

**BEFORE THE
GEORGIA PUBLIC SERVICE COMMISSION**

In re:

**Georgia Power Company's
Application for Approval of
Its 2013 Integrated Resource
Plan And Application for
Decertification of Plant Branch
Units 3 and 4, Plant McManus
Units 1 and 2, Plant Kraft Units
1-4, Plant Yates Units 1-5,
Plant Boulevard Units 2 and 3,
and Plant Bowen Unit 6**

Docket No. 36498

DIRECT TESTIMONY OF

KYLE C. LEACH, GAREY C. ROZIER,

LARRY T. LEGG AND LARRY S. MONROE

MARCH 19, 2013

**DIRECT TESTIMONY OF
KYLE C. LEACH, GAREY C. ROZIER,
LARRY T. LEGG AND LARRY S. MONROE**

IN SUPPORT OF GEORGIA POWER COMPANY'S

**2013 INTEGRATED RESOURCE PLAN AND APPLICATION
FOR DECERTIFICATION OF PLANT BRANCH UNITS 3 AND 4,
PLANT MCMANUS UNITS 1 AND 2, PLANT KRAFT UNITS 1-4,
PLANT YATES UNITS 1-5, PLANT BOULEVARD UNITS 2 AND 3,
AND PLANT BOWEN UNIT 6**

GPSC DOCKET NO. 36498

I. INTRODUCTION

1 **Q. PLEASE STATE YOUR NAMES, TITLES AND BUSINESS ADDRESSES.**

2 A. My name is Kyle C. Leach. I am the Director of Resource Policy and Planning
3 for Georgia Power Company ("Georgia Power" or the "Company"). My business
4 address is 241 Ralph McGill Boulevard, N.E., Atlanta, Georgia 30308.

5

6 A. My name is Garey C. Rozier. I am the Manager of Resource Planning for
7 Southern Company Services ("SCS"). My business address is 600 N. 18th Street,
8 Birmingham, Alabama 35203.

9

10 A. My name is Larry T. Legg. I am the Manager of Market Planning for Georgia
11 Power. My business address is 241 Ralph McGill Boulevard, N.E., Atlanta,
12 Georgia 30308.

13

14 A. My name is Larry S. Monroe. I am a General Manager of Environmental Affairs
15 for Georgia Power. My business address is 241 Ralph McGill Boulevard, N.E.,
16 Atlanta, Georgia 30308.

1 **Q. MR. LEACH, PLEASE SUMMARIZE YOUR EDUCATION AND**
2 **PROFESSIONAL EXPERIENCE.**

3 A. I graduated from Auburn University in 1983 with a Bachelor of Science degree in
4 Civil Engineering. I joined Georgia Power in 1980 as a co-op in the Civil
5 Engineering department and moved from there into a Power Marketing Engineer
6 role in various regions around Atlanta. I then worked as a Key Account Manager
7 responsible for servicing major Georgia Power industrial accounts, and following
8 that role, I served as Sales Manager at Southern Company's former operating
9 subsidiary in Bristol, England. From 2000 to 2006, I held various positions
10 throughout the marketing organization at Georgia Power, including assistant to
11 the Senior Vice President of Marketing, Manager of the Business Development
12 Organization and Manager of the Key Account program. Most recently, I served
13 as the Director of Federal Regulatory Affairs in Southern Company's Washington
14 D.C. office, where I was the liaison between Southern Company and the Federal
15 Energy Regulatory Commission.

16

17 In August 2011, I was appointed the Director of Resource Policy and Planning for
18 Georgia Power. In this position, my responsibilities include integrated resource
19 planning, generation development and procurement and contract administration.

20

21 I have testified before the Georgia Public Service Commission (the
22 "Commission") regarding the Company's recent Application for Decertification
23 of Plant Branch Units 1 and 2 and Plant Mitchell Unit 4C, the Application for
24 Certification of the Power Purchase Agreements with BE Alabama LLC from the
25 Tenaska Lindsay Hill Generating Station and with Southern Power Company
26 from the Harris, West Georgia and Dahlberg Electric Generating Plants and
27 Updated Integrated Resource Plan in Docket No. 34218 ("2011 IRP Update"). I
28 have also testified in the Company's Application for the Certification of Capacity
29 from Block 1 and Capacity from Blocks 2-4 in Docket No. 26550, the Review of

1 Proposed Revisions and Verification of Expenditures Through the Quarter Ending
2 June 30, 2011 Pursuant to Georgia Power Company's Certificate of Public
3 Convenience and Necessity for Plant McDonough Units 4, 5 and 6 in Docket No.
4 24506, and also in the Vogtle Construction Monitoring proceedings in Docket No.
5 29849 regarding the Fifth, Sixth and Seventh Semi-Annual Reports.

6

7 **Q. MR. ROZIER, PLEASE SUMMARIZE YOUR EDUCATION AND**
8 **PROFESSIONAL EXPERIENCE.**

9 A. I graduated from Auburn University in 1972 with a Bachelor of Science degree in
10 Industrial Engineering. After graduation, I joined Georgia Power as an engineer in
11 the System Planning Department. From 1972 to 1989, I held various engineering
12 and managerial positions in transmission planning, generation planning, and bulk
13 power. During this period, I attended Georgia State University and earned a
14 Masters degree in Business Administration in 1982.

15

16 In 1989, I transferred to SCS in the position of Director of System Planning,
17 where I was responsible for providing bulk transmission planning and integrated
18 resource planning analysis for Southern Company operating subsidiaries. I
19 returned to Georgia Power in March 1992 as General Manager, Bulk Power
20 Markets and was responsible for transmission planning, integrated resource
21 planning, and bulk power contracts.

22

23 In 1996, I was transferred back to SCS, where I assumed my current position as
24 Manager of Resource Planning.

25

26 **Q. MR. LEGG, PLEASE SUMMARIZE YOUR EDUCATION AND**
27 **PROFESSIONAL EXPERIENCE.**

28 A. I graduated from Mercer University in 1988 with a Bachelor's degree. I joined
29 Georgia Power in 1990 in the Customer Service organization. From 1990 to 2006,

1 I held various staff and managerial positions in Customer Service, Sales, Software
2 Development, Revenue Accounting, and Pricing and Rates. During this period, I
3 attended Georgia State University and earned a Masters degree in Business
4 Administration in 1997.

5

6 I was named Rate Design Manager for Georgia Power in 2003 where I led the
7 development of Rate Design for the 2004 Retail Rate Case. In 2006, I assumed
8 my current position as Manager of Market Planning for Georgia Power. In this
9 position, my responsibilities include the load, energy and revenue forecast, as well
10 as economic evaluation of demand side management (“DSM”) and marketing
11 programs.

12

13 I have previously testified before the Commission in the 2007 IRP in Docket No.
14 24505, the Vogtle Certification in Docket No. 27800, the 2010 IRP in Docket No.
15 31081, the 2010 DSM certification in Docket No. 31082 and the 2011 IRP
16 Update.

17

18 **Q. DR. MONROE, PLEASE SUMMARIZE YOUR EDUCATION AND**
19 **PROFESSIONAL EXPERIENCE.**

20 A. I graduated from Auburn University in 1979 with a Bachelor of Science degree in
21 Chemical Engineering. After graduation, I joined E.I. DuPont as a plant engineer
22 in Wilmington, North Carolina at a chemical manufacturing facility. In 1981, I
23 left DuPont to attend the Massachusetts Institute of Technology where I studied
24 coal combustion and the formation chemistry of coal emissions, graduating with a
25 Ph.D. in Chemical Engineering in 1989. After graduation, I joined Southern
26 Research Institute (“SRI”) in Birmingham, Alabama in 1990. At SRI, I held the
27 position of Group Manager responsible for the Combustion Research facility, coal
28 fuel evaluations, and emissions control technology development.

1 In 1998, I joined the Southern Company Services Research and Environmental
2 Affairs department in Birmingham, where I was responsible for directing research
3 and development (“R&D”) on emissions control technology in support of the
4 generating fleet. In that position, I managed and directly investigated
5 improvements in existing emissions control technologies, as well as developing
6 new technologies for reducing emissions.

7
8 In that capacity, I have also served as a co-chairperson and industry representative
9 for numerous committees including emissions control and technology committees
10 at the Electric Power Research Institute (“EPRI”), the Utility Air Regulatory
11 Group, and various working groups of the United States Environmental Protection
12 Agency (“EPA”) organized to inform mercury regulations and greenhouse gas
13 guidelines and regulations. I have also testified before both the U.S. Senate and
14 the U.S. House on coal-based technologies.

15
16 In January 2011, I was appointed a General Manager in Georgia Power’s
17 Environmental Affairs department, where I oversee the air regulatory permitting
18 and reporting group, the air testing and monitoring group, and the environmental
19 services laboratory.

20
21 **Q. WHAT IS THE PURPOSE OF YOUR TESTIMONY?**

22 A. The purpose of our testimony is to present and seek approval of Georgia Power’s
23 2013 Integrated Resource Plan (“IRP”) and the Application for Decertification of
24 Plant Branch Units 3 and 4, Plant McManus Units 1 and 2, Plant Kraft Units 1-4,
25 Plant Yates Units 1-5, Plant Boulevard Units 2 and 3 and Plant Bowen Unit 6 (the
26 “Decertification Application”).

