Florida Public Service Commission
2540 Shumard Oak Blvd.
Tallahassee, FL 32399-0850

Re: Docket No. 20200092-EI
Petition of Florida Power & Light Company for Approval of the
2021 Storm Protection Plan Cost Recovery Clause Factors

Dear Mr. Teitzman:

Enclosed for electronic filing in the above-referenced docket, please find Florida Power & Light Company's Petition requesting approval of the Storm Protection Plan Cost Recovery Clause factors to be applied to bills issued during the projected period of January 1, 2021 through December 31, 2021, pursuant to Section 366.96, Florida Statutes, and Rule 25-6.031, Florida Administrative Code, together with the supporting direct testimonies and exhibits of FPL witnesses Michael Jarro, Liz Fuentes, and Renae B. Deaton. Copies of this filing will be provided as indicated on the enclosed Certificate of Service.

If you or your staff have any question regarding this filing, please contact me at (561) 691-7144.

Respectfully submitted,

/s/Christopher Wright

Enclosure

BEFORE THE FLORIDA PUBLIC SERVICE COMMISSION

In re: Storm Protection Plan Cost Recovery
Clause

Docket No. 20200092-EI

Filed: July 24, 2020

**PETITION OF FLORIDA POWER & LIGHT COMPANY FOR
APPROVAL OF THE PROJECTED 2021 STORM PROTECTION PLAN
COST RECOVERY CLAUSE FACTORS**

Florida Power & Light Company (“FPL” or the “Company”) hereby files this petition (the “Petition”) requesting that the Florida Public Service Commission (“Commission”) approve the Storm Protection Plan Cost Recovery Clause (“SPPCRC”) Factors to be applied to bills issued during the projected period of January 1, 2021 through December 31, 2021, pursuant to Section 366.96, Florida Statutes (“F.S.”), and Rule 25-6.031, Florida Administrative Code (“F.A.C.”). Through this Petition, FPL is seeking recovery of the incremental Storm Protection Plan (“SPP”) capital investment costs projected to be incurred for each SPP program during 2021, as well as certain incremental programming, administrative, and resource costs that are necessary to manage and track the annual SPP projects and costs for the annual SPPCRC filings. In support of this Petition, FPL incorporates the testimonies and exhibits of FPL witnesses Michael Jarro, Liz Fuentes, and Renae B. Deaton, and states as follows:

1. The name and address of the Petitioner is:

Florida Power & Light Company
700 Universe Blvd
Juno Beach, FL 33408

2. FPL is a corporation organized and existing under the laws of the State of Florida and is an electric utility as defined in Sections 366.02(2) and 366.96, F.S. FPL provides generation, transmission, and distribution service to nearly five million retail customer accounts.

3. Any pleading, motion, notice, order or other document required to be served upon the petitioner or filed by any party to this proceeding should be served upon all of the following individuals:

Kenneth A. Hoffman
Vice President, Regulatory Affairs
Florida Power & Light Company
134 W. Jefferson Street
Tallahassee, FL 32301
Phone: 850-521-3919
Fax: 850-521-3939
Email: ken.hoffman@fpl.com

John T. Burnett
Vice President and Deputy General Counsel
Christopher T. Wright
Senior Attorney
Florida Power & Light Company
700 Universe Boulevard
Juno Beach, FL 33408-0420
Phone: 561-691-7144
Fax: 561-691-7135
Email: john.t.burnett@fpl.com
Email: christopher.wright@fpl.com

4. The Commission has jurisdiction pursuant to Section 366.96, F.S., and Rule 25-6.031, F.A.C.

5. This Petition is being filed consistent with Rule 28-106.201, F.A.C. The agency affected is the Commission, located at 2540 Shumard Oak Boulevard, Tallahassee, Florida 32399. This case does not involve reversal or modification of an agency decision or an agency's proposed action. Therefore, subparagraph (c) and portions of subparagraphs (b), (e), (f) and (g) of subsection (2) of Rule 28-106.201, F.A.C., are not applicable to this Petition. In compliance with subparagraph (d) of Rule 28-106.201, F.A.C., FPL states that it is not known which, if any, of the issues of material fact set forth in the body of this Petition may be disputed by any others who may plan to participate in this proceeding. The discussion below demonstrates how the petitioner's substantial interests will be affected by the agency determination.

6. On June 27, 2019, the Governor of Florida signed CS/CS/CS/SB 796 addressing Storm Protection Plan Cost Recovery, which was codified in Section 366.96, F.S. Therein, the Florida Legislature directed each utility to file a ten-year SPP that explains the storm hardening

programs and projects the utility will implement to achieve the legislative objectives of reducing restoration costs and outage times associated with extreme weather events. *See* Section 366.96(3), F.S. The Florida Legislature also directed the Commission to conduct an annual proceeding to determine the utility's prudently incurred SPP costs and to allow the utility to recover such costs through a charge separate and apart from its base rates, to be referenced as the SPPCRC. *See* Section 366.96(7), F.S.

7. FPL's 2020-2029 SPP was filed in Docket No. 20200071-EI on April 10, 2020, and corrected by Errata filed on May 12, 2020 and a Second Errata filed on July 13, 2020. FPL's SPP is a systematic approach to achieve the legislative objectives of Section 366.96, F.S., to reduce restoration costs and outage times associated with extreme weather events. A true and correct copy of FPL's SPP is provided as Exhibit MJ-1 to the direct testimony of FPL witness Michael Jarro. FPL's SPP is currently pending before the Commission in Docket No. 20200071-EI.¹

8. Rule 25-6.031(2), F.A.C., provides that after a utility has filed its SPP it may petition the Commission for recovery of the costs associated with the SPP and implementation activities. Rule 25-6.031, F.A.C., specifies the information to be included in each utility's SPPCRC filings. Consistent with these requirements, FPL is herein submitting its 2021 SPPCRC projection filing to establish recovery factors for the SPP capital investment costs to be incurred in 2021, as well as certain incremental programming, administrative, and resource costs that are necessary to manage and track the annual SPP projects and costs for the annual SPPCRC filings.

9. Although SPP costs incurred after the April 10, 2020 SPP filing date are eligible for SPPCRC recovery under Rule 25-6.031(6)(a), F.A.C., FPL has committed and previously

¹ Pursuant to Rule 25-6.031(2), F.A.C., FPL will file an amended SPPCRC petition and supporting testimony if the Commission approves FPL's SPP with modifications.

advised parties that it will not seek SPPCRC recovery of the costs incurred for SPP programs and projects prior to January 1, 2021. Therefore, FPL is not requesting and will not be addressing the final true-up of SPP program cost recovery for a prior year or the actual/estimated SPP program cost recovery of the current year in this docket. Accordingly, pursuant to Rule 25-6.031(3), F.A.C., the scope of review for this proceeding “will be limited to determining the reasonableness of projected Storm Protection Plan cost...and to establish Storm Protection Plan cost recovery factors consistent with the requirements of this rule” for amounts requested for recovery in 2021.²

10. Consistent with Rule 25-6.031(7)(c), F.A.C., the direct testimony and exhibits of FPL witness Michael Jarro identify each of the SPP programs for which costs will be incurred during 2021, as well as provide a description of the work projected to be performed for each SPP program during 2021. Mr. Jarro explains that the projected number of SPP projects and associated costs to be incurred during 2021 are consistent with FPL’s SPP currently pending before the Commission at Docket No. 20200071-EI.

