**TO:** Ann Cole, Commission Clerk - PSC, Office of Commission Clerk  
**FROM:** Cristina Slaton, Executive Secretary to Commissioner Balbis  
**RE:** Docket Correspondence – 080503-EI

080503-EI

Ann,

This office has received the attached letter from Richard Sedano, Director, US Programs, The Regulatory Assistance Project (RAP). RAP is listed as an interested party on docket no. 080503-EI.

The correspondence has not been viewed or considered in any way by Commissioner Balbis. Under the terms of the advisory opinion from the Commission on Ethics (issued July 24, 1991 as CEO 91-31-July 19, 1001), the attached letter does not constitute an ex parte communication by virtue of the fact that it was not shown to the Commissioner. Because it is not deemed to be an ex parte communication, it does not require dissemination to parties pursuant to the provisions of section 350.042, Florida Statutes. However, in such cases Commissioner Balbis has requested that a copy of the correspondence be placed in the correspondence folder of the docket file.

Energy solutions  
for a changing world

Commissioner Eduardo Balbis  
2540 Shumard Oak Boulevard  
Gerald Gunter Building  
Tallahassee, FL 32399

February 9, 2011

Dear Commissioner Balbis,

The Regulatory Assistance Project (RAP) has been advising commissioners for nearly two decades on the long-term economic and environmental sustainability of the power and natural gas sectors. RAP's principals are all former regulators. While we enjoyed our time in government, we now devote our careers to helping public officials with the important challenges you face, providing educational and policy assistance on a broad range of issues that are critical to the work you do. With this letter, I would like to introduce you to RAP.

RAP is a non-profit that receives funding from foundation and government sources that enables us to provide significant support to states at no charge. RAP traditionally does not have "clients" and you won't see us representing parties in your hearing rooms. Rather, we are here to serve decision-makers as advisors, conveners and idea generators.

In our current and ongoing US activities, RAP staff members assist the NARUC Climate Policy Task Force and the NARUC-FERC Smart Response Collaborative. Much of our work with states relates to energy efficiency, demand response and renewable energy deployment, and we work with national associations such as NARUC, NASEO and NACAA to help integrate energy and environmental policy.

RAP also supports the State Energy Efficiency Action Network (continuing our work with the National Action Plan for Energy Efficiency); the Lawrence Berkeley National Laboratory's work on the Smart Grid Investment Grant's dynamic pricing and consumer behavior studies; and the Western Governors' Association work on Renewable Energy Zones. While we have assisted nearly every state in the US, RAP also supports government officials in China, the European Union, India and other regions.

In addition to the direct assistance we provide, RAP frequently publishes papers on current and emerging regulatory topics. Recent papers include:

- *Clean First: Aligning Power Sector Regulation with Environment and Climate Goals*
- *Smart Policies Before Smart Grids: How State Regulators Can Steer Investments Toward Customer-Side Solutions*

Global  
US  
China  
EU

The Regulatory Assistance Project

50 State Street, Suite 3  
Montpelier, Vermont 05602

phone: 802-223-8199  
fax: 802-223-8172

[www.raponline.org](http://www.raponline.org)

These and other reports and PowerPoint presentations covering a full range of topics can be found on our website at [www.raponline.org](http://www.raponline.org). RAP's upcoming work will include a paper on decoupling utility revenues from sales; a guide to utility regulation; a piece on utility pricing; a report showing how energy efficiency dramatically reduces line losses; and a companion piece on integrating energy efficiency into transmission and distribution planning.

Our objectives are to provide basic insights for commissioners and staff members who are new to these issues, identify new challenges and offer guidance based on our many years of experience and observations.

Most of our US team, including Lisa Schwartz, Dave Farnsworth, Chris James, Richard Cowart and myself, will be at the Winter NARUC meeting next week. On Tuesday, I will be on the Committee on Energy Resources and the Environment's afternoon panel on integrated resource planning. We would enjoy meeting you during the week or at a later time to discuss the challenges you face and explore ways that RAP might be of help.

Best wishes on the important work you do,

Richard Sedano

Commissioner Nathan Skop  
FL

Dear Public Service Commissioner,,

Florida can do better! The proposed 10% renewable energy standard by 2025 is too timid. We must be as aggressive in fighting global warming as we are in pursuing clean industries. A measly ten percent is not doing either.

To avoid the worst impacts of global warming, we must be working toward decreasing greenhouse gas emissions 80% by 2050. The Sunshine state has some of the best solar resources in the country and should be capitalizing on this abundant resource. Governor Crist recognizes the economic opportunities of fighting global warming: Florida will have a new clean energy industry offering green jobs while protecting Florida's assets from rising seas and stronger storms.

A better RPS is good for rate-payers! Renewable energy will bring electric rates down by diversifying

7/12/2010

the energy portfolio. The average electric bill for Florida residents has increased 25% since 2005 because of an over dependence on fuel that suffers from price shocks in a global market. Sun and wind are local resources that can't be manipulated by foreign governments or market speculators and the jobs created can't be outsourced.

Furthermore, ten percent will not bring renewable energy companies to Florida! Other states are providing stronger standards and we must be able to compete for these companies. The Florida PSC should be as aggressive and decisive as the Governor and Legislature and increase the standard to 20% renewable energy by 2020.

Thank you for your time and hard work.

Sincerely,

Tanya Peterson

## FIRST ENERGY IN OHIO RELEASES PLAN TO RIP OFF CUSTOMERS

### Ohio's Energy-Efficient Light Bulb Program

At the request of Public Utilities Commission of Ohio (PUCO) Chairman Alan Schriber, FirstEnergy has agreed to further discuss with the Commission its PUCO-approved program to provide compact fluorescent light bulbs to customers of its Ohio utilities -- Ohio Edison Company, The Cleveland Electric Illuminating Company and The Toledo Edison Company.

What will be under discussion is First Energy's CFL Program.

According to First Energy this is "To help customers use energy more efficiently, we're delivering two compact fluorescent light bulbs (CFLs) to the homes of residential customers of FirstEnergy's Ohio operating companies -- Ohio Edison Company, The Cleveland Electric Illuminating Company, and Toledo Edison Company. These types of bulbs use up to 75 percent less electricity than incandescent bulbs and can last 10 times longer -- contributing to significant money and energy savings over the life of the bulb. Providing energy-efficient light bulbs is just one way we can help our customers save money while also helping the environment."

But here is the truth behind the "feel good" program and that it's a total outrage and a severe rip off of First Energy customers.

First Energy is going to deliver two lightbulbs to each customer. The lightbulbs cost FE \$3.50 each (\$7.00 total) but whether you want them or not, First Energy will be allowed by the PUCO to charge \$.60 per month for three years (\$21.60) for those \$7 lightbulbs (that you could actually buy at a store for less than that).

IN ADDITION TO THAT OVERCHARGE, the utility will be allowed to charge you an "assessment fee" to make up for the lower electricity use. In other words, if you use a dollar less each month with the bulbs then the company can charge you the dollar anyway. And yes, if you don't use the bulbs at all, you still get the fee charge.

This is no different than the Federal Government's current approach on health care. First Energy is forcing you to buy two \$3.50 light bulbs for the \$21.60 price whether you want them or not.

Now before you dismiss this craziness as some sort of insanity that could only happen in Ohio (or California or

Wisconsin or .... ), I think you are now getting the idea. States copy each other in just what they can get away with when it comes to new taxes, fees or excuses when it comes to putting their hands in your pockets. It may not be tomorrow or next week, but if Ohio and First Energy gets away with this one, the 49 states will see the approach sooner or later.

Incidentally this government endorsed "green" approach to daily life that costs you money, is the heart and sole of "Cap and Trade" Nancy is pushing in DC.

Contact them: If you have questions about the Ohio CFL program you can e-mail [bigidea@powerdirect.net](mailto:bigidea@powerdirect.net) or call them at 1-888-8-GO 2 CFL.

**WE STRONGLY SUGGEST YOU FLOOD THEIR E-MAIL AND THEIR PHONE LINES TO GIVE THEM YOUR OPINION.**

RECEIVED--FPSC  
09 MAR 26 AM 9:50  
COMMISSION  
CLERK

Dear Commissioners:

The City of Gainesville recently approved a powerful incentive for solar energy known as a feed-in tariff. With the Commission's approval, Gainesville Regional Utility will serve as the first testing ground for this innovative policy that pays solar energy producers an attractive rate for the electricity they produce.

Because of your support for an aggressive draft Renewable Portfolio Standard of 20 percent by 2020, Florida has moved to the forefront of national efforts to reduce our dependence on fossil fuels and fight harmful greenhouse gas emissions. I wholeheartedly support Gainesville's efforts, which further cement Florida's role as a leader in developing clean, renewable energy.

Thank you for your leadership. I will continue to work in the Senate to promote new ways to expand renewable energy in Florida.

Sincerely,

*Bill Nelson*

Office of Governor Charlie Crist  
State of Florida  
PL-05 The Capitol  
Tallahassee, FL 32399-0001

Dear Governor Crist,

As a concerned resident of Florida, I strongly believe that you need to immediately address our Renewable Energy Policy direction. The Public Service Commission is currently leaning toward a policy called Renewable Energy Credits (REC's). REC's would allow a few big out of state companies to come in, build their installations, establish a monopoly, then leave Florida. This will benefit very few Floridians. There is a solution, the proven policy that I believe you have an understanding of; Renewable Energy Payments Policy (Feed in Tariffs), this policy will make Florida and America leaders in renewable energy technology deployment. It is my hope that you, the Public Service Commission, and the state legislature will work together toward the adoption of Renewable Energy Payments. This form of policy will allow more people to produce and benefit from renewable energy, creating thousands of good jobs in Florida and fast track what I know will be a robust renewable energy industry in Florida.

The " Sunshine State" should and will be a leader in renewable energy like solar, wind and biomass and can pave the way for other states to follow suit. It is imperative that we, as a state, take this opportunity to strengthen our economy, and take all the steps needed to save our planet for future generations.

Please give Renewable Energy Payments strong consideration when reviewing our current energy policy options. This policy has been proven to be the best renewable energy policy in 45 other nations. The adoption of this policy will create long term good paying jobs in Florida, and greatly surpass all renewable energy expectations.

Thank You for leading us toward this vision of energy independence,

Sincerely,

2/20/2009

**Subject:** NUCLEAR ENERGY

January 30, 2009

Palm Beach Post  
Editorial

Dear Editor:

I agree with your editorial introduction stating that the Florida Public Service Commission did a disservice by ducking the question of whether nuclear power can be considered green energy. However, I feel that the service commission did a disservice to the state by not calling nuclear power clean and renewable energy. Please, let us get real and for the sake of our children, we need a responsible energy policy.

Please note, when a naturally occurring material called Uranium is used to generate power in a nuclear reactor, no greenhouse discharge is the result. There is continuous dependable generation of clean power. As has been proven for the last 40+ years throughout this world. After the completion of the reactor cycle, the reactor also produces a new element called Plutonium that can be used again to re-power the core. This "breeder technology" has been available for years and is the ultimate in "renewable power". The antinuclear lobby, with a very specific agenda of maintaining the profits from other energy sources has been successful and deceptive by linking nuclear energy with the visual of a "mushroom cloud". The unfortunate incident at Seven-Mile Island is also used to build up the mushroom facade. Let us remember that no life was lost during that unfortunate incident. Nuclear waist is a solvable issue.

As a physician and surgeon, I am aware of millions of people whose lives have been saved and improved with the diagnostic and therapeutic power of these isotopes. Why can't we use it to make a better world.

YES WE CAN make this a better cleaner world for our future generations.

Sincerely

STEVE S SPECTOR M.D. , MSNES  
WEST PALM BEACH,FL.  
(masters in nuclear engineering science)

**Sent:** Monday, January 12, 2009 2:04 PM  
**To:** Office of Commissioner McMurrian  
**Subject:** Renewable Portfolio Standard

Dear Commissioner McMurrian,

I understand there are now efforts being made to add nuclear and "clean coal" to the list of qualified, "clean energy" sources. This would change the "Renewable Portfolio Standard" into a "Clean Portfolio Standard"

Nuclear energy is not renewable energy.