27
28 We adopt the 2013 IRP and Decertification Application as filed with the
29 Commission on January 31, 2013 as part of our testimony.

1 **Q. WHAT IS THE IRP?**

2 A. The IRP is primarily comprised of the Company's demand and energy forecast for
3 a twenty year period and its plan for meeting the requirements shown in the
4 forecast in an economical and reliable manner. Within the IRP, the Company
5 provides an analysis of all viable capacity resource options, including both
6 demand-side and supply-side options, to determine candidates for future resource
7 additions and sets forth Georgia Power's planning assumptions and conclusions
8 with respect to the effect of each capacity resource option on the future cost and
9 reliability of electric service.

10

11 **Q. HOW MANY IRPs HAS THE COMPANY FILED?**

12 A. This 2013 IRP is the eighth full IRP filed by Georgia Power since enactment of
13 the Integrated Resource Planning Act, O.C.G.A. § 46-3A-1 *et seq.*, which requires
14 the filing of such a plan every three years.

15

16 **Q. PLEASE SUMMARIZE YOUR TESTIMONY.**

17 A. Georgia Power's 2013 IRP describes how the Company will cost-effectively and
18 reliably meet its customers' demand for electricity while maintaining the
19 flexibility needed to meet the challenges of a rapidly changing power industry.
20 The IRP contemplates that the Company's forecast requirements will be met with
21 existing capacity resources, existing power purchases, existing DSM programs,
22 capacity additions that have already been approved, additional certified and
23 amended DSM programs and a diverse set of longer-term resource additions.
24 Georgia Power also intends to continue to offer pricing options to its customers
25 that are effective in reducing the demand for electricity.

26 The 2013 IRP builds on the actions taken in the 2011 IRP Update, where the
27 Company and the Commission took proactive steps to ensure cost-effective,
28 reliable electricity in light of what was at that time an unprecedented period of
29 uncertainty in the industry driven by the impact of new and pending

1 environmental regulations, including, most significantly, the EPA’s Mercury and
2 Air Toxics Standards (“MATS”) rule. Since the conclusion of the 2011 IRP
3 Update, the Company has continued to refine its analyses of the impact of
4 numerous environmental regulations through a unit-by-unit evaluation of its coal-
5 and oil-fired generating fleet.

6
7 Based on that analysis, and drawing on the technical expertise of Southern
8 Company, Georgia Power has presented in this 2013 IRP a plan for MATS
9 compliance that will result in a robust and diverse set of resources that benefits
10 customers. While the Company has been successful in identifying MATS
11 compliance options for a number of its coal-fired generating units that are less
12 costly than had been forecasted, including switching the primary fuel of certain
13 units from coal to natural gas, MATS will nevertheless still impose significant
14 compliance costs on the Company and our customers.

15
16 And while MATS compliance has been the most significant factor in the
17 Company’s analysis, Georgia Power has also taken into consideration the
18 uncertainty that remains with respect to other pending and potential
19 environmental regulations including the Company’s best predictions of the
20 requirements, the timing, and the costs to comply with such rules. These rules
21 include the cooling water intake structure (316(b) rule), the coal combustion
22 residuals (“CCR”) ash rule, and the steam effluent guidelines waste water
23 treatment rule.

24
25 Taking into account the impact of MATS, as well as other pending or potential
26 regulations, the Company’s analysis of its generating units has also led to the
27 conclusion that it is in the best interest of customers to retire approximately 2,100
28 megawatts (“MW”) of generating resources. The Company has requested
29 decertification of these resources in its Decertification Application. Such a slate

1 of retirements is unprecedented in the history of Georgia Power, and the
2 Company fully recognizes the impact these decisions have on employees and
3 local communities. Only after extensive analyses and evaluation and after
4 exploring a wide range of feasible compliance options did the Company
5 determine that retirement and decertification of these units is in the best interest of
6 customers.

7
8 The Company's MATS compliance strategy and its decertification requests,
9 however, are just one piece of the 2013 IRP. The Company also continues its
10 efforts, in collaboration with the Commission, to responsibly grow its portfolio of
11 renewable resources. With over 1,088 MW of hydro generation, over 62 MW of
12 solar generation (in service or under contract today), and 142 MW of biomass
13 generation, the Company has demonstrated a firm commitment to identifying all
14 cost-effective renewable resources for the benefit of customers. The Georgia
15 Power Advanced Solar Initiative ("GPASI") is the most recent and most
16 significant step taken by the Company to obtain an increasing amount of solar
17 resources, as declining technology prices make such resources more economic.
18 The GPASI builds on the solar resources already obtained by the Company
19 through the Large Scale Solar ("LSS") program and the Green Energy Program.
20 After all resources are obtained through the GPASI, the Company expects to have
21 270 MW of solar capacity under contract in Georgia. In total, the Company
22 expects to have more than 1,500 MW of renewable generation available to serve
23 customers by the end of 2016.

24
25 The Company also continues its disciplined pursuit of cost-effective DSM
26 programs through its collaboration with Commission Staff and the Demand Side
27 Management Working Group ("DSMWG"). The specific certification and
28 amendment requests of the Company have been made concurrently with this
29 filing in the Application for the Certification of its Amended Demand Side

1 Management Plan in Docket No. 36499 (“2013 DSM Application”). Specifically,
2 in its 2013 DSM Application, the Company requests certification of one new
3 commercial program, amendment of three currently certified programs,
4 decertification of one program (though the program activities will be subsumed
5 by an existing program), and approval of updated program budgets for the
6 remaining programs previously certified in Docket No. 31082. The Company’s
7 current DSM portfolio consists of demand response programs, energy efficiency
8 programs, pricing tariffs, and other activities. The Company projects that by
9 2016, these programs will reduce peak demand by approximately 2,000 MW.

10
11 This 2013 IRP is the product of a thorough planning process that has resulted in a
12 robust and diverse portfolio of generation and demand side resources that will
13 continue to provide customers cost-effective, reliable service. The Company is
14 well-positioned for the return of customer load growth given Georgia’s positive
15 long-term economic prospects as a state with an attractive climate, relatively low
16 living costs, and a business friendly environment. By 2020, the state of Georgia
17 is projected to add more than one million new residents, and the ability to have in
18 place the necessary energy infrastructure for such growth is a direct result of the
19 collaborative planning process facilitated by the IRP Act and guided by the
20 Commission. This process has enabled the Company and the Commission to
21 maintain a reasoned and disciplined approach to meeting customer demand while
22 effectively responding to a changing regulatory environment, all while
23 maintaining rates below the national average.

1 **II. SUPPLY-SIDE PLAN**

2
3 **Q. PLEASE DESCRIBE THE STATUS OF GEORGIA POWER'S CURRENT**
4 **SUPPLY-SIDE PLAN.**

5 A. Georgia Power's current supply-side plan, as set forth in the 2011 IRP Update and
6 as further supplemented herein, is sufficient to provide cost-effective and reliable
7 sources of capacity and energy through 2015 and beyond. As described more
8 fully below, in light of current and pending environmental regulations that impact
9 all of the Company's coal- and oil-fired steam generating resources, the Company
10 has developed a fleet-wide compliance strategy that results in a diverse, robust set
11 of generation resources. The Company is in the midst of a significant transition in
12 its fleet that will result in a more diverse fuel portfolio and ensure that Georgia
13 Power is able to continue to provide its customers with reliable and affordable
14 electricity while helping to mitigate the risk of fuel price volatility. This period of
15 transition will also result in a more efficient fleet with fewer coal resources, which
16 will reduce customers' exposure to the cost of potential carbon regulation or
17 legislation. Additionally, by further controlling the Company's largest and most
18 efficient coal units in which the Company has already invested significant capital
19 for environmental controls, the Company retains the significant energy benefits of
20 these units, while also positioning itself to be able to respond to future increases
21 or volatility in the cost of natural gas.

22
23 **Q. PLEASE DESCRIBE THE COMPANY'S 2011 IRP UPDATE.**

24 A. In the 2011 IRP Update, the Company presented its near term plan for seeking to
25 ensure reliable service in light of the significant uncertainty caused by an array of
26 pending environmental regulations, the most significant of which was the EPA's
27 MATS rule. Though the MATS rule had not been finalized at the time the
28 Company filed its 2011 IRP update, it was nevertheless incumbent on the
29 Company, in light of the stringent requirements and compressed compliance

1 timelines contained in the proposed rule, to develop compliance strategies to
2 ensure a reliable supply of electricity for its customers.

3

4 Specifically, the Company requested authorization to proceed with initiation of
5 construction of baghouses that were anticipated to be needed at Plants Bowen,
6 Wansley and Hammond to comply with the MATS rule and also recommended
7 deferral of decisions concerning 2,600 MW of generating units. However, the
8 Company asserted that it was reasonable to assume that 2,000 MW of that
9 capacity would be unavailable in 2015 as a result of the MATS rule. In light of
10 the assumed unavailability of 2,000 MW of capacity, the Company sought
11 certification of certain power purchase agreements (“PPA”) identified through the
12 2015 Request for Proposals (“RFP”). Finally, the Company also requested
13 Commission approval for the decertification of Plant Branch Units 1 and 2 and
14 Plant Mitchell Unit 4C.

