## P R O C E E D I N G S

1  
2 (Transcript follows in sequence from  
3 Volume 14.)

4 **CHAIRMAN CARTER:** We are back on the record.  
5 And when we last left we had completed with Witness  
6 Schultz.

7 Mr. Rehwinkel, call your next witness.

8 **MR. REHWINKEL:** The Citizens of Florida call  
9 Jacob Pous to the stand.

10 Mr. Pous, were you sworn as a witness in this  
11 proceeding yet?

12 **THE WITNESS:** No.

13 **CHAIRMAN CARTER:** Mr. Pous, would you please  
14 stand and raise your right hand?

15 And if there are any other witnesses that will  
16 be testifying today that have not been sworn --  
17 Mr. Larson -- Mr. Lawson is here.

18 Would you please raise your right hand?

19 (Witnesses collectively sworn.)

20 Thank you. Please be seated.

21 Mr. Rehwinkel.

22 **MR. REHWINKEL:** Thank you.

**JACOB POUS**

23  
24 was called as a witness on behalf of the Office of  
25 Public Counsel and, having been duly sworn, testified as

1 follows:

2 **DIRECT EXAMINATION**

3 **BY MR. REHWINKEL:**

4 **Q.** Good morning, Mr. Pous. Could you state your  
5 name, employer and address for the record?

6 **A.** My name is Jacob Pous. That's P-O-U-S. My  
7 employer is Diversified Utility Consultants, Inc. My  
8 address is 1912 West Anderson Lane, Suite 202, Austin,  
9 Texas 78757.

10 **CHAIRMAN CARTER:** Excuse me, Mr. Rehwinkel.  
11 Let's back up for a second. Let's back up for a second.

12 I don't remember if we did the exhibits. Did  
13 we do the exhibits --

14 **MR. REHWINKEL:** I moved --

15 **CHAIRMAN CARTER:** -- for Mr. Schultz?

16 **MR. REHWINKEL:** -- 169 through 172.

17 **CHAIRMAN CARTER:** We did those? Let me be --  
18 out of an abundance of caution here. Okay. I got it.  
19 Thank you.

20 **MR. REHWINKEL:** Yes, sir.

21 **CHAIRMAN CARTER:** You may proceed.

22 **BY MR. REHWINKEL:**

23 **Q.** And, Mr. Pous, on whose behalf are you  
24 testifying today?

25 **A.** The Office of Public Counsel.

1           Q.    In that regard, did you cause to be prepared  
2           prefiled direct testimony in this docket consisting of  
3           137 pages?

4           A.    Yes.

5           Q.    Do you have any changes or corrections to make  
6           to that testimony?

7           A.    Just one.  Page 101.

8           Q.    Okay.

9           A.    Line 23, the parentheses says, "See Exhibit  
10           (EMR-2) page 2-227."  It should have been 2-7.  So you  
11           need to strike the number two at the end of the  
12           parentheses.  That's it.

13          Q.    Okay.  With that correction, if I asked you  
14           the questions contained in your prefiled direct  
15           testimony, would your answers be the same?

16          A.    Yes.

17               **MR. REHWINKEL:**  Mr. Chairman, I would ask that  
18           Mr. Pous' prefiled direct testimony be admitted into the  
19           record.

20               **CHAIRMAN CARTER:**  The prefiled testimony of  
21           the witness will be inserted into the record as though  
22           read.

23           **BY MR. REHWINKEL:**

24           Q.    Mr. Pous, did you also prepare a series of  
25           exhibits to your testimony, consisting of JP-Appendix A

1 and JP-1 through JP-11, which have been identified as  
2 Exhibits, hearing Exhibits 133 through 144?

3 **A.** Yes.

4 **Q.** Do you have any changes or corrections to make  
5 to those exhibits?

6 **A.** No.

7 (Exhibits 133 through 144 marked for  
8 identification.)

Of

JACOB POUS

On Behalf of the Office of Public Counsel

Before the

Florida Public Service Commission

Docket No. 090079-EI

---

**SECTION I: INTRODUCTION**

**A. STATEMENT OF QUALIFICATIONS**

**Q. PLEASE STATE YOUR NAME AND BUSINESS ADDRESS.**

A. My name is Jacob Pous. My business address is 1912 W Anderson Lane, Suite 202, Austin, Texas 78757.

**Q. WHAT IS YOUR OCCUPATION?**

A. I am a principal in the firm of Diversified Utility Consultants, Inc. ("DUCI"). A description of my qualifications appears as Exhibit \_\_ (JP-Appendix A).

**Q. PLEASE DESCRIBE DIVERSIFIED UTILITY CONSULTANTS, INC.**

A. DUCI is a consulting firm located in Austin, Texas. DUCI has an international client base. DUCI provides engineering, accounting, and financial services to clients. DUCI provides utility consulting services to municipal governments with utility systems, to end-users of utility services and to regulatory bodies such as state public service commissions. DUCI provides complete rate case analyses, expert testimony,

1 negotiation services and litigation support in electric, gas, telephone, water, and sewer  
2 utility matters.

3  
4 **Q. HAVE YOU PREVIOUSLY TESTIFIED IN PUBLIC UTILITY**  
5 **PROCEEDINGS?**

6 A. Yes. Exhibit\_\_\_(JP-Appendix A) also includes a list of proceedings in which I have  
7 previously presented testimony. In addition, I have been involved in numerous utility  
8 rate proceedings that resulted in settlements before testimony was filed. In total, I  
9 have participated in well over 300 utility rate proceedings in the United States and  
10 Canada. I have testified on behalf of the staff of five different state regulatory  
11 commissions on subjects relating to appropriate depreciation rates.

12  
13 **Q. WHAT IS YOUR PROFESSIONAL BACKGROUND?**

14 A. I am a registered professional engineer. I am registered to practice as a Professional  
15 Engineer in the State of Florida, as well as numerous other states.

16  
17 **Q. ON WHOSE BEHALF ARE YOU PROVIDING THIS TESTIMONY?**

18 A. Florida's Office of Public Counsel ("OPC") engaged me to address the depreciation  
19 study and the depreciation aspects of the revenue requirements request of Progress  
20 Energy Florida ("PEF" or "the Company") pending before Florida Public Service  
21 Commission (the "Commission" or "FSPC").

1           **B. OVERVIEW**

2   **Q.    CAN YOU PROVIDE A QUICK OVERVIEW OF THE RELATIVE**  
3   **SIGNIFICANCE OF DEPRECIATION-RELATED MATTERS IN THE**  
4   **CONTEXT OF PEF'S REQUESTED INCREASE IN REVENUES?**

5   A.   Yes. In terms of revenue impacts, the subject of depreciation is extremely significant  
6   in this proceeding. In my testimony, I will report the results of my account-by-  
7   account analysis of the depreciation study that PEF is sponsoring, the results of which  
8   are reflected in PEF's calculation of its revenue requirements. I will identify  
9   numerous examples in which PEF's witness overstates depreciation expense, and  
10   refute PEF's proposed treatment on the basis of the inappropriate assumptions and  
11   rationales that he employed. My approach is a "from the bottom up" type of analysis,  
12   in which I review the details of individual accounts and build up the individual  
13   adjustments into a total dollar recommendation. In the aggregate, my adjustments  
14   amount to \$275 million of reduced depreciation expense annually based on plant as of  
15   December 31, 2009. Approximately \$161 million of this annual amount is intended to  
16   return to current customers a *portion* of a massive reserve excess that is the result of  
17   PEF's having over collected depreciation expense over time; the balance relates to my  
18   adjustments to PEF's calculation of annual depreciation expense that the utility  
19   should recognize "going forward." When applied to PEF's proposed increase, the  
20   impact of my \$275 million recommendation is to reduce PEF's revenue requirements  
21   dollar for dollar. In other words, when PEF's overly aggressive depreciation practices  
22   and proposals, past and present, are modified to conform to available data and  
23   reasonable assumptions, the result is to offset a sizeable portion of PEF's half billion  
24   dollar rate increase request for 2010. At first blush, the magnitude of the overall

1 recommendation may be surprising. However, as I will show, the result is the sum of  
2 dozens of smaller individual adjustments, each of which is a “standalone” topic and  
3 each of which I will document, discuss, and support in detail in the course of my  
4 testimony.

5

6 **Q. HOW HAVE YOU ORGANIZED YOUR TESTIMONY?**

7 A. I will begin with an introductory background section, in which I will define and  
8 describe the basic nature and role of depreciation in the context of a regulated electric  
9 utility. Next, I will provide an “executive summary” of my analysis. I will then  
10 develop the issues that I have identified and my analysis of the appropriate  
11 disposition of those issues in detail.

12

13 **C. GENERAL BACKGROUND**

14

15 **Q. PLEASE BRIEFLY EXPLAIN THE CONCEPT OF DEPRECIATION AS IT**  
16 **APPLIES TO A REGULATED ELECTRIC UTILITY.**

17 A. While the term “depreciation” is commonly used to describe a loss of value due to  
18 “wear and tear,” it has a precise and specialized meaning as an accounting concept.  
19 Depreciation refers to the recoupment of a capital investment, less net salvage, over  
20 the useful life of the asset to which the investment relates.

21

22 **Q. CAN YOU ILLUSTRATE THE MEANING OF THE TERM?**

23 A. Yes. Perhaps the best way to explain the concept is to contrast an item that is  
24 depreciated with one that is not depreciated. As the example of an item that is not  
25 depreciated, let’s use copier paper. Assume the utility purchases 1,000 reams of paper

1 for \$5,000, and consumes all of the paper within the month in which it was  
2 purchased. The utility therefore “expenses” the full \$5,000 in the period of the  
3 purchase. Assume the utility spends \$250,000 on copier paper annually. The annual  
4 total cost of copier paper is recorded as a portion of operations and maintenance  
5 expense, which is deducted from operating revenues to calculate net income for the  
6 year in which the paper was purchased. Recognizing the full cost of the paper  
7 purchased in the year is appropriate from a matching standpoint, because the paper  
8 was consumed completely in the period in which it was purchased. Moreover,  
9 because rates are designed to recover operating costs and provide a return on  
10 investment, the annual cost of copier paper is embedded in the rates that the utility  
11 charges its customers, and \$250,000 of overall revenues serves the purpose of  
12 recovering from customers the cost of copier paper consumed during the year.

13  
14 **Q. PLEASE CONTINUE.**

15 **A.** Now, let’s compare that situation with the example of an investment in copper  
16 conductor. Assume the conductor costs \$100,000 to purchase and install, and the  
17 utility expects to use it in the business for forty years. At the end of forty years the  
18 utility expects to sell the copper for \$30,000 but also anticipates it will incur \$10,000  
19 of cost in removing it from the system. This means that its net depreciable  
20 investment will be \$80,000 ( $\$100,000 - \$30,000 + \$10,000$ ). To recognize the full  
21 \$80,000 in a single year would be to distort the manner in which that investment in  
22 copper conductor is employed in the operation of the business. Said differently, the  
23 utility expects to “consume” the service value of the conductor—not within a year—  
24 but over forty years. Therefore, the investment is “capitalized” and added to rate  
25 base. Subsequently, each year 1/40th, or \$2,000 of the capitalized cost is recognized

1 as depreciation expense associated with the conductor. Because depreciation expense  
2 is a component of the utility's overall cost of providing service, it is reflected in the  
3 design of rates that the utility charges customers. The \$2,000 of annual depreciation  
4 expense associated with the conductor is accumulated with other depreciation and  
5 operating expenses and netted against operating revenues to determine net income for  
6 the period. Of the revenues collected during the year, \$2,000 serves to recoup the  
7 portion of the capital investment that is applicable to the period. Accordingly, the  
8 utility will reduce its rate base by the annual amount of the \$2,000 that it recouped  
9 from customers. It does so by recording \$2,000 in an account called the accumulated  
10 provision for depreciation or reserve. The value of the rate base is calculated by  
11 subtracting the total of the accumulated provision by depreciation from the original  
12 depreciable value of the investment. Each year the utility incurs depreciation  
13 expense, it adds the amount of expense to the reserve, thereby reducing rate base by  
14 that amount.

15  
16 **Q. IN ADDITION TO THE BASIC DEFINITION, WHAT ELSE CAN BE**  
17 **GLEANED FROM YOUR EXAMPLES?**

18 A. First, the examples illustrate a major difference between depreciation expense and  
19 other operating expenses. In the case of copier paper, the utility must make a cash  
20 outlay during each annual period. In the case of the conductor, there is an initial  
21 outlay of cash to purchase and install the conductor; thereafter, the recognition of the  
22 annual component of expense applicable to the period does not involve cash outlays.  
23 For this reason, depreciation is referred to as a "non-cash" expense. However, the  
24 dollars that are collected and applied to defray this non-cash expense are as real to the

1 utility and the customers who pay them through rates as the dollars that were  
2 expended to acquire the capital item or pay for the copier paper.

3  
4 **Q. DOES THE EXAMPLE OF THE CONDUCTOR ILLUSTRATE ANY OF THE**  
5 **ISSUES TO WHICH A DEPRECIATION STUDY MAY GIVE RISE?**

6 A. Certainly. The example illustrates the determination of the appropriate useful life; the  
7 assumed salvage value upon retirement; and the projected cost of removing the item  
8 from service that the utility may incur to realize the salvage. While the analytical  
9 techniques, which may involve statistical measurements, actuarial analyses, and  
10 review of historical and comparative industry data, can become technical and  
11 involved, all of the debates surrounding the establishing of appropriate depreciation  
12 rates involve the interplay between and among service lives and related remaining  
13 lives, salvage values, and cost of removal. If the utility assumes too short a useful  
14 life, the total depreciation expense will be allocated over too few periods, and the  
15 expense recognized in a single period will be higher than it should be. If a utility  
16 understates expected salvage or overstates the cost of removing the item upon  
17 retirement, it will overstate the amount of depreciation expense that is allocated over  
18 the life of the asset. When in my testimony I observe that PEF has been overly  
19 aggressive in proposing depreciation rates, I mean that it continues to attempt to  
20 overstate depreciation expense currently through one or more of these means.

21 The example of the copper conductor also illustrates another important point.  
22 Depreciation practices applicable to assets that have long useful lives very quickly  
23 give rise to issues of intergenerational equity. For instance, if a utility has reason to  
24 believe that the conductor will be in service for forty years, but proposes to depreciate  
25 it over only five years, the utility would be calling on current customers to bear an

1 inordinate proportion of the cost of the investment, thereby subsidizing future  
2 customers, who will pay none of the depreciation cost of the asset providing service  
3 to them in the future.

4  
5 There is another point that belongs in this introductory section. Setting depreciation  
6 rates necessarily involves the use of estimates and projections. If the estimates and  
7 projections are inaccurate, or if circumstances change such that estimates that were  
8 good at the time they were made are no longer valid, a utility's depreciation posture  
9 can require corrective action. Earlier I mentioned the reserve or the accumulated  
10 provision for depreciation, which serves to provide a "running total" of the extent to  
11 which individual assets or groups of assets have been depreciated. It is useful to  
12 compare the actual reserve to the "theoretical reserve," or the reserve that would be  
13 necessary to enable the utility to remain "on course" to recoup its investment ratably  
14 over the current estimate of life of the asset or assets in question at a given point in  
15 time. If a "reserve excess" or "reserve deficiency" is discovered in the course of a  
16 periodic depreciation study, corrective action can be devised. The time frame that is  
17 appropriate for addressing an excess or a deficiency is in part a function of the  
18 severity of the imbalance. If the degree to which the actual depreciation experience is  
19 ahead of or behind schedule is slight, the typical regulatory response is to devise  
20 modified depreciation rates that will cure the imbalance over the remaining life of the  
21 asset. However, if the imbalance is so severe that it amounts to unfair and inequitable  
22 treatment of customers or the utility, the regulators have the obligation and the means  
23 with which to require remedial action that is more direct and immediate. In my  
24 testimony, I will demonstrate that by over collecting depreciation expense in the past,  
25 PEF has built a massive depreciation reserve excess-- so massive that the

1 Commission should require PEF to return a portion of the excess to customers over a  
2 four year period.

3  
4 **Q. WHAT DO YOU MEAN BY “DEPRECIATION RATES”?**

5 A. A depreciation rate differs from the tariff rates that are applied to a customer’s usage  
6 to calculate a bill for service. In the above example, I noted that 1/40<sup>th</sup> of the  
7 investment in conductor cable would be quantified as depreciation expense for the  
8 annual period. This translates into a “depreciation rate” of 2.5% of the investment  
9 annually. However, this is only a step in the ratemaking process. The depreciation  
10 rate is applied to the original gross investment to calculate the annual depreciation  
11 expense that the utility should recognize on its books. When the Commission  
12 conducts a revenue requirements case, the total depreciation expense is rolled into the  
13 overall revenue requirement that retail rates are then designed to recover.

14  
15 **Q. DO YOU HAVE ANY ADDITIONAL OBSERVATIONS OF A GENERAL  
16 NATURE BEFORE YOU BEGIN THE PRESENTATION OF YOUR  
17 ANALYSIS OF PEF’S DEPRECIATION STUDY?**

18 A. Yes. Generally speaking, it is in an electric utility’s financial self-interest to collect  
19 more dollars from customers than fewer dollars, to collect those dollars sooner than  
20 later, and, once having collected dollars, to keep them rather than returning them to  
21 customers. This is true of depreciation practices. Because depreciation expense  
22 results in revenues that do not have a concurrent cash outlay associated with them,  
23 depreciation expense is a source of cash flow, and higher depreciation expense means  
24 greater cash flow. Plus, recouping more of an investment in early years than would  
25 be warranted by the comparison of actual and theoretical reserves would reduce the

1 risk of not recouping the investment in later years. Accordingly, even though issues  
2 of depreciation affect the timing of recoupment of capital investments rather than  
3 whether the utility should recover its claimed capital costs, a utility has an incentive  
4 to favor higher depreciation expense and higher depreciation reserves. The  
5 Commission therefore must scrutinize the utility's practices and studies to ensure that  
6 current customers are not called on to bear more than their appropriate share of the  
7 depreciation expense.

8  
9 **D. EXECUTIVE SUMMARY**

10  
11 **Q. PLEASE PRESENT YOUR MAIN POINTS IN SUMMARY FASHION.**

12 **A.** PEF's own depreciation study shows a reserve excess of \$646 million. However, as  
13 I will show, the claimed excess of \$646 million is an understatement. It reflects the  
14 result of inappropriate assumptions and rationales that PEF's depreciation witness  
15 Mr. Robinson employed in the course of his depreciation study. The real excess  
16 reserve is far greater than the \$646 million that PEF claims. My analysis, based upon  
17 data, assumptions, and rationales that I develop and support in detail, reveals that PEF  
18 has a current reserve excess of \$858 million. The excess reserve would be even  
19 higher were I to incorporate a more realistic useful life for combined cycle generators  
20 than the inadequate 30 year life that PEF's witness employs, or recognize the impact  
21 of other issues.

22  
23 The massive reserve excess necessarily means that current and past customers have  
24 paid PEF far more than would be needed to enable PEF to be on track to recoup its  
25 investment in plant over the service lives of the plant. PEF proposes to correct the

1 reserve excess by modifying the amount of depreciation on a going forward basis  
2 over its claimed 21 years of remaining life. In view of the size of the excess that  
3 customers have paid, the size of its overall rate increase request and the resulting  
4 justification for remedying the situation, PEF's proposed response is unrealistic and  
5 unacceptable. PEF's proposal would be inadequate and unfair to current customers,  
6 even if the value of \$646 million that it assigns to the excess reserve were near the  
7 appropriate amount. The corrected imbalance of \$858 million has the effect of  
8 increasing the impetus to return the excess to customers more rapidly.

9  
10 Bearing in mind that I have demonstrated a total reserve excess of at least \$858  
11 million, the Commission should at a minimum require PEF to amortize its identified  
12 \$646 million of the excess reserve to customers over a period of four years. By  
13 returning only this portion to customers over a period more rapid than the remaining  
14 life, the Commission conservatively will leave PEF with a substantial cushion of  
15 excess in its reserve. Moreover, as OPC witness Dan Lawton testifies, requiring this  
16 more equitable treatment will not adversely affect PEF's strong, robust financial  
17 condition.

18  
19 When the \$646 million amount is amortized over four years, \$161 million is available  
20 to reduce revenue requirements in each year, including the 2010 test period. The  
21 above measure is needed to address PEF's sizeable depreciation reserve excess,  
22 which is the result of past practices and over collections. I have also examined the  
23 appropriate amount of depreciation expense that PEF should be allowed to recognize  
24 annually on a going forward basis. I find that PEF has overstated its need for  
25 depreciation expense. The overstatement of overall depreciation expense results from

1 having employed inappropriate service lives, understating expected salvage, and  
2 overstating the projected cost of removing assets upon retirement. I have described  
3 the flaws in PEF's claims and have supported my proposed alternatives in the detailed  
4 discussion that follows. As a result of my detailed analysis, I recommend that the  
5 Commission reduce PEF's proposed annual depreciation expense by \$113 million  
6 based on plant as of December 31, 2009 as reflected in the Company's depreciation  
7 study.

8  
9 The overall impact of my recommendations in the areas of correcting the massive  
10 reserve excess and reducing future depreciation expense is to reduce PEF's claimed  
11 revenue requirements by \$227 million for the 2010 test year. The resulting  
12 depreciation expense adjustment has been provided to OPC witness Bill Schultz.

13  
14 **Q. DOES YOUR RECOMMENDATION MEAN THAT PEF WILL NOT**  
15 **RECOVER ANY PART OF ITS CAPITAL INVESTMENT?**

16 A. No, it does not mean that. In my testimony, I have not challenged or sought to  
17 disallow recovery of any of the investments in plant. My proposed adjustments affect  
18 only the timing of the collection. If the Commission adopts my recommendation, the  
19 portion of the reserve excess that is amortized over four years will be added back to  
20 rate base at the same time. Over time, PEF will recoup all of the capital investment  
21 that the Commission deems prudent and reasonable.

22  
23 **E. ANALYSIS**

24  
25 **Q. PLEASE PROCEED WITH YOUR MORE DETAILED PRESENTATION.**

1 A. The Company retained AUS Consultants to perform a new depreciation study, the  
2 results of which are sponsored by Mr. Robinson. The Company's depreciation  
3 analysis is based on estimated plant levels through the end of 2009. Based on the  
4 plant in service as projected through December 31, 2009 the Company proposes  
5 \$445,613,594 of depreciation expense, which represents a \$97,355,430 or 22%  
6 increase. (See Exhibit No. \_\_ (EMR-2) page 2-8). After reviewing the Company's  
7 presentation, data, responses to discovery requests, and information in the public  
8 domain, I conclude that the Company's request is significantly overstated. In fact,  
9 rather than a proposed increase in depreciation expense as requested by the Company,  
10 a reduction of \$113,112,961 to the requested level or a \$15,757,531 reduction to  
11 existing depreciation expense is warranted as set forth on Exhibit\_ (JP-1).

12  
13 The Company's request for an increase in depreciation expense is inconsistent with  
14 the undisputed fact that customers have significantly overpaid depreciation expense  
15 historically, even prior to recognition that the depreciation parameters reflected in the  
16 Company's study are excessively aggressive and inappropriate. The acceleration of  
17 depreciation expense as proposed by the Company is not warranted and should be  
18 denied by the Commission. A brief discussion of the various issues I will address in  
19 detail later in my testimony follows.

20 • **Excess Reserve:** The Company, through its depreciation study,  
21 admits to a \$646 million excess reserve. This level of excess reserve  
22 increases significantly when one applies to PEF's production and mass  
23 property accounts the different depreciation parameters I recommend  
24 and support in my analysis. Consistent with the Commission's prior  
25 decisions, it is appropriate to return to customers some portion of the

1 excess reserve over a period shorter than the remaining life. In order  
2 to remain conservative, I recommend returning the Company-  
3 identified \$646 million amount over a 4-year period. Limiting the  
4 return of the excess reserve to the Company's identified amount rather  
5 than the full amount that results from my recommended adjustments  
6 leaves the Company with a substantial cushion of remaining excess  
7 reserve, which can be addressed in future depreciation studies. OPC  
8 witness Dan Lawton establishes in his testimony that limiting the  
9 amount to be amortized to \$646 million, and accomplishing the  
10 amortization over four years, will assure that the adjustment leaves  
11 PEF with very strong financial integrity. The impact of my  
12 recommendation is a \$161,451,136 annual depreciation expense credit,  
13 prior to jurisdictional allocation, for the next four years.

- 14
- 15 ● **Production Plant Life Spans:** The Company proposes artificially  
16 short life spans (the time frame between when a unit goes into service  
17 and when it ultimately retires) for many of its steam generating units.  
18 The Company has also underestimated the reasonable life expectancy  
19 of its investment in combined cycle generation. As a first step toward  
20 correcting this situation, I recommend that the life spans for the  
21 Crystal River 4 and 5 coal-fired units be increased from the low 50-  
22 year range as proposed by the Company to 60 years as is now being  
23 recognized by other regulators and utilities. I further recommend that  
24 the minimum life span for the two large steam oil-fired generating  
25 units at Anclote be set at a minimum of 50 years. The approximate

1 impact of this recommendation is a \$26 million reduction to the  
2 Company's depreciation expense based on plant as of December 31,  
3 2009.

- 4  
5 • **Interim Retirements:** Interim retirements are intended to represent  
6 limited downward adjustments to the life span for generating units due  
7 to items of investment that will retire and be replaced prior to the  
8 ultimate retirement date for a generating facility. The Company has  
9 proposed a method that is inappropriate for generation investment and  
10 which overstates depreciation expense by millions of dollars. The  
11 Company's proposed interim retirement results are excessively  
12 aggressive, even when measured against the interim retirement results  
13 that the Company's depreciation consultant, AUS Consultants, has  
14 proposed elsewhere. Correcting the method and level of interim  
15 retirements results in an approximate \$45 million annual reduction in  
16 depreciation expense based on plant as of December 31, 2009.

- 17  
18 • **Interim Production Net Salvage:** There are two types of production  
19 net salvage. The first is interim retirement net salvage associated with  
20 the interim retirements that are estimated to transpire prior to the final  
21 termination of a generating station or unit. The second type of  
22 production net salvage is terminal net salvage as reflected in the  
23 Company's request for dismantlement costs discussed elsewhere.  
24 Based on excessively negative net salvage estimates for interim  
25 retirements, and an excessive level of projected interim retirements,

1 the Company seeks in excess of \$600 million of interim net salvage to  
2 be collected over the remaining life of its generating facilities.  
3 Correcting the Company's excessively negative levels of interim  
4 retirement related production net salvage results in a \$30 million  
5 reduction to annual depreciation expense based on plant as of  
6 December 31, 2009.

- 7
- 8 • **Terminal Production Net Salvage:** The Company has presented  
9 dismantlement calculations for its various generating facilities. These  
10 studies represent a worst case scenario of the ultimate disposition of  
11 the investment. In addition to assuming the worst case scenario of  
12 having to completely remove each facility and restore the site, the  
13 Company's assumed approach to demolition is also the most costly  
14 option available. Moreover, the Company incorporates an unjustified  
15 level of contingencies as well as other costs that further inflate the  
16 overall demolition cost estimates artificially. The Company also  
17 erroneously calculated labor costs. It would be difficult to develop an  
18 alternative demolition estimate that would be higher than the  
19 Company's request. A review of the Company's proposal, as well as  
20 what has actually transpired with recent demolition of generating  
21 facilities, would support a reduction to the Company's request.  
22 However, rather than recommend a specific adjustment in costs, I  
23 recommend the Commission order the Company to develop more  
24 realistic and supportable demolition studies for its next rate case. At a  
25 minimum, such studies should rely on more cost effective demolition

1 approaches than the costly “reverse construction” approach that PEF  
2 presented in this case.

- 3
- 4 • **Mass Property Life Analysis:** Mass property consists of  
5 transmission, distribution and general plant. The Company has relied  
6 on its interpretation of actuarial results to propose life characteristics  
7 for its various accounts. The Company’s proposals are not the best  
8 statistical results obtained from its actuarial analysis and fail to  
9 recognize other Company specific information which would result in  
10 longer average service lives (“ASL”). After reviewing the Company’s  
11 proposals on an account by account basis, I recommend adjustments to  
12 2 mass property accounts which result in a \$13 million reduction to  
13 annual depreciation expense based on plant as of December 31, 2009.

- 14
- 15 • **Mass Property Salvage Analysis:** The Company performed  
16 an “interpretative” analysis. The Company failed to provide any  
17 specific support for its various proposals in theory derived from its  
18 “interpretative” analyses. Also, by failing to correct for “catastrophic”  
19 hurricane events or explain significant changes or unusual amounts or  
20 occurrences, PEF skewed its future net salvage proposals. Those  
21 proposals are not appropriate because they are not indicative of future  
22 expectations for the investment in each of the Company’s plant  
23 accounts. After my review and investigation, I recommend  
24 adjustments to the proposed net salvage level for 15 mass property  
25 accounts. The standalone impact of these recommendations results in

1 a reduction of \$29 million in annual depreciation expense based on  
2 plant as of December 31, 2009.

- 3
- 4 • **Combined Impact:** Due to the interaction of life and salvage  
5 parameters, life spans, and interim retirement levels, the combined  
6 impact of my various recommendations is not simply the summation  
7 of each standalone adjustment. As shown on Exhibit\_\_(JP-1), the  
8 combined impact of all adjustments results in a \$274,564,296  
9 reduction to annual depreciation expense based on plant as of  
10 December 31, 2009. The recommended adjustment is reduced to  
11 \$226.9 million when applied to 2010 test year plant balances and then  
12 allocated to the retail jurisdiction.

13

14 **Q. ARE YOU AWARE OF THE MAGNITUDE OF YOUR RECOMMENDED**  
15 **ADJUSTMENT RELATIVE TO THE COMPANY'S REQUEST?**

16 A. Yes. My recommendation must be viewed in two distinct categories: the return of a  
17 portion of excess reserve in the amount of \$161 million for the next 4 years; and,  
18 \$113 million in normal annual depreciation adjustments. The \$113 million of annual  
19 normal depreciation adjustments represents approximately 25% of the Company's  
20 request for normal depreciation expense, but is only a 14% reduction to the existing  
21 level of depreciation rates. The Company's request represents a greater increase to  
22 existing rates than my recommended decrease represents, absent the reserve  
23 amortization.

24

1 To place my recommended adjustments in proper perspective, it is necessary to  
2 recognize that the Company has significantly over collected depreciation expense  
3 from prior and current customers. The intent underlying the concept of depreciation  
4 is that the Company should recover 100% of what it is due, no more and no less. If  
5 the Company over collects in earlier periods, then the remaining life approach to  
6 depreciation requires that a lower level of depreciation must be charged in the future  
7 in order to reach 100% recovery over the life of the investment. There can be no  
8 doubt that the Company has significantly over recovered depreciation expense from  
9 customers. However, as the Commission will see once it reviews the individual  
10 account and generating unit discussions contained in the balance of my testimony, the  
11 Company has proposed unrealistically short life spans or ASLs and excessively  
12 negative net salvage values in an apparent attempt to minimize the level of excess  
13 reserve it would present in its depreciation study.

14  
15 To remain conservative in my level of adjustments, I have not proposed in this  
16 proceeding longer life spans for over a billion dollars of investment in new combined  
17 cycle generating facilities. The Company's proposal for 30-year life spans for this  
18 new investment is artificially short. Extending the assumption to 35-year life spans or  
19 longer for this type of generation would have resulted in substantial further reductions  
20 to the Company's request. In addition, the Company's terminal demolition cost  
21 estimates for its generating facilities are excessively high. Correcting the Company's  
22 request with a more realistic and reasonable scenario would further reduce the level  
23 of annual depreciation expense.

24

1 The Company did not reach this position of being in a significant excess reserve  
2 position overnight, and should not be required to correct it overnight. However,  
3 allowing the Company to correct its situation over the remaining life is simply unfair  
4 and unjust, as this Commission has determined in prior proceedings. While my  
5 recommendation represents a substantial reduction to the Company's depreciation  
6 expense, it is a fair and reasonable first step in a process that might take several rate  
7 cases. Delaying the beginning of the correction to the Company's huge over  
8 collection would only exacerbate the problem and continue an unreasonable level of  
9 intergenerational inequity.

10  
11 **SECTION II. DEPRECIATION**

12  
13 **Q. PLEASE ELABORATE ON THE BASIC DEFINITION OF DEPRECIATION**  
14 **THAT YOU PROVIDED IN THE GENERAL BACKGROUND SECTION.**

15 A. There are two commonly-cited definitions of depreciation. The first, from the Federal  
16 Energy Regulatory Commission ("FERC"), appears in Title 18 of the Code of Federal  
17 Regulation ("CFR"), Part 101:

18 'Depreciation', as applied to depreciable plant, means the loss  
19 in service value not restored by current maintenance, incurred  
20 in connection with the consumption or prospective retirement  
21 of electric plant in the course of service from causes which are  
22 known to be in current operation and against which the utility  
23 is not protected by insurance. Among the causes to be given  
24 consideration are wear and tear, decay, action of the elements,

1           inadequacy, obsolescence, changes in the art, changes in  
2           demand and requirements of public authorities.

3  
4           The second definition, from the American Institute of Certified Public Accountants  
5           ("AICPA"), is similar:

6           Depreciation accounting is a system of accounting which aims  
7           to distribute the cost or other basic value of tangible capital  
8           assets, less salvage (if any) over the estimated useful life of the  
9           unit (which may be a group of assets) in a systematic and  
10          rational manner. It is a process of allocation, not of valuation.  
11          Depreciation for the year is a portion of the total charge under  
12          such a system that is allocated to the year. Although the  
13          allocation may properly take into account occurrences during  
14          the year, it is not intended to be a measurement of the effect of  
15          all such occurrences.

16  
17   **Q.   WHAT ARE THE TWO GENERAL FORMULAS USED IN DETERMINING**  
18   **DEPRECIATION RATES?**

19   A.   The *whole life* and the *remaining life* techniques are the most commonly used  
20   formulas. The whole life technique is as follows:

$$\text{Depreciation Rate (\%)} = \left[ \frac{\text{Original Cost - Net Salvage}}{\text{Average Service Life}} \right] \text{Original Cost}$$

22

1 The remaining life technique is as follows:

$$\begin{array}{c}
 \text{Depreciation Rate (\%)} \\
 = \\
 \left[ \begin{array}{c}
 \frac{\text{Original Cost-Accumulated Provision for Depreciation -- Net}}{\text{Average Service Life}} \\
 - \\
 \frac{\text{Salvage}}{\text{Original Cost}}
 \end{array} \right]
 \end{array}$$

2 The two formulas should equal each other when the difference between the  
 3 theoretical reserve and the actual Accumulated Provision for Depreciation  
 4 ("APFD") is recovered over the remaining life of the investment under the  
 5 whole life formula.