11. Consistent with Rule 25-6.031(6)(b), F.A.C., the direct testimony and exhibits of FPL witness Liz Fuentes explain how FPL determined the amount of forecasted 2021 SPP costs for which it is seeking recovery through the SPPCRC are incremental from base rates. Ms. Fuentes also explains how FPL will uniquely identify and record costs to be recovered through the SPPCRC beginning in 2021 as required by Rule 25-6.031(5). Finally, Ms. Fuentes explains and provides support for the calculation of the projected 2021 Weighted Average Cost of Capital (“WACC”) to be used in order to calculate the return on 2021 SPPCRC capital investments as permitted by Rule 25-6.031(6)(c).

² Rule 25-6.031(2), F.A.C., provides that the actual SPP costs incurred by a utility are subject to a prudence review. As explained above, FPL is not seeking SPPCRC recovery of actual SPP program and project costs in this filing.

12. To calculate its proposed SPPCRC factors for the period of January 1, 2021 through December 31, 2021, FPL applied the methodology and prescribed schedules contained in Commission Forms 1P through 7P, which are provided in Appendix I of Exhibit RBD-1 attached to the direct testimony of FPL witness Renae B. Deaton. As set forth in Ms. Deaton's direct testimony and exhibits, FPL is requesting recovery of total projected jurisdictional SPP costs in the amount of \$43,439,331, adjusted for revenue taxes, representing: (a) \$42,549,801 of incremental capital investment costs associated with FPL's SPP programs projected to be incurred between January 1, 2021 and December 31, 2021; (b) \$435,470 of capital investment costs associated with incremental, one-time IT and programing costs that are necessary to properly manage and track the annual SPP projects and costs for the SPPCRC filings; and, (c) \$454,060 for projected 2021 administrative and resource expenses that are necessary to manage and track the annual SPP projects and costs for the annual SPPCRC filings. Based on these calculations, FPL seeks Commission approval of the SPPCRC factors, as set forth in Appendix I of Exhibit RBD-1 attached to the direct testimony of FPL witness Renae B. Deaton and in Attachment A to this Petition, for the January 2021 through December 2021 billing period, effective starting January 1, 2021, and continuing until modified by subsequent order of this Commission.

13. Pursuant to Rule 25-6.031, F.A.C., the prudence and true-up of the actual SPP costs incurred during the projected period of January 1, 2021 through December 31, 2021, will be addressed in FPL's final true-up filing for 2021, which will be filed in 2022. *See* Rule 25-6.031(3) and (7)(c), F.A.C.

14. FPL submits that the 2021 SPPCRC factors are reasonable, consistent with FPL's 2020-2029 SPP filed in Docket No. 20200071-EI, fully compliant with the requirements of Rule

25-6.031, F.A.C., and consistent with the Commission's methodology for calculating the recovery factors. Therefore, the proposed 2021 SPPCRC factors should be approved.

WHEREFORE, FPL respectfully requests that the Commission find FPL's projected 2021 SPP costs to be reasonable and approve the proposed SPPCRC factors for application to bills beginning the first billing cycle in January 2021 through the last billing cycle December 2021 and continuing until modified by subsequent order of this Commission.

I. INTRODUCTION

Q. Please state your name and business address.

A. My name is Michael Jarro. My business address is Florida Power & Light Company, 15430 Endeavor Drive, Jupiter, FL, 33478.

Q. By whom are you employed and what is your position?

A. I am employed by Florida Power & Light Company (“FPL” or the “Company”) as the Vice President of Distribution Operations.

Q. Please describe your duties and responsibilities in that position.

A. My current responsibilities include the operation and maintenance of FPL’s approximately 68,000 miles of distribution infrastructure, including 42,000 miles of overhead and 26,000 miles of underground, that safely, reliably, and efficiently deliver electricity to more than five million customers in FPL’s service territory covering approximately 28,000 square miles. I am responsible for the oversight of more than 1,600 employees in a control center and sixteen management areas. The functions and operations within my area are quite diverse and include distribution operations, major projects and construction services, power quality, meteorology, and other operations that together help provide the highest level of service to FPL’s customers.

Q. Please describe your educational background and professional experience.

A. I graduated from the University of Miami with a Bachelor of Science Degree in Mechanical Engineering and Florida International University with a Master of

1 Business Administration. I joined FPL in 1997 and have held several leadership
2 positions in distribution operations and customer service, including serving as
3 distribution reliability manager, manager of distribution operations for the south
4 Miami-Dade area, control center general manager, director of network operations,
5 senior director of customer strategy and analytics, senior director of power delivery
6 central maintenance and construction, and vice-president of transmission and
7 substations.

8 **Q. Have you previously testified before the Florida Public Service Commission**
9 **(“PSC” or the “Commission”)?**

10 A. Yes, I submitted written direct testimony on April 10, 2020, and written rebuttal
11 testimony on June 26, 2020, in support of FPL’s 2020-2029 Storm Protection Plan
12 (“SPP”) filing in Docket No. 20200071-EI.

13 **Q. What is the purpose of your testimony?**

14 A. The purpose of my testimony is to describe FPL’s 2021 SPP programs and
15 associated costs, and explain how those activities and costs are consistent with
16 FPL’s SPP filed at Docket No. 20200071-EI.

17 **Q. Are you sponsoring any schedules in this case?**

18 A. Yes. I am sponsoring Exhibit MJ-1 – FPL’s Storm Protection Plan 2020-2029 that
19 was filed with and is currently pending before the Commission in Docket No.
20 20200071-EI. I am also sponsoring Exhibit MJ-2 – Storm Protection Plan Work
21 Projected to be Completed in 2021. Finally, I am co-sponsoring portions of Form
22 6P - Program Description and Progress Report that is included in FPL witness
23 Renae Deaton’s Exhibit RBD-1.

- 1 • Vegetation Management – Transmission Program
- 2 • Substation Storm Surge/Flood Mitigation Program

3 The type of activities and scope for each of these SPP programs are described in
4 detail in Exhibit MJ-1 and Form 6P - Program Description and Progress Report.

5 **Q. Is FPL seeking to recover any actual SPP costs incurred for the prior year**
6 **through the Storm Protection Plan Cost Recovery Clause (“SPPCRC”)?**

7 A. No. The prior year would be the year-ended December 31, 2019. Pursuant to Rule
8 25-6.031(6)(a), F.A.C., the utility is only permitted to seek recovery of SPP costs
9 incurred after the filing date of the SPP. In this case, FPL’s SPP was filed on April
10 10, 2020, and it is the first SPP that has been filed. Therefore, there is no “prior
11 year” (2019) applicable to the SPPCRC in this proceeding. As such, the actual or
12 prior year costs will not be further addressed.