Coal is not clean. Just look at the recent TVA coal disaster in Tennessee.

( <http://www.cleanenergy.org/hottopics/index.cfm?id=105>)

Only truly renewable resources such as solar, wind power, ocean energy, and biomass should qualify for the state renewable portfolio standard.

There are already many incentives for nuclear power, but it must not take the place of truly renewable resources. Nuclear power will not deliver the jobs and market incentives that the Legislature and Florida Governor intended when they mandated a Renewable Portfolio standard.

The Public Service Commission staff has overstepped its authority to suggest this to the Legislature. The Legislature never mentioned nuclear in last year's energy bill's directive to come back with a RPS rule. There is no mention of nuclear in the RPS mandate. Nuclear is NOT included in the definition of renewable energy in Florida Statute and it needs to stay that way.

The intent language in the Renewable Portfolio Standard has a strong economic component to jump-start renewables. Including nuclear and "clean coal" will defeat this purpose.

Your consideration is much appreciated.

Sincerely,

Mr. Terry Thorkildson

**To:** Office of Commissioner Argenziano; Office of Commissioner Skop; Office of Commissioner McMurrian; Office of the Chairman; Office Of Commissioner Edgar  
**Subject:** RPS -- a health future for citizens and business

Dear Chairman Matthew Carter and Commissioners Nancy Argenziano, Lisa Polak Edgar, Katrina McMurrian and Nathan Skop

It is essential to the future generations of citizens and to stimulate the green jobs that you propose a Renewable Portfolio Standard that requires utilities in Florida to produce 20% clean renewable energy in our state by 2020.

Do not allow nuclear to be defined as a Class 1 or renewable energy source in the Renewable Portfolio Standard. Mining for plutonium is not renewable and ruins the local source environment. Spent waste has not been sufficiently addressed. It is costly to the rate payers and incentive for it will divert much of the resources away from renewable, lower cost carbon-free energy – such as solar and wind.

Clean Coal technology does not really exist. Mining of coal destroys the environment and its byproducts poison the water supply. Do not include this in the RPS.

Please set high standards and short timeframes like California and other states which have more enlightened legislatures. Our state needs to quickly to develop renewable energy such as wind, solar, biomass, and ocean technology.

Sincerely,

CJ Reynolds

**To:** Office of Commissioner McMurrian; Office Of Commissioner Edgar; Office of the Chairman; Office of Commissioner Argenziano; Office of Commissioner Skop  
**Subject:** Renewable Portfolio Standard

I urge you to resist any pressures to add nuclear energy to the list of energy sources to be supported by legislation for Renewable Energy (the Renewable Portfolio Standard).

Nuclear energy already has a record of intensive development of almost half a century, supported by government-funded research, and should be able to stand on its own as a competing energy source. But key concerns that prevent nuclear power from in good faith being labeled 'clean' have not yet been resolved

An example: As an architect involved in the design and construction of a nuclear power plant in Germany in the '60s, I have followed the history of that project: it began production in 1968, but was decommissioned in 1977 -- after only 8-9 years of operation, following a defect in one component, and will be demolished by 2013. A replacement plant was built, beginning production in 1988 -- But its radioactive waste is still stored in a 'temporary' storage facility on the site, waiting for the construction of a highly controversial and uncertain permanent storage facility by the federal government, which is not expected to be available before 2030 -- near or after the end of the expected life span of that plant itself. I cannot see whether or how the costs of those facilities are properly included in the cost estimates and energy cost projections. They are separate projects funded by the taxpayer.

Any legislative and regulatory measures relating to energy generating technology should give priority to the development and implementation of projects using truly clean renewable sources such as solar, wind, ocean energy.

**Sent:** Thursday, January 22, 2009 8:19 AM  
**To:** Office Of Commissioner Edgar  
**Subject:** Renewable Portfolio Standard

Dear Commissioner,

I am asking you to support a Renewable Portfolio Standard that requires utilities in Florida to produce 20% clean renewable energy in our state by 2020, and gives renewable developers financial certainty through long-term and negotiated contracts. I urge you NOT to support a Clean Energy Portfolio Standard (CEPS), which will include nuclear energy and "clean coal" as part of its criteria. Only truly renewable resources, such as solar, wind power, ocean energy, and biomass should qualify for the state renewable portfolio standard. It is important to understand that THERE IS NO SUCH THING AS CLEAN COAL. This is a technology that does not exist, not to mention the overall environmental risks of using coal, evidenced most recently by the TVA coal disaster in Tennessee. Further, there are already too many incentives for nuclear power, which is not a renewable form of energy. In addition, nuclear power is expensive and unsafe and nuclear power plants take too long to be built and come on line. Nuclear power will take valuable resources away from the development of truly renewable resources, and fail to deliver the jobs and market incentives that the Legislature and Florida Governor intended when they mandated a Renewable Portfolio standard.

Thank you,

*Melissa Baird*

Commissioner McMurrian's office received a phone call this morning from Ms. Bonnie Nickel of Venice, FL. Ms. Nickel was calling to give the Commissioner her comments opposing the RPS Special Agenda tomorrow. She specifically is opposed to making nuclear energy and coal qualify as clean energy. She said this would profit FPL and not the environment. She and other citizens are interested in protecting the environment and this will undermine their intent.

I told Ms. Nickel I would pass her comments on to the Commissioner and I would also send them to the Clerk's Office to be filed in the docket file. She expressed her thanks.

Dear Governor Crist and Public Service Commissioners,

Re: PSC Docket 080503 - RPS Staff Report (submitted 12/31/08 at  
<http://www.psc.state.fl.us/dockets/cms/docketFilings2.aspx?docket=080503>  
)

It is the ultimate in greenwashing to call nuclear power "clean" and weaken the state's renewable portfolio standard by doing so.

Does anyone really believe that nuclear power plants are emissions free? Has anyone but me read the radionuclide release data, the strontium 90 reports in baby teeth, the reports of increased incidence of childhood leukemia near nuclear power plants, the barely regulated thermal discharges altering coastal aquatic systems? And all this without accidents, all this without waste transport (yet). Soon we will need to move our spent nuclear fuel across the country by some means, safely.

Similarly, we are not fooled by the industry's claim of "Clean Coal". Even if IGCC with CCS were emissions-free, coal extraction and transport have devastating environmental and public health impacts including egregious Clean Water Act violations and the need to blast the tops off mountains.

We must keep nuclear and coal power as a separate issues from renewables. We are not that foolish. We know that doing otherwise serves only big utilities who are struggling to meet the Governor's mandate of 20% of their production through renewables.

Allowing nuclear and/or coal to fill the slot that should and must be

**\*\*CLK OFFICIAL DOCUMENT...\*\***

occupied by truly sustainable renewable energy robs Floridians of their ratepayer investments and global citizens of a meaningful investment in climate crisis mitigation.

Governor Crist, you have an opportunity to do the right thing. Please uphold the intent of your executive order.

Thank you,  
Rhonda Roff

Re: Comment for the Renewables Portfolio Standard Decision  
**Docket 080503**

Establishment of rule on  
renewable portfolio standard

In the early days of the 21<sup>st</sup> century, the people of a great nation cried out for cheap, abundant energy to light their nights, warm their homes in the winter and cool their sweaty brows in the summer. They sought power to charge their ipods, their phones, their Blackberries and Palm Pilots, and to run their laptops and plasma TVs. They sought the blessed, seven-seated SUV to carry their 2.5 children and occasionally their soccer teams. They built McMansions for two, and left their lights on at night to drive away the darkness. They warmed or cooled their homes while they were away so they would be comfortable upon their return....

Great companies arose to meet the desires of the people – to supply cheap and abundant energy. They found ways to meet the demand that not only supplied the people's insatiable hunger, but which also created great profits for the companies and those who stood at their helm. They knew they could build huge radiation-emitting nuclear and resource-wasting biomass-burning plants that polluted the environment; and they could build them even

1/14/2009

if they weren't needed, because people feared any lack of comfort. They even sought, and were granted, many exemptions from pollution standards; the people's hunger was so great.

The people and the companies that served them were given over to their desires and their greed. Mountains were still being leveled and streams diverted or buried. Fish sickened and died. The skies darkened with poisonous greenhouse gases, toxic mercury particles, particulate matter from tree-burning biomass plants which sickened their children, the snows fled their ancient homes, the ice packs to the north and south retreated in fear. Children who once breathed the free air became hostages to asthma, allergies, cancer, heart disease, brain damage and death. The elderly feared to leave their heated or air conditioned homes because there were code red days and ozone alerts that meant simply breathing outside brought for them the risk of death. Many in Florida had already had to leave their ocean-side condos and homes as the tide had been steadily rising, encroaching further and further into Florida. Clean water, once plentiful, was a very scarce necessity of life, causing constant skirmishes among the people.

The day came when the children of the earth feared the outdoors even more than they feared not having enough power to run all their gadgets and toys. They feared the sun that brought with it deadly cancer. They feared the breeze that brought with it asthma and emphysema. They told the great companies, "Enough! Enough of the great coal burning plants that destroy the air. Enough of the mining that destroys the mountains, ruins the streams, and pollutes our waters. Enough burning of trees, wood chips, and plantlife which should naturally be capturing carbon instead of the incinerator in disguise burners and utilities being allowed to falsely sell carbon credits. We will let go of our greed – and make wise decisions on efficient ways of living. We will demand that products we buy make more efficient use of power. We will support solar and cleaner ways of producing energy – harnessing the wind and rushing waters."

And the great companies finally listened to the wisdom of the people. They saw how the destruction of mountains and the pollution of rivers harmed the earth and her people. They saw how adding more coal-fired burners, more nuclear, more so-called "waste to energy" facilities, more "incinerators in disguise", more supposedly technologically-advanced but wasteful burners caused deadly health issues to the very people they sought to serve. And they, as fellow human beings on this fragile earth, our island home, used their money in an attempt to heal the world.

But they had waited too long. And the people's stewardship of the earth came to an end. Because even God could not keep alive a world that wanted to die.

Please take these comments into consideration today, as you vote on the renewables portfolio standard. Every dollar wasted on harmful nuclear, wasteful not-carbon-neutral biomass and plasma arc methods, the so-called "waste to energy" polluting methods, could wisely be spent instead on the really clean, really renewable sources of energy such as solar, wind, and water current. We have everything to lose, and everything to gain.

Comments:

Pollution is pollution, no matter if it is air pollution from burning fossil fuels, waste from processing "clean coal" or nuclear waste. Florida is in the unique position to utilize solar, wave and wind generation, as well as the cleaner natural fuels such as LNG and natural gas. Let's concentrate on these.

Comments:

Public Service Commission: Please do not include nuclear or "clean" coal in the Florida Renewable Portfolio Standard. Neither nuclear nor coal is renewable, neither is clean, and it is a travesty that you would consider their inclusion in what is meant to be an environmentally sound and careful portfolio. Focus on the true renewables and do the necessary work to protect all of us, now and in the future, and our precious environment.

Thank you.  
Lola Sorensen  
St. Augustine

Thank you for putting this into Docket #080503 - EI  
Renewable Portfolio Standard  
From: Emily Casey

Public Service Commission  
Docket#080503 -EI  
1/09/2009

#### RENEWABLE PORTFOLIO STANDARD:

Florida is the SUNSHINE STATE, according to the solar energy map on <http://apps1.eere.energy.gov>, (National Renewable Energy Lab) Florida receives the same kWh/m<sup>2</sup>/dg as does Northern California and Colorado – the two leading states in the country in the use of solar energy! Even Germany can produce energy from solar

Why can't Florida be amongst them? The renewable portfolio standard is forward looking thinking on the behalf of the state of Florida. It is time we move forward and into the 21<sup>st</sup> century, so do not compromise the proposed standard 20% renewable energy by 2020, it can be done!

The requirement for utilities to have a 20% energy reserve available at all times could be changed back to the 15% that it was just a short time ago and this would alleviate some of the need that the utilities state as to why they need to build a base load plant.