6  
 7 **Q. ARE THERE ADDITIONAL CONSIDERATIONS IN DEPRECIATION**  
 8 **BEYOND THE DEFINITIONS?**

9 A. Yes. The definitions provide only a general outline of the overall utility depreciation  
 10 concept. In order to arrive at a depreciation-related revenue requirement in a rate  
 11 proceeding, a depreciation system must be established.

12  
 13 **Q. WHAT IS A DEPRECIATION SYSTEM?**

14 A. A depreciation system constitutes the method, procedure, and technique employed in  
 15 the development of depreciation rates.

16  
 17 **Q. BRIEFLY DESCRIBE WHAT IS MEANT BY "METHOD".**

1 A. Method identifies whether a straight-line, liberalized, compound interest, or other  
2 type of calculation is being performed. The straight-line method is normally  
3 employed for utility depreciation proceedings.

4  
5 **Q. BRIEFLY DESCRIBE WHAT IS MEANT BY "PROCEDURE".**

6 A. "Procedure" identifies a calculation approach or grouping. For example, procedures  
7 can reflect the grouping of only a single item, items by vintage (year of addition),  
8 items by broad group or total grouping, and equal life groupings. The average life  
9 group ("ALG") procedure is used by the vast majority of utilities.

10

11 **Q. PLEASE BRIEFLY DESCRIBE WHAT IS MEANT BY "TECHNIQUES".**

12 A. There are two main categories of "techniques" with various sub-groupings: the whole  
13 life technique, and the remaining life technique. The whole life technique simply  
14 reflects the calculation of a depreciation rate based on the whole life (e.g., a ten-year  
15 life would imply a ten percent depreciation rate over the life of a plant using a  
16 straight-line depreciation method). The remaining life technique recognizes that  
17 depreciation is a forecast or estimation process that is never precisely accurate and  
18 requires true-ups in order to recover only 100% of what a utility is entitled to over the  
19 entire life of the investment. Therefore, as time passes, the remaining life technique  
20 attempts to recover the remaining unrecovered balance over the remaining life or  
21 other period of time. Most utilities rely on a remaining life technique in utility rate  
22 matters.

23

24 **Q. DO THE METHODS, PROCEDURES, AND TECHNIQUES INTERACT**  
25 **WITH ONE ANOTHER?**

1 A. Yes. Different depreciation rates will result depending on what combination of  
2 method, procedure, and technique is employed. Differences can occur even if the  
3 same average service life and net salvage values are employed at the outset.

4  
5 **Q. HOW ARE THE LIFE AND REMAINING LIFE DETERMINED?**

6 A. The determination of the appropriate life to associate with production plant differs  
7 from the corresponding determination for mass property, which includes  
8 transmission, distribution and general plant. The estimation of production plant life  
9 relies on a life span method. The life span method requires an estimate of the  
10 probable future retirement date and the impact of interim additions, both of which are  
11 discussed in detail later in my testimony. The estimation of mass property plant life  
12 (average service life, or ASL) normally relies on an actuarial analysis. This approach  
13 recognizes a dispersion pattern of retirements in the life estimation process. The  
14 industry relies on a series of standardized dispersion patterns identified as Iowa  
15 Survivor curves to arrive at the appropriate ASL for a category of mass property.  
16 Exhibit\_\_(JP-11) to my testimony provides additional detail regarding Iowa Survivor  
17 curves.  
18 Once an overall life for production plant and an ASL for mass property have been  
19 determined, a remaining life can be calculated. The remaining life for mass property  
20 is dependent not only on the ASL, but also on the Iowa Survivor curve selected.

21  
22 **Q. WHAT IS NET SALVAGE?**

23 A. Net salvage is the value obtained from retired property (the gross salvage) less the  
24 cost of removal. Net salvage can be either positive in cases where gross salvage

1 exceeds cost of removal, or negative in cases where cost of removal is greater than  
2 gross salvage.

3  
4 **Q. HOW DOES NET SALVAGE IMPACT THE CALCULATION OF**  
5 **DEPRECIATION?**

6 A. The intent of the depreciation process is to allow the Company to recover 100% of  
7 investment less net salvage. Therefore, if net salvage is a positive 10%, then the  
8 utility should only recover 90% of its investment through annual depreciation  
9 charges, under the theory that it will recover the remaining 10% through net salvage  
10 at the time the asset retires (e.g.,  $90\% + 10\% = 100\%$ ). Alternatively, if net salvage is  
11 a negative 10%, then the utility should be allowed to recover 110% of its investment  
12 through annual depreciation charges so that the negative 10% net salvage that is  
13 expected to occur at the end of the property's life will still leave the utility whole (i.e.,  
14  $110\% - 10\% = 100\%$ ).

15 **Q. PLEASE IDENTIFY SOME OF THE MAJOR FACTORS THAT AFFECT A**  
16 **DEPRECIATION "SYSTEM."**

17 A. The concept of depreciation utilized for utility ratemaking has evolved over time.  
18 Currently, there are still many different combinations of methods, procedures, and  
19 techniques employed in the development of utility depreciation rates. A depreciation  
20 system must, among other things, be systematic and rational. The regulator must  
21 further take into the account the quality, quantity, and timeliness of data relied upon,  
22 as well as the quality of the judgment employed by the depreciation analysts. Given  
23 the subjectivity involved in the various estimation processes, judgment plays an  
24 important role in establishing depreciation rates. While judgment is critical, that does

1 not mean that an analyst can simply refer to “judgment” as the basis for a proposal  
2 without providing meaningful factual support for that “judgment,” nor can  
3 “judgment” serve as the basis for ignoring relevant facts.  
4

5 **Q. WHAT ARE THE KEY ELEMENTS OF THE DEPRECIATION FORMULA**  
6 **AT ISSUE IN THIS PROCEEDING?**

7 A. The life parameters and net salvage for the mass property accounts in the above  
8 formula are at issue. Also, the treatment of the Company’s excess reserve is at issue  
9 in this case.  
10

11 **SECTION: III RESERVE IMBALANCE**

12  
13 **Q. WHAT IS THE FUNDAMENTAL PURPOSE OF DEPRECIATION?**

14 A. As I have stated, depreciation is the recovery of invested capital less net salvage over  
15 the life of the investment. It is intended to match the recovery of the investment less  
16 net salvage with the periods of time in which the related asset is employed, thereby  
17 recouping the investment from all of the customers that received the benefit of the  
18 investment.  
19

20 **Q. IS THE RECOVERY OF CAPITAL THROUGH DEPRECIATION A**  
21 **PRECISE PROCESS?**

22 A. No. The depreciation process for utility ratemaking relies on forecasting the future  
23 life and net salvage of the investment. As with any forecasting process, there are  
24 inherent inaccuracies that will exist whether due to inappropriate forecasts of  
25 mortality characteristics or real changes in life and salvage characteristics over time.

1 In recognition of the inherent inaccuracies, depreciation studies should be performed  
2 on a regular basis and should incorporate a true-up provision to address recognized  
3 excesses or deficiencies that are indentified.

4  
5 **Q. HOW ARE RESERVE EXCESSES OR DEFICIENCIES IDENTIFIED?**

6 A. The normal process is to calculate what is called a theoretical reserve and compare  
7 that value to the actual book reserve of the utility. The theoretical reserve is the  
8 calculated balance that would be in the accumulated provision for depreciation  
9 (FERC Account 108), often called the reserve, at a point in time if current  
10 depreciation parameters (i.e., current life and salvage estimates) had been applied  
11 from the outset. The theoretical reserve measures the amount of depreciation expense  
12 a utility should have collected in order to be "on schedule" with respect to recovering  
13 its investment over the life of the depreciable asset. The book reserve reflects what  
14 *actually* has been collected or incurred. One can compare the book reserve to the  
15 theoretical reserve. If the book reserve is greater than the theoretical reserve, then the  
16 utility has collected more than is needed as of that point in time; it is ahead of  
17 schedule. The difference is a reserve excess. If the theoretical reserve is greater than  
18 the book reserve, the utility has under collected as of that point, it is behind schedule  
19 and a reserve deficiency exists.

20  
21 **Q. WHAT ARE THE GUIDING PRINCIPLES THAT SHOULD BE**  
22 **CONSIDERED IN DETERMINING THE CAPITAL RECOVERY PATTERN**  
23 **THROUGH DEPRECIATION OVER TIME?**

24 A. In my opinion, the overriding considerations of fairness and equity that govern the  
25 utility ratemaking process mandate adherence to the matching principle. In other

1 words, the generation of customers that causes an expense or cost to be incurred  
2 should be the generation of customers that pays for such expense or cost through the  
3 rates charged for usage of the final product, in this case electricity. The matching  
4 principle attempts to achieve the goal of eliminating intergenerational inequities.  
5 Intergenerational inequities occur when one set or generation of customers pays too  
6 much or too little for its use of the investment necessary to provide electricity, and  
7 transfers either an undue benefit or undue burden to some future set of customers.

8  
9 **Q. HAS THIS COMMISSION HISTORICALLY RECOGNIZED THE**  
10 **MATCHING PRINCIPLE WHEN IT COMES TO CAPITAL RECOVERY**  
11 **THROUGH DEPRECIATION?**

12 A. Yes. When capital recovery becomes materially imbalanced between generations of  
13 customers, as measured by the difference between the theoretical and book reserve,  
14 normally one of two industry options is employed. The two options for truing-up or  
15 correcting the imbalance are (1) to amortize the calculated differences over a short  
16 period of time, or (2) to simply implement new depreciation rates based on the  
17 remaining life technique where the recovery period is the remaining life. This  
18 Commission has established a long and identifiable policy of correcting material  
19 reserve imbalances by (1) reserve transfers, (2) one time reserve adjustments based on  
20 changes to revenue requirement areas other than depreciation, and (3) amortizing the  
21 reserve differences over periods much shorter than the remaining life of the  
22 investment. In addition to these practices, this Commission recently approved a  
23 settlement in Florida Power & Light Company ("FPL") last rate case that allowed  
24 FPL to reduce revenue requirements by \$500 million over a four year period, or \$125  
25 million per year, through credits to depreciation expense. (See Exhibit CRC-1, page

1 69 in Docket No. 080677-EI). Rigid adherence to “remaining life” concepts would  
2 not have permitted this flexibility.

3  
4 **Q. CAN YOU PROVIDE EXAMPLES OF THIS COMMISSION’S LONG AND**  
5 **IDENTIFIABLE POLICIES TO WHICH YOU REFER?**

6 A. Yes. In the area of implementing corrective reserve transferences, some examples of  
7 this Commission’s previous actions are Gulf Power Company in Docket No. 880053-  
8 EI and Marianna Electric Division by Florida Public Utilities Company in Docket No.  
9 010669-EI. These examples occurred during the time frame of the 1980s through the  
10 early 2000s. (See Order Nos.19901, PSC-01-2270-PAA-EI). An example of a  
11 Commission action to change the depreciation reserve due to revenue requirements  
12 from an area other than depreciation is Tampa Electric Company in Docket No.  
13 860868-EI. (See Order No. 19438). Finally, examples of depreciation reserve  
14 differences that the Commission required to be amortized over periods shorter than  
15 the average remaining life are General Telephone Co. in Docket No. 840049-TL, City  
16 Gas Company in Docket No. 890203-GU, and FPL in Docket No. 970410-EI. (See  
17 Order Nos. 14929, 22115, PSC-97-0499-FIF-EI).

18  
19 **Q. WHAT HAS THE COMMISSION STATED AS ITS UNDERLYING POLICY**  
20 **OR BASIS WHEN ADDRESSING THE TREATMENT OF RESERVE**  
21 **DIFFERENCES OR INTERGENERATIONAL INEQUITIES?**

22 A. The Commission has adopted the position that depreciation reserve differences  
23 “*should be recovered as fast as possible*, unless such recovery prevents the Company  
24 from earning a fair and reasonable return on its investments.” (Emphasis added).  
25 (See Order No. PSC-93-1839-FOF-EI). In another case, the Commission adopted a

1 one-year write-off for a portion of a utility's reserve deficit by stating that "we  
2 believe that it [the deficit] should be *written off as quickly as possible*." (Emphasis  
3 added). (See Order No. 13918). In yet another case, the Commission addressed the  
4 fairness issue as it relates to intergenerational inequity. In establishing a funded  
5 nuclear decommissioning reserve the Commission stated "[f]airness dictates that  
6 those receiving services and imposing costs be obligated to pay those costs, instead of  
7 placing the risk of recovery on other ratepayers who may not get service from the  
8 nuclear units." (Emphasis added). It went on to state, "that a further delay in  
9 changing rates to recognize the responsibility of current ratepayers to pay the full cost  
10 of operating the nuclear generators *simply continued an already unfair situation*. We  
11 determined that *it was unfair that current ratepayers were not paying their full share*  
12 *and could therefore properly change FP&L's and FPC's rates to alleviate unfair,*  
13 *unjust and unreasonable rates.*" (Emphasis added). (See Order No. 13427).

14 **Q. IN THE CASES YOU CITED, DID THE AMOUNT OF THE RESERVE**  
15 **IMBALANCE THAT THE COMMISSION DECIDED TO CORRECT OVER**  
16 **A PERIOD SHORTER THAN THE REMAINING LIFE APPROACH HALF**  
17 **BILLION DOLLARS?**

18 A. No.

19  
20 **Q. HOW HAVE YOU NORMALLY HANDLED RESERVE MATERIAL**  
21 **IMBALANCE SITUATIONS LIKE THIS?**

22 A. Before this Commission in Docket No. 050078-EI, I recommended that PEF's \$844  
23 million of excess reserve above the \$504 million of excess reserve PEF itself  
24 identified be amortized back to customers over a 4-year period. (See Mr. Pous'  
25 Direct Testimony at page 34 in Docket No. 050078-EI). That case settled prior to the

1 scheduled evidentiary hearing. Also in Docket No. 080677-EI, FPL's current case, I  
2 recommend a 4-year amortization of that company's identified \$1.25 billion excess  
3 reserve. In other cases, utilities normally perform frequent depreciation studies and  
4 implement corrective measures so as not to get too far out of line with current  
5 depreciation expectations. In this case, PEF identifies over *\$645 million* dollars of  
6 excess reserve based on its proposed depreciation parameters. (See Exhibit No. \_\_  
7 (EMR-2) page 2-79).

8  
9 Rather than acting on such a significant and increasing level of excess with an  
10 immediate and meaningful response, the Company proposes "business as usual."  
11 That approach would attempt to correct the excess reserve situation over the average  
12 21-year remaining life of all its current investment. (See Exhibit No. \_\_ (EMR-2)  
13 page 2-22). Particularly in view of the fact that, as I will demonstrate later, the actual  
14 magnitude of the reserve excess is \$858 million – in other words, about a third greater  
15 than the amount the Company identified, I do not believe this is an appropriate  
16 reaction to the facts and circumstance presented in this case. The magnitude of the  
17 intergenerational inequity compels an immediate and sizeable departure from the  
18 remaining life approach to mitigate the degree of unfairness that otherwise could be  
19 imposed on current customers.

20  
21 **Q. DOES THE EXCESS LEVEL OF RESERVE AFFECT REVENUE**  
22 **REQUIREMENTS?**

23 A. Yes. The effect of the excess reserve imbalance on revenue requirements is  
24 significant, no matter the approach undertaken to correct this situation. The shorter  
25 the period utilized to return the excess to current customers, the greater the revenue

1 requirement impact in this case. For example, the Company-identified \$645 million  
2 excess reserve is already reflected in the Company's filing and is partially responsible  
3 for the Company's recommended increase in depreciation expense of an amount less  
4 than \$100 million annually. (See Exhibit No. \_\_ (EMR-2) page 2-8). However, had  
5 the Company's calculated excess reserve been credited back to current customers  
6 over a period shorter than the remaining life utilized by the Company in its  
7 calculation, the overall revenue requirement impact could be a decrease in  
8 depreciation expense.

9 **Q. SHOULD THE CORRECTIVE TREATMENT OF A RESERVE IMBALANCE**  
10 **DIFFER DEPENDING ON WHETHER IT IS MATERIAL EXCESSIVE OR**  
11 **MATERIAL DEFICIENT?**

12 A. No. The identical rationale should be applied to either scenario. In this regard, it is  
13 important to note that under the depreciation process the utility will not be "harmed"  
14 by a corrective adjustment. The matter is one of the timing of recovery. On the other  
15 hand, imbalances have prejudicial impacts on certain customers.

16 **Q. WHY DO YOU REFER TO *MATERIAL* IMBALANCES RATHER THAN**  
17 **IMBALANCES IN GENERAL?**

18 A. Any process that involves estimates will result in actual values that differ from the  
19 predicted values. As previously noted, I do not believe most utilities allow identified  
20 imbalances of this magnitude to be created. Generally speaking, by revisiting the  
21 reserve situation with a comprehensive study every few years, one would reasonably  
22 expect the variance between the theoretical reserve and the book reserve to stay  
23 within reasonable bounds. When reserve imbalances occur, they are normally treated  
24 through the remaining life process. Not every discrepancy between theoretical and  
25 book reserves is so large as to require a departure from the method of recalculating

1 the accrual that will recover the asset over its remaining life. However, the greater  
2 the disparity in the reserve, the greater the level of intergenerational inequity that  
3 exists. The greater the level of intergenerational inequity, the more compelling  
4 becomes the corresponding rationale for addressing the imbalance over a shorter  
5 period.

6  
7 **Q. IS THERE ANY REASONABLE QUESTION IN THIS CASE WHETHER A**  
8 **SIGNIFICANT OR MATERIAL EXCESS IN THE DEPRECIATION**  
9 **RESERVE EXISTS?**

10 A. No, in my view there is no room for argument on this question. The Company  
11 identifies a \$645 million excess in its depreciation study. I submit that this level of  
12 excess must be considered material and significant by any reasonable measuring  
13 index. Moreover, the \$645 million size of the reserve excess reported in PEF's  
14 depreciation study has been artificially *understated* by the effect of inappropriate net  
15 salvage and life estimates. When restated to adjust for the distortions created by the  
16 inappropriate net salvage and life assumptions, the reserve excess is not \$645 million,  
17 but over \$850 million as shown on Exhibit (JP-2). The magnitude of the excess is so  
18 huge, and the prejudicial impact of the imbalance on current customers is so great,  
19 that fairness compels a departure from PEF's "business as usual" remaining life  
20 approach so that current customers do not continue to subsidize future customers to  
21 such a large extent.

22  
23 **Q. WHAT IS THE BASIS FOR THE COMPANY'S TREATMENT OF THIS**  
24 **MATTER?**

1 A. The Company's depreciation study is silent on this matter. However, Mr. Robinson  
2 made various comments regarding this matter in his rebuttal testimony in the last case  
3 that sheds light on the Company's position. First, Mr. Robinson stated that "the  
4 FPSC has no mandate for companies under their jurisdiction to provide any special  
5 treatment of the variance." (See Mr. Robinson's rebuttal testimony in Docket No.  
6 050078-EI at page 5). In other words, unless the Commission orders it to correct the  
7 intergenerational inequity on a more expedited basis, the Company will rely on the  
8 remaining life approach.

9

10 Next, Mr. Robinson stated that if approval from the Nuclear Regulatory Commission  
11 is not received for the Crystal River life extension, then "a sizable portion of the  
12 reserve variance will instantaneously disappear." (See Mr. Robinson's rebuttal in  
13 Docket No. 050087-EI at page 6). Mr. Robinson went on to introduce additional  
14 concerns regarding the potential early shut down of Crystal River 3 and the additional  
15 investment that will be needed, which will have a shorter life span. All these  
16 unsubstantiated, generalized and unwarranted concerns were presented as support for  
17 the Company's position that unless the Commission orders it to correct the imbalance  
18 on an expedited basis, it will not do so, and will take advantage of such situation by  
19 increasing the level of excess as it has done since the last case.

20

21 **Q. DOES THIS POSITION COMPORT WITH COMMISSION PRECEDENT?**

22 A. As previously noted, the Commission often has employed the recovery of a reserve  
23 imbalance over periods shorter than the remaining life.

24

1 Q. DOES THIS POSITION TAKEN BY PEF ADEQUATELY ADDRESS THE  
2 INTERGENERATIONAL INEQUITY THAT EXISTS FOR CURRENT  
3 CUSTOMERS?

4 A. No. For example, the 20-year change in the number of residential customers on an  
5 actual and forecasted basis is 33%, as set forth on page 2-3 of the Company's Ten-  
6 Year Site Plan dated April 1, 2009. While this is a sizeable change in the customer  
7 base, it tells only part of the story. The 33% growth is a net number and does not  
8 identify how many customers left or will leave the system. Thus, the change in  
9 customers corresponding to the remaining life period employed by PEF for the return  
10 to customers of its prior acceleration of depreciation expense, at least for the  
11 residential class, could easily be over 40%. I submit that the current intergenerational  
12 inequity that exists due to the current excess of the depreciation reserve created by  
13 prior accelerated levels of depreciation (whether intentional or not) cannot reasonably  
14 be addressed or rectified by relying on a 21-year remaining life period.

15

16 Q. DOES MR. ROBINSON'S RELIANCE ON THE REMAINING LIFE  
17 APPROACH TO ADDRESS RESERVE IMBALANCES IN OTHER  
18 JURISDICTIONS DIMINISH THE NEED TO FOLLOW FPSC'S LONG AND  
19 IDENTIFIABLE PRECEDENT?

20 A. No. In my opinion it would be unfair to customers to deny them the *same treatment*  
21 *afforded utilities* by the FPSC when the situation was reversed. Inconsistent  
22 application of concepts in the rate setting process causes uncertainty. Needless  
23 uncertainty in the ratemaking process is not in the public interest and can result in  
24 higher rate case expenses and other higher costs in the future.

25

1 Q. IS THERE A VALID CONCERN REGARDING A POTENTIAL  
2 TURNAROUND OF THE EXCESS RESERVE IN THE NEAR TERM  
3 FUTURE?

4 A. No. While the excess reserve level identified by the Company is sizeable and has  
5 increased since the last case, I am confident that it will increase even further if the  
6 Company's proposed depreciation rates are adopted. Even with my recommended  
7 excess reserve amortization, which would amortize only \$646 million of the \$858  
8 million identified excess more rapidly than the remaining life, the Company is well  
9 protected until the next depreciation study. Because I have purposely tempered my  
10 recommendation to be conservative, under the circumstances I believe there is no  
11 realistic scenario under which PEF could swing to a reserve deficiency prior to the  
12 next study. Certainly, that extremely remote prospect is more than outweighed by the  
13 prejudice to current customers if the Commission were to take no action to address  
14 the severe imbalance more rapidly than the remaining lives of the assets. My position  
15 is that there is no realistic basis or possibility that the excess reserve would  
16 turnaround and become a deficiency by the time the next depreciation study is  
17 completed in four years.

18

19 Q. WHAT IS YOUR SPECIFIC PROPOSAL REGARDING THE TREATMENT  
20 OF THE RESERVE EXCESS?

21 A. I recommend an approach that should satisfy all concerns if all or even a portion of  
22 my recommended adjustments to net salvage and life parameters are adopted. I  
23 recommend that the \$645,805,342 Company identified excessive reserve be returned  
24 to customers over the next 4-years. The excess reserve associated with my

1 adjustments to net salvage and life parameters can be returned to customers over the  
2 remaining life of the assets in this case. This latter aspect provides a safety cushion  
3 for those that may believe that one is necessary, while providing the most  
4 representative generation of customers available the return of a significant portion of  
5 their prior overpaid depreciation expense. This approach addresses the matching  
6 principle as it relates to the intergenerational inequity problem, but not to the degree  
7 that this Commission has previously found appropriate in other cases. This approach  
8 also takes into account the need to gauge the impact of a shorter amortization period  
9 so as to protect the financial integrity of the Company. I have discussed the impact of  
10 my recommended adjustment with OPC's financial, policy and accounting witnesses,  
11 who confirmed that PEF can implement my recommendation *and* maintain the  
12 healthy coverage ratios adequate to access the capital markets on reasonable terms.  
13 Dan Lawton addresses this subject in detail.

14  
15 **Q. WHY DID YOU CHOOSE A 4-YEAR AMORTIZATION PERIOD?**

16 A. The 4-year period is not only within the range of periods previously adopted by this  
17 Commission for other cases where a reserve deficiency was present, it also corrects  
18 the intergenerational equity situation in an effective but manageable manner. Further,  
19 the 4-year period provides sufficient time for the Company to gain additional  
20 experience and perform and present a new, complete and well-documented  
21 depreciation study within the normal cycle required by the Commission's rule on the  
22 mater. Finally, one must always recognize that the ratemaking process already  
23 disadvantages current customers in the intergenerational inequity scenario.  
24 Remember, those generations of customers nearer to the end of the useful life of an  
25 investment pay much less for service than do customers at the beginning of the useful

1 life. While future customers will not see a difference in the actual product (i.e., a kwh  
2 of energy or a Kw of capacity), a different price will be paid for specific assets.  
3 Payment for electricity near the end of the useful life of an investment is associated  
4 with heavily depreciated investment. Recognition of heavily depreciated investment  
5 results in a much smaller return on investment being required for that asset.  
6 Therefore, it is inappropriate to violate the strong and identifiable precedent  
7 employed by this Commission in the past by penalizing current customers for the  
8 benefit of future customers.

9  
10 **Q. WHAT IS THE IMPACT ON REVENUE REQUIREMENTS IF YOUR**  
11 **BIFURCATED APPROACH TO THE BILLION DOLLAR RESERVE**  
12 **EXCESS IS ADOPTED?**

13 A. Amortizing the \$645,805,342 excess reserve PEF has identified as of December 31,  
14 2009 over a 4-year period results in a \$161,456,336 reduction in annual depreciation  
15 expense, and a corresponding reduction to that amount in the Company's overall  
16 revenue requirements prior to the impact of jurisdictional allocation.

17

18 **SECTION: IV PRODUCTION PLANT**

19

20 **A. INTRODUCTION**

21

22 **Q. PLEASE PROVIDE AN OVERVIEW OF THE COMPANY'S PRODUCTION**  
23 **PLANT RELATED DEPRECIATION REQUEST.**

24 A. The Company has approximately \$6.5 billion of generating investment reflected in its  
25 depreciation request. (See Exhibit No. \_\_\_ (EMR-2) page 2-2, 2-3, and 2-6).

1 Associated with this level of investment the Company seeks in excess of \$238 million  
2 of annual depreciation expense based on plant as December 31, 2009.

3  
4 **Q. IS DEPRECIATION EXPENSE CALCULATED THE SAME FOR**  
5 **PRODUCTION PLANT AS IT IS FOR TRANSMISSION, DISTRIBUTION OR**  
6 **GENERAL PLANT?**

7 A. No. The Company relies on a life span approach to depreciation for production plant.  
8 In addition, the Company also seeks recovery of costs associated with terminal  
9 dismantlement studies that estimate the cost to totally demolish existing generating  
10 facilities.

11  
12 **Q. ARE THESE THE ONLY DIFFERENCES?**

13 A. No. For production plant, the Company has proposed the recognition of interim  
14 retirements. As discussed later, those interim retirements *simply reflect individual*  
15 *items at a power station that are projected to retire before the final plant is retired.*  
16 For transmission, distribution, and general plant analyses the concept of interim  
17 retirements does not exist.

18  
19 **Q. IS THERE ANOTHER DIFFERENCE BETWEEN PRODUCTION PLANT**  
20 **AND MASS PROPERTY DEPRECIATION?**

21 A. Yes. For production plant, the Company must estimate a future expected retirement  
22 year or "Projected Year of Retirement" in conjunction with the life span method.  
23 Thus, if a generating unit was placed in service in the middle of 2000 with a 60-year  
24 life span it would be expected to retire in the *middle of 2060.* Again, the need to  
25 *forecast a specific future retirement date is not an issue for mass property accounts.*

1 Q. HAVE YOU REVIEWED THE VARIOUS COMPONENTS OF THE  
2 COMPANY'S PROPOSED PRODUCTION DEPRECIATION EXPENSE?

3 A. Yes. After a detailed review, I find that the Company's proposed production plant  
4 depreciation request is excessive and must be modified. The Company's proposed life  
5 and net salvage parameters can only be characterized as aggressive. In other words,  
6 based on available information, the Company's proposed life spans are artificially  
7 short, its proposed interim retirement method and results excessively reduce the  
8 remaining life for its generating units, its proposed interim net salvage is excessively  
9 negative, and its proposed terminal net salvage represents a high-side estimate of a  
10 worst case scenario.

11

12 Q. IS THE COMPANY'S NEED FOR AN INCREASE IN DEPRECIATION  
13 EXPENSE QUESTIONABLE GIVEN THE EXCESS RESERVE POSITION?

14 A. Yes. The Company proposes a remaining life technique for depreciation. The  
15 remaining life technique adjusts the depreciation expense for the future, taking into  
16 account whether the existing reserve is excessive or understated. If the existing  
17 reserve is excessive in comparison to the theoretical reserve based on the Company-  
18 proposed mortality characteristics, then the remaining life technique forces a  
19 reduction in annual depreciation expense from what would have been the level absent  
20 an excess in the reserve. In other words, if depreciation expense has been collected  
21 on an accelerated basis historically, whether intentionally or not, the rate of  
22 recovering the remaining level of expense must be decelerated over the remaining life  
23 so that only 100% of cost is recovered.

24

1 Q. DOES THE COMPANY ADMIT TO AN EXCESS RESERVE POSITION FOR  
2 ITS GENERATION-RELATED DEPRECIATION?

3 A. Yes. The Company claims a \$472.5 million excess reserve position for production  
4 plant. (See Exhibit No. \_\_\_ (EMR-2) page 2-75 and 2-77).  
5

6 Q. WHAT ARE THE MAJOR AREAS OF THE COMPANY'S PRODUCTION  
7 PLANT DEPRECIATION REQUEST THAT YOU WILL BE ADDRESSING?

8 A. I will address the Company's life span estimates for several of its steam and nuclear  
9 generating units, the Company's method and results for interim retirements, and the  
10 Company's over statement of negative net salvage.  
11

12 **B. PRODUCTION PLANT LIFE SPANS**

13  
14 Q. WHAT IS THE ISSUE IN THIS PORTION OF YOUR TESTIMONY?

15 A. This portion of my testimony will deal with limited modifications to the Company's  
16 proposed retirement dates for its steam-fired generating facilities.  
17

18 Q. WHAT LIFE SPANS HAS THE COMPANY PROPOSED FOR ITS VARIOUS  
19 STEAM-FIRED GENERATORS AT THE THREE GENERATING STATIONS  
20 ACCOUNTED FOR IN STEAM PLANT ACCOUNTS 311 THROUGH 316?

21 A. The Company has proposed four different future retirement dates for the Company's  
22 steam production investment. For the Crystal River 1 and 2 coal-fired units, the  
23 Company proposes a retirement date in the middle of 2020. For the Crystal River 4  
24 and 5 coal-fired generating units, the Company proposes a mid 2035 retirement date.  
25 For the Anclote units the Company proposes a mid 2022 retirement date, and for the

1 remaining 3 Suwannee generating units the Company proposes a mid 2013 retirement  
2 date, or only 3 ½ years beyond the end of the depreciation study period of 2009.  
3

4 **Q. WHAT ARE THE OVERALL LIFE SPANS THAT CORRESPOND TO**  
5 **THESE RETIRMENT DATES?**

6 A. The Company's mid 2020 retirement date for its investment in Crystal River 1 and 2  
7 units equates to a 53.5 and 50.5-year life spans, respectively. The Company's mid  
8 2022 retirement date for the Anclote 1 and 2 units yields 47.5 and 43.5-year life  
9 spans, respectively. The Company's proposed mid 2035 retirement date for the  
10 Crystal River 4 and 5 units results in 52.5 and 50.5-year life spans, respectively.  
11

12 **Q. DO ANY OF THE COMPANY'S PROPOSED RETIREMENT DATES FALL**  
13 **WITHIN THE PLANNING HORIZON OF THE COMPANY'S 10-YEAR SITE**  
14 **PLAN?**

15 A. Yes. The most recent 10-year site plan for the Company encompasses a planning  
16 horizon only for the Suwannee plant.  
17

18 **Q. ARE THE COMPANY'S PROPOSED RETIREMENT DATES FOR ITS**  
19 **STEAM FIRED GENERATING FACILITIES REASONABLE?**

20 A. No. The Company's proposed life spans for its newer large coal-fired and its large oil  
21 and gas-fired generating units are inadequate or short.  
22

23 **Q. ON WHAT DO YOU BASE YOUR STATEMENT THAT THE LIFE SPANS**  
24 **FOR THE COMPANY'S NEWER COAL AND LARGE OIL AND GAS-FIRE**  
25 **GENERATING FACILITIES ARE INADEQUATE OR SHORT?**

1 A. There are various reasons, but the most compelling is the fact that the Company has  
2 demonstrated through actual operation that it can operate its other oil and gas fired  
3 generating facilities for more than 55 years. Moreover, the Company's expectation is  
4 that such facilities can operate in excess of 60 years. (See OPC's POD 7 No. 174,  
5 Attachment). If the Company has or expects to operate smaller less efficient  
6 generating facilities for 60 years or longer, estimated life spans for its newer, larger  
7 and costly generating facilities should not be limited to the low 50-year range. The  
8 Company's proposal is contrary to standard economic theory which dictates that large  
9 capital intensive investments should be operated to maximum levels in order to  
10 deliver the economic worth that such facilities are capable of obtaining.

11

12 **Q. ARE THERE OTHER REASONS WHY THE COMPANY'S PROPOSED LIFE**  
13 **SPANS APPEAR TO BE UNREASONABLY SHORT?**

14 A. Yes. I have been performing utility depreciation analyses for over 35 years. At the  
15 beginning of my career I did experience utilities proposing life spans for steam-fired  
16 generating facilities in the low to mid thirty year range. Those expectations were  
17 based on claims of typical design life and concerns about higher temperature and  
18 pressure operating characteristics of units being placed into service in the 1960s and  
19 early 1970s. At that time no empirical data existed to demonstrate that 30 to 35-year  
20 life spans were unreasonably short, even though older units operating at lower  
21 temperatures and pressures had operated for longer life spans.

22

23 As time progressed and more empirical data became available the life span issue  
24 changed from one where utilities would propose 30 to 35-year lives to where the  
25 utilities were proposing upper 30 to low 40-year lives. In other words, as time

1 progressed and it became obvious that units were operating for time periods  
2 approaching or exceeding the initially proposed 30 to 35 years of operation, coupled  
3 with the fact that there were no plans for retirement, utilities could no longer support  
4 the initial artificially short life spans. As additional years passed the life span  
5 discussion for steam-fired generation continued to change. Utilities began proposing  
6 45 and 50-year life spans, again in recognition of reality. The process continues  
7 through today. In the last several years utilities and regulators are recognizing that 50  
8 and 60-year life spans are more appropriate for steam-fired generating facilities.