13 **Q. Is FPL seeking to recover any actual/estimated SPP project costs for the**
14 **current year of the SPP through the SPPCRC?**

15 A. No. Although SPP costs incurred after April 10, 2020, are eligible for recovery
16 under Rule 25-6.031(6)(a), F.A.C., FPL has committed and previously advised
17 parties that it will not seek recovery of the 2020 SPP project costs through the
18 SPPCRC. Therefore, the actual/estimated project costs (i.e., 2020 SPP project
19 costs) will not be further addressed.

20 **Q. Is FPL seeking to recover any projected SPP costs through the SPPCRC?**

21 A. Yes. As described by FPL witness Liz Fuentes, FPL is requesting Commission
22 approval to recover the projected 2021 SPP capital expenditures through the

1 SPPCRC. FPL is not seeking to recover any of the 2021 SPP Operations and
2 Maintenance (“O&M”) expenses or cost of removal through the 2021 SPPCRC.

3 **Q. Has FPL provided details on the annual SPP programs and associated costs?**

4 A. Yes. This information is provided in Form 6P - Program Description and Progress
5 Report, which is a form prescribed by Commission Staff. For each SPP program,
6 Form 6P describes the program activities, identifies the fiscal expenditures incurred
7 to date, reports on the progress for the current year, and provides a projection of
8 work to be completed and the associated costs for the subsequent year.

9 **Q. Has FPL provided a description of the work projected to be performed in 2021
10 for each SPP program?**

11 A. Yes. FPL has identified the work projected to be performed in 2021 for certain of
12 its SPP programs. FPL’s Pole Inspections - Distribution Program, Structures/Other
13 Equipment Inspections – Transmission Program, Vegetation Management –
14 Distribution Program, and Vegetation Management – Transmission Program, are
15 on-going annual inspection and vegetation management programs that do not have
16 project components and, instead, are completed on a cycle-basis throughout FPL’s
17 service territory as explained further in Exhibit MJ-1 and Form 6P - Program
18 Description and Progress Report. As such, these four SPP programs that do not
19 lend themselves to identification of specific projects to be performed.

20
21 With respect to the other four programs included in FPL’s SPP (Feeder Hardening
22 (EWL) – Distribution Program, Lateral Hardening (Undergrounding) – Distribution
23 Program, Wood Structures Hardening (Replacing) – Transmission Program, and

1 Substation Storm Surge/Flood Mitigation – Program), FPL has identified the work
2 projected to be performed in 2021 for each of these four SPP programs. These
3 projections are provided in Exhibit MJ-2 attached to my testimony. However, the
4 SPP projects that will actually be completed in 2021 could vary based on a number
5 of factors, including, but not limited to: permitting; easement issues; change in
6 scope; resource constraints (i.e., labor & material); and/or extreme weather events.
7 Any such variances will be addressed in FPL’s 2021 actual/estimated filing to be
8 submitted in 2021, and the final 2021 true-up filing to be submitted in 2022.

9 **Q. Are the SPP activities and costs estimated for 2021 consistent with FPL’s SPP?**

10 A. Yes. The number of projects and costs estimated for each SPP program during
11 2021 are consistent with those described in FPL’s SPP as shown in Appendix C to
12 Exhibit MJ-1 and Form 6P - Program Description and Progress Report. I note that
13 the forecasted 2021 capital costs provided in FPL’s SPP included the cost of
14 removal, which was based on historical averages. As explained by FPL witness
15 Fuentes, FPL is not seeking to recover the cost of removal through the SPPCRC.

16
17 As of the time I prepared my direct testimony, FPL is not aware of any variances in
18 the number of SPP projects or SPP costs estimated for 2021. However, as I
19 previously stated, the number of SPP projects that will actually be completed in
20 2021, as well as the associated SPP costs, could vary based on a number of factors.
21 Additionally, it should be noted that the 2021 program costs are the projected costs
22 estimated as of the April 10, 2020 filing date of FPL’s SPP, and the actual SPP
23 program costs incurred could vary. Consistent with Rule 25-6.031, F.A.C., the

1 actual SPP costs incurred by FPL in 2021 will be addressed and decided in FPL's
2 final 2021 true-up filing, which will be submitted in 2022.

3 **Q. How will FPL record and track the costs incurred for its SPP projects and**
4 **programs approved for recovery through the SPPCRC?**

5 A. As described by FPL witness Fuentes in her testimony, FPL has established the
6 appropriate accounting framework to distinguish which costs are recoverable
7 through the SPPCRC and how they will be recorded on its books and records
8 beginning January 1, 2021. In accordance with this accounting framework, FPL
9 has created unique master data in its systems (i.e., work order type and work
10 breakdown structure) to record and track activity performed by employees and
11 contractors for SPP projects approved for recovery through SPPCRC. All capital
12 expenditures for SPP projects starting in 2021 will be recorded to master data
13 tagged for recovery through the SPPCRC while O&M expenses and cost of
14 removal will be recorded to master data tagged for recovery through base rates.

15 **Q. Does this conclude your direct testimony?**

16 A. Yes.

Florida Power & Light Company 2020-2029 Storm Protection Plan

I. Executive Summary

Pursuant to Section 366.96, Florida Statutes (“F.S.”), and Rule 25-6.030, Florida Administrative Code (“F.A.C.”), Florida Power & Light Company (“FPL”) submits its Storm Protection Plan for the ten (10) year period 2020-2029 (hereinafter, the “SPP”). As explained herein, the SPP is largely a continuation of FPL’s successful storm hardening and storm preparedness programs previously approved by the Florida Public Service Commission (“Commission”) over the last fourteen years. FPL anticipates the programs included in the SPP will have zero bill impacts on customer bills during the first year of the SPP and only minimal bill increases for years two and three of the SPP.¹

Since 2006, FPL has been implementing Commission-approved programs to strengthen its transmission and distribution (“T&D”) infrastructure. These programs include multiple storm hardening and storm preparedness programs, such as feeder hardening, replacing wood transmission structures, vegetation management, and pole inspections. As demonstrated by recent storm events, these ongoing storm hardening and storm preparedness programs have resulted in FPL’s T&D electrical grid becoming more storm resilient, experiencing less infrastructure damage and reduced restoration times, as compared to non-hardened facilities. These programs have also provided significant improvements in day-to-day reliability.

The success of FPL’s storm hardening and storm preparedness programs has been achieved through the development and implementation of FPL’s forward-looking storm hardening, grid modernization, and reliability initiatives and investments, combined with the use of cutting-edge technology and strong employee commitment. Under the SPP, FPL remains committed to continue these successful and industry-leading programs to

¹ The recovery of the costs associated with the SPP, as well as the actual and projected costs to be included in FPL’s Storm Protection Plan Cost Recovery Clause, will be addressed in a subsequent and separate Storm Protection Plan Cost Recovery Clause docket pursuant to Rule 25-6.031, F.A.C.

further strengthen its T&D infrastructure, mitigate restoration costs and outage times, continue to provide safe and reliable electric service to customers, and meet future increasing needs and expectations.

