of Florida Power & Light
8 Company, and, having been duly sworn, testified as follows:

9 DIRECT EXAMINATION

10 BY MR. ANDERSON:

11 Q Good morning, Mr. Hicks.

12 A Good morning.

13 Q Would you please tell us your name and your business
14 address.

15 A David Hicks, 700 Universe Boulevard, Juno Beach,
16 Florida 33408.

17 Q By whom are you employed and in what capacity?

18 A I'm employed by Florida Power & Light as the Senior
19 Director of Project Development.

20 Q Have you prepared and caused to be filed 28 pages of
21 prefiled direct testimony in this proceeding?

22 A Yes, I have.

23 Q Did you also cause to be filed errata to your direct
24 testimony on April 13th, 2007?

25 A Yes, I have.

1 Q Do you have any further changes or revisions to your
2 prefiled direct testimony?

3 A No, I do not.

4 Q With the changes in your errata, if I asked you the
5 same questions contained in your prefiled direct testimony,
6 would your answers be the same?

7 A Yes, they would.

8 MR. ANDERSON: FPL asks that Mr. Hicks' prefiled
9 direct testimony be inserted into the record as though read.

10 CHAIRMAN EDGAR: The prefiled direct testimony with
11 the errata will be entered into the record as though read.

12 BY MR. ANDERSON:

13 Q Are you sponsoring any exhibits to your direct
14 testimony?

15 A Yes, I am.

16 Q Those are documents DNH-1 through DNH-14?

17 A Yes, they are.

18 MR. ANDERSON: Madam Chairman, I'd note that
19 Mr. Hicks' exhibits have been premarked for identification as
20 25 through 38.

21 CHAIRMAN EDGAR: Thank you.

25

1 **BEFORE THE FLORIDA PUBLIC SERVICE COMMISSION**

2 **FLORIDA POWER & LIGHT COMPANY**

3 **DIRECT TESTIMONY OF DAVID N. HICKS**

4 **DOCKET NO. 07 ___-EI**

5 **JANUARY 29, 2007**

6

7 **Q. Please state your name and business address.**

8 A. My name is David N. Hicks. My business address is Florida Power & Light,
9 700 Universe Boulevard, Juno Beach, Florida 33408.

10 **Q. By whom are you employed and what is your position?**

11 A. I am employed by Florida Power & Light Company ("FPL" or the
12 "Company") as a Senior Director of Project Development. In my position at
13 FPL, I have responsibility for the development of power generation projects to
14 meet the needs of FPL's customers.

15 **Q. Please describe your duties and responsibilities with regard to the
16 development of solid fuel generation to meet FPL customer needs.**

17 A. Commencing in the summer of 2003, I was assigned the responsibility for
18 leading the investigation into the potential of adding new solid fuel generation
19 to FPL's system, and the subsequent development of new solid fuel generation
20 additions to FPL's power generation fleet. I was responsible for the
21 development and permitting team for the Southwest St. Lucie Power Park
22 ("SWLPP"). I am currently leading the development and permitting team for
23 the FPL Glades Power Park ("FGPP").

1 **Q. Please describe your education and professional experience.**

2 A. I received a Bachelor of Economics degree from the University of Hawaii-
3 Manoa in 1983 and a Masters of Economics degree from the University of
4 California-Santa Barbara in 1987. I have over 18 years experience in the
5 power generation industry, including power plant asset management, power
6 plant development due diligence, power plant site development and
7 permitting, and utility system modeling.

8 **Q. Are you sponsoring an exhibit in this case?**

9 A. Yes. I am sponsoring an exhibit that consists of the following documents:

10	Document No. DNH-1	FPL's Report on Clean Coal Generation,
11		March 2005
12	Document No. DNH-2	Clean Coal Technology Selection Study
13	Document No. DNH-3	FGPP Development Milestones
14	Document No. DNH-4	FGPP Vicinity Map
15	Document No. DNH-5	FGPP Project Boundary Aerial
16	Document No. DNH-6	FGPP Process Diagram Overview
17	Document No. DNH-7	FGPP Process Diagram Coal Handling
18		System
19	Document No. DNH-8	FGPP Process Diagram Limestone
20		Handling System
21	Document No. DNH-9	FGPP Process Diagram Byproduct
22		Handling System
23	Document No. DNH-10	FGPP Site Plan Overall

1 Document No. DNH-11 FGPP Site Plan Power Island
2 Document No. DNH-12 FGPP Site Plan Typical Elevations
3 Document No. DNH-13 FGPP Fact Sheet
4 Document No. DNH-14 FGPP Overall Water Balance

5 **Q. What is the purpose of your testimony in this proceeding?**

6 A. My testimony provides an overview of the technology and site selection
7 processes used by FPL in arriving at its proposed generating plant contained
8 in the Need Application submitted to the Florida Public Service Commission
9 (the "FPSC" or "Commission") in this proceeding. My testimony describes
10 the specific site and unit characteristics for the ultra-supercritical pulverized
11 coal ("advanced technology coal" or "USCPC") plant proposed for the FGPP
12 site, including the size, number and type of units, the heat rate and operating
13 characteristics (i.e., equivalent availability factor, equivalent forced outage
14 rate, capacity factor, and operating costs), emissions control equipment, and
15 the fuel types that will be utilized in the plant.

16 **Q. Please summarize your testimony.**

17 A. Beginning in the summer of 2003, FPL conducted an extensive investigation
18 of the potential of adding solid fuel generation to its resource mix. After a
19 careful and thorough analysis of available technology options and fuel supply
20 issues, and after conducting a comprehensive siting study, FPL concluded that
21 the addition of a USCPC plant, augmented with a complete suite of state-of-
22 the-art emissions control equipment, and plant design that will allow for the
23 recycling of combustion and pollution control byproducts into useful

1 commercial products, will provide FPL's customers reliable, cost-effective
2 fuel diversity employing proven, state-of-the-art generation and pollution
3 control technology.

4

5 **I. OVERVIEW AND TECHNOLOGY SELECTION**

6

7 **Q. Please summarize FPL's actions since 2003 regarding the potential**
8 **addition of solid fuel generation to FPL's generation resource portfolio.**

9 A. FPL's actions since the summer of 2003 have been directed towards (1)
10 analyzing the conditions under which the addition of solid fuel generation
11 would be beneficial to FPL's customers, (2) refining the solid fuel addition
12 strategy to enhance the benefits and reduce risks to its customers, and (3)
13 implementing that addition as early as is reasonably possible.

14

15 FPL's substantive actions towards bringing solid fuel generation into its
16 system include:

- 17 • FPL conducted and disseminated a comprehensive study on current
18 opportunities and issues regarding solid fuel generation (*FPL's Report on*
19 *Clean Coal Generation, March 2005*). This study was the result of over a
20 year of engineering due diligence, commercial negotiation, and analytical
21 review.
- 22 • A dedicated team was staffed to develop all necessary aspects of FPL's
23 future advanced technology coal projects including: local approvals and

1 public outreach, environmental issues and concerns, and a considerable
2 effort to obtain competitive rail transport and coal terminal agreements.

3 • FPL contracted with Sargent & Lundy to develop conceptual power plant
4 designs.

5 • FPL contracted with Worley-Parsons to develop detailed design
6 engineering plans.

7 • FPL has initiated procurement of major equipment, which includes the
8 boilers, steam turbines and the pollution control equipment. In addition,
9 FPL has secured engineering, procurement and construction pricing for
10 FGPP.

11 **Q. Please summarize FPL's primary conclusion regarding available solid
12 fuel generation technologies.**

13 A. After a careful evaluation of the current state of solid fuel generation
14 technology design and air quality control systems, FPL concluded that
15 significant improvements had been made in solid fuel generation, emissions
16 control technologies, and plant design such that FPL had a number of
17 technology options, all of which would provide fuel diversity while
18 maintaining FPL's leadership position as an environmental steward by being
19 protective of the environment.

20 **Q. What technologies provided FPL options for new solid fuel generation
21 additions?**

22 A. The potential technologies included sub-critical pulverized coal ("SPC"),
23 USCPC, circulating fluidized bed ("CFB"), and integrated gasification

1 combined cycle ("IGCC"). A discussion of each of these technologies is
2 included in *FPL's Report on Clean Coal Generation, March 2005*, a copy of
3 which is attached as Document No. DNH-1.

4 **Q. Which technology did FPL ultimately select?**

5 A. FPL selected USCPC, an advanced form of the supercritical technology.

6 **Q. Please describe the evaluation process that led to the selection of the**
7 **USCPC technology.**

8 A. Initially, basic configurations were developed for each of the potential
9 technologies for a target level of 1,200 to 1,700 MW of new solid fuel fossil
10 generation. Each of the technologies was reviewed and the configurations
11 developed in a scaled-up size consistent with commercial availability. For the
12 USCPC steam generator technology, unit sizes selected were 600 and 850
13 MW, which were unit sizes already commercially available at the time of the
14 initial analysis. In the case of less mature technologies, CFB and IGCC, unit
15 sizes were configured to account for risk due to scale-up. In the case of the
16 CFB technology, each unit was configured as a 2x300 MW boiler providing
17 steam to a single steam turbine. The IGCC configuration was a unit with a 2-
18 on-1 combined cycle configuration with an output of 600 MW.¹ For each of
19 the alternatives, estimates were developed for unit output, heat rate,

¹ A combined cycle unit is a combination of combustion turbines (CTs), heat recovery steam generators (HRSGs), and a steam-driven turbine generator (STG). Each of the combustion turbines produce electricity. The exhaust gas produced by each turbine, is passed through a HRSG before exiting the stack. The energy extracted by the HRSG produces steam, which is used to drive a STG. Each CT/HRSG combination is called a "train." Therefore, a combined cycle plant with two trains and one steam turbine would be called a "two on one" (2x1) combined cycle plant.

1 availability, capital cost, fixed and variable O&M costs, capital replacement
2 costs, and emissions rates. This information was provided to FPL's Resource
3 Assessment and Planning Group, which conducted an economic evaluation
4 analyzing each technology option over a multi-decade period. This long-term
5 economic evaluation, combined with the engineering evaluation of the
6 technologies, identified the USCPC technology as the best coal technology
7 option.

8 **Q. Since deciding on the use of USCPC technology, has FPL continued to**
9 **study alternative coal technologies?**

10 A. Yes. FPL has continued to closely monitor continuing developments across
11 the country and around the world with respect to solid fuel technology. For
12 example, as part of its efforts to test and verify that its analysis of alternative
13 solid fuel technologies was correct and reasonable, in 2006 FPL retained the
14 Black & Veatch engineering firm to work with the Company to prepare a
15 detailed Clean Coal Technology Selection Study. The purpose of the study
16 was to incorporate the most up-to-date information available in the industry
17 concerning each technology into FPL's technology assessment. Accordingly,
18 each technology scenario involved consideration of the advantages and
19 disadvantages with respect to each technology for the addition of a nominal
20 2,000 MW of capacity. The study compared SPC, USCPC, CFB, and IGCC
21 technologies for consideration to meet FPL's generation needs in the 2012 to
22 2014 timeframe. The study uses 2012 as the reference year for cost
23 comparisons between the different technologies. I served as FPL's project

1 lead for the study, and am a co-author of the study. A copy is attached as
2 Document No. DNH-2.

3

4 In addition, FPL conducted its own economic analysis of these four coal
5 technologies. Dr. Sim addresses this analysis in his testimony.

6 **Q. Please summarize FPL's conclusions based on the study jointly conducted
7 by FPL and Black & Veatch.**

8 A. Based on the assumptions, conditions, and engineering estimates made in this
9 study jointly conducted by FPL and Black & Veatch, FPL concluded that the
10 USCPC option, by a large and significant margin, is the preferred technology
11 selection for the addition of a nominal 2,000 MW net output at the FGPP site.

12

13 For example, the busbar cost of the USCPC case is nearly 10 percent less than
14 SPC, which is the second lowest busbar cost case. USCPC will have good
15 environmental performance because of its high efficiency. Emissions of NOx
16 and PM will be very similar across all technologies. Sulfur emissions would
17 be slightly lower for IGCC than the PC and CFB options, although start-up
18 and shutdown flaring will reduce the potential benefit of IGCC. The lower
19 expected reliability of IGCC, particularly in the first years of operation, could
20 compromise FPL's ability to meet baseload generation requirements and
21 require FPL to run existing units at higher capacity factors.

1 For the 2012 through 2014 planning time period, USCPC will be the best
2 technical and economic choice for the installation of 2,000 MW of capacity at
3 the Glades site.

4 **Q. IGCC technology, in particular, has garnered significant recent interest**
5 **in the United States. Please describe FPL's efforts to ensure that it has**
6 **obtained and relied on the most current and accurate industry**
7 **information concerning this technology.**

8 A. FPL selected Black & Veatch, a global engineering and construction
9 company, as the co-author of the joint study, in part due to its extensive
10 experience with IGCC, in order to help ensure that FPL has access to the most
11 current industry information in considering and supporting its technology
12 choice for FGPP. FPL is aware of and valued that Black & Veatch is
13 currently providing a wide range of IGCC and gasification engineering
14 services to entities investigating its potential use. Black & Veatch is also a
15 joint venture partner with Uhde, who has a technology agreement with Shell.
16 The purpose of this joint venture is to market IGCC solutions to potential
17 customers. The Clean Coal Technology Selection Study leveraged Black &
18 Veatch's considerable knowledge and expertise in IGCC, and its recent
19 experience in developing life cycle IGCC cost estimates for various
20 customers. For similar reasons, FPL retained Stephen D. Jenkins of URS
21 Corporation, who is an expert in and advocate for IGCC technology, to submit
22 testimony in this proceeding in order to provide the Commission, and the

1 public, with the most current and accurate information concerning IGCC
2 technology.

3 **Q. Please describe the IGCC process.**

4 A. IGCC produces power by converting a solid fuel such as coal into a synthetic
5 combustible gas which is burned in a combustion turbine that is part of a
6 combined cycle power plant. The coal is placed in a gasifier vessel (or
7 reactor) where it is partially combusted in a controlled environment. The
8 combustion exhaust from the gasifier vessel is a combustible gas commonly
9 referred to as "syngas." The syngas is then passed through a clean-up process
10 where particulates, sulfur and other impurities are removed and then it is used
11 as the fuel for a combustion turbine.

12
13 "Integration" refers to the interconnection of the gasification and combined
14 cycle parts of the IGCC power plant. For example, heat produced in the
15 gasifier is converted to steam which is routed to and mixed with steam
16 produced in the combined cycle heat recovery system and then the combined
17 steam product is used to drive the steam turbine which produces power.

18 "Gasified" refers to the process whereby the coal is broken down into multiple
19 constituent parts, one of which is the syngas that is used as a fuel to generate
20 power. "Combined Cycle" refers to the process of combining a primary heat
21 source with a heat recovery system to more efficiently use a fuel source to
22 generate power.

1 **Q. Why did FPL choose the USCPC technology over IGCC?**

2 A. FPL determined that USCPC technology will materially outperform all
3 available alternative coal electric generation technologies, including IGCC.

4
5 At the most basic level, USCPC technology is proven and reliable in large
6 scale utility applications. In contrast, IGCC is not proven and reliable in large
7 scale utility applications. This is demonstrated by the fact that there are only
8 four operating coal-fired IGCC plants in the world, two of which are in the
9 U.S. Unlike existing USCPC units, existing IGCC units are small (less than
10 300 MW), and are demonstration projects. USCPC units have been built
11 commercially and have satisfied projections of cost, efficiency, reliability, and
12 environmental performance. In contrast, existing IGCC units have not been
13 built commercially, and despite the economic advantage of receiving
14 substantial government funding have not met projections of cost, efficiency,
15 reliability, and environmental performance. The "next generation" IGCC
16 plants expected to be operational in the 2011-2015 period will be in the 600
17 MW range. None of the next generation IGCC units have been built;
18 therefore such units have not been proven to be cost-effective, reliable, and to
19 deliver acceptable environmental performance. For all of these reasons, both
20 the current and next generation of IGCC plants are insufficient to meet the
21 fuel diversity goals of FPL for its customers. These points are discussed in
22 greater detail by Mr. Jenkins.

1 FPL specifically chose the USCPC technology over IGCC for an
2 approximately 2,000 MW solid fuel addition at a new site that would be
3 required to produce reliable, cost-effective baseload power for the following
4 reasons:

- 5 (1) USCPC is more reliable than IGCC. USCPC technology has a proven
6 performance record of 90% or greater reliability. In comparison,
7 existing IGCC plants fueled by coal have been able to reach
8 approximately 80% reliability, at best, after five to ten years of
9 operation. In addition, the complexity of an IGCC plant, specifically the
10 complex integration involved in an IGCC design, has limited its
11 performance.
- 12 (2) The USCPC emissions profile is generally similar to IGCC, and the
13 lower reliability of IGCC creates higher emissions from restarts and
14 replacement power while the IGCC is restarting. The USCPC
15 technology, coupled with an initial extensive array of pollution control
16 equipment, will produce an emissions profile as good as, if not better
17 than, that of the "next generation" IGCC plant. FPL's USCPC plant will
18 achieve a 90% mercury removal rate, which is on par with "next
19 generation" IGCC. USCPC plants can be built with a footprint allowing
20 more advanced emissions control equipment when it becomes
21 commercially viable.
- 22 (3) USCPC technology is more efficient than IGCC. USCPC technology is
23 highly efficient, meaning substantially less coal is used to produce the

1 same amount of electricity with fewer emissions than older,
2 conventional coal plants. USCPC is more efficient than existing and
3 next generation IGCC plants (i.e. USCPC uses less coal to produce the
4 same amount of electricity).