9  
10 **Q. HAVE THERE BEEN RECENT CASES TO WHICH 60-YEAR LIFE SPANS**  
11 **HAVE BEEN ADOPTED FOR STEAM GENERATING FACILITIES?**

12 A. Yes. For example, in a 2007 Oklahoma Corporation Commission (“OCC”) ordered  
13 Public Service Company of Oklahoma (“PSO”), a member of the very large  
14 American Electric Power Company group, was ordered to rely on a 60-year life span  
15 for its coal-fired generating facilities. (See OCC Cause No. 200600285). In PSO’s  
16 most recent case decided in early 2009, PSO did not challenge and even relied on a  
17 60-year life span for its coal generating facilities. (See OCC Cause No. 200800144).  
18 In fact, the head of generation production for American Electric Power Corporation  
19 stated that based on its experience and expectation there was no reason why it could  
20 not operate generating facilities for a minimum of 60 years. PSO’s life spans for its  
21 gas-fired generating facilities were not at issue as PSO was proposing 60-plus years  
22 for such facilities.

23  
24 **Q. CAN YOU PROVIDE OTHER EXAMPLES?**

1 A. Yes. Another example is a recent Rocky Mountain Power Company case in the state  
2 of Utah. In that case, the regulatory staff of five states negotiated a settlement where  
3 that company's proposed life span for its coal-fired generating facilities was reduced  
4 to 61 years. (See Utah Public Service Commission Docket No. 07-035-13). In that  
5 case, the Company had actually proposed a longer life span for its coal-fired  
6 generating facilities.

7  
8 Yet another very recent example is the settlement in the Southwestern Public Service  
9 Company ("SPS") case in Texas. (See Public Utility Commission of Texas Docket  
10 No. 35763). It should further be noted that SPS is part of the large Xcel holding  
11 company which has operations in numerous states across the country. In that case,  
12 SPS had proposed a 55-year life span for its coal-fired generating facilities, but settled  
13 and accepted a 60-year life span. It is worth noting that SPS is one of the utilities that  
14 for decades argued in rate cases that anything in excess of a 35-year life span was  
15 unrealistic and would not occur. Yet, in only a period of a decade or so SPS is now  
16 not only proposing 55-year life spans, but accepting 60-year life spans for its coal-  
17 fired generating facilities.

18  
19 **Q. DOES THE FEDERAL GOVERNMENT MAINTAIN INFORMATION THAT**  
20 **WOULD FURTHER SUPPORT LONGER LIFE SPANS FOR COMPANY'S**  
21 **GENERATING FACILITIES THAN THOSE THE COMPANY PROPOSES IN**  
22 **THIS PROCEEDING?**

23 A. Yes. The Energy Information Administration of the Department of Energy maintains  
24 a listing of all generating facilities. I have reviewed such information numerous times  
25 in the past. The government's database clearly demonstrates that there is more than

1 adequate empirical data to support life spans much longer than what the Company  
2 proposes in this case for its coal-fired generation.

3  
4 **Q. IS THERE ANY QUESTION THAT FROM A PHYSICAL STANDPOINT**  
5 **THE COMPANY'S GENERATING FACILITIES CAN LAST FOR 50 TO 60**  
6 **YEARS, OR LONGER?**

7 A. No. From a physical standpoint there is nothing presented by the Company or the  
8 industry which can refute that coal, oil and gas-fired generating facilities can and  
9 have operated for longer periods of time.

10  
11 **Q. HAS THE COMPANY PRESENTED ANY ECONOMIC ANALYSIS WHICH**  
12 **CLEARLY DEMONSTRATES THAT THE ECONOMIC OPERATION OF**  
13 **ITS LARGE COAL, GAS OR OIL-FIRED FACILITIES CANNOT OPERATE**  
14 **FOR MUCH LONGER PERIODS THAN IT PROPOSES?**

15 A. No. Not only am I not aware of any, I would question the validity of any assumptions  
16 which would support a life expectancy for such facilities being as short as 43 years as  
17 proposed by the Company for one of its Anclote units.

18  
19 **Q. IS THERE CONCERN REGARDING THE CARBON EMISSIONS FOR THE**  
20 **COMPANY'S VARIOUS GENERATING FACILITIES?**

21 A. Yes. I think everyone is concerned regarding the carbon emissions of all fossil-fired  
22 generating facilities. However, that does not change the fact that based on what we  
23 know today, these large and efficient operating units can be expected to operate  
24 beyond the Company's proposed retirement dates. Moreover, other utilities and

1 regulators across the country are recognizing the longer realistic life spans for such  
2 units with full knowledge and concerns regarding carbon emissions.

3

4 **Q. IS THERE ANY BASIS TO DENY LONGER LIFE SPANS ASSOCIATED**  
5 **WITH ANY POTENTIAL ARGUMENT ASSOCIATED WITH INTERIM**  
6 **ADDITIONS?**

7 A. No. First, it must be noted that some utilities have claimed that longer life spans  
8 cannot be recognized for ratemaking purposes absent the recognition of interim  
9 additions. Interim additions simply mean certain unknown levels and timing of  
10 capital additions in the future to keep generating facilities operating for the expected  
11 life spans.

12

13 **Q. WHY WOULD SUCH AN ARGUMENT NOT BE APPROPRIATE?**

14 A. The interim addition issue has been an issue before regulators for an extended period  
15 of time. The FERC and other state jurisdictions have ruled, consistent with the  
16 National Association of Regulatory Utility Commissioners' ("NARUC") publication  
17 entitled "Public Utility Depreciation Practices," that interim additions are not  
18 appropriate for inclusion in depreciation analyses. Interim additions represent  
19 significant unknown timing and quantities. They should be recognized after the fact  
20 once they have occurred. Thus, any argument raised by the Company associated with  
21 interim additions should be dismissed as having no merit.

22

23 **Q. WHAT DO YOU SPECIFICALLY RECOMMEND?**

24 A. In order to present a conservative initial adjustment, I recommend the lengthening of  
25 life spans for Crystal River 4 and 5 coal-fired generating units, as well as the

1 Company's large Anclote oil-fired generating units. Specifically, I am  
2 recommending a 60-year life span for Crystal River 4 and 5 coal-fired generating  
3 units and a minimum 50-year life span for the Company's Anclote large oil-fired  
4 generating units.

5  
6 **Q. IS THE COMPANY'S PROPOSED LIFE SPAN FOR CRYSTAL RIVER 3**  
7 **NUCLEAR PLAN ARTIFICIALLY SHORT?**

8 A. Yes. Unlike steam generating units the Company's nuclear unit has a very specific  
9 license termination date. With the requested 20-year license extension, the license  
10 termination date is December 3, 2036. The Company has proposed a mid-2036  
11 retirement date. Therefore, I recommend the remaining life for crystal River 3 be  
12 extended to recognize approximately 11/12ths of calendar year 2036.

13  
14 **Q. DO YOU BELIEVE THE PROPOSED LIFE SPANS FOR THE COMPANY'S**  
15 **REMAINING GENERATING FACILITIES ARE APPROPRIATE?**

16 A. No. In particular, the Company's proposal for an approximate 30-year life span for  
17 combined cycle generating units is also understated. Other utilities and regulators are  
18 recommending longer life spans for combined cycle generating facilities. In this case,  
19 I recommend that the Commission order the Company to perform a detailed analysis  
20 demonstrating why its substantial investment in combined cycle generating facilities  
21 cannot be expected to reasonably operate for 35 years or longer, and present the study  
22 in its next depreciation filing. However, if the Commission were so inclined, it would  
23 be more than reasonable to increase the life span to 35 years as initial steps in this  
24 case. It is no longer reasonable to expect customers to overpay for decades for the

1 use of generating facilities that realistically should and can be expected to last longer  
2 than the Company's unsubstantiated 30-year life expectations.

3  
4 **Q. WHAT IS THE IMPACT OF YOUR ADJUSTMENT?**

5 A. I have not made a precise quantification of the standalone impact of this adjustment  
6 due to the manner in which the Company has presented its data. However, a  
7 reasonable estimate of the impact on a standalone basis is a reduction to depreciation  
8 expense of \$26 million annually.

9  
10 **C. INTERIM RETIREMENTS**

11  
12 **Q. WHAT ISSUE DO YOU ADDRESS IN THIS PORTION OF YOUR**  
13 **TESTIMONY?**

14 A. The issue in this portion of my testimony addresses the Company's choice for  
15 estimation of interim retirements and the ultimate interim retirement life-curve  
16 combinations proposed for production plant accounts.

17  
18 **Q. WHAT ARE INTERIM RETIREMENTS?**

19 A. Interim retirements have been characterized as a fine tuning adjustment to the life  
20 span analysis. The life span method is used in estimating the retirement date for any  
21 large unit of property such as an entire generating unit. The theory behind interim  
22 retirement rates is that even though a large unit of property such as a generating unit  
23 might retire in 60 years, in the interim period many components have to be replaced  
24 in order to maintain the overall generating facility in operating condition. An analogy  
25 to this would be a car which might be anticipated to have a service life of 10 years.

1 During the 10-year life of the car, the owner might have to replace the battery, tires,  
2 alternator and other components in order to maintain the automobile in a safe and  
3 operable condition. Therefore, even though the automobile may have an overall 10-  
4 year life span, its dollar weighted adjusted life span may be 9.8 years due to the  
5 averaging of the automobile's overall life span with the average of the individual  
6 replaced components. In other words, the interim retirement rate would be a fine  
7 tuning factor used to reduce the service life from 10 years to 9.8 years.

8  
9 **Q. HAS THE COMPANY INCORPORATED THE IMPACT OF INTERIM**  
10 **RETIREMENTS IN ITS DEPRECIATION ANALYSIS?**

11 A. Yes. The Company proposes to implement a calculation procedure for interim  
12 retirements based on truncated Iowa Survivor curves that are "designed" to recognize  
13 "anticipated" interim retirements. (See Exhibit No. \_\_ (EMR-2) page 1-4).

14  
15 **Q. DO YOU AGREE WITH THE COMPANY'S POSITION?**

16 A. While I agree with the Company that interim retirements should be included in the  
17 calculation of production plant depreciation rates, I do not agree with the Company's  
18 proposed process or results. I find the Company's proposal inappropriate and  
19 cumbersome for application in this proceeding.

20  
21 **Q. PLEASE EXPLAIN THE PROBLEMS WITH THE COMPANY'S PROPOSED**  
22 **METHOD.**

23 A. The Company's approach relies on an actuarial analysis of the historical data to  
24 determine an interim retirement life-curve combination. Actuarial analyses are  
25 normally performed on more homogeneous-type investments that are not generally

1 dependent on one another, such as poles or wires. In particular, the varying types of  
2 investments within each of the major production plant accounts do not reasonably  
3 lend themselves to actuarial analyses. In other words, the retirement forces  
4 experienced by electric motor drives booked in Account 312 are noticeably different  
5 than the retirement forces on smoke stacks, also booked in Account 312. However,  
6 the Company's actuarial approach treats all items in the same account as one type of  
7 item for life estimation purposes.

8  
9 The actuarial approach can also overreact to unusual activity or the timing of unusual  
10 activity. Indeed, the results of the Company's actuarial analysis are greatly affected  
11 by the unusual retirement activity that the Company booked during the past 4 years  
12 since its last depreciation study. For example, the Company's assumed "25O1" life-  
13 curve combination for Account 343 is based on unusual levels of infant mortality.  
14 (See Exhibit No. \_\_ (EMR-2), page 5-39 through 5-41). In order to properly recognize  
15 what has transpired since the Company's last depreciation study and the impact on  
16 the Company's current proposal, I have attached the equivalent analysis performed by  
17 Mr. Robinson in his last depreciation study as Exhibit (JP-3). In the last case Mr.  
18 Robinson proposed a 48R0.5 life-curve combination for Account 343. Therefore, his  
19 proposal in this proceeding basically cuts the average service life in half and  
20 dramatically changes the shape of dispersion pattern.

21  
22 **Q. DOES MR. ROBINSON'S SELECTION AND APPROACH FOR ACCOUNT**  
23 **343 REPRESENT APPROPRIATE DEPRECIATION ESTIMATION**  
24 **PRACTICES?**

1 A. No. First, it must be noted that even Mr. Robinson states that "gradualism" is a  
2 concept he employs in the development of his depreciation studies. (See Mr.  
3 Robinson's rebuttal testimony in Docket No. 050078-EI at page 10). Given that Mr.  
4 Robinson's previously proposed average service life for interim retirement purposes  
5 for this account was 48 years, or approximately 100% higher than his current  
6 proposal, it appears he must have made an unexplained and unwarranted exception to  
7 his concept.

8  
9 Next, Mr. Robinson chose not to explain why in the last case a zero level of  
10 retirements existed for the zero to one half year age interval, meaning no infant  
11 mortality, yet in this proceeding he relies on \$46.5 million of infant mortality during  
12 the same age interval. Retirements of this magnitude at the time of installation of  
13 investment, an age of zero, is simply not realistic or practical for estimation purposes.  
14 Moreover, the claimed retirement activity between the Company's prior depreciation  
15 study and the current depreciation study for the first four age brackets increased by  
16 more than a 1,000%. Whether such activity represents true retirement activity  
17 experienced by the Company during the last 4 years, it cannot reasonably or  
18 realistically be assumed to be a repeating pattern in the future absent reliance on  
19 imprudent activity.

20  
21 **Q. WHAT IS THE PRACTICAL IMPACT OF MR. ROBINSON'S PROPOSED**  
22 **INTERIM RETIRMENT APPROACH FOR ACCOUNT 343?**

23 A. The real practical impact of Mr. Robinson's method and assumptions are best  
24 described as it applies to the new combined cycle investment for Account 343 –  
25 Bartow combined cycle. Mr. Robinson proposes a 5.08% depreciation rate

1 corresponding to an estimated \$632 million of new investment. (See Exhibit  
2 No.\_\_(EMR-2), page 2-4). While the Company claims a 2039 Probable Year of  
3 Retirement date for this new investment (See OPC's POD 7-174, Attachment), which  
4 corresponds to a 30-year life span, Mr. Robinson reduces that value to only 20.7 years  
5 for remaining life purposes. (See Exhibit No.\_\_(EMR-2), page 2-18, column (j)). In  
6 other words, Mr. Robinson's proposed interim retirement approach and resulting life-  
7 curve combination takes the 30-year life span proposed by the Company and cuts off  
8 a full 1/3<sup>rd</sup> of that life span due to the impact of his assumed interim retirement  
9 calculation. Such massive and artificial reduction in life spans due to Mr.  
10 Robinson's approach and quantification of interim retirements can only be  
11 characterized as an attempt to create and implement an accelerated form of  
12 depreciation. The annual revenue requirement impact of reducing a 30-year life span  
13 to a 20.7-year adjusted remaining life for this single account for this single generating  
14 unit is \$9.8 million. It is precisely this type of activity that will result in an excess  
15 level of depreciation reserve in the future if the Company's proposal is adopted. This  
16 practice must be stopped now before it acerbates the current excess reserve situation.

17  
18 **Q. IS THERE ANOTHER ASPECT TO THE COMPANY'S INTERIM**  
19 **RETIREMENT PROPOSAL THAT HIGHLIGHTS ITS UNREASONABLE**  
20 **RESULTS?**

21 **A.** Yes. In this case the Company proposes two types of net salvage for production  
22 plant: interim retirement net salvage and terminal net salvage. The interim retirement  
23 net salvage is associated only with the retirements that are estimated by employing  
24 the Company's proposed interim retirement life-curve combination approach. For

1 other production plant the Company calculated interim retirements as 47% of total  
2 investment as of December 31, 2009. (See Exhibit No.\_\_(EMR-2) page 2-134).

3  
4 The Company performed this analysis for interim net salvage in order to determine  
5 how to adjust its total proposed plant account net salvage values so that the adjusted  
6 value applied to total plant in service would be the equivalent of applying the net  
7 salvage only to interim retirements. For example, for Account 312 the Company  
8 proposes a total overall negative 50% net salvage estimate. However, the Company  
9 realized that it should not apply the negative 50% to the entire plant balance since the  
10 entire plant balance does not correspond to the level of "estimated" interim  
11 retirements prior to the final retirement of each generating unit. Therefore, the  
12 Company presented an approach which reduces its proposed total account net salvage  
13 level to a negative 21% in an attempt to make it equivalent to only the level of interim  
14 retirements. The significance of this example is that the Company's proposed interim  
15 retirement approach, which relies on a 48S0 truncated Iowa Survivor curve, projected  
16 that \$394 million of plant would retire between January 1, 2010 and the projected 20-  
17 year remaining life for its boiler plant equipment. (See Exhibit No.\_\_(EMR-2), pages  
18 2-131 and 9-15).

19 **Q. CAN YOU PLACE THE \$394 MILLION OF PROJECTED INTERIM**  
20 **RETIREMENT ACTIVITY FOR BOILER PLANT EQUIPMENT INTO**  
21 **PROPER PERSPECTIVE?**

22 **A.** Yes. The Company provided the annual historical boiler plant retirement activity for  
23 the period 1976 through 2007. (See Exhibit No.\_\_(EMR-2), pages 8-5 through 8-8).  
24 This time frame represents a 32-year period or 1.6 times the Company's projected  
25 remaining life for the existing boiler plant equipment. During the historical 32-year

1 period the Company reports retirements of approximately \$60 million or \$1.8 million  
2 per year. Thus, on a per year basis the Company's projected interim retirement  
3 values are more than *10 times* the historical annual retirement levels experienced by  
4 the Company for the same plant. There is no evidence that demonstrates that such a  
5 proposed expansion of interim retirements is reasonable or realistic.

6  
7 **Q. DOES INDUSTRY DATA CONFIRM THE REASONABLENESS OF THE**  
8 **COMPANY'S PROPOSAL?**

9 A. No. A review of the electric industry data provided by the Company's depreciation  
10 consultant identifies longer lives than his proposal for Account 312 in this case. For  
11 example, Mr. Robinson's interim retirement values average over 60 years with half of  
12 his prior proposals at or above 70 years for Account 312. (See OPC's 5<sup>th</sup>  
13 Interrogatories No. 192, Attachment). Mr. Robinson's historical average represents a  
14 28% increase above the value he proposed in this case. Thus, the method employed  
15 by Mr. Robinson for interim retirements produced results that vary to a significant  
16 extent and artificially reduce the remaining life of the production facilities to too great  
17 of an extent in this case.

18 **Q. ARE YOU PROPOSING ANY ADJUSTMENTS TO THE LEVEL OF**  
19 **INTERIM RETIREMENTS REQUESTED BY THE COMPANY?**

20 A. Yes. Given (1) the excessive level of interim retirements that are produced by the  
21 Company's approach, (2) the level of variance between what the Company proposed  
22 compared to what the Company's consultant has proposed in other proceedings for  
23 the same accounts, and (3) the unrealistic results that are a direct fallout of the  
24 Company's process, I recommend an alternative approach and values for interim  
25 retirements.

1 Q. **WHAT DO YOU RECOMMEND?**

2 A. I propose an interim retirement adjustment that is not based on truncated Iowa  
3 Survivor curves. In other words, I have replaced the actuarial component of the  
4 analysis, given that the plant analyzed is neither reasonably homogeneous nor  
5 independent from the life of the overall generating unit. The method I rely upon is  
6 one sponsored by the California Public Utilities Commission in its publication  
7 entitled "Determination of Straight - Line Remaining Life Depreciation Accruals  
8 Standard Practice U-4", and also recognized by the NARUC in its publication entitled  
9 "Public Utility Depreciation Practices." Thus, there can be no doubt that the method I  
10 recommend has been employed and adopted historically and currently by utilities and  
11 utility regulators.

12  
13 Next, I developed interim retirement ratios for each of the plant accounts based on  
14 actual and realistic Company specific information. In other words, the interim  
15 retirement ratios utilized in my approach were developed from the historical reported  
16 levels of retirement activity by account for each of the steam, nuclear and other  
17 production accounts as also relied upon by the Company. (See Exhibit No.\_\_(EMR-  
18 2), page 8-1 through 8-62). The resulting interim retirement ratios and the  
19 corresponding impact on remaining lives are set forth on Exhibit (JP-4).

20  
21 Q. **WHAT IS THE IMPACT OF YOUR RECOMMENDED MODIFICATIONS  
22 TO THE APPROACH AND LEVEL OF INTERIM RETIREMENTS?**

23 A. The adoption of my recommended approach for interim retirement ratios on a  
24 standalone basis results in an approximate \$45 reduction to depreciation expense on a  
25 total Company basis.

**D. INTERIM NET SALVAGE**

25

**Q. WHAT IS THE ISSUE IN THIS PORTION OF YOUR TESTIMONY?**

A. This portion of my testimony addresses the Company's proposal for net salvage associated with interim retirements. The Company has proposed a wide array of values ranging from zero to a negative 50% for various production plant accounts.

**Q. WHAT IS INTERIM NET SALVAGE?**

A. The Company proposes two different types of net salvage for production plant, interim net salvage and terminal net salvage. Terminal net salvage corresponds to the estimated cost associated with the final retirement and disposition of a generating facility once it has been retired. Alternatively, interim net salvage reflects the cost the Company estimates it will incur when replacing components of the plant that retire between now until when the Company forecasts the unit will retire. In other words, interim net salvage corresponds to the interim retirements projected by the Company.

**Q. HOW DID THE COMPANY DEVELOP ITS PROPOSED INTERIM NET SALVAGE LEVELS?**

A. That is a good question; unfortunately, the Company provided no specifics that support the Company's proposals. Rather, the Company states that it relied on an "interpretive as opposed to an arithmetic approach." (See OPC's 2<sup>nd</sup> Interrogatories No. 64). The Company also states that the "level of interim net salvage of each property was based upon an account level analysis of historic data to date." (See Exhibit No. (EMR-2), Section 4 pages 4-1 through 4-31). Mr. Robinson further stated that the interim net salvage "was based upon an analysis of the Company's

1 historical experience, consideration of the prepared net salvage forecast, plus current  
2 and perspective factors.” (See Mr. Robinson’s direct testimony at page 22). In other  
3 words, the Company admits that its presentation is based on some vague  
4 interpretation of a combination of historical data, considerations of Mr. Robinson’s  
5 forecast approach to net salvage, plus current and perspective “factors.”

6

7 **Q. DID MR. ROBINSON PRESENT AN ANALYSIS OF EACH ACCOUNT?**

8 A. Yes, however, the mathematical analyses presented do not correspond to or verify the  
9 interim net salvage proposals made by Mr. Robinson. This lack of connection  
10 between numerical analysis and Mr. Robinson’s proposed results are to be expected  
11 given his admission that his estimation process is an “interpretative as opposed to an  
12 arithmetic approach.”

13

14 **Q. DID YOU SEEK SPECIFICS REGARDING MR. ROBINSON’S RELIANCE**  
15 **ON JUDGMENT AND EXPERIENCE IN DETERMINING THE FINAL**  
16 **SELECTION OF NET SALVAGE SELECTIONS?**

17 A. Yes. In fact, the Company was specifically requested to provide a “detailed narrative  
18 identifying and explaining each item of judgment and experience relied upon by  
19 account and/or subaccount in the estimation of life and net salvage values.” (See  
20 OPC’s 2<sup>nd</sup> Interrogatories No. 64, Subpart C). It is in response to this request that the  
21 Company admits for the first time that its process is interpretative as opposed to  
22 mathematical, yet both the Company and Mr. Robinson failed to provide any  
23 specifics as requested.

24

1 Q. HAVE YOU REVIEWED MR. ROBINSON'S NOTES TO DETERMINE IF  
2 HE PROVIDED INFORMATION THAT MIGHT RELATE TO CURRENT  
3 AND SPECIFIC FACTORS ASSOCIATED WITH HIS INTERIM NET  
4 SALVAGE PROPOSALS?

5 A. Yes. (See OPC's 2<sup>nd</sup> Interrogatories No. 99, Attachment). Mr. Robinson's notes shed  
6 no additional light on the specific proposal he presents and the Company relies upon  
7 for its depreciation request. His failure to provide any meaningful information by  
8 account regarding the current proposed factors is inappropriate given he also states  
9 that "input from management regarding its view of current and potential changes in  
10 coming years are considered in the process." (See OPC's 2<sup>nd</sup> Interrogatories No. 64).  
11 Mr. Robinson cannot be allowed to claim that his process is "interpretative" and relies  
12 on "input from management" and then not provide a single specific item of  
13 information regarding this process when requested to do so. The real issue is that Mr.  
14 Robinson and the Company failed to provide any specifics in the first place when the  
15 case was filed.

16  
17 Q. DO YOU AGREE WITH THE COMPANY'S PROPOSAL?

18 A. No. Most of the Company's proposals are excessively negative. The Company's  
19 failure to investigate the underlying data other than through a faulty "forecast"  
20 process has caused it to inappropriately select excessively negative values which are  
21 not representative of the remaining investment in the account. Moreover, the  
22 Company fails to provide any specifics of how it arrived at its proposal, versus any  
23 other value, for each separate account. (See OPC's 2<sup>nd</sup> Interrogatories No. 64 and 5<sup>th</sup>  
24 Interrogatories No. 177). In fact, Mr. Robinson provided less specifics than he did in  
25 his last study.

1 Q. CAN YOU PROVIDE AN EXAMPLE OF THE COMPANY'S FAILURE TO  
2 PROVIDE ADEQUATE EXPLANATION AND SUPPORT FOR ITS  
3 PROPOSALS?

4 A. Yes. I will use steam production plant Account 312 – Boiler Plant Equipment for the  
5 example. For this account, the Company has proposed an overall negative 50% net  
6 salvage. When adjusted for the Company's claimed level of interim retirements the  
7 negative 50% net salvage is reduced to a negative 21%. (See Exhibit No.\_\_(EMR-  
8 2) page 2-130). The Company's depreciation study and responses to interrogatories  
9 and document productions failed to identify how the initial negative 50% net salvage  
10 level was established. What the Company has provided is general statements that (1)  
11 it relied on an "interpretative" approach, (2) it reviewed historical data, (3) it did a  
12 "forecast" analysis, and (4) it relied on input from management. However, a review  
13 of the historical data and analyses, forecasted data and analyses, information from the  
14 Company's last study, Company notes, responses relating to input from management,  
15 etc., all fail to identify why a negative 50% net salvage was selected or why it was  
16 appropriate in the first place.

17  
18 What the Company's information does identify is that the overall historical data  
19 indicates a negative 37% net salvage and that the Company's forecast analysis  
20 indicates a negative 130% net salvage. (See Exhibit No.\_\_(EMR-2) page 4-3). Thus,  
21 the negative 50% proposed by the Company does not appear to be based on either the  
22 forecast or the historical information. Given that the Company failed to provide any  
23 specifics regarding the input, and the impact of such input, from any Company  
24 individual, renders its proposal completely void of any supporting evidence.

25

1 Q. HOW DOES THE COMPANY'S PROPOSAL COMPARE TO ITS  
2 PROPOSAL FOR THIS SAME ACCOUNT IN THE LAST CASE?

3 A. The two proposals are identical. However, the net salvage "forecast" in the last case  
4 was a negative 384%, while in this case it is only a negative 130%. Thus, while the  
5 forecasted amount has been reduced by 2/3<sup>rd</sup> there is no change in the Company's  
6 proposed negative 50% overall net salvage. Obviously, the "forecast" analysis played  
7 no meaningful role in the selection process. Turning to the historical data, the overall  
8 net salvage for this account in the last study was a negative 67%. In this study that  
9 value has changed to a negative 36%, yet the Company made no change in its  
10 proposed negative 50% overall net salvage. Obviously the Company's proposal is  
11 not based on any analysis or a review of historical data or trends in the data.  
12 Moreover, the ultimate interim retirement related net salvage as proposed by the  
13 Company in the last case was a negative 12.5%. However, in this case the Company  
14 now proposes a negative 21%. This proposal is made in spite of the fact that its own  
15 "forecast" analysis has been cut by 2/3<sup>rd</sup> and the overall historical data indicates  
16 approximately a 50% cut in negative net salvage. In spite of these contradictory  
17 movements between cases, Mr. Robinson and the Company elected to remain silent  
18 as to the basis for the proposal.

19

20 Q. PLEASE SUMMARIZE THE COMPANY'S PRESENTATION?

21 A. The Company presentation is less than vague, yet based on the depreciation study it  
22 still seeks approximately \$33 million of annual revenue requirements based on plant  
23 as of December 31, 2009. (See Exhibit No. (EMR-2) pages 2-31, through 2-36).  
24 Rather than presenting any specific facts, considerations, documents, exhibits or even  
25 meaningful testimony in support of its various proposals, the Company simply places

1 such values within its 165 pages of summary numerical documentation identified as  
 2 Section 2 of its depreciation study. There are no notes that explain the various  
 3 proposals, there are no workpapers that explain the proposal, and there is no  
 4 testimony that explains the proposal other than to indicate three potential approaches.  
 5 Indeed, while the study identifies three very generalized basis for Mr. Robinson's  
 6 proposals, the Company only admits in response to an interrogatory that the  
 7 arithmetic approach reflected in the historical analysis and in the forecast analyses  
 8 were not relied upon. Even when making such admission the Company and Mr.  
 9 Robinson still fail to provide any support for the bases of its proposals. The  
 10 Company's proposal should be denied since the Company has met no burden of proof  
 11 associated with its interim net salvage request and has still not identified any credible  
 12 support.

13  
 14 **Q. WHAT DO YOU RECOMMEND?**

15 A. While a zero level of net salvage would be a logical reaction to the Company's total  
 16 failure to present and support its proposals, I have two recommendations. First, I  
 17 recommend that the actual overall historic values reflected in the Company's  
 18 depreciation study be utilized for interim retirement purposes, with one very  
 19 conservative limitation. That limitation is that in each instance where the historical  
 20 data for interim net salvage yields a positive value that the interim net salvage be set  
 21 to zero. This limitation is conservative in favor of the Company. The second  
 22 recommendation is that the Commission order the Company to perform a detailed,  
 23 thorough and well documented depreciation study for its next proceeding. The  
 24 presentation by the Company should clearly identify what was specifically relied  
 25 upon by account and how the various items of information relied on result in

1 whatever proposal the Company makes in its next depreciation study. The  
2 Commission and customers should not be left hanging in the dark even after  
3 requesting information that was intended to elicit the clear basis and support for the  
4 Company's proposals.

5  
6 **Q. WHAT SPECIFIC INTERIM NET SALVAGE VALUES RESULT FROM  
7 YOUR RECOMMENDATION?**

8 A. Exhibit (JP-5) presents a listing of the overall net salvage and interim net salvage by  
9 account for production plant as proposed by the Company and as I recommend based  
10 on actual Company specific data.

11  
12 **Q. WHAT IS THE IMPACT OF YOUR RECOMMENDATION?**

13 A. My recommendation results in an approximate \$30 million reduction to annual  
14 depreciation expense based on plant as of December 31, 2009.

15  
16 **E. INCONSISTENT INTERIM NET SALVAGE ANALYSES**

17  
18 **Q. IS THERE INTERNAL INCONSISTENCY IN THE COMPANY'S  
19 PRESENTATION FOR INTERIM NET SALVAGE?**

20 A. Yes. Once the Company establishes the overall proposal for net salvage for an  
21 account it then adjusts the proposed value downward to reflect the fact that it will be  
22 applied to total plant, yet intended to have the effect of only being applicable to  
23 interim retirements. Unfortunately, the Company calculates the modification to its  
24 proposed overall net salvage value based on data as of December 31, 2007. While  
25 this portion of the depreciation analysis is based on data as of December 31, 2007, the

1 Company specifically carries forward additions and retirements through the end of  
2 2009 in all other portions of its study. The Company takes such projected additions  
3 and retirements into account in calculating the remaining life for the overall  
4 depreciation expense and resulting rates, but fails to update the applicable level of  
5 interim retirements due in part to its reliance on a truncated Iowa Survivor curve  
6 approach in establishing the level of interim retirements.

7  
8 **Q. CAN SUCH INTERNAL INCONSISTENCY HAVE A SIGNIFICANT**  
9 **IMPACT IN THE FINAL RESULT?**

10 A. Yes. For example, Account 322 – Nuclear Plant Equipment represents one such  
11 instance. A review of Exhibit No. (EMR-2) pages 7-49 and 7-50, which reflects  
12 data as of December 31, 2007, and page 9-39, which reflects plant data as of  
13 December 31, 2009, establishes that substantial additions and retirements are  
14 projected to occur to this account. In particular, the plant balance increased from  
15 \$267 million at the end of 2007 to approximately \$516 million as of the end of 2009.  
16 A close comparison of these pages identifies that the Company projected additions of  
17 \$311,892,596.74 during calendar year 2008 and 2009. However, when these  
18 additions are added to the 2007 plant balance set forth on page 7-50 it yields a  
19 difference of \$62.8 million. This is precisely the amount the Company estimated  
20 would retire during 2008 and 2009. The \$62.8 million of retirements are interim  
21 retirements. The significant additions of over \$311 million and the \$62.8 million of  
22 retirements have a dramatic impact on the average age of the investment that should  
23 be reflected in the depreciation study in order to be consistent.

24

1 Q. WHAT AGE DID THE COMPANY RELY UPON IN PERFORMING ITS  
2 STUDY?

3 A. As set forth only in the Company's electronic workpapers provided during discovery,  
4 the Company relied on a 19.5 year average age as of December 31, 2007 for this  
5 account. This value can be duplicated by multiplying the original cost set forth on  
6 Exhibit No. \_\_ (EMR-2) pages 7-49 and 7-50 beginning with 0.5 year of age  
7 corresponding to 2007 and increasing the age by one year as values move back in  
8 time to 1951, and dividing the sum of the weighted dollars by the total original cost.  
9 When the same calculation is performed on the values on page 9-39, which reflects  
10 the substantial new additions in 2008 and 2009, the average age drops to 8 years. The  
11 age for this account that Mr. Robinson used in one portion of his study is 2.4 times  
12 the age of the investment relied on in a different portion of his study.

13

14 Q. WHAT DIFFERENCE DOES THE AVERAGE AGE HAVE IN THE  
15 CALCULATION PRESENTED BY THE COMPANY?

16 A. The Company's calculation of age was used to establish the 48-year average age for  
17 the Projected Year of Retirement on Table 2 – a, set forth at page 2-131 of the  
18 Company's depreciation study. The 48-year value was calculated by adding the age  
19 of 19.5 years to the remaining life for this unit of 28.5 years. This 48-year average  
20 age was divided by the 40-year average service life reflected in the Company's  
21 proposed 40-R0.5 life-curve combination in its interim retirement approach. That  
22 calculation yields a value of 120% of the average service life as set forth on Table 2 –  
23 a, page 2-131 of the Company's study. The Company then identified a 62% value for  
24 the level of plant retired on an interim basis from standard Iowa Survivor tables for a  
25 40R0.5 at 48 years of age. This 62% value is critical as it represents the Company's

1 assumed level of interim retirements and was applied to the negative 20% net salvage  
2 value estimated on an overall basis for the account. Multiplying 62% times the  
3 proposed negative 20% net salvage yields the Company's proposed interim retirement  
4 net salvage level of negative 12.4%. Also set forth on page 2-131 of the Company's  
5 study, the Company relied on the negative 12.4% interim net salvage proposal for  
6 calculating the ultimate depreciation rate it proposed.