As stated previously, FPL's SPP is, in large part, a continuation and expansion of its previously approved storm hardening and storm preparedness programs, and includes the following SPP programs:

- Pole Inspections – Distribution Program
- Structures/Other Equipment Inspections – Transmission Program
- Feeder Hardening (EWL) – Distribution Program
- Lateral Hardening (Undergrounding) – Distribution Program
- Wood Structures Hardening (Replacing) – Transmission Program
- Vegetation Management – Distribution Program
- Vegetation Management – Transmission Program

In addition, FPL will implement a new Substation Storm Surge/Flood Mitigation Program to harden certain targeted substations that, based on prior experience, are susceptible to storm surge or flooding during extreme weather events.

With the exception of the new storm surge/flood mitigation program, the majority of the programs included in the SPP have been in place since 2007. As demonstrated by recent storm events, these programs have been successful in reducing restoration costs and outage times following major storms, as well as improving day-to-day reliability. FPL submits that continuing these previously approved storm hardening and storm preparedness programs in the SPP, together with the new storm surge/flood mitigation substation program, is appropriate and necessary to address the mandates set forth in Section 366.96, F.S., and Rule 25-6.030, F.A.C., as well as the expectations of FPL's customers and other stakeholders for increased storm resiliency and will result in fewer

outages, reduced restoration costs, and prompt service restoration.² The SPP will continue and expand the benefits of hardening, including improved day-to-day reliability, to all customers throughout FPL's system.

The following sections provide information and details on FPL's SPP as required by and in compliance with Rule 25-6.030, F.A.C. For the reasons explained below, FPL submits that implementing the SPP is necessary and appropriate to achieve the goals and requirements expressed by the Florida Legislature in Section 366.96, F.S., to reduce restoration costs and outage times associated with extreme weather events and improve overall service reliability to customers and the State of Florida by promoting the overhead hardening of electrical transmission and distribution facilities, the undergrounding of certain electrical distribution lines, and vegetation management.

II. The 2020-2029 SPP will Strengthen FPL's Infrastructure to Withstand Extreme Weather Conditions and will Reduce Restoration Costs and Outage Times

Pursuant to Rule 25-6.030(3)(a), F.A.C., this section provides an overview of how the SPP will strengthen FPL's electric utility infrastructure to withstand extreme weather conditions by promoting the overhead hardening of electrical transmission and distribution facilities, the undergrounding of certain electrical distribution lines, and vegetation management. Consistent with Rule 25-6.030(3)(b), F.A.C., this section also provides a summary of how the SPP is expected to further reduce restoration costs and outage times associated with extreme weather conditions and, therefore, improve overall service reliability.

To date, significant progress has been made toward strengthening FPL's infrastructure. For example, at year-end 2019, approximately 54% of FPL's distribution feeders have been either hardened or placed underground, and approximately 96% of FPL's transmission structures are either steel or concrete. Also, since 2006, FPL has completed multiple system-wide cycles of distribution and transmission pole inspections and

² As explained below, a couple of the programs included in the SPP are expected to be completed within the next several years.

vegetation management. Within the next few years several significant milestones are also expected to be reached, including replacement of all wood transmission structures with steel or concrete structures by year-end 2022 and for all feeders to be hardened or placed underground by year-end 2024.

FPL also implemented a three-year Storm Secure Underground Program Pilot in 2018 (“SSUP Pilot”) that converts certain targeted overhead laterals – laterals that have been impacted by recent storms and have a history of vegetation-related outages and other reliability issues – to underground laterals. At year-end 2020, the final year of the SSUP Pilot, FPL expects 220-230 of these targeted laterals to be converted from overhead to underground. In addition, FPL’s Design Guidelines incorporate and apply extreme wind loading (“EWL”) criteria to the design and construction of all new overhead pole lines and major planned work, including pole line extensions, relocations, and certain pole replacements.

FPL’s SPP programs have already demonstrated that they have and will continue to provide increased T&D infrastructure resiliency, reduced restoration time, and reduced restoration costs when FPL’s system is impacted by severe weather events. In FPL’s Third Supplemental Response to Staff’s First Data Request No. 29 (“Third Supplemental Amended”) in Docket No. 20170215-EI,³ FPL prepared and submitted an analysis of Hurricanes Matthew and Irma that indicated the restoration construction man-hours (“CMH”), days to restore, and storm restoration costs for these storms would have been significantly higher without FPL’s storm hardening programs. Below is a summary of the results of FPL’s analysis:

Without Hardening	Hurricane Matthew	Hurricane Irma
Additional CMH (%)	93,000 (36%)	483,000 (40%)
Additional days to restore (%)	2 (50%)	4 (40%)
Additional restoration costs (\$millions) (%)	\$105 (36%)	\$496 (40%)

³ The Commission opened Docket No. 20170215-EI to review electric utility preparedness and restoration actions and to identify potential areas where infrastructure damage, outages, and recovery time for customers could be minimized in the future.

A copy of FPL's Third Supplemental Amended Response in Docket No. 20170215-EI, including the analysis referenced above, is provided in Appendix A. Based on a 40-year net present value analysis, the savings achieved from storm hardening would equate to \$653 million (for a storm occurring once every three years) and \$406 million (for a storm occurring once every five years) for a storm similar to Hurricane Matthew and \$3.1 billion (for a storm occurring once every three years) and \$1.9 billion (for a storm occurring once every five years) for a storm similar to Hurricane Irma.

These programs have also provided increased levels of day-to-day reliability. For example, FPL has previously submitted reports to the Commission that show hardened feeders have performed approximately 40% better (*i.e.*, fewer outages) on a day-to-day basis than non-hardened feeders.⁴ Further details on the benefits of the SPP programs are provided throughout the remaining sections of this SPP.

Although FPL's storm preparedness and hardening programs to date have produced a more storm resilient and reliable T&D electrical grid, FPL must continue its efforts to storm-harden its T&D electrical grid consistent with the findings, conclusions, and objectives of the Florida Legislature in Section 366.96, F.S. Indeed, Florida remains the most hurricane-prone state in the nation and, with the significant coast-line exposure of FPL's system and the fact that the vast majority of FPL's customers live within 20 miles of the coast, a robust storm protection plan is critical to maintaining and improving grid resiliency and storm restoration.

Safe and reliable electric service is essential to the life, health, and safety of the public, and has become a critical component of modern life. Importantly, as evidenced by the significant numbers of Florida's workforce that are working remotely during the COVID-19 pandemic, today's digital society, economy, national security, and daily life are more dependent on reliable electric service than ever before. While no electrical system can be made completely resistant to the impacts of hurricanes and other extreme weather conditions, the programs included in FPL's SPP have already demonstrated that they

⁴ See Appendix A.

mitigate and will continue to mitigate the impacts of future storms.⁵ While FPL's nation-leading initiatives have made significant progress toward strengthening FPL's infrastructure, continuing these previously approved storm hardening and storm preparedness programs in the SPP, together with the new storm surge/flood mitigation substation program, is appropriate and crucial to further mitigate restoration costs and outage times, continue to provide safe and reliable electric service to customers, and meet current and future needs and expectations of customers, today and for many years to come.