5 (4) Life cycle costs of the USCPC technology are substantially lower than
6 those of IGCC technology. As demonstrated in the joint study, the
7 lifecycle levelized delivered busbar cost of an IGCC plant is more than
8 40% higher than that for a similarly sized USCPC plant. Cost
9 differences are even greater when comparing the "next generation" 600
10 MW IGCC reference plants being developed to the commercially
11 available 980 MW USCPC sizing chosen by FPL.

12

13 II. SITE SELECTION

14

15 **Q. Please describe FPL's work to obtain an acceptable site for its proposed**
16 **coal-fueled units.**

17 **A. FPL performed an independent analysis of the local permitting requirements**
18 **in the most likely candidate counties for development, conducted meetings**
19 **with local leadership committees, and performed other information-gathering**
20 **activities designed to ascertain the level of receptivity of those counties to the**
21 **economic benefits associated with the construction and operation of an**
22 **advanced technology coal-fired electric power plant.**

1 The effort also included a comprehensive study of potential sites, based on the
2 following six criteria:

- 3 (1) Rail access that would foster coal transportation competition at origin
4 and destination for the delivery of domestic and foreign coal and
5 petroleum coke;
- 6 (2) Adequate property to site a large coal-fired power plant, and required
7 support facilities;
- 8 (3) Adequate water supplies;
- 9 (4) Location of property considering transmission proximity to FPL's major
10 load centers;
- 11 (5) Location of property allowing feasible transmission interconnection and
12 integration; and
- 13 (6) Site selection considering the goal of minimizing the environmental
14 impediments to permitting (e.g., wetlands, threatened and endangered
15 species, contamination, etc.).

16

17 Applying the six key criteria discussed above, FPL chose its proposed site in
18 Glades County. My testimony below provides a detailed description of the
19 proposed FGPP site.

20

21 To date, FPL has obtained Glades County site plan approval, and resolutions
22 of support from five different groups including government agencies and
23 economic development. Groups that have passed resolutions include: the

1 Moore Haven City Council, the Glades County Commission, the Glades
2 County Economic Development Council, the School Board of Glades County
3 and Florida's Heartland Rural Economic Development Initiative.

4 **Q. Was the Glades site the first site proposed by FPL?**

5 A. No. Prior to the selection of the Glades site, FPL selected a site in St. Lucie
6 County. The St. Lucie County Commission did not approve the required
7 rezoning and conditional use application necessary to complete development
8 of this site.

9 **Q. Please provide an overview of the major development milestones for**
10 **FGPP.**

11 A. It is important to note that FPL must overcome a number of significant
12 challenges before it can proceed to construct a coal-fueled unit. It must obtain
13 local zoning, permits and/or authorizations for the new site. In addition, once
14 the coal-fueled addition is granted a determination of need, approval by
15 Florida's Power Plant Siting Board is required. Obtaining all the numerous
16 governmental approvals in a timely manner is not assured. A schedule of the
17 important development milestones for the FGPP is contained in Document
18 No. DNH-3.

1 **III. OVERVIEW OF PROPOSED FPL GLADES POWER PARK**

2

3 **Q. Please provide an overview of FGPP.**

4 A. The FGPP project involves the proposed construction of FGPP 1 and 2. Each
5 unit will be a solid fuel-fired coal generating unit with a nominal net electrical
6 output of 980 MW. FGPP will be located on an approximately 4,900-acre
7 property located in unincorporated Glades County. The advanced coal
8 technology design selected by FPL is a USCPC steam-electric generating
9 station designed for baseload operation. Bituminous coal, both domestic and
10 foreign supply, will be the primary fuel with the use of up to 20% petroleum
11 coke. The site has direct rail access to the South Central Florida Express,
12 which is connected to two major rail carriers for the delivery of bituminous
13 coal and petroleum coke. The rail access can also be used for delivery of bulk
14 materials such as ammonia and limestone and for the off-site shipment of
15 byproducts such as gypsum and ash. Common associated facilities will
16 include fuel handling and storage facilities for fuel, limestone and ammonia
17 along with handling and storage facilities for byproducts such as gypsum and
18 ash.

19 **Q. Please describe the location of the FGPP site.**

20 A. The site is located approximately four miles Northwest of the town of Moore
21 Haven in an unincorporated area of Glades County. Site access will be from
22 State Road 78, which is approximately one mile to the East of the site.

1 Document No. DNH-4 is a vicinity map of the area surrounding the site,
2 showing various roads and the town of Moore Haven.

3 **Q. What are some of the surrounding land uses and features of the site?**

4 A. Document No. DNH-5 is an aerial photo of the site, showing the property
5 boundary along with other surrounding features. The general area
6 surrounding the site consists of undeveloped land currently owned by private
7 landowners, generally to the North and West, and agricultural land, generally
8 to the East and South. The town of Moore Haven is to the Southeast. Lake
9 Okeechobee is located East of the site. The site has direct rail access, which
10 abuts the entire Southern boundary of the site.

11

12

IV. DESIGN

13

14 **Q Please describe the proposed electric generation technology for FGPP.**

15 A. Each unit will consist of a supercritical steam generator (boiler), one steam
16 turbine generator ("STG"), a mechanical draft cooling tower and a suite of
17 back-end pollution control equipment. The term "supercritical" in the context
18 of a boiler refers to higher steam operating temperatures and pressures than
19 conventional (sub-critical) boiler designs and results in much greater
20 efficiency of the plant. A boiler which produces steam at pressures less than
21 3,208 psia is sub-critical in design. Boilers which produce steam at pressures
22 greater than 3,208 psia are classified as supercritical. For FGPP, the operating
23 pressure and temperature will be approximately 3,700 psia and 1,130°F which

1 would classify it as a supercritical boiler. An ultra-supercritical design, as
2 classified by the Department of Energy, is when the pressure is greater than
3 3,600 psia with temperatures exceeding 1,100°F. Because the proposed FGPP
4 meets the definition of ultra-supercritical, FPL refers to the FGPP technology
5 as ultra-supercritical.

6 **Q. Please describe the facilities that are proposed for FGPP.**

7 A. Document No. DNH-6 shows an overall process diagram of FGPP. As I just
8 discussed, each unit's power island will consist of a supercritical pulverized
9 coal steam generator, a steam turbine generator, a mechanical draft cooling
10 tower, and a suite of pollution control equipment. Coal and petroleum coke
11 will be delivered to the site via rail cars that will be unloaded and transferred
12 to either an active or inactive storage pile. The active storage area will be
13 designed to hold approximately three-days of fuel supply while the inactive
14 storage area will have the ability to store up to 60-days of fuel.

15

16 Fuel will be reclaimed from the active storage area and conveyed to a crusher
17 tower where the fuel is processed by crushing it to a specified grain size. The
18 crushed fuel will then be transferred to fuel storage silos that will feed the coal
19 into the boiler for combustion. Document No. DNH-7 shows a more detailed
20 process flow diagram of the coal handling system.

21

22 Another significant material delivery and storage feature of the facility will be
23 for limestone, which will be used as part of pollution control equipment, more

1 specifically the Wet Flue Gas Desulphurization ("WFGD") system. The
2 limestone will also be delivered by rail to the site, and will be unloaded and
3 transferred to a covered storage area. The limestone will be reclaimed and
4 transferred to a preparation building prior to use in the WFGD system.
5 Document No. DNH-8 shows a more detailed process flow diagram of the
6 limestone handling system.

7
8 Byproduct handling and storage for FGPP would include facilities for fly ash,
9 bottom ash, and gypsum. These are byproducts from either the combustion
10 process (ash) or from the removal of sulfur dioxide from the flue gas. In all
11 three cases, the byproducts are collected and processed for off-site recycling.
12 In addition, a permanent long term byproduct storage area will be provided for
13 off-specification material and for use in the event that recycling opportunities
14 are interrupted or otherwise unavailable. Document No. DNH-9 shows a
15 more detailed process flow diagram for the ash and gypsum byproduct
16 facilities.

17 **Q. How will the site be configured with all the various facilities that you have**
18 **generally described?**

19 A. As shown in Document No. DNH-10, the power plant has been located
20 essentially in the center of the proposed 4,900 acre site. This will provide
21 FPL with the maximum separation distance from the power plant to the
22 property boundaries, helping minimize impact on off-site land uses and plant

1 visibility. Document No. DNH-11 shows a more detailed plan view of the
2 two power islands.

3
4 Other prominent power-island related features of the site are shown in
5 Document No. DNH-10. These include the byproduct and material delivery,
6 handling and storage facilities to the North of the power islands, long term
7 byproduct storage facilities to the Northeast, water storage ponds to the East,
8 electrical interconnection and heat dissipation systems to the South, and
9 temporary construction areas to the West.

10

11 Document No. DNH-12 shows typical elevation views of the various facilities
12 that I have described.

13 **Q. What are the expected operating characteristics of FGPP 1 and 2?**

14 **A.** The units are being designed with state-of-the-art performance features,
15 including an extremely efficient power generation cycle design. The
16 projected output of 980 MW per unit with an average predicted heat rate of
17 8,800 Btu/kWh over the useful life of FGPP will make it among the most
18 efficient coal-fired electric generating facilities in the United States. The
19 ultra-supercritical technology that FPL will be applying is proven, having
20 been applied at facilities in Japan and Europe. Document No. DNH-13
21 provides a summary of the projected performance characteristics for FGPP.

1 **Q. Please describe the types of fuel the FGPP units will be able to use,**
2 **including any fuels for start-up.**

3 A. FGPP will be able to use domestic and foreign bituminous coal, as well as
4 petroleum coke, as fuel during power production operations. Low sulfur fuel
5 oil will be used as the startup fuel.

6 **Q. Please describe how the fuels will be delivered to the site, off-loaded and**
7 **stored.**

8 A. The fuels will be delivered to the site by train, off-loaded mechanically, and
9 stored in both short-term and long-term coal storage facilities.

10 **Q. What environmental controls will be installed as part of FGPP?**

11 A. Environmental compliance is important to FPL's business, both as an
12 environmental steward and because FPL is required to comply with applicable
13 environmental laws and regulations. Other federal and state agencies will
14 fully review the environmental compliance of FGPP. However, in this filing,
15 FPL has included information with respect to environmental compliance in
16 order to provide assurance to the Commission that these, as well as other legal
17 and regulatory requirements, will be satisfied through FPL's construction of
18 FGPP, and so that the Commission is informed concerning the expected costs
19 of environmental compliance. To this end, FPL will install and operate those
20 environmental controls necessary to comply with all applicable environmental
21 laws and regulations.

1 For example, from an air emissions compliance perspective, environmental
2 controls will be installed to control emissions of nitrogen oxides (NO_x), sulfur
3 oxides (SO₂ and SO₃), mercury and particulate matter. Sources of air
4 emissions consist of FGPP's two supercritical boilers, two mechanical draft-
5 cooling towers, two emergency generators, the auxiliary boiler, and the
6 material handling facilities. FPL's witness Mr. Ken Kosky discusses FGPP's
7 environmental compliance in further detail.

8 **Q. Please describe environmental control processes that will be used to**
9 **control NO_x emissions from FGPP.**

10 **A.** NO_x is a chemical byproduct formed by the combustion of fossil fuels such as
11 oil, natural gas, and coal. NO_x formation in the two supercritical boilers will
12 be minimized through application of good combustion controls, particularly
13 by controlling combustion temperatures and by properly staging combustion.
14 The boilers will minimize NO_x production by using low-NO_x burners
15 ("LNB") and over-fire air ("OFA"). Additional environmental controls for
16 NO_x will include a post-combustion environmental control process further
17 reducing NO_x emissions. The post-combustion technology being proposed
18 for FGPP is Selective Catalytic Reduction ("SCR"). SCR technology is a
19 proven and widely used post-combustion NO_x-control technology that utilizes
20 the selective reaction of ammonia with NO_x in the presence of a catalyst. In
21 the process, ammonia is injected into the flue gas upstream of a catalyst. The
22 selective reduction reactions occur on the surface of the catalyst to transform

1 nitrogen oxides into water and nitrogen. Overall, the removal efficiency of
2 the NOx environmental controls will be greater than 90%.

3 **Q. What environmental controls will be installed to control SO₂ and SO₃?**

4 A. The primary source of sulfur compounds from the combustion of fossil fuels
5 comes from the fuel itself, with very minimal contribution from the air being
6 introduced into the boiler. It is for this reason that the application of good
7 combustion controls will not significantly minimize the formation of sulfur
8 dioxides. For pulverized coal-fired utility boilers, SO₂ emission reduction is
9 accomplished by treating the post-combustion flue gas. The technology being
10 proposed for FGPP will involve the use of a WFGD process. The wet
11 scrubbing process involves a reaction in which the SO₂ is transferred to a
12 scrubbing liquid, which, in this case, is a calcium-based wet limestone. The
13 resulting byproduct of the process after further oxidation is a marketable
14 byproduct known as gypsum, which is used in the manufacturing of building
15 materials such as wallboard. Overall, the removal efficiency of the SO₂
16 environmental controls will be greater than 98.5%.

17
18 SO₃ produced through the combustion process is condensed into an aerosol in
19 the flue gas desulfurization system. The technology being proposed for FGPP
20 will involve the use of a Wet Electric Static Precipitator ("WESP"). This
21 technology utilizes an electric field which imparts an electric charge to the
22 aerosol particles in the flue gas. These particles are attracted to collector
23 plates. Water is used to wash the particles from the collector plates and out of

1 the flue gas stream. Overall, the removal efficiency of SO₃ achieved through
2 environmental controls will be greater than 90%.

3 **Q. Please describe the environmental controls that will be installed for the**
4 **control of particulate matter.**

5 A. The primary sources of particulate matter emissions from the facility will be
6 from the combustion of the fossil fuel in the boiler, emissions from the
7 mechanical draft cooling towers, and fugitive emissions from the handling
8 facilities associated with bulk materials such as fuel, limestone and
9 byproducts.

10

11 With respect to the cooling towers, water droplets exhausted into the
12 atmosphere as part of the cooling process contain dissolved solids and
13 chemical impurities which come from the original make-up water supply. In
14 order to minimize the release of these water droplets into the atmosphere, thus
15 minimizing particle matter carry over, drift eliminators will be installed to
16 remove the water droplets from the air stream exhausting from the cooling
17 towers.

18

19 Fugitive particulate emissions from bulk material handling and storage
20 facilities will be minimized by equipment design and operating procedures.
21 Materials such as fuel and limestone will be unloaded into bottom dump
22 underground hoppers, which will be protected from wind and which will
23 minimize the generation of fugitive dust. Dust that does get generated from

1 unloading operations will be further controlled using dust collection and
2 suppression systems. Conveyors used for transfer of the bulk materials will
3 be enclosed for minimizing wind-borne fugitive dust. Conveyance points will
4 be designed with either telescoping chutes for stock piling into storage piles,
5 or will be provided with dust collection and suppression systems at the points
6 of on-loading into enclosed hoppers, silos or staging areas for storage. All
7 conveyor transfer points will have a dust collection system.

8
9 The major source of particulate matter from FGPP will be from combusting
10 coal in the boiler. Combusting coal and petroleum coke in a pulverized coal-
11 fired boiler produces ash, which is the non-combustible portion of the fuel.
12 Ash is solid and is therefore classified as particulate matter. About 20% of the
13 ash falls to the bottom of the boiler as bottom ash and is removed by the
14 bottom ash system. The remaining 80% of the ash, which does not fall to the
15 bottom of the boiler, is called "fly ash" and is entrained by the flue gases
16 leaving the boiler. The two most commonly used particulate matter
17 environmental controls technologies being used in the industry today are
18 electric static precipitators ("ESP") and fabric filters. ESP technology uses an
19 electric field to impart an electric charge to particles in the flue gas. Particles
20 are magnetically attracted to collector plates. Rapping mechanisms, that are
21 operated intermittently, dislodge the collected particles, which subsequently
22 fall into a hopper for collection and disposal. Fabric filter technology, in
23 contrast, removes particulate matter from the flue gas as it passes through a

1 fabric filter media, such as woven cloths or felts. The filters are arranged as a
2 number of cylinders or tubes (commonly referred to as "bags") through which
3 the flue gas is directed. Cleaning of the bags in the fabric filter usually
4 involves shaking, pulse-jet or reverse-air methods. Dislodged particulates
5 subsequently fall into a hopper for collection and disposal. Both technologies
6 are highly efficient, providing up to 99.9% removal efficiency. The selected
7 technology for FGPP is a fabric filter.