7  
8 **Q. WOULD THE SIGNIFICANT CHANGE IN THE AGE PROPOSED BY MR.**  
9 **ROBINSON EFFECT THE PROPOSED LEVEL OF INTERIM**  
10 **RETIREMENTS?**

11 A. Absolutely. Reducing the 19.5-year age to 8 years of age relied upon and proposed  
12 by the Company through the end of 2009 results in a 36.5-year average age for the  
13 investment in this account at the Projected Year of Retirement versus the 48-year  
14 value relied upon by Mr. Robinson. Performing the same calculations as the  
15 Company did in its study results in a 91% percent of average service life value  
16 compared to the Company's 120% value. The final percentage retirements  
17 corresponding to the level of interim retirements that should have been utilized drops  
18 to 42% compared to the Company's proposed 62%, or a full 20 percentage point  
19 reduction.

20  
21 Even assuming the Company's proposed overall negative 20% net salvage for this  
22 account was appropriate, which it is not, the resulting negative net salvage applicable  
23 to interim retirements would have declined to a negative 8.4% compared to the  
24 Company's proposed 12.4%. In other words, the Company's proposed value is  
25 approximately 50% higher than it should have been had the Company calculated its

1 interim net salvage process on a consistent basis. This single change for this single  
2 account reduces the Company's claimed depreciation expense by \$929,000. The  
3 Company has performed this calculation on over 150 entries corresponding to  
4 different accounts by generating units. While there is no impact in those instances  
5 where the Company did not project additions or retirements for a given account for a  
6 generating unit, the Company has proposed additions and retirements for the vast  
7 majority of the 150 plus entries.

8  
9 **Q. HAVE YOU CORRECTED EACH OF THE COMPANY'S ERRORS?**

10 A. By relying upon my recommended approach to calculating and quantifying interim  
11 retirements, I have effectively corrected the Company's errors due to inconsistent  
12 recognition of plant additions and retirements. I have not recalculated the impact of  
13 the Company's errors relying on its inappropriate approach to interim retirements.

14  
15 **F. TERMINAL NET SALVAGE**

16  
17 **Q. WHAT ISSUE DO YOU ADDRESS IN THIS PORTION OF YOUR**  
18 **TESTIMONY?**

19 A. This portion of my testimony will address the Company's dismantlement study for its  
20 various generating facilities.

21  
22 **Q. HAVE YOU REVIEWED THE COMPANY'S DISMANTLEMENT STUDY?**

23 A. Yes. I have reviewed the study, as well as the information provided by the Company  
24 in support of such study.

1 **Q. DOES THE COMPANY'S PRESENTATION JUSTIFY ITS REQUEST?**

2 A. No. There are two separate levels from which to review the Company's request. The  
3 first level of review relates to how the Company's request compares to the various  
4 options available to the Company associated with final retirement of the generating  
5 facilities under utility regulation. The second level of review for the Company's  
6 presentation occurs once the option associated with the final retirement from utility  
7 operation is selected. This review addresses the quantification of the cost of removal  
8 within the retirement process selected.

9

10 **Q. WHAT OPTIONS ASSOCIATED WITH THE RETIREMENT OF A**  
11 **GENERATING FACILITY ARE AVAILABLE TO A UTILITY?**

12 A. The range of options available to a utility range from total dismantlement and site  
13 restoration to the sale of the facility. The cost to the utility and thus the cost to the  
14 customers vary dramatically depending on the option selected. For example, if any  
15 form of sale of the facility occurs, substantial levels of gross salvage can be expected  
16 to be obtained and positive net salvage is a realistic result. Positive net salvage means  
17 that the Company needs to recover less than 100% of its costs through depreciation,  
18 as the balance of the cost is obtained through sale proceeds. On the other end of the  
19 spectrum is the full dismantlement and site restoration approach. This approach  
20 normally results in cost of removal exceeding gross salvage, and thus an overall  
21 negative net salvage is required.

22

23 Basically, the options available to the Company range from the worst case scenario of  
24 total dismantlement and site restoration, to the best case scenario corresponding to the  
25 sale of the facility at an amount significantly above net book value. Since ratemaking

1 is an attempt to charge expected average costs, some weighting of future probabilities  
2 associated with each potential option should be recognized.

3  
4 **Q. HAS THE COMPANY RECOGNIZED ANY WEIGHTING OF DIFFERENT**  
5 **OPTIONS ASSOCIATED WITH THE RETIREMENT COSTS FOR ITS**  
6 **GENERATING FACILITIES?**

7 A. No. The Company has assumed a 100% probability of the worst case scenario, that  
8 being full demolition and site restoration. This assumption by the Company is  
9 unreasonable and inappropriate for ratemaking purposes.

10  
11 **Q. ARE YOU AWARE OF GENERATING FACILITIES THAT HAVE BEEN**  
12 **SOLD RATHER THAN DEMOLISHED AT THE TIME THEY WERE**  
13 **RETIRED FROM UTILITY OPERATIONS?**

14 A. Yes. Approximately 1,000 generating units have sold in the United States since the  
15 late 1990s. The vast majority of such sales are associated with areas that became  
16 deregulated for electric generation purposes. In those instances even very old, small,  
17 and inefficient generating facilities sold at prices substantially above net book value.

18  
19 **Q. IS PEF SUBJECT TO ELECTRIC DEREGULATION?**

20 A. No, not at this time. However, the possibility always exists that the situation could  
21 occur in the future.

22  
23 **Q. ABSENT DEREGULATION, DO ELECTRIC UTILITIES EVER SELL**  
24 **GENERATING FACILITIES?**

1 A. Yes. While such situations are far less frequent, there have been sales of generating  
2 facilities that were still in operation at price levels above net book value. Thus, the  
3 Company's total exclusion of any possible approach to cost recovery other than  
4 assuming full facility dismantlement and site restoration is unreasonable and results  
5 in excessive costs to customers.

6

7 **Q. DID THE COMPANY PROPOSE ANY LESSER COST FORM OF**  
8 **DISMANTLEMENT?**

9 A. No. Even though the Company is not legally required to dismantle and restore the  
10 site to a greenfield condition, it has elected to charge customers for that scenario.

11

12 **Q. IS THIS APPROACH REASONABLE?**

13 A. No. First, generating sites and facilities are valuable resources. The plant normally  
14 will have access to water, adequate zoning for industrial usage, if applicable, and  
15 most important, access to transmission corridors necessary to connect to the  
16 transmission grid. In fact, the Company has used many of its existing generating plant  
17 sites for new generation. The need to charge customers for returning such sites to a  
18 greenfield status is unrealistic and quite excessive.

19

20 **Q. HOW WOULD YOU CHARACTERIZE THE COMPANY'S REQUEST AS IT**  
21 **PERTAINS TO THE FIRST LEVEL OF REVIEW YOU HAVE ADDRESSED?**

22 A. The Company's demolition approach must be categorized as a worst case scenario.  
23 Charges to customers should not be set on presentations associated with worst case  
24 scenario revenue requirements, especially when other less expensive options are more  
25 realistic.

1 **Q. PLEASE DISCUSS THE SECOND LEVEL OF REVIEW ASSOCIATED**  
2 **WITH DEMOLITION COST ESTIMATES.**

3 A. The second level of review comes into play after the approach to generation  
4 retirement has been established. As previously noted, the Company has proposed a  
5 worst case site demolition and greenfielding of the location. Once this decision is  
6 made, the second level of review addresses how such activities are to be performed.

7  
8 **Q. WHAT APPROACH HAS THE COMPANY PROPOSED?**

9 A. The Company's approach is in effect what the industry identifies as "reverse  
10 construction." The Company's approach assumes that it will take down the  
11 generating facility piece by piece, and then break up foundations and remove  
12 underground piping.

13  
14 **Q. WHY IS THIS SIGNIFICANT?**

15 A. The approach proposed by the Company is again the worst case scenario for the  
16 dismantlement option. A good example to depict what is at issue is the  
17 dismantlement of a tall smoke stack at a power plant. In a recent case in Oklahoma,  
18 the demolition cost estimator projected a cost of \$2 million to demolish a 600 foot tall  
19 smoke stack. The estimate was predicated on a process that began at the top of the  
20 smoke stack and knocked off sections of the smoke stack, tumbling the debris into the  
21 stack. This process was to continue from the 600 foot elevation down to the base.  
22 Once the rubble had been accumulated in a large cone at the bottom of the base, the  
23 utility would remove it and dispose of it. This approach is very costly in comparison  
24 to the available alternative of demolition, which involves exploding the smoke stack  
25 base and allowing the stack to topple and break apart along a predefined "fall line".

1 Once the stack has been broken apart by gravity as it falls and smashes to the ground,  
2 the rubble can be gathered and disposed of more easily and more cheaply.

3  
4 **Q. ARE YOU AWARE OF SIGNIFICANT COST DIFFERENCES IN THE TWO**  
5 **DIFFERENT TYPES OF APPROACHES?**

6 A. Yes. In another recent case in Nevada, another major engineering estimator projected  
7 the cost of performing a reverse construction approach for generating facilities.  
8 Shortly thereafter, Nevada Power Company actually entered into a contract with a  
9 demolition firm to demolish the plant. The contractor employed explosive demolition  
10 and controlled toppling of the facilities rather than the reverse construction approach.  
11 The cost differential between the engineering firm's cost estimate based on a reverse  
12 construction approach and the actual demolition based on explosive charges and  
13 toppling the facility to the ground was about 30 cents on the dollar. In other words,  
14 the estimate for reverse construction approach was approximately 3 times greater than  
15 the cost that the utility incurred to employ the explosive demolition method.

16  
17 **Q. TURNING TO THE COMPANY'S COST ESTIMATES, CAN YOU PROVIDE**  
18 **A BRIEF OVERVIEW OF THE CRITICAL COMPONENTS OF A**  
19 **DEMOLITION STUDY?**

20 A. Yes. To make a "reverse construction" demolition cost estimate, it is necessary to  
21 have three key items of information. Those three key items are (1) the quantity of  
22 material to be removed by type of materials (2) the labor rates and corresponding  
23 crew sizes and mix (i.e., how many laborers, welders, supervisors, etc.), and (3) the  
24 productivity factors or the rate at which the labor crew can perform activities.

25

1 Q. **HAVE YOU REVIEWED NUMEROUS DEMOLITION COST ESTIMATES?**

2 A. Yes.

3  
4 Q. **WHAT IS THE GENERAL PROBLEM YOU FIND WITH SUCH**  
5 **ESTIMATES?**

6 A. Of the three main categories of variables, the quantity of material to be removed is  
7 generally not a major issue. However, the labor costs and productivity factors are  
8 normally major issues. In addition, such studies normally include excessive levels of  
9 indirect costs and contingency factors.

10

11 Q. **IN THIS CASE WAS THE COMPANY ABLE TO PROVIDE THE**  
12 **UNDERLYING PRODUCTIVITY FACTORS?**

13 A. No. The Company hired Burns & McDonnell ("BM") as its new cost estimating firm  
14 for this case. The Company then had BM rely on the crew mix, man-hours and  
15 associated productivity factors that were developed by a different cost estimating firm  
16 that performed a prior demolition cost estimate study as a starting point for this case.  
17 (See OPC's Fifth Interrogatories No. 204). Thus, the Company does not have an  
18 adequate underlying basis for the productivity factors that it employs in its demolition  
19 cost estimates.

20

21 Q. **HAS THE COMPANY ALSO INCLUDED A CONTINGENCY FACTOR ON**  
22 **TOP OF WHAT APPEARS TO BE A HIGH SIDE COST ESTIMATE FOR**  
23 **DEMOLISHING POWER PLANTS?**

24 A. Yes. The Company states that a 20% "contingency was included because they "are  
25 expected to be expended." (See Exhibit No. (EMR-2) page 4-3).

1 Q. IS THE COMPANY'S USE OF A 20% CONTINGENCY FACTOR  
2 REASONABLE AND NECESSARY?

3 A. No. The 20% contingency factor is excessive given the dismantlement approach  
4 proposed. In other words, if an estimate is based on a low side cost estimates --one  
5 that assumes very efficient operation, no weather related delays, etc. -- then a positive  
6 contingency might be warranted. However, if the cost estimate is based on a "reverse  
7 construction" approach then a *negative* contingency may be warranted.

8  
9 Q. WHAT TYPE OF APPROACH HAS THE COMPANY PROPOSED?

10 A. As previously noted, the Company has proposed a very high side cost estimate. This  
11 is precisely the type of situation that I referenced earlier when discussing the situation  
12 in Nevada. The cost to pre-cut members, beams, piping etc., high above the ground  
13 and carefully lowering them, rather than blowing the support beams and toppling the  
14 facility, produces an excessively high cost estimate. Therefore, to the extent any  
15 contingency should be considered in this case, it should be a negative contingency. In  
16 fact, under the right circumstances demolition contractors will actually pay a positive  
17 value for the right to demolish a power plant.

18  
19 Q. ARE YOU SAYING THAT IT IS POSSIBLE THAT, EVEN WITHOUT  
20 SELLING THE GENERATING FACILITIES AS ONGOING OPERATING  
21 STATIONS, THE COMPANY COULD POSSIBLY OBTAIN POSITIVE  
22 SALVAGE?

23 A. Yes. In fact, recently the Fort Pierce Florida Utilities Authority employed a  
24 contractor to demolish the King generating plant. The demolition contractor actually

1 paid Fort Pierce approximately \$1 million for the right to demolish the plant and sell  
2 the resulting scrap.

3  
4 **Q. CAN SUCH SITUATIONS REASONABLY BE ANTICIPATED TO OCCUR**  
5 **IN ALL INSTANCES?**

6 A. No, not necessarily. At the time of the Fort Pierce transaction, scrap metal prices had  
7 reached their all time high. Since that time, prices have fallen noticeably. However,  
8 it is reasonable to expect that the economies of China and India will again begin to  
9 grow at substantial rates. At that time the scrap metal market will experience higher  
10 prices. The key point to be taken from this is that the theory that the Company  
11 operates under is neither accurate nor economically efficient. Customers should not  
12 be subject to worst case scenarios and inappropriate procedures, approaches and cost  
13 estimates.

14  
15 **Q. IS THERE ANOTHER PROBLEM WITH THE COMPANY'S DEMOLITION**  
16 **STUDIES?**

17 A. Yes. The Company has made an error in its calculation of labor costs.

18  
19 **Q. WHAT IS THE ERROR?**

20 A. The Company claims that for "the study an average of these two wage rates was  
21 utilized." The two wage rates referenced are local union wage rates and the pay  
22 scales listed in the 2008 RS Means Heavy Construction Cost Data, 22<sup>nd</sup> Annual  
23 Edition. (See OPC's Fifth Interrogatories No. 189).

24  
25 **Q. IS THE COMPANY'S STATEMENT ACCURATE?**

1 A. No. A review of the fully loaded labor rates demonstrates that rather than using the  
2 average of union and RS Means pay scales, the Company's study actually relies on  
3 only the higher union labor rates.

4  
5 This error can be seen by review of the Iron Worker labor rate of \$67.98 per hour  
6 employed by the Company. (See OPC's Fifth Interrogatories No. 200, Attachment at  
7 bate stamp 3). This fully loaded labor rate starts with the union only labor rate for an  
8 iron worker of \$37.58. (See OPC's Fifth Interrogatories No. 200, Attachment bate  
9 stamp page 1 for iron worker at the Anclote plant). The calculation ignores a \$33.96  
10 hourly rate for the same iron worker as reported in the RS Means publication.  
11 Increasing the \$37.58 base labor rate by the 30% contractor burden, an additional  
12 10% to cover overtime, and finally by the 26.499% proposed additional "mark up"  
13 precisely yields the previously referenced \$67.98 labor rate. (See OPC's Fifth  
14 Interrogatories No. 200, the attachment identified as "PROGRESS FLORIDA mark  
15 up.pdf at bate stamp 8). In other words, the Company has overstated labor costs for  
16 this category of workers by a minimum of over 5% prior to the impact of the  
17 Company's additional 10% mark up for indirect costs and the 20% mark up for  
18 contingencies. The value is initially overstated by 11% when comparing union versus  
19 non union base labor rates.

20

21 **Q. GIVEN THE VARIOUS PROBLEMS YOU HAVE IDENTIFIED, WHAT DO**  
22 **YOU RECOMMEND?**

23 A. Given the significant level of adjustments that I recommend elsewhere in the area of  
24 depreciation, I have elected not to propose an additional adjustment to the Company's  
25 requested level of demolition cost revenue requirements. However, I do recommend

1 that the Commission order the Company to perform detailed and well documented  
2 analyses of the different approaches and probabilities of end of life termination for  
3 generating facilities. I further recommend that the Commission also order the  
4 Company to develop and fully justify the most cost efficient manner for any actual  
5 demolition cost approach that it determines to be appropriate. This study, with all  
6 analyses, work papers, etc., should be provided to the Commission no later than the  
7 Company's next depreciation or rate proceeding. However, if the Commission finds  
8 that it is appropriate to modify or adjust the Company's request in this proceeding, I  
9 would recommend that it reduce the Company's requested costs by 60%.

10  
11 **Q. WHAT IS YOUR BASIS FOR A 60% REDUCTION?**

12 A. The 60% reduction is based on the approximate relationship experienced by Nevada  
13 Power Company between the reverse construction cost estimate approach to  
14 demolishing power plants and what an actual demolition contractor charged to tear  
15 down the facilities. The actual differential was greater than 60%, so the 60% estimate  
16 is conservative. Moreover, when one recognizes the likelihood of reusing generating  
17 sites for future generation, and the fact that substantial costs are included in the  
18 Company's estimate for site restoration, a reduction of only 60% of the Company's  
19 cost estimate would be conservative in favor of the Company.

20  
21 **SECTION V: MASS PROPERTY LIFE ANALYSES**

22  
23 **A. INTRODUCTION**  
24

1 Q. WHAT IS THE PURPOSE OF THE LIFE PORTION OF A DEPRECIATION  
2 ANALYSIS?

3 A. The purpose of a life analysis is to determine the "average service life" or ASL, the  
4 dispersion pattern and remaining life for each account or subaccount. This  
5 information is necessary to properly perform the depreciation calculation. A longer  
6 ASL results in a longer remaining life and therefore a lower depreciation expense.  
7 Alternatively, a shorter ASL will reduce the remaining life and increase depreciation  
8 expense. The dispersion pattern is important, as it is critical in the overall selection  
9 process of the best fitting results. The same ASL with different Iowa Survivor curves  
10 also results in different remaining lives, due to the remaining expected pattern of  
11 retirements.

12  
13 Q. WHAT ARE THE MAIN TOOLS UTILIZED IN PERFORMING LIFE  
14 ANALYSIS?

15 A. Life analysis is normally performed through the use of actuarial or semi-actuarial  
16 analyses. Actuarial analyses rely on aged data. In other words, when an item of  
17 property is retired, the age at retirement is known. This is the type of analysis  
18 performed by insurance companies when developing life tables in order to establish  
19 premiums. Semi-actuarial analyses are performed in instances in which the age of  
20 retired plant is not known.

21  
22 Q. PLEASE PROVIDE MORE INFORMATION REGARDING HOW A  
23 DEPRECIATION ANALYST PERFORMS A LIFE ANALYSIS THAT  
24 RELIES ON AN ACTUARIAL APPROACH.

1 A. Aged data is gathered and analyzed. Aged data means that when an asset retires in  
2 2007 we know that it originally went in service in 1967, and was 40 years old at the  
3 time of retirement. When all the aged data in a group is statistically analyzed by  
4 actuarial techniques, a resulting Observed Life Table or OLT is developed that  
5 depicts the rate of retirement over the life of the group. The OLT starts at 100%  
6 surviving and declines from there as each year of age is obtained and retirements  
7 occur. Naturally, not all units retire at once; instead, the retirement dates are  
8 dispersed through time, creating a "dispersion pattern." In order to permit testing of  
9 the results some standard or index must be used. The principal tool that a  
10 depreciation analyst uses for this aspect of the study is a set of "survivor curves."  
11 The industry standard and most extensively used curves are called the Iowa Survivor  
12 Curves. The name is derived from the fact that they were developed at Iowa State  
13 College in the 1930s.

14  
15 Most often, and as is the case for many of PEF accounts, the data analyzed does not  
16 yield a complete OLT, one that fully declines to 0% surviving. This means that the  
17 data set will produce an incomplete OLT or a "stub curve." Also, the limited data  
18 base may include atypical or abnormal events not reasonably anticipated to occur  
19 again or at the same magnitude during the remaining life.

20 The Iowa Survivor Curves are based on empirical studies of retirement "behavior" of  
21 physical property. They are designed to predict the retirement patterns of the  
22 property under study based on detailed past observations. The Iowa Survivor Curves  
23 make the calculation of the average service life far more manageable and comparable;  
24 instead of making and weighting a myriad of individual calculations that include each  
25 data point in the universe, the analyst measures the area below the curve and uses an

1 established equation or standard curve to “solve” for the average service life. And,  
2 even if the data set is incomplete—which is often the case —by properly choosing a  
3 closely fitting curve to the known data, the analyst can better predict the behavior of  
4 the entire universe and calculate the average service life with reasonable statistical  
5 accuracy, if a meaningful “stub curve” exists. The result of any estimation is more  
6 reliable if 70% of an OLT is known and only 30% must be assumed, than if only 10%  
7 of the OLT is known and 90% must be assumed.

8  
9 Not surprisingly, choosing the survivor curve that provides the best fit to the data is  
10 critical to the accuracy of the analysis. When fitting the curves to the OLT the  
11 analyst must bear in mind that some data points—those that occur on the points of the  
12 graph that reflect the most significant level of plant exposed to retirement events-- are  
13 more important to the determination of the ASL and dispersion pattern than others.  
14 Further, the analyst cannot use the curves in isolation of other considerations. The  
15 analyst must incorporate such things as knowledge of the nature of the property being  
16 studied, an understanding of the causes of unusual events, recognition of changes or  
17 trends, and judgment when using the curves. Also, the nature of survivor curves  
18 limits their usefulness. For instance, they are best suited to studies of homogeneous  
19 items that, because of their physical similarity and common exposure to retirement  
20 forces, can be expected to share common retirement characteristics. (By analogy:  
21 When an insurance actuary performs a mortality/longevity study for life insurance  
22 purposes, the actuary does not combine people and horses in the universe of data). It  
23 is for that reason that I criticized PEF’s analyst for inappropriately applying the Iowa  
24 Survivor Curves to interim retirements for generation plant. The items of generation  
25 plant involved in interim retirements frequently are far from homogeneous.

1 **Q. HAVE YOU REVIEWED THE COMPANY'S LIFE ANALYSES?**

2 A. Yes, I have reviewed the Company's life analyses. The main problem with the  
3 analyses is that for two accounts Mr. Robinson proposes ASLs with corresponding  
4 Iowa Survivor curves that are significantly out of line with realistic expectations and  
5 fail to properly evaluate factors that directly impact the OLT. Mr. Robinson's  
6 selections for these two accounts reflect a bias toward artificially short ASLs. Mr.  
7 Robinson fails to provide support for his questionable practice.

8  
9 **Q. BASED ON YOUR REVIEW OF THE COMPANY'S LIFE ANALYSES, ARE**  
10 **YOU RECOMMENDING ADJUSTMENTS?**

11 A. Yes. I recommend adjustments to 2 accounts. The two accounts are 364 –  
12 Distribution Poles and Fixtures and 368 – Distribution Line Transformers.

13  
14 The combined impact of the two adjustments I recommend result in a standalone  
15 impact of a \$13,977,196 reduction to annual depreciation expense, based on plant as  
16 of December 31, 2009.

17  
18 **Q. WHAT IS THE RESULT OR OUTPUT OF AN ACTUARIAL ANALYSIS?**

19 A. The output of an actuarial analysis is called an observed life table or OLT. This OLT  
20 output includes a graphical depiction of the remaining surviving level at each  
21 progressive age of the plant. In other words, all plant additions start at "100%  
22 surviving" when first placed into service. As plant ages and items of plant begin to  
23 retire, the initial 100% survivor level decreases until it reaches zero, if it has  
24 completed a full life cycle.

25

1 Q. DO MOST OF THE COMPANY'S OBSERVED LIFE TABLES REFLECT A  
2 COMPLETE LIFE CYCLE?

3 A. No. Many of the OLTs decline to 20% or 30% surviving, while others decline to  
4 only 40%, 50%, or higher values.

5  
6 Q. HOW ARE THE ULTIMATE LIFE-CURVE SELECTIONS MADE?

7 A. The best fitting life-curve selections are made by visually matching the OLT to  
8 standardized Iowa Survivor Curves.

9  
10 Q. IN THE VISUAL MATCH PROCESS, ARE ALL POINTS OF COMPARISON  
11 EQUAL?

12 A. No. Many of the points of comparison for an OLT may reflect dollar levels of  
13 exposures that differ by *a factor of 10,000 or more.*

14 Q. IN THE CURVE FITTING PROCESS, IS IT MORE IMPORTANT TO  
15 MATCH THE POINTS ON THE OLT THAT REFLECT LARGER DOLLAR  
16 LEVELS OF EXPOSURES THAN THOSE POINTS WHERE THE DOLLAR  
17 LEVEL IS MUCH LOWER?

18 A. Yes. It would be foolish to accept the results of a standardized life-curve that better  
19 fits the results of the end or "tail" of the OLT rather than a life-curve combination that  
20 is a better fit near the "head" or top of the OLT. While it is desirable to have close  
21 fitting results all along the OLT, this unfortunately does not occur for many accounts.  
22 Therefore, recognition of the dollar level of exposures at different points of the OLT  
23 is critical.

24

1 This is significant, since as each additional year of plant activity transpires the OLT  
2 can and usually does change. However, the future changes will not occur equally to  
3 all portions of the OLT. In fact, it is highly unlikely, given the level of exposures  
4 near the "head" or top of the OLT, that the few years between depreciation studies  
5 would result in any appreciable movement of that portion of the OLT. The same  
6 cannot be said of the "tail" portion of the OLT, and potentially even the mid portion  
7 of the curve. If larger retirements transpire in older age intervals, or more dollars of  
8 exposures filter further down in the OLT without corresponding retirements, the mid  
9 portion or tail of the OLT can move significantly based on only a few years of  
10 additional data. That is precisely why matching the "head" of the observed life table  
11 is more important than matching the "tail."

12  
13 **Q. DID MR. ROBINSON FOLLOW THIS PRACTICE IN HIS CURVE FITTING**  
14 **PROCESS?**

15 A. No, not to the extent he should have. As will be discussed in the Account Specific  
16 portion of my testimony, Mr. Robinson did not perform appropriate curve fitting  
17 practices in conjunction with evaluation of projected levels of retirement recognized  
18 elsewhere in his depreciation study. As a result, he understated the appropriate ASL  
19 or chose an Iowa Survivor curve that is not the best fit to the OLT.

20  
21 **B. ACCOUNT SPECIFIC**

22  
23 **Q. WHAT DOES THE COMPANY PROPOSE FOR ACCOUNT 364 -**  
24 **DISTRIBUTION POLES, TOWERS AND FIXTURES?**

1 A. The Company proposes a 29-year ASL with a corresponding R4 Iowa Survivor curve.  
2 This proposal represents a 1-year change from the Company's last depreciation study  
3 and a modification from an L4 to a R4 Iowa Survivor curve. The existing ASL is a  
4 result of a settlement in the last case.

5

6 **Q. WHAT IS THE COMPANY'S BASIS FOR ITS PROPOSAL?**

7 A. From a narrative standpoint, the Company is silent as to the basis for its proposal.  
8 The Company performed actuarial analyses and presented the full band results, 1957  
9 through 2007. (See Exhibit No. \_\_\_ (EMR-2) page 5-92). Therefore, the Company's  
10 basis can only be characterized as Mr. Robinson's interpretation of the full band  
11 actuarial analysis.

12

13 **Q. DO YOU AGREE WITH THE COMPANY'S PROPOSAL?**

14 A. No. The Company's proposal reflects an ASL significantly shorter than any ASL Mr.  
15 Robinson has presented for investment in this account during the past 10 years. The  
16 shortest ASL Mr. Robinson has proposed during the past 10 years is 35 years, while  
17 the average of his proposals was 42 years. (See OPC's Fifth Interrogatories No. 192,  
18 Attachment). The obviously short ASL on its face should have caused Mr. Robinson  
19 to further investigate or explain in detail why such an artificially short life is  
20 reasonable for the Company. As previously noted, no such explanation or analysis  
21 has been provided. I recommend a 35-year ASL with a corresponding R3 Iowa  
22 Survivor curve.

23

24 **Q. WHAT IS THE BASIS FOR YOUR RECOMMENDATION?**

1 A. First, my recommendation corresponds to the shortest ASL Mr. Robinson has  
2 proposed for any other electric utility during the past 10 years and is still 7 years  
3 below the average ASL Mr. Robinson proposed during that period. The 35-year ASL  
4 recommendation is also equivalent to what Mr. Robinson proposed for Progress  
5 Energy Carolina, a sister company.

6  
7 Unlike Mr. Robinson, I investigated further into the base data in an effort to identify  
8 the underlying cause for such a short ASL. The underlying cause indication can be  
9 identified on Exhibit No. (EMR-2) at page 5-92. There the values for age interval  
10 24.5 to 25.5 years and the following two subsequent years drive the observed life  
11 table appreciably downward at a steep rate of decline. These particular data points  
12 appear to be the driving factor to which Mr. Robinson reacted in order to propose his  
13 artificially short ASL.

14  
15 **Q. DOES THE MAGNITUDE OF THE RETIREMENTS IN RELATIONSHIP TO**  
16 **THE EXPOSURES FOR THESE THREE AGE INTERVALS APPEAR**  
17 **REASONABLE?**

18 A. No. For example, the average retirement ratio (the ratio of dollars retired in an age  
19 interval divided by the dollars exposed to retirement at the beginning of the age  
20 interval) for the three years in question is 0.12226. The equivalent ratio for the prior  
21 three age intervals is only 0.02115. Thus, the retirement ratio during the unusual  
22 period is six times the average retirement ratio experienced during the three age  
23 intervals immediately prior to that period. Indeed, the period in question is also four  
24 times the level of the retirement ratio for the three age intervals immediately  
25 following the period in question. Moreover, one age interval, 24.5 to 25.5 years of

1 age, reflects a dollar level of retirements that is approximately two to eight times the  
2 dollar level of retirement activity in the 3-year brackets proceeding or following that  
3 particular age interval. This single unusual year of activity caused over a 14% drop in  
4 the observed life table.

5  
6 **Q. IS THIS PARTICULAR YEAR SIGNIFICANT?**

7 A. Yes. Given the manner in which observed life tables are calculated, dollar retirement  
8 levels of such magnitude can have an artificial impact for a period of time. However,  
9 if the underlying events are more atypical than normal, the impact of such event over  
10 time will diminish. For example, in the Company's last depreciation study the same  
11 significant level of retirement activity that occurred during the 24.5 to 25.5 year age  
12 interval yielded a 0.21646 retirement ratio. (See Docket No. 050078-EI 2005  
13 Depreciation Study at page 5-75). The impact of this single age interval declined by  
14 approximately 1/3<sup>rd</sup> since the last depreciation study (0.21646 versus 0.14496). This  
15 decline since the last study is due to more dollars being exposed to retirements during  
16 the age interval. In the last case, the unusually high dollar level of retirement activity  
17 for the 24.5 to 25.5 age interval was associated with \$64 million of exposures. In this  
18 case, because four more years of exposures have passed through this age interval, the  
19 level increased to \$97 million. In other words, because the actual retirements during  
20 the last 4 years for this age interval increased only by 1%, yet the dollar level of  
21 exposures in the last 4 years increased by 51%, the resulting retirement ratio declined  
22 dramatically.

23  
24 Exhibit \_\_ (JP-6) sets forth the observed life table for this account for both the current  
25 and prior depreciation studies. As can be seen, there is relatively little movement

1 between the two studies at early ages, but the difference becomes more pronounced  
2 once an age of approximately 20 years is reached. The unusual activity that occurred  
3 during the 24.5 to 25.5 year and the two subsequent age intervals are not repeated as 4  
4 additional years of history experienced. The middle portion of the observed life table  
5 moves upward over time to reflect this reality. Mr. Robinson failed to recognize the  
6 unusual nature of this portion of the observed life table and the dynamic upward  
7 movement in the shape of the observed life table over time as the impact of some  
8 prior unusual events diminishes.

9  
10 **Q. DO YOU EXPECT THE OBSERVED LIFE TABLE TO CONTINUE TO**  
11 **MOVE UPWARD BY THE TIME OF THE NEXT DEPRECIATION STUDY?**

12 A. Yes. For example, the Company projected retirement activity for this account  
13 through 2009 of approximately \$5 million, or \$2.5 million per year. (See Exhibit  
14 No. (EMR-2) pages 2-44 and 2-51). The Company has not projected any retirement  
15 activity corresponding to the age intervals of concern. Assuming this pattern  
16 continues for the years 2010 and 2011, the dollar level of exposures corresponding to  
17 the 24.5 to 25.5 age interval can be estimated to increase to approximately \$150  
18 million. A \$150 million level of exposures corresponds to an approximate 50%  
19 increase in exposures ( $\$150/\$97$ ). If no additional retirements occur for this age  
20 interval during 2010 and 2011, the new retirement ratio would drop to approximately  
21 0.093, which represents another 35% reduction by the time of the next depreciation  
22 study. This new reduction in the retirement ratio would again have the affect of  
23 raising the middle portion of the survivor curve indicating a longer ASL than the 29-  
24 year level proposed by Mr. Robinson.

25

1 Q. **HAVE YOU ANALYSED THE COMPANY'S PROPOSED OBSERVED LIFE**  
2 **TABLE?**

3 A. Yes. Exhibit \_\_ (JP-7) sets forth my comparative analysis. As can be seen, the  
4 Company's proposal versus my recommended 35R3 life-curve combination are  
5 approximately equal matches through the first 21 years of age. However, my  
6 recommendation is a better fit to the actual data through approximately 25 years of  
7 age. At that point, the observed life table is impacted by the major retirements that  
8 occurred during the 24.5 to 25.5 age interval as previously discussed. While  
9 subsequent to that age the Company's proposal is a better match than my  
10 recommendation, that is precisely the portion of the curve that will change to the  
11 greatest extent by the next depreciation study. As previously noted we are already 2  
12 years into the 4 year period between depreciation studies. The Company's  
13 presentation for those 2 years 2008 and 2009, do not continue the unusual retirement  
14 activity reflected in the 24.5 to 25.5 age interval. The survivor curve that I currently  
15 recommend will be a much better fit to the observed life table in the next proceeding  
16 as the impact of the unusual historical event is diminished due to substantial more  
17 exposures. Therefore, from a knowledge based life-curve combination matching  
18 process, my recommendation is superior to the artificially short ASL proposal by Mr.  
19 Robinson. Moreover, unlike Mr. Robinson's proposal, my recommendation reflects  
20 proper evaluation of historical data in order to make appropriate estimates of future  
21 expectations.