III. Description of Service Area and T&D Facilities

Pursuant to Rule 25-6.030(3)(c), F.A.C., this section provides a description of FPL's service area, including areas prioritized for enhancement, if any, and any areas where FPL has determined that enhancement of its existing T&D facilities would not be feasible, reasonable, or practical at this time.

Today, FPL's service territory consists of approximately 28,000 square miles. To serve its more than 5 million customers, FPL has constructed a T&D electric grid that contains approximately 75,000 miles of electrical lines, including:

- Approximately 42,000 miles of overhead distribution lines;
- Approximately 26,000 miles of underground distribution lines;
- Approximately 7,000 miles of high-voltage transmission lines;
- Approximately 1.2 million distribution poles; and
- Approximately 68,000 transmission structures.

FPL's service territory is divided into sixteen (16) distribution management areas. A map depicting FPL's service territory and distribution management areas (with the number of customers served within each management area) is provided in Appendix B.

At this time, FPL has not identified any areas of its service territory where its SPP programs would not be feasible, reasonable, or practical. While all of FPL's SPP

⁵ It is important to note that despite the implementation of these storm hardening and storm preparedness programs, outages will still occur when severe weather events impact Florida.

programs are currently system-wide initiatives, annual activities are prioritized based on certain factors such as last inspection date, last trim date, reliability performance, and efficient resource utilization.⁶ At this time, there is no area specifically targeted or prioritized for enhanced performance based on its geographical location.

IV. 2020-2029 SPP Programs

Pursuant to Rule 25-6.030(3)(c)(d), F.A.C., this section provides a description of each program included in FPL's SPP. If applicable, each program description below includes: (1) a description of how each program is designed to enhance FPL's existing transmission and distribution facilities including an estimate of the resulting reduction in outage times and restoration costs due to extreme weather conditions; (2) identification of the actual or estimated start and completion dates of the program; (3) a cost estimate including capital and operating expenses; (4) a comparison of the costs and the benefits; and (5) a description of the criteria used to select and prioritize storm protection programs.

A. Pole Inspections – Distribution Program

1. Description of the Program and Benefits

The Pole Inspection – Distribution Program included in the SPP is a continuation of FPL's existing Commission-approved distribution pole inspection program. Below is an overview of FPL's existing distribution inspection program and its associated benefits.

a. Overview of the Distribution Pole Inspection Program

In response to the 2004-2005 storm seasons and, in particular, the "large number of poles throughout Florida that required replacement," the Commission required investor-owned utilities ("IOUs") to implement an eight-year pole inspection cycle for all wood distribution poles.⁷ FPL's plan was approved in September 2006⁸ and modified in January 2007.⁹

⁶ The criteria and factors used to select and prioritize projects within each SPP program are described below.

⁷ See Order No. PSC-06-0144-PAA-EI.

⁸ See Order No. PSC-06-0778-PAA-EU.

⁹ See Order No. PSC-07-0078-EU.

Subsequently, FPL expanded its distribution pole inspection plan to also include concrete poles.

FPL's eight-year pole inspection cycle for all distribution poles targets approximately 1/8 of the system annually (the actual number of poles inspected can vary somewhat from year to year). To ensure inspection coverage throughout its service territory, FPL established nine (9) inspection zones (based on FPL's management areas and pole population) and annually performs pole inspections of approximately 1/8 of the distribution poles in each of these zones, as well as any necessary remediation as a result of such inspections. FPL utilizes Osmose Utilities Services, Inc. ("Osmose"), an industry-leading pole inspection contractor, to perform the system-wide inspection of its distribution poles.

FPL's strength and loading calculations for its distribution poles and pole inspections are based on the National Electrical Safety Code's ("NESC") Grade B construction standard, as outlined by Table 261-1A section 26 of the NESC. Osmose utilizes mobile computing technology to record inspection data and to calculate strength and loading. The loading calculation, span lengths, attachment heights, and wire sizes are recorded in the mobile computer to determine whether the remaining pole strength capacity meets or exceeds NESC requirements. This data is then transferred to FPL's Geographic Information System ("GIS"). Pole locations inspected by Osmose are also randomly audited by FPL to verify that inspections are completed and meet inspection standards.

Inspections include a visual inspection of all distribution poles from the ground-line to the top of the pole to identify visual defects (e.g., woodpecker holes, split tops, decayed tops, cracks, etc.). If, due to the severity of the defects, the poles are not suitable for continued service, the poles are designated for replacement.

Wood poles that pass the above-ground visual inspection are excavated to a depth of 18" (where applicable), and sounded and bored to determine the internal condition of the pole. Poles encased in concrete or asphalt are not excavated, but are sounded and bored to determine their internal condition using a standard industry-accepted inspection process called "Shell Boring." All suitable wood poles receive external and/or internal preservative treatment or, if not suitable, are replaced. Strength calculations are also

performed on wood poles to determine compliance with NESC requirements. The poles that are not suitable for continued service are designated for replacement or remediation.

In 2014, FPL obtained Commission approval to: (1) exempt the loading assessment during the second eight-year cycle for any pole that had less than 80% of full load during FPL's initial eight-year cycle; and (2) excavate Chromium Copper Arsenate ("CCA") poles every 28 years (extended from 16 years originally approved by the Commission).¹⁰ To ensure that these exceptions to the standard eight-year inspection cycle do not compromise existing safety and storm hardening programs, FPL conducts annual testing on 1% of the exempted poles.

b. Benefits of the Distribution Pole Inspection Program

The Commission has previously found that "efforts to maintain system components can reduce the impact of hurricanes and tropical storms upon utilities' transmission and distribution systems," and noted that an "obvious key component in electric infrastructure is the transmission and distribution poles."¹¹ The Commission has also previously identified multiple benefits of and reasons for justifying pole inspections cycles for electric utilities, including, but not limited to: the likelihood of increased hurricane activity in the future; the high probability for equipment damage if a pole fails during a storm; the likelihood that failure of one pole often causes other poles to fail; the fact that deteriorated poles are more prone to fail when exposed to high winds; the fact that Florida electric utilities replaced nearly 32,000 poles during the 2004 storm restoration efforts; and the fact that restoration times increase significantly when a large number of poles fail, which limits the electric utilities' ability to respond quickly to widespread outages.¹²

In addition to the benefits discussed above that underlie the creation of the Commission's mandated pole inspection requirements, recent storm events indicate that FPL's distribution pole inspection program has contributed to the overall improvement in distribution pole performance during storms, resulting in reductions in storm damage to poles, days to restore, and storm restoration costs. The table below compares distribution

¹⁰ See Order No. PSC-14-0594-PAA-EI.

¹¹ See Order No. PSC-06-0144-PAA-E.

¹² See *id.*

pole performance for Hurricane Wilma, which occurred in 2005 before FPL implemented its current distribution pole inspection program, and Hurricane Irma, which occurred in 2017 after FPL implemented its current distribution pole inspection program:

	Hurricane Wilma	Hurricane Irma
Hurricane Strength (Category)	3	4
Customer Outages (Millions)	3.2	4.4
Distribution Poles Replaced	>12,400	<2,900 ¹³
Total Days to Restore	18	10
Average Days to Restore	5.4	2.1

FPL's Commission-approved distribution pole inspection program has facilitated the replacement and/or strengthening of over 140,000 distribution poles since it was first implemented in 2006 and has directly improved and will continue to improve the overall health and storm resiliency of its distribution pole population.