8 **Q. Please describe the environmental controls that will reduce emissions of**
9 **trace amounts of metals which are released when coal is combusted, such**
10 **as mercury.**

11 A. Trace amounts of metals are released in the combustion process, which are
12 collected using a combination of pollution controls of the types I have already
13 described in order to achieve compliance with applicable environmental
14 regulations. As an example, the combination of controls is especially
15 important for mercury, one of the trace elements in coal. Mercury removal is
16 enhanced by the SCR where elemental mercury is oxidized into a form that
17 can be readily collected by the particulate and sulfur control systems.
18 Additionally, FGPP will include a sorbent injection system specifically for the
19 control of mercury emissions. The sorbent injection system will oxidize the
20 mercury, further enhancing its collection in the particulate and sulfur removal
21 control systems.

1 **Q. What are the water requirements for FGPP and how will they be met?**

2 A. The primary water requirements for FGPP include make-up water to the heat
3 dissipation system, which would consist of mechanical draft cooling towers,
4 water for the WFGD system, process water for cycle make-up into the steam
5 cycle, service water for general maintenance, fire protection water, waste
6 treatment systems, byproduct handling, and fugitive emissions control for
7 material handling operations.

8
9 Water for the plant will be from a combination of sources which include
10 Upper Floridan aquifer wells, recycled water from onsite water storage ponds
11 and excess water from adjacent South Florida Water Management District
12 controlled canals. Document No. DNH-14 shows a typical annual water
13 balance with the various sources and usage of the water at FGPP.

14 **Q. Are the pollution control systems proposed to be installed at FGPP
15 representative of the state-of-the-art in emissions control equipment?**

16 A. Yes. FPL is proposing to install a complete suite of state-of-the-art, emissions
17 control technology that meets or exceeds the Best Available Control
18 Technology Standard set by the federal Environmental Protection Agency.
19 FPL's witness, Mr. Kosky provides detailed information with respect to these
20 matters in his testimony.

21
22 The inclusion of this equipment, along with the plant design to allow for
23 recycling of the byproducts from the combustion and emissions control

1 processes, sets a new standard of excellence for coal-fired electric generating

2 stations in the United States.

3 **Q. Does this conclude your direct testimony?**

4 **A. Yes.**

In re: Florida Power & Light Company's)
Petition to Determine Need for FPL Glades)
Power Park Units 1 and 2 Electrical Power Plant)

Docket No: 070098-EI

ERRATA SHEET

DIRECT TESTIMONY OF DAVID N. HICKS

<u>PAGE #</u>	<u>LINE #</u>	<u>CORRECTION</u>
18	3	Change "exceeding" to "approaching"
14	22	Change "five" to "seven"
15	3	Delete "and"; Add after Initiative "Hendry County Economic Development Council, and Highlands Economic Development Council"

1 BY MR. ANDERSON:

2 Q Have you prepared a summary of your testimony?

3 A Yes, I have.

4 Q Please provide your summary to the Commission.

5 A Good morning, Chairman Edgar and Commissioners. As
6 the Senior Director of Project Development I am responsible for
7 the development of power generation projects to meet the needs
8 of FPL's customers.

9 Beginning in 2003, FPL conducted a thorough and
10 extensive investigation into the potential for adding solid
11 fuel generation to its resource mix and concluded that
12 significant improvements had been made in solid fuel
13 technology, emissions control technologies and plant designs
14 such that FPL had a number of technology options, all of which
15 would provide fuel diversity to FPL's system.

16 After a detailed analysis of the available technology
17 options, we determined that the addition of an
18 ultra-supercritical pulverized coal plant augmented with a
19 complete suite of state-of-the-art emissions control equipment
20 will best meet the power generation needs identified in the
21 2012 to 2014 period and provide FPL's customers reliable,
22 cost-effective and environmentally sensitive fuel to pursue.

23 In March of 2005, FPL filed with this Commission the
24 Report on Clean Coal Generation, a comprehensive study on
25 current opportunities and issues regarding solid fuel

1 generation. In 2006, we developed the FPL Glades Power Park,
2 including site selection, engineering and plant layout, and the
3 negotiation of construction and major equipment contracts. In
4 January 2007, we completed the Clean Coal Technology Selection
5 Study incorporating the most current information available in
6 the industry concerning solid fuel generating technology. As a
7 result of this study, FPL reconfirmed that ultra-supercritical
8 technology will materially outperform all available alternative
9 coal generation technologies including integrated gasification
10 combined cycle or IGCC.

11 When comparing technologies, it's important to look
12 at seven factors: Technological maturity, reliability,
13 construction risk, life cycle costs, generation efficiency,
14 environmental performance and CO2 emissions.

15 As summarized on these charts, the
16 ultra-supercritical plant proposed for FPL Glades Power Park is
17 superior to IGCC in six of the categories. And in terms of
18 environmental performance, the next-generation IGCC plants will
19 have roughly the same emissions profile as the Glades Power
20 Park if the IGCC plants achieve their projected environmental
21 performance.

22 By the United States Department of Energy definition
23 of ultra-supercritical pulverized coal there are over 30
24 ultra-supercritical units in commercial operation and
25 construction. In contrast, there are only four relatively

1 small coal-to-electricity IGCC demonstration plants in
2 operation, each delivering less than 300 megawatts, which all
3 required large government subsidies without which they would
4 not have been built. Ultra-supercritical plants have a proven
5 track record of greater than 90 percent availability. In
6 contrast, three of the four IGCC coal-to-electricity plants
7 have never achieved the lower 80 percent availability level and
8 the fourth has barely met that lower level of performance. In
9 large part, due to its technological maturity and proven
10 performance, FPL has been able to negotiate an engineering
11 procurement and construction or EPC contract and major
12 equipment supplier contracts with guarantees on performance,
13 schedule and cost. In contrast, IGCC developers have yet to
14 secure a viable EPC contract.

15 Life cycle costs for ultra-supercritical plants are
16 significantly lower than IGCC due to much lower capital costs,
17 lower operations and maintenance costs and higher efficiency.
18 The ultra-supercritical generation efficiency at the Glades
19 Power Park will exceed both current IGCC performance and the
20 projected, but as yet unrealized, generation efficiency for
21 next-generation IGCC plants. This means that FPL's Glades
22 Power Park will use less coal to deliver electricity to FPL's
23 customers.

24 The guaranteed environmental performance of the FPL
25 Glades Power Park, which will be protective of human health and

1 the environment, exceeds today's IGCC plants and will be
2 similar to next-generation IGCC, if next-generation IGCC
3 operates as projected. It should be noted, however, that the
4 significant efficiency advantage of Glades Power Park over IGCC
5 will result in lower CO2 emissions for the Glades Power Park.

6 In summary, the FPL Glades Power Park employing
7 ultra-supercritical generating technology, a complete suite of
8 state-of-the-art emissions control equipment and incorporating
9 a plant design that will allow for the recycling of the
10 by-products from the combustion emissions control processes
11 sets a new standard of excellence for coal-fired electric
12 generating stations in the United States. The FPL Glades Power
13 Park will meet the need requirements for the 2012 to 2014 time
14 period, providing FPL's customers with reliable, cost-effective
15 and environmentally sensitive fuel-diverse electric power.

16 Thank you.

17 MR. ANDERSON: Mr. Hicks is available for
18 cross-examination.

19 CHAIRMAN EDGAR: Thank you.

20 Ms. Perdue, any questions?

21 MS. PERDUE: No.

22 CHAIRMAN EDGAR: No questions.

23 Mr. Beck?

24 MR. BECK: No questions.

25 CHAIRMAN EDGAR: Mr. Guest.

1 MR. GUEST: Thank you, Madam Chairman.

2 CROSS EXAMINATION

3 BY MR. GUEST:

4 Q Good morning, Mr. Hicks. I'd like to just ask a few
5 questions to get some clarification on some of these items that
6 you've testified about.

7 CHAIRMAN EDGAR: I need you to pull the microphone
8 closer or make sure it's on.

9 MR. GUEST: Okay. It's on. Well, I think that -- is
10 that right?

11 CHAIRMAN EDGAR: That's better.

12 MR. GUEST: Okay. May I bellow, Madam Chairman?

13 CHAIRMAN EDGAR: You may bellow. We want to make
14 sure that we all hear you clearly.

15 BY MR. GUEST:

16 Q Good morning, Mr. Hicks.

17 A Good morning.

18 Q I'd like to just go through and get some
19 clarification on some items on your chart back there. The
20 first item I see here is that you refer to USCPC. That stands
21 for ultra-supercritical pulverized coal.

22 A That is correct.

23 Q And the concept of ultra-supercritical means that
24 it's extremely efficient; isn't that right?

25 A Ultra-supercritical pulverized coal uses advanced

1 engineering techniques and advanced metals to burn coal and
2 produce steam at much higher efficiencies, much higher
3 pressures and steam temperatures to result in a much more
4 efficient production of electricity.

5 Q And the concept here is that by having very, very
6 high pressure in the boiler, you have a higher fraction of
7 water as compared to steam so that you get higher conductivity
8 and you're able to extract more of the heat and thus become
9 more efficient; isn't that the concept?

10 A That's, that's a good summary of it.

11 I would mention that the Japanese have done a
12 considerable amount of research on this issue both in terms of
13 pressure and temperature, and what they have found is that
14 temperature incrementally -- increases in temperature
15 incrementally have a much greater impact on efficiency than
16 pressure.

17 Let's take a 2,400-pound pressure subcritical unit
18 operating at 1,000 degrees Fahrenheit. What they found was
19 by -- if you increase that pressure from 2,400 pounds to 4,500
20 pounds, an increase of about 75 percent, you get about a 2.5
21 percent incremental increase in efficiency. Contrast to that,
22 if you took the 2,400-pound pressure and the 1,000-pound
23 temperature and increased the temperature by 10 percent to
24 1,100 degrees, that would actually get about a 4.5 percent
25 increase in efficiency. So they have focused a lot on

1 temperature.

2 Q Now I think that you testified previously that the
3 proposed Glades coal plant would operate at 3,700 pounds per
4 square inch; is that correct?

5 A That is correct.

6 Q And that, that would produce an efficiency of about
7 38 or so percent, 39?

8 A The combination -- as I stated before, it's both
9 pressure and temperature. The combination of the 3,700-pound
10 pressure and the 1,112, 1,130-degree Fahrenheit temperature
11 would produce an average annual heat rate over the life of the
12 facility of 8,800 Btus per kWh.

13 Q And that translates to an efficiency rate of about
14 38.8 percent?

15 A Roughly, yes.

16 Q Okay. So you say that those characteristics show
17 that this is an ultra-supercritical state-of-the-art coal-fired
18 power plant; is that correct?

19 A The U.S. Department of Energy defines
20 ultra-supercritical as temperature -- pressures above 3,600
21 pounds, 3,600 pounds or greater, and temperatures approaching
22 1,100 degrees Fahrenheit. By that definition this is an
23 ultra-supercritical pulverized coal plant.

24 Q You're familiar, are you not, with the National
25 Energy Technology Laboratory at the Department of Energy?

1 A I'm aware of them. Yes, I am.

2 Q And they're an authoritative source on matters like
3 this.

4 A They are a source of information on coal technology,
5 yes.

6 Q An authoritative source.

7 A I don't know, I don't know how you're defining
8 "authoritative," so I can't comment on that.

9 Q Well, it's the National Environmental -- National
10 Energy Technology Laboratory at the Department of Energy.

11 A It's a government agency that does work on coal
12 plants. Yes.

13 Q Okay. I have to -- I would like to show you a, a
14 document from the National Energy Technology Laboratory at the
15 Department of Energy, and it's called the Materials Research
16 Program.

17 I'd like to distribute it, if I may, to various
18 people.

19 CHAIRMAN EDGAR: You may. Obviously, yes, to our
20 staff, to the Commissioners, to the court reporter and to the
21 other attorneys. Should we go ahead and mark this? Are you
22 going to want to --

23 MR. GUEST: I'm just going to ask him some questions
24 on it.

25 CHAIRMAN EDGAR: Okay.

1 MR. ANDERSON: May I have a copy?

2 CHAIRMAN EDGAR: You may. We'll give it a minute to
3 have it distributed.

4 Ms. Brubaker.

5 MS. BRUBAKER: Just if it's going to be identified, I
6 think we are at Number 166.

7 CHAIRMAN EDGAR: We are at Number 166. Should we go
8 ahead and do that for clarify? We will do that for clarity.
9 We will number this one 166 and label it NETL Materials
10 Research Program. And once that is passed out, then, Mr.
11 Guest, when you are ready. I'll guess we'll give it a minute.

12 MR. GUEST: Everybody has it.

13 (Exhibit 166 marked for identification.)

14 BY MR. GUEST:

15 Q Mr. Hicks, would you be so kind as to turn to the
16 one, two, three, four, five, six, seven, eighth page. It's the
17 chart that looks like this. Can everyone see it? This is the
18 chart.

19 Have you had an opportunity to review that,
20 Mr. Hicks?

21 A I just looked at it. Yes, I did.

22 Q Okay. So now what this chart from the National
23 Energy Technology Laboratory indicates is that
24 ultra-supercritical has an efficiency rate of 47 to 49 percent,
25 almost 10 percent higher than what you're calling

1 ultra-supercritical; isn't that right?

2 A This chart right here is not indicative of the
3 general consensus with regard to ultra-supercritical
4 technology. The United States Department of Energy, of which
5 NETL is a part of that, defines ultra-supercritical as
6 temperatures above or approaching 1,100 degrees and pressures
7 at 3,600 pounds or greater.

8 In addition, the Japanese, who also build
9 ultra-supercritical plants, use as a bright white (phonetic)
10 line 1,100 degrees Fahrenheit. It is a general consensus in
11 this industry that the pressures and temperatures of this plant
12 represent ultra-supercritical technology.

13 It should also be -- it's also important to realize
14 in terms of efficiency and in terms of heat rate average
15 degraded over the life of the plant you have to take into
16 consideration degradation, you have to take into consideration
17 ambient air temperatures, et cetera.

18 So this plant represents a -- the efficiency that's
19 calculated for this plant represents an average degraded heat
20 rate over the life of the plant, which is important to
21 customers, but also represents the ambient air temperatures
22 that are consistent in South Florida.

23 Q Okay. Looking, continuing on this same page, I see
24 that it's got -- in addition to an efficiency rate for
25 ultra-supercritical, this chart shows that the psi is 4,500,

1 which is by my count 800 psi higher than what you're talking
2 about for the proposed Glades plant; is that right?

3 A I see that on this chart, yes. But, once again, I
4 would comment that the United States Department of Energy
5 explicitly defines ultra-supercritical as 3,600 pounds pressure
6 greater, temperatures approaching 1,100 degrees Fahrenheit, and
7 the general consensus in this industry is that this is an
8 ultra-supercritical plant.

9 I'm not denying that if you went to these much higher
10 temperatures and pressures, you would still be
11 ultra-supercritical. But the plant that we're proposing for
12 Glades County is an ultra-supercritical plant.

13 Q Okay. Now --

14 CHAIRMAN EDGAR: Mr. Guest, excuse me. I'm sorry to
15 interrupt. But one of the copies that was distributed up here
16 does not have this page, and so I need to ask you if you
17 have -- I'm sure it was just collating. But if you have
18 another copy available, that would be useful to us.

19 MR. GUEST: You know, I'll just stick it in my --
20 that's great.

21 CHAIRMAN EDGAR: Okay. Thank you.

22 MR. GUEST: That's a collating error. I actually, I
23 could blame it on someone else.

24 CHAIRMAN EDGAR: There's no need to blame anyone at
25 all. Thank you. Go right ahead.

1 (Laughter.)

2 BY MR. GUEST:

3 Q Now continuing to look at this page, Mr. Hicks, from
4 the National Energy Technology Laboratory, you're looking -- if
5 you look at the front page, this is from the Department of
6 Energy; correct?

7 A Yes.

8 Q Okay. And so we're looking at this page. And now if
9 you look at the middle box, it has pressures greater than 3,500
10 psi and efficiencies of 41 to 45 percent. So using this page
11 from the National Environmental Technology Laboratory -- you
12 know, I always say environmental, I mean energy -- and the
13 41 to 45 percent, that's really, according to this document,
14 what the proposed Glades Power Plant is is actually
15 supercritical according to this document.

16 A No, I would disagree with that. This plant, the
17 Glades Power Park has a pressure of 3,700 pounds per square
18 inch, temperatures of 1,112 degrees and 1,130 degrees
19 Fahrenheit. With South Florida conditions, average degraded
20 heat rate over the life of the plant, it's around 38.8 percent
21 efficiency. That is recognized by the industry as an
22 ultra-supercritical pulverized coal plant.