It was stated at an informational public meeting with Progress Energy that the proposed nuclear power plants in Levy County would only allow them to produce enough energy to meet this 20 % requirement up through the year 2023. Therefore it would only be 6 years before the utility will be back asking for you to approve more building!! This will result in the ratepayers having to pay even more money than we are already being forced to pay!! WILL THIS EARLY COST RECOVERY CHARGE EVER STOP OR WILL WE PAY FORVER?? It seems as if it will be allowed to continue forever if we do not adopt a renewable standard without caps on renewable energy.

**RENEWABLE ENERGY:** Capable of being replaced by natural ecological cycles  
If this definition were changed then all the text books in the world would have to be changed!

**CLEAN:** Free from dirt or disease  
The entire process necessary to produce nuclear energy is not free from dirty

1/12/2009

materials which produce radioactive, toxic wastes that are detrimental to our health and the health of our environment

**COST: Can we afford nuclear power?**

- 1) Other regions in this country are developing lower – cost methods of producing energy – this could actually make Florida non competitive in their electrical rates and ultimately impact customers by the inability to sell homes.
- 2) Natural gas and coal (but this is a dirty fuel also) are fuels obtained in this country. Using uranium will have the same effect as oil is now – As per the Energy Information Administration Annual Energy Review 2007 – the United States purchased 54.1 million pounds of uranium oxide from international sources and used only 4.53 million pounds of uranium concentrate obtain in the US. Here we go again depending on foreign sources. Think about how much more secure our country could be and we could improve our economic debt. It is time for CHANGE – take the road not traveled before, we KNOW that the nuclear road is not the way to go!
- 3) Most of the utilities in the US are managing their growth needs by combining a diverse and stable energy mix from renewable energy methods, using demanded reduction methods, taking cost –effective measures to avoid the need for new plants. They have not chosen the most costly, most toxic method to produce energy because the states will not allow money to be taken from their citizens to finance a private business years in advance from producing the product. Thus Florida has created a business where there is no risk to that business, but all the risk and cost are place on that states citizens!!

At any time the utility company may decide to walk away from the Project with our money and there will be no consequences on their behalf!!  
If I want to expand a business can I get that privilege also??

- 4) Nuclear Power - JUST COST TO MUCH and is increasing!!  
Solar Photovoltaic - COST JUST KEEP DECREASEING!!

I do not understand why we are still having this debate on nuclear power, it is the 21<sup>st</sup> century. Be creative, think outside the box –

Share energy resources across the country!!

Thank You,  
Emily Casey

 COMMISSION  
 CLERK

Dear Chairman Carter,

On behalf of the Everglades Coalition, and recognizing that our member organizations are unable to attend the PSC hearing scheduled for January 9, 2009 because of conflicts with our annual conference being held in Miami-Dade County, we submit the Everglades Coalition's Climate Change Resolution passed on January 8, 2008.

As restoration progresses, the importance of integrated energy and water planning is necessary. A healthy, functioning Everglades will assist in offsetting sea-level rise and climate change impacts in South Florida. Accordingly, we ask the Public Service Commission to consider our attached Climate Change Resolution and recommend to the legislature a strong renewable portfolio standard (RPS) that targets 20% greenhouse gas emissions by 2020 which supports genuine renewable energy solutions.

Thank you in advance for your time and consideration.

Sincerely,

Mark Perry

**WHEREAS**, The world's scientific community has reached consensus that climate change is occurring and that human greenhouse gas emissions from fossil fuels, used to generate electricity and power vehicles, is a main cause of climate change.

**WHEREAS**, Florida, its wildlife, and natural lands are especially vulnerable to the impacts of climate change, including salt-water intrusion, sea-level rise, more intense storms and storm surges, droughts and fires.

**WHEREAS**, Efforts to restore the Everglades, consistent with the findings of the National Research Council of the National Academy of Sciences, and other reports, are more urgent than ever. Restoration will recreate the freshwater flow of water south from Lake Okeechobee to the Everglades, which in turn will increase levels of peat, which can serve as a defense to sea-level rise, and provide a freshwater head to stave off salt-water intrusion.

**WHEREAS**, The electric utility sector is responsible for 42% and the transportation sector is responsible for 36% of greenhouse gas emissions in Florida.

*Therefore be it resolved:*

The Everglades Coalition resolves and recommends the following:

1. That federal and state efforts to implement Everglades restoration plans and projects be prioritized and accelerated.
2. That federal legislation be passed this year to reduce greenhouse gas emissions that is aligned with Governor Crist's goal for Florida of an 80% reduction of greenhouse gas emissions below 1990 levels by the year 2050, and that Florida and municipalities strive to meet the same goals.
3. That any cap and trade legislation contain a natural resources section intended to provide dedicated funding to help wildlife and the habitats they rely on, to cope with the adverse impacts of climate change. This includes directing a portion of the funding to the restoration of the nation's aquatic ecosystems, including the Everglades.
3. That the Florida Legislature pass a renewable portfolio standard (RPS) to achieve 20% renewable energy generation by 2020, and that this standard include truly renewable energy resources, consistent with HB 7135, which does not include nuclear or coal derived energy.

[www.evergladescalition.org](http://www.evergladescalition.org)

Ph: 561-746-8078 • Fax: 561-745-8936 • P.O. Box 1902, Jupiter, FL 33468

4. That the State of Florida and the state's electric utilities aggressively pursue programs to maximize the benefits of energy efficiency and conservation as the fastest and most cost-effective means to reduce greenhouse gas emissions and mitigate the need for additional power plants.

5. That the Florida legislature adopt the strong vehicle emissions standards approved by the Florida Environmental Regulatory Commission, to significantly reduce the greenhouse gas emissions from the transportation sector. We support future efforts to explore alternative transportation methods which do not rely on fossil fuels.

Approve January 8, 2009

RE: PSC Inquiry 817233C

Dear Mr. Perry & Ms. Fain:

This is to acknowledge receipt of your letter to Chairman Matthew M. Carter II, Florida Public Service Commission, regarding Progress Energy Florida, Incorporated (Progress Energy). Given the nature of your concerns, Chairman Carter feels it would be appropriate for specialized staff of the Division of Service, Safety and Consumer Assistance to respond directly to you.

We appreciate your comments regarding the petition to establish rules on renewable portfolio standard and will add your correspondence to Docket No. 080503-EI.

If you have any questions or concerns please call Ellen Plendl at 1-800-342-3552 or by fax at 1-800-511-0809.

Sincerely,

A handwritten signature in black ink, appearing to read "Randy Roland".

## **The Truth about BG&E and Biomass in Tallahassee**

Florida League of Conservation Voters, (not associated with NationalLCV) Floridians Against Incinerators in Disguise, Big Bend Group of the Sierra Club, Help Our Polluted Environment, Environmental Alliance of North Florida, Jake Gaithers Neighborhood Association, Greenaction for Health and Environmental Justice, oppose biomass burners.

**These Renewables are not Clean and we do not want biomass, nuclear, nor plasma arc, included in the RPS.**

**1. The proposed biomass plant is really nothing more than an "incinerator in disguise." As with all incinerators, local air quality will be impacted and Leon County already has the 2nd worst air quality of any county in Florida.**

**2. The specific air filtering equipment (including bag houses and precipitators) that has been promoted by BG&E and their public relations firm as "state of the art" is actually Edsel-era equipment originally developed in the 1940's, 50's, and 60's.**

**2a. BG&E have asked and continue to ask for exceptions to the Clean Air Act to emit numerous pollutants during start up, shut down, and other operational procedures.**

**2b. BG&E continues to request air quality exceptions from Florida DEP even though the Department provided notice of intent to issue the Air Permit, with pages of air quality exceptions back in November 2008.**

**<http://www.dep.state.fl.us/Air/permitting/construction/tallahassee.htm>**

**3. BG&E, the company proposing the plant has a poor track record as a responsible corporate citizen, both in terms of environmental stewardship and caring for communities.** BG&E was formerly known as FERCO and while the name has changed, the players are the same (Glenn & Milton Farris). FERCO established a biomass gasification unit in Burlington Vermont but the company declared bankruptcy after settling a lawsuit with the surrounding Riverside neighbors due to air, noise, water, dust, soil contamination and pollution that caused the properties to decrease in value. FERCO left the city with \$2 million in debt and with serious groundwater contamination. According to the Burlington Electric Dept, the gasification unit "seemed just like bad business" and tests at the McNeil plant ended in 2001. The gasification facility sits, unused. "We shut off the lights in 2001," Irving (project manager) said. "The whole thing has left a real bitter taste in our mouth."

**4. The BG&E biomass gasification incinerator will be exempt from major provisions of the Clean Air Act. Air pollution in excess of Clean Air Act standards will be produced included many toxic substances that will be carried by prevailing winds to communities all over the area.**

a. The "char combustor" is allowed to emit 10 pounds per hour (each) of particulate matter, NOx (Nitrous oxides) and CO (carbon monoxide). (Page 10 of the air permit);

b. the combustion turbines are allowed to emit 17.2 pounds per hour of carbon monoxide, 17.2 pounds per hour of NOx, and 10 pounds per hour of particulate matter. (Pages 15-16)

c. We can see that this facility is not entirely a gas burner. Almost one-third of the heat input, and more than one third of the air emissions, come from burning solid materials.

d. From the DEP "public notice of intent," cover letter dated October 24, 2008)

**<http://www.dep.state.fl.us/Air/permitting/construction/tallahassee/BGENOTICE.pdf>** )

1/12/2009

<u>Pollutants</u>	Estimated Emm. (TPY)	Potential Emm (TPY)
Carbon Monoxide (CO)	204	231
Nitrogen Oxides (NOX)	197	214
Particulate Matter (PM/PM10)	114/114	156/156
Sulfur Dioxide (SO2)	83	83
Volatile Organic Compounds (VOC)	18	18
Hazardous Air Pollutants (HAP)	<5	<5
-----	----	-----
total tons per year	621	707
total pounds per year	1,242,000	1,414,000

e. The "potential to emit", the most important number to consider, is what the facility could put out without violating its air permit. Sometimes facilities claim that their "expected" emissions are far less, but that is not the case here: the "potential is 1.4 million pounds per year and the "estimated," or "expected" is 1.2 million pounds per year. To put this in plain terms, the applicants admit that they expect to emit over 1.2 million pounds of health-damaging air pollutants every year (3400 pounds per day), and would be allowed to emit over 1.4 million pounds per year (3900 pounds per day). This means a potential of two tons per day of air pollutant emissions.

f. There are many points to consider in the permit. The proposal is to maintain on the site an inventory of 10,000 to 14,000 tons (28 million pounds) of "wet biomass." (page 6) This would apparently be kept in covered piles. There is considerable potential for emissions of hazardous and odorous air pollutants, as well as mold spores and allergens, from such an inventory, especially in the warm and humid climate of Florida. There is also a possibility of spontaneous combustion which could be difficult to extinguish and would be very hazardous and unpleasant to be around. We know of no evacuation plan for the neighborhoods and schools in the area in case of leaks, hazardous emissions, or explosions.

g. It's also worth noting that diesel locomotives tend to be very high emitters of toxics. Judging from the amount of trackage in the area, the surrounding communities are already "disproportionately impacted" by rail operations, which would increase if this facility was built. Approximately 5200 train car loads per year of fuel shipments are expected and these would be allowed to be spotted for unloading at all hours of days and nights (page 5-6). (The overall fuel consumption seems to be estimated at 365,000 wet tons per year.)