22

23 Q. **ARE THERE OTHER CONSIDERATIONS WHY A LONGER ASL IS**  
24 **WARRANTED AT THIS TIME?**

1 A. Yes. Recall that depreciation is a projection of anticipated events in the future.  
2 Historical analyses are a starting point for future expectations. With this in mind,  
3 there are additional facts that further support increasing the ASL at this time. First,  
4 the Company notes that it has implemented a “program to inspect poles on an  
5 ongoing basis.” (See Exhibit No. \_ (EMR-2) at page 4-54). Based on this inspection  
6 program the Company has become more proactive in maximizing the life expectancy  
7 for its investment. Due to the inspection program the Company now reinforces poles,  
8 which permits poles to achieve a longer service life due to such reinforcement.  
9 Another consideration is the fact that the Company now chemically treats wood poles  
10 with preservatives. Again, the purpose of such actions is to lengthen the life  
11 expectancy of poles compared to historical time frames. These are precisely the type  
12 of considerations that a depreciation analyst should take into account when making  
13 recommendations. *Mr. Robinson failed to account for such considerations, which*  
14 *helps explain why he is proposing an artificially short ASL for this account.*  
15

16 **Q. DID FP&L EXPERIENCE THE SAME HIGH LEVELS OF RETIREMENT**  
17 **RATIOS FOR THIS ACCOUNT?**

18 A. No. I just recently reviewed FP&L’s life analyses for this account in Docket No.  
19 080677-EI). Exhibit No. \_\_ (JP-8) sets forth FP&L’s observed life table for this  
20 account. During the first 38.5 year of age FP&L did not experience a retirement ratio  
21 anywhere near what PEF experienced during the mid 20-year age intervals, the period  
22 during, which Mr. Robinson reacted as the basis for his proposal.  
23

24 **Q. PLEASE SUMMARIZE YOUR ADJUSTMENT?**

1 A. A longer ASL is warranted for this account given (1) both Mr. Robinson and the  
2 industry sponsor longer service lives for investment in this account, (2) the Company  
3 has not explained why it significantly deviates from industry expectations, including  
4 those of its sister utility, (3) Mr. Robinson failed to investigate unusual historical  
5 retirement activity which significantly impacts the shape of the observed life table,  
6 (4) Mr. Robinson failed to recognize the limited level of retirement activity he has  
7 projected elsewhere in the depreciation study for 2008 and 2009 that would force the  
8 observed life table to move upward from what he relied upon and (5) Mr. Robinson  
9 failed to take into account the new inspection program and the Company's practice of  
10 chemically treating poles with preservatives in order to lengthen the life expectancy  
11 compared to prior periods. Therefore, the Commission should adopt my 35-year R3  
12 life-curve combination as a conservative estimate of the life characteristics for this  
13 account. The Commission should further order the Company to fully investigate and  
14 substantiate whether the unusual historical retirement activity during the mid 20 year  
15 age intervals is representative of the future, and present its results in the next  
16 depreciation study.

17 **Q. WHAT IS THE IMPACT OF YOUR RECOMMENDATION?**

18 A. The standalone impact of my recommendation results in a \$8,451,288 reduction to  
19 annual depreciation expense based on plant as of December 31, 2009.

21 **Q. WHAT DOES THE COMPANY PROPOSE FOR ACCOUNT 368 -**  
22 **DISTRIBUTION LINE TRANSFORMERS?**

23 A. The Company proposes a 27-year ASL with a corresponding R2 Iowa Survivor curve.  
24 This proposal represents a 1-year change from the Company's last depreciation study

1 and a modification from an R2.5 to a R2 Iowa Survivor curve. The existing ASL is a  
2 result of a settlement in the last case.

3  
4 **Q. WHAT IS THE COMPANY'S BASIS FOR ITS PROPOSAL?**

5 A. From a narrative standpoint, the Company is again silent as to the basis for its  
6 proposal. The Company performed actuarial analyses and presented the full band  
7 results, 1957 through 2007. (See Exhibit No. \_\_\_ (EMR-2) page 5-105). Therefore,  
8 the Company's basis can only be characterized as Mr. Robinson's interpretation of  
9 the full band actuarial analysis.

10  
11 **Q. DO YOU AGREE WITH THE COMPANY'S PROPOSAL?**

12 A. No. The Company's proposal reflects an ASL significantly shorter than any ASL Mr.  
13 Robinson has presented for investment in this account during the past 10 years. The  
14 shortest ASL Mr. Robinson has proposed during the past 10 years is 34 years, while  
15 the average of his proposal was 40 years. (See OPC's Fifth Interrogatories No. 192,  
16 Attachment). The obviously short ASL on its face should have caused Mr. Robinson  
17 to further investigate or explain in detail why such an artificially short life is  
18 reasonable for the Company. As previously noted, no such explanation or analysis  
19 has been provided. I recommend a 33-year ASL with a corresponding S0.5 Iowa  
20 Survivor curve.

21  
22 **Q. WHAT IS THE BASIS FOR YOUR RECOMMENDATION?**

23 A. First, my recommendation corresponds to basically the shortest ASL Mr. Robinson  
24 has proposed for any other electric utility during the past 10 years and is still 7 years  
25 below the average ASL Mr. Robinson proposed during that period. The 33-year ASL

1 recommendation is 2 years less than what Mr. Robinson proposed for Progress  
2 Energy Carolina, a sister company.

3  
4 Unlike Mr. Robinson, I investigated further into the base data in an effort to identify  
5 the underlying cause for such a short ASL indication. The underlying cause for such  
6 a short ASL indication can be identified on Exhibit No. \_\_ (EMR-2) at page 5-105.  
7 There the values for age intervals 26.5 to 27.5 years and the following year drive the  
8 observed life table appreciably downward at a steep rate of decline. These particular  
9 data points appear to be the driving factor to which Mr. Robinson reacted in order to  
10 propose his artificially short ASL.

11  
12 **Q. DOES THE MAGNITUDE OF THE RETIREMENTS IN RELATIONSHIP TO**  
13 **THE EXPOSURES FOR THESE TWO AGE INTERVALS APPEAR**  
14 **REASONABLE?**

15 A. No. For example, the average retirement ratio for the two years in question is  
16 0.14232. The equivalent ratio for the prior two age intervals is only 0.05608. Thus,  
17 the retirement ratio during the unusual period is 2.5 times the average retirement ratio  
18 experienced during the two age intervals immediately prior to that period. Moreover,  
19 one age interval, 26.5 to 27.5 years of age, reflects a dollar level of retirements that is  
20 approximately two to three times the dollar level of retirement activity in the 2-year  
21 brackets preceding that particular age interval. This single unusual year of activity  
22 caused over a 15% drop in the observed life table.

23  
24 **Q. IS THIS PARTICULAR YEAR SIGNIFICANT?**

1 A. Yes. Given the manner in which observed life tables are calculated, dollar retirement  
2 levels of such magnitude can have an artificial impact for a period of time. However,  
3 if the underlying events are more atypical than normal, the impact of such event over  
4 time will diminish. For example, in the Company's last depreciation study the same  
5 significant level of retirement activity that occurred during the 26.5 to 27.5 year age  
6 interval yielded a 0.19179 retirement ratio. (See Docket No. 050078-EI 2005  
7 Depreciation Study at page 5-87). The impact of this single age interval declined by  
8 approximately 25% since the last depreciation study (0.19179 versus 0.14665). This  
9 decline since the last study is due to more dollars being exposed to retirements during  
10 the age interval. In the last case, the unusually high dollar level of retirement activity  
11 for the 26.5 to 27.5 age interval was associated with \$50 million of exposures. In this  
12 case, because four more years of exposures have passed through this age interval, the  
13 level increased to \$90 million. In other words, because the actual retirements during  
14 the last 4 years for this age interval increased only by 16%, yet the dollar level of  
15 exposures in the last 4 years increased by 80%, the resulting retirement ratio declined  
16 dramatically. The unusual activity that occurred during the 26.5 to 27.5 year age  
17 interval is not repeated as 4 additional years of history was experienced. The middle  
18 portion of the observed life table moves upward over time to reflect this reality. Mr.  
19 Robinson has failed to recognize the unusual nature of this portion of the observed  
20 life table and the dynamic upward movement in the shape of the observed life table  
21 over time as the impact of some prior unusual events diminishes.

22

23 **Q. DO YOU EXPECT THE OBSERVED LIFE TABLE TO CONTINUE TO**  
24 **MOVE UPWARD BY THE TIME OF THE NEXT DEPRECIATION STUDY?**

1 A. Yes. For example, the Company projected retirement activity for this account  
2 through 2009 of approximately \$5 million, or \$2.5 million per year. (See Exhibit  
3 No. \_\_\_ (EMR-2), pages 2-44 and 2-51). The Company has not projected any  
4 retirement activity corresponding to the age intervals of concern. Assuming this  
5 pattern continues for the years 2010 and 2011, the dollar level of exposures  
6 corresponding to the 26.5 to 27.5 age interval can be estimated to increase to  
7 approximately \$140 million. A \$140 million level of exposures would correspond to  
8 an approximate 55% increase in exposures (\$140/\$90). If no additional retirements  
9 occur for this age interval during 2010 and 2011, the new retirement ratio would drop  
10 to approximately 0.0943, which represents another 35% reduction by the time of the  
11 next depreciation study. This new reduction in the retirement ratio would again have  
12 the affect of raising the middle portion of the survivor curve indicating a longer ASL  
13 than the 27-year level proposed by Mr. Robinson.

14  
15 **Q. HAVE YOU ANALYSED THE COMPANY PROPOSED OBSERVED LIFE**  
16 **TABLE?**

17 A. Yes. Exhibit \_\_\_ (JP-9) sets forth my comparative analysis. As can be seen, the  
18 Company's proposal versus my recommended 33S0.5 life-curve combination is  
19 approximately equal matches through the first 17 years of age. However, my  
20 recommendation is a better fit to the actual data from 22 through approximately 27  
21 years of age. At that point, the observed life table is impacted by the major  
22 retirements that occurred during the 26.5 to 27.5 age interval as previously discussed.  
23 While subsequent to that age the Company's proposal is a better match than my  
24 recommendation, that is the portion of the curve that will change to the greatest  
25 extent by the next depreciation study. As previously noted we are already 2 years into

1 the 4 year period between depreciation studies. The Company's presentation for  
2 those 2 years, 2008 and 2009, does not continue the unusual retirement activity  
3 reflected in the 26.5 to 27.5 age interval. The survivor curve that I currently  
4 recommend will be a much better fit to the observed life table in the next proceeding  
5 as the impact of the unusual historical event is diminished due to more exposures.

6  
7 Another consideration is the level of dollars exposed to retirement forces at each age  
8 interval. Mr. Robinson's efforts to match the observed life table at ages beginning at  
9 28.5 years is misguided. The beginning level of exposures for this account is \$636  
10 million. (See Exhibit No. \_\_ (EMR-2) page 5-105). The exposures at the 28.5 age  
11 bracket are \$56 million, or only 9% of the original level. The exposure relationship  
12 falls swiftly at older ages and is only 5% of the original level by 31.5 years of age.  
13 The minimal levels of exposures should be given little weight in the matching process  
14 since they can change significantly from year to year. Therefore, from a knowledge  
15 based life-curve combination matching process, my recommendation is superior to  
16 the artificially short ASL proposal by Mr. Robinson.

17  
18 **Q. ARE THERE OTHER CONSIDERATIONS WHY A LONGER ASL IS**  
19 **WARRANTED AT THIS TIME?**

20 A. Yes. Recall that depreciation is a projection of anticipated events in the future.  
21 Historical analyses are a starting point for future expectations. With this in mind,  
22 there is an additional fact that further supports increasing the ASL at this time. The  
23 Company notes that it has implemented an inspection program for pad mounted  
24 underground service transformers. (See Exhibit No. \_ (EMR-2) at page 4-62). Based  
25 on this inspection program the Company has become more proactive in maximizing

1 the life expectancy for its pad mounted underground service transformers. The  
2 inspection program will yield a longer life expectancy for the investment in the  
3 future. This program is significant since the majority of the investment in this  
4 account relates to underground service transformers. (See OPC's Second  
5 Interrogatories No.96, Attachment). This is precisely the type of consideration that a  
6 depreciation analyst should take into account when making recommendations. Mr.  
7 Robinson failed to account for such consideration, which helps explain why he is  
8 proposing an artificially short ASL for this account.

9  
10 **Q. PLEASE SUMMARIZE YOUR ADJUSTMENT?**

11 A. A longer ASL is warranted for this account given (1) both Mr. Robinson and the  
12 industry sponsor longer service lives for investment in this account, (2) the Company  
13 has not explained why it significantly deviates from industry expectations, including  
14 those of its sister utility, (3) Mr. Robinson failed to investigate unusual historical  
15 retirement activity which significantly impacts the shape of the observed life table,  
16 (4) Mr. Robinson failed to recognize the limited level of retirement activity he has  
17 projected elsewhere in the depreciation study for 2008 and 2009 that would force the  
18 observed life table to move upward movement from what he relied upon, (5) Mr.  
19 Robinson failed to recognize the limited level of plant exposure at older ages where  
20 he attempted to match the observed life table while sacrificing better curve matches at  
21 ages with more meaningful levels of exposures, and (6) Mr. Robinson failed to take  
22 into account the new inspection program that will result in longer life expectancy  
23 compared to prior periods. Therefore, the Commission should adopt my 33-year S0.5  
24 life-curve combination as a conservative estimate of the life characteristics for this  
25 account.

1 Q. WHAT IS THE IMPACT OF YOUR RECOMMENDATION?

2 A. The standalone impact of my recommendation results in a \$5,525,908 reduction to  
3 annual depreciation expense based on plant as of December 31, 2009.

4

5 **SECTION VI: MASS PROPERTY NET SALVAGE ANALYSES**

6

7 A. GENERAL

8

9 Q. WHAT IS NET SALVAGE?

10 A. FERC's Uniform System of Accounts ("USOA") defines various salvage related  
11 terms as follows:

12 "Salvage value" means the amount received for property retired, less any expenses  
13 incurred in connection with the sale or in preparing the property for sale; or, if  
14 retained, the amount at which the material is recoverable is chargeable to Materials  
15 and Supplies, or other appropriate amount.

16

17 "Cost of removal" means the cost of demolishing, dismantling, tearing down or  
18 otherwise removing electric plant including the cost of transportation and handling  
19 incidental thereto.

20 One additional definition is required order to properly follow the USOA Electric  
21 Plant Instructions. That definition is for "Replacing" or "replacement," and is as  
22 follows:

23 "Replacing" or "replacement," when not otherwise indicated in the  
24 context, means the *construction or installation* of electric plant in

1 place of property retired, *together with the removal of the property*  
2 *retired.*" (Emphasis added).

3 In other words, "net salvage" is simply the value received for the sale, reuse, or  
4 reimbursement of retired property (gross salvage), less the cost of retiring such  
5 property (cost of removal), whether the retirement reflects demolition of the item of  
6 plant or only the accounting transaction for retiring an item of property in place  
7 (abandonment). Limited or no costs of removal should occur with replacement  
8 activity. This situation conforms to USOA Electric Plant Instructions 10B(2). That  
9 instruction recognizes cost of removal being "appropriate" when not accompanied by  
10 replacement activity. However, the crediting of the plant account for the retirement  
11 shall occur, with or without replacement.

12  
13 **Q. CAN YOU ILLUSTRATE "NET SALVAGE" USING AN ACTUAL FPL**  
14 **EXAMPLE?**

15 A. Yes. For Account 364, Distribution Poles and Fixtures, the Company has requested a  
16 negative 50% net salvage. This means PEF assumes that removing a pole will  
17 impose a net cost on the system that equals 50% of the original cost of buying and  
18 installing the pole. Given the plant balance of \$506 million, the Company's proposed  
19 net salvage figure would result in approximately \$253 million of depreciation  
20 expense over the life of the investment *above* the recovery of the original \$506  
21 million investment. (See Exhibit \_\_ (EMR-2) page 2-13). The proposed annual  
22 depreciation rate for this account to recover all proposed amounts, both investment  
23 and net salvage, is 5.91%. (See Exhibit (EMR-2) page <sup>2-7</sup>~~2-27~~). If one assumes the  
24 scrap value of the pole at retirement is exactly offset by the cost of removing it, in  
25 other words a zero level of net salvage, the annual depreciation rate falls to only

1 3.29%. The difference in rates that would be applied to the \$506 million plant  
2 balance corresponding to the different net salvage assumption results in over \$13  
3 million of additional annual revenue requirements for this account alone.

4  
5 **Q. WHAT PERIOD HAS THE COMPANY CHOSEN TO ANALYZE TO**  
6 **DERIVE ITS NET SALVAGE VALUES?**

7 A. The Company has analyzed a 32-year period, 1976 through 2007. (See Exhibit  
8 No. \_\_ (EMR-2) Section 8).

9  
10 **Q. HAVE YOU REVIEWED ALL OF THE INFORMATION PRESENTED BY**  
11 **THE COMPANY IN SUPPORT OF ITS NET SALVAGE REQUEST?**

12 A. Yes. The information provided is inadequate to support or demonstrate the  
13 appropriateness of its request for an overall *negative 22%* net salvage for electric  
14 transmission, distribution and general property. (See Exhibit No. \_\_ (EMR-2) pages  
15 2-27, 30, 37 and 38). PEF's request includes \$1.2 billion for negative net salvage  
16 related to electric mass property over the life of the investment. PEF's requested  
17 negative net salvage requires over \$43 million of annual revenue requirements as  
18 compared to a zero (0) level of net salvage.

19 **Q. PLEASE SUMMARIZE YOUR RECOMMENDATION CONCERNING**  
20 **PROPOSED NET SALVAGE VALUES FOR MASS PROPERTY.**

21 A. PEF's proposed net salvage reflected in the 2007 Study is flawed and insufficiently  
22 substantiated. As a result, it proposes excessive levels of negative net salvage. I  
23 recommend a reduction to PEF's depreciation expense based on adjustments to its  
24 proposed net salvage level for 15 accounts as summarized on Exhibit \_\_ (JP-10). The

1 standalone impact of my net salvage recommendations is a reduction of \$29,041,861  
2 in annual depreciation expense.

3  
4 **Q. WHY DO YOU BELIEVE PEF'S PROPOSED NET SALVAGE LEVELS ARE**  
5 **INAPPROPRIATE?**

6 There are numerous problems with PEF's proposals. For example, (the following is  
7 not intended to be a comprehensive listing):

- 8 • Mr. Robinson relies on data that incorporates "catastrophic  
9 circumstances" related to hurricane events.
- 10 • Mr. Robinson calculates a forecasted future level of cost of removal  
11 that attempts to only recognize estimated future inflation.
- 12 • Mr. Robinson makes no meaningful effort to actually identify and  
13 understand what is reflected in PEF's historical retirement database  
14 from a net salvage standpoint.
- 15 • Mr. Robinson fails to investigate the reasonableness of unusually high  
16 levels of cost of removal in the historical database.
- 17 • Mr. Robinson fails to investigate or explain significant changes in net  
18 salvage values between the existing and proposed levels, including  
19 swings that exceed \$200 million of net salvage (i.e., Account 364).
- 20 • Mr. Robinson fails to explain the underlying reasons for changes that  
21 cause revenue requirements to increase by more than \$10 million  
22 annually for an individual account.

- 1 • The Company fails to comply with NARUC Interpretation No. 67 as it  
2 relates to reimbursed retirements.
  
- 3 • Mr. Robinson fails to adequately recognize, or recognize at all, the  
4 impact that economies of scale will have in the future.

5  
6 In summary, when the Company's net salvage proposals seek over *\$40 million of*  
7 *annual revenue requirements*, the Commission and customers are entitled to a  
8 *qualitative* presentation of the basis for net salvage proposals adequate to support the  
9 request. PEF has not met this standard with its study and in fact has reduced the  
10 narrative explanation for its proposals when compared to its prior study. I  
11 recommend that the Commission order the Company to develop and present --not just  
12 a depreciation study supported by substantial *quantities of paper* -- but a study that is  
13 substantiated by *meaningful levels of explanations and analyses* of what caused the  
14 retirements and related net salvage, and to determine whether such historical causes  
15 and relationships are indicative of future expectations. Mr. Robinson's approach of  
16 simply claiming that costs have increased can no longer be an acceptable basis for  
17 seeking such increases in annual revenue requirements. The concern I raise is the  
18 same concern that was raised at the Annual NARUC meeting this year. I submit that  
19 if it is reasonable for the Commission to have previously required substantial  
20 documentation and support for assumptions when reviewing forecasts for future  
21 resources and loads, then it should demand no less for projections of future net  
22 salvage when such net salvage requests seek over \$1 billion from customers over the  
23 life of the assets. The Company's presentation in this case, even though backed by  
24 significant quantities of paper, does not meet the standard. It is important to

1 distinguish quantity from quality of information. Mr. Robinson completely failed to  
2 explain and substantiate his interpretation and blending of the results of an  
3 inappropriate "forecast" with his review of different portions of historical data that  
4 results in a proposal that falls outside the range of results is unacceptable (e.g.,  
5 Account 369.1). (See Exhibit \_\_ (EMR-2) page 4-64). Mr. Robinson's presentation  
6 does not constitute a reasonable and appropriate basis upon which to set such  
7 substantial levels of revenue requirements.

8  
9 **B. REIMBURSED RETIREMENTS**

10  
11 **Q. WHAT ARE REIMBURSED RETIREMENTS?**

12 A. I define reimbursed retirements as a situation in which a third party reimburses the  
13 Company for the retirement of plant.

14  
15 **Q. DOES MR. ROBINSON STATE THAT REIMBURSED RETIREMENTS ARE**  
16 **AN APPROPRIATE COMPONENT OF NET SALVAGE?**

17 A. Yes.

18 **Q. DOES MR. ROBINSON'S STATED POSITION COMPLY WITH**  
19 **GUIDELINES?**

20 A. Yes. In NARUC Interpretation No. 67, NARUC has identified how such amounts are  
21 to be treated. In particular, for any amount received from a third party to be  
22 considered as a contribution in aid of construction, it must specifically be designated  
23 as such on a *contractual basis*.

24

1 **Q. WHAT DOES NARUC INTERPRETATION NO. 67 SPECIFICALLY STATE?**

2 A. NARUC Interpretation No. 67 states the following:

3 The cost of plant retirements should be accounted for in  
4 accordance with the rules applicable thereto. The cost of new  
5 plant should include in the appropriate plant accounts at actual  
6 cost of construction. The reimbursement received shall be  
7 accounted for (a) by crediting operation and maintenance  
8 expenses to the extent of actual expenses occasioned by the  
9 plant changes and (b) crediting the remainder to the reserve for  
10 depreciation, unless contractual terms definitely characterize  
11 residual or specific amounts as applicable to the cost of  
12 replacement. In the latter event, appropriate credits should be  
13 entered in the plant accounts.

14

15 **Q. IS THE COMPANY'S DATABASE RELIED UPON BY MR. ROBINSON**  
16 **CONSISTENT WITH NARUC'S INTERPERTATION?**

17 A. No. As discussed later, the Company has inappropriately assigned a portion of  
18 amounts received from third parties as contributions in aid of construction.

19

20 **C. ECONOMIES OF SCALE**

21

22 **Q. IS PEF'S HISTORICAL NET SALVAGE DATABASE REPRESENTATIVE**  
23 **OF WHAT CAN REASONABLY BE ANTICIPATED IN THE FUTURE?**

24 A. No. The Company's historical database, as it applies to net salvage, reflects a  
25 situation in which relatively few retirement dollars have occurred compared to the

1 level of retirement activity that will occur in the future on an annual basis. In other  
2 words, in future years, as a greater level of the Company's investment approaches its  
3 ASL, a larger number of investments will retire on an annual basis. The greater level  
4 of annual retirements should result in a reduction to the per unit cost of removal as  
5 economies of scale are realized. Recognition of this concept belongs in the proper  
6 technique to be utilized in any depreciation analysis. By contrast, the Company's  
7 approach is more reflective of an analysis of historical data without proper evaluation  
8 of future expectations.

9  
10 **Q. ARE YOU AWARE OF ANY SOURCES WHICH CONCUR WITH YOUR**  
11 **CONCEPT OF ECONOMIES OF SCALE?**

12 A. Yes. In its publication "*Public Utility Depreciation Practices*" NARUC indicates,  
13 among other things that while future cost of removal logically may be higher than  
14 past costs, this premise does not necessarily indicate that the percentage cost of  
15 removal will increase over time. Moreover, the publication acknowledges that as  
16 labor costs increase over time, so do the number of items to be removed, thus making  
17 it more economical in many cases to invest in special tools, which may actually result  
18 in an overall decrease in cost of removal per item removed. This rationale  
19 reflects the appropriate depreciation rates to be utilized in the future better. Moreover,  
20 the NARUC stated concept and my reference of the concept does not rely on a  
21 concept "similar to a production line" approach as Mr. Robinson incorrectly  
22 referenced in his rebuttal testimony at page 11 in the prior case.

23  
24 **D. ACCOUNT SPECIFIC**

1 Q. WHAT DOES THE COMPANY PROPOSE FOR ACCOUNT 353.1 –  
2 TRANSMISSION STATION EQUIPMENT?

3 A. The Company proposes a zero level of net salvage for this account. The Company's  
4 specific basis is not presented. The Company only notes the results of its most recent  
5 3-year rolling bands as well as the 5, 10, 15, 20 and full band historical analyses.  
6 (See Exhibit No. \_\_ (EMR-2), page 4-36). The Company also identifies a forecasted  
7 net salvage value of a negative 42%.

8

9 Q. DO YOU AGREE WITH THE COMPANY'S PROPOSAL?

10 A. No. The Company's proposal at best is unsubstantiated. Moreover, it appears that  
11 the Company's proposal reacts to a limited level of recent negative net salvage  
12 occurrences. (See Exhibit No. \_ (EMR-2), pages 8-71 through 8-74). Therefore, I  
13 recommend a *positive* 5% net salvage.

14 My recommended positive 5% net salvage is based on several factors. First, the  
15 Company's summary for this account is wrong when it identifies a zero level of net  
16 salvage for its 1975 through 2007 full depth band analysis. The Company sets forth  
17 the correct value later in its study as a positive 20%. (See Exhibit No. \_ (EMR-2),  
18 pages 8-71 through 8-74). Next, it is important to note that the Company cannot  
19 identify the mix of investment in this account or the mix of retirements that are  
20 reflected in its historical retirement activity. (See OPC's Second Interrogatories No.  
21 78 and 79). This situation is in contrast to what Mr. Robinson stated in completing  
22 his prior depreciation analyses that "consideration is given to the range and level of  
23 historic activity (gross salvage and cost of removal), *the content of the account*, and  
24 the likely and/or potential for generating gross salvage at the end of the property's  
25 useful life." (Emphasis added). (See Mr. Robinson's rebuttal testimony in Docket

1 No. 050078-EI at page 29). Taking Mr. Robinson at his word and the Company's  
2 responses to interrogatories, it is clear that he could not have taken into account the  
3 mix of investment within the account nor the mix of retirements.

4  
5 **Q. WHY IS THIS IMPORTANT?**

6 A. This account normally reflects transformers as the largest single investment.  
7 However, the account normally contains substantial amounts for breakers, switches,  
8 foundations and other investment. If the historical retirement data in recent years  
9 reflects negative net salvage corresponding to retirements that excluded large  
10 transformers or reflected a disproportionately lower level of transformer investment,  
11 then the negative values provide false indications of the overall net salvage potential  
12 for this account. This was precisely the situation for FP&L, a utility that does  
13 identify the investment and retirement mix unlike PEF. (See Docket No. 050078-EI,  
14 Mr. Pous' direct testimony pages 148-151).

15  
16 **Q. DID THE COMPANY RECENTLY EXPERIENCE ITS LARGEST DOLLAR**  
17 **LEVEL OF RETIREMENT ACTIVITY?**

18 A. Yes. In 2007 the Company reported approximately \$11.7 million of retirement  
19 activity for this account. (See Exhibit No. (EMR-2), page 8-72). Normally when  
20 large retirement activity occurs, one anticipates that large transformers are reflected in  
21 such activity. The corresponding net salvage experienced by the Company yielded a  
22 positive 5% net salvage. In 2006, the year before the large positive net salvage  
23 corresponding to the large retirement activity, the Company retired only \$2 million.  
24 In that year the Company experienced the largest negative net salvage percent in its  
25 entire database. This event, in part, appears to be the activity that the Company relied

1 upon to change from a positive 10% net salvage last approved by the Commission in  
2 a fully litigated proceeding to the Company's proposed zero level, which corresponds  
3 to its most recent settled proceeding.

4  
5 Another consideration is the fact that transformers and other scrap material have  
6 increased in value during the last several years. For example, copper prices hit a peak  
7 of over \$4 in the scrap metal market during 2008, or approximately 10 times the level  
8 experienced earlier in the 2000's. While the level of scrap metal prices has declined  
9 from the peak during 2008 it is anticipated that they will again increase as the  
10 economies of China and India eventually again ramp back up. The Company's  
11 depreciation analysis fails to take into account the trend in gross salvage values  
12 contrary to its actions relating to its fossil-fired dismantlement study also part of this  
13 case. (See Staff's 6<sup>th</sup> Interrogatories No. 12).

14  
15 **Q. DOES YOUR RECOMMENDATION ALSO CORRESPOND WITH MR.**  
16 **ROBINSON'S STATED GOAL OF GRADUALISM?**

17 **A.** Yes. Mr. Robinson's reaction to the recent negative net salvage values, which  
18 represent a relatively small component of the overall database, is contrary to his  
19 stated principal of relying on gradualism. Mr. Robinson has previously stated that "it  
20 is prudent not to move all at once to the results indicated by the analysis." (See Mr.  
21 Robinson's rebuttal testimony in Docket no. 050078-EI at page 10). According to  
22 Mr. Robinson, if movement is to transpire, it should be done so in a step wise manner.

23  
24 Mr. Robinson's failure to recognize the significant increase in scrap metal prices that  
25 have transpired since the early 2000's is contrary to his position that

1 recommendations should not be “based upon the Company’s historical experience  
2 with no consideration of anticipated future costs incorporated into future net salvage  
3 estimates.” (See Mr. Robinson’s rebuttal Docket No. 050078-EI at page 14).

4  
5 **Q. DID THE COMPANY RECOMMEND A POSITIVE 10% NET SALVAGE IN  
6 ITS 2002 DEPRECIATION STUDY?**

7 A. Yes. While Mr. Robinson has attempted to distance the Company from its own  
8 recommendation in its 2002 depreciation study by referencing what has been  
9 identified as “abnormal” net salvage, the fact is the Company did recognize and  
10 recommended results predicated on what was labeled as “abnormal” net salvage.  
11 (See Docket No. 050078-EI Mr. Robinson’s rebuttal testimony at Exhibit No. (EMR-  
12 2)). In other words, while the Company employed the term “abnormal” for reuse and  
13 reimbursed retirements, it appropriately did recognize that such amounts represent  
14 real and ongoing gross salvage amounts.

15 **Q. PLEASE SUMMARIZE THE BASIS FOR YOUR RECOMMENDATION?**

16 A. The Company’s failure to present adequate support for its position should not be  
17 allowed to default to the concept that the Commission should accept its proposal.  
18 The Company recognizes the importance of knowing what is in the account but fails  
19 to investigate the investment mix and retirement mix to see if the historical data is  
20 representative of current expectations. Review of the historical data does indicate  
21 that when the largest level of retirement activity occurs a positive net salvage can  
22 normally be expected. In addition, the Company’s historical database is predicated  
23 on low levels of scrap metal prices, which understates the realistic level of gross  
24 salvage that can and will be experienced in the future. Mr. Robinson has over reacted  
25 to recent negative net salvage occurrences that correspond to hurricane time frames.

1 Q. **WHAT IS THE IMPACT OF YOUR RECOMMENDATION?**

2 A. My recommendation results in a \$647,102 reduction to the Company's request based  
3 on plant as of December 31, 2009.

4

5 Q. **WHAT DOES THE COMPANY PROPOSE FOR ACCOUNT 355 -**  
6 **TRANSMISSION, POLES AND FIXTURES?**

7 A. The Company proposes a negative 50% net salvage. The proposed value represents a  
8 doubling of the existing negative 25% net salvage that was a result of a settlement in  
9 the last case. It also represents a 67% increase from the Company's negative 30%  
10 established in the Company's last litigated rate proceeding. (See Docket No. 050078-  
11 EI, Exhibit No. \_ (EMR-2)).

12

13 Neither the Company's written narrative in its depreciation study nor in Mr.  
14 Robinson's testimony sheds light on the Company's significant movement towards a  
15 more a negative value. The only information provided that represents any basis for  
16 the Company's significant movement is the actual negative net salvage recorded  
17 during the last several years. (See Exhibit No. \_ (EMR-2) at pages 8-82 through 8-  
18 85).

19

20 Q. **DOES THE COMPANY'S PROPOSAL IN THIS CASE VIOLATE MR.**  
21 **ROBINSON'S PREVIOUSLY STATED CONCEPT OF GRADUALISM?**

22 A. Yes. The Company's presentation in this proceeding is a significant movement both  
23 from the existing level of negative net salvage as well as the last Commission  
24 approved level set in a fully litigated proceeding.

25

1 Q. WHAT DO YOU RECOMMEND?

2 A. I recommend a negative 25% net salvage. The recommendation does not react to the  
3 unexplained 5 to 10 fold increase in cost of removal experienced by the Company  
4 during the last several years. This is significant given the hurricane related activity  
5 associated with this time frame. The Company admits that its replacement activity  
6 for this account occurred "under catastrophic circumstances." (See Staff's 15<sup>th</sup>  
7 Interrogatories No. 169). Modifying future net salvage parameters based on  
8 "catastrophic circumstances" is inappropriate and should be denied. Moreover, only  
9 one year out of the past 4 years since the Company's last depreciation study reflects  
10 any level of gross salvage. (See Exhibit No. \_\_ (EMR-2) at page 8-83). This  
11 contrasts significantly with the average 36% gross salvage associated with the  
12 Company's entire historical database. Thus, the combination of dramatic increases in  
13 cost of removal, elimination of gross salvage and Mr. Robinson's stated policy of  
14 gradualism would all contradict the Company's movement to a negative 50% net  
15 salvage.

16  
17 Another consideration is the fact that the Company is replacing wood poles with steel  
18 poles. (See Exhibit (EMR-2) at page 4-42). Consideration of future expectations  
19 rather than reliance on history would indicate that scrap value for steel poles will be  
20 recognized in the future contrary to what the Company has experienced since the last  
21 depreciation study. In summary, the Company has not substantiated any valid basis  
22 upon which to base its substantial change in net salvage absent reaction to  
23 catastrophic occurrences during the past several years. The Commission should order  
24 the Company to investigate and substantiate the dramatic change in cost of removal

1 and gross salvage values since the last depreciation study and present such findings in  
2 the Company's next depreciation study.