23 Q Okay. And I would note just to -- if you would look
24 at that center box under supercritical, you see the bird's
25 mouth that indicates greater than, greater than 3,500 psi, and

1 that also applies to 41 to 45 percent efficiency.

2 A Uh-huh.

3 Q Okay. So let me turn to another document which we're
4 going to hand out.

5 CHAIRMAN EDGAR: Okay. While that's distributed, we
6 will go ahead and mark, and it will be Number 167. And, Mr.
7 Guest, can you give me a title?

8 MR. GUEST: This is the United -- this is a document
9 by the EPA, Federal Environmental Protection Agency. It's
10 called Final Report, Environmental Footprints and Costs of
11 Coal-Based Integrated Gasification Combined Cycle and
12 Pulverized Coal Technologies dated July 2006.

13 CHAIRMAN EDGAR: Okay. And for, for my listing I'm
14 going to abbreviate to EPA Final Report, Environmental
15 Footprints and Costs, IGCC.

16 MR. GUEST: Well, what they mean is IGCC versus PC.
17 I mean, that's what that's a comparison of.

18 CHAIRMAN EDGAR: Versus PC. We can do that. Okay.

19 (Exhibit 167 marked for identification.)

20 BY MR. GUEST:

21 Q And I would -- just a very simple point, Mr. Hicks.
22 If you turn to the second page of this document, at the very
23 bottom line it reads, "PC plants." That means pulverized coal
24 plants; right?

25 A That's correct.

1 Q "With ultra-supercritical steam conditions of 4,500
2 psi and 1,100 to 1,100 °F double reheat," is the description of
3 ultra-supercritical.

4 A Yes. And that is consistent, once again, with the
5 U.S. Department of Energy definition, which is plants that have
6 steam pressures 3,600 psi or greater and temperatures
7 approaching 1,100 degrees Fahrenheit, those plants are
8 ultra-supercritical. This plant would be an
9 ultra-supercritical under that definition.

10 Q Okay. So but you're 800 psi short and you're not
11 anywhere close to the 45 percent efficiency that you'd get for
12 ultra-supercritical.

13 A No. This, this plant represents a, a combination of
14 temperature and pressure that is unique, would be unique for
15 the United States. It represents the cutting edge of
16 ultra-supercritical technology in the world. It is state of
17 the art and meets the definition of ultra-supercritical
18 technology.

19 Q Now FP&L hired a consulting firm called
20 Black & Veatch, V-E-A-T-C-H; is that correct?

21 A We hired Black & Veatch as a, to assist us in
22 preparing the Clean Coal Technology Selection Study.

23 Q And do you know a person named Mr. Ron Ott, O-T-T?

24 A I'm familiar with him, yes.

25 Q Could you tell us who he is?

1 A He's an employee of Black & Veatch or was an employee
2 of Black & Veatch as of two years ago when I last talked to
3 him.

4 Q Was he the Senior Vice President and Coal Program
5 Director?

6 A I'm not sure.

7 MR. GUEST: Okay. I'd like to show you a document
8 which is a presentation by your consultants, Black & Veatch.

9 CHAIRMAN EDGAR: Okay. We will mark 168, Black &
10 Veatch Supercritical Plant Technology Overview.

11 (Exhibit 168 marked for identification.)

12 MR. GUEST: Does everybody have one? Okay.

13 BY MR. GUEST:

14 Q Do you have it?

15 A Yes, I do.

16 Q I would like to turn first to the -- let's just go
17 from backwards here. It would be the third last page of this
18 document. But before I do that, does it reflect your
19 recollection seeing the front page of it that says Mr. Ott is
20 the Senior Vice President and the Coal Program Director?

21 A It doesn't, doesn't refresh my memory. I know of a
22 gentleman named Ron Ott that worked at Black & Veatch a couple
23 of years ago. I have not had discussions with him since then.

24 Q Okay. And I would turn now to the third page from
25 the beginning. Are you with me?

1 A Yes.

2 Q And the title is Thermal Generation Technology
3 Spectrum. Are you on that page with me?

4 A Yes.

5 Q And if we turn to the bottom of that page under the
6 description of ultra-supercritical, it shows a net plant
7 efficiency of 44 percent; is that correct?

8 A It does. I'm not -- you know, once again, you have
9 to look at ambient air temperatures, what is the -- what
10 efficiency are you looking at, are you looking at design
11 efficiency, are you looking at initial test efficiency, are you
12 looking at efficiency over the life of the plant?

13 What we're reporting for this plant is the efficiency
14 over the life of the plant, including degradation, including
15 forced outages, et cetera.

16 Q And when you look to the item that's called
17 supercritical, which is two above that, it identifies the net
18 plant efficiency at 38 percent.

19 A I see that on the page. Yes, sir.

20 Q And that's very close to the 38.8 that you testified
21 to.

22 A It is close to the 38.8. But, once again, I'll say
23 it again, the 38.8 that we are representing is an average
24 degraded efficiency over the life of the plant. It is not
25 indicated here what this efficiency represents.

1 Q And it also refers to -- I'm still on the same page.
2 Under supercritical it refers to a pressure of 3,500 psi;
3 correct?

4 A It does on this page, yes.

5 Q Which is close to your 3,700 psi; correct?

6 A I would not necessarily say it's close to the 3,700.
7 It's approximately 200 psi lower.

8 MR. GUEST: May I have a moment?

9 CHAIRMAN EDGAR: Yes.

10 MR. GUEST: This came up just at the last moment,
11 Madam Chairman, so I don't have copies for everybody, but this
12 is already in the record. Maybe he'll recall this so we don't
13 have to fool around with it.

14 BY MR. GUEST:

15 Q I'm on the determination of needs, the needs study
16 that was actually filed with the petition. And on Page 22 at
17 the top under the diagram Figure III.A.5 it reads, underneath
18 that is B, and it's Unit 1 and 2 design, and the first line
19 reads, "Each unit will consist of a supercritical steam
20 generator." Does that refresh your recollection?

21 A I'd have to see it. I don't have the document with
22 me. It would be helpful if I could see the document.

23 CHAIRMAN EDGAR: Mr. Guest, why don't you approach
24 and let the witness -- and actually why don't you start with
25 Mr. Anderson so that he is sure of --

1 (Pause.)

2 BY MR. GUEST:

3 Q Have you had an opportunity to look at that,
4 Mr. Hicks?

5 A Yes, I have.

6 Q So the description of this plant in the needs
7 determination was that it was supercritical; is that correct?

8 A The boiler was supercritical. The plant is
9 ultra-supercritical because a supercritical boiler is a boiler
10 that's above, has a pressure above 3,208. Ultra-supercritical
11 as defined by the Department of Energy, which is the definition
12 we used for this plant, is pressures above 3,600 pounds psi or
13 above and temperatures approaching 1,100 degrees Fahrenheit.

14 Q Did FP&L do any internal studies that examined the
15 matter of whether this was critical or ultra-supercritical?

16 A FPL examined various technologies, invited vendors to
17 meet with us, went through various technology assessments with
18 those vendors, did internal studies, negotiated the contracts,
19 and this plant, as a result of all that analysis, internal
20 analysis and external work, this plant as defined by the
21 Department of Energy is an ultra-supercritical pulverized coal
22 plant that will bring levels of pressure and temperature unique
23 to the United States that will result in, when looking at the
24 plant over the life of the plant, the heat rate of the plant,
25 the life of the plant, including forced outages, et cetera,

1 would be the most efficient coal plant in the United States,
2 meeting the definition for ultra-supercritical.

3 Q The question was whether or not FP&L had hired
4 consultants to examine the issue.

5 A Yes. We internally looked at that issue also.

6 MR. GUEST: Okay. May I have a moment, Your Honor?

7 I'm sorry. Madam Chairman is what I mean.

8 CHAIRMAN EDGAR: Yes.

9 (Pause.)

10 MR. GUEST: Madam Chairman, there's a confidential
11 document that was produced in discovery. We did not anticipate
12 having a need to use it. What we've made a decision to do is
13 work with counsel to come up with a way to work through that so
14 that the parts that are trade secrets or whatever else can be
15 kind of separated and just this issue can be isolated and
16 presented somehow. So we'll move on from there.

17 CHAIRMAN EDGAR: Mr. Anderson.

18 MR. ANDERSON: In fact, if counsel just wants to give
19 us the page he's interested in, we can look at it on the side
20 while he continues to interrogate so we can continue moving on.

21 BY MR. GUEST:

22 Q Okay. Let's press on.

23 The next item you have on your, on your demonstrative
24 exhibit over here after you -- I guess the first item is
25 technological maturity. Let me jump over from that to the

1 reliability issue.

2 Now we have a number of different terms that are used
3 here. Availability means the percent of time that the plant is
4 capable of producing electricity; is that correct?

5 A Yes.

6 Q And then reliability goes to unplanned outages;
7 correct?

8 A Reliability is also another, another way of defining
9 availability. Yes.

10 Q Okay. And so availability together really is planned
11 plus unplanned outages.

12 A Yes.

13 Q Okay. And the capacity factor, excuse me, is the
14 time plant -- the time the plant can operate at its maximum
15 output.

16 A The capacity factor is the, is the, taking the total
17 amount of generation divided by the total potential amount of
18 generation from the plant over the course of a year.

19 Q Thank you. I'd like to return now to the document
20 that we talked about earlier by the consulting firm hired by
21 FP&L, Black & Veatch, that we previously identified as Exhibit
22 Number -- or you gave it a number of 168. And I think this
23 time I would like to go -- I think I want to go three pages
24 from the back this time. Yes. Three pages from the back,
25 three pages from the end, the third last page. And I see

1 here -- are you with me?

2 A Could you tell me which page exactly you're on?

3 Q It's the one that reads Supercritical Versus --
4 "Subcritical versus Supercritical Technology."

5 A Yes. I see that.

6 Q And I see that, if you go down to the column under
7 "Supercritical" and the row that reads "Availability Factor,"
8 the availability factor for supercritical plants is
9 83.2 percent; is that correct?

10 A That's using NERC GADS data for 1994 to 1998. That
11 would include supercritical plants that could have been built
12 as early as 1957.

13 Q I'd like to turn now to a new document -- may I have
14 a moment?

15 CHAIRMAN EDGAR: Yes.

16 MR. GUEST: This document is the Ten-Year Site Plan
17 for Electrical Generating Facilities and Associated
18 Transmission Lines, January 2006 to December 2015, from TECO.
19 It's dated -- Tampa Electric Company, dated April 1, 2006.

20 CHAIRMAN EDGAR: Okay. Is this already in the
21 record?

22 MR. GUEST: I don't believe so. Oh, wait a minute.
23 Yes, it is. No. No.

24 CHAIRMAN EDGAR: No. Okay. And Ms. Brubaker concurs
25 that it is not, so we will mark it 169.

1 (Exhibit 169 marked for identification.)

2 MR. GUEST: This is 169; is that correct?

3 CHAIRMAN EDGAR: Yes, sir.

4 BY MR. GUEST:

5 Q Have you had an opportunity to review that?

6 A Yes, I have.

7 Q I'm turning to the second page and I'm looking under
8 the number 12. Do you see the 12 in the columns on the left?

9 A Yes, I do.

10 Q It's under the group called projected unit
11 performance data. And I see that it has a -- the second last
12 line under number 12 is resulting capacity factor of 87 percent
13 and an equivalent availability factor of 85.07 percent; is that
14 correct?

15 A Yes, I do. I see those.

16 Q And that's for an IGCC plant.

17 A And let me mention that is an IGCC plant that would
18 be used in baseload, as a baseload plant in the TECO system.

19 The FPL facility, the FPL Glades Power Park will be a
20 baseload facility in the FPL system. Our internal analysis and
21 also our hands-on external review of ultra-supercritical plants
22 in Japan has led us to project with great confidence that we
23 will have a 92 percent capacity factor at our plant, at the FPL
24 Glades Power Park.

25 I think it's also important to look at the next line

1 which has an arrow next to it, and that arrow says average net
2 operating heat rate of 9,306. That average net operating heat
3 rate is 506 Btus higher than the ultra-supercritical plant
4 proposed for Glades Power Park.

5 But what's also very important, and this goes to what
6 I had discussed earlier, is there is a footnote, footnote
7 number one. And footnote number 1 says, "Based on in-service
8 year." So that's the average annual heat rate for the first
9 year of the plant, not the average annual heat rate over the
10 life of the plant. Due to degradation in the performance and
11 the equipment one would expect a higher average heat rate over
12 the life of the plant.

13 In fact, our own internal analysis and the analysis
14 of Black & Veatch has demonstrated that an IGCC plant would
15 incur average degradation over the life of the plant of about
16 2.5 percent.

17 What's interesting about this number right here is if
18 you take this number, 9,306, and you multiply by 1.025, which
19 is the average degradation rate, you get an average annual heat
20 rate over the life of the plant of 9,538. What's interesting
21 about it is AEP, American Electric Power, filed air permit
22 applications for two IGCC plants, 600-megawatt demonstration
23 plants or 600-megawatt plants, one in Ohio and one in West
24 Virginia. In those air permit filings the calculated heat rate
25 using the same technology that TECO is proposing for this plant

1 is 9,538, exactly the same number as taking this number and
2 multiplying by 1.025. That leads me to believe that the
3 average annual heat rate over the life of this TECO plant will
4 be 9,538, 738 Btus higher than the average annual heat rate for
5 the FPL Glades Power Park, approximately 10 percent less
6 efficient. That means 10 percent more coal burned to produce
7 the same amount of electricity and more CO2 emissions.

8 MR. GUEST: May I have a moment, Your Honor, or Madam
9 Chairman?

10 MR. ANDERSON: While counsel is looking, just to
11 close the loop on the confidential point, I brought over to
12 counsel the portion of the prehearing order that lays out the
13 instructions for how confidential things are handled at the
14 Commission with envelopes and things. And if those are
15 complied with, we're fine, but we don't know that the materials
16 are had by Intervenors here.

17 CHAIRMAN EDGAR: Mr. Guest, why don't we go ahead and
18 take ten minutes, and, and during that time maybe you could get
19 with our staff and with Mr. Anderson and work through the
20 confidentiality issue as well. And we'll come back ten minutes
21 from now.

22 MR. GUEST: Thank you, Madam Chairman.

23 CHAIRMAN EDGAR: Thank you.

24 (Recess taken.)

25 CHAIRMAN EDGAR: We will get started again.

1 Mr. Guest.

2 MR. GUEST: I think we've reached an intelligent
3 stipulation here to deal with the matter of the confidential
4 study by reading only a couple of sentences. One of them might
5 be two sentences, and then not putting the document in. We
6 have a stipulation to do that.

7 CHAIRMAN EDGAR: Mr. Anderson.

8 MR. ANDERSON: That's acceptable, and we recognize
9 that that couple of sentences will be in the public record.
10 We've reviewed it and it is acceptable.

11 CHAIRMAN EDGAR: All right. Then thank you for the
12 cooperation on both parts. And we are ready to go forward.

13 MR. GUEST: Thank you.

14 BY MR. GUEST:

15 Q Mr. Hicks, there was a confidential study in
16 April 2006 prepared by M.J. Bradley and Associates on behalf of
17 Florida Power and Light concerning the proposed power plant?

18 A Yes, a confidential study done by M.J. Bradley and
19 Associates, an environmental consulting firm.

20 Q And the study has in it a statement that FPL is
21 continuing to evaluate the efficacy of pursuing a new
22 supercritical PC plant in Florida, and this was dated
23 April 2006?

24 A I don't have it in front of me, so I'll accept your
25 reading.

1 Q Turning now to the matter of efficiency. You agree,
2 do you not, that IGCC plants can achieve an efficiency of 90 to
3 94 percent?

4 A No, I don't agree that they can achieve an efficiency
5 of 90 to 94 percent.

6 Q I'd like to show you -- we are going to hand this
7 out.

8 MR. GUEST: I will identify it for the record, if I
9 might. This is an article in Gas Turbine World, and it's
10 entitled, "Refinery IGCC Plants are Exceeding 90 Percent
11 Capacity Factor After Three Years."

12 CHAIRMAN EDGAR: Okay. And this will be Number 170.
13 (Exhibit 170 marked for identification.)

14 MR. GUEST: Just for the record, I see my document
15 here has, also, that notation "Supplemental Exhibit RCF-29" on
16 it, which means that it's going to bounce in under Mr. Rich
17 Furman's testimony.

18 BY MR. GUEST:

19 Q Mr. Hicks, do you have that before you?

20 A Yes, I do.

21 Q And I would like to direct your attention to the
22 first page of this document, and you see there's three boxes
23 there in the left column after the second paragraph, three
24 boxed paragraphs, do you see those?

25 A Yes, I see those.

1 Q And the first one is in the first year of commercial
2 operation syngas, it was 93 percent. Do you see that one?
3 That is ISAB Energy.