15

16 **Q. WHAT DID THE COMMISSION APPROVE IN THE 2011 IRP UPDATE?**

17 A. The Commission approved the Company’s expenditures associated with the
18 initiation of construction of baghouses for Plant Bowen Units 1–4, Plant Wansley
19 Units 1 and 2, and Plant Hammond Units 1–4, and the Company was ordered to
20 keep the Commission apprised of its evaluation through monthly reports filed at
21 the Commission. The Commission also certified three PPAs, decertified Plant
22 Branch Units 1 and 2 and Plant Mitchell Unit 4C and approved the accounting
23 treatment requested by the Company in connection with the decertified units.

24

1 **Q. WHAT STEPS HAS THE COMPANY TAKEN SINCE THE 2011 IRP**
2 **UPDATE TO EVALUATE THE IMPACT OF MATS ON THE**
3 **COMPANY'S GENERATING UNITS?**

4 A. Since the 2011 IRP Update, Georgia Power has continued to evaluate the
5 requirements of the final MATS rule and the overall compliance strategy on a
6 unit-by-unit basis, relying on the Company's and Southern Company's extensive
7 research and development expertise. Now that the Company has had the
8 opportunity to further analyze and assess the impact of the final MATS rule, a
9 significant portion of the uncertainty that framed the discussion in the 2011 IRP
10 Update has been eliminated, as the Company has developed a compliance plan
11 that is intended to maintain long-term reliability for customers in a cost-effective
12 manner.

13

14 **Q. WHAT ARE THE COMPANY'S CONCLUSIONS REGARDING THE**
15 **NEED FOR BAGHOUSES?**

16 A. As a result of its analysis, the Company determined, and has previously notified
17 the Commission in Docket No. 34218, that only Plant Bowen Units 3 and 4 need
18 baghouses at this time and that MATS compliance can be achieved at Plant
19 Bowen Units 1 and 2, Plant Wansley Units 1 and 2 and Plant Hammond Units 1–4
20 by installing activated carbon and hydrated lime injection systems and performing
21 precipitator work. Activated carbon and hydrated lime injection systems will also
22 be added to Plant Bowen Units 3 and 4 for mercury control. All units at Plants
23 Bowen, Hammond and Wansley will install scrubber additive systems. For
24 MATS compliance, every coal-fired power plant in the Georgia Power fleet will
25 have a dedicated system added to control mercury emissions and to ensure MATS
26 compliance.

27

1 **Q. WHY WERE ONLY TWO BAGHOUSES REQUIRED?**

2 A. Capitalizing on differences between the proposed MATS rule and the final rule,
3 the Company utilized its and Southern Company's substantial R&D capabilities
4 and technical expertise to develop a solution that resulted in the removal of five
5 baghouses from its compliance strategy. Chief among the differences in the rule
6 was a change in the particulate matter standard between the proposed and final
7 rules. In the proposed rule, the EPA would have imposed a very stringent and
8 complicated limit on particulate emissions that ultimately would have resulted in
9 a unit-specific limit on particulate matter emissions, thereby removing all
10 compliance margin without accounting for natural variation in the operation of a
11 generating unit. Therefore, the only compliance option under the proposed rule
12 would have been installation of baghouses to attempt to comply under all
13 operating conditions. In the final rule, however, the EPA altered the form of the
14 particulate matter limit such that, while still very stringent, it is a standard limit
15 that applies to all units rather than a unit-specific limit. The limit is also in a form
16 that allows for additional compliance options to be considered and evaluated on a
17 unit-specific basis, as is further explained in the Environmental Compliance
18 Strategy ("ECS") document in Technical Appendix Volume 2 of the 2013 IRP.

19
20 **Q. WHAT OTHER MATS COMPLIANCE ACTIONS IS THE COMPANY**
21 **RECOMMENDING?**

22 A. Aside from the coal-fired units for which the Company seeks decertification and
23 the environmental controls being added to Plant Bowen Units 1–4, Plant Wansley
24 Units 1 and 2, and Plant Hammond Units 1–4, additional environmental controls
25 and other changes will be required for some remaining coal-fired units to continue
26 to operate on coal after the MATS compliance date of April 16, 2015.
27 Specifically, Georgia Power plans to switch Plant McIntosh Unit 1 to operate on
28 low-sulfur, lower-priced Powder River Basin ("PRB") coal (pending a successful
29 test burn and further study). If the test burn is deemed successful, Plant McIntosh

1 will also add MATS controls, namely an activated carbon injection system for
2 mercury control and a dry sorbent injection (“DSI”) system to ensure compliance
3 with the MATS acid gases limit. In addition, Plant Scherer Units 1-3 will also be
4 retrofitted with additional controls in order to ensure MATS compliance.
5 Although these units will be well controlled due to installation of the required
6 Georgia Multipollutant rule controls, a bromide injection system will be installed
7 in order to most cost-effectively comply with the MATS requirements.

8
9 For the other remaining coal-fired units that will continue to operate, the
10 Company has concluded that it is not cost-effective to install the environmental
11 controls necessary to enable these units to remain operational on coal. Instead,
12 the Company has found it to be most cost-effective for customers to switch Plant
13 Yates Units 6 and 7 and Plant Gaston Units 1–4 to natural gas as the primary fuel.
14 See Table 1 below for a summary of the Company’s recommended MATS
15 compliance actions.

TABLE 1	
Installation of Environmental Controls for MATS Compliance	
Plant Bowen Units 3 and 4	Baghouses, activated carbon and hydrated lime injection systems and scrubber additive systems
Plant Bowen Units 1 and 2	Activated carbon and hydrated lime injection systems, electrostatic precipitator (“ ESP”) work, and scrubber additive systems
Plant Wansley Units 1 and 2	Activated carbon and hydrated lime injection systems, ESP work, and scrubber additive systems
Plant Scherer Units 1-3	Bromide Injection system
Plant Hammond Units 1-4	Activated carbon and hydrated lime injection systems, ESP work, and scrubber additive systems
Switching Primary Fuels for MATS Compliance	
Plant Yates Units 6 and 7	Coal to natural gas
Plant McIntosh Unit 1	Bituminous coal to PRB coal; activated carbon and dry sorbent injection systems
Plant Gaston Units 1-4	Coal to natural gas

Q. HOW DO THE COMPANY’S ESTIMATED MATS COMPLIANCE COSTS COMPARE WITH WHAT HAD BEEN PROJECTED DURING THE 2011 IRP UPDATE?

A. While the Company will be required to incur significant capital costs to comply with the final MATS rule, the projected capital costs required for compliance are less than had been anticipated at the time of the 2011 IRP Update. These costs are lower for two primary reasons. First, as discussed above, key changes were made to the final rule that enabled the Company to lower the cost of compliance, thereby benefitting customers. Southern Company, on behalf of Georgia Power and its other operating companies, as well as this Commission, played a major role in communicating to the EPA the need for changes due to the impacts that the

1 overly stringent proposed rule would have had on the reliability and affordability
2 of electricity. Second, because of these changes in the rule, the Company was
3 able to utilize its and Southern Company's substantial R&D capabilities and
4 technical expertise to develop innovative compliance solutions that were less
5 expensive than previously expected.

6

7 **Q. PLEASE DESCRIBE IN MORE DEPTH HOW THE COMPANY HAS**
8 **DRAWN ON THE R&D EXPERTISE OF SOUTHERN COMPANY.**

9 A. Southern Company has a long history of R&D in support of the operating
10 companies, including Georgia Power. Southern Company's R&D programs cover
11 a wide range of topics, all aimed at improving technical knowledge in key areas
12 that can provide benefits to customers. In the environmental area, this research is
13 designed to identify cost-effective and reliable solutions for compliance with air,
14 water, and land regulations.

15

16 The R&D conducted by Georgia Power and Southern Company concerning
17 emissions control has been directly applicable to the specific technology decisions
18 at Georgia Power plants presented in the 2013 IRP. For example, the research
19 conducted by Southern Company on mercury and particulate control beginning in
20 the 1990s led to innovations in baghouse design. The knowledge gained from this
21 research led to the development of the Compact Hybrid Particulate Collector
22 ("COHPAC") baghouse design that is used at Plant Scherer and will be used at
23 Plant Bowen Units 3 and 4 to achieve MATS compliance. The COHPAC
24 baghouse is now established in the industry as an effective means of improving
25 both particulate control and mercury control and is less costly than traditional
26 baghouse installations.

27

28 Southern Company R&D activities were also instrumental in helping Georgia
29 Power identify mercury control technologies (a primary component of MATS

1 compliance) that were significantly less costly than baghouse installations. This
2 process began in the early 2000s, when Southern Company conducted several
3 activated carbon injection studies and discovered that sulfur oxides present in flue
4 gas can interfere with mercury capture by activated carbon. This sulfur
5 chemistry interference is the reason that the use of activated carbon for the control
6 of mercury without a baghouse was widely considered to be infeasible while
7 burning higher sulfur coals. However, building on Southern Company's
8 discovery in the early 2000s, testing at Plants Bowen, Hammond, and Wansley in
9 2012 led by Southern Company researchers showed that the careful use of
10 hydrated lime greatly reduced the interference, and that the injection of both
11 activated carbon and hydrated lime into an ESP was a viable option for certain
12 units and less costly than a baghouse. This testing was conducted as part of the
13 initial baghouse work approved by the Commission in the 2011 IRP Update.