3  
4 **Q. WHAT IS THE IMPACT OF YOUR RECOMMENDATION?**

5 A. My recommendation results in a \$3,612,647 reduction to annual depreciation and  
6 expense based on plant as of December 31, 2009.

7  
8 **Q. WHAT DOES THE COMPANY PROPOSE FOR ACCOUNT 356 -**  
9 **TRANSMISSION OVERHEAD CONDUCTORS AND DEVICES?**

10 A. The Company proposes a negative 30% net salvage. This value is equivalent to the  
11 existing rate as adopted in the Company's last proceeding, which reflected a  
12 settlement, but is more negative than the negative 20% approved by the Commission  
13 in the Company's last fully litigated case.

14 Unlike the Company's last depreciation study, the Company provides no explanative  
15 narrative in support of its proposal. It appears the Company's proposal is predicated  
16 on some combination of the full depth analysis of historical data, which yields a  
17 negative 10%, and the very high negative net salvage values experienced during  
18 recent years that incorporates the impact of hurricanes. (See Exhibit No. \_\_ (EMR-2)  
19 at page 4-44).

20  
21 **Q. DO YOU AGREE WITH THE COMPANY'S PROPOSAL?**

22 A. No. The Company's proposal is excessively negative and not justified. I recommend  
23 a negative 10% net salvage.

24 The negative 10% net salvage recognizes that prior to the impact of the recent  
25 hurricanes the Company had almost exclusively experienced positive net salvage for

1 this account. (See Exhibit No. \_\_ (EMR-2) at page 8-86 and 8-87). The Company  
2 appears to be overreacting to the excessive level of negative net salvage incurred in  
3 association with various projects that are heavily weighted to hurricane activity. The  
4 3-year rolling bands relied upon by the Company that encompass the 2004 through  
5 2007 hurricane related time frames range from a negative 63% to a high of a negative  
6 209%. In contrast the comparable four 3-year rolling bands immediately prior to the  
7 2004 hurricane period yield a range from a low of a positive 9% to a positive 127%.  
8 Therefore, the Company's proposal is not supported by what can reasonably be  
9 expected absent significant hurricane activity.

10

11 **Q. IS THERE ANOTHER PROBLEM WITH THE COMPANY'S PROPOSAL?**

12 A. Yes. The Company was requested to provide information regarding retirement  
13 activity for this account, including copies of work orders relating to more than 1  
14 linear mile of overhead conductor billing retired during the past 10 years. (See  
15 OPC's 2<sup>nd</sup> Interrogatories No. 92). A review of the limited number of work orders  
16 provided clearly establishes that the Company's database reflected in its depreciation  
17 study is erroneous. For example, in 2005 the Company provided 5 separate work  
18 orders that produced a total level of gross salvage of approximately \$250,000. Yet,  
19 the Company's reported value in its deprecation study is zero. Further, even if one  
20 were to assume that the work order may actually encompass other accounts such as  
21 Account 354 or 355, a review of the gross salvage for 2005 for those accounts also  
22 indicates a zero level of gross salvage. This concept of zero level of gross salvage  
23 when significant levels of retirement activity have occurred is inconsistent with the  
24 Company's previously stated history. It is only during the hurricane related time  
25 frame that the Company for the first time begins to report zero levels of gross salvage

1 compared to all prior years where the Company reported substantial levels of gross  
2 salvage.

3  
4 The Company's depreciation related net salvage database relied upon by Mr.  
5 Robinson differs from actual work order reported values. Therefore, it appears Mr.  
6 Robinson has relied on data which has overstated the level of negative net salvage  
7 appropriate for this account.

8  
9 **Q. IS THERE ANOTHER CONCERN REGARDING THE COMPANY'S**  
10 **PROPOSAL?**

11 A. Yes. Review of work orders corresponding to instances where the Company retired  
12 more than the one linear mile of transmission lines sets forth projects where the  
13 Company received reimbursement for the retirement activity. When that situation  
14 occurred the Company reported a zero level for gross salvage and over \$50,000 for  
15 cost of removal, yet assigned the entire reimbursement as a contribution in aide of  
16 construction. This particular accounting is inappropriate and in conflict with NARUC  
17 Interpretation No. 67 as previously discussed. This situation further calls into  
18 question the underlying negative net salvage reflected in the Company's historical  
19 data, which Mr. Robinson relied for his proposal.

20  
21 Given the questionable accounting employed by the Company and relied upon by Mr.  
22 Robinson, I recommend that the Commission order the Company to further analyze  
23 its historical data and correct such situations so as to properly report gross salvage  
24 and present such data in a fully documented and explained manner in the Company's  
25 next depreciation study. Until that time, the Commission should deny the Company's

1 request and adopt my recommendation which reflects a blending of both the overall  
2 historical data as well as partial recognition of the negative net salvage activity that  
3 has occurred during the hurricane time frame.

4  
5 **Q. WHAT IS THE IMPACT OF YOUR RECOMMENDATION?**

6 A. My recommendation results in a \$1,555,815 reduction to annual depreciation expense  
7 based on plant as of December 31, 2009.

8  
9 **Q. WHAT DOES THE COMPANY PROPOSE FOR ACCOUNT 358 -**  
10 **TRANSMISSION UNDERGROUND CONDUCTORS AND DEVICES?**

11 A. The Company proposes a negative 3% net salvage. This proposal represents a change  
12 from the zero level of net salvage last approved by the Commission in a fully litigated  
13 case for the Company, but is equivalent to the net salvage adopted in the settlement in  
14 the Company's last rate proceeding.

15  
16 **Q. DO YOU AGREE WITH THE COMPANY'S PROPOSAL?**

17 A. No. The Company's proposal lacks support and is excessively negative. Therefore, I  
18 recommend a zero level of net salvage equivalent to what the Commission adopted in  
19 the Company's last fully litigated rate proceeding.

20  
21 Given that the Company failed to provide any narrative explanation for its proposal,  
22 and that the proposal is equivalent to the same proposal made by the Company in its  
23 last depreciation study, a review of the last case provides insight into the Company's  
24 reasoning. In the last depreciation study the Company stated that its forecasted level  
25 of net salvage "is not anticipated for all the current property investments,

1 nevertheless, some modest amount of negative net salvage *is anticipated* in  
2 conjunction with future retirements. *Based upon the limited size of the amount of the*  
3 *property* in the account, net salvage is estimated at negative three (3) percent.”  
4 (Emphasis added). (See Docket No.050078-EI 2005 Depreciation Study at page 4-  
5 32). The only basis Company can establish for its proposal is that it is “anticipated”,  
6 as well as reference to the limited size of the amount of the property. Neither of these  
7 generalized statements rise to the level of a credible basis for the Company’s  
8 proposal.

9  
10 The actual history for this account indicates retirements in only 4 years over the past  
11 31 years. (See Exhibit No. \_\_ (EMR-2) page 8-94 and 8-95). While the overall net  
12 salvage for this account is a negative 0.27%, the overall retirement activity is less  
13 than one half of one percent of the existing balance over the entire 31-year period.  
14 Therefore, from a materiality, frequency, or pattern standpoint set forth in historical  
15 data, there is no basis for the Company’s proposed expectations or anticipation. A  
16 zero level of net salvage is the only appropriate value based on available information.

17  
18 **Q. WHAT IS THE IMPACT OF YOUR RECOMMENDATION?**

19 A. My recommendation results in a \$287,862 reduction to annual depreciation expense  
20 based on plant as of December 31, 2009.

21  
22 **Q. WHAT DOES THE COMPANY PROPOSE FOR ACCOUNT 362 –**  
23 **DISTRIBUTION STATION EQUIPMENT?**

24 A. The Company proposes a negative 15% net salvage, this represents a significant  
25 change from the Company last fully litigated case where a *positive* 15% level was

1 adopted. A negative 15% does correspond to the level adopted in the Company's last  
2 rate case, which was based on a settlement.

3  
4 **Q. DO YOU AGREE WITH THE COMPANY'S PROPOSAL?**

5 A. No. The Company's proposal is excessively negative and unsubstantiated. I  
6 recommend a zero net salvage be adopted.

7  
8 Given the Company's failure to provide any narrative basis for its proposal in its  
9 current depreciation study, a review of the Company's prior depreciation study  
10 provides limited yet some information. In the last depreciation study where the  
11 Company proposes the same negative 15% net salvage, Mr. Robinson stated that:

12 "the Company's experienced net salvage has historically averaged  
13 approximated twenty-five (25) percent. However, the historically experienced  
14 net salvage has principally occurred as a result of the relocation and reuse of  
15 existing transformers and is not generally the product of final salvage  
16 generated from the disposal of property at the final end of life. Furthermore,  
17 positive net salvage has been declining during recent years and has turned  
18 negative. The forecast of the historical net salvage experience indicates future  
19 net salvage of negative thirty (30) percent. Giving consideration to the recent  
20 experience and anticipated higher future cost of removal, future net salvage is  
21 estimated at negative fifteen (15) percent." (Emphasis added). (See Docket  
22 No. 050078-EI 2005 Depreciation Study at pages 4-35 and 4-36).

23 (See Docket No. 050078-EI 2005 Depreciation Study at pages 4-35 and 4-36). The  
24 Company's statement that its historical activity is principally a result of relocation  
25 and reuse of existing transformers is questionable given the Company's inability to

1 provide the categorization of investment or retirement activity when requested to do  
2 so. (See OPC's 2<sup>nd</sup> Interrogatories Nos. 78 and 79). Next, the Company's reliance on  
3 its "forecast" of net salvage provides no support or evidence as even Mr. Robinson  
4 makes it a practice to heavily discount or ignore his own forecast given the  
5 excessively high negative net salvage levels that are normally produced. Finally, the  
6 Company's "anticipated higher future cost of removal" also is without support or  
7 basis. Thus, the Company's significant swing from a positive 15% to a negative 15%  
8 in the last proceeding and its attempt to continue such position into this case are  
9 unsupported.

10  
11 The net salvage experienced by the Company since the last depreciation study also  
12 calls into question its current proposal. While the retirement activity from 2004 to  
13 2007 produced a negative net salvage, it reflects retirements that were "significantly  
14 impacted by a group of devastating hurricanes." (See Staff's 15<sup>th</sup> Interrogatories No.  
15 175). A review of the historical data demonstrates a dramatic shift from prior history  
16 to the period encompassed by hurricane activity. To base a negative net salvage  
17 proposal on unusual activity which reflects higher costs of removal than would be  
18 anticipated during more normal operation should not be relied upon for establishing  
19 long term net salvage expectations.

20 Another consideration is the higher scrap metal prices that currently exist and can  
21 reasonably be anticipated to increase as the economies of China and India again gain  
22 momentum. This is significant since transformers normally comprise a significant  
23 component of the investment in this account. Transformers also contain significant  
24 quantities of copper. Copper prices had previously increased by a factor of  
25 approximately 10 prior to the recent world wide economic downturn. However,

1 current copper prices are still over 5 times the level they were in the late 90s and early  
2 2000s.

3  
4 Another consideration is the fact that the Company has proposed a zero level of net  
5 salvage for transmission station equipment. This represents a significant difference  
6 from the Company's negative 15% proposed for this account. Moreover, as  
7 previously noted I recommend a positive 5% for transmission station equipment.  
8 Therefore, a zero level of net salvage for this account at this time is a reasonable and  
9 realistic level to be utilized for ratemaking purposes. The zero value I recommend is  
10 still conservative in favor of the Company given the historical data, includes the  
11 events during the hurricane period I recommend yields an overall positive 10% net  
12 salvage overall.

13

14 **Q. WHAT IS THE IMPACT OF YOUR RECOMMENDATION?**

15 A. My recommendation results in a standalone impact of \$1,521,831 reduction to annual  
16 depreciation expense based on plant as of December 31, 2009.

17

18 **Q. WHAT DOES THE COMPANY PROPOSE FOR ACCOUNT 364 -**  
19 **DISTRIBUTION POLES, TOWERS AND FIXTURES?**

20 A. The Company proposes a negative 50% net salvage. This level represents a 100%  
21 increase in the level of negative net salvage previously approved by the Commission  
22 in the Company's last fully litigated proceeding. It also represents a 43% increase  
23 from the negative 35% value adopted as part of the settlement in the last proceeding.

24

25 **Q. DO YOU AGREE WITH THE COMPANY'S PROPOSAL?**

1 A. No. The Company's proposal is still excessively negative, just as it was in the  
2 Company's last proceeding. In the Company's last proceeding Mr. Robinson  
3 proposed a negative 90% for this account. (See Mr. Robinson's rebuttal testimony in  
4 Docket No. 050078-EI, Exhibit No. (EMR-2) ). While Mr. Robinson now recognizes  
5 his proposal in the last proceeding for a negative 90% net salvage was extremely  
6 unreasonable, his proposal for a negative 50% in this proceeding is still excessively  
7 negative and unreasonable.

8  
9 I recommend a negative 35% net salvage as a reasonable yet still conservative value  
10 in favor of the Company. While the Company relied on values that it admitted in the  
11 last proceeding were "bogus" (See Mr. Robinson's deposition in Docket No. 050078-  
12 EI at page 141), Mr. Robinson again attempts to rely on data that the Company  
13 admits occurred "under catastrophic circumstances". (See Staff's 15<sup>th</sup> Interrogatories  
14 No. 177). In fact, even during the catastrophic circumstances that occurred in  
15 association with hurricanes subsequent to the last depreciation study, the level of  
16 negative net salvage was less negative than the negative 50% Mr. Robinson proposes  
17 this proceeding. In other words, even in association with catastrophic events, the  
18 Company did not sustain an overall level of a negative 50% net salvage for the  
19 investment in this account.

20  
21 My recommendation for a negative 35% net salvage still provides the Company with  
22 over \$11 million of annual negative net salvage for this account based on plant as of  
23 December 31, 2009. This amount is over 12.5 times the level the Company  
24 experienced on average during the past 10 years, including the "bogus" value Mr.  
25 Robinson admits to. Moreover, the negative 35% provides the Company with 3.7

1 times the highest level it has ever experienced, the value Mr. Robinson identified as  
2 being “bogus.” Therefore, my recommendation is very conservative while providing  
3 additional time to determine how net salvage levels settle once the impacts of  
4 catastrophic circumstances associated with hurricane activity subside.

5  
6 **Q. WHAT IS THE IMPACT OF YOUR RECOMMENDATION?**

7 A. My recommendation results in a \$4,774,199 reduction to annual depreciation expense  
8 based on plant in service of December 31, 2009.

9 **Q. WHAT DOES THE COMPANY PROPOSE FOR ACCOUNT 365 –**  
10 **DISTRIBUTION OVERHEAD CONDUCTORS AND DEVICES?**

11 A. The Company proposes a negative 45% net salvage. This proposal is approximately  
12 30% more negative than the negative 35% last approved by the Commission in a fully  
13 litigated case, and is 3 times the existing level of net salvage as established in the last  
14 case, which was settled.

15  
16 **Q. DO YOU AGREE WITH THE COMPANY’S PROPOSAL?**

17 A. No. The Company’s proposal is excessively negative and unsupported. Therefore, I  
18 recommend a negative 20% net salvage.

19  
20 My recommendation reflects historical experience of the Company with less weight  
21 placed on the more recent activities since the last case. Placing less weight on recent  
22 events is due in part to the Company’s admission that it failed to report gross salvage  
23 for the years 2003 through 2006. Another consideration is the Company’s admission  
24 that cost of removal increased since the Company’s last depreciation study “due to  
25 the affect of the 2004/2005 hurricanes.” (See Staff’s 15<sup>th</sup> Interrogatories No. 179).

1 Thus, the Company's proposal, which results in a significantly more negative level of  
2 net salvage for this account, appears to be in reaction to hurricane related activity.  
3 Reactions to hurricane related activity artificially skews the results from what can  
4 reasonably anticipated for the investment in the future. In addition, my  
5 recommendation of a negative 20% net salvage is more in line with Mr. Robinson's  
6 previously stated basis for his proposal in the last depreciation study. There Mr.  
7 Robinson stated his proposal was in part "based upon the Company's overall  
8 experience." (See Docket No. 050078-EI 2005 Depreciation Study at page 4-38).  
9 Had Mr. Robinson been consistent between studies he would have recognized a  
10 negative 20% net salvage for the overall level of this account. (See Exhibit No. \_\_  
11 (EMR-2) at page 8-117).

12  
13 My recommendation is also conservative given that there are still substantial  
14 quantities of copper wire in the system, and the price of copper can reasonably be  
15 expected to increase as the economies of the world return to higher growth rates than  
16 reflected in the current economic situation. (See OPC's 2<sup>nd</sup> Interrogatories No. 94,  
17 Attachment). In addition, my recommendation still provides the Company with \$5.1  
18 million of annual negative net salvage. This level of negative net salvage is almost 9  
19 times the average level experienced historically and higher than every year in the  
20 Company's database with the exception of 2005, which reflects hurricane related  
21 activity. Thus, the Company is more than adequately protected until its next  
22 depreciation study where it can demonstrate, absent hurricane related activities, what  
23 a more realistic level of net salvage for this account might be.

24  
25 **Q. WHAT IS THE IMPACT OF YOUR RECOMMENDATION?**

1 A. My recommendation on a standalone basis results in a \$5,100,267 reduction to annual  
2 depreciation expense based on plant as of December 31, 2009.

3  
4 **Q. WHAT DOES THE COMPANY PROPOSE FOR ACCOUNT 366 -**  
5 **DISTRIBUTION UNDERGROUND CONDUIT?**

6 A. The Company proposes a negative 10% net salvage. This compares to the zero level  
7 of negative net salvage that it proposed in the last case as well as the zero level  
8 approved by the Commission in the Company's last fully litigated proceeding.

9 **Q. DO YOU AGREE WITH THE COMPANY'S PROPOSAL?**

10 A. No. The Company's proposal is again excessively negative and not indicative of the  
11 underlying facts. Therefore, I recommend a zero level of net salvage for this account.

12 My recommendation takes into account several factors. First, it is common practice  
13 in the industry to abandon in place investment in this account whenever possible.  
14 Plant abandoned in place normally does not incur any appreciable level of negative  
15 net salvage. Another consideration is that if plant is removed rather than abandoned,  
16 normally some level of gross salvage should be experienced. However, just as was  
17 the situation for Account 365, the Company reported a zero level of gross salvage for  
18 the years 2004 through 2006 representing the only years in the Company's entire 33-  
19 year database with zero salvage values. (See Exhibit No. (EMR-2) at pages 8-118  
20 and 8-119). Another consideration is the excessive level of cost of removal the  
21 Company experienced during the recent hurricanes.

22  
23 It is also significant that the Company itself proposed a zero level of net salvage for  
24 this account in its last depreciation study. In fact, while Mr. Robinson failed to

1 provide any narrative supporting his proposal in this proceeding, in the last  
2 proceeding he stated that “little or no salvage is expected to be achieved in  
3 conjunction with future retirements. Based upon the experience and future  
4 expectations, future net salvage is estimated at zero (0) percentage.” (See Docket No.  
5 050078-EI 2005 Depreciation Study at page 4-39). Thus, without any explanation,  
6 Mr. Robinson proposes a significant movement in net salvage for this account based  
7 on impacts of hurricane related activity. There is no support for Mr. Robinson’s  
8 unsubstantiated position.

9  
10 **Q. WHAT IS THE IMPACT OF YOUR RECOMMENDATION?**

11 A. The standalone impact of relying on a zero level of net salvage for this account  
12 reduces annual depreciation expense by \$375,423 based on plant as of December 31,  
13 2009.

14  
15 **Q. WHAT DOES THE COMPANY PROPOSE FOR ACCOUNT 367 -**  
16 **DISTRIBUTION UNDERGROUND CONDUCTORS AND DEVICES?**

17 A. The Company proposes a negative 10% net salvage. This proposed value compares  
18 to the zero level of net salvage found appropriate by the Commission in the  
19 Company’s last fully litigated case, and the existing negative 5% net salvage adopted  
20 by settlement in the Company’s last rate proceeding.

21  
22 **Q. DO YOU AGREE WITH THE COMPANY’S PROPOSAL?**

23 A. No. Again, the Company failed to present any narrative basis for its proposed level of  
24 negative net salvage. The Company apparently believes sole reliance on unidentified  
25 portions of the historical data or reference to a “forecasted” value that Mr. Robinson

1 heavily discounted, if not totally ignored, is adequate support for its proposal. I  
2 recommend a negative 5% net salvage.

3  
4 In the last proceeding, Mr. Robinson did provide a limited narrative identifying that  
5 his then proposed negative 15% net salvage was "based upon the Company's  
6 experience and expectations." (See Docket No. 050078-EI 2005 Depreciation Study  
7 at page 4-40). One can only assume that in this case Mr. Robinson again relied on  
8 historic experience and a changing expectation of the future. In any instance, the  
9 Company's negative 10% net salvage is still too negative.

10 The Company's recent experience subsequent to its last depreciation study  
11 encompasses the significant impact associated with hurricane activity. In fact, absent  
12 the resulting excessive levels of negative net salvage associated with calendar years  
13 2004 and 2005 the Company would actually be in a *positive* historical net salvage  
14 position. (See Exhibit No. (EMR-2) at page 8-123). Thus, from the standpoint of the  
15 Company's normalized experience, a positive net salvage might be warranted.  
16 Another consideration is the fact that the Company admits that it has a "policy to  
17 retire the investment in this account in place when possible." (See OPC's 2<sup>nd</sup>  
18 Interrogatories No. 95). Thus, while the Company obviously does not retire all of its  
19 investment in this account in a manner where such investment is *abandoned in place*,  
20 one can expect a significant component of the retirement activity to be retired without  
21 being removed. Moreover, in instances where the Company actually removes  
22 conductor, such conductor should have a gross salvage associated with it. In  
23 summary, the Company has not justified movement to a more negative net salvage  
24 than a negative 5%. Moreover, a negative 5% may also be excessively negative.

25

1 Q. **WHAT IS THE IMPACT OF YOUR RECOMMENDATION?**

2 A. The standalone impact of my recommendation results in a \$1,052,091 annual  
3 reduction in depreciation expense based on plant as of December 31, 2009.

4

5 Q. **WHAT DOES THE COMPANY PROPOSE FOR ACCOUNT 368 -  
6 DISTRIBUTION LINE TRANSFORMERS?**

7 A. The Company proposes a negative 15% net salvage. This represents a level equal to  
8 what the Commission last approved to the Company's most recently fully litigated  
9 case, but is more negative than the existing negative 5% adopted by settlement in the  
10 Company's last proceeding. Further, the negative 15% proposal is more negative  
11 than Mr. Robinson's proposed negative 10% in the Company's last proceeding.

12

13 Q. **DO YOU AGREE WITH THE COMPANY'S PROPOSAL?**

14 A. No. The Company's proposal is again unsubstantiated and excessively negative. I  
15 recommend a negative 5% net salvage for this account.

16

17 The historical data relied upon by the Company since the last depreciation study  
18 contains excessively negative aspects associated with hurricane activities. (See  
19 Staff's 15<sup>th</sup> Interrogatories No. 181). In addition, the Company admits to reassessing  
20 its salvage potential and reported a true-up of increased gross salvage in 2007  
21 offsetting zero values in 2004 and 2005, as well as possibly understating 2006. The  
22 historic understatement of salvage during 2004 through potentially 2006 appears to be  
23 part of the cause of the Company's decision to propose a more negative net salvage.  
24 Alternatively, a consideration that the Company apparently did not take into account  
25 is the fact that during 2005 and 2006 it retired a significantly higher percentage of

1 pole mounted transformers rather than pad mounted transformers. This relationship is  
2 opposite the dollar level of investment for this account where pad mounted  
3 transformers represent 56% of the investment. (See OPC's 2<sup>nd</sup> Interrogatories No. 96,  
4 Attachment).

5  
6 Another consideration demonstrating why the Company's proposal is excessive is the  
7 fact that excluding the hurricane related activity the Company did not report a single  
8 annual occurrence as negative as it proposes in this case during the past 10 years.  
9 (See Exhibit No. (EMR-2) at pages 8-126 and 8-127). During this period the  
10 Company reported positive values in three years and reported values less negative  
11 than the negative 5% that I am recommending in six of those years. Thus, when Mr.  
12 Robinson states that a "negative five (5) percent to negative fifteen (15) percent  
13 identified through an analysis of the Company's historical experience and future  
14 expectations" is the basis for his net salvage proposal, (See Mr. Robinson's direct  
15 testimony at page 25) it becomes clear that his proposal is based on an inappropriate  
16 encompassing of hurricane related activity as a normal ongoing expectation.  
17 Excluding hurricane related activity, my recommended negative 5% net salvage is a  
18 conservative value at this time.

19 **Q. WHAT IS THE IMPACT OF YOUR RECOMMENDATION?**

20 A. The standalone impact of my recommendation results in an annual \$3,026,237  
21 reduction to depreciation expense based on plant as of December 31, 2009.

22  
23 **Q. WHAT DOES THE COMPANY PROPOSE FOR ACCOUNT 369.1 -**  
24 **DISTRIBUTION SERVICES - OVERHEAD?**

1 A. The Company proposes a negative 50% net salvage. This compares to the same level  
2 of net salvage approved by the Commission in the Company's last fully litigated case  
3 and is the level adopted by settlement in the last proceeding. However, the proposed  
4 value is noticeably less negative than the negative 75% Mr. Robinson proposed in the  
5 last case.

6  
7 **Q. DO YOU AGREE WITH THE COMPANY'S PROPOSAL?**

8 A. No. The Company's proposal is unsupported and excessively negative. I recommend  
9 a normal reduction to a negative 40% net salvage.

10 In the last case, Mr. Robinson had no problem with claiming that "based upon the  
11 Company's experience and expectations and anticipated level of increased retirement  
12 activity at progressively higher retirement cost, future net salvage is estimated at  
13 negative seventy-five (75) percent." (See Docket No. 050078-EI 2005 Depreciation  
14 Study at page 4-42). Now, Mr. Robinson recognizes that his previously proposed  
15 negative 75% net salvage was severely excessive. However, he still fails to recognize  
16 the updated data, including the impact of hurricane related activity, yields a positive  
17 level of net salvage. In fact, reliance on data during the last 5 to 10 years would  
18 indicate a positive net salvage to no more than a negative 5% to 10% net salvage  
19 would be warranted. However, in recognition of the concept of gradualism I am only  
20 recommending a change to a negative 40% net salvage for this account. It is further  
21 worth noting that even if the gross salvage reported in 2004 were totally eliminated,  
22 the negative net salvage during the past 10 years would still not exceed a negative  
23 10%. Therefore, I recommend a minimum 10 percentage point reduction to the  
24 Company's proposal, which results in a negative 40% net salvage for this account.

25

1 Q. WHAT IS THE IMPACT OF YOUR RECOMMENDATION?

2 A. My recommendation on a standalone basis results in a \$516,263 reduction in annual  
3 depreciation expense based on plant as of December 31, 2009.

4

5 Q. WHAT DOES THE COMPANY PROPOSE FOR ACCOUNT 369.2 –  
6 DISTRIBUTION SERVICES – UNDERGROUND?

7 A. The Company proposes a negative 15% net salvage. This value compares to the  
8 value approved by the Commission in the Company's last fully litigated case, but is  
9 significantly more negative than the zero level reflected in the Company's most  
10 recent case, which was settled. The value is also less negative than the negative 25%  
11 Mr. Robinson proposed in the Company's last rate proceeding.

12

13 Q. DO YOU AGREE WITH THE COMPANY'S PROPOSAL?

14 A. No. The Company's proposal again appears to react to a major cost of removal  
15 reported during 2005 corresponding to hurricane related activity. Based on my  
16 review of the information I recommend a zero level of net salvage for this account.

17

18 Since Mr. Robinson failed to provide any narrative explanation for his proposal, a  
19 review of the narrative he did provide in the last depreciation study provides insight  
20 to his approach. In the last study, Mr. Robinson stated that "the Company has  
21 routinely experienced negative net salvage in conjunction with Underground Service  
22 retirements. The three year rolling band analysis shows net salvage has varied  
23 between a positive and negative salvage and averaged approximately four (4) percent.  
24 Future net salvage is forecasted to [be] in excess of negative thirty (30) percent.  
25 Based upon the Company's experience and expectations and anticipated level of

1 increase of retirement activity at progressively higher retirement costs, future net  
2 salvage is estimated at negative twenty-five (25) percent.” (See Docket No. 050078-  
3 EI 2005 Depreciation Study at page 4-43). In other words, the Company reviewed  
4 historical averages, specifically recent rolling bands, performed its “forecast” analysis  
5 of inflating values into the future, and then made a proposal based on historical  
6 experience, its expectation and anticipation of higher levels of negative net salvage.  
7 Assuming that Mr. Robinson was consistent between his last study and this study, one  
8 can identify that the “forecasted” future net salvage is still approximately negative  
9 30%. Therefore, that portion of the two different analyses is basically identical. That  
10 leaves actual Company experiences apparently as the driving factor. The four years  
11 in between studies, even after the inclusion of hurricane related activity, yields only a  
12 negative 11.5% level of net salvage. This would explain why Mr. Robinson elected  
13 to propose a negative 15% in this proceeding rather than the negative 25% he  
14 proposed in the last study, but leaves the undefined and unsubstantiated “anticipation  
15 and expectation” of the future still as a basis for Mr. Robinson’s artificial increase in  
16 negative net salvage.

17  
18 Mr. Robinson apparently again failed to recognize the unusual and negative aspect of  
19 hurricane related activity. Had Mr. Robinson eliminated both the retirement and the  
20 significant level of negative net salvage that occurred in 2005 associated with  
21 hurricane activity, the overall results for over the last 10 years would generally be  
22 between zero and a negative 4%, with trends towards zero. Mr. Robinson’s failure to  
23 compensate in any manner for the unusual storm related activity during the last  
24 several years is incorrect and unacceptable.

25

1 In addition, even Mr. Robinson recognizes that “much, if not most of underground  
2 services will be abandoned in place.” (See Docket No. 050078-EI, Mr. Robinson’s  
3 rebuttal testimony at page 46). While some level of cost of removal may be incurred  
4 in association with abandonment, there may also be gross salvage in instances where  
5 third party reimbursements occur or scrap metal maybe salvaged when services are in  
6 fact removed. Given these facts, a negative 15% net salvage does not rise to an  
7 acceptable level of reasonableness. As can clearly be seen by a review of the  
8 Company’s historical data during the past 10 years, with the exclusion of the single  
9 hurricane event in 2005, a zero level net salvage is reasonable and appropriate at this  
10 time.

11  
12 **Q. WHAT IS THE IMPACT OF YOUR RECOMMENDATION?**

13 A. The standalone impact of my recommendation results in a \$1,692,112 reduction in  
14 depreciation expense based on plant as of December 31, 2009.

15  
16 **Q. WHAT DOES THE COMPANY PROPOSE FOR ACCOUNT 370 –**  
17 **DISTRIBUTION METERS?**

18 A. The Company proposes a negative 10% net salvage. This compares to the same level  
19 approved by the Commission in the Company’s last fully litigated case, but represents  
20 a slight change from the negative 8% reflected in the Company’s last rate proceeding,  
21 which was based on a settlement.

22  
23 **Q. DO YOU AGREE WITH THE COMPANY’S PROPOSAL?**

1 A. No. The Company's proposal to move from a negative 8% to a negative 10% is  
2 inappropriate given the Company's actual information and other industry information.  
3 Therefore, I recommend a negative 6% net salvage.

4  
5 The Company retired \$82 million of investment in this account during 2006. The  
6 resulting net salvage was a negative 6%. In addition, Oncor Delivery Company, the  
7 largest utility in Texas just went through a similar significant concentrated change out  
8 of meters and testified that a \$5.63 cost of removal per meters was reasonable. While  
9 I recognize that labor rates between Florida and Texas may be different, relying on a  
10 \$5.63 per cost of removal for retiring meters would also yield an approximate  
11 negative 6%, based on the Company's number of meters. (See Staff's 4<sup>th</sup>  
12 Interrogatories No. 71). Therefore, a negative 6% net salvage would appear to be a  
13 reasonable and appropriate value at this time.

14

15 **Q. WHAT IS THE IMPACT OF YOUR RECOMMENDATION?**

16 A. My recommendation on a standalone basis results in a \$359,623 reduction to  
17 depreciation expense based on plant as of December 31, 2009.

18

19 **Q. WHAT DOES THE COMPANY PROPOSE FOR ACCOUNT 373 -**  
20 **DISTRIBUTION STREET LIGHTING AND SIGNALS?**

21 A. The Company proposes a negative 20% net salvage. This compares to the negative  
22 10% net salvage last approved by the Commission in a litigated case and the existing  
23 zero level which was established by means of settlement in the Company's last  
24 proceeding. The Company again provides no narrative basis for its position.

25

1 **Q. DO YOU AGREE WITH THE COMPANY'S PROPOSAL?**

2 A. No. The Company's proposal is excessively negative. Had Mr. Robinson remained  
3 consistent with his statements in the last case where his proposal was "based on the  
4 trend of recent experience and future expectations" (See Docket No. 050078-EI 2005  
5 Depreciation Study at page 4-46), he would have proposed a zero to negative 5% net  
6 salvage in this case, exclusive of the impact of the hurricane event during 2005. In  
7 fact, the most recent data indicates a positive 3% net salvage. (See Exhibit  
8 No. \_\_ (EMR-2) at page 8-147).

9

10 Street lighting investment poses a somewhat different situation from many other  
11 accounts. The Company can go years without selling a street lighting system and then  
12 incur a significant positive salvage associated with a sale. To assume that the  
13 Company will not sell any street lighting systems in the future has not been  
14 established as reasonable and would be contrary to historical activity. Such an  
15 assumption also fails to recognize that the overall net salvage for this account is a  
16 positive 8%. However, in order to remain conservative, I am recommending a  
17 negative 5% net salvage based on historical data exclusive of the hurricane related  
18 activity recorded during 2005. The negative 5% is both reasonable and appropriate,  
19 but does not give adequate weight to the potential of selling future street lighting  
20 systems. Therefore, my recommendation is conservative in favor of the Company.

21

22 **Q. WHAT IS THE IMPACT OF YOUR RECOMMENDATION?**

23 A. The standalone impact of my recommendation is a \$3,520,001 reduction to  
24 depreciation expense based on plant as of December 31, 2009.