4 A I see that, yes.

5 Q And the next one is Sarlux Saras has a 90 percent
6 efficiency. And then the third one is that Api Energia has
7 94 percent efficiency.

8 A I don't think those are efficiencies. I think what
9 they are referring to there is capacity factors, and that is
10 different from efficiency. And I also note that the three
11 facilities that are on this page are not coal-based IGCC
12 plants. They are asphalt residues, and residues. There is a
13 substantial difference between IGCC plants that run on asphalt,
14 residue, et cetera. No one is proposing to do those in the
15 United States. Mr. Jenkins, who is our expert, our retained
16 expert on IGCC, can provide you greater detail about the
17 differences between the two.

18 So I think, Counsel, you are confusing efficiency and
19 capacity factor, first of all, in your question to me; and,
20 second of all, you are making an apples-to-oranges comparison
21 by pulling up this document, which I would mention is not a
22 document that is peer reviewed. It's this gentleman's opinion.

23 But, most importantly, Mr. Jenkins can provide the
24 Commissioners detail with regard to why comparing IGCC plants
25 that run on such feed stocks as asphalt and residues should not

1 be compared to coal-based IGCC plants.

2 Q Well, IGCC plants run on a diverse array of fuels, do
3 they not?

4 A I would disagree with that. IGCC plants, just like
5 pulverized coal plants, you design that plant for a specific
6 type of fuel type. If you deviate from that fuel type, that
7 can cause considerable problems. It's called a design point.
8 So, for example, there is two design points for the pulverized
9 coal plant at the FPL Glades Power Park. One design point is
10 bituminous coal. The second design point is bituminous coal
11 with 20 percent petroleum coke. That gives us great fuel
12 flexibility in sourcing bituminous coals and petroleum cokes
13 throughout the United States and also throughout the world.

14 Now, we can run that plant on other types of fuel,
15 such as subbituminous coals. We would take a slight derate on
16 capacity or a slight derate on efficiency, but we can run on
17 other fuels. But we have designed that plant for certain types
18 of fuel. It's the same thing with IGCC. You design it for a
19 specific type of fuel. If you deviate from that fuel, that can
20 cause considerable problems.

21 Mr. Jenkins, once again, can provide additional
22 detail on the issues associating with designing an IGCC for a
23 particular type of fuel and then deviating from those fuels and
24 the impacts on the IGCC operation. But it's not a correct
25 statement to say that an IGCC plant can run on a diverse set of

1 fuels.

2 Q Well, we have IGCC plants that run on coals of all
3 types, is that right?

4 A They are designed for specific types of coals, but
5 they can be designed to run on different types of coals,
6 correct. Just like a PC plant can be designed to run on
7 different types of coals.

8 Q And they can run on petcoke?

9 A They can run on petcoke. If designed specifically to
10 run on petcoke, they can run on petcoke. Just like a PC plant,
11 such as FGPP, can be designed to run on petroleum coke as a
12 portion of the overall fuel mix.

13 Q The maximum amount of petcoke that can be used in the
14 Glades proposed coal plant is 20 percent?

15 A It is 20 percent based upon an average weighted
16 sulfur content of two percent for the total fuel supply. I
17 would mention to you that we have done feasibility studies on
18 IGCC plants and the standard reference plant, particularly with
19 one vendor that we are working with, that plant has a maximum
20 sulfur content that is allowable in the design point of
21 4 percent, which does not allow it to be run on 100 percent
22 petroleum coke. We could design that plant to run on 100
23 percent petroleum coke as a design point, but it would cost
24 substantially more to do so in terms of capital cost.

25 Q And in addition to petroleum coke, or petcoke -- just

1 while we're talking about petcoke, we will come to this
2 probably several times in this hearing. Now, as I understand
3 it, petcoke is a waste product from the process of refining
4 crude oil where you take the aromatic bottoms that are below
5 asphalt, and then crack them through a chemical process where
6 you add hydrogen molecules and make them as a waste product
7 that has some energy source value, is that the case?

8 A That's generally the case. It is also considered to
9 be an opportunity fuel in the sense that it's virtually
10 impossible to contract for it on a long-term basis. Because it
11 is a waste product from the refinery process, refiners are
12 reluctant to sign long-term contracts for it. We looked at the
13 petroleum coke market and determined that because it is an
14 opportunity fuel, because it is a fuel that doesn't have the
15 capability for long-term contracting, we considered it an
16 opportunity fuel and that although it is an opportunity fuel,
17 we include it as part of the plant design.

18 Q What fraction of petcoke does the TECO plant run on?

19 A I'm not sure.

20 Q Does 60 percent sound right?

21 A I'm not sure.

22 Q The TECO plant could run on 100 percent petcoke?

23 A Mr. Jenkins is actually the deputy project manager
24 for TECO, and he can provide you additional information on
25 that.

1 Q Okay. So an IGCC plant could run on all type of coal
2 and on petcoke. Biomass?

3 A Pulverized coal plants can also --

4 MR. ANDERSON: We object to form. The witness very
5 clearly said that that wasn't so.

6 MR. GUEST: Well, let me just get some clarification,
7 then.

8 BY MR. GUEST:

9 Q Do you know whether an IGCC plant could run on
10 biomass?

11 A An IGCC plant can be designed, if you put it into the
12 original design, it can be designed to co-fire for some portion
13 of the fuel on biomass. Similarly, a pulverized coal plant can
14 be designed to run on biomass, co-fire with biomass.

15 Q And an IGCC plant can run on natural gas?

16 A No, an IGCC plant cannot run on natural gas. An IGCC
17 plant, if you were to eliminate the IGCC function and just
18 concentrate on the combined cycle portion of it, it can run on
19 natural gas. But I have to mention that when an IGCC plant, a
20 plant that is designed to be an IGCC plant is shifted over to
21 natural gas, then the efficiency suffers versus a dedicated
22 combined cycle plant.

23 Q So just to be clear here, you're saying that if you
24 have got natural gas as a back-up to run the turbine and the
25 steam boiler at an IGCC plant that you get a lower heat

1 efficiency by switching to natural gas rather than the syngas
2 produced by the IGCC, is that your testimony?

3 A When you design an IGCC plant, and that IGCC plant
4 doesn't run on syngas, but runs on natural gas, it will be less
5 efficient than a dedicated combined cycle facility. Now, one
6 has to note that if you design an IGCC plant to have natural
7 gas backup, you have to pay the costs associated with that.
8 For example, let's say that FPL were to design an IGCC plant at
9 the FPL Glades Power Park site. The situation that we would be
10 faced with is both gas pipelines, both major gas pipelines come
11 into the state after FPL signed the gas contract for West
12 County. Both of those pipelines are fully allocated, there's
13 no firm capacity left.

14 In order to get natural gas backup, we would have to
15 contract for an upgrade of that pipeline. In order to
16 contract, you would have to contract under a long-term
17 take-or-pay agreement. In other words, that firm gas supply we
18 would have to either take it or pay for it.

19 So to try to compensate for the deficiency in overall
20 availability between an IGCC plant and the ultra-supercritical
21 plant, one way of doing that would be to put in natural gas
22 backup, but that would be at a substantial additional cost to
23 the facility. The IGCC without natural gas backup is
24 significantly more expensive in terms of life-cycle cost.
25 Adding natural gas backup to try to make up for that deficiency

1 in availability would only exacerbate that delta in terms of
2 life-cycle costs.

3 Q Now, let we continue on the fuel issue. I think we
4 talked about biomass, natural gas, petcoke, coal of all types.
5 I take it you are familiar with the new IGCC plant in the
6 Netherlands that uses 40 percent wood waste?

7 A I'm aware of an IGCC plant in the Netherlands that
8 was not originally designed for biomass, but has made changes
9 so that it can burn some biomass, yes. That plant -- by the
10 way, that plant has a very low average annual availability
11 factor. It has suffered through significant forced outages,
12 and it has never met an average annual availability of
13 80 percent.

14 Q We'll deal with that issue separately, too. Now,
15 diesel fuel, that's another available fuel for an IGCC plant?

16 A An IGCC plant, you can design it to run on syngas or
17 natural gas as a back-up; you could design it to run on syngas
18 and fuel oil as a back-up, but you couldn't design it to run on
19 all three.

20 Q Asphalt, can they run on asphalt?

21 A You could design an IGCC plant to run on asphalt as
22 the design point. If you deviated from that feedstock, there
23 would be significant penalties. And Mr. Jenkins can provide
24 you additional information on the issues associated with that.

25 Q And they could also run on tar?

1 A You could design -- I'm not aware of a tar-based IGCC
2 plant. Mr. Jenkins could provide you additional information,
3 once again, with regard to designing a plant to run on
4 different types of feedstocks or a different type of feedstock
5 and the implications for that in terms of fuel supply.

6 Q A lot of the products that I listed there that we
7 have been through are waste materials, are they not?

8 A It depends on whose perspective you are looking at.
9 It could be characterized as a waste material.

10 Q Well, the one in the Netherlands is using wood waste.
11 That's waste, isn't it?

12 A It could be characterized as a waste material.

13 Q Let's turn directly to the matter of petcoke. And,
14 you know, do you not, that the Polk Plant, the TECO Polk Plant
15 uses a high fraction of petcoke in addition to coal?

16 A Once again, with regard to the fuel type for the TECO
17 plant, I think that question is best addressed to Mr. Jenkins
18 who was a deputy project manager of the facility.

19 Q Do you know anything about petcoke at all?

20 A I'm aware of petcoke. I'm aware of it as an
21 opportunity fuel, where it comes from, the economics of it and
22 the fact that it is an opportunity fuel.

23 Q It is a whole lot cheaper than coal, isn't it?

24 A Not necessarily. In fact, FPL in conjunction with
25 the Jacksonville Electric Authority sometimes uses petroleum

1 coke at the power park that we have in Jacksonville. And, in
2 fact, over the last year or so FPL and Jacksonville Electric
3 Authority have actually cut back on petroleum coke because the
4 price has either met or exceeded the price of coal, and I
5 believe Mr. Schwartz actually has this in his testimony.

6 Q Yes. So let's -- I'm going to show you a piece, an
7 exhibit from Mr. Schwartz' testimony which we are distributing
8 here. I believe this is in evidence. It's identified as
9 SS-19.

10 CHAIRMAN EDGAR: Okay. And SS-19, which was labeled
11 91 in the comprehensive exhibit.

12 MR. GUEST: Thank you, Madam Chairman.

13 BY MR. GUEST:

14 Q Have you had an opportunity to review this document,
15 Mr. Hicks?

16 A I looked at it just now, yes.

17 Q This was an exhibit to Mr. Schwartz' testimony. You
18 see there that the dotted line at the bottom represents Florida
19 Power and Light's medium case forecast of delivered coal
20 prices, and this dotted line is the medium case forecast of
21 delivered petcoke prices, correct?

22 A Yes.

23 Q And what it shows, also, is that the solid line is
24 the Central Appalachian coal that FPL proposes to use at the
25 proposed Glades coal plant?

1 A FPL proposes to use, as a base combination,
2 40 percent Central Appalachian, 40 percent foreign, and
3 20 percent petroleum coke, and did an economic analysis based
4 upon that. In addition, we did economic analysis, both FPL and
5 through the clean coal technology selection study looking at
6 use of petroleum coke both for the PC technology, the
7 ultra-supercritical technology, and IGCC technology. The
8 results were that the IGCC -- delivered cost of IGCC power was
9 greater than 40 percent over the life of the plant versus an
10 ultra-supercritical pulverized coal plant. And that's
11 contained in the clean coal technology selection study, both in
12 the summary and in the text of the document.

13 And that delta in terms of significantly higher
14 delivered cost over the life of the plant for an IGCC plant
15 that's burning 50 percent petroleum coke was consistent,
16 including without emissions, with emissions, with degradation
17 on heat rate, and also with CO2 emissions.

18 Q Well, the big picture that you see from Exhibit 91 is
19 that petcoke per million Btu is consistently a dollar or two or
20 perhaps even three cheaper than your coal source, isn't that
21 right?

22 A Not necessarily. Because, once again, the coal
23 source that is assumed for FPL Glades Power Park includes
24 petroleum coke. It includes petroleum coke, foreign coal, and
25 Central Appalachian coal. Once again, it has to be -- this

1 document also has to be, it has to be understood that petroleum
2 coke is an opportunity fuel. It's not a fuel that one can sign
3 long-term contracts for. And because it is an opportunity
4 fuel, you need to be careful about the usage of that fuel when
5 you look at your fuel mix.

6 Q There's a 20 percent limit on how much you can put in
7 the proposed Glades coal plant?

8 A That is correct.

9 Q For petcoke. And this document, Exhibit 91, has the
10 projected price, correct?

11 A Yes, it does.

12 Q And you have no reason to think that price is wrong,
13 do you?

14 A It's a projection. It's a projection of future
15 prices.

16 MR. GUEST: Let's turn to the matter of, you know,
17 I'm going through the items on your benefits list here, let's
18 turn to the matter of capital cost of building the proposed
19 Glades pulverized coal plant. I think it might be useful at
20 this juncture to compare some very gross numbers from the
21 petition to do a comparison. So we're going to hand out Page
22 10, I think, of the petition so we can look at some base
23 numbers. Should this be separately marked as an exhibit even
24 though it's Page 10 of the petition?

25 MS. BRUBAKER: I don't believe it needs to be

1 separately marked. And, actually, on that note, I would note
2 that what has been identified as Exhibit 170 has actually been
3 marked as Exhibit 121, it's Mr. Furman's Supplemental Exhibit
4 RCF-29. The only difference, that we can tell, is that it is
5 in color. If that's significant, we can certainly leave it
6 marked as 170. If it's not --

7 MR. GUEST: We would prefer to leave it in color.

8 MS. BRUBAKER: That's fine. I just wanted that
9 clarification. Thank you.

10 MR. GUEST: Is everyone together here with us?

11 BY MR. GUEST:

12 Q Now, Mr. Hicks, we start with a total estimated cost
13 of 5.7 billion, is that correct?

14 A That is correct, in 2014 dollars.

15 Q And then you could take out some numbers, \$125
16 million for land acquisition for the site and 73 million for
17 transmission line land. That is about 200 million, right?

18 A The document that I have before me says that there is
19 125 million for land acquisition, which is correct, and
20 73 million for land acquisition for off-site transmission
21 systems, included in the 5.7 billion.

22 Q Right. So if you wanted to take out land acquisition
23 costs, you would take out about 200 million?

24 A Correct.

25 Q So that would leave you at about 5.5 billion, is that

1 right?

2 A In 2014 dollars, yes.

3 Q And so, you have 18, I'm sorry, 1960 kilowatt hour,
4 megawatt capacity -- pardon me for garbling this story -- and
5 so if you take that 5.5 billion, and divide it by 1960, your
6 cost per kilowatt hour comes out to \$2,704.

7 A No, that's not correct. The cost per kilowatt hour
8 would not be \$2,704.

9 Q I'm sorry, the cost per kilowatt.

10 A The cost per kilowatt installed, yes, in 2004
11 dollars. And I don't have a calculator in front of me, so I
12 don't have a way of verifying your --

13 Q Well, let me supply you with a state-of-the-art
14 calculator. It may take a minute, because that is a
15 solar-powered calculator just to conserve energy.

16 A What was the number you came up with?

17 Q 2,704, \$2,704.

18 A In 2014 dollars?

19 Q Yes.

20 A At the summer-rated capacity of the unit, 1,960
21 megawatts.

22 Q That's it. And if you were to compare that to a
23 document we used a few moments ago, Number 169, do you have
24 that with you?

25 A Yes, I do.

1 Q Under Number 13, the third line, this is for the TECO
2 Polk Unit Plan, the new one that's going to come on-line in
3 2013, the third line shows the total installed cost is
4 \$2,626.70.

5 A I see that, but I believe that calculation is done on
6 the winter capacity and not the summer capacity. There is
7 nothing in here that indicates it is done on summer capacity.
8 Second of all, it is a 2013 number rather than a 2014 number.
9 Number three, it fails to account for the delta in terms of
10 transmission upgrades necessary. A proper comparison would be
11 for an IGCC plant that's is built at the Glades Power Park site
12 and has an equivalent amount of transmission costs.

13 Now, we did that analysis for the FPL clean coal
14 technology selection study. And what we found was that the
15 capital cost of a similarly sized IGCC unit would be
16 36.8 percent higher in same year dollars.

17 The other important thing to understand here is that
18 this is a 2006 document, and what it represents is an estimate
19 before feasibility and frontend engineering and design studies
20 are done. The way an IGCC plant is developed is you single
21 source it. There's about six different developers out there,
22 but you single source with a vendor. You pick a vendor, and
23 you engage that vendor in a contract and they do a feasibility
24 study for you, and that takes up to a year. At the end of that
25 feasibility study period, you get a cost with a very wide, a

1 very large error factor in it. Then you do what's called a
2 frontend engineering and design study, which is a much more
3 detailed study to come up with a much more detailed cost.