14
15 Southern Company has also conducted various investigations of chemical
16 additives to flue gas scrubbers to help retain captured mercury in the scrubber and
17 has studied the use of calcium bromide as a coal additive for increasing mercury
18 capture by scrubbers on low chlorine coals, such as the PRB coal used at Plant
19 Scherer. These additives are incorporated into the Company's compliance
20 strategy for the plants to achieve mercury MATS compliance at the least cost.

21
22 In summary, the Company has been able to utilize Southern Company's R&D
23 expertise to inform environmental compliance strategy decisions that provide
24 lower cost compliance options for our customers.
25

1 **Q. WHY IS IT VITAL THAT THE COMPANY RETAIN A DIVERSE FLEET**
2 **OF GENERATING RESOURCES?**

3 A. Maintaining a diverse fleet of generating resources gives the Company the ability
4 to capitalize on the lowest cost fuel options over the long term. A fleet that is
5 over reliant on one particular fuel would cause customers to bear significant risk
6 with respect to the cost of that particular fuel. By maintaining a diverse fleet of
7 resources, the Company mitigates risk with respect to any particular fuel source.
8 For instance, based on the resources assumed in this IRP, the Company has
9 projected that under a low gas price scenario in 2020, the Company could
10 generate up to 50% of its electricity from its natural gas resources (while reducing
11 its coal generation to just 18%). On the other hand, in a high gas price scenario,
12 the Company would be able to shift and generate up to 40% of its electricity from
13 coal resources (while reducing natural gas-fired generation to just 28%). In either
14 fuel cost scenario, the Company's growing nuclear generation fleet will continue
15 to produce stable, low cost energy. This flexibility will deliver significant
16 benefits to customers.

17
18 Flexibility is critical in light of the various risk factors that could result in higher
19 than forecast natural gas prices, whether over the short- or long-term. For
20 instance, a temporary but significant interruption in natural gas production could
21 lead to a spike in natural gas prices over the short-term or new regulation of
22 hydraulic fracturing drilling ("fracking") could lead to a longer-term increase in
23 natural gas prices. In either case, the Company's diverse fleet will allow it to shift
24 generation in order to benefit from the lowest cost fuel option. Together, the
25 Company's nuclear and renewable generating resources account for
26 approximately 30% of the Company's electricity production.

27
28 A diverse fleet also provides operational flexibility that further protects
29 customers. Coal and natural gas generation rely on two completely separate fuel

1 delivery infrastructures. By maintaining a diverse fleet, the Company is able to
2 more quickly and efficiently adjust to a disruption in the supply chain of one
3 particular fuel. Unlike coal generation, for which stockpiles are maintained on
4 site, natural gas generation relies on “just in time delivery.” A significant
5 disruption in natural gas transportation could impact the Company’s ability to rely
6 on a particular natural gas generation facility. In such an event, the Company’s
7 diverse fleet would allow the Company to shift generation if needed to continue to
8 provide reliable service to customers.

9
10 As mentioned above, nuclear generation is a crucial factor in maintaining
11 diversity in the Company’s generation fleet, and the addition of Plant Vogtle
12 Units 3 and 4 will only enhance such diversity. Nuclear generation provides a
13 protection to customers because of its consistent, low fuel price and zero carbon
14 emissions.

15
16 The Company’s cost-effective renewable resources, including hydroelectric
17 resources, are also an important source of fuel diversity for customers. These
18 resources have a positive impact on the fuel costs and emissions of the Company.

19
20 **Q. WHAT ROLE DO OTHER PENDING AND POTENTIAL**
21 **ENVIRONMENTAL REGULATIONS PLAY IN THE COMPANY’S**
22 **ANALYSES?**

23 A. The Company takes into account the potential future impact of additional
24 environmental regulations through the controls assumed in the Unit Retirement
25 Study (“URS”) as evaluated across the nine planning scenarios. There are two
26 ways in which future environmental rules are factored into the URS. First, the
27 structure of the scenarios accounts for differing levels of stringency for future
28 regulations that restrict emissions of greenhouse gases, primarily carbon dioxide
29 (“CO₂”). By evaluating a range of future CO₂ emissions restrictions as a cost per

1 ton of emissions, the impact of any such future regulation can be evaluated in the
2 scenario results. Since there have been, and currently are, multiple legislative and
3 regulatory approaches for greenhouse gas emissions being considered at the
4 federal level, the price-based scenario evaluation is a robust method to evaluate a
5 wide range of potential regulatory outcomes.

6
7 Second, the impacts of pending and future environmental rules are considered and
8 the anticipated costs of compliance are included in the URS just as with MATS.
9 As previously discussed, these rules include the 316(b) rule, the CCR rule, and the
10 steam effluent guidelines rule. These rules are currently being promulgated by
11 EPA, and the Company has included the anticipated impacts of these rules in its
12 analysis based on known stringency, timing, and the projected costs to comply.

13
14 **Q. FOR WHICH UNITS DOES THE COMPANY REQUEST**
15 **DECERTIFICATION?**

16 A. As shown in Table 2, the Company is requesting decertification of Plant Branch
17 Units 3 and 4, Plant McManus Units 1 and 2, Plant Kraft Units 1-4, Plant Yates
18 Units 1-5, Plant Boulevard Units 2 and 3 and Plant Bowen Unit 6 (collectively,
19 the “Retirement Units”) for a total of 2,093 MW of generating capacity.

20

<u>TABLE 2</u>	
Requested Decertifications and Applicable Dates	
Plant Branch Units 3 and 4	By the MATS compliance date of April 16, 2015
Plant Yates Units 1-5	By the MATS compliance date of April 16, 2015
Plant McManus Units 1 and 2	By the MATS compliance date of April 16, 2015
Plant Kraft Units 1-4	1 year past the MATS compliance date (by April 16, 2016)
Plant Boulevard Units 2 and 3	Date of the final order in this proceeding
Plant Bowen Unit 6	By April 16, 2013

21
22
23
24
25
26
27
28
29

1 **Q. PLEASE DESCRIBE THE EVALUATION PROCESS THAT LED TO THE**
2 **COMPANY'S DECERTIFICATION REQUESTS.**

3 A. The Company explored all feasible compliance options for its generating units in
4 its attempt to identify optimal compliance solutions across its fleet. From plant to
5 plant, and in some cases from unit to unit, a unique set of compliance options are
6 feasible based on factors such as the unit's design, operating characteristics, and
7 existing environmental controls, and the Company has thoroughly vetted
8 numerous potential scenarios. And though the MATS rule and other existing and
9 pending environmental regulations are the key drivers, the current forecasts of
10 natural gas prices and the recent economic downturn and resulting loss of load
11 have also had a negative impact on the economics of the Retirement Units.

12

13 The Retirement Units have a long and distinguished history of service to Georgia
14 Power customers, and the Company is mindful of the impact that plant
15 retirements can have on the communities in which the plants are located.
16 Nevertheless, based primarily on the results of the URS, the Company believes
17 that it is in the best interest of customers that these particular units be retired.

18

19 **Q. PLEASE EXPLAIN THE METHODOLOGY USED IN THE COMPANY'S**
20 **2013 UNIT RETIREMENT STUDY.**

21 A. At the most basic level, the URS compares the projected value of the continued
22 operation of a particular unit to the value of replacement generation over a 30 year
23 period. The value of a coal/oil unit is determined by analyzing the energy and
24 capacity benefits of continued operation in light of the fixed and variable costs
25 associated with investing in the unit to meet compliance requirements. The value
26 of replacement generation is determined by analyzing the energy and capacity
27 benefits related to the fixed and variable costs associated with adding the
28 replacement generation to the system. The values of both options are then
29 compared to determine which results in the greater net benefit for customers.

1 **Q. PLEASE EXPLAIN WHY THE COMPANY HAS REQUESTED**
2 **DECERTIFICATION OF PLANT BRANCH UNITS 3 AND 4.**

3 A. Plant Branch Units 3 and 4 are two coal-fired units with a total capacity of 509
4 MW and 507 MW, respectively, which were placed in service in 1968 and 1969,
5 respectively. As a result of MATS and the Georgia Multipollutant Rule, continued
6 operation of Plant Branch Units 3 and 4 would require major capital investment to
7 achieve compliance, and economic analysis shows that it would not be beneficial
8 for customers. Therefore, the Company requests decertification of these units. To
9 put the magnitude of these costs into perspective, the total combined cost of
10 MATS compliance for all the units the Company plans to control or fuel switch is
11 roughly equal to the cost of bringing Plant Branch Units 3 and 4 alone into
12 compliance with both MATS and the Georgia Multipollutant Rule. The Company
13 requests that the timing of the retirements of Plant Branch Units 3 and 4 coincide
14 with the applicable MATS compliance deadline for these units of April 16, 2015.

15

16 **Q. WHAT IS THE COMPANY REQUESTING WITH RESPECT TO THE**
17 **PREVIOUSLY APPROVED DECERTIFICATION DATE FOR PLANT**
18 **BRANCH UNITS 1?**

19 A. The Company requests that the Commission amend its final order in Docket No.
20 34218 to extend the decertification date of Unit 1 from December 31, 2013 to
21 April 16, 2015.