**5. This pollution will disproportionately impact a predominately African-American neighborhood and will have a devastating effect on South Side development and revitalization. This violates the long-held position of the Sierra Club and other groups against environmental racism. For a legal challenge filed regarding Environmental Justice, please visit**

<http://groups.yahoo.com/group/FloridiansAgainstIncineratorsInDisguise/message/154>

**6. Florida's own flawed definition of biomass will allow the plant to burn much more than "woody waste" and like materials. The plant will be allowed to burn much more toxic substances like sludge from paper mills, chemically treated scrap lumber and other sources that increase cancer risks throughout the area.** The new Florida definition of biomass allows biomass burners in Florida to burn many "fuels": Biomass-energy production is the production of energy (electricity; liquid, solid, and gaseous fuels; and heat) from biomass. Biomass may be any organic matter including dedicated energy crops and trees, forest manufacturing products and waste, agricultural food and feed crop residues, aquatic plants, wood and wood residues, animal wastes and other organic waste including the aerobic and anaerobic break-down product of any organic matter and waste streams. By definition, pulp and paper mill wastes, such as toxic sludge containing dioxins and furans would be allowed as fuels. The owners have not been forthcoming in the actual fuels to be used; they have said at various times: wood chips, Arundo Donax (a dangerous invasive exotic plant species), paper mill wastes and yard wastes. According to state statute any and all of these could be incinerated as well as poisonous arsenic/CCA treated wood and municipal solid waste. The permit and state law are at odds, which may lead to fuels not included in the permit to be legally burned.

**6. Biomass generates unsustainable land uses that may release soil carbon to the atmosphere. Accelerated and poorly-managed harvesting of forests and crops as fuel, accompanied by the conversion of natural ecosystems to fuel farms, such as the growing of the BG&E biomass fuel source called "Arundo donax", will increase global warming and degrade the environment.**

**7. Biomass burners are not "CLEAN, RENEWABLE, and SUSTAINABLE" merely because industry lobbyists and legislatures have passed laws that say they are. Massive new biomass energy resources are NOT available without risking soil and forest health, given the lack of commitment by governments and industry to preservation, restoration, and conservation of natural resources.**

**8. This biomass plant could easily begin burning garbage for power generation when the intended "CLEAN" fuel sources supply runs short.**

**9. Burning materials is NOT clean energy.** Combustion for energy production is responsible for much of the world's air pollution and, indirectly through deposition, much of its water and land pollution as well. These pollutants, including smog, acid rain, and persistent bioaccumulative toxics, threaten human health and the global ecosystem. All fossil fuels and most biomass technologies aggravate global warming by producing CO<sub>2</sub>. Unless very carefully managed, biomass operations may not be sustainable and may add to the CO<sub>2</sub> problem because of damage to soil health or failure to assure sustainable regrowth of the fuel stock. Biomass is in principle renewable, but native soils hold substantial carbon, mostly in root mass, and while it is possible to preserve soil carbon balances, conventional agricultural practices rarely do so. Much of the debate surrounding biomass technologies involve assessing their environmental impact against the benchmark of coal-fired energy production. We are increasingly concerned that biomass projects may rely on or may create incentives for fuel derived from unsustainable forestry and agricultural practices.

**10. CLEAN RENEWABLE Energy means MONEY.** The utilities and venture capitalist investors promoting the so called "Clean, Renewable Energy Alternatives" have been working for years to set up funding streams that will make them money. The CAP and TRADE pollution credits program will allow polluting plants to continue polluting as long as they buy/purchase/trade credits with the so called "CLEAN, Renewable Energy Alternatives." Amazing advantages are available: Tax subsidies, tax credits, tax incentives, research grants, preferential pricing for "Green Power" and inclusion in the "Renewable Portfolio Standards" currently being discussed and no doubt will be approved by the Florida Public Service Commission and modified even further by the 2009 Florida Legislature. **These Renewables are not Clean and we do not want biomass, nuclear, nor plasma arc, included in the RPS.**

## **REAL CLEAN SOLUTIONS**

These Organizations believes that energy use should be minimized through conservation and efficiency, and that sustainable, renewable energy resources be utilized for human needs. In the near future, efficiency is the only "energy source" which does not incur some environmental damage and which is available immediately in generous supply. Sophisticated building construction, efficient appliances, recycling, modernized industrial processes, "smart" buildings that turn off lights and lower the temperature in unused rooms, programmable thermostats, public transit supplemented by fuel-efficient cars, and many other innovative technologies can reduce energy use tremendously, usually while saving money.

- **These Organizations believe that the City of Tallahassee has not adequately**

**encouraged an effective policy of energy conservation and efficiency. We believe that residents, taxpayers and businesses are willing to cut back the electric use successfully.**

- **The City's current power plant fuel, using natural gas, is less expensive than depleting non-sustainable forest resources. Yard waste can and should be composted, creating jobs, and providing for soil health.**
- **Solar voltaic power is becoming less and less expensive. State rebates at 50% are available for residential and commercial customers, offering income tax deductions.**
- **These Organizations believe that effective conservation and efficiency strategies would encourage small local business and create jobs; and that there is no need for any new power plant, especially a polluting, resource wasting, biomass example of environmental injustice.**

Re: Docket # 080503

Dear Chairman Carter,

On behalf of the Everglades Coalition, and recognizing that our member organizations are unable to attend the PSC hearing scheduled for January 9, 2009 because of conflicts with our annual conference being held in Miami-Dade County, we submit the Everglades Coalition's Climate Change Resolution passed on January 8, 2008.

As restoration progresses, the importance of integrated energy and water planning is necessary. A healthy, functioning Everglades will assist in offsetting sea-level rise and climate change impacts in South Florida. Accordingly, we ask the Public Service Commission to consider our attached Climate Change Resolution and recommend to the legislature a strong renewable portfolio standard (RPS) that targets 20% greenhouse gas emissions by 2020 which supports genuine renewable energy solutions.

Thank you in advance for your time and consideration.

Sincerely,

Mark Perry  
State Co-Chair

Conservation Foundation  
Save It Now, Glades!

WHEREAS, The world's scientific community has reached consensus that climate change is occurring and that human greenhouse gas emissions from fossil fuels, used to generate electricity and power vehicles, is a main cause of climate change.

WHEREAS, Florida, its wildlife, and natural lands are especially vulnerable to the impacts of climate change, including salt-water intrusion, sea-level rise, more intense storms and storm surges, droughts and fires.

WHEREAS, Efforts to restore the Everglades, consistent with the findings of the National Research Council of the National Academy of Sciences, and other reports, are more urgent than ever. Restoration will recreate the freshwater flow of water south from Lake Okeechobee to the Everglades, which in turn will increase levels of peat, which can serve as a defense to sea-level rise, and provide a freshwater head to stave off salt-water intrusion.

WHEREAS, The electric utility sector is responsible for 42% and the transportation sector is responsible for 36% of greenhouse gas emissions in Florida.

*Therefore be it resolved:*

The Everglades Coalition resolves and recommends the following:

1. That federal and state efforts to implement Everglades restoration plans and projects be prioritized and accelerated.
2. That federal legislation be passed this year to reduce greenhouse gas emissions that is aligned with Governor Crist's goal for Florida of an 80% reduction of greenhouse gas emissions below 1990 levels by the year 2050, and that Florida and municipalities strive to meet the same goals.
3. That any cap and trade legislation contain a natural resources section intended to provide dedicated funding to help wildlife and the habitats they rely on, to cope with the adverse impacts of climate change. This includes directing a portion of the funding to the restoration of the nation's aquatic ecosystems, including the Everglades.
3. That the Florida Legislature pass a renewable portfolio standard (RPS) to achieve 20% renewable energy generation by 2020, and that this standard include truly renewable energy resources, consistent with HB 7135, which does not include nuclear or coal derived energy.

[www.evergladescoalition.org](http://www.evergladescoalition.org)

Ph: 561-746-8078 ♦ Fax: 561-745-8936 ♦ P.O. Box 1902, Jupiter, FL 33468

4. That the State of Florida and the state's electric utilities aggressively pursue programs to maximize the benefits of energy efficiency and conservation as the fastest and most cost-effective means to reduce greenhouse gas emissions and mitigate the need for additional power plants.

5. That the Florida legislature adopt the strong vehicle emissions standards approved by the Florida Environmental Regulatory Commission, to significantly reduce the greenhouse gas emissions from the transportation sector. We support future efforts to explore alternative transportation methods which do not rely on fossil fuels.

Re: Comment for the Renewables Portfolio Standard Decision  
**Docket 080503**

**Establishment of rule on  
renewable portfolio standard**

In the early days of the 21<sup>st</sup> century, the people of a great nation cried out for cheap, abundant energy to light their nights, warm their homes in the winter and cool their sweaty brows in the summer. They sought power to charge their ipods, their phones, their Blackberries and Palm Pilots, and to run their laptops and plasma TVs. They sought the blessed, seven-seated SUV to carry their 2.5 children and occasionally their soccer teams. They built McMansions for two, and left their lights on at night to drive away the darkness. They warmed or cooled their homes while they were away so they would be comfortable upon their return....

Great companies arose to meet the desires of the people – to supply cheap and abundant energy. They found ways to meet the demand that not only supplied the people's insatiable hunger, but which also created great profits for the companies and those who stood at their helm. They knew they could build huge radiation-emitting nuclear and resource-wasting biomass-burning plants that polluted the environment; and they could build them even if they weren't needed, because people feared any lack of comfort. They even sought, and were granted, many exemptions from pollution

standards; the people's hunger was so great.

The people and the companies that served them were given over to their desires and their greed. Mountains were still being leveled and streams diverted or buried. Fish sickened and died. The skies darkened with poisonous greenhouse gases, toxic mercury particles, particulate matter from tree-burning biomass plants which sickened their children, the snows fled their ancient homes, the ice packs to the north and south retreated in fear. Children who once breathed the free air became hostages to asthma, allergies, cancer, heart disease, brain damage and death. The elderly feared to leave their heated or air conditioned homes because there were code red days and ozone alerts that meant simply breathing outside brought for them the risk of death. Many in Florida had already had to leave their ocean-side condos and homes as the tide had been steadily rising, encroaching further and further into Florida. Clean water, once plentiful, was a very scarce necessity of life, causing constant skirmishes among the people.

The day came when the children of the earth feared the outdoors even more than they feared not having enough power to run all their gadgets and toys. They feared the sun that brought with it deadly cancer. They feared the breeze that brought with it asthma and emphysema. They told the great companies, "Enough! Enough of the great coal burning plants that destroy the air. Enough of the mining that destroys the mountains, ruins the streams, and pollutes our waters. Enough burning of trees, wood chips, and plantlife which should naturally be capturing carbon instead of the incinerator in disguise burners and utilities being allowed to falsely sell carbon credits. We will let go of our greed – and make wise decisions on efficient ways of living. We will demand that products we buy make more efficient use of power. We will support solar and cleaner ways of producing energy – harnessing the wind and rushing waters."

And the great companies finally listened to the wisdom of the people. They saw how the destruction of mountains and the pollution of rivers harmed the earth and her people. They saw how adding more coal-fired burners, more nuclear, more so-called "waste to energy" facilities, more "incinerators in disguise", more supposedly technologically-advanced but wasteful burners caused deadly health issues to the very people they sought to serve. And they, as fellow human beings on this fragile earth, our island home, used their money in an attempt to heal the world.

But they had waited too long. And the people's stewardship of the earth came to an end. Because even God could not keep alive a world that wanted to die.

Please take these comments into consideration today, as you vote on the renewables portfolio standard. Every dollar wasted on harmful nuclear, wasteful not-carbon-neutral biomass and plasma arc methods, the so-called "waste to energy" polluting methods, could wisely be spent instead on the really clean, really renewable sources of energy such as solar, wind, and water current. We have everything to lose, and everything to gain.

Ms. Ann Cole  
Commission Clerk  
Florida Public Service Commission  
2540 Shumard Oak Blvd  
Tallahassee, FL 32399-0850  
Submitted to [filings@psc.state.fl.us](mailto:filings@psc.state.fl.us)

Subject: Docket #080503 Renewable Portfolio Standard Rulemaking

Dear Ms. Cole,

I am the Chairman of the Sarasota County Task Force on Solar Hot Water Heating. This letter is being written on my behalf alone (as an educated individual) and in no way reflects the official position of either Sarasota County or the Task Force.