4 This does not represent -- what's in this document
5 does not represent the results of a frontend engineering and
6 design study analysis. And what is very important about that
7 is what we're seeing over and over again is when the frontend
8 engineering design study is completed, the costs rise
9 dramatically.

10 And there's a number of examples of that over the
11 last four months. The first example is American Electric
12 Power. They are proposing a 600-megawatt IGCC plant in Ohio
13 and one in West Virginia. When they proposed the plant cost
14 early in that process similar to this, they proposed a cost of
15 about 1.1 billion. Then they worked on the frontend
16 engineering and design study with GE and Bechtel. In December
17 of 2006, they were scheduled to file, make a filing with the
18 Ohio Public Utilities Commission on the cost of the plant.
19 Their goal was to get the cost of that 600-megawatt IGCC plant
20 to within 20 percent of a similarly sized pulverized coal
21 plant.

22 Now, should we mention that going from a 600-megawatt
23 pulverized coal unit to a 980-megawatt unit, which is the size
24 of one of the two at FPL Glades Power Park, there's economies
25 of scale there, coal technologies and economies of scale

1 technologies. The larger you build it, the smaller the capital
2 cost per kilowatt hour installed.

3 So moving from a 600-megawatt pulverized coal unit to
4 a 980-megawatt pulverized coal unit you get about a 15 percent
5 decrease in cost per kW installed. So if AEP was able to
6 achieve its goal of being within 20 percent of a similarly
7 sized pulverized coal unit, they would be about 35 percent more
8 expensive on a dollars per kW basis versus a 980-megawatt unit.
9 At the end of December, they made a filing with the Ohio Public
10 Utilities Commission saying that they were going to have to
11 delay their filing on cost to the late summer to early fall of
12 2007 because they were unable to achieve their stated goal of
13 20 percent.

14 The second example of the rising costs with respect
15 to IGCC capital costs as you move down the engineering path,
16 was a filing made on April 2nd, 2007 by Duke Indiana before the
17 Indiana Utilities Regulatory Commission. On April 2nd, they
18 filed the results of their frontend engineering design study.
19 They stated that that feed study took 13 months, 11 full-time
20 employees, 15 part-time employees, and 30,000 man hours.

21 As a result of that study, the cost that they
22 reported to the Indiana Utilities Regulatory Commission had
23 risen to \$2 billion in 2011 dollars. Escalating that to 2014
24 puts it at about \$3,500 a kW, which is very similar to the
25 price, the cost that we had in the FPL Clean Coal Technology

1 Selection Study.

2 In addition to that, another data point was the
3 Masaba Project (phonetic), which is a 600-megawatt IGCC project
4 proposed for Minnesota. The Masaba Project filed for tax
5 credits under the Energy Policy Act of 2006, and there is a DOE
6 document associated with that on the award of those tax
7 credits. The cost, the estimated cost of the plant in the
8 spring of 2006 was \$2,155,000,000 for a 600-megawatt plant.
9 Over \$3,500 per kilowatt installed in 2011 dollars, once again.

10 It should be mentioned that 12 days ago, April 12th,
11 two administrative law judges in the state of Minnesota after
12 hearing testimony on the Masaba Project recommended that the
13 Minnesota Public Utilities Commission deny the Masaba Project's
14 contract or proposed contract with Excel because it was not in
15 the best interest of the customers of Minnesota in great part
16 because the costs were unreasonable.

17 So when you look at IGCC projects, it's very
18 important to understand the delta between the original
19 estimates, feasibility study estimates and when you go through
20 that feasibility and more detailed engineering analysis and how
21 those costs rise. If you look at what happened with AEP, you
22 look at what happened with Duke Indiana, and you look at the
23 actual numbers, the proposed numbers for the Masaba Project,
24 those numbers are consistent with the numbers that are in the
25 FPL Clean Coal Technology Study, which indicate a cost premium,

1 a capital cost premium of about 37 percent for an IGCC plant.

2 Q Tampa Electric Company had actually constructed an
3 IGCC plant in 1996.

4 A Yes, they did. And the original cost of that
5 plant -- the original projected cost of that plant was
6 \$303 million of which 50 percent of it was funded by the DOE.
7 The actual cost of the plant as reported by the DOE was
8 \$606 million, double the original projected cost.

9 Q And based on the experience that TECO has had, they
10 are building another one.

11 A They are proposing to build a 600-megawatt unit, a
12 coal-to-electricity 600-megawatt IGCC plant that has never been
13 built before, and they have not completed the feasibility and
14 feed study analysis to the best of my knowledge.

15 Q Now, let's turn to another item on your list here.
16 We have dealt already with the fuel costs, petcoke, et cetera,
17 petcoke and coal. Let's turn to -- we dealt with reliability.
18 Let's turn to technological maturity and construction risk.

19 Now, it's your testimony -- well, first, let me ask a
20 basic background question. It's true, isn't it, that
21 electrical powered utilities tend to be risk averse? Is that
22 right?

23 A I don't think that's a good question to ask me. I
24 can't really comment on that, whether they are risk averse or
25 not risk averse. I think, generally, utilities have a mandate

1 to produce reliable cost-effective power for their customers,
2 and they take actions to produce that type of power for their
3 customers. Your characterization of risk averse is one that I
4 can't really comment on.

5 Q You have testified that IGCC is not really
6 commercially available, is that right?

7 A No. What I have testified is that IGCC plants, there
8 have been four coal-based IGCC plants built in the world,
9 relatively small, government subsidized, and that the next wave
10 of IGCC plants in the 600-megawatt range have not been built
11 yet. So are they commercially available? You could design and
12 build one if you wanted to, if that was your choice, if that
13 was the utility's choice, but those plants are not in operation
14 today.

15 Q The earliest one is actually 13 years ago.

16 A That was a demonstration. Actually the earliest IGCC
17 plant that I am aware of is the Coolwater Facility (phonetic),
18 which was constructed in Southern California. It operated for
19 a few years, had significant problems, and then was torn down.

20 There were four coal-based IGCC plants, relatively
21 small demonstration projects built in the early 1990s.
22 Actually, I correct myself. There was actually five built,
23 three in the United States and two in Europe. One of the three
24 in the United States, Pinyon Pine (phonetic), was constructed
25 by Sierra Pacific Power with a grant from the Department of

1 Energy. It was a complete failure. It never operated. The
2 gasifier was never able to operate, so it was shut down. So
3 there was actually five built, four in operation.

4 MR. GUEST: I would like to ask the witness some
5 questions about a document that has been previously admitted as
6 Staff Exhibit Number 2, composite exhibit, and the Bates stamp,
7 which I think is the exhibit number, or the subnumber is 313.
8 Those being the last three digits. And 314, it is two pages.

9 CHAIRMAN EDGAR: Ms. Brubaker.

10 MS. BRUBAKER: Madam Chairman, if I could just
11 actually step back a second. Earlier a couple of pages from
12 FPL's petition was handed out. At the time the document was
13 being identified verbally, I misunderstood what was being
14 described. If Sierra Club wishes, I think it would be
15 appropriate to identify that document separately. And, if so,
16 that would be 171.

17 CHAIRMAN EDGAR: Okay. For clarity we can go ahead
18 and do that.

19 MR. GUEST: Certainly. 171 is the first page and
20 Page 10 of the petition by FPL.

21 MS. BRUBAKER: Which would have us at Number 172 for
22 the document just handed out. Just for clarity, this is
23 straight from the staff exhibit. You do wish it separately
24 identified?

25 MR. GUEST: For simplicity, yes.

1 CHAIRMAN EDGAR: Okay. Thank you.

2 (Exhibit 171 and 172 marked for identification.)

3 BY MR. GUEST:

4 Q Have you had an opportunity to review this exhibit,
5 Mr. Hicks?

6 A I am looking at it right now. Yes, I have looked at
7 the document.

8 Q Let's start with the total number of coal plants.
9 There is the one in Nuon in the Netherlands from 1994 that runs
10 on coal and biomass, correct?

11 A I see a Nuon (Demkolec), 253-megawatt net rating of
12 power from coal and biomass, yes.

13 Q And below that is the Wabash unit in Indiana from
14 1995 that runs on coal?

15 A Yes. One of the four coal-to-electricity plants that
16 are in operation, IGCC plants.

17 Q The third one is the TECO 1996 plant.

18 A Yes. I would note that the TECO, this line for the
19 TECO plant has an inaccurate capital cost number. It has the
20 original projected cost of 303 million, which was 50 percent
21 funded by the DOE. The actual cost of the plant reported by
22 the DOE was 606 million, double the original projected cost.

23 Q The next one is the Czech Republic plant, which is
24 coal and coke from 1996. That is coal and coke. I'm just
25 going through the coal plants first. Do you see that one?

1 A Yes, I see that one.

2 Q Now we are up to four. Then you have got the one in
3 Spain, three down from that.

4 A And, you know, one thing I would caution you on is
5 Mr. Jenkins has a greater knowledge of some of these other
6 plants, such as the Czech Republic plant, et cetera, and how
7 much of those plants are actually operating on steam.

8 Q Well, we're just counting them right now. And then
9 we have -- you actually have the Schwarze plant that operates
10 on lignite and waste. Lignite is a kind of coal, is that
11 right?

12 A It's a very small plant, a 40-megawatt plant, and my
13 understanding of it, it produces mainly methanol.

14 Q But the question was is lignite a kind of coal?

15 A Yes, it is.

16 Q And then we have two plants at the end of this second
17 page in China that run on coal.

18 A I don't know. Once again, I don't have any
19 verification that these plants are actually in operation. I
20 don't know from this document whether those two Chinese plants
21 are in operation. One appears to be a 2007. I don't know
22 whether they are announced in operation and construction, don't
23 have any verification on that.

24 Q So what we have on this list is eight plants that are
25 IGCC plants that are operating partly or entirely on coal.

1 A And may or may not be producing power at all or
2 relatively small, yes.

3 Q And then if you look at the total number of operating
4 IGCC facilities, which is what this document is, the total
5 number is 17.

6 A And it includes various fuels. As I stated earlier,
7 there is a significant difference between operating on coal to
8 produce power versus other types of fuels. Once again, Mr.
9 Jenkins can provide you greater detail on that.

10 Q And now turning to plants that are in the works, I
11 would like to refer to Staff Exhibit Number 2 at Bates stamp
12 Pages 309 to 11, which we are fixing to distribute here.

13 MR. ANDERSON: Just as a suggestion as things are
14 being passed out, Mr. Jenkins is probably the witness for all
15 the international projects if you have questions, but however
16 you want to proceed.

17 MR. GUEST: I think we can just make a couple of
18 quick points here.

19 CHAIRMAN EDGAR: Okay. So I'm on 173, proposed
20 projects IGCC and polygeneration in North America?

21 MR. GUEST: Right.

22 (Exhibit 173 marked for identification.)

23 BY MR. GUEST:

24 Q And I would like you to either count them or assume
25 that I am correctly counting that there is 39 plants in the

1 works in North America that are IGCC plants.

2 A I think you are mischaracterizing by calling them "in
3 the works". I think those are proposed plants. Many of those
4 plants you can see the start up here is not available. There
5 is a big difference between a proposed plant and one that
6 actually gets built. For example, there is over -- I believe
7 over 150 pulverized coal plants proposed for the United States.
8 It's clear to us that many of those will not be built.

9 There are literally thousands of pulverized coal
10 plants proposed in the world, many of those will not be built.
11 This type of difference between proposed and actual built is
12 something that we have seen over and over again. Many, many,
13 many gas-fired combined cycles were proposed during the gas
14 bubble in the late part of the last decade, early part of this
15 decade. The overwhelming majority of those have never been
16 built.

17 I would also mention that some of these are, for
18 example, you have the TXU 2014 Colorado City and Henderson
19 plants, those are announcements that they are looking at the
20 possibility of building those plants. So saying those plants
21 are in the works is, I think, a mischaracterization of those
22 facilities, many of which are proposed or announcements of
23 potential plants.

24 Q Well, with that correction, you would agree with me
25 then that there is about 39 proposed IGCC plants in the United

1 States?

2 A It appears to be somewhere around 35 to 40 proposed
3 facilities in the United States. Many of them appear to not be
4 producing power, to be producing other types of chemicals.

5 Q And almost all of these are operating on some kind of
6 coal or coal waste. That's the proposal, isn't that correct?

7 A That's the listed fuel on this sheet.

8 Q Now, I would like to turn on this issue lastly to
9 Staff Exhibit Number 2, Page 316 and 317, which will be
10 following our numbers, 174.

11 CHAIRMAN EDGAR: Yes.

12 MR. GUEST: Which is Proposed IGCC Plants Other Than
13 in North America.

14 CHAIRMAN EDGAR: Thank you.

15 (Exhibit 174 marked for identification.)

16 BY MR. GUEST:

17 Q Have you had an opportunity to review that?

18 A Yes, I have.

19 Q So we have about another 27 proposed plants?

20 A Proposed, yes. And I don't know what state they are
21 in, how much is behind them, are they just an initial
22 announcement, et cetera. As a sort of point on this, if you
23 look at Germany's long-run supply plan through the year 2020,
24 they propose 37,150 megawatts of coal-fired power plants. Of
25 those 37,150 in their official supply plan about

1 36,700 megawatts are pulverized coal and circulating fluidized
2 bed and only 450 in their official plan is IGCC. Once again,
3 what information proposed really gives you is rather nebulous,
4 because many proposed plants are never built.

5 Q And most of the ones on this list are coal or coal
6 waste?

7 A Yes.

8 Q So if you put together that 27 and the 39 proposed
9 for the United States, we have 66 around the world, and
10 presumably they are basing their proposals on the experience of
11 the 17 existing plants that have been in service for up to 13
12 years, is that correct?

13 A I have no evidence to support whether or not they are
14 based on the operations of existing plants or not. One thing I
15 would note is each one of these plants with the exception of
16 the Nuon plant in the Netherlands, which is mischaracterized as
17 a 1200-megawatt plant, that's actually a 600-megawatt IGCC and
18 a 600-megawatt combined cycle, that all of those plants are
19 less than -- appear to be less than 600 megawatts.

20 Q Now, continuing on our comparison of benefits of the
21 proposed Glades plant versus IGCC, let's turn to carbon capture
22 costs under the assumption that there will be some sort of
23 regulatory system or tax or cap and trade or something that
24 will provide an incentive in the future to capture and
25 sequester carbon dioxide.

1 MR. GUEST: And in that connection, I think I would
2 like to hand out and show the witness a Department of Energy
3 exhibit from the National Energy Technology Laboratory at the
4 Department of Energy.

5 CHAIRMAN EDGAR: Okay. 175, Cost of Electricity
6 Comparison.

7 (Exhibit 175 marked for identification.)

8 BY MR. GUEST:

9 Q Have you had an opportunity to review this, Mr.
10 Hicks?

11 A I am currently looking at it. I note it says, "Note:
12 Preliminary results as of September 2006. Final report release
13 date January 2007." It does not say where these plants are
14 located, it does not give any backup with regard to how these
15 costs were calculated.

16 Q Okay. I would like to note that this is also listed
17 as RCF-7, just for the record. And I guess this is Number --

18 CHAIRMAN EDGAR: 175.

19 BY MR. GUEST:

20 Q So let's just look at a comparison of the carbon
21 capture costs that you can infer from this bar graph, starting
22 with the tan bars, the two of them on the far left. Do you see
23 those?

24 A Yes, I do.

25 Q And you see that by having carbon dioxide capture you

1 add an additional 1.58 cents to the cost per kilowatt hour. Do
2 you see that?

3 A I'm not sure how that's calculated, what the basis
4 for that is, what type of plant they are looking at, what type
5 of carbon capture system they are using, et cetera. So it
6 shows that. What value that has without looking at the backup
7 to that you just can't make a determination of what the value
8 of that is.

9 Q But you agree with me that the difference is 1.58
10 cents?

11 A On this diagram, yes, 1.58 cents.

12 Q Per kilowatt hour. And let's assume that we have
13 800 -- I'm sorry, 8,760 hours in a year, because there is 24
14 hours in a day and 365 days in a year. And further that you
15 will operate the plant at 90 percent of the time at its
16 capacity of 1960 megawatts.

17 I don't see you working the calculator, Mr. Hicks.

18 A Yes, because there is nothing in here that says this
19 is a 1960-megawatt plant, nothing in here that indicates to me
20 what the -- where these costs were derived from. We know from
21 our own analysis the NETL capital costs and operating costs
22 that they are significantly below the industry. They are as
23 much as 100 percent below the recent indications of costs that
24 I mentioned to the Commission, et cetera.

25 Q Just let's continue with this calculation. I

1 understand the point that you have made. Using the Department
2 of Energy document here, and applying the 1.58 cents to the
3 number of hours in the year to the capacity of the plant
4 assuming it's on line 90 percent of the time, you come up with
5 a carbon capture cost for IGCC estimated at about \$241 million
6 per year. Is that correct?