2. Actual/Estimated Start and Completion Dates

The SPP will continue FPL's ongoing Commission-approved distribution pole inspection program described above. With approximately 1.2 million distribution poles as of year-end 2019, FPL expects to inspect approximately 150,000 poles annually (spread throughout its nine inspection zones) during the 2020-2029 SPP period.

3. Cost Estimates

Estimated/actual annual distribution pole inspection costs are a function of the number of inspections estimated to be/actually completed and the number of poles estimated to be/actually remediated/replaced as a result of the annual inspections. Although costs to inspect the poles are operating expenses, the vast majority of pole inspection program costs are capital costs resulting from remediation/replacement of poles that fail inspection.

¹³ Approximately 99% of distribution poles replaced after Hurricane Irma were non-hardened poles.

The table below provides a comparison of the 2017-2019 total actual distribution pole inspection costs with the 2020-2022 (first three years of the SPP) total estimated distribution pole inspection costs and the 2020-2029 total estimated distribution pole inspection costs:

	Total Program Costs (millions)	Annual Average Program Costs (millions)
2017-2019	\$152	\$51
2020-2022	\$170	\$57
2020-2029	\$605	\$61

Further details regarding SPP estimated distribution pole inspection costs, including estimated annual capital expenditures and operating expenses, are provided in Appendix C.¹⁴

4. Comparison of Costs and Benefits

As provided in Section (IV)(A)(3) above, during 2020-2029, total costs for FPL's Pole Inspection – Distribution Program are expected to average approximately \$61 million per year. Benefits associated with FPL's Pole Inspection – Distribution Program, discussed in Sections II and IV(A)(1)(b) above, include a more storm resilient pole population that will result in reductions in pole failures and poles needing to be replaced during storms, fewer storm-related outages and reductions in storm restoration costs.

5. Criteria used to Select and Prioritize the Program

Poles to be inspected annually are selected/prioritized within each of the nine (9) inspection zones established throughout FPL's service territory based on the last cycle's inspection dates, to ensure that poles are in compliance with FPL's established eight-year

¹⁴ Note, the 2020-2029 program costs shown above are projected costs estimated as of the time of this filing. Subsequent projected and actual costs could vary by as much as 10% to 15%. The annual projected costs, actual/estimated costs, actuals costs, and true-up of actual costs to be included in FPL's Storm Protection Plan Cost Recovery Clause will all be addressed in subsequent and separate Storm Protection Plan Cost Recovery Clause filings pursuant to Rule 25-6.031, F.A.C. The Commission has opened Docket No. 20200092-EI to address Storm Protection Plan Cost Recovery Clause petitions to be filed the third quarter of 2020.

cycle. As such, approximately 1/8 of the distribution poles in each inspection zone are inspected annually.

At this time, FPL has not identified any areas where the Pole Inspection – Distribution Program would not be feasible, reasonable or practical.

B. Structures/Other Equipment Inspections – Transmission Program

1. Description of the Program and Benefits

The Structures/Other Inspections – Transmission Program included in the SPP is a continuation of FPL's existing Commission-approved transmission inspection program. Below is an overview of FPL's existing transmission inspection program and the associated benefits.

a. Overview of the Transmission Inspection Program

In 2006, as part of its Storm Preparedness Initiative No. 3, the Commission required electric utilities to develop and implement plans to fully inspect all transmission structures, substations, and all hardware associated with these facilities on a six-year cycle. Consistent therewith, FPL implemented a Commission-approved transmission inspection plan in 2006 and has continued that plan to date.

Under its Commission-approved transmission inspection plan, FPL inspects its transmission circuits, substations, and other equipment on a six-year cycle. Additionally, all of FPL's transmission structures are visually inspected from the ground each year. Finally, FPL performs climbing or bucket truck inspections on all wood transmission structures on a six-year cycle and all steel and concrete structures on a ten-year cycle.

Inspections for wood structures include an overall assessment of the condition of the structures, as well as other pole/structure components including the foundation, all attachments, insulators, guys, cross-braces, cross-arms, and bolts. If a wood transmission structure does not pass visual inspection, it is designated for replacement with a concrete or steel transmission structure.

For steel and concrete structures, the visual inspection includes an overall assessment of the structure condition (e.g., cracks, chips, exposed rebar, and rust) as well as other pole/structure components including the foundation, all attachments, insulators, guys, cross-braces, cross-arms, and bolts. If a concrete or steel pole/structure fails the inspection, it is designated for repair or replacement.

The SPP will continue FPL's current transmission inspection program which requires: (a) transmission circuits and substations and all associated hardware to be inspected on a six-year cycle; (b) wood structures to be inspected visually from the ground each year and climbing or bucket truck inspections to be conducted on a six-year cycle; and (c) steel and concrete structures to be inspected visually each year and climbing or bucket truck inspections to be conducted on a ten-year cycle.

b. Benefits of the Transmission Inspection Program

As noted in Section IV(A)(1)(b) above, the Commission has found numerous benefits and reasons justifying inspections of electrical utility facilities, including transmission facilities. Importantly, the transmission system is the backbone of the electric grid. While outages associated with distribution facilities (e.g., a transformer, lateral or feeder) can result in an outage affecting anywhere from a few customers up to several thousands of customers, a transmission related outage can affect tens of thousands of customers. Additionally, an outage on a transmission facility could cause cascading (a loss of power at one transmission facility can trigger the loss of power on another interconnected transmission facility, which in turn can trigger the loss of power on another interconnected transmission facility, and so on) and result in the loss of service for hundreds of thousands of customers. As such, it is imperative that transmission facilities be properly inspected using appropriate cycles and standards to help ensure they are prepared for storms.

Further, the performance of FPL's transmission facilities during recent storm events indicates FPL's transmission inspection program has contributed to the overall storm resiliency of the transmission system and provided savings in storm restoration costs. The table below compares the performance of FPL's transmission system for Hurricane Wilma, which occurred in 2005 before FPL implemented its current transmission

inspection program, and Hurricane Irma, which occurred in 2017 after FPL implemented its current transmission inspection program:

Transmission Facilities	Hurricane Wilma	Hurricane Irma	Improvement
Line Section Outages	345	215	38%
Substation Outages	241	92	62%
Structures Failed	100	5	95%

As shown above, the impacts on FPL’s transmission facilities associated with Hurricane Irma were significantly reduced from those experienced with Hurricane Wilma, even though Hurricane Irma’s winds were stronger and its path impacted substantially more of FPL’s facilities. As reflected in the Commission’s reasoning for mandating transmission facility inspections, FPL submits that its systematic transmission inspection program is a key factor for this improved performance.

2. Actual/Estimated Start and Completion Dates

The SPP will continue FPL’s ongoing Commission-approved transmission inspection program described above. This requires FPL to inspect: (a) transmission circuits and substations and all associated hardware on a six-year cycle; (b) wood structures to be visually inspected from the ground each year and conduct climbing or bucket truck inspections on a six-year cycle; and (c) steel and concrete structures visually each year and conduct climbing or bucket truck inspections on a ten-year cycle.