I am firmly opposed to the change of the direction of the rulemaking process from "Renewable Portfolio Standard" to "Clean Energy Portfolio Standard" and including nuclear energy in the new portfolio. Although I recognize that renewable sources can never provide 100% of the energy requirements of the State of Florida, there was no need to attempt to dilute the intent of the original statute and Governor Crist's intent to provide a mechanism to provide a financial incentive to renewable resources. Nuclear is not "clean" in that although the operation of the plant does not generate a large amount of carbon dioxide, one must consider the total birth to death carbon dioxide generation of the resource. The construction of nuclear power plants generate a huge amount of carbon dioxide in providing the enormous amount of concrete as well as other parts of the plant. One must also consider that nuclear waste is certainly not "clean".

In addition, I would like to point out that the fundamental study and assumptions by Navigant which led to the recommendations is flawed. By completely omitting solar thermal installations under 2 MW and also omitting Solar Thermal Utilities, erroneous conclusions were made as to the feasibility of achieving the goal of 20% renewable resources by 2020.

I would rather have the Public Service Commission issue no rule at this time rather than one that is fundamentally flawed.

Sincerely,

Lawrence J. Altman, Ph.D.

Kim. I don't know the proper procedure, but I have had 3 additional calls regarding this matter. One from Jessie Glickstein, June Cussen and Rev. Warren Clarke. They are all against making nuclear energy and coal qualify as clean energy. Also opposed to changing the date from 2020 to 2041. Thanks - questions, please call.

Commissioner McMurrian's office received a phone call this morning from Ms. Bonnie Nickel of Venice, FL. Ms. Nickel was calling to give the Commissioner her comments opposing the RPS Special Agenda tomorrow. She specifically is opposed to making nuclear energy and coal qualify as clean energy. She said this would profit FPL and not the environment. She and other citizens are interested in protecting the environment and this will undermine their intent.

1/8/2009

I told Ms. Nickel I would pass her comments on to the Commissioner and I would also send them to the Clerk's Office to be filed in the docket file. She expressed her thanks.

Re: PSC Docket 080503 - RPS Staff Report  
<http://www.psc.state.fl.us/dockets/cms/docketFilings2.aspx?docket=080503>

I must take exception to the designation of nuclear power as "CLEAN". To further develop nuclear power plants rather than work to give incentives to alternative renewable energy that will truly by "CLEAN" while protecting our natural resources is without conscious.

If you read the radionuclide release data, the strontium 90 reports in baby teeth, the reports of increased incidence of childhood leukemia near nuclear power plants, the barely regulated thermal discharges altering coastal aquatic systems? And then what is to be expected when we move waste across country and "WHERE" are we going to store this waste and at what expense to the environment and future generations.

"Clean Coal" is also a very scary designation given to building new power plants. Has anybody read about the recent devastation of a city in Tennessee affected by coal extraction and the need to blast the tops off mountains. When are we going to "STOP" this kind of devastation to our beautiful country - "LOOK" at the damage to our mountains, rivers and streams and the harm caused the neighboring communities affected & "LISTEN" to the scientists conerning "Global Warming" and how important it is for us to develop new sustainable renewable energy.

Governor Crist, you have an opportunity to do the right thing and build a legacy that will call you a "LEADER" in the protection of our natural resources. Please move forward on the energy conservation policies you have said you support and uphold the intent of your executive order.

Thank you,

*Sheila Calderon*

Dear Governor Crist,

As a concerned resident of Florida, I strongly believe that you need to immediately address our Renewable Energy Policy direction. The Public Service Commission is currently leaning toward a policy called Renewable Energy Credits (REC"s). REC"s would allow a few big out of state companies to come in, build their installations, establish a monopoly, then leave Florida. This will benefit very few Floridians. There is a solution, the proven policy that I believe you have an understanding of; Renewable Energy Payments Policy (Feed in Tariffs), this policy will make Florida and America leaders in renewable energy technology deployment. It is my hope that you, the Public Service Commission, and the state legislature will work together toward the adoption of Renewable Energy Payments. This form of policy will allow more people to produce and benefit from renewable energy, creating thousands of good jobs in Florida and fast track what I know will be a robust renewable energy industry in Florida.

The "Sunshine State" should and will be a leader in renewable energy like solar, wind and biomass and can pave the way for other states to follow suit. It is imperative that we, as a state, take this opportunity to strengthen our economy, and take all the steps needed to save our planet for future generations.

Please give Renewable Energy Payments strong consideration when reviewing our current energy policy options. This policy has been proven to be the best renewable energy policy in 45 other nations. The adoption of this policy will create long term good paying jobs in Florida, and greatly surpass all renewable energy expectations.

Thank You for leading us toward this vision of energy independence,

Sincerely,

*Monica Kennedy*

Comments:

PSC's current proposal to classify nuclear and carbon capture coal as "clean energy" is disengenious since neither nuclear or coal currently meet those requirements. It seems to me and my family and friends that FPL (Commissioner Nathan Skop being a recent employee)is being gifted the money and support it needs to escape true renewable energy such as wind, solar, wave and geothermal. What ever happened to FPL's partnership with Ausra? What real progress has been made towards these true (and currently available) forms of energy generation?

## **\*\*CLK OFFICIAL DOCUMENT...\*\*b>**

The PSC might well consider such plans as Google Energy's to meet the needs of the US 2500x over using solar, wind and geothermal (currently used in Iceland). Or the use of solar photovoltaic panels to cover currently existing parking lots to power the businesses. In the online book, Carbon-Free and Nuclear-Free, A Roadmap for US Energy Policy, Arjun Makhijani outlines just what has been done such as this US Naval Base in operation since 2002 and working quite nicely in California. These are just a couple of great examples as to what is possible if we can get past the fear and greed, join together to solve our common problems

Comments:

I was shocked to learn that the PSC staffers are recommending the Renewable Energy Portfolio be modified to include nuclear and clean coal as clean energy sources. This is totally unacceptable and flies in the face of the objectives trying to be achieved.

Creating a "Clean Energy Standard" as opposed to the directed "renewable portfolio standard" is just another example of the government handing corporate America gifts, instead of forcing them into the difficult changes that need to be implemented. DO NOT change the standard and do not allow nuclear and coal (which is never

**\*\*CLK OFFICIAL DOCUMENT...\*\*b>**

truly 'clean'). You should be ashamed of yourselves.

**Comments:**

There are growing and concerning calls to add nuclear and clean coal to the list of qualified, "clean energy" sources. This would mean changing the "Renewable Portfolio Standard" into a "Clean Portfolio Standard" PLEASE do not allow that to happen. Nuclear is not really 'clean' and there is no such thing as 'clean' coal!

**Subject:** Docket 080503 Establishment of rule on renewable portfolio standard

Dear Governor Crist and Public Service Commissioners,

Re: PSC Docket 080503 - RPS Staff Report (submitted 12/31/08 at <http://www.psc.state.fl.us/dockets/cms/docketFilings2.aspx?docket=080503>)

It is the ultimate in greenwashing to call nuclear power "clean" and weaken the state's renewable portfolio standard by doing so.

Does anyone really believe that nuclear power plants are emissions free? Has anyone but me read the radionuclide release data, the strontium 90 reports in baby teeth, the reports of increased incidence of childhood leukemia near nuclear power plants, the barely regulated thermal discharges altering coastal aquatic systems? And all this without accidents, all this without waste transport (yet). Soon we will need to move our spent nuclear fuel across the country by some means, safely.

Similarly, we are not fooled by the industry's claim of "Clean Coal".

Even if IGCC with CCS were emissions-free, coal extraction and transport have devastating environmental and public health impacts including egregious Clean Water Act violations and the need to blast the tops off mountains.

1/6/2009

We must keep nuclear and coal power as a separate issues from renewables. We are not that foolish. We know that doing otherwise serves only big utilities who are struggling to meet the Governor's mandate of 20% of their production through renewables.

Allowing nuclear and/or coal to fill the slot that should and must be occupied by truly sustainable renewable energy robs Floridians of their ratepayer investments and global citizens of a meaningful investment in climate crisis mitigation.

Governor Crist, you have an opportunity to do the right thing. Please uphold the intent of your executive order.

Thank you,  
Rhonda Roff

Commissioner Katrina McMurrian,  
FL

Dear Public Service Commissioner,,

Florida can do better! The proposed 10% renewable energy standard by 2025 is too timid. We must be as aggressive in fighting global warming as we are in pursuing clean industries. A measly ten percent is not doing either.

To avoid the worst impacts of global warming, we must be working toward decreasing greenhouse gas emissions 80% by 2050. The Sunshine state has some of the best solar resources in the country and should be capitalizing on this abundant resource. Governor Crist recognizes the economic opportunities of fighting global warming: Florida will have a new clean energy industry offering green jobs while protecting Florida's assets from rising seas and stronger storms.

A better RPS is good for rate-payers! Renewable energy will bring electric rates down by diversifying the energy portfolio. The average electric bill for Florida residents has increased 25% since 2005 because of an over dependence on fuel that suffers from price shocks in a global market. Sun and wind are local resources that can't be manipulated by foreign governments or market speculators and the jobs created can't be outsourced.

Furthermore, ten percent will not bring renewable energy companies to Florida! Other states are providing stronger standards

1/6/2009

and we must be able to compete for these companies. The Florida PSC should be as aggressive and decisive as the Governor and Legislature and increase the standard to 20% renewable energy by 2020.

Thank you for your time and hard work.

Sincerely,

Christine Dobey  
707 Wood St  
Dunedin, FL 34698

**Subject:** Docket 080503 Establishment of rule on renewable portfolio standard

Dear Governor Crist and Public Service Commissioners,

Re: PSC Docket 080503 - RPS Staff Report (submitted 12/31/08 at <http://www.psc.state.fl.us/dockets/cms/docketFilings2.aspx?docket=080503>)

It is the ultimate in greenwashing to call nuclear power "clean" and weaken the state's renewable portfolio standard by doing so.

Does anyone really believe that nuclear power plants are emissions free? Has anyone but me read the radionuclide release data, the strontium 90 reports in baby teeth, the reports of increased incidence of childhood leukemia near nuclear power plants, the barely regulated thermal discharges altering coastal aquatic systems? And all this without accidents, all this without waste transport (yet). Soon we will need to move our spent nuclear fuel across the country by some means, safely.

Similarly, we are not fooled by the industry's claim of "Clean Coal". Even if IGCC with CCS were emissions-free, coal extraction and transport have devastating environmental and public health impacts including egregious Clean Water Act violations and the need to blast the tops off mountains.

We must keep nuclear and coal power as a separate issues from renewables. We are not that foolish. We know that doing otherwise serves only big utilities who are struggling to meet the Governor's mandate of 20% of their production through renewables.

Allowing nuclear and/or coal to fill the slot that should and must be occupied by truly sustainable renewable energy robs Floridians of their ratepayer investments and global citizens of a meaningful investment in climate crisis mitigation.

Governor Crist, you have an opportunity to do the right thing. Please uphold the intent of your executive order.

Thank you,  
Rhonda Roff

Dear Public Service Commissioner,,

Florida can do better! The proposed 10% renewable energy standard by 2025 is too timid. We must be as aggressive in fighting global warming as we are in pursuing clean industries. A measly ten percent is not doing either.

To avoid the worst impacts of global warming, we must be working toward decreasing greenhouse gas emissions 80% by 2050. The Sunshine state has some of the best solar resources in the country and should be capitalizing on this abundant resource. Governor Crist recognizes the economic opportunities of fighting global

**\*\*CLK OFFICIAL DOCUMENT...\*\***

warming: Florida will have a new clean energy industry offering green jobs while protecting Florida's assets from rising seas and stronger storms.

A better RPS is good for rate-payers! Renewable energy will bring electric rates down by diversifying the energy portfolio. The average electric bill for Florida residents has increased 25% since 2005 because of an over dependence on fuel that suffers from price shocks in a global market. Sun and wind are local resources that can't be manipulated by foreign governments or market speculators and the jobs created can't be outsourced.

Furthermore, ten percent will not bring renewable energy companies to Florida! Other states are providing stronger standards and we must be able to compete for these companies. The Florida PSC should be as aggressive and decisive as the Governor and Legislature and increase the standard to 20% renewable energy by 2020.