22

23 **Q. WHY IS THE COMPANY REQUESTING THIS AMENDMENT?**

24 A. Once it was determined that decertification of Plant Branch Units 3 and 4 was in
25 the best interest of customers, the Company also determined that maintaining
26 Plant Branch Unit 1 in its current state was the most economic choice for
27 providing needed startup steam to Units 3 and 4. Therefore, this adjustment in the
28 decertification date of Plant Branch Unit 1 is necessary to ensure an economic and
29 reliable method for the startup of Plant Branch Units 3 and 4 until their retirement

1 in 2015. As a result, the compliance deadline in the Georgia Multipollutant Rule
2 for Branch 1 must be amended, and the Georgia Environmental Protection
3 Division (“EPD”) has recently proposed to align the Multipollutant Rule
4 deadlines for Branch 1, 3, and 4 with the MATS compliance deadline of April 16,
5 2015.

6

7 **Q. PLEASE EXPLAIN WHY THE COMPANY HAS REQUESTED**
8 **DECERTIFICATION OF PLANT MCMANUS UNITS 1 AND 2.**

9 A. Plant McManus Units 1 and 2 are oil-fired steam units that went in service in
10 1952 and 1959, respectively, and have 43 MW and 79 MW of generating
11 capacity, respectively. Economic analysis shows that investing in these units for
12 continued operation would not be beneficial for customers. As oil-fired units,
13 little to no energy benefit is realized, and given the recent economic downturn, the
14 value of capacity has decreased. In addition, the MATS rule contains
15 requirements which limit an oil-fired plant’s capacity factor, thus further limiting
16 the value of Plant McManus. The Company requests that the Commission
17 approve retirement of the units by the MATS compliance deadline of April 16,
18 2015.

19

20 **Q. PLEASE EXPLAIN WHY THE COMPANY HAS REQUESTED**
21 **DECERTIFICATION OF PLANT KRAFT UNITS 1-4.**

22 A. Plant Kraft Units 1-4 are a combination of coal and oil-fired units with natural gas
23 backup that were placed in service at various times between 1958 and 1971 and
24 have a total generating capacity of 316 MW. As initially described in Docket No.
25 34218, fuel switching to natural gas was shown as the most economic option for
26 continued operation of Plant Kraft Units 1-4, but the Company subsequently
27 determined that it was not feasible to obtain the supply of natural gas that would
28 be needed to allow the units to operate on natural gas. Because neither
29 controlling nor converting the units was a viable option, operation on oil remained

1 as the only option for continued operation. However, similar to Plant McManus,
2 as oil-fired units, Plant Kraft Units 1-4 provide little or no energy benefit, and
3 given the recent economic downturn, the value of capacity has decreased. In
4 addition, the MATS rule contains requirements which limit an oil-fired plant's
5 capacity factor, thus further limiting the value of Plant Kraft operating on oil.
6 Therefore, the Company requests that the Commission approve retirement of the
7 units one year past the MATS compliance deadline of April 16, 2016. The
8 additional year is necessary to ensure needed transmission improvements are
9 completed prior to the retirement of the units.

10
11 **Q. PLEASE EXPLAIN WHY THE COMPANY HAS REQUESTED**
12 **DECERTIFICATION OF PLANT YATES UNITS 1-5.**

13 A. Plant Yates Units 1-5 are coal-fired generating units that were placed into service
14 at various times between 1950 and 1958 and have 579 MW of total generating
15 capacity. Given the cost to bring these units into compliance with MATS,
16 economic analysis shows that investing in these units for continued operation
17 would not be beneficial for customers. The Company requests that the
18 Commission approve retirement of the units by the MATS compliance deadline of
19 April 16, 2015.

20
21 **Q. PLEASE EXPLAIN WHY THE COMPANY HAS REQUESTED**
22 **DECERTIFICATION OF PLANT BOULEVARD UNITS 2 AND 3.**

23 A. Plant Boulevard Units 2 and 3 are two oil-fired combustion turbines rated at a
24 capacity of 14 MW each and were installed in 1970 along with Unit 1. Units 2
25 and 3 have recently experienced significant equipment failures. Based on the cost
26 of repair, the age of the units, and the potential for additional failure, the
27 Company's economic analysis demonstrates that the repairs are not in customers'
28 best interest. The Company requests decertification of the units effective as of the
29 date of the final order in this proceeding.

1 **Q. PLEASE EXPLAIN WHY THE COMPANY HAS REQUESTED**
2 **DECERTIFICATION OF PLANT BOWEN UNIT 6.**

3 A. Plant Bowen Unit 6 is a 32 MW oil-fired CT that can only operate during the non-
4 summer months due to ozone nonattainment requirements in the area. An
5 evaluation determined that it is uneconomic to continue operating this unit. To
6 help facilitate baghouse construction occurring at Plant Bowen Units 3 and 4, the
7 Company determined that it is most optimal for this unit to be removed no later
8 than June 1, 2013. The Company requests expedited decertification of the unit by
9 April 16, 2013.

10

11 **Q. PLEASE EXPLAIN WHY THE COMPANY IS REQUESTING**
12 **EXPEDITED APPROVAL OF THE DECERTIFICATION OF PLANT**
13 **BOWEN UNIT 6.**

14 A. While evaluating the cost-effectiveness of the unit, the Company proactively
15 sought sale opportunities for the generator and was able to reach an agreement to
16 sell the unit (which sale is contingent on Commission approval of decertification)
17 that is in the best interest of customers. The Company requests that the
18 Commission grant this decertification by April 16, 2013 to take advantage of the
19 sale agreement. Expedited Commission approval of the decertification of the unit
20 will allow the buyer sufficient time to remove the unit before June 1, 2013, and
21 help facilitate construction of the baghouses for Plant Bowen Units 3 and 4 given
22 certain logistical constraints of the site.

23

1 **Q. WHAT IMPACT WILL THE DECERTIFICATION OF CERTAIN OF**
2 **THE RETIREMENT UNITS HAVE UPON THE AMOUNT OF**
3 **WHOLESALE BLOCK CAPACITY CERTIFIED BY THE**
4 **COMMISSION?**

5 A. The decertification and retirement of Plant Branch Units 3 and 4 and Plant Yates
6 1-5, which make up a portion of the wholesale block capacity certified by the
7 Commission, will reduce Block 1 and Blocks 2-4 accordingly, while the requested
8 amendment to the decertification date for Plant Branch Unit 1 will delay the
9 impact of the retirement of Plant Branch Unit 1 on Blocks 2-4.

10

11 Block 1 and Blocks 2-4 were certified by the Commission on March 26, 2012 in
12 Docket No. 26550. Block 1 is comprised of 250 MW of coal-fired capacity that
13 will become available to retail on April 1, 2016 and Blocks 2-4 is comprised of
14 312 MW of coal-fired capacity that will become available to retail on January 1,
15 2015. The Commission previously approved the decertification and retirement of
16 Plant Branch Units 1 and 2, which reduced the capacity of Block 1 and Blocks 2-4
17 by 21 MW and 46 MW, respectively. If the Commission approves decertification
18 of Plant Branch Units 3 and 4, the capacity of Block 1 will be further reduced by
19 approximately 187 MW and if the Commission approves the decertification of
20 Plant Yates 1-5, Blocks 2-4 will be further reduced by 57 MW.

21

22 **Q. WHAT EFFECT DID THE COMMISSION'S PREVIOUS**
23 **DECERTIFICATION OF PLANT MITCHELL UNIT 4C HAVE UPON**
24 **THE BLOCKS 5 AND 6 CAPACITY PREVIOUSLY CERTIFIED BY THE**
25 **COMMISSION?**

26 A. On March 5, 2010, the Commission certified Blocks 5 and 6, consisting of 178
27 MW of oil-fired peaking capacity. Portions of the Blocks 5 and 6 capacity will
28 become available to retail at different times as the existing wholesale contracts
29 expire, with the total capacity in retail rate base on January 1, 2016. With the

1 retirement of Plant Mitchell Unit 4C in March 2012, the capacity was reduced to
2 170 MW. However, the Commission specified in its order accepting Blocks 5
3 and 6 that the Company should market this capacity in the wholesale market for
4 years 2011 through 2015, and the Company has been diligently seeking
5 opportunities to remarket this capacity as requested by the Commission.

6

7 **Q. HAS THE COMPANY BEEN EXPLORING ADDITIONAL**
8 **OPPORTUNITIES TO MARKET CAPACITY CURRENTLY SERVING**
9 **THE RETAIL JURISDICTION IN ADDITION TO WHAT THE**
10 **COMMISSION APPROVED IN ITS ORDER ACCEPTING BLOCKS 5**
11 **AND 6?**

12 A. In addition to block sales, the Company is also considering additional remarketing
13 opportunities, including long-term requirements service agreements.
14 Requirements service agreements would involve joint integrated long-term
15 planning of wholesale and retail loads and generation resources. The wholesale
16 customers' load and generation resources would be combined with the
17 Company's load resources for planning as well as generation commitment and
18 dispatch, thereby resulting in greater economies of scale. Our retail customers
19 would benefit from these agreements through joint planning of generation and
20 transmission capacity, as well as economies of scale resulting in capacity and
21 energy savings. The Company will continue to look for such arrangements and
22 will keep the Commission informed of any such opportunities.