3. Cost Estimates

Estimated/actual annual transmission inspection costs are a function of the number of inspections estimated to be/actually completed and the transmission facilities estimated to be/actually remediated/replaced as a result of those annual inspections. Although the inspection costs are operating expenses, the vast majority of the transmission inspection program costs are capital costs resulting from remediation/replacement of facilities that fail inspection.

The table below provides a comparison of the 2017-2019 total actual transmission inspection costs with the 2020-2022 (first three years of the SPP) total estimated

transmission inspection costs and the 2020-2029 total estimated transmission inspection costs:

	Total Program Costs (millions)	Annual Average Program Costs (millions)
2017-2019	\$128	\$43
2020-2022	\$97	\$32
2020-2029	\$500	\$50

Further details regarding the SPP estimated transmission inspection costs, including estimated annual capital expenditures and operating expenses, are provided in Appendix C.¹⁵

4. Comparison of Costs and Benefits

As provided in Section IV(B)(3) above, during 2020-2029, total costs for FPL's Structures/Other Inspections – Transmission Program are expected to average approximately \$50 million per year. Benefits associated with the Structures/Other Inspections – Transmission Program discussed in Sections II and IV(B)(1)(b) above, include avoiding outages that can affect tens of thousands of customers and, in particular, cascading outages where the loss of service can affect hundreds of thousands of customers.

5. Criteria used to Select and Prioritize the Program

As explained above, FPL visually inspects from the ground all transmission structures on an annual basis. For the inspection of transmission circuits and substations and all associated hardware, the facilities are selected/prioritized throughout FPL's service territory based on the last cycle's inspection dates, to ensure that facilities are inspected in compliance with the established six-year inspection cycle. Similarly, for bucket truck or climbing inspections, structures are selected/prioritized throughout FPL's service territory based on the last cycle's inspection dates, to ensure that structures are inspected

¹⁵ See footnote 14.

in compliance with the established six-year (wood) and ten-year (steel and concrete) cycles.

At this time, FPL has not identified any areas where the Structures/Other Inspections – Transmission Program would not be feasible, reasonable or practical.

C. Feeder Hardening (EWL) – Distribution Program

1. Description of the Program and Benefits

The Feeder Hardening (EWL) – Distribution Program included in the SPP is a continuation of FPL's existing Commission-approved approach (most recently approved in Docket No. 20180144-EI) to harden existing feeders and certain critical distribution poles, as well as FPL's initiative to design and construct new pole lines and major planned work to meet the NESC's extreme wind loading criteria ("EWL"). FPL will continue the distribution feeder hardening program until 2024, when FPL expects 100% of its feeders to be hardened or underground. Below is an overview of FPL's existing distribution feeder hardening program and the associated benefits.

a. Overview of the Distribution Feeder Hardening Program

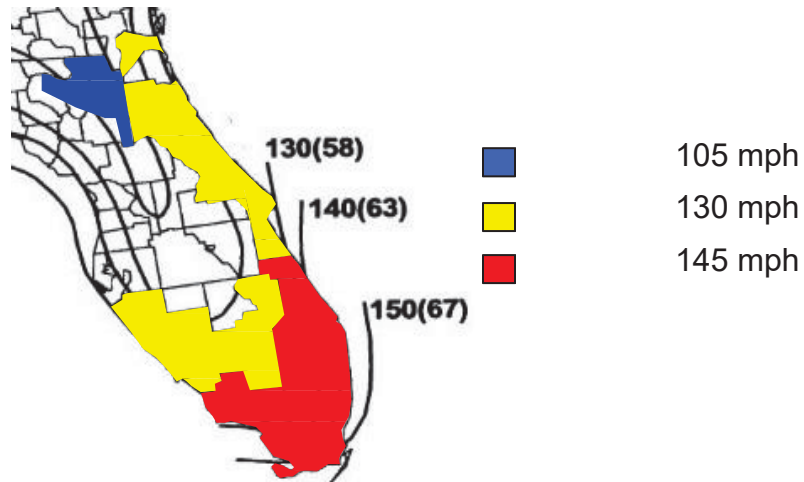

The foundation for FPL's distribution feeder hardening program was the extensive forensic and other analyses that FPL conducted after Hurricane Wilma.¹⁶ These analyses concluded that "wind only" (as opposed to, for example, trees or other flying debris) was the predominant root cause of distribution pole breakage. This data, together with the overall performance of FPL's transmission poles that were already built to the NESC EWL standards and the performance of hardened feeders during Hurricanes Matthew and Irma, formed the basis for FPL's feeder hardening strategy.

The SPP will continue FPL's previously approved approach to apply EWL criteria to harden existing distribution feeders and certain critical poles. The NESC extreme wind map for Florida will continue to be applied to FPL's system by dividing the application of

¹⁶ These analyses were conducted either directly by FPL or with the aid of external resources (e.g., KEMA, Inc.).

EWL into three wind regions, corresponding to expected extreme winds of 105, 130 and 145 mph, as shown below.

FPL Extreme Wind Regions - mph (meter/sec)

By evaluating each of the counties served by FPL, including each county's applicable wind zones, FPL determined that utilizing three extreme wind regions of 105, 130 and 145 mph for its service territory was appropriate for the following reasons:

- A smaller number of wind regions generate advantages through efficiency of work methods, training, engineering and administrative aspects (e.g., standards development and deployment); and
- Using 105, 130 and 145 mph wind zones is a well balanced approach that recognizes differences in the EWL requirements in the counties within each region.

The SPP will also continue to utilize FPL's Design Guidelines and processes that apply EWL criteria to the design and construction of new pole lines and major planned work, including pole line extensions and relocations and certain pole replacements. Depending on the scope of the work that is performed in a particular project, this could result in the EWL hardening of an entire circuit (in the case of large-scale projects) or in EWL hardening of one or more poles (in the case of small projects) so that the affected circuit will be in a position to be fully EWL hardened in the future. The Design Guidelines are

primarily associated with changes in pole class, pole type, and desired span lengths to be utilized. The Design Guidelines standardize the design and construction of new pole lines and major planned work to ensure that these projects align with FPL's hardening strategy.

FPL's current pole sizing guidelines provide for a minimum installation of: Class 2 wood poles for all new feeder and three-phase lateral work; Class 3 wood pole for two-phase and single-phase lateral work; and Class 3 wood pole for service and secondary work. For critical poles, FPL's current pole sizing guidelines provide for the installation of concrete poles at accessible locations. These guidelines significantly increase the wind ratings (up to nearly 50 percent) from the Design Guidelines in place prior to 2007. FPL's current Distribution Design Guidelines are provided in Appendix D.

To determine how an existing overhead circuit or critical pole will be hardened, a field survey of the circuit facilities is performed. By capturing detailed information at each pole location, such as pole type, class, span distance, attachments, wire size, and framing, a comprehensive wind-loading analysis can be performed to determine the current wind rating of each pole, and ultimately the circuit itself. This data is then used to identify specific pole locations on the circuit that do not meet the desired wind rating. For all poles that do not meet the applicable EWL, FPL develops recommendations to increase the allowable wind rating of the pole.