Thank you for your time and hard work.

Sincerely,

Denise Redgrave

Several points of thoughts when considering reviewing the renewable portfolio standard.

#### THE WORLD IS WATCHING

1.) Navigate studies only went to 2020 - after that point is when the use of renewable energies would really pay for themselves if they were implemented today. Think about how long it takes to construct a nuclear power plant and how expensive it is in the long run, does it really ever pay for itself!! Yet they show conditions which discourage the use of renewable in Florida now - maybe later.

Progress Energy states that the 2 proposed nuclear power plants in Levy County would only supply enough energy to meet the reserved requirements set by you - the PSC (20%) until 2023 -just 6 years after the plants are scheduled to be completed and only 3 years beyond the Navigate study. During a public information meeting held in Levy County, a Progress Energy employee stated that they could either "go solar at that time or perhaps build another nuclear power plant", when asked what would Progress Energy do after the year 2023!

The two ideas above when put together point toward the fact that big business wants to continue with business as usual and the Public Service Commission is not really looking out for the public interest. Would the PUBLIC EVER finish paying for new base load power plants??? To repeat a phrase - it is "Nationalization of Expenses and Privatization of Profits" and the only thing the PUBLIC gets is higher and higher bills!!!!

2.) Why are we always using other countries as models to follow?? Are we here in the US not capable of thinking for ourselves??

With that said - if Progress Energy wants to follow France then look at what they are now doing with feed in tariffs to encourage the use of renewable energy sources!!!

Why not follow Germany?? They are the leading country in the use of solar technologies - We are told by Progress Energy that Florida does not have enough Sunshine -I guess Florida is really not the Sunshine State as the Florida Tourism board states!!! They can not both be true!! The fact that Germany uses solar technology at all ,to generate energy also implies (using Progress Energy's thought process) that all it takes for Germany to be the leader is for that country to have large amounts of sunshine everyday. This would then make the sun feasible to use as a source for energy generation. I think we both know that statement is not true. What it takes for Germany and other countries to be successful at using renewables to generate energy is the desire to make it happen.

What will it take for Florida to be successful in changing how energy is generated and distributed? Forward looking thinking on part of the Governor and the Public Service Commission is needed. Change in how big business can influence our government decisions for that business own profit. Change in the methods that utilities are allowed to make money, so that building base load power plants

12/8/2008

---

is not the way for utilities to make money, and that money should not come directly from their rate payers!!

### 3.) Got Water??

Globally water is becoming a very scarce commodity! To encourage the proliferation of new nuclear power plants in the United States would cause a huge increase in this country's water consumption. The problem of water shortage and energy generation must be solved together. The way that the two problems can be addressed at the same time is to reduce the amount of water needed to generate electrical energy and this can be done by implementing the use of various renewable energy technologies NOW, not just sometime in the future. The future is now!

### 4.) Green Jobs and Low Carbon Economy

When Progress Energy presents their plans, it sounds as if nuclear power plants are the only path that would provide jobs in this area. The movement today toward using solar power, wind power, retrofitting existing buildings to improve energy efficiency, constructing "smart" electrical transmission grid systems, expanding mass transit and creating more local sustainable agricultural practices would all create more jobs. This would in turn reduce the need for large base load power plants, would put Florida quickly on the road to combating global warming and also help America obtain the energy security we need.

We as citizens of the Sunshine State ask the PSC and the Governor of Florida to implement a policy similar to the process in California for the use of truly renewable resources which generate the power needed to supply electricity to our homes, offices and other work places. Yes, the world is watching and they will soon want to follow the United States led in the quest to quickly reduce carbon emission and thus slowing the process of climate change. It will be seen that business as usual is no longer practiced here!

Sincerely,  
Emily Casey

Details:  
Dear Friends,

We are opposed to any additional power lines or transmission facilities in our neighborhood. There are already enough high tension lines within a block of my house and they are noisy, unsightly, and unhealthy. New load requirements should be shared by other communities that use the service and have no transmission lines or facilities.

We are also opposed to adding any new nuclear power generation to within a few miles of this major population center, Miami. They need to emphasize improved efficiencies and improvements to the power facilities they now have as well as safety and contingencies for a disaster.

Thank you.

# Renewable Energy Resources

## Renewable Energy Resources

**Why should our country be so different than the rest of the world by using <sup>LESS</sup> more renewable energy sources you may ask yourself? What is renewable energy? Renewable energy is water wind and of course the sun. We can also use geo thermal heat pumps to heat and cool our homes. These are renewable energy sources because they will always be around. This is a very process for our environment because there is no pollution being produced.**

**Although many people don't believe there are many other ways to save money, and be greener by taking a few quick easy steps. If the average Joe would turn off lights when not being used, and unplug everything that is not being used. You will watch your electric bill fall dramatically. If you get outside light with motion sensors they will shut off automatically and not be on all night. This way you won't have a light switch that can accidentally be turned on and waste energy. Also fluorescent light bulbs are energy efficient and light the room better. So how could you go wrong with these quick and easy steps?**

**We can use solar panels to capture the sun's rays to power our house instead using the grid. This is a good way for Americans to save money and even get paid for the electric we produce ourselves that we are not using. Yes Electric Company by law has to buy all unused energy if you are producing it yourself without using the grid. As of right now solar panels are expensive but they will eventually pay for themselves and it may be a better way to have more money in your pocket for anything else you want. The average person spends 1000's of dollars' just on electricity.**

EAN HEINTZ

**When you hear the word windmill you probably think of old farm houses or even the country. Wind mills have been used for centuries now to produce energy and at that they produce a lot of energy. One windmill is enough to power a basic house with a refrigerator, a stove, lights and all your TV's in your house. So after thinking about it going back into time two centuries ago would not be harmful on the environment or even more money in your pocket where our economy is hurting the worse. Really as bad as the economy is right now who has all that money for these outrageous rise in our electric bills. Yes they might be bulky or big but who cares they will save you a fortune and once again the wind will never stop blowing so we can never run out of electricity with a windmill.**

**Hydroelectricity means using running water to turn a turbine to create an energy source. In places like the Florida Keys or even the New Jersey shore can all use this to power things because they are right on the water and we will never run out of that resource. There is electricity all around the United States in water and we would rather just pay power companies to give us power than get it for free or even half the price. Water is everywhere and the ideas never stop coming. Every day people are finding ways to harness energy inside of moving water and it wouldn't surprise me one day if I saw someone find a way to use rain to cut back on electric bills.**

**What is a Geothermal heat pump? A Geothermal heat pump is a long pole that goes to earths crust and uses stable underground temperatures to warm and cool our homes. This would be good because everyone around the world could use it and it still wouldn't cause any harm to our environment. This could have a downside like everything else. However I'm ready for a change even if I have to do it myself to show people how to save that pretty penny we spend on electric bills.**

**As you have read, these are some reasons why our country should be so different and use renewable energy sources instead of the grid. Yes they might be costly and expensive to fix but**

**they will always be around and they will eventually pay for themselves. So remember windmills, solar panels, hydroelectricity, and geothermal heat pumps will save you a lot of money and help protect our environment. Also the economy is not getting better for us so I think its time to start doing something new and save us average Joes a couple of dollars.**

# Why should American people switch to Renewable Resources?

*Well* we all know that the non-renewable resources are non-renewable

and well it says so in its name after all it doesn't take a genius to figure that one out. Its like this there are no more Dinosaurs left in the world alive at least and they are not coming back so therefore how would we get more? Once it is gone its gone for about another million years. We the people that used it all up will be dead and not known of by the time there is more.

We should switch from non-renewable resource to renewable like from coal, oil, and natural gasses, to trees, fish and fresh water. Non-renewable fossil fuels take millions of years to form naturally, and cannot be replaced once it is consumed. Renewable resources can be used and replaced as they are used because they are continually reproduced, and capable of being produced.

By using the non-renewable resources we are all damaging the world slowly but surely then where are our children, grandchildren, and great grand children going to live. Don't you want your future family to have the same things you did when you were their age? I know that I do and that's for sure. People act like they are not hurting anything and they are not aware of the fact that they are hurting this place that we love and the place where they live.

So with all of that said I hope this essay changes your mind next time you go to the store and go to buy propane or something that is non-renewable you will think of all

the things it could destroy and you switch it out to something that is Renewable. This world is very important and all the people on it depend on it to live and be happy and enjoy what they do. So Go Green and save the planet, and the Fossil Fuels one day and thing at a time.

NOTES/COMMENTS:

---

The nuclear power plants are unreasonable to construct. There are other, more efficient alternatives to produce electricity. These sources are windmills and solar energy. But more important, the nuclear plants are harming our ecosystems and damaging lives. It is important that we consider the alternatives before making a decision that could effect generations to come.

The nuclear power plants put off more waste than any energy source there is. We are polluting our air and drinking water, not only by powering these plants, but just by cleaning them, as well. The nuclear plants are harming our lives and our children's lives by the waste and radioactive materials they emit. The nuclear power plants also set a target for terrorists because it only takes one wrong chemical to get in the mix and every species in a 10 or more mile radius would be destroyed. Also, the nuclear plants are the most costly source for receiving electricity. When operating these power plants we are consuming more water than is necessary. It is also a proven fact that over time being introduced to these radioactive materials and waste will cause health problems, not only in our lives, but our children's lives.

Solar energy is one alternative to produce electricity. The most beneficial aspect of this alternative is that it is a renewable resource. Also, using solar energy is completely silent, along with it's very low maintenance. Another contribution that solar energy gives to the environment is that it is non-polluting and does not harm humans or animals. Using solar energy will also put more money in your pocket over time. It is also easy to install and is set right on your home. Also, if the sun ever completely quit shining, life would not be sustainable. This makes solar energy the most convenient alternative.

Another alternative to nuclear power plants is windmills. Windmills are the cheapest source to produce electricity. It is also another eco-friendly resource, as well. They do not pollute or harm the environment. The windmills are 100% natural, clean, and healthy. The wind is a renewable form of power. It is also doubtful that the wind will ever quit blowing which makes this a quality alternative.

So you see, we do not have to pollute our environment just to have electricity. We also do not have to harm the ecosystem and damage lives. These alternatives are more beneficial and less costly. There is no reason why we should not do what is best for the people and disregard the idea of poisoning our home and community with more nuclear power plants.

Reference Docket # -080503 -EI

We now have the technology to use solar, wind, water and magnetic fields for energy production. It is necessary to move forward with renewable energy NOW, before any more money is spent on old methods of creating electrical energy!!!! nuclear plants need to be phased out as the newer, cleaner, renewable energies come on line. Our society will be going backward in development if nuclear plants are permitted to begin building again. The use of spent rods to extract the plutonium is an end in itself. Please don't approve the building of nukes for energy.

**Subject:** ATTN: Matthew Carter - Florida's RPS

Dear Mr. Carter,

As a resident of Volusia County, I am very concerned about Florida's economy, environment and clean energy future. I am upset that PSC staff has proposed targets and timeframes for Florida's renewable portfolio standard (RPS) that are extremely weak in comparison to those adopted by the majority of states, and that will greatly hinder efforts to reduce greenhouse gases as recommended by Governor Crist (80% of 1990 levels by 2050), while still resulting in rising energy costs to Florida consumers. Please instead adopt a strong RPS of 20%, as recommended by Governor Crist, within a timeframe of 2020-2025, as considered by the Governor's Action Team on Energy and Climate Change's Energy Supply and Demand Technical Work Group.

Clean energy is well worth the investment in Florida's future. A strong renewable portfolio standard with aggressive timeframes is essential to bring more clean energy projects to our state, stimulate green jobs and to adequately reduce greenhouse gases. Prompt emphasis on solar and wind energy as well as energy efficiency, through an aggressive RPS and attractive incentives, will open doors to related industries resulting in a local influx of high paying engineering, manufacturing, and installation jobs that will do much to stimulate Florida's economy. As demand for renewable energy grows globally, Florida can seek to attract related industries, positioning itself for future prosperity, or continue to lose these opportunities to other forward-thinking states and countries. Solar is a very attractive clean energy option for Florida; why should we have to continue to rely on Germany or even California for quality solar equipment components when we could be producing them cheaper locally? Renewable energy will also help insulate customers against additional price shocks from increasingly expensive to retrieve fossil fuels and the far more costly development of nuclear infrastructure.