23

24 **Q. PLEASE DESCRIBE HOW RENEWABLE RESOURCES FIT INTO THE**
25 **COMPANY'S 2013 IRP.**

26 A. Georgia Power continues to pursue opportunities to cultivate renewable
27 generation in Georgia in a responsible manner. As a result of the collaborative
28 efforts of Georgia Power, the Commission, and the renewable energy community,
29 there currently are 11.6 MW of solar generation (with another 50 MW under

1 contract to commence service in the future), 142 MW of biomass generation
2 including landfill methane gas, and 1,088 MW of hydro generation serving
3 customers. Combined, these resources provide enough electric capacity to power
4 the peak needs of more than 257,000 homes. With the introduction of the GPASI,
5 the total amount of solar energy under contract by Georgia Power is expected to
6 be more than 270 MW by the end of 2014. In addition to procuring cost-effective
7 renewable resources, Georgia Power also supports research and demonstration of
8 renewable and emerging technologies. In all of these efforts, the Company seeks
9 to responsibly expand the fuel diversity of our supply mix through our
10 commitment to renewable generation. Notably, Georgia Power is one of the
11 national leaders among utilities operating in states in which there is no mandate
12 for solar procurement.

13
14 **Q. PLEASE DESCRIBE IN MORE DETAIL THE COLLABORATIVE STEPS**
15 **RECENTLY TAKEN BY THE COMPANY, THE COMMISSION AND**
16 **THE SOLAR ENERGY COMMUNITY TO ENCOURAGE THE**
17 **DEVELOPMENT OF NEW SOLAR RESOURCES IN GEORGIA?**

18 A. On June 7, 2011, the Commission requested that Georgia Power and Commission
19 Staff develop options for expanding large-scale solar projects. In response to the
20 Commission's request, the Company developed the 2015 LSS proposal. The
21 Commission approved the Company's LSS proposal on July 22, 2011 in Docket
22 No. 34229 and ordered the Company to file the LSS program's procedural details
23 within 30 days. Under the LSS proposal, the Company purchased a total of 50
24 MW of solar capacity. This purchase was in addition to the Company's current
25 solar procurement activities and will add to the generation procured through the
26 2015 RFP. The Company entered into PPAs for terms of 20 years for individual
27 solar projects in Georgia that were greater than 1 MW, but less than or equal to 30
28 MW in size.

1 On September 26, 2012, Georgia Power filed the GPASI in Docket No. 36325.
2 This initiative complements other ongoing efforts to pursue cost-effective
3 renewable resources and was designed to maximize opportunities for solar
4 development by encouraging wider participation. The resources procured under
5 the GPASI will be in addition to the solar resources the Company currently
6 procures through the Commission-approved Green Energy contract, Solar
7 Procurement and Renewable and Non-Renewable Resources tariff, the LSS
8 program, and other Qualifying Facility (“QF”) purchases.
9

10 **Q. WHAT IS THE STATUS OF SOLAR PHOTOVOLTAIC**
11 **DEMONSTRATION PROJECTS CURRENTLY UNDERWAY AT**
12 **SOUTHERN COMPANY FACILITIES?**

13 A. There are three solar demonstrations underway at Southern Company facilities.
14 The first is located on the roof of the Georgia Power headquarters building in
15 Atlanta, Georgia. The objective of this pilot-scale demonstration is to compare
16 the performance and reliability of seven different commercially available
17 photovoltaic (“PV”) technologies. A second solar demonstration project,
18 conducted by Southern Company Research & Environmental Affairs, is located
19 on the rooftop of the Alabama Power headquarters building in Birmingham,
20 Alabama. The objective of this pilot-scale demonstration is to gain system-wide
21 experience with micro-inverters being used on different commercially available
22 solar technologies and to compare different module technologies, similar to the
23 Georgia Power demonstration project. The third solar demonstration project, also
24 conducted by Southern Company Research & Environmental Affairs, is located at
25 an Alabama Power facility in Mobile, Alabama. This project continues the work
26 of the previous two projects but will focus on the specific effect of coastal
27 weather on solar output.
28

1 In the 2010 IRP, the Commission approved the Company's request to develop a
2 portfolio of solar demonstration projects totaling up to 1 MW to evaluate solar
3 project siting, procurement, construction, and maintenance. The Company has
4 evaluated several potential solar projects, including high profile sites at customer
5 locations as well as installations at or on Company-owned facilities. The
6 Company will continue to seek optimal locations to install this portfolio of
7 projects totaling 1 MW and gain valuable experience in installing, owning and
8 operating solar PV projects.

9
10 **Q. IS THE COMPANY PROPOSING ANY REVISIONS TO THE**
11 **COMPANY'S SELF-BUILD SOLAR PV DEMONSTRATION PROJECT?**

12 A. Yes. The Company seeks to revise the solar demonstration project at the Georgia
13 Power headquarters building into a second phase once the final results of the
14 initial solar demonstration are complete. The Company wishes to expand the
15 demonstration project as a test bed for commercially viable solar technologies.
16 Upon completion of the initial phase, as outlined above, the Company intends to
17 update the existing solar systems on the roof of the Georgia Power headquarters
18 building to reflect the most recent and emerging solar technologies. The research
19 goals of the demonstration project would remain the same through evaluation of
20 environmental impacts such as sunlight hours, temperature and humidity. In
21 addition, the Company seeks to implement a battery storage demonstration project
22 as a complement to the existing Georgia Power headquarters building solar
23 demonstration. A battery storage system could be installed on one or more of the
24 4 kilowatt ("kW") solar modules to help evaluate the benefits and costs of battery
25 storage. The Company expects the cost of modifying the Georgia Power
26 headquarters building solar demonstration to add both the battery storage
27 evaluation and the newest commercially viable technologies would not exceed
28 \$200,000.

29

1 **Q. PLEASE DESCRIBE THE COMPANY'S PROPOSED WIND**
2 **DEMONSTRATION PILOT PROJECT.**

3 A. Georgia Power and Southern Company are evaluating a potential project to
4 compare and evaluate several different small to medium (20-100kW) wind turbine
5 technologies. Between four and six small wind turbines, of both horizontal and
6 vertical axis designs, would be installed in the Georgia Power service territory.
7 The intent of the demonstration would be to understand the feasibility of small
8 scale wind generation as well as evaluating wind resources in various geographic
9 areas of the state. These efforts are in addition to the Company's continuing
10 evaluation of utility scale off-shore wind installations. The Company expects the
11 cost of the Small Wind Demonstration Pilot Project not to exceed \$9,000 per kW
12 installed.

13

14 **Q. PLEASE DESCRIBE THE STATUS OF THE COMPANY'S**
15 **PROCUREMENT FROM QFs.**

16 A. The Company continues to purchase capacity and energy under the QF proxy
17 contract methodology in conjunction with the Company's RFPs. Three proxy
18 contracts with QFs that noticed into the 2015 RFP have been executed and
19 approved to date in 2013, for a total of 81 MW. The Company continues to
20 negotiate with other QFs that noticed into the 2015 RFP and will file any executed
21 contracts for Commission approval this year. The Company has 24 standard QF
22 contracts currently in place at the avoided cost rate and continues to contract with
23 QFs as applicable pursuant to the Public Utility Regulatory Policies Act of 1978
24 ("PURPA").

25

26 **Q. WHAT IS THE STATUS OF THE CONVERSION OF PLANT MITCHELL**
27 **UNIT 3?**

28 A. The Company continues to evaluate the economic benefit to customers of the
29 Plant Mitchell Unit 3 biomass conversion. A decision concerning the conversion

1 of Plant Mitchell Unit 3 is being deferred at this time. The Company is currently
2 conducting a thorough evaluation of the impacts of the final EPA Industrial Boiler
3 Maximum Achievable Control Technology (“IB MACT”) standard and the
4 revised National Ambient Air Quality Standard for fine particular matter (PM
5 2.5), both of which were released in December. Additionally, the Company
6 recently completed a study on the feasibility of using Direct Injection (“DI”)
7 technology for the Mitchell project. The study estimates the required equipment
8 modification, performance, emissions, and cost associated with using DI for the
9 project. The Company shared the results of the study with the Commission Staff
10 in January 2013. In this 2013 IRP, Plant Mitchell Unit 3 is currently assumed to
11 be unavailable in 2015 and 2016 and then available as a biomass generating unit
12 in 2017.

13 14 **III. DEMAND-SIDE PLAN**

15 16 **Q. WHAT IS GEORGIA POWER’S PROPOSED DEMAND-SIDE PLAN?**

17 A. The recommended DSM action plan includes seeking Commission approval for a
18 certificate for one new DSM program, certification amendment for three currently
19 certified DSM programs, decertification of one DSM program (though the
20 program activities will be subsumed by an existing program) and updated
21 program economics for the remaining certified DSM programs in the Company’s
22 2013 DSM Application. The Company also intends to continue the Power Credit
23 residential program, which was previously certified in Docket No. 6315 and
24 reauthorized by the Commission in Docket No. 13305.