7 A Without sitting down and doing the calculation, I
8 can't verify that.

9 Q Well, you have got a calculator right next to you. I
10 gave it to you.

11 A But I would prefer to take my time and do the
12 calculation rather than --

13 MR. GUEST: Okay. Well, maybe what we can do is I
14 would like the record to reflect that that is what I have done,
15 and give the witness an opportunity after a break to correct
16 the error if there is one. May we do that?

17 CHAIRMAN EDGAR: Mr. Anderson.

18 MR. ANDERSON: No, we don't agree with that. We
19 think it is an entirely inappropriate comparison. It is well
20 known this document is based upon -- I think it was a generic
21 midwest plant. The witness has testified numerous bases why
22 there is really no foundation for this type of computation. If
23 counsel's client wishes to introduce a computation, they should
24 do it with their own witness.

25 MR. GUEST: This is something that one can take

1 official recognition of because this is the communicative
2 property of multiplication. That is all this is. My point is
3 very simple, is that 1.58 cents applied to the number of
4 kilowatt hours being generated at 90 percent capacity produces
5 a cost of 244 million. That's multiplication, that's all. It
6 is another way of expressing 1.58 cents.

7 CHAIRMAN EDGAR: Ms. Brubaker.

8 MS. BRUBAKER: It seems to me that we are kind of
9 talking past each other. The pure math, I don't think anyone
10 is disputing. I think what the witness is disputing is the
11 underlying facts and assumptions which he doesn't actually have
12 available to him. Even if he did, I suppose he might take
13 still some exception to those underlying assumptions. The math
14 is what it is. With that understanding, can you rephrase the
15 question, or --

16 MR. GUEST: Well, all I'm trying to do is, I'm making
17 one very narrow point, which is that a difference of 1.58 cents
18 translates, if that were correct, would translate to a
19 difference of about \$244 million a year. That's all.

20 CHAIRMAN EDGAR: Do you have further questions?

21 MR. GUEST: Yes. Then I want to compare to
22 supercritical, the right set of green bars.

23 BY MR. GUEST:

24 Q And, if you look at those, Mr. Hicks, you see that
25 that is comparing 8.35 cents 4.97 cents, which gives you a

1 difference of 3.38 cents. Is that correct?

2 A That is what it says on this document, yes. But,
3 once again, you don't know where this plant was built, you
4 don't know what the basis for the capital costs are, you don't
5 know what the basis is for the carbon capture system that's on
6 here. Is this an MEA system; is it an ammonia chill system?
7 So without having that knowledge and being able to comment on
8 that, I can't comment on the veracity of these numbers whether
9 they make any sense or not.

10 Q Well, my point very simply is that using the
11 Department of Energy document that we have before us, you would
12 agree with me that 3.38 cents per kilowatt hour translates to
13 an additional cost of \$522 million per year. Those are
14 equivalent numbers.

15 A That is your calculation. I will agree that is your
16 calculation.

17 Q Okay. And I can assure you that I did it several
18 times. And then the last issue is that if this is correct,
19 based on this issue, and if those numbers are correct, and I
20 assure you they are, the difference in carbon capture costs is
21 a quarter of a billion dollars every year, if this is right?

22 A And I would say from what we know of NETL, that that
23 NETL analysis is not correct, and does not include the most up
24 to date carbon capture systems.

25 Q Now, our previous stipulation that we reached was the

1 confidential study for Florida Power and Light by M.J. Bradley
2 and Associates, that we agreed to read a sentence into the
3 record and ask the question of the witness but not introduce
4 the document. And so here we have this. Let me see if it
5 actually is -- it is actually two sentences. And it is IGCC
6 versus supercritical PC comparison, that is what it is under.
7 And it reads, "Generally speaking, IGCC plants are viewed as
8 cleaner than conventional PC plants in that they have equal or
9 lower emissions of conventional and hazardous air pollutants,
10 use less water, and produce smaller amounts of solid wastes.
11 IGCC plants are also generally more efficient than PC plants,
12 and perhaps, more importantly, they have the ability to capture
13 and collect CO2 much more cost-effectively than PC plants."

14 Do you disagree with the conclusions of these
15 consultants?

16 A Yes, I do. I disagree with those conclusions. That
17 is an environmental consulting firm. That is a firm that has
18 never designed a coal power plant of any technology. Never
19 built one, never operated one. That an opinion of an
20 environmental consulting firm. And there is ample evidence
21 that indicates that many of those conclusions are incorrect.

22 MR. GUEST: May I have a moment? May we have a
23 couple of minutes? I'm having trouble making a conversion.

24 CHAIRMAN EDGAR: Take five in place. Everybody stay
25 close.

1 (Brief recess.)

2 CHAIRMAN EDGAR: Okay. We are going to go back on
3 the record from break.

4 Mr. Guest.

5 MR. GUEST: We have reached an agreement where what
6 we are going to do is I'm going to read a sentence or two of
7 the same confidential report to the witness, but he's going
8 have an opportunity to review the preceding pages and think
9 about it before he answers. That's our compromise.

10 CHAIRMAN EDGAR: Mr. Anderson.

11 MR. ANDERSON: Yes. We just wanted the witness to
12 have the context of the sentence or two he is looking at.

13 BY MR. GUEST:

14 Q Do you have it, Mr. Hicks?

15 A I have two pages in front of me. One that's labeled
16 5-3 in the bottom right corner and one that is labeled 5-2 in
17 the bottom right corner.

18 Q Would you be kind enough to review those two pages,
19 and when you have reviewed them I may ask you a question or
20 two.

21 A Okay. I have looked through them.

22 Q This is yet another excerpt from the confidential
23 Bradley study of the proposed Glades coal plant, and on one of
24 the pages it reads --

25 MR. ANDERSON: If we might pause for a moment. I

1 don't think that is the right characterization of the document.

2 MR. GUEST: Go ahead. Maybe we can --

3 MR. ANDERSON: Do you have the first page? Just tell
4 us the title of the document, because I think it was pre-FGPP.

5 MR. GUEST: Okay. Assessment of future environmental
6 liabilities --

7 MR. ANDERSON: Right. Thank you.

8 MR. GUEST: -- facing a new coal-fired power plant in
9 Florida, April 2006 Report Update prepared by M.J. Bradley and
10 Associates on behalf of Florida Power and Light.

11 MR. ANDERSON: Thank you for being clear. That was
12 exactly my point that it wasn't FGPP specific.

13 CHAIRMAN EDGAR: Okay. Thank you, Mr. Anderson.
14 Mr. Guest.

15 BY MR. GUEST:

16 Q And on one of the pages, the second one that you
17 have, it reads, "The avoided cost of carbon dioxide from the
18 IGCC is less than half that from the PC plant. Similar studies
19 by EPRI and others have produced similar results."

20 And my question is I just showed you a set of
21 computations that showed that according to the Department of
22 Energy, Number 175, according to the Department of Energy
23 National Energy Technology Laboratory Report, the cost would be
24 about double. Isn't it true that the confidential report that
25 says about half, one, in the first sentence, and, two, the

1 similar studies by EPRI and others, are all consistent with
2 that finding that the cost for IGCC of carbon capture is about
3 half?

4 A No, I would not agree with that, and let me give you
5 some more clarity, some more color on that. Many of these
6 studies, and this is an example of it, were done on older types
7 of carbon capture systems. If I were to come before the
8 Commission two months ago, I would have told you there's about
9 25 different R&D programs out there for carbon capture from
10 pulverized coal plants. Today I can come here and tell you
11 there is well over 30 because of the concentration now on
12 carbon capture.

13 One of the most promising examples of carbon capture
14 for pulverized coal plants is a system being developed by
15 Alstom (phonetic) called an ammonia chill system. That ammonia
16 chill system has been recognized by many as being a quantum
17 leap in technology with regard to carbon capture for pulverized
18 coal systems. One indication of that is in the second
19 paragraph of Page 5-2, where it talks about the volume of
20 syngas being an issue.

21 One of the challenges for IGCC is that about
22 20 percent of the total amount of electricity produced by IGCC
23 plants is actually burned up inside the plant to keep the plant
24 running. For a PC plant, about 6.5 to 7 percent is actually
25 used up. So it is a big advantage for a PC plant.

1 One way of substantially reducing the cost of CO2
2 capture for a PC plant is to chill or bring down the
3 temperature of the flue gas. By bringing down the temperature
4 of the flue gas from 120 to 140 degrees down to about
5 35 degrees Fahrenheit, the volume of that flue gas is
6 dramatically reduced, dramatically reducing the cost of
7 subsequent capture. This ammonia chill process has actually
8 been embraced by several utilities, including We Energies
9 (phonetic), which now is a 5-megawatt test pilot at their
10 Pleasant Prairie project, and by AEP. AEP is doing a
11 30-megawatt project in West Virginia and then following up with
12 a much larger project that will commercially demonstrate this
13 technology.

14 So things are changing very rapidly with regard to
15 carbon dioxide capture. So these type of statements based upon
16 older obsolete technologies may or may not be true,
17 particularly when you look at the differences between a
18 600-megawatt IGCC plant updated for those feed costs, those
19 more robust costs that come from going through the feasibility
20 and frontend engineering design analysis versus a 980-megawatt
21 or 2000-megawatt plant at the FGPP site.

22 It is fairly widely recognized by many that the costs
23 for carbon capture for both IGCC and PC will converge over
24 time. This study mentions an EPRI study. There is a recent
25 EPRI study done for CPS in Texas looking at the comparison

1 between an ultra-supercritical plant and an IGCC plant. The
2 conclusion is both with and without capture, the cost of
3 electricity from the ultra-supercritical plant is less.

4 Also, the MIT study that recently came out in March,
5 a well-received MIT study stated that they also anticipated the
6 cost for the two types of capture systems to converge. And
7 given the uncertainty of future costs, it makes a very primary,
8 a first and very primary recommendation. The first and primary
9 recommendation of the MIT study is that entities such as
10 utilities that are designing and building coal-fired power
11 plants today, that they design those plants to be as efficient
12 as economically justifiable. And by doing so you reduce the
13 amount of CO2 that has to be dealt with no matter what regime
14 or what control mechanism is employed.

15 With FGP, with the Glades Power Park, that is exactly
16 what FPL is doing. It is building the most efficient
17 coal-fired power plant ever proposed for the United States, and
18 that coal-fired power plant will be advantaged versus every
19 other type of coal plant. Just during this cross-examination,
20 I showed you that the next generation TECO proposed IGCC plant
21 was almost 10 percent less efficient, meaning almost 10 percent
22 more CO2 that is going to have to be captured at a later date.
23 So, I don't agree with what is in this thing because technology
24 is changing rapidly.

25 Q Just one final follow-up. A second to final

1 follow-up apparently, is you do agree that the quantity of flue
2 gases pouring out of the smoke stack, if you will, in your
3 pulverized coal plant is 160 times larger?

4 A No, I don't. That depends on the type of IGCC
5 technology that's employed. The amount of flue gas volume
6 coming out of a PC plant versus an oxygen-blown IGCC plant is
7 different than a comparison of volume between a pulverized coal
8 plant and an air-blown IGCC plant.

9 Q Okay. I want the comparison to be syngas, like the
10 TECO plant, versus a supercritical pulverized coal plant. That
11 is 160 to one, isn't it?

12 A I don't know whether it is 160 or not. I do know the
13 volume is higher, but as I mentioned earlier, with the ammonia
14 chill process for a very small penalty in terms of parasitic
15 load, or the energy that is used up inside the plant, you can
16 dramatically reduce that volume of flue gas that needs to be
17 treated for CO2 emissions.

18 Remember I said earlier, an IGCC plant, about
19 20 percent of the gross power from that plant is used up
20 internally to run the plant versus about 6.5 percent for
21 pulverized coal plant. For a penalty of only about a percent
22 or two more you can dramatically reduce the volume of flue gas
23 that needs to be treated in a pulverized coal plant by chilling
24 that, and that is exactly what this Alstom ammonia chill
25 program is addressing.

1 Q That is not part of this plant, is it?

2 A This plant can be readily modified to include a wide
3 variety of carbon capture, carbon conversion, and advanced
4 combustion techniques. This plant is on a site that is 4,900
5 acres, of which 4,000 will be on the plant side, and we are
6 leaving space in the design to allow this plant to be readily
7 upgraded to include carbon capture systems when and if they are
8 needed.

9 Q So what you have now is basically a footprint. Does
10 it have grass on it?

11 A We have a footprint, we have a design for the plant,
12 and that is very similar to IGCC plants. IGCC plants from the
13 major vendors are leaving a space for carbon capture in the
14 plant design similar to what is being done with the FPL Glades
15 Power Park. In fact, General Electric will tell you that they
16 are leaving a space that is 500 feet by 500 feet in the design
17 for potential future carbon capture.

18 Q That's about four acres of grass, right?

19 A It about four acres. It may have grass on it or not.
20 I would mention that most of this site is in sugarcane
21 production right now.

22 MR. GUEST: Okay. No further questions at this time.

23 CHAIRMAN EDGAR: Mr. Krasowski, do you have questions
24 on cross for this witness?

25 MR. KRASOWSKI: Yes, I have a few, Madam Chair.

1 Thank you.

2 CROSS EXAMINATION

3 BY MR. KRASOWSKI:

4 Q Hello, Mr. Hicks.

5 A Hello.

6 Q Mr. Hicks, I noticed in your testimony that you
7 are -- let's see, you're in charge specifically of the -- you
8 head up this project, the development of this specific project?

9 A Yes, I am. I am the senior director of project
10 development. I have direct responsibility for the FPL Glades
11 Power Park.

12 Q So in doing so, you are specifically focussed on this
13 project. Have you done an evaluation or been involved in the
14 evaluation of alternatives or energy efficient programs?

15 A Prior to about May of 2006, I was the development
16 group at FPL, and I had responsibility for the -- well, I was
17 the Director of Project Development responsible for the West
18 County Energy Center, which was granted a site certificate in
19 December. I was in charge of the nuclear development. I was
20 in charge of coal-fired development.

21 I have also worked on the wind demonstration project
22 that FPL is working on in the state of Florida. I would say
23 around the late fall of 2005, I commissioned a study, a mapping
24 of the state of Florida with regard to potential wind
25 generation. And we used a firm called Wind Logics, which is a

1 firm that we use on the FPL Energy side. And I know that being
2 a customer of FPL that you are probably aware that FPL Energy
3 competes with a utility out of Spain of being the largest
4 developer of wind turbines in the world.

5 So we employed Wind Logics to do wind mapping of the
6 state of Florida, and there are three conclusions that came out
7 of that wind mapping. Number one, the State of Florida is a
8 relatively poor state with regard to wind resources. It
9 doesn't have the type of wind energy necessary to make wind
10 generation commercially viable, particularly with regard to
11 independent power development.

12 Number two, the wind that is available in the state
13 is really concentrated on the coastline between South
14 Hutchinson Island in St. Lucie County up to Jacksonville on the
15 east coast of the state and sort of around the horn between
16 Sarasota and Naples on the west coast.

17 The maximum capacity factors, or availability factors
18 for wind in those areas range between 15 to 20 percent. As a
19 rule of thumb, a typical capacity factor that one needs with
20 production tax credits to make wind viable is about 33 percent.

21 And then the third conclusion we came to was that
22 wind is a seasonal resource in the state of Florida. Really
23 what you see is that what wind there is is really concentrated
24 between October through April of the next year.

25 Given that set of data, I then commissioned two

1 additional studies. One that focussed just on the east coast
2 of Florida from South Hutchinson Island up to Jacksonville and
3 one from Sarasota down to Naples. And those were concentrated
4 studies in those areas. And what we found, the conclusion we
5 found is if you are right on the coastline, you can get a 15 to
6 20 percent availability factor. If you move even a half a mile
7 inland, it drops to about 5 percent.

8 With that information in tow, we attempted to build
9 or attempted to permit a wind demonstration project of about
10 ten megawatts. And that ten megawatt facility, we are actually
11 on our fifth site right now. The first site was in New Smyrna.
12 I got voted down by the city commission there four-to-one.

13 We then went to Cape Canaveral. Cape Canaveral juts
14 out. It is part of the development business. You don't always
15 get your first one, so you pick up the pieces and you move on.
16 So then we moved on to Cape Canaveral. And if you look at the
17 geography of the state, Cape Canaveral sort of juts out and
18 gets natural wind. We looked both at the Cape Canaveral Air
19 Force Station, and were rejected there by the Air Force, and
20 then we went to NASA.

21 Now, we learned something new when we went to NASA.
22 That north/south access along the east coast of the state,
23 that's where you get a lot of bird migration. In fact, one of
24 the largest bird refuges in the state is just north of Cape
25 Canaveral. Well, NASA was very keen on employing this

1 technology, but Fish and Wildlife won out at the end of the
2 day.