**\*\*CLK OFFICIAL DOCUMENT...\*\*b>**

Overreliance on conventional energy sources has resulted in an average 25% increase in Florida electric bills since 2005, with greater increases expected from planned nuclear plants. Meanwhile, costs of renewable energy are declining due to improved technology and increased demand.

Please help secure Florida's future by establishing a strong renewable portfolio standard of 20% by 2020-2025.

Thank you for your attention to this critical issue.

Sincerely,

Sharon B. Rich

Dear Ms. Rich:

This is to acknowledge receipt of your email to Chairman Matthew M. Carter II, Florida Public Service Commission, regarding renewable energy standards. Given the nature of your concerns, Chairman Carter feels it would be appropriate for specialized staff of the Division of Service, Safety and Consumer Assistance to respond to your concerns.

You expressed a concerns about the establishment of a rule on renewable portfolio standards. We appreciate your comments regarding the docket and will add your correspondence to Docket No. 080503-EI.

If you have any questions or concerns please call me at 1-800-342-3552 or by fax at 1-800-511-0809.

Sincerely,

Ellen Plendl

Dear Chairman Carter,

As a citizen of Florida I am contacting you in support of a strong Renewable Portfolio Standard (RPS) of at least 20% by 2020, or higher. We need a strong RPS to help jump-start a clean renewable energy industry and create new green collar jobs in Florida. Please listen to Governor Crist's request for a 20% by 2020 RPS and don't let Florida fall behind many other states that are already implementing strong RPS.

Sincerely,

*080503*

Dear Chairman Carter,

As a citizen of Florida I am contacting you in support of a strong Renewable Portfolio Standard (RPS) of at least 20% by 2020, or higher. We need a strong RPS to help jump-start a clean renewable energy industry and create new green collar jobs in Florida. Please listen to Governor Crist's request for a 20% by 2020 RPS and don't let Florida fall behind many other states that are already implementing strong RPS.

Sincerely,

*Don Jammas Tom*

Dear Commissioner.

COMMISSION  
CLERK

Progress Energy of Florida got a bonus from you at our expenses...  
25% more on its charges....

Not only for the Energy charge.... but also for the fuel charge  
which went up and up with the crude oil prices...  
Now tha. the crude oil is going down and down.. you still took  
the liberty for them to have a bonus. Some of you must have some  
shares in the company....

Every body wants a BAIL OUT one way or the other... this is epidemic.  
Try to clean up the charade.... enough of it.

Now the elctricity.... next the water... than the sewers. and cable..  
and a myriad of others...

Thank you for your generosity... Like they say:  
"with the skin of others, it is easy to make LARGE BELTS"

Dear Chairman Carter,

As a citizen of Florida I am contacting you in support of a strong Renewable Portfolio Standard (RPS) of at least 20% by 2020, or higher. We need a strong RPS to help jump-start a clean renewable energy industry and create new green collar jobs in Florida. Please listen to Governor Crist's request for a 20% by 2020 RPS and don't let Florida fall behind many other states that are already implementing strong RPS.

Sincerely,

Dear FPSC:

I urge you to set significantly higher targets for the Renewable Portfolio Standard in Florida. I support renewable energy targets of 20% by 2020.

It is imperative that we bring more clean renewable energy projects to Florida. By doing so, we will help our citizens and Florida businesses avoid the ever-increasing use of costly fossil fuels. An investment in renewable energy will create jobs and income for us. Such an investment will also help reduce our country's financial support for foreign oil tyrants.

I am concerned about global warming and anxious that Florida make clean energy a priority.

Sincerely,

Joyce Milford

Chairman Mathew M Carter II ,  
FL

Dear Public Service Commissioner,,

Florida can do better! The proposed 10% renewable energy standard by 2025 is too timid. We must be as aggressive in fighting global warming as we are in pursuing clean industries. A measly ten percent is not doing either.

To avoid the worst impacts of global warming, we must be working toward decreasing greenhouse gas emissions 80% by 2050. The Sunshine state has some of the best solar resources in the country and should be capitalizing on this abundant resource. Governor Crist recognizes the economic opportunities of fighting global warming: Florida will have a new clean energy industry offering green jobs while protecting Florida's assets from rising seas and stronger storms.

A better RPS is good for rate-payers! Renewable energy will bring electric rates down by diversifying the energy portfolio. The average electric bill for Florida residents has increased 25% since 2005 because of an over dependence on fuel that suffers from price shocks in a global market. Sun and wind are local resources that can't be manipulated by foreign governments or market speculators and the jobs created can't be outsourced.

Furthermore, ten percent will not bring renewable energy companies to Florida! Other states are providing stronger standards and we must be able to compete for these companies. The Florida PSC should be as aggressive and decisive as the Governor and Legislature and increase the standard to 20% renewable energy by 2020.

Thank you for your time and hard work.

Sincerely,

DAn Tonsmeire

**Subject:** Beef Up the RPS!

Chairman Mathew M Carter II ,  
FL

Dear Public Service Commissioner,,

Florida can do better! The proposed 10% renewable energy standard by 2025 is too timid. We must be as aggressive in fighting global warming as we are in pursuing clean industries. A measly ten percent is not doing either.

To avoid the worst impacts of global warming, we must be working toward decreasing greenhouse gas emissions 80% by 2050. The Sunshine state has some of the best solar resources in the country and should be capitalizing on this abundant resource. Governor Crist recognizes the economic opportunities of fighting global warming: Florida will have a new clean energy industry offering green jobs while protecting Florida's assets from rising seas and stronger storms.

A better RPS is good for rate-payers! Renewable energy will bring electric rates down by diversifying the energy portfolio. The average electric bill for Florida residents has increased 25% since 2005 because of an over dependence on fuel that suffers from price shocks in a global market. Sun and wind are local resources that can't be manipulated by foreign governments or market speculators and the jobs created can't be outsourced.

Furthermore, ten percent will not bring renewable energy companies to Florida! Other states are providing stronger standards and we must be able to compete for these companies. The Florida PSC should be as aggressive and decisive as the Governor and Legislature and increase the standard to 20% renewable energy by 2020.

Thank you for your time and hard work.

Sincerely,

Dear Chairman Carter,

As a citizen of Florida and member of the American Association of Retired Persons (AARP) I am contacting you in support of a strong Renewable Portfolio Standard (RPS) of at least 20% by 2020, or higher. We need a strong RPS to help jump-start a clean renewable energy industry and create new green collar jobs in Florida. Please listen to Governor Crist's request for a 20% by 2020 RPS and don't let Florida fall behind many other states that are already implementing strong RPS.

As a citizen of Florida I am contacting you in support of a strong Renewable Portfolio Standard (RPS) of at least 20% by 2020, or higher. We need a strong RPS to help jump-start a clean renewable energy industry and create new green collar jobs in Florida. Please listen to Governor Crist's request for a 20% by 2020 RPS and don't let Florida fall behind many other states that are already implementing strong RPS.

Sincerely, *[Signature]*

Chairman Mathew M Carter II ,  
FL

Dear Public Service Commissioner,,

Florida can do better! The proposed 10% renewable energy standard by 2025 is too timid. We must be as aggressive in fighting global warming as we are in pursuing clean industries. A measly ten percent is not doing either.

To avoid the worst impacts of global warming, we must be working toward decreasing greenhouse gas emissions 80% by 2050. The Sunshine state has some of the best solar resources in the country and should be capitalizing on this abundant resource. Governor Crist recognizes the economic opportunities of fighting global warming: Florida will have a new clean energy industry offering green jobs while protecting Florida?s assets from rising seas and stronger storms.

A better RPS is good for rate-payers! Renewable energy will bring electric rates down by diversifying the energy portfolio. The average electric bill for Florida residents has increased 25% since 2005 because of an over dependence on fuel that suffers from price shocks in a global market. Sun and wind are local resources that can?t be manipulated by foreign governments or market speculators and the jobs created can?t be outsourced.

Furthermore, ten percent will not bring renewable energy companies to Florida! Other states are providing stronger standards and we must be able to compete for these companies. The Florida PSC should be as aggressive and decisive as the Governor and Legislature and increase the standard to 20% renewable energy by 2020.

Thank you for your time and hard work.

Sincerely,

Kenny Shier

Re: Acct. No.: 1348492453

I am again requesting that the charge of \$9.75 for the final month of the Sunshine Energy Program be removed from my account because the program was terminated by the Florida Public Service Commission in July.

I have continued to pay the remainder of my bills in full and on time.

I look forward to your acknowledgment of and favorable response to my request.

Dear Public Service Commissioner,,

Florida can do better! The proposed 10% renewable energy standard by 2025 is too timid. We must be as aggressive in fighting global warming as we are in pursuing clean industries. A measly ten percent is not doing either.

To avoid the worst impacts of global warming, we must be working toward decreasing greenhouse gas emissions 80% by 2050. The Sunshine state has some of the best solar resources in the country and should be capitalizing on this abundant resource. Governor Crist recognizes the economic opportunities of fighting global warming: Florida will have a new clean energy industry offering green jobs while protecting Florida's assets from rising seas and stronger storms.

Renewable energy is also a a long-term economic and national security issue. Petroleum and even coal will eventually be depleted, and we cannot realistically drill and dig our way out of dependency on oil from hostile foreign powers. We can reduce global warming AND slow down the inevitable depletion of petroleum and coal AND become more energy independent by rapidly increasing our exploitation of renewable energy. Renewable energy will not run out until the sun runs out.

A better RPS is good for rate-payers! Renewable energy will bring electric rates down by diversifying the energy portfolio. The average electric bill for Florida residents has increased 25% since 2005 because of an over dependence on fuel that suffers from price shocks in a global market. Sun and wind are local resources that can't be manipulated by foreign governments or market speculators and the jobs created can't be outsourced.

**From:** Sharon Rich [sharonrich@yahoo.com]  
**Sent:** Wednesday, October 29, 2008 8:05 PM  
**To:** Office of the Chairman  
**Subject:** Beef Up the RPS!

Chairman Mathew M Carter II ,  
FL

Dear Public Service Commissioner,,

Florida should be as aggressive in fighting global warming as we are in pursuing clean industries. The Florida PSC should follow the Governor's and Legislature's lead and establish Florida's renewable energy standard at 20% renewable energy by 2020.

To avoid the worst impacts of global warming, we must work towards decreasing greenhouse gas emissions 80% from 1990 levels by 2050. This will require an aggressive restructuring of our energy infrastructure, but will provide great economic opportunities for those states who take the lead in implementing the imminent Green Revolution.

The Sunshine state has some of the best solar resources in the country and should be capitalizing on this abundant resource. Governor Crist recognizes the economic opportunities of fighting global warming: Florida will have a new clean energy industry offering green jobs while protecting Florida's assets from rising seas and stronger storms. However, a ten percent RES will not help bring the desired green economy, renewable energy companies and jobs to Florida! Other states are providing stronger standards and we must be able to compete for these companies. A strong RES will stimulate growth of clean energy manufacturing, engineering, installation and other jobs much needed in this state.

A 20% RPS is good for rate-payers too! Renewable energy will bring electric rates down by diversifying the energy portfolio. The average electric bill for Florida residents has increased 25% since 2005 because of an over dependence on fuel that suffers from price shocks in a volatile global market. Sun and wind are local resources that can't be manipulated by foreign governments or market speculators and the related jobs created can't be outsourced.

To ensure Florida's future, The Florida PSC must increase Florida's RES to 20% renewable energy by 2020.

Thank you for your time and hard work.

Sincerely,

Dear Public Service Commissioner, ,

There is much more to renewable energy production than just solar vs fossil fuel. 50% of all our potable water goes to support an outdated, outmoded, wasteful system of power generation. As we run out of water, we should not be building more fossil fueled power production, we should be looking to the sun and saving water at the same time.