25
26 In accordance with the final order in the 2010 IRP, the Company has continued to
27 work closely with the DSMWG through the use of the Nine Step process for DSM
28 program development. The Company prepared an updated energy efficiency
29 technology catalog, completed and filed an energy efficiency potential study, and

1 conducted a comprehensive analysis of potential DSM programs with the
2 assistance and input of the DSMWG.

3

4 However, the Company notes that the current lower avoided cost savings have
5 had a significant and negative impact on the economics of the Company's current
6 and proposed DSM programs. Total Resource Cost ("TRC") Test results declined
7 and Ratepayer Impact Measure ("RIM") Test results worsened, causing concerns
8 for the Company in its efforts to balance the economic benefits these programs
9 provide for participating customers with the rate impacts on all customers within a
10 given class caused by the programs. For a variety of reasons, including a desire to
11 minimize market disruption, to continue meeting customers' expectations, and to
12 maintain positive relationships with vendors performing qualified program
13 improvements, the Company supports continuation of the energy efficiency
14 programs approved in the 2010 DSM Certification filing and also seeks to certify
15 a Small Business program targeted toward a hard to reach customer sector. The
16 Company plans to continue to monitor program costs and economics during 2014
17 - 2016 and will be prepared to modify or discontinue programs in the future if the
18 significant upward pressure on rates continues.

19

20 Summary information for two alternative DSM sensitivity cases is also included
21 in the filing. One alternative sensitivity case, deemed the "Advocacy Sensitivity
22 Case," presents a potential set of DSM programs designed around the
23 recommendations from some members of the DSMWG to achieve 10 year
24 cumulative energy savings of 9.5 percent. The other alternative sensitivity case
25 represents the "Aggressive Sensitivity Case" that was outlined in the Nine Step
26 process. The Company does not recommend approval of either of these sensitivity
27 cases.

1 **Q. HOW WERE NEW DSM MEASURES EVALUATED IN THE 2013 IRP?**

2 A. The Company continues to follow the Commission's economic screening policy
3 outlined in the 2004 IRP Final Order, Docket No. 17687, which directs that the
4 proposed DSM plans minimize upward pressure on rates and maximize economic
5 efficiency. Additionally, the Company's DSM plan treats DSM as a priority
6 resource. In fact, the first step in the Company's IRP process is to reduce the
7 Company's energy and demand forecast by the proposed DSM plan energy and
8 demand impacts prior to developing any supply-side alternatives. Also,
9 dispatchable DSM resources are included with supply-side resources prior to
10 evaluating the need for future supply-side resources. The Company conducted the
11 cost/benefit analysis results of each initiative using the Participant Test ("PT"),
12 RIM Test, and TRC Test.

13

14 **Q. WHAT IMPACT WILL DSM PROGRAMS HAVE UPON THE**
15 **COMPANY'S DEMAND FORECAST?**

16 A. The Company projects that by 2016, these programs will reduce peak demand by
17 approximately 2,000 MW. This load reduction represents more than 12 percent of
18 the Company's current peak demand.

19

20 **Q. PLEASE DESCRIBE THE COMPANY'S PLAN FOR OFFERING NEW**
21 **PRICING OPTIONS FOR CUSTOMERS.**

22 A. The Company will continue its strategy of developing and promoting rates that
23 give customers pricing signals that encourage peak demand reduction and load
24 shifting. Innovative programs developed by Georgia Power (such as our Real
25 Time Pricing program, Demand Plus Energy Credit and Time of Use ("TOU")
26 rates) have been effective in reducing the peak demand for electricity.

27

28 Georgia Power completed installation of the Advanced Metering Infrastructure
29 ("AMI") "smart" meters in 2012. The Company leverages the AMI investment

1 by promoting rates that send strong, clear pricing signals such as the Time of Use-
2 Residential Energy Only and Time of Use Plug-in Electric Vehicle (“TOU-PEV”)
3 rates. The Company’s promotions will continue to focus on helping customers
4 save money and energy by reducing usage or shifting loads from the on-peak time
5 period.

6
7 Georgia Power also offers the Time of Use-Fuel Cost Recovery (“TOU-FCR”)
8 rider. TOU-FCR was made permanent and expanded in 2012, and is now
9 available on a voluntary basis to all customers on TOU base tariffs. Additionally,
10 the Time of Use-Fuel Cost Recovery Three Part (“TOU-FCR-TP”) pilot rate was
11 introduced in 2012. The TOU-FCR-TP pilot rate is available to customers on the
12 TOU-PEV and Time of Use-Medium Business rates. TOU-FCR rates will further
13 strengthen price signals seen by customers on time of use rates.

14
15 **IV. FORECASTING**

16
17 **Q. PLEASE SUMMARIZE GEORGIA POWER’S DEMAND AND ENERGY**
18 **FORECASTS THAT WERE FILED IN THE 2013 IRP.**

19 A. The nation’s recovery from the Great Recession has been full of promise that, for
20 the most part, has not yet materialized. Georgia’s economic recovery has been
21 similar, but with a lag and, by some measures, weaker than the nation’s.
22 Although 2013 is expected to be another year of moderate growth, 2014 and 2015
23 are expected to be significantly stronger before the economy settles down to its
24 long-term growth rate.

25
26 Much like the nation overall, Georgia’s economy is expected to regain strength
27 over the next several years. Surveys show that the state remains an attractive
28 place to do business. Living costs also remain attractive relative to many states.
29 The demographic forces that once propelled the state to near the top of the

1 economic growth league will continue to strengthen as ongoing home price
2 adjustments break the housing logjam that nearly halted net migration during the
3 recession. As the economy improves, energy sales will follow suit. A detailed
4 discussion of the revised territorial energy and demand forecasts is set forth in
5 Technical Appendix Volume 2 of the 2013 IRP.

6
7 **V. RESERVE MARGIN**

8
9 **Q. DOES GEORGIA POWER'S 2013 IRP PROVIDE SUFFICIENT**
10 **RELIABILITY FOR GEORGIA POWER'S CUSTOMERS?**

11 A. Yes. After an analysis of load forecast and weather uncertainty, the cost of
12 Expected Unserved Energy ("EUE"), as well as the current and near-term
13 projected generation reliability of the Southern Electric System, the Company will
14 continue to maintain its long-term planning target reserve margin at 15 percent.
15 These planning reserves are needed to protect against any shortfall in capacity due
16 to unforeseen future events, such as greater than expected load growth, generation
17 unit forced outages, or unusual weather. These reserve margins are based on
18 balancing the cost of adding new generation to maintain an acceptable level of
19 reliability versus the weighted average of the outage cost to the various customer
20 classes.

21
22 **Q. DID THE COMPANY CONDUCT AN EXPECTED UNSERVED ENERGY**
23 **STUDY FOR THE 2013 IRP?**

24 A. An outage cost survey of Georgia Power and Mississippi Power customers was
25 completed in 2011 by Freeman Sullivan & Company in accordance with the
26 Commission's final order in the 2010 IRP. The cost to non-residential customer
27 classes of EUE from this survey is substantially higher than in previous studies.
28 Since EUE is so infrequent, even at lower reserve margins, this change only

1 slightly increased the reserve margin for the minimum cost point. For results of
2 the study, see the EUE Study in Technical Appendix Volume 1.

3

4 **Q. WHAT RESERVE MARGIN DOES THE 2013 IRP MAINTAIN FOR**
5 **GEORGIA POWER'S CUSTOMERS?**

6 A. For the short-term horizon, the Company will maintain a 13.5% system planning
7 reserve margin guideline, but may periodically review the availability and cost of
8 resources in the market and adjust short-term resource procurement decisions
9 accordingly. For the long-term, the Company will maintain a reserve margin
10 target of 15%.

11

12

VI. TRANSMISSION

13

14 **Q. PLEASE DESCRIBE GEORGIA POWER'S TRANSMISSION PLAN**
15 **FILED IN THE 2013 IRP.**

16 A. This IRP includes the Company's ten-year transmission plan, which identifies the
17 transmission improvements needed (based upon current planning assumptions) to
18 maintain a strong and reliable transmission system. The development of this plan
19 is conducted in accordance with the Southern Company System transmission
20 planning guidelines and with the North American Electric Reliability Council
21 planning standards. Along with the ten-year plan, Georgia Power has included a
22 comprehensive and detailed bulk transmission plan of the Georgia Integrated
23 Transmission System, as required by the amended rules adopted by the
24 Commission in Docket No. 25981. Additional transmission information has also
25 been provided as required by the Commission order in Docket No. 31081.

26

1 **VII. COST RECOVERY**

2
3 **Q. WHAT ARE THE COSTS THE COMPANY SEEKS TO RECOVER IN**
4 **CONNECTION WITH THE RETIREMENT UNITS?**

5 A. The costs associated with the Retirement Units include: (1) the net book value
6 (“NBV”) of the Retirement Units that will remain at the proposed retirement dates
7 (including Plant Bowen Unit 6 if the Commission does not grant expedited
8 decertification); (2) Construction Work in Progress (“CWIP”) balances directly
9 attributable to environmental controls that will now no longer be completed; (3)
10 any remaining Materials & Supplies (“M&S”) inventory that cannot be sold or
11 used at another generating plant; and (4) any costs that represent recoverable fuel
12 costs under the Company’s FCR tariffs incurred in connection with the
13 termination of any fuel transportation contracts associated with the Retirement
14 Units.