25

1 Q. WHAT DOES THE COMPANY PROPOSE FOR ACCOUNT 390 – GENERAL  
2 STRUCTURES AND IMPROVEMENTS?

3 A. The Company proposes a negative 5% net salvage. This compares to the zero level  
4 established in the Company’s last rate proceeding which was based on a settlement.  
5

6 Q. DO YOU AGREE WITH THE COMPANY’S PROPOSAL?

7 A. No. The Company’s proposal is unrealistic and inappropriate. Buildings can be  
8 anticipated to appreciate rather than depreciate in value over the useful life proposed  
9 by the Company. Therefore, as a first step in the proper recognition of future positive  
10 salvage for the Company’s investment I am recommending a positive 15% net  
11 salvage.  
12

13 Mr. Robinson yet again remains silent on the basis for his proposal in this case. In  
14 the prior case Mr. Robinson recognized that there was a 6% overall positive level of  
15 net salvage, but that he “anticipated” an increase in cost of removal as interim  
16 retirements occurred due to renovations at the Company’s various properties and  
17 estimated a zero level of net salvage overall. (See Docket No. 050078-EI 2005  
18 Depreciation Study at page 4-47 and 4-48). This is yet another account where review  
19 of historic data may not be adequate given the nature of the investment in the account.  
20

21 In particular, approximately 20% of investment in the account is associated with the  
22 Company’s ten largest general plant structures and improvements. (See OPC’s 2<sup>nd</sup>  
23 Interrogatories No. 80). The Company has recently expended over \$20 million for  
24 block and concrete or metal buildings to house various distribution operation centers,  
25 garages etc. Moreover, the Company has proposed only a 24-year ASL for the

1 investment in this account. (See Exhibit No.\_\_(EMR-2), page 4-72). It is  
2 unreasonable and unrealistic to believe that block and concrete buildings, or metal  
3 buildings, after only 24 years or even 30 years would require demolition and the  
4 removal rather than a sale or reuse. As a standard practice throughout the United  
5 States, commercial buildings are expected to increase in value not decline in value  
6 over time. A building can obviously sell for more than 100% net salvage after  
7 extended periods of time. Failure to properly recognize the type of investment at  
8 issue and its significant potential for positive net salvage results in the Company's  
9 proposal being inaccurate and inappropriate. Some form of positive salvage is  
10 appropriate. Therefore, as a first step in the right direction I recommend the  
11 Commission adopt a positive 15% net salvage for this account.

12  
13 **Q. WHAT IS THE IMPACT OF YOUR RECOMMENDATION?**

14 A. My recommendation on a standalone basis would result in a \$1,218,203 reduction to  
15 depreciation expense based on plant in service as of December 31, 2009.

16  
17 **Q. DOES THIS CONCLUDE YOUR TESTIMONY?**

18 A. Yes; however, to the extent I have not addressed a method, value, issue, etc., it should  
19 not be assumed that I am accepting or endorsing that method, value, or issue.

1 **BY MR. REHWINKEL:**

2 Q. Mr. Pous, do you have a summary of your  
3 prefiled direct testimony prepared?

4 A. Yes.

5 Q. And mindful of the five-minute limitation by  
6 the Commission, can you give that summary to the  
7 Commission now?

8 A. Yes.

9 Depreciation is a very large dollar issue in  
10 this case. PEF's aggressive depreciation practices and  
11 proposals are the direct cause of its excessive request.  
12 PEF's aggressive depreciation proposals reflect unusual  
13 short estimates of service lives for certain accounts  
14 and certainly low projections of net salvage that are  
15 often skewed by recent hurricane impacts. Collecting  
16 the cost of plant over too short a period of time and  
17 underestimating the net salvage value has the effect of  
18 increasing annual depreciation expense above the  
19 appropriate amount.

20 In my testimony and exhibits I identify PEF's  
21 inappropriate service lives and net salvage parameters,  
22 explain with specificity why they are inappropriate, and  
23 then develop and support my recommended alternatives in  
24 detail on an account-by-account basis.

25 My recommendations and presentations are

1 superior to that of the company, as it failed to provide  
2 the actual substantiating factors in its study as  
3 required by the Commission rules. While my resulting  
4 total adjustments are large, they are the result of a  
5 detailed approach that examines and adjusts numerous  
6 individual accounts.

7 My adjustments to PEF's overly aggressive  
8 depreciation parameters has two effects. First, they  
9 reduce the amount of annual depreciation expense by  
10 113 million, thereby reducing test year expenses and  
11 reducing PEF's claimed revenue deficiency. Second, a  
12 periodic depreciation study is also used to compare the  
13 amounts of depreciation that would have been collected  
14 using the updated depreciation parameters, theoretical  
15 reserve, with what was actually collected, the book  
16 reserve.

17 The existence of a reserve and balance, either  
18 positive or negative, indicates that past customers have  
19 paid either too much or too little. Once the surplus or  
20 deficiency in the reserve is identified, a decision can  
21 be made as to whether to simply roll the difference into  
22 the amount to be collected over the remaining life of  
23 the plant or whether the discrepancy is so material and  
24 the inequity so great that another option of eliminating  
25 the surplus of reserve should be adopted.

1           In the area of reserve and balance, the  
2           company admits to a \$646 million excess. Moreover, the  
3           level of the excess reserve has increased since the last  
4           case and will continue to increase if PEF's proposals  
5           are adopted. Based on more appropriate life and salvage  
6           parameters than those developed in the company's  
7           depreciation study, I calculate the company's reserve  
8           excess to be \$858 million.

9           Under either calculation of excess reserve,  
10          the surplus level is massive and imposes an unreasonable  
11          and unacceptable level of intergenerational inequity on  
12          current customers who have paid far more for their use  
13          of the plant to date than was either appropriate or  
14          equitable. The magnitude of the imbalance calls for a  
15          departure from the company's proposed remaining life  
16          approach to curing imbalances.

17          A reserve surplus is as inequitable as a  
18          reserve deficiency. I contend that equity requires that  
19          the approach to rectifying material imbalances, positive  
20          or negative, to be symmetrical. I recognize that it's  
21          not possible to rectify PEF's 858 million surplus  
22          overnight. I recommend that 646 million of the  
23          858 million surplus be amortized back to customers over  
24          four years. The result is an annual amortization in the  
25          amount of \$161 million.

1           OPC witness Dan Lawton has examined the impact  
2 of this proposal on PEF's financial conditions. He will  
3 testify that PEF can accomplish the four-year  
4 amortization that I recommend and continue to possess  
5 strong financial integrity.

6           In summary, my adjustments to PEF's  
7 depreciation parameters would reduce annual depreciation  
8 expense by 113 million. Adopting my proposal to  
9 amortize 646 million over four years would lower  
10 depreciation expense by an additional 161 million per  
11 year. When combined, my proposal to amortize a portion  
12 of PEF's reserve surplus over four years and to reduce  
13 its proposed depreciation rates would be to reduce its  
14 expense by approximately \$275 million prior to the  
15 impact of special riders.

16           I have every expectation that even after my  
17 adjustments PEF will still be in an excess reserve  
18 position when it performs its next depreciation study.

19           **MR. REHWINKEL:** Mr. Pous is tendered for  
20 cross-examination.

21           **CHAIRMAN CARTER:** Thank you, Mr. Rehwinkel.

22           Ms. Bradley.

23           **CROSS EXAMINATION**

24           **BY MS. BRADLEY:**

25           **Q.** Mr. Pous, could you explain -- you used the

1 term "intergenerational inequity." Can you explain what  
2 that is?

3 **A.** Yes. In the area of depreciation,  
4 intergenerational inequity implies that one group of, or  
5 generation of customers is paid more than its fair share  
6 or less than its fair share. In an example, if you  
7 assume that an item of plant will last ten years, and  
8 you're five years into the analysis and customers have  
9 paid for half of the use of the plant, at least what  
10 they thought, and then we find out that the life  
11 analysis really should have been 15 years, so we have an  
12 additional ten years of life, well, customers up to that  
13 point have paid half of it, yet the remaining two-thirds  
14 of the life of the investment is still out there. That  
15 means future ratepayers have gotten a benefit because  
16 historic ratepayers have paid more than their fair  
17 share. That's inequitable. That's what's considered  
18 intergenerational inequity.

19 **MS. BRADLEY:** No further questions.

20 **CHAIRMAN CARTER:** Thank you, Ms. Bradley.

21 Ms. Kaufman.

22 **MS. KAUFMAN:** I have no questions, Mr.

23 Chairman.

24 **CHAIRMAN CARTER:** Ms. Armstrong --

25 Ms. Alexander.

1                   **MS. ALEXANDER:** No questions.

2                   **CHAIRMAN CARTER:** Sorry about that,

3 Ms. Alexander.

4                   Mr. Lavia.

5                   **MR. LAVIA:** No questions, Mr. Chairman.

6                   **CHAIRMAN CARTER:** Mr. Walls.

7                                   **CROSS EXAMINATION**

8                   **BY MR. WALLS:**

9                   **Q.** Good morning, Mr. Pous.

10                  **A.** How are you today?

11                  **Q.** I'm doing fine. How are you?

12                  **A.** I'm alive.

13                                 (Laughter.)

14                  **Q.** Mr. Pous, you're an engineer; correct?

15                  **A.** Among other things.

16                  **Q.** You have no degree in accounting; correct?

17                  **A.** Correct.

18                  **Q.** And you don't practice as a CPA or anything  
19 like that; right?

20                  **A.** I don't practice as a CPA, but I do testify on  
21 accounting matters and financial matters before  
22 regulatory bodies throughout the United States.

23                  **Q.** Okay. I want to talk a minute about the  
24 variance between the depreciation book reserve and the  
25 theoretical reserve. Okay?

1           **A.**    Fine.

2           **Q.**    Your proposal is to pay \$161 million a year  
3 out of the depreciation book reserve back to customers;  
4 correct?

5           **A.**    Yes.

6           **Q.**    And so at the end of the four years the  
7 depreciation book reserve would have to be restated to  
8 reflect that annual \$161 million adjustment; correct?

9           **A.**    Yes.  It would be \$646 million lower than it  
10 would be absent any of the amortization that I propose.

11          **Q.**    And you determined the amount by going to the  
12 company's calculation of the theoretical versus book of  
13 the \$646 million in the depreciation study, and that's  
14 the amount that you recommend to be amortized over four  
15 years; correct?

16          **A.**    Yes.  I chose the lower of the amounts that  
17 were available to be amortized back to customers at this  
18 point.

19          **Q.**    And could you turn to Page 30, Line 7 to 11 of  
20 your testimony?

21          **A.**    You said Line 7 to 11?

22          **Q.**    Yes.

23          **A.**    Okay.

24          **Q.**    Are you there?

25          **A.**    I am there now, yes.

1           **Q.**    Okay.  And you say there, quote, at, beginning  
2           at Line 7, "The theoretical reserve is the calculated  
3           balance that would be in the accumulated provision for  
4           depreciation (FERC account 108), often called the  
5           reserve, at a point in time if current depreciation  
6           parameters (i.e., current life and salvage estimates)  
7           had been applied from the outset."  Did I read that  
8           correctly?

9           **A.**    Yes.

10          **Q.**    And what you do with the theoretical  
11          calculation is from the outset you assume that those  
12          proposed parameters that are recommended to the  
13          Commission that they use have always been in effect  
14          since the Commission -- commencement of the operation of  
15          the assets; correct?

16          **A.**    Yes and no.

17          **Q.**    Do you have your deposition with you?

18          **A.**    No.

19                   (Document given to witness.)

20          **Q.**    If you could turn to Page 82, Lines 19 to 25,  
21          and Page 83, Lines 1 to 2 of your deposition, and I  
22          asked you the following question.

23                   "Question:  And what you do with the  
24          theoretical calculation is from the outset you assume  
25          that those proposed parameters you're recommending to

1 the Commission that they use have always been in effect  
2 since the commencement of operation of the assets;  
3 correct?

4 "Answer: It would create the theoretical  
5 level.

6 "Question: So the answer to my question is  
7 yes?

8 "Answer: Yes."

9 Did I read that accurately?

10 **A.** Yes.

11 **Q.** Okay.

12 **A.** But you failed to note elsewhere in the  
13 deposition, such as on Page 82, that I also say it's a  
14 forward-looking concept. You have to understand the  
15 actual calculation of the theoretical reserve and how  
16 it's interactive. It is theoretically correct going  
17 forward, but it is also theoretically going backwards  
18 under certain conditions. Historically, you would have  
19 to have the same level of plant that we have today,  
20 which we know we don't have. So a historical review of  
21 the rates in the past would not get you to the  
22 theoretical reserve that you would have today. That's  
23 why it's a prospective-looking theoretical reserve  
24 calculation, as required by this Commission.

25 **Q.** Mr. Pous, could you answer my questions,

1 please?

2 **A.** I believe I did. I expanded on it.

3 **Q.** I only asked you if I read that correctly;  
4 right? And you said yes.

5 **A.** And I was pointing out that you left out other  
6 aspects of the deposition.

7 **Q.** Well, if you would like for other aspects of  
8 your deposition to be read, I'm sure Mr. Rehwinkel can  
9 handle it on redirect. But would you kindly answer my  
10 questions, please?

11 **A.** I definitely will.

12 **Q.** Thank you.

13 **MR. REHWINKEL:** Mr. Chairman, I want to object  
14 to this. I think it's argumentative with the witness,  
15 and it's contrary to the Commission's practice of  
16 allowing for each and every question that a yes and no  
17 be required, which Mr. Pous did do, with the opportunity  
18 for explication, which he did do.

19 **CHAIRMAN CARTER:** Okay. It's too far from  
20 lunch for you guys to get antsy, so let's kind of dial  
21 it back a little bit. The witness can answer the  
22 question yes or no or I don't know, and then they'll be  
23 entitled to respond or explain their answer. Let's  
24 proceed.

25

1 **BY MR. WALLS:**

2 **Q.** So, Mr. Pous, will you agree with me the  
3 theoretical calculation, under the theoretical  
4 calculation you're taking your proposed rates and  
5 applying them over the historical plant activity;  
6 correct?

7 **A.** That's one way you can do it with a number of  
8 assumptions. The correct way, which will get you to the  
9 same answer, is what is required by this Commission as a  
10 prospective-looking analysis. If you're looking to  
11 simply take the historic depreciation rates and apply  
12 them to the history, you don't have the same level of  
13 plant we have today when the calculation is made on a  
14 historical basis.

15 **Q.** Mr. Pous, could you turn to Page 84 of your  
16 deposition?

17 **A.** I'm there.

18 **Q.** Lines 20 to 24, where I ask you the following  
19 question, you gave me the following answer.

20 "Right, because to do the theoretical  
21 calculation, you're taking your proposed rates and  
22 applying them over the historical plant activity;  
23 correct?

24 "Answer: Yes."

25 Did I read that accurately?

1           **A.**    Yes, you did.

2           **Q.**    Thank you.  And that assumption has to be made  
3           in order to do the theoretical calculation, in order to  
4           compare the theoretical to the book reserve; right?

5           **A.**    No.  In Florida it is a prospective-looking  
6           theoretical reserve.  You can still do it historically,  
7           but you have to make a lot more assumptions.

8           **Q.**    Could you turn to Page 85 of your deposition,  
9           Lines 4 to 8?

10          **A.**    I'm there.

11          **Q.**    Where I asked you the following question and  
12          you gave me the following answer.

13                   "Question:  Right.  But that assumption has to  
14                   be made in order to do the theoretical calculation in  
15                   order to compare it to the book; right?

16                   "Answer:  To establish one of the two points  
17                   in the analysis, the theoretical portion of the  
18                   analysis."

19                   Did I read that accurately?

20          **A.**    Yes.  And there is still many other places in  
21          the deposition where I explain to you very clearly that  
22          it's a prospective-looking theoretical reserve analysis.  
23          You can still do it historically, but there are  
24          different assumptions.

25          **Q.**    Mr. Pous, we know that over the entire time

1 period of the historic time period that there were  
2 depreciation rates in effect; correct?

3 **A.** Absolutely.

4 **Q.** And you would agree that the customers paid  
5 the legal rate adopted by the Commission in the past;  
6 right?

7 **A.** I haven't audited it, but I would be surprised  
8 otherwise.

9 **Q.** And when you do the theoretical to book  
10 calculation, it's a snapshot, right, taken when you  
11 quantify the theoretical reserve and subtract it from  
12 book reserve and get an imbalance as of a point in time;  
13 correct?

14 **A.** Correct.

15 **Q.** And when you do that calculation, you're using  
16 rates that are proposed to be in effect, because they  
17 haven't even been approved, and they're proposed to be  
18 in effect from that point forward and that point  
19 backwards; right?

20 **A.** Not that point backwards.

21 **Q.** Could you turn --

22 **A.** Unless you make certain additional  
23 assumptions.

24 **Q.** Could you turn to Page 124, Lines 3 to 8 of  
25 your deposition, where I asked you the following

1 question and you gave me the following answer?

2 "Right. And when you do that calculation,  
3 you're using rates that are proposed to be in effect  
4 because they haven't even been approved, right, yet  
5 they're proposed to be in effect from that point  
6 forward?

7 "Answer: And that point backwards."

8 Did I read that correctly?

9 **MR. REHWINKEL:** Mr. -- before he answers that  
10 question, I want to object. I think there was a, a, and  
11 I could be mistaken, but I think there was a, an  
12 illustrative diagram that Mr. Walls was drawing on that  
13 this answer was related to, if I'm not correct (sic.).

14 **MR. WALLS:** Yes. And I just read the answer  
15 that he gave, and I'd like him to answer if that's the  
16 answer he gave me in the deposition.

17 **MR. REHWINKEL:** Well, I don't think -- I'm  
18 sorry. I don't think the answer can be given or that --  
19 I mean, what Mr. Walls is trying to do is impeach the  
20 witness, live testimony based on statements he gave in  
21 his deposition. And I think he's entitled, since this  
22 answer was given with Mr. Walls standing it (phonetic)  
23 on a table, drawing on a piece of paper, and that piece  
24 of paper was made an exhibit to this deposition. I  
25 think he's entitled to see that and look at the full

1 context of the question and answer.

2 **CHAIRMAN CARTER:** Here's the plan, before we  
3 go -- I'm not going to rule on the objection. I'm just  
4 going to give a caution. If you can answer the question  
5 yes or no, answer it yes or no first, or I don't know.  
6 Then you can explain your answer. He's entitled to do  
7 that. And as you get to the page, if you say, hey, I  
8 said yes, but here's why I said that. Okay?

9 **THE WITNESS:** No problem.

10 **CHAIRMAN CARTER:** We can do that. So let's  
11 move forward, gentlemen. Mr. Walls.

12 **MR. WALLS:** Okay. And if it would help, I  
13 mean, I, I would --

14 **CHAIRMAN CARTER:** Let's proceed. Let's  
15 proceed. Let's proceed.

16 **BY MR. WALLS:**

17 **Q.** I'll go back to the question I had asked you,  
18 Mr. Pous, at Lines 124, 3 to 8, I asked you the  
19 following question and you gave the following answer.

20 "And when you do that calculation, you're  
21 using rates that are proposed to be in effect because  
22 they haven't even been approved; right? They're  
23 proposed to be in effect from that point forward.

24 "Answer: And that point backwards."

25 Did I read that correctly?

1           **A.**    Yes.

2           **Q.**    And that's the answer you gave me; right?

3           **A.**    That's the answer I gave you based on the  
4           limited question you provided.

5           **Q.**    Could you please turn to Pages 33 and 34 of  
6           your testimony, your direct testimony?

7           **A.**    I'm there.

8           **Q.**    And do you see at the bottom of Page 33,  
9           carrying over to 34, where you say how you've normally  
10          handled reserve material imbalance in situations like  
11          this?

12          **A.**    Yes.

13          **Q.**    Okay.  And in answering this question the only  
14          example you give is the prior rate proceeding involving  
15          Progress Energy Florida; correct?

16          **A.**    Yes.

17          **Q.**    And outside of Florida Power & Light and  
18          Progress Energy in their current rate proceedings and  
19          Progress Energy Florida in the 2005 proceeding, you have  
20          not made a similar reserve and balance adjustment  
21          recommendation in any other proceeding; correct?

22          **A.**    I don't recall any.

23          **Q.**    And as a result I cannot go out and find in  
24          any other commission around this country where you made  
25          a certain reserve imbalance adjustment proposal and the

1 commission has ruled on that proposal; correct?

2 **A.** I don't believe you can.

3 **Q.** Okay. And in fact you testify at Page 35,  
4 Lines 23 to 24 of your direct testimony, that when  
5 reserve imbalances occur, they are normally treated  
6 through the remaining life process; correct?

7 **A.** Correct.

8 **Q.** And by normally treated, you mean by utilities  
9 and regulatory commissions; correct?

10 **A.** Yes.

11 **Q.** And you could proceed by establishing  
12 depreciation rates on a going-forward basis using a  
13 remaining life technique without doing the calculation  
14 of the theoretical versus book reserve; correct?

15 **A.** Correct.

16 **Q.** And in fact you are using the average  
17 remaining life technique in your recommendations as well  
18 apart from this amortization; correct?

19 **A.** Yes.

20 **Q.** Now you're asking the Commission to take  
21 \$646 million out of the company's book depreciation  
22 reserve and pay it back to customers over four years,  
23 and you cannot show me in your direct testimony or at  
24 your deposition any Commission order approving a  
25 proposal like that that resulted in depletion of the

1 book reserve to pay customers back money out of the  
2 reserve or a period shorter than average remaining life  
3 that was calculated based on a theoretical to book  
4 reserve variance calculation without stipulations or  
5 settlements; correct?

6 **MR. REHWINKEL:** I want to object to the word  
7 "depletion." It's vague and I think it assumes facts  
8 not in evidence.

9 **CHAIRMAN CARTER:** Rephrase.

10 **MR. WALLS:** Well, it's the same question I  
11 asked at the depo and he didn't object.

12 **MR. REHWINKEL:** Well --

13 **CHAIRMAN CARTER:** Rephrase. Rephrase.  
14 Rephrase. Let's move it.

15 **BY MR. WALLS:**

16 **Q.** You're asking the Commission to take  
17 646 million out of the company's book depreciation  
18 reserve and pay that back to customers over four years,  
19 and you cannot show me in your direct testimony or at  
20 your deposition any Commission order approving a  
21 proposal like that that used money out of the reserve  
22 over a period shorter than the average remaining life  
23 that was calculated based on a theoretical to book  
24 reserve variance calculation without stipulations or  
25 settlements; correct?

1           **A.** You want to tell me what page of the  
2 deposition you're talking about?

3           **Q.** Yes. Page --

4           **CHAIRMAN CARTER:** That was a long, convoluted  
5 question. If you could break it down, that'd be  
6 helpful.

7 **BY MR. WALLS:**

8           **Q.** If you would turn to Page 109, Lines 8 to 23  
9 of your deposition.

10          **A.** 109, what lines?

11          **Q.** Lines 13 --

12          **A.** Okay.

13          **Q.** Or, I'm sorry, Lines 8 to --

14          **CHAIRMAN CARTER:** Mr. Walls, Mr. Walls, not  
15 that there's any law against long, convoluted questions,  
16 but we usually get those late at night.

17          **MR. WALLS:** I'm sorry.

18          **CHAIRMAN CARTER:** You may proceed.

19          **MR. WALLS:** There was a lot that had to be  
20 included. I apologize.

21          **CHAIRMAN CARTER:** You may proceed.

22 **BY MR. WALLS:**

23          **Q.** Lines 8 through 23, do you see that, where I  
24 asked you this same question?

25          **A.** Yes.

1           **Q.**   And you answered, "With that list of caveats I  
2           can't do that today, but I can't say that there's not  
3           one at this point."   Correct?

4           **A.**   That's what it says.

5           **Q.**   Thank you.   Now you acknowledge that the  
6           average remaining life recognizes that depreciation is a  
7           forecast or estimation process; correct?

8           **A.**   I don't think the average remaining life  
9           itself does it, but it takes it into account.

10          **Q.**   And depreciation is a forecast estimation  
11          process; right?

12          **A.**   Yes.

13          **Q.**   And you would agree that any process that  
14          involves estimates, which depreciation does, will result  
15          in actual values differing from predicted values;  
16          correct?

17          **A.**   Normally that will occur.

18          **Q.**   And that means that no one, including  
19          yourself, is entirely accurate; correct?

20          **A.**   I think I said in my deposition something like  
21          I'm not that lucky.

22          **Q.**   Yes.   That's pretty close.   You would agree  
23          that the utility system is going to change daily,  
24          monthly, yearly; correct?

25          **A.**   Yes, you would expect it to.   If not -- it

1 doesn't necessarily have to, but you would expect it to.

2 Q. And if we reran the theoretical calculation  
3 and do the estimate again, even the estimates may be  
4 different; correct?

5 A. You would expect that's a distinct  
6 possibility. Yes.

7 Q. And even your estimates of the additional  
8 variance that you calculated could turn out to be  
9 different than what you estimated; correct?

10 A. Yes. And I would expect they would. As I  
11 stated in my testimony, that I did not make adjustments  
12 for the combined cycle short lives that the company has  
13 proposed. I haven't made adjustments for the terminal  
14 net salvage studies that the company has proposed, which  
15 are excessive. So I would expect that my reserve that I  
16 calculate would understate the actual excess reserve  
17 that exists.

18 Q. Under GAAP, isn't it true that depreciation  
19 changes in estimates, service lives, net salvage are  
20 applied prospectively?

21 A. I think GAAP does say that. But you also are  
22 aware that GAAP doesn't dictate ratemaking.

23 Q. Under your proposal, the company's book  
24 depreciation reserve will decrease by \$161 million for  
25 four years; correct?

1           **A.**   Per year.  Yes.

2           **Q.**   And that \$160 million would be subtracted from  
3 current depreciation expense under your proposal; right?

4           **A.**   Yes.

5           **Q.**   And you would agree that's a reduction in cash  
6 flow to the company; right?

7           **A.**   Yes.

8           **Q.**   And you did not look at the impact of reducing  
9 the company's depreciation expense by \$161 million a  
10 year on the company's net income in the test year;  
11 correct?

12           **A.**   That is correct.  That's why I brought the  
13 matter up with my client, had them get a conference call  
14 together with the accounting witness, the rate of return  
15 witness, and the financial witness in order to apprise  
16 them of the magnitude of the adjustment I was proposing  
17 and have them come back and tell me whether it was  
18 doable and not harming the company's financial position.

19           **Q.**   You would agree with me your recommendation --  
20 if, if your recommendation is accepted, the rate base  
21 will increase by at least \$161 million each year  
22 starting in 2010; correct?

23           **A.**   Correct.

24           **Q.**   And the company is certainly entitled to an  
25 opportunity to earn a return on that higher rate base;

1 right?

2 **A.** They're entitled to the opportunity to earn  
3 that. But you always have to bear in mind, this is one  
4 component of the overall cost of service. The company  
5 may under recover in theory one component of a cost of  
6 service and overrecover in another area and choose not  
7 to come in for a rate proceeding because it may still be  
8 overearning in total.

9 **Q.** Mr. Pous, and you have not done anything in  
10 your testimony or analysis that you can show me in your  
11 testimony or exhibits where you performed any  
12 calculations showing the impact of that \$161 million  
13 reduction in the reserve over four years on rate base  
14 and the increase in return on rate base; correct?

15 **A.** Correct.

16 **Q.** And you also did not adjust the depreciation  
17 rates going forward to take into account the impact of  
18 your proposal to amortize the variance between the  
19 theoretical and book on depreciation rates; correct?

20 **A.** Correct.

21 **Q.** Okay. I want to turn briefly to another  
22 topic, the service lives for CR-4 and 5. As I  
23 understand your testimony, you proposed 60 years for  
24 Crystal River Units 4 and 5, the coal units, but no  
25 change for CR-1 and 2; correct?

1           **A.**    That is correct.

2           **Q.**    And when I took your deposition, you could not  
3 recall if you were aware at the time you filed your  
4 testimony that PEF had extended the life of Crystal  
5 River Units 4 and 5 14 years from their last study to  
6 the present one; correct?

7           **A.**    That's correct. I didn't remember it was 14  
8 years.

9           **Q.**    Okay. And part of the basis of your  
10 recommendation regarding the service lives of the coal  
11 plant extending 60 years, you rely on someone else who  
12 actually operates a coal plant for a different company  
13 in a different part of the country; correct?

14          **A.**    I said in part, if I remember correctly.

15          **Q.**    Yes, you did. And I said in part.

16          **A.**    Okay.

17          **Q.**    Did you undertake to compare the manufacturer  
18 of the units at Crystal River Units 4 and 5 to the units  
19 that you recommended with respect to your 60-year  
20 service lives?

21          **A.**    No, I did not. But based on past experience  
22 of having looked at the manufacturers at other plants  
23 and not being able to discern any difference in the  
24 projected service lives due to the manufacturer, I  
25 didn't think that was appropriate or necessary.

1           **Q.** And you also didn't compare capital  
2 expenditures at the units that you identified in your  
3 testimony compared to Crystal River Units 4 and 5;  
4 correct?

5           **A.** No, I did not. But, again, when you're  
6 looking at a plant that has a probable retirement date  
7 20 or more years in the future, you're not going to have  
8 any capital expenditures known today that are going to  
9 be applicable for that period into the future, so it's  
10 meaningless.

11           **Q.** And you didn't compare O&M costs at Crystal  
12 River Units 4 and 5 against the units from these other  
13 jurisdictions, did you?

14           **A.** Again -- I did not. But, again, when you're  
15 looking at probable retirement dates decades into the  
16 future, you don't know what those O&M costs will be  
17 decades into the future for each of the units. So I  
18 couldn't have compared them if I wanted to.

19           **Q.** And you agree that it would be foolish for a  
20 depreciation manual to include a statement that says  
21 coal plants have to have 60-year service lives; correct?

22           **A.** I don't think there's any manual that tells  
23 you that.

24           **Q.** Okay. A few questions about net salvage,  
25 Mr. Pous.

1           You made recommended changes to 15 mass  
2 property accounts, and you didn't make modifications to  
3 the other mass property accounts; correct?

4           **A.** I didn't take a position on the other ones.

5           **Q.** And you focused on the transmission and  
6 distribution mass property counts that had the most  
7 value; right?

8           **A.** I haven't gone back and looked, but I wouldn't  
9 be surprised. I would expect that to be the case.

10          **Q.** And you would agree with me that you've  
11 recommended lower net salvage parameters in every single  
12 account of these 15 accounts that you address; correct?

13          **A.** Yes. And that's in reaction to the very  
14 specific data that was applicable to the company that I  
15 reviewed and analyzed.

16          **Q.** And you would also agree with me that net  
17 salvage parameters are also estimates; correct?

18          **A.** Yes.

19          **Q.** And therefore even your proposals are  
20 estimates; right?

21          **A.** Absolutely.

22          **Q.** And will you agree with me then as well that  
23 this estimate is not going to be absolutely the same in  
24 the future; right? That would be sheer coincidence.

25          **A.** That would be coincidence, but you have

1 different levels of estimation. You have, let's say,  
2 the universe of opportunity to elect a number. The  
3 company's approach, as you heard during Mr. Robinson's  
4 cross-examination, was he performs a forecast analysis.  
5 If you look at the individual account forecast analysis  
6 that he performs, it proposes a number that's so high  
7 that it creates a value of hundreds of percent that he  
8 can choose within.

9 I am of the opinion you can't create a range  
10 of values that is so ridiculously wide that you can  
11 choose anything in between and say that's appropriate.  
12 The data that you can analyze can define a range, and if  
13 you're within that range, it's fine. But you cannot  
14 make the range too wide and have it have credibility.

15 That's why, yes, I do forecast in the future.  
16 Yes, the company does forecast in the future. I implore  
17 you to look at the forecasting methods that are  
18 employed, the discussions, the underlying basis, the  
19 premises, and determine if one is more of a pluck a  
20 number out of a very, very wide range and another one is  
21 a more detailed explanation of why I narrowed the range  
22 and why the value I chose is more realistic.

23 Q. Are you finished?

24 A. Yes.

25 Q. Thank you. You would also agree with me that

1 you should not just take a pure mathematical calculation  
2 to arrive at net salvage; right? Judgment has to be  
3 exercised; correct?

4 **A.** Yes. And it has to be good judgment.

5 **Q.** And if that's all true, there's a range of  
6 reasonableness, right, in these net salvage estimates;  
7 correct?

8 **A.** I think I stated that before. But you can't  
9 have the range of reasonableness, reasonableness be, for  
10 example, 0 to 400 percent negative net salvage. That's  
11 not a reasonable range.

12 **Q.** Mr. Pous, you also agreed looking at the  
13 depreciation experience for other Florida utilities  
14 gives you an additional data point; correct?

15 **A.** Yes.

16 **Q.** But you did not look at other Florida  
17 utilities' net salvage parameters; correct?

18 **A.** That is correct. Well, I looked at Florida  
19 Power & Light I think is what I told you in my  
20 deposition.

21 **Q.** Okay. And, Mr. Pous, the method that you're  
22 following for the mass property accounts in identifying  
23 an average remaining life in an Iowa curve to correspond  
24 to the retirement history and experience is the same  
25 methodology that was followed by the company's witness

1 in preparing the depreciation study in 2009 and in 2005;  
2 correct?

3 **A.** The mathematical calculations are. The  
4 interpretation of the data is different.

5 **Q.** And with respect to PEF's calculation of the  
6 average remaining life, you don't have a problem with  
7 the company's mass property remaining life calculation.  
8 In fact, you believe you duplicated it precisely;  
9 correct?

10 **A.** That is correct. That's the mathematical  
11 components. We did have a problem in the FP&L case  
12 where the number cannot be duplicated in the normal  
13 standard calculation approach.

14 **MR. WALLS:** That's all the questions I have.  
15 Thank you, Mr. Pous. Always a pleasure.

16 **THE WITNESS:** Yes, it is.

17 **CHAIRMAN CARTER:** Thank you, Mr. walls.  
18 Staff.

19 **MR. YOUNG:** Thank you, Mr. Chairman.

20 **CROSS EXAMINATION**

21 **BY MR. YOUNG:**

22 **Q.** Good morning, Mr. Pous. How are you?

23 **A.** I'm alive still.

24 (Laughter.)

25 **Q.** My name is Keino Young. I'm with the

1 Commission staff. I have several questions for you this  
2 morning.

3 **MR. YOUNG:** But before we begin that, Mr.  
4 Chairman, just a point of information. Last night staff  
5 handed out the staff composite exhibit for Mr. Pous, and  
6 these are consistent of late-filed deposition exhibits  
7 that have been agreed to by all the parties. And this  
8 will need to be numbered. We're about to hand it out  
9 right now.

10 **CHAIRMAN CARTER:** Let's hand it out and then  
11 I'll give you a number, and the number will be 286.  
12 Number 286.

13 **MR. YOUNG:** Yes, sir. And a short title will  
14 be Late-Filed Deposition of Pous, Numbers 4, 9 and 10.

15 **CHAIRMAN CARTER:** How about just Late-Filed  
16 Deposition of Witness Pous? Will that work for you?

17 **MR. YOUNG:** That's fine too, sir.

18 **CHAIRMAN CARTER:** Okay. Good deal.

19 (Exhibit 286 marked for identification.)

20 **MR. YOUNG:** And at your pleasure, Mr.  
21 Chairman, we can either move it in now or we can move it  
22 in at the end of Mr. Pous.

23 **CHAIRMAN CARTER:** I'd rather do it at the end,  
24 and that way we can finish cross and redirect and we'll  
25 deal with that when we deal with the exhibits.