Florida can do better! The proposed 10% renewable energy standard by 2025 is too timid. We must be as aggressive in fighting global warming as we are in pursuing clean industries. A measly ten percent is not doing either.

To avoid the worst impacts of global warming, we must be working toward decreasing greenhouse gas emissions 80% by 2050. The Sunshine state has some of the best solar resources in the country and should be capitalizing on this abundant resource. Governor Crist recognizes the economic opportunities of fighting global warming: Florida will have a new clean energy industry offering green jobs while protecting Florida's assets from rising seas and stronger storms.

A better RPS is good for rate-payers! Renewable energy will bring electric rates down by diversifying the energy portfolio. The average electric bill for Florida residents has increased 25% since 2005 because of an over dependence on fuel that suffers from price shocks in a global market. Sun and wind are local resources that can't be manipulated by foreign governments or market speculators and the jobs created can't be outsourced.

Furthermore, ten percent will not bring renewable energy companies to Florida! Other states are providing stronger standards and we must be able to compete for these companies. The Florida PSC should be as aggressive and decisive as the Governor and Legislature and increase the standard to 20% renewable energy by 2020.

Thank you for your time and hard work.

Sincerely,

Eric West  
1401 S. Palmetto Ave., #112

Florida can do better! The proposed 10% renewable energy standard by 2025 is too timid. We must be as aggressive in fighting global warming as we are in pursuing clean industries. A measly ten percent is not doing either.

To avoid the worst impacts of global warming, we must be working toward decreasing greenhouse gas emissions 80% by 2050. The Sunshine state has some of the best solar resources in the country and should be capitalizing on this abundant resource. Governor Crist recognizes the economic opportunities of fighting global warming: Florida will have a new clean energy industry offering green jobs while protecting Florida's assets from rising seas and stronger storms.

A better RPS is good for rate-payers! Renewable energy will bring electric rates down by diversifying the energy portfolio. The average electric bill for Florida residents has increased 25% since 2005 because of an over dependence on fuel that suffers from price shocks in a global market. Sun and wind are local resources that can't be manipulated by foreign governments or market speculators and the jobs created can't be outsourced.

Furthermore, ten percent will not bring renewable energy companies to Florida! Other states are providing stronger standards and we must be able to compete for these companies. The Florida PSC should be as aggressive and decisive as the Governor and Legislature and increase the standard to 20% renewable energy by 2020.

Thank you for your time and hard work.

Sincerely,

Wes Winters

The Sunshine state has some of the best solar resources in the country and should be capitalizing on this abundant resource. Governor Crist recognizes the economic opportunities of fighting global warming: Florida will have a new clean energy industry offering green jobs while protecting Florida's assets from rising seas and stronger storms.

A better RPS is good for rate-payers! Renewable energy will bring electric rates down by diversifying the energy portfolio. The average electric bill for Florida residents has increased 25% since 2005 because of an over dependence on fuel that suffers from price shocks in a global market. Sun and wind are local resources that can't be manipulated by foreign governments or market speculators and the jobs created can't be outsourced.

Furthermore, ten percent will not bring renewable energy companies to Florida! Other states are providing stronger standards and we must be able to compete for these companies. The Florida PSC should be as aggressive and decisive as the Governor and Legislature and increase the standard to 20% renewable energy by 2020.

Thank you for your time and hard work.

Sincerely,

Phil Craggs

Dear Public Service Commissioner,,

Florida can do better! The proposed 10% renewable energy standard by 2025 is too timid. We must be as aggressive in fighting global warming as we are in pursuing clean industries. A measly ten percent is not doing either.

To avoid the worst impacts of global warming, we must be working toward decreasing greenhouse gas emissions 80% by 2050. The Sunshine state has some of the best solar resources in the country and should be capitalizing on this abundant resource. Governor Crist recognizes the economic opportunities of fighting global warming: Florida will have a new clean energy industry offering green jobs while protecting Florida's assets from rising seas and stronger storms.

A better RPS is good for rate-payers! Renewable energy will bring electric rates down by diversifying the energy portfolio. Comments:

This country, our state of Florida included, does not have the luxury not to act where renewable energy is concerned. Governor Crist has taken a leadership role in pushing for a significant increase in the production and use of renewable energy in Florida. However this challenge is not being met by the Public Services Commission or the utility companies. According to a recent article in the Orlando Sentinel, "Last year, Gov. Charlie Crist challenged the PSC to set up regulations that would require Florida's power companies to produce 20 percent of its energy from renewable sources by 2020. That means sources like solar and hydropower, not coal and nuclear plants.

"This week, the PSC's staff meekly suggested that power companies should produce 5 percent of their power from renewable sources by 2017. Under the PSC's standards, which commissioners will talk about at their meeting on Tuesday, the governor's 20 percent goal wouldn't be met until 2041.

"The PSC's response was pathetic. And that 5 percent mark by 2017? It includes the 3.6 percent that Florida already generates from renewable sources."

**Office of Commission Clerk Official Filing**

As a citizen of this state of Florida, I am appalled by the lack of action being taken by the PSC and the power companies. If the PSC suggestions are followed, practically no progress will be made - 1.4% increase in 9 years?! And while nuclear power does have the benefit of a low carbon footprint; it is very expensive to build, a security risk (theft and storage of spent fuel, etc.), and the money to build it could much more profitably be spent on developing true renewable energy sources and industries.

The most economically successful countries are those who have developed sustainable and renewable sources of energy. Is the lobby from the power companies so strong that the commissioners are afraid to act to protect our future? We need to do something now. Get with the program PSC and develop progressive regulations that will improve our state of being.

I'm contacting you in regard to the proposed Renewable Portfolio Standard released last week.

When I read that you turned down the power company's request to have nuclear power count as renewable

**\*\*CLK OFFICIAL DOCUMENT...\*\***

energy, I was happy to see the commission was standing up to FPL and making the right decision for Florida. But then I read this proposed plan and it's goal of %20 renewable energy by 2050 and was greatly disappointing. This is way to little, way to late.

This state has a wealth of renewable resources that can be tapped to bring it's residents clean, affordable energy. The power companies are, however, willing to let our current energy crisis reach a critical point before investing seriously in renewable energy. Instead, depleting our current energy sources and polluting our state for quick and easy profit.

Sadly this standard as proposed allows them to do just that. I implore you to consider the long term effects to the residents of Florida over the profits of the power companies. Please, adjust the Renewable Portfolio standard to make Florida one of the leading states in renewable energy production in the future and not one left behind.

Thank You,  
Ray Myers  
Florida Resident

Instead, depleting our current energy sources and polluting our state for quick and easy profit.

Sadly this standard as proposed allows them to do just that. I implore you to consider the long term effects to the residents of Florida over the profits of the power companies. Please, adjust the Renewable Portfolio standard to make Florida one of the leading states in renewable energy production in the future and not one left behind.

Thank You,  
Ray Myers  
Florida Resident

Comments:

I'm contacting you in regard to the proposed Renewable Portfolio Standard released last week.

When I read that you turned down the power company's request to have nuclear power count as renewable energy, I was happy to see the commission was standing up to FPL and making the right decision for Florida. But then I read this proposed plan and it's goal of %20 renewable energy by 2050 and was greatly disappointing. This is way to little, way to late.

This state has a wealth of renewable resources that can be tapped to bring it's residents clean, affordable energy. The power companies are, however, willing to let our current energy crisis reach a critical point before investing seriously in renewable energy. Instead, depleting our current energy sources and polluting our state for quick and easy profit.

Sadly this standard as proposed allows them to do just that. I implore you to consider the

Comments:

Your recent recommendation that florida achieve 20% renewable energy by 2041 is an embarrassment. How dare you insult us with such a position. By 2041, at least 60% of our energy needs to be clean and renewable. Our state government's administration of development in our state demonstrates incompetence, and apparently that trend continues. Please resign and lets folks with intellect, vision and caring marshall our state into the future. Clearly uou are incapable of making decisions other than for the benefit of big business and lobbyist.

Comments:

The PSC needs to implement a plan to have 20% of Florida's energy generated by renewable resources by 2020. Any lesser plan or staff proposal that falls short should be rejected. Remember that you work for us, not the power companies.

DOC NUMBER NO.	07769-08
DATE RECEIVED	

Subject: Docket #080503 Renewable Portfolio Standard Rulemaking

Dear Ms. Cole:

Sarasota County is committed to building a Sustainable Community and diversifying our local economy. Effective and ambitious implementation of renewable energy technologies is a priority strategy toward achieving this broadly supported goal. Sarasota County partnered with Florida Power and Light in hosting the largest solar array in the state on our Rothenbach Park, is developing landfill gas to energy projects on our landfills, and is exploring a potential project to deploy solar hot water heaters on homes around our community. Our citizens have identified renewable energy as a priority at their community environmental summit held in February and set a goal of 50 percent of homes with solar hot water heaters within five years. These initiatives and others will be key to developing local demand for renewable energy and building the potential for green jobs in our economy.

As the Public Service Commission considers the details of the Renewable Portfolio Standard (RPS), Sarasota County would like to express support for a strong standard that would increase the local opportunities for renewable energy in communities like ours. With a requirement of 20 percent by 2020, utilities and customers would be presented with the incentives necessary to overcome market barriers and implement renewable energy projects at a scale that would boost local economic opportunities in the industry and help achieve sustainable energy goals in the near term.

Sarasota County is particularly interested in the inclusion of solar hot water offsets of electric generation. This technology has been identified by our citizens as a key tool in the implementation of renewable energy, with proven technology, rapid payback, and significant energy potential. The inclusion of solar hot water heating in the Renewable Portfolio Standard would be critical to the achievement of our community's solar thermal goals.

The Florida Solar Energy Center (FSEC) has done an analysis that shows the current draft of the Renewable Portfolio Standard would put Florida last among all states with an RPS. The FSEC has shown that a target of 20 percent by 2020 would be achievable and economical, returning

savings to citizens around the state and inspiring innovations among local businesses. Sarasota County would like to encourage the Public Service Commission to continue Florida's pattern of leadership on climate change and renewable energy, by recommending a rule that includes the 20 percent by 2020 standard and includes solar hot water among the eligible technologies.

Sincerely,

James L. Ley  
County Administrator

4665 Pebble Bay South  
Vero Beach, FL 32963  
September 6, 2008

Dear Commissioners,

Just a few months ago, I was pleased to be able to spread the good news in my community that the Public Service Commission had been strong and progressive in their stand against big utility companies – insisting that net metering become mandated. I saw this as a very positive incentive for individuals and businesses to

9/8/2008

take the risk and start investing in alternative energy sources for Florida. And in fact, I think the result was that it put pressure on the private utility companies, like FPL, to begin investing in alternative energy sources themselves.

Now this week, I was disappointed to read about the Public Service Commission's draft proposal for renewable energy production. The tiered objectives of 2% by 2010, 3.75% by 2017, 6% by 2025 and 20% by 2050 fall short of the targets that we need to set. The U. S. Department of Energy has set a goal of 20% of the U.S. Electric power to come from Renewable Sources by 2030. Florida should be leading this effort, not falling behind other states that are less suited for renewable energy.

I urge you as Commissioners to set the goals at a level that join the national effort for our nation to become energy independent. I also urge you to adopt an official policy as part of your mission statement regarding the usage of renewable energy.

Sincerely,

Judy Orcutt  
IRC Sustainability Committee

Comments:

PSC, Your proposed one percent increased cost to consumers cap for renewable energy projects is much too low and should be a 20-25 percent cap as in recent proposals for new nuclear power plants. Please remember that these costs can be recovered over time in many economic ways. Further, I oppose building nuclear plants until all nuclear waste disposal safety issues have been resolved at local, national and global levels. I also support Gov. Christ's ambition for 20 percent renewables by year 2020. Your timid goals smack of utility industry favoritism. We Floridians must do our share to reduce the impacts of global warming. Please maintain the Public in PSC decisions.