15
16 **Q. PLEASE DESCRIBE THE ACCOUNTING TREATMENT BEING**
17 **REQUESTED BY THE COMPANY TO RECOVER THE NBV OF PLANT**
18 **BRANCH UNITS 3 AND 4 AND PLANT BOULEVARD UNITS 2 AND 3**
19 **THAT WILL REMAIN ON THE PROPOSED RETIREMENT DATES.**

20 A. The Company proposes to reclassify the NBV remaining on the proposed
21 retirement dates of the units to a regulatory asset account. The regulatory asset
22 would be amortized ratably over a period equal to the respective unit’s remaining
23 useful life as approved by the Commission in Docket No. 31958. This is
24 consistent with the accounting treatment approved by the Commission in Docket
25 No. 34218 in connection with the retirement of Plant Branch Units 1 and 2 and
26 Plant Mitchell Unit 4C.

27

1 **Q. PLEASE DESCRIBE THE ACCOUNTING TREATMENT BEING**
2 **REQUESTED BY THE COMPANY TO RECOVER THE NBV OF PLANT**
3 **BOWEN UNIT 6 THAT WILL REMAIN ON THE PROPOSED**
4 **RETIREMENT DATE IF THE COMMISSION DOES NOT APPROVE**
5 **EXPEDITED DECERTIFICATION OF THE UNIT.**

6 A. If the Commission does not approve expedited decertification of Plant Bowen
7 Unit 6, the Company proposes to reclassify the NBV remaining on the proposed
8 retirement date of the unit to a regulatory asset account, just as with Plant Branch
9 Units 3 and 4 and Plant Boulevard Units 2 and 3. The regulatory asset would be
10 amortized ratably over a period equal to the respective unit's remaining useful life
11 as approved by the Commission in Docket No. 31958.

12

13 **Q. PLEASE DESCRIBE THE ACCOUNTING TREATMENT BEING**
14 **REQUESTED BY THE COMPANY TO RECOVER THE CWIP**
15 **BALANCES ASSOCIATED WITH ENVIRONMENTAL CONTROLS FOR**
16 **PLANT BRANCH UNITS 3 AND 4 AND PLANT YATES UNITS 6 AND 7.**

17 A. The Company has \$38 million and \$14 million of CWIP attributable to
18 environmental controls at Plant Branch Units 3 and 4 and Plant Yates Units 6 and
19 7, respectively, that have been reclassified to regulatory asset accounts in
20 accordance with the Commission's Order in Docket No. 31958. The Company
21 proposes to amortize the \$38 million and \$14 million balances ratably over three
22 years beginning January 2014.

23

24 **Q. PLEASE DESCRIBE THE ACCOUNTING TREATMENT BEING**
25 **REQUESTED BY THE COMPANY TO RECOVER THE REMAINING**
26 **M&S INVENTORY BALANCES ASSOCIATED WITH THE**
27 **RETIREMENT UNITS.**

28 A. The Company proposes to reclassify the balances associated with any remaining,
29 unusable M&S inventory to a regulatory asset account by the respective

1 retirement dates for each Retirement Unit, in accordance with the Commission's
2 Order in Docket No. 31958. The Company proposes to amortize the regulatory
3 asset balance for recovery over a period to be determined by the Commission in
4 the Company's next base rate case following the unit retirements.

5

6 The Company will make every effort to manage M&S inventory balances, while
7 maintaining an adequate level to ensure the units continue to operate up to their
8 proposed retirement dates. While the Company will take appropriate steps to find
9 uses for existing inventory, including the sale of such inventory, it is reasonable to
10 expect there will be some inventory that cannot be used at other Georgia Power
11 generating plants.

12

13 **Q. PLEASE DESCRIBE THE ACCOUNTING TREATMENT BEING**
14 **REQUESTED BY THE COMPANY TO RECOVER ANY FUEL**
15 **RELATED COSTS ASSOCIATED WITH THE RETIREMENT UNITS.**

16 A. The Company proposes to record any costs that represent recoverable fuel costs
17 under the Company's FCR tariffs incurred in connection with the termination of
18 any fuel transportation contracts associated with the Retirement Units as incurred.
19 All such costs, along with the associated carrying costs, would be deferred until
20 the Company's next fuel rate case following the conclusion of this IRP for
21 recovery through the FCR tariffs over a period to be determined by the
22 Commission. Furthermore, such fuel expenses would be excluded from the
23 calculation of under- or over-recovered fuel expense for the purpose of the interim
24 fuel rider adjustment mechanism. The Company shall use good faith efforts to
25 look for opportunities to reduce such costs that would otherwise remain upon the
26 unit retirement dates. This proposed treatment is consistent with the accounting
27 treatment approved by the Commission in Docket No. 24506 in connection with
28 the extension of the commercial operation dates of the Plant McDonough-
29 Atkinson combined cycle generating units.

Q. HOW WILL THE ACCOUNTING TREATMENT BEING PROPOSED BY THE COMPANY IN CONNECTION WITH THE DECERTIFICATION AND RETIREMENT OF THE RETIREMENT UNITS IMPACT CUSTOMERS?

A. The Company has proposed to recover the remaining costs of the units being retired in a manner that significantly limits any impact on customer rates. The most significant costs resulting from the decision to retire these units—the remaining net book values—will be amortized at the same rate the Commission approved in Docket No. 31958, and thus, will have no incremental impact on current rates. The three year amortization period proposed for the relatively small balances related to CWIP and the amortization period established by the Commission for the M&S inventory is expected to result in limited customer rate impact. Likewise, any fuel or fuel transportation costs recovered through the FCR tariff would be amortized over a period approved by the Commission and would not be expected to have a significant incremental impact since the current costs of such contracts are already included in rates.

VIII. CONCLUSION

Q. WHAT IS GEORGIA POWER REQUESTING OF THE COMMISSION IN THE 2013 IRP?

A. The Company seeks approval of:

- 1) Its 2013 Integrated Resource Plan and the associated Action Plan;
- 2) Decertification of Plant Branch Units 3 and 4, Plant Yates Units 1-5, and Plant McManus Units 1 and 2 effective by the MATS compliance date of April 16, 2015, decertification of Plant Kraft Units 1-4 one year past the MATS compliance date (by April 16, 2016), decertification of Plant Boulevard Units 2 and 3 effective as of the date of the final order in this

1 proceeding, and approval of expedited decertification of Plant Bowen Unit
2 6 by April 16, 2013 as specified in the 2013 Decertification Application;

3 3) A switch to natural gas as the primary fuel for Plant Yates Units 6 and
4 7 and Plant Gaston Units 1-4;

5 4) An amendment of the decertification date specified in the
6 Commission's final order in Docket No. 34218 for Plant Branch Unit 1
7 from December 31, 2013 to coincide with the decertification of Plant
8 Branch Units 3 and 4;

9 5) A certificate of public convenience and necessity for one new DSM
10 program, a certificate amendment for three previously certified programs,
11 decertification of one DSM program, and approval of updated program
12 economics and budgets for all other previously certified energy efficiency
13 DSM programs and other DSM activities as further specified in the 2013
14 DSM Application in Docket No. 36499;

15 6) Reclassification of the remaining net book values of Plant Branch Units
16 3 and 4 and Plant Boulevard Units 2 and 3 as of their respective retirement
17 dates to regulatory asset accounts and the amortization of such regulatory
18 asset accounts ratably over a period equal to the respective unit's
19 remaining useful life approved in Docket No. 31958;

20 7) In the event the Commission does not approve the expedited
21 decertification of Plant Bowen Unit 6, reclassification of the remaining net
22 book value of Plant Bowen Unit 6 as of its respective retirement date to a
23 regulatory asset account and the amortization of such regulatory asset
24 account ratably over a period equal to the unit's remaining useful life
25 approved in Docket No. 31958;

26 8) Amortization of approximately \$38 million of Plant Branch Units 3
27 and 4 and approximately \$14 million of Plant Yates Units 6 and 7
28 environmental CWIP (which has been reclassified as a regulatory asset in

1 accordance with the Commission's Order in Docket No. 31958) ratably
2 over a three year period beginning January 2014;

3 9) Reclassification of any unusable M&S inventory balance remaining at
4 the unit retirement dates to a regulatory asset as identified in accordance
5 with the Commission's Order in Docket No. 31958 for recovery over a
6 period to be determined by the Commission in the Company's next base
7 rate case following the unit retirements;

8 10) Recovery of any costs that represent recoverable fuel costs under the
9 Company's FCR tariffs incurred in connection with the termination of any
10 fuel transportation contracts associated with the Retirement Units over a
11 period to be determined by the Commission in the Company's first fuel
12 case following the conclusion of this IRP;

13 11) The capital costs the Company will incur for a portfolio of certain
14 renewable demonstration projects (but not yet the recovery of such costs),
15 as set out in the Selected Supporting Information section of Technical
16 Appendix Volume 2; and

17 12) The capital and O&M costs (but not yet the recovery) of measures
18 taken to comply with existing government-imposed environmental
19 mandates, as set out in the Selected Supporting Information section of
20 Technical Appendix Volume 2.

21
22 **Q. DOES THIS CONCLUDE YOUR TESTIMONY?**

23 **A. Yes.**