3 Then we went to Sarasota. We got rejected there.

4 And we are on our fifth site that we are working on
5 right now. So, we have looked at renewables.

6 We also looked at solar. We looked at commercial
7 solar. FPL Energy, our subsidiary, is one of the largest solar
8 developers in the world, and has the largest plant in the
9 Mojave Desert. And a couple of conclusions we came to by
10 leveraging their expertise is solar in the state of Florida, you
11 are looking at about a 15 to 20 percent, or 15 to 17 percent
12 availability factor and very high costs.

13 So, yes, we have looked at renewables. I have not
14 looked at energy efficiency and demand-side management. That
15 is the purview of others within our company.

16 Q All right. Thank you. I wasn't expecting such a
17 long answer, but I appreciate it. It's good to know these
18 things.

19 Let me ask you, earlier you said something about the
20 difference between a proposed plant and one that will actually
21 be built. What is the status of this FGPP plant, is it
22 proposed, as well?

23 A It is a proposed facility.

24 Q Okay. Thank you. That's good enough. I mean, I
25 just wanted to make that point. If you don't mind, I don't

1 want to take too much time. I'm not an expert lawyer, so I
2 don't want to be burdened with delaying everyone else. Okay.
3 If we can keep it brief and to the question.

4 Now, this plant, as you specified, is very important
5 and has been designed for bituminous coal. Is that Appalachian
6 coal?

7 A It has been designed with two design points. One is
8 for bituminous coal.

9 Q Exactly.

10 A And the second design point is bituminous coal and
11 petroleum coke.

12 Q Is the bituminous coal Appalachian coal?

13 A It could be Appalachian coal, it could be western
14 coal, it could be foreign coals. This plant could also, with
15 derates also burn subbituminous coal. So, you could source
16 coal, bituminous coals domestically and foreign coals.

17 Q Do you have any concern with the fact that the
18 Peabody Coal Company has pulled out of Kentucky and Appalachia?

19 A They have not pulled out of Kentucky and Appalachia.
20 What they have done is it looks like what they are going to do
21 is spin-off their Central Appalachian facilities. I don't view
22 it as a concern. I view it as an opportunity to potentially
23 maybe through an equity investment or some other vehicle gain
24 long-term very good long-term pricing for our customers.

25 Q Are you aware of the recent determination in the Ohio

1 Valley Environmental Coalition versus the United States Army
2 Corps of Engineers --

3 A I'm not aware of that. I think Mr. Schwartz was
4 aware of that.

5 Q Okay. Are you concerned that this case shows that
6 there is a large community effort to restrict the use of
7 mountaintop removal and other practices?

8 A I'm not aware of that.

9 Q Now, you said if the Commission would have asked you
10 two months ago about sequestration technologies that you would
11 have been able to tell them about 25 methods?

12 A About 25 R&D programs, yes.

13 Q Now we are up to 30?

14 A Well over 30, yes.

15 Q How many opportunities will there be in a year or
16 two? How many opportunities for sequestration, or different
17 technologies, or methods do you think there will be in a year
18 from now?

19 A What I was discussing was carbon capture. Carbon
20 capture and sequestration is a sort of horse and cart issue.
21 Where the horse is sequestration, the cart is carbon capture.
22 Without sequestration it doesn't matter what the carbon capture
23 system is. But nevertheless, there are a number of carbon
24 capture programs in place.

25 In terms of sequestration, one of the primary

1 potential sequestration types, or sequestration areas,
2 potential sequestration areas is deep saline aquifers. The
3 estimated total capacity of deep saline aquifers in the world
4 is about 9,600 gigatons. A gigaton is about a billion tons.
5 About 40 percent of that world potential capacity is in the
6 United States.

7 FPL has a service territory of about 27,650 square
8 miles. Of that 27,650 square miles, virtually all of it is
9 characterized geologically by deep saline aquifers. In
10 addition, there was oil drilling that occurred about 75 miles
11 southwest of the plant. That has left depleted oil well fields
12 which is also a potential reservoir for carbon sequestration.
13 So there is another option there available, also.

14 Last of all, there has been discussion or there has
15 been research into using the different levels of the sea to
16 capture carbon, and the Gulf of Mexico is within striking
17 distance of this plant. So there is a number of different
18 options out there available for sequestration.

19 Once again, the MIT study recognizes that not a lot
20 has been done in the United States. Not in the United States,
21 but in the world, not a lot has been done in terms of
22 sequestration. And it recommends, given that lack of
23 uncertainty, and it makes recommendations with how to address
24 it, but given that lack of uncertainty, coal plant developers
25 should build their plants as efficient as economically

1 justifiable.

2 Q Now, why would you capture the carbon and what would
3 you do with it if you weren't going to sequester it?

4 A There are other potential things that can be done
5 with carbon. For example, enhanced oil recovery is generically
6 a way of doing it. Now, there isn't enhanced oil recovery
7 fields field close and in Florida, but that is another option
8 available.

9 Q Okay. And there is a lot of debate and analysis as
10 to how effective or what amount of sequestration could occur
11 with that, and what is the cost/benefit of doing that in the
12 oil that you then reclaim and then the pollution associated
13 with the oil that you burn after you go through the effort of
14 bringing it out of the ground and how much pollution that
15 creates.

16 A I wouldn't necessarily characterize it as a lot of
17 debate. I think that, you know, enhanced oil recovery is one
18 option. And there is a lot of work that's going to be done on
19 that and other sequestration efforts in the country and around
20 the world.

21 Q Are you familiar with the Department of Energy --
22 they are participating in a project near Orlando for IGCC? Is
23 that what you referred to earlier when you said -- when you
24 mentioned something about the DOE having a project in --

25 A DOE is cofunding a number of projects. One of them

1 in the Stanton B project, which is a 283-megawatt IGCC project
2 in which they provided about \$230 million of funding. That
3 project appears to be going forward in Orlando. I would
4 mention that the emissions profile of that plant is
5 significantly worse than the emissions profile for the FPL
6 Glades Power Park, particularly with regard to nitrogen oxide
7 and mercury.

8 Q And when will the study associated with that project,
9 when will the results be understood for analysis?

10 A I believe that that is a -- it is a project to
11 demonstrate the ability of IGCC to operate on Powder River
12 Basin. That is my understanding of it. And I believe it is a
13 four year -- it is projected to come on-line in 2011 and be a
14 four-year demonstration of whether or not that technology
15 actually works.

16 That technology has never been built greater than, I
17 believe, four or six megawatts. So you are scaling that
18 technology up about 50 to 60 times. So there is a question
19 about whether or not the technology would actually work, and it
20 is a demonstration to see if that technological works, and
21 particularly if that technology can work with Powder River
22 Basin.

23 Q Being that the ratepayers, and if certain laws are
24 passed, being that the ratepayers will pay one way or the other
25 for this plant that you propose to build, how does the cost

1 compare between IGCC and what's proposed now, whether it is
2 ultra-supercritical, the plant you are proposing to build?

3 A I think Mr. Sim actually did an analysis on that and
4 he is going to testify, and you can ask him that question. But
5 it is a substantially higher present value of revenue
6 requirements for an IGCC plant at the site versus an
7 ultra-supercritical plant.

8 Q I have just a few more questions. How does the
9 requirement to use lower level aquifer waters impact the cost
10 being that the lower level waters -- because there is a drought
11 now, and there is a discussion with the South Florida Water
12 Management District, okay, as far as what waters you will be
13 able to access. If you have to go lower, how will that impact
14 the cost of the plant?

15 A The water supply plan for the project involves four
16 types of water. Number one is what we call the Upper Floridan,
17 which is a nonpotable or non-drinking water source that has
18 saline qualities to it. The operations and maintenance costs
19 associated with using that are in the project budget.

20 The second type of water resource is what we call
21 excess stormwater. There are discharges from the lake every
22 year. Those discharges cause environmental issues both in the
23 St. Lucie estuary and in the Fort Myers area. Under the supply
24 plan that we have proposed that we are working with with the
25 South Florida Water Management District, they would notify us

1 when we should use that excess stormwater to better utilize
2 that water.

3 Number three, this is a 5,000 acre site. We are
4 going to have significant catchment ponds, or water storage on
5 the site, so we will use that as a third water supply. Last of
6 all --

7 Q Mr. Hicks, could you just stick to my question, which
8 was how --

9 CHAIRMAN EDGAR: Mr. Krasowski, let me do that, okay?

10 MR. KRASOWSKI: Yes, ma'am. I was trying to focus.
11 I'm sorry. My apologies. I didn't mean to offend you.

12 CHAIRMAN EDGAR: We have been trying to focus for a
13 couple of days actually. But, why don't you pose your question
14 to the witness.

15 MR. KRASOWSKI: Yes.

16 BY MR. KRASOWSKI:

17 Q The question is how will the need, if necessary, if
18 it is necessary to draw from a lower aquifer impact the cost of
19 operating the plant, whether it be IGCC or the plant you
20 propose, given that that lower material is understood to
21 require more treatment for it to be used in the method you want
22 to use it?

23 A If you could clarify your question. We are using one
24 of the four water sources, the Upper Floridan. Are you talking
25 about the Upper Floridan?

1 Q Well, that is the one that there is a problem with
2 because of the drought.

3 A No, we have not got an indication from the South
4 Florida Water Management District that there is a problem with
5 that.

6 Q Oh, really?

7 A No.

8 Q You are not aware that they have issued a declaration
9 that they will no longer be permitting extractions from the
10 Everglades Water Basin to build homes or businesses?

11 A No, I'm not aware that. In fact, we are in constant
12 communication with them. We have had on-going meetings, and
13 they have not expressed, to my knowledge, any reticence with
14 regard to our drawing from the Upper Floridan.

15 The water supply plan we are for FPL Glades Power
16 Park is very similar to the water supply plan that the South
17 Florida Water Management District approved for the West County
18 Energy Center.

19 Q Okay. Have you identified your fly ash and bottom
20 ash and other byproduct buyers?

21 A Yes. We have had on-going discussions with a number
22 of buyers. One buyer -- I could sign contracts for both fly
23 ash and the bottom ash and the synthetic gypsum. Synthetic
24 gypsum is a direct result of the flue gas desulphurization
25 process. Limestone is used in that flue gas desulphurization

1 process, and the byproduct is synthetic gypsum which is
2 actually of a higher quality gypsum than naturally occurring
3 gypsum for the use in wallboard. And I could sign contracts
4 very quickly for 100 percent of all of those resources. In
5 fact, one wallboard manufacturer is very keen to get access to
6 this because they claim that if they could gain access to this
7 synthetic gypsum they could control the wallboard market south
8 of Orlando. So very keen interest.

9 One opportunity that I'm pursuing on that is an
10 overall opportunity that would involve getting limestone from a
11 limestone supplier for free and then providing them the
12 byproducts and they would take the byproducts. So from a plant
13 perspective, the plant manager would not have to worry about
14 either limestone supply or dealing with the byproducts
15 themselves. So, a number of different options available to us.

16 Q What are you going to do with the ash if it
17 becomes -- if it has to be held on-site?

18 A If it had to be held on-site, it would be landfilled
19 in a double-lined landfill that meets all federal and state
20 requirements.

21 Q And where is that, on-site?

22 A It would be on-site, yes, sir.

23 Q And how much of a capacity do you have on-site for
24 the ash byproduct?

25 A We have ample capacity on-site. Even though it

1 appears that all of those byproducts will be sold, we have
2 ample capacity on-site for the entire life of the plant.

3 Q Really. And who was responsible for, or will it be
4 included in your costs, the train, the repair or bringing up to
5 standards the train tracks? I understand they are not in any
6 shape to be taking these coal shipments.

7 A No, that is not correct. This site is advantaged in
8 the sense that the southern boundary of the site is the South
9 Central Florida Express. The South Central Florida Express
10 connects to two major networks, the Norfolk Southern and the
11 CSX. That gives us rail competition, origin and destination,
12 foreign and domestic. Very important for the life-cycle
13 economics of a power plant.

14 The South Central Florida Express, and I think this
15 is what you are alluding to, has signed two agreements with the
16 DOT. In those two agreements, the DOT is funding 75 percent of
17 the total upgrades necessary to bring those lines up to a
18 status that will allow heavy trains such as the coal trains and
19 heavy equipment trains to access the site. The first contract
20 is from Lakeport, which is a town on the south side of the
21 lake, to Morehaven, which is in Glades County. That upgrade
22 has already been completed.

23 The second contract has already been let out, and
24 that upgrade will be completed by the Spring of 2008, in time
25 for us to start construction and reduce the transportation cost

1 for major equipment to the site. So, those issues have been
2 resolved. Those issues would have been resolved whether or not
3 we built the plant.

4 Q So it is not a cost to you?

5 A We have a contract with the South Central Florida
6 Express for the life of the plant, and that's about 99 percent
7 completed. But the costs associated with those upgrades, they
8 were funded 75 percent DOT, 25 percent South Central Florida
9 Express. They would have been completed regardless of whether
10 or not this plant is actually built.

11 Q 75 percent was funded by the DOT?

12 A Florida Department of Transportation, yes, sir.

13 Q Florida Department of Transportation. And I assume
14 that is taxpayer money?

15 A I don't know where that money comes from.

16 Q They don't print it, right? Okay. You don't know.

17 And my last question is how does the close proximity
18 to the Everglades National Park and the monies dedicated to the
19 Lake Okeechobee cleanup enter into the appropriateness of your
20 site selection for this FGPP project?

21 A FPL takes its responsibility as an environmental
22 steward very, very seriously. And we have designed this plant
23 with six separate pollution control devices, almost a billion
24 dollars worth. Four of those pollution control devices -- all
25 of those pollution control devices are wrapped under a single

1 air quality control system contract where the supplier
2 guarantees the emissions control. Four of those are proven
3 technologies in operation, state of the art. Two are next
4 generation technologies. With all of those pollution control
5 technologies this project will be very environmentally
6 sensitive for its location. I should mention that there is a
7 landfill to the east of the site, and a state penitentiary to
8 the south, and it's in an agriculture area, so it is well
9 suited. It also provides a substantial economic benefit to the
10 people of Glades County and surrounding areas.

11 Q One more last question if, I may. I apologize. What
12 is the cost to the DOT for their participation in the rail
13 contract?

14 A They are not participating in the rail contract.
15 They have two separate -- before we even got involved with
16 them, the DOT and South Central Florida Express put together a
17 package to upgrade those rail lines. So DOT is not part of the
18 contract for rail service between the South Central Florida
19 Express and FPL. Those upgrades would have been completed
20 whether or not the power plant was built there.

21 The contract we have is with the South Central
22 Florida Express for transportation to pick up trains from CSX
23 at Sebring, bring them to the plant site, pick up trains from
24 the Northfolk Southern FEC at Fort Pierce and bring them to the
25 plant site.

1 Q So I suppose I should ask DOT what that cost was? I
2 mean you, are not involved in that?

3 A That's not my bailiwick, no.

4 MR. KRASOWSKI: Okay. Thank you very much, Mr.
5 Hicks.

6 THE WITNESS: You're very welcome.

7 MR. KRASOWSKI: Thank you, Madam Chair.

8 CHAIRMAN EDGAR: Thank you.

9 Are there questions from staff for this witness?

10 MS. BRUBAKER: Yes.

11 CHAIRMAN EDGAR: Any idea of how long?

12 MS. BRUBAKER: I would say about ten or fifteen
13 minutes, depending on the length of the answers.

14 CHAIRMAN EDGAR: Okay. Why don't we go ahead and,
15 Commissioner McMurrian, I will give you the option. Would you
16 like to ask your questions now or go on lunch break and you can
17 start then? You're fine either way? Okay. Commissioner
18 Carter, your preference?

19 I'm hungry, so let's take a lunch break and we will
20 come back at 2:00 o'clock. And we will continue with this
21 witness at that time.

22 Thank you.

STATE OF FLORIDA)

:

CERTIFICATE OF REPORTERS

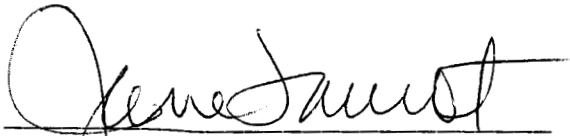

COUNTY OF LEON)

WE, JANE FAUROT, RPR, and LINDA BOLES, RPR, CRR, Official Commission Reporters, do hereby certify that the foregoing proceeding was heard at the time and place herein stated.

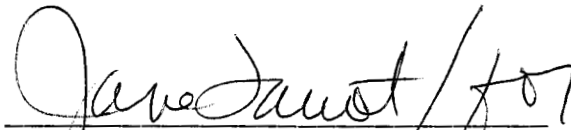

IT IS FURTHER CERTIFIED that we stenographically reported the said proceedings; that the same has been transcribed under our direct supervision; and that this transcript constitutes a true transcription of our notes of said proceedings.

WE FURTHER CERTIFY that we are not a relative, employee, attorney or counsel of any of the parties, nor are we a relative or employee of any of the parties' attorneys or counsel connected with the action, nor are we financially interested in the action.

DATED THIS 25TH DAY OF APRIL, 2007.

JANE FAUROT, RPR
FPSC Official Commission
Reporter