1           **MR. YOUNG:** Thank you, sir.

2           **CHAIRMAN CARTER:** Okay. Does all the parties  
3 have a copy?

4           Mr. Rehwinkel, do you have one?

5           **MR. REHWINKEL:** Yes, sir. Thank you.

6           **CHAIRMAN CARTER:** Okay. You may proceed,  
7 Mr. Young.

8           **MR. YOUNG:** Thank you, sir.

9           **BY MR. YOUNG:**

10           **Q.** Mr. Pous, are you aware of the PSC's Review of  
11 Commission Depreciation Practice published in 1992?

12           **A.** I read it about a month ago.

13           **Q.** Okay. Are you aware that the, that this  
14 publication contained a summary of the Commission's  
15 depreciation practices?

16           **A.** I believe that was the indication in the  
17 publication, or in the document.

18           **Q.** All right. Are you aware that one of the  
19 practices discussed in this document is capital recovery  
20 schedules?

21           **A.** Yes.

22           **Q.** Are you aware that the use of capital recovery  
23 schedules have been the practice of, of this Commission  
24 for many years?

25           **A.** I believe that's correct.

1           **Q.** Also, Mr. Pous, are you aware that the use of  
2 the reserve transfer has also been a practice of the  
3 Commission for many years?

4           **A.** Yes. I've read that in a number of decisions.

5           **Q.** All right. Depreciation -- moving to  
6 depreciation study rules. Are you aware of the  
7 Commission depreciation study rule, Rule 25-6.0436,  
8 *Florida Administrative Code*?

9           **A.** Yes.

10          **Q.** Is it your understanding, Mr. Pous, that this  
11 rule requires a prospective theoretical reserve  
12 calculation rather than a retrospective calculation?

13          **A.** Yes. And I just will reiterate, it's a  
14 100 percent calculation. If you do it on a prospective  
15 basis and it says 30 percent needs to be recovered, then  
16 in theory you could go back and calculate historically  
17 that 70 percent has been recovered. You don't exceed  
18 100 percent. But the proper calculation is a  
19 prospective-looking analysis, but it still can be done  
20 historically with many additional assumptions.

21          **Q.** Mr. Pous, are you familiar with the National  
22 Association of Regulatory Commission publication  
23 entitled *Public Utilities Depreciation Practices*?

24          **A.** Yes, I am.

25          **Q.** Mr. Pous, are you aware that the National

1 Association of Regulatory Commission suggests that the  
2 use of an annual amortization over a short period of  
3 time is a common option for eliminating a material  
4 reserve, material reserve imbalance?

5 **A.** I believe I can recall that.

6 **Q.** Mr. Pous, do you consider the publication as  
7 an authoritative, as authoritative in the area of  
8 utility depreciation?

9 **A.** Parts of it I would say yes. I can't say the  
10 whole portion. It's a good primer. It gives good  
11 information. It wouldn't be at the level that you would  
12 expect to be authoritative in rate proceedings based on  
13 the unique issues and the way they're raised in cases.

14 **Q.** Do you consider this publication as setting  
15 forth generally accepted depreciation principles?

16 **A.** I think that's a fair characterization.

17 **Q.** Looking at the matching concept, the concept  
18 of matching depreciation expense, expenses to the life  
19 of the property is called a matching principle; is this  
20 correct?

21 **A.** I would agree with that.

22 **Q.** If depreciation is matched to the economic  
23 climate, would this be a conflict with the matching  
24 principle?

25 **A.** Can you repeat the question, please?

1           **Q.** If depreciation is matched to the economic  
2 climate, would this be in conflict with depreciation,  
3 with the matching principle?

4           **A.** I'm not sure I completely understand the  
5 question. If you match depreciation to the economic  
6 climate, did you say?

7           **Q.** Yes, sir.

8           **A.** So if you're saying the economic climate  
9 shortens the life, then I would agree. If the economic  
10 climate doesn't shorten the life, then I wouldn't agree.

11          **Q.** All right. Do you consider PEF's calculation  
12 reserve variance to be material?

13          **A.** Yes.

14          **Q.** How would you define "material" in this  
15 circumstance?

16          **A.** Well, there is no absolute number. The only  
17 jurisdiction that I'm aware of that has a value for  
18 reserve amortization is the Alberta, Canada province.  
19 And they say that if your reserve imbalance is 5 percent  
20 or more, you take that into account and you put, build  
21 that into your depreciation rates. If it's less than  
22 5 percent, you leave it alone. You expect there will be  
23 some variance in your reserve between the theoretical  
24 and the actual book, you accept some of it. They have a  
25 5 percent level. I don't hold necessarily to that

1 level, but that's the only one I'm aware of  
2 specifically.

3 In this case we're talking about \$646 million,  
4 as admitted to by the company. I believe that is  
5 substantial and significant and material in anybody's  
6 book. I've quantified it at 858 million, and I believe  
7 it's actually higher than that because of the other  
8 adjustments I have proposed.

9 So under all those criteria I believe it is  
10 significant and material.

11 Q. Okay. Looking at the study requirements,  
12 based on your review of PEF's depreciation study, does  
13 the study contain specific information regarding PEF's  
14 load management, load demand? Excuse me.

15 A. Repeat that again.

16 Q. Based on your review of PEF's depreciation  
17 study, does the study contain specific information with  
18 regards to PEF's load, PEF's load demand?

19 A. No.

20 Q. Does the study contain specific information  
21 with respect to conditions of generating plants?

22 A. No.

23 Q. Does the study contain specific information  
24 with regards to PEF's experience with the operating of  
25 its generating units?

1           **A.**    No.

2           **Q.**    Does the study contain specific information  
3 with respect to PEF's experience with, with the  
4 maintenance of these units?

5           **A.**    No.

6           **Q.**    Does the study contain specific information  
7 substantiating PEF's unique load demand on the operating  
8 conditions?

9           **A.**    No.

10          **Q.**    Does the study contain specific information  
11 substantiating PEF's unique load demand under  
12 environmental conditions?

13          **A.**    No.

14          **Q.**    Does the study contain specific, contain  
15 specific information substantiating PEF's unique load  
16 demand under regulatory conditions?

17          **A.**    No.

18          **Q.**    Does the study contain specific information  
19 regarding -- excuse me. Does the study contain specific  
20 information regarding this, the current economic  
21 conditions of the generating units and how this impacts  
22 on the lifespan?

23          **A.**    No.

24          **Q.**    Does the, does the study contain specific  
25 information regarding update, updates, change, recon,

1 reconfigurations made at each plant and how each plant  
2 affects the lifespan?

3 **A.** No.

4 **Q.** Does the study contain specific information  
5 with respect to the complexity of the operation and  
6 maintenance and long-term validity of the generating  
7 units?

8 **A.** No.

9 **Q.** Does the study contain specific information  
10 regarding the impact of operating subtropical conditions  
11 of the lifespan of its units, generating units?

12 **A.** No.

13 **Q.** Does the study contain specific information  
14 with respect to the impact that climate change may have  
15 a, may have on the lifespan of PEF's generating units?

16 **A.** No.

17 **Q.** And does the study contain specific  
18 information regarding the impact of renewable, renewable  
19 energy requirements that have a lifespan on the  
20 generating facilities?

21 **A.** No.

22 **MR. YOUNG:** Thank you, Mr. Chairman. No  
23 further questions.

24 **CHAIRMAN CARTER:** Thank you.

25 Commissioner Skop.

1                   **COMMISSIONER SKOP:** Thank you, Mr. Chairman.

2                   Good morning, sir.

3                   **THE WITNESS:** Good morning.

4                   **COMMISSIONER SKOP:** I just wanted to ask a few  
5 follow-up questions. You previously stated that you're  
6 not an accountant; correct?

7                   **THE WITNESS:** I'm not by education, but I do  
8 testify on accounting issues.

9                   **COMMISSIONER SKOP:** Okay. And so you'd be  
10 familiar with the accounting concept of the true-up;  
11 correct?

12                   **THE WITNESS:** Yes.

13                   **COMMISSIONER SKOP:** Okay.

14                   **THE WITNESS:** Well, it's more than just an  
15 accounting concept.

16                   **COMMISSIONER SKOP:** I understand.

17                   **THE WITNESS:** Okay.

18                   **COMMISSIONER SKOP:** In that regard, do you  
19 believe that a full rate case should essentially  
20 function as the ultimate true-up for all regulatory  
21 accounts?

22                   **THE WITNESS:** Are we talking the realm of  
23 depreciation or overall?

24                   **COMMISSIONER SKOP:** Overall, but specifically  
25 to depreciation.

1           **THE WITNESS:** The answer is in theory you  
2 would like that to be the case. It doesn't always  
3 happen because there aren't always the adequate  
4 presentation or facts presented in the case for each of  
5 the issues. Estimates still have to be made, but the  
6 intention is yes.

7           **COMMISSIONER SKOP:** All right. Thank you. On  
8 Page 16 of your prefiled testimony, Line 21. Are you  
9 there?

10          **THE WITNESS:** Yes. I'm sorry.

11          **COMMISSIONER SKOP:** And you state that the  
12 company has admitted to a \$646 million excess reserve  
13 for depreciation; is that correct?

14          **THE WITNESS:** Correct.

15          **COMMISSIONER SKOP:** Okay. And following on  
16 Page 17 of your prefiled testimony, Lines 11 through 13,  
17 you signify the, that your recommendation is an annual  
18 depreciation credit expense in the amount of  
19 \$161.4 million that would be amortized over the next  
20 four years; is that correct?

21          **THE WITNESS:** Correct.

22          **COMMISSIONER SKOP:** Okay. And that's not --  
23 that just represents the four-year amortization of the  
24 \$646 million excess reserve that the company stated;  
25 correct?

1           **THE WITNESS:** Correct.

2           **COMMISSIONER SKOP:** Not, not the higher amount  
3 that you came to the conclusion.

4           **THE WITNESS:** That's right. I left the  
5 cushion of over 200 million in addition to the  
6 additional issues. I did not make the adjustments for  
7 those other areas as combined cycles. And when you  
8 consider the massive level of investment the company has  
9 in combined cycles and the short life, I assure you a  
10 proper study in the future would show significantly  
11 additional excess reserves being created by that  
12 process.

13           **COMMISSIONER SKOP:** Okay. So I think that,  
14 subject to check, and please correct me, I think that  
15 the number that you mentioned that you would have used  
16 based on your calculations was excess reserve -- or  
17 excuse me -- yeah, excess reserve of approximately  
18 858 million; is that correct?

19           **THE WITNESS:** That sounds correct.

20           **COMMISSIONER SKOP:** Okay. All right. But  
21 you're taking a more conservative approach and just  
22 using the company's number; is that correct?

23           **THE WITNESS:** Yes.

24           **COMMISSIONER SKOP:** Okay. All right. If I  
25 could next turn your attention to Page 21 of your

1 prefiled testimony, please.

2 **THE WITNESS:** I'm there.

3 **COMMISSIONER SKOP:** Okay. Generally Lines 14  
4 through 20. Do you see that?

5 **THE WITNESS:** Yes.

6 **COMMISSIONER SKOP:** Okay. On, beginning on  
7 Line 17 you speak of the four-year amortization of  
8 161 million. And you also speak on Line 18 about  
9 113 million in normal annual depreciation adjustments.  
10 Can you briefly explain that 113 million to me, please?

11 **THE WITNESS:** Those are the adjustments to net  
12 salvage for 15 accounts; adjustment to net salvage for  
13 mass property accounts. I'm sorry. That's transmission  
14 distribution, general and plant. Adjustments to the  
15 life analysis for two distribution accounts; adjustments  
16 to the production plant for the lives of the Crystal  
17 River 4 and 5 units; the Anclote 2 units; River Bend --  
18 not River Bend. I'm sorry. Crystal River 3, small  
19 adjustment for life; adjustments for interim retirements  
20 in the application of calculation of production plant;  
21 the adjustment to the interim net salvage levels for  
22 production plant also. It's a combination of all those  
23 adjustments would total \$113 million of annual impact.

24 **COMMISSIONER SKOP:** Okay. And so that's  
25 additional adjustments on top of the four-year

1 amortization that you've recommended; is that correct?

2 **THE WITNESS:** Yes.

3 **COMMISSIONER SKOP:** Okay. How does that  
4 relate in any way to the company's proposal to increase  
5 depreciation amounts by approximately, subject to check,  
6 \$96 million per year?

7 **THE WITNESS:** I thought it was around 97, but  
8 that's pretty close. My \$113 million would wipe that  
9 \$99 million increase out and reduce it by approximately,  
10 I guess that would be a hundred -- by \$16 million.

11 **COMMISSIONER SKOP:** Okay. So essentially not  
12 only would you resolve the issue of the stated excess  
13 reserve by crediting, you'd also make further reductions  
14 that would not only deny the company's request for  
15 additional depreciation, but make further reductions in  
16 terms of credits that would be passed on to ratepayers;  
17 is that correct?

18 **THE WITNESS:** Yes. And that makes perfect  
19 sense when you consider the level of the excess reserve  
20 that exists already. They got there for a reason,  
21 higher aggressive depreciation practices in the past,  
22 and you'd want to correct for that. The company's  
23 reaction to the excess reserve is to ask for even more  
24 depreciation expense in the future, which is illogical  
25 given the level of the excess reserve that exists.

1           **COMMISSIONER SKOP:** Okay. And in terms of  
2           it's been, been stated by the company that depreciation  
3           is a noncash item, so making those credits obviously --  
4           what impact might that have on the company,  
5           notwithstanding the fact that it would clearly benefit  
6           the ratepayer in terms of either making credits, or  
7           would that impact cash flows, or how would the company  
8           deal with those issues in terms of implementing your  
9           recommendations?

10           **THE WITNESS:** It would obviously reduce  
11           revenue requirements, it would reduce expenses. But it  
12           would have an impact on cash flow, and that would  
13           potentially impact the company's financial operations,  
14           and that's what Mr. Lawton is addressing.

15           **COMMISSIONER SKOP:** Okay. Very well. If I  
16           could next turn your attention to Page 30 of your  
17           prefiled testimony, please.

18           **THE WITNESS:** I'm there.

19           **COMMISSIONER SKOP:** Okay. And generally on  
20           Lines 5 through 19, do you see that?

21           **THE WITNESS:** Yes.

22           **COMMISSIONER SKOP:** Okay. Beginning at Line  
23           12 through 17 you discuss the theoretical reserve and  
24           the book reserve. Do you see that?

25           **THE WITNESS:** Yes.

1                   **COMMISSIONER SKOP:** Okay. And so essentially,  
2 beginning on Line 15, if the book reserve is greater  
3 than the theoretical reserve, the utility has collected  
4 more than is needed to that point and is ahead of  
5 schedule. Do you see that?

6                   **THE WITNESS:** Yes.

7                   **COMMISSIONER SKOP:** Okay. And you  
8 characterize that difference on Line 17 as a reserve  
9 excess; is that correct?

10                  **THE WITNESS:** Yes.

11                  **COMMISSIONER SKOP:** Okay. So essentially what  
12 you're saying is that the book reserve in this case is  
13 clearly greater than the theoretical reserve, and the  
14 company has overcollected as far as its depreciation  
15 requirements are, are, are such.

16                  **THE WITNESS:** Yes. Based on the proposed  
17 parameters by the company, and I limited it to the  
18 company's basis, which is the 646 million, the company  
19 has overcollected and we have an excess reserve  
20 position.

21                  **COMMISSIONER SKOP:** Okay. The word I was  
22 searching for was overcollected on its depreciation  
23 requirements, but my tongue got tied there. So I'll  
24 accept your answer as responsive to my question.

25                   If I could next turn your attention to Page 31

1 of your prefiled testimony, continuing on to -- let me  
2 see where it went. Give me one second, please.

3 **THE WITNESS:** No problem.

4 **COMMISSIONER SKOP:** Okay. It would be Line, I  
5 mean, Page 31 of your prefiled testimony, continuing on  
6 to the bottom of Page 33. But in, on Page 31, beginning  
7 with Lines 9 through 25, generally, you speak to how the  
8 Commission has dealt with truing up or correcting the  
9 material imbalance between the generation of customers.  
10 Do you see that?

11 **THE WITNESS:** Yes.

12 **COMMISSIONER SKOP:** Okay. Lines 22 through 25  
13 specifically you talk about the settlement in the FPL  
14 case where FPL reduced revenue requirements by  
15 500 million over a four-year period, or 125 million per  
16 year through credits to depreciation expense. Do you  
17 see that?

18 **THE WITNESS:** Yes.

19 **COMMISSIONER SKOP:** And that was through a  
20 settlement; correct?

21 **THE WITNESS:** Correct.

22 **COMMISSIONER SKOP:** Okay. And as you  
23 previously stated, to your knowledge, this Commission or  
24 other commissions, absent the two settlements that you  
25 cited, one of which we'll get to in a second, has never

1 done a true-up for correcting a depreciation imbalance;  
2 is that correct?

3 **THE WITNESS:** I think they have done  
4 adjustments for correcting imbalances.

5 **COMMISSIONER SKOP:** Okay.

6 **THE WITNESS:** What I said, I think the  
7 question was effectively have I seen where other  
8 commissions have addressed an excess reserve that wasn't  
9 done through a settlement, and I said I don't know if I  
10 could find that. But I believe this Commission has  
11 historically on numerous occasions made modifications to  
12 the reserve to make, account for reserve transfers  
13 within functions, within accounts to take care of  
14 technological changes to address the imbalance.

15 And in fact there's a stated policy in one of  
16 the Commission orders that specifically says it's the  
17 policy of the Commission to reverse or eliminate reserve  
18 imbalances as quickly as possible.

19 **COMMISSIONER SKOP:** Okay. So that notion of  
20 truing up imbalances is consistent with a full rate case  
21 functioning as essentially a true-up mechanism for all  
22 regulatory accounts; is that correct?

23 **THE WITNESS:** Normally I would think you'd  
24 want to do it in a rate case.

25 **COMMISSIONER SKOP:** Okay.

1           **THE WITNESS:** It doesn't have to be, but  
2 normally I would expect it to be in a rate case.

3           **COMMISSIONER SKOP:** Okay. And then just  
4 finally on Page 33 at the bottom of the page, Lines 21  
5 through 25. Do you see that?

6           **THE WITNESS:** Yes.

7           **COMMISSIONER SKOP:** I think that you mentioned  
8 the settlement for the prior Progress case as the other  
9 citation for the authority of where the Commission has  
10 done adjustments to depreciation expense; is that  
11 correct?

12          **THE WITNESS:** Yes.

13          **COMMISSIONER SKOP:** Okay. But outside of  
14 those two settlements, to your knowledge, this  
15 Commission has never made adjustment to depreciation, or  
16 outside of a settlement context there's no, you're not  
17 able to cite specific authority?

18          **THE WITNESS:** I'm trying to remember. I think  
19 the previous Florida Power & Light case prior to the  
20 2005 one -- I think in 2001 is another case where there  
21 was a reserve adjustment. I believe that was a settled  
22 case though also.

23          **COMMISSIONER SKOP:** Okay. And the reason I'm  
24 exploring that is, again, the issue was raised, I  
25 believe, on cross by one of the parties to the nature

1 of, I believe it was Mr. Walls with respect to the  
2 reasons for why that might have been done in the context  
3 of a settlement where there's negotiation, give and  
4 take, and stipulation of certain issues versus just  
5 taking the approach, as you mentioned, of correcting the  
6 imbalance, which generally in rate cases is a good thing  
7 to do, I would imagine, based on your testimony.

8 **THE WITNESS:** Yes. But even in a settlement  
9 I, and I would assume you would agree that commissions  
10 normally act in the best interest of the public, in  
11 meeting the public interest. So if they accept a  
12 concept in the settlement, I got to believe that they're  
13 accepting the concept as being reasonable, accurate,  
14 legal and so forth. So I'm not sure the great  
15 distinction between a settlement case where the  
16 settlement is brought to the Commission, and I've seen  
17 other commissions in the country that have seen portions  
18 of settlements and say, I can't live with this, and  
19 they've denied the settlement entirely.

20 But if you accept the settlement, not being  
21 you personally, but a commission accepts it, they're  
22 indicating, yes, we've looked at the various aspects, we  
23 think it's overall in the public interest, we don't find  
24 anything illegal in it, it's acceptable.

25 **COMMISSIONER SKOP:** Okay. And just one final

1 question. I guess Mr. Young had asked you a series of  
2 questions on cross from staff relating to considerations  
3 that may have been made or not made in a depreciation  
4 study.

5 Just generally speaking, why should this  
6 Commission give more credence to your proposals and  
7 recommendations over the depreciation study that the  
8 company performed?

9 **THE WITNESS:** Let me give you the best answer  
10 on that one. I defy you or anybody else to go to the  
11 company's depreciation study and find the basis for  
12 their proposals. Not only is it not in there, it's not  
13 in his work papers, it's not in responses to data  
14 requests where I asked for this type of information. I  
15 have basically numerical analysis that the company has  
16 presented. I have a data response that says it's not an  
17 arithmetic process, it's an interpretive process, which  
18 means we set aside the arithmetic, which is what they  
19 presented. They didn't provide any other basis,  
20 narrative, explanations.

21 And, in fact, if you go back to the 2005 study  
22 by the same company witness, he actually put a  
23 narrative. So in this study he's reversed what he did  
24 before. He's given you less information.

25 So why would you believe my presentation over

1 the company's? At least I gave you reasons. I set  
2 forth parameters, gave you information, cited to  
3 documents. I defy you again to go back to the company's  
4 study and find any of that information. We have  
5 generalized statements at best. They're vague at best.  
6 There's no documentation. And the company truly has the  
7 burden of proof in the process.

8 So from that standpoint, I don't think there's  
9 any comparison regarding the presentation and the  
10 credibility of the results between what the company  
11 presented and what I have presented.

12 **COMMISSIONER SKOP:** Okay. Very well. And  
13 then just, again, in summary, and one final question.  
14 Based on your analysis of not only the company's  
15 depreciation study and their testimony on that issue,  
16 but your own independent analysis, that you would  
17 recommend \$161 million be basically credited back to  
18 depreciation expense over the next four years; is that  
19 correct?

20 **THE WITNESS:** Yes. And that the company come  
21 back and perform a thorough detailed analysis study,  
22 including new theoretical reserve. There will still be  
23 cushion left over at that time, and you can make final  
24 determinations as to whether further adjustments need to  
25 be made at that time or not.

1                   **COMMISSIONER SKOP:** All right. Thank you.

2                   **THE WITNESS:** You're welcome.

3                   **CHAIRMAN CARTER:** Thank you.

4                   Mr. Pous, just one question.

5                   Commissioners, I'll come back to the bench in  
6 a moment. I want to get this out before I forget it.

7                   You've testified in cases, I think over  
8 300 cases in the United States and Canada; is that  
9 correct?

10                  **THE WITNESS:** Probably over 400 by now.

11                  **CHAIRMAN CARTER:** About 400? Has it been your  
12 experience, particularly within the last 20 years or so,  
13 has most, have most of the cases, particularly rate  
14 cases, have they gone to full decision by the commission  
15 or gone to the process where the commissions were  
16 presented with stipulations by the parties? Is there  
17 any way to quantify that?

18                  **THE WITNESS:** All right. Can you maybe  
19 explain that a little bit better to me?

20                  **CHAIRMAN CARTER:** Okay. A case can go, a  
21 full-blown rate case can go all the way through where  
22 the commission --

23                  **THE WITNESS:** Fully litigated.

24                  **CHAIRMAN CARTER:** Fully litigated. The  
25 commission makes a decision. A full-blown rate case, at

1 any point in time during the proceedings the parties can  
2 get together and stipulate and then bring that  
3 stipulation to the Commission and the Commission accepts  
4 that.

5 **THE WITNESS:** Yes.

6 **CHAIRMAN CARTER:** My question to you is that,  
7 if you know, is there a way to quantify how many of  
8 those that actually went to the full-blown rate hearing  
9 or those that were in the context of a full-blown rate  
10 hearing that actually entered into a stipulation and  
11 that stipulation was presented to the commission? Do  
12 you understand it now?

13 **THE WITNESS:** I think I do. I don't have hard  
14 numbers, but given my experience, probably we settle  
15 60 to 70 percent of the cases we're in. We don't go  
16 through a full litigated proceeding. As far as  
17 demarking what percentage of that entered into a  
18 proceeding before we got to the settlement, usually if  
19 there's a settlement, we get there before the hearing  
20 actually starts. It's relatively infrequent, but it  
21 does happen that a settlement occurs after a hearing has  
22 started but before the commission makes a final  
23 determination or closes the record.

24 **CHAIRMAN CARTER:** So most of them are  
25 primarily you say before you get to --

1           **THE WITNESS:** To what we're doing right now.

2           **CHAIRMAN CARTER:** I appreciate that. It has  
3 nothing to do with your testimony. I just wanted to ask  
4 you that question and --

5           **THE WITNESS:** No problem.

6           **CHAIRMAN CARTER:** -- take advantage of your  
7 experience on that and kind of get some feel.

8           Has that been within the context of -- and I  
9 was trying to ask that within the context of the last 20  
10 years or so. But based upon your experience, that's --

11          **THE WITNESS:** There are more settlements now  
12 than there were 20 years ago.

13          **CHAIRMAN CARTER:** Oh, really?

14          **THE WITNESS:** Yes. But bear in mind, there's  
15 a lot more rate cases now than there were 20 years ago.

16          **CHAIRMAN CARTER:** And that, that --

17          **THE WITNESS:** And I'm talking about energy  
18 companies. I'm not talking about telephones.

19          **CHAIRMAN CARTER:** Right. That's what I'm  
20 talking about too.

21          **THE WITNESS:** Okay.

22          **CHAIRMAN CARTER:** And is, in that context is  
23 that they usually settle and come with the stipulation  
24 to the commissions prior to going into the, what, as you  
25 say in your words, what we're doing today?

1           **THE WITNESS:** Yes. This process affords a lot  
2 of uncertainty to both sides, to all sides, and there's  
3 give and take that occurs in order to gain certainty  
4 that you know what the final result is without leaving  
5 it up to the knowledgeable hands of commissioners.

6           **CHAIRMAN CARTER:** Well, I sincerely appreciate  
7 your, your, your thoughts on that. I just wanted to --  
8 I've been, you know, I've been thinking about that, and  
9 I said let me just ask the next witness. So it was you.

10           Commissioner Skop.

11           **COMMISSIONER SKOP:** Thank you, Mr. Chairman.  
12 Just one final question for the witness.

13           If I could turn your attention to Page 40 of  
14 your prefiled testimony.

15           **THE WITNESS:** Is that 4-0?

16           **COMMISSIONER SKOP:** 40. Yes.

17           **THE WITNESS:** I'm there.

18           **COMMISSIONER SKOP:** Okay. Generally on Lines  
19 15 through 25 on that page; do you see that?

20           **THE WITNESS:** Yes.

21           **COMMISSIONER SKOP:** All right. And on that,  
22 in that passage you discuss your rationale for why a  
23 four-year amortization period was appropriate; is that  
24 correct?

25           **THE WITNESS:** There, and I believe I also made

1 reference earlier to the concept of if you do the  
2 remaining life, it's a 20-, 21-year period, and that  
3 customers, there's -- at least under the company's own  
4 projections there'd be a 33 percent turnover in  
5 customers on a net basis. And on a gross basis I  
6 estimated that to be over 40 percent of customers being  
7 turned over.

8 So in order to repay the most representative  
9 group of customers, you'd want to do it as quickly as  
10 possible.

11 **COMMISSIONER SKOP:** Okay. And specifically on  
12 Line 18 of Page 40, do you see that?

13 **THE WITNESS:** Yes. I'm there.

14 **COMMISSIONER SKOP:** Okay. And you state  
15 basically that the four-year amortization period, that  
16 it would essentially correct the intergenerational  
17 equity situation in an effective but manageable manner;  
18 is that correct?

19 **THE WITNESS:** Yes.

20 **COMMISSIONER SKOP:** Okay. Now obviously I  
21 think you previously mentioned that any time you would  
22 have to do such a credit, obviously there would be a  
23 cash flow issue on the company's financials; correct?

24 **THE WITNESS:** Yes.

25 **COMMISSIONER SKOP:** Okay. So doing that in a

1 shorter period of time or a shorter amortization period  
2 might present a substantial hardship on the company; is  
3 that correct?

4 **THE WITNESS:** It would have an impact. That's  
5 again why, you know, I brought this to the attention of  
6 the client so that he could bring together the  
7 financial, the accounting, the rate of return persons to  
8 discuss this and determine is it feasible. If it  
9 wasn't, if they would have come back and said, you need  
10 to do this over six years, I would have agreed to that,  
11 you know, because of the financial consideration of harm  
12 on the company.

13 **COMMISSIONER SKOP:** Okay. All right. So just  
14 in a nutshell then, if the Commission were to adopt your  
15 recommendations and move forward with what you've  
16 proposed, the appropriate period in your mind would be a  
17 four-year amortization period?

18 **THE WITNESS:** And it also affords you the  
19 ability to come back four years later when they're  
20 supposed to do another depreciation study and take  
21 another snapshot and see where you stand at that point  
22 in time.

23 **COMMISSIONER SKOP:** Okay. Very well. Thank  
24 you.

25 **THE WITNESS:** You're welcome.

1           **CHAIRMAN CARTER:** Thank you.

2           One second, Mr. Rehwinkel. I'm still on my  
3 train of thought.

4           This is not within the scope of your testimony  
5 or anything like that.

6           **THE WITNESS:** I always love those.

7           **CHAIRMAN CARTER:** I'm just trying, I'm just  
8 trying to take advantage of your experience over the  
9 years and all like that. You said that there are a lot  
10 more rate cases now.

11          **THE WITNESS:** Yes.

12          **CHAIRMAN CARTER:** And a lot more of them are  
13 settling now. Let me ask you this, if you know, is  
14 that -- and this is probably an unfair question and you  
15 can say it's unfair, and I'm not --

16          **THE WITNESS:** Shall I say it first?

17          **CHAIRMAN CARTER:** No. No. Don't say it  
18 first. Give me some hope.

19          **THE WITNESS:** Okay.

20          **CHAIRMAN CARTER:** Has there been any, within  
21 the confines of people in your industry, you know,  
22 expert witnesses both for the companies, against the  
23 companies, or just within the milieu of professional  
24 experts, have there been in your experience any kind of  
25 overlay of that, that process of all of these

1 settlements in the context of the financial markets? I  
2 mean from a global standpoint, that you know of. If you  
3 don't, don't worry about it.

4 **THE WITNESS:** Well, companies raise the  
5 financial markets in their basis for asking for rate  
6 cases. When we get to settlements, it still comes up  
7 sometimes, but rarely. I hate to say it, but usually  
8 the cry of wolf that we can't, we won't have access to  
9 the capital markets without much higher costs is for  
10 your consumption.

11 In the settlement process I think they're  
12 realizing they're dealing with people that may not buy  
13 the argument to the same extent others would, and so  
14 they don't raise it.

15 There have been some instances where they  
16 said, you know, we need to settle, we need to have at  
17 least this amount of money because of our financial  
18 considerations, and we take that into account in our  
19 settlement process.

20 But, you know, we do analysis still to  
21 determine the validity of their statements. We vet the  
22 statements by looking at the financial information. And  
23 if we agree with it, then we're more inclined to come up  
24 in a settlement mode than otherwise.

25 **CHAIRMAN CARTER:** Thank you.

1           Mr. Rehwinkel, I know that was not within the  
2 confines of your witness's expertise, but I just, I just  
3 wanted to ask him a question from an opinion standpoint.

4           **MR. REHWINKEL:** I appreciate that.

5           **CHAIRMAN CARTER:** Commissioners, anything  
6 further from the bench?

7           Mr. Rehwinkel, redirect.

8           **MR. REHWINKEL:** Yes. Briefly, Mr. Chairman.

9                           **REDIRECT EXAMINATION**

10          **BY MR. REHWINKEL:**

11           **Q.** Mr. Pous, you were asked a couple of times  
12 about whether you were an accountant. I just want to  
13 make sure I understand. You are not an accountant, but  
14 have you been accepted as an expert in regulatory  
15 accounting related to depreciation?

16           **A.** Not just depreciation. On other matters too.

17           **Q.** And in how many states would you say?

18           **A.** Excuse me?

19           **Q.** In how many states would you say?

20           **A.** I've probably testified in 15 to 20 different  
21 states, maybe more.

22           **Q.** Okay. The company study, was it performed by  
23 an accountant?

24           **A.** No. Mr. Robinson to my knowledge does not  
25 even have a college degree.

1 Q. Okay.

2 A. A full four-year college degree.

3 Q. I think you, in response to a question from  
4 Mr. Walls in reference to your deposition on Page 109,  
5 you were asked about whether you could point him to any  
6 Commission orders that approved a proposal like yours.  
7 Is that, is that how you understood the question?

8 A. It's been a while, but it's something along  
9 that line, yes.

10 Q. Are you aware of, of orders by not only other  
11 commissions but this Commission where depreciation  
12 surpluses have been returned to the customers in less  
13 than the remaining life period?

14 A. Yes. And I believe I filed a late-filed  
15 exhibit in this case that provided a list of those.

16 Q. Is that, is that list of orders contained in  
17 staff Exhibit 286, which looks to be very near the end,  
18 OPC-LFE-POUS-000092?

19 A. The only reason I'm hesitating is I thought I  
20 added one more case to this, and that was the Progress  
21 Energy docket in 2001, which I don't see here.

22 Q. Is this the list though that you provided?

23 A. Yes.

24 **MR. REHWINKEL:** Okay. Mr. Chairman, those are  
25 all the questions I have on redirect.

1                   **CHAIRMAN CARTER:** Thank you, Mr. Rehwinkel.  
2 Exhibits?

3                   **MR. REHWINKEL:** I would move Mr. Pous'  
4 exhibits.

5                   **CHAIRMAN CARTER:** On Page, start on Page 36.  
6 That would be 133 through 144, I believe it is.

7                   **MR. REHWINKEL:** Yes, sir. 133 through 144.

8                   **CHAIRMAN CARTER:** Are there any objections?

9                   **MR. WALLS:** No.

10                  **CHAIRMAN CARTER:** Without objection, show it  
11 done.

12                   (Exhibits 133 through 144 admitted into the  
13 record.)

14                   Staff, you're recognized.

15                  **MR. YOUNG:** Mr. Chairman, at this time we'd  
16 move Exhibit 286.

17                  **CHAIRMAN CARTER:** Are there any objections?

18                  **MR. WALLS:** No objection.

19                  **CHAIRMAN CARTER:** Without objection, show it  
20 done.

21                   (Exhibit 286 admitted into the record.)

22                   Anything further for this witness?

23                  **MR. REHWINKEL:** Just to ask if he and  
24 Mr. Schultz may be excused.

25                  **CHAIRMAN CARTER:** Absolutely. Have a great

1 day. TGIF.

2 **THE WITNESS:** Thank you very much. You too.