FPL plans to continue to utilize its "design toolkit" that focuses on evaluating and using cost-effective hardening options for each location, including:

- Storm Guying – Installing a guy wire in each direction perpendicular to the line, which is a very cost-effective option but is dependent on proper field conditions;
- Equipment Relocation – Moving equipment on a pole to a stronger pole nearby;
- Intermediate Pole – Installing an additional single pole within long span lengths, which reduce the span length and increases the wind rating of both adjacent poles;

- Upgrading Pole Class – Replacing the existing pole with a higher class pole to increase the pole’s wind rating; and;
- Undergrounding Facilities – Evaluated on a case-by-case basis using site-specific factors and conditions.

These options are not mutually exclusive and, when used in combination with sound engineering practices, provide cost-effective methods to harden a circuit. FPL’s design recommendations also take into consideration issues such as hardening, mitigation (minimizing damage), and restoration (improving the efficiency of restoration in the event of failure). Since multiple factors can contribute to losing power after a storm, utilizing this multi-faceted approach to pole design helps to reduce the amount of work required to restore power to a damaged circuit.

b. Benefits of the Distribution Feeder Hardening Program

Distribution feeders are the backbone of the distribution system and are critical component to providing safe and reliable electric service to FPL’s customers. Thus, improving the storm resiliency of distribution feeders logically provides substantial benefits for customers. Therefore, hardening distribution feeders has been and continues to be one of FPL’s highest storm hardening priorities.

During the period 2006-2019, FPL hardened over 1,300 existing feeders, the vast majority being Critical Infrastructure Function (“CIF”) feeders (*i.e.*, feeders that serve hospitals, 911 centers, police and fire stations, water treatment facilities, county emergency operation centers) and Community Project feeders (*i.e.*, feeders that serve other key community needs like gas stations, grocery stores, and pharmacies) throughout FPL’s service territory. Additional feeders were hardened as a result of FPL’s Priority Feeder Initiative, a reliability program that targeted feeders experiencing the highest number of interruptions and/or customers interrupted. As of year-end 2019, approximately 54% of FPL’s feeders were either hardened or placed underground. Additionally, FPL has hardened 125 highway crossings and over 300 “01” switches (first pole out of a substation with a feeder switch). FPL also applied EWL to the design and construction of new pole

lines and major planned work, including pole line extensions and relocations and certain pole replacements.

As provided in previous FPL Annual Reliability Report filings and three-year Storm Hardening Plan filings (per Rule 25-6.0342, F.A.C.) hardened feeders perform better than non-hardened feeders. This has been demonstrated in-day-to-day reliability performance and during severe storms. For example, when comparing day-to-day reliability performance, hardened feeders have performed 40% better than non-hardened feeders. Also, during Hurricanes Matthew and Irma, hardened feeders performed better than non-hardened feeders.

Additionally, in Docket No. 20170215-EU, the Commission reviewed the electric utilities' storm hardening and storm preparedness programs and found for Hurricane Irma that: (1) outage rates were nearly 20% less for hardened feeders than non-hardened feeders; (2) CMH to restore hardened feeders were 50% less than non-hardened feeders (primarily due to hardened feeders experiencing less damage than non-hardened hardened feeders); and (3) hardened feeders had significantly less pole failures as compared to non-hardened feeders.¹⁷

2. Actual/Estimated Start and Completion Dates

FPL initiated its feeder hardening initiative in 2006. As of year-end 2019, there are approximately 1,600 feeders remaining to be hardened or placed underground. FPL expects to harden approximately 250-350 feeders annually, with 100% of FPL's feeders expected to be hardened or underground by year-end 2024 and with the final costs of the program to be incurred in 2025.

¹⁷ See *Review of Florida's Electric Utility Hurricane Preparedness and Restoration Actions 2018*, Docket No. 20170215-EU (July 24, 2018), available at <http://www.psc.state.fl.us/library/filings/2018/04847-2018/04847-2018.pdf>.

3. Cost Estimates

Estimated distribution feeder hardening costs are determined utilizing the length of each feeder, the average historical feeder hardening cost per mile, and updated cost assumptions (e.g., labor and materials).

The table below provides a comparison of the 2017-2019 total actual distribution feeder hardening costs with the 2020-2022 (first three years of the SPP) total estimated distribution feeder hardening costs and the total estimated distribution feeder hardening costs to be incurred over the period of 2020-2025¹⁸:

	Total Program Costs (millions)	Annual Average Program Costs (millions)
2017-2019	\$1,492	\$497
2020-2022	\$1,958	\$653
2020-2025	\$3,206	\$534

Further details regarding the SPP distribution feeder hardening costs, including estimated annual capital expenditures are provided in Appendix C.¹⁹

4. Comparison of Costs and Benefits

As provided in Section IV(C)(3) above, during 2020-2025, total costs for FPL's Feeder Hardening (EWL) – Distribution Program average approximately \$534 million per year through 2025. Benefits associated with the Feeder Hardening (EWL) – Distribution Program discussed in Sections II and IV(C)(1)(b) above, include improved storm resiliency as well as improved day-to-day reliability.

5. Criteria used to Select and Prioritize the Program

As explained above, there are approximately 1,600 feeders remaining to be hardened or placed underground. FPL attempts to spread its annual projects throughout its service territory. In prioritizing the remaining existing feeders to be hardened each year,

¹⁸ It is currently estimated that 100% of FPL's feeders will be hardened or underground by year-end 2024, with the final costs to be incurred in 2025.

¹⁹ See footnote 14.

considerations include the feeder's historical reliability performance, restoration difficulties (e.g., environmentally sensitive areas, islands with no vehicle access, river crossings, etc.), on-going or upcoming internal/external projects (e.g., FPL maintenance or system expansion projects, municipal overhead/underground conversion project or municipal road project) and geographic location.

At this time, FPL has not identified any areas where the Feeder Hardening (EWL) – Distribution Program would not be feasible, reasonable or practical.

D. Lateral Hardening (Undergrounding) – Distribution Program

1. Description of the Program and Benefits

In 2018, FPL implemented a three-year Commission-approved SSUP Pilot. The SSUP Pilot is a program that targets certain overhead laterals for conversion from overhead to underground. As part of its SPP, FPL will expand undergrounding laterals in 2021-2029. Below is an overview of FPL's Lateral Hardening (Undergrounding) – Distribution Program and the associated benefits.

a. Overview of the Distribution Lateral Hardening Program

As part of the SPP, FPL will complete its existing approved three-year SSUP Pilot (in 2020) and expand the application of the SSUP during 2021-2029 to the implementation of the system-wide Lateral Hardening (Undergrounding) – Distribution Program. The SSUP Pilot targeted certain overhead laterals that were impacted by recent storms and that have a history of vegetation-related outages and other reliability issues for conversion from overhead to underground. Key objectives of the SSUP Pilot included validating conversion costs and identifying cost savings opportunities, testing different design philosophies, better understanding customer impacts and sentiments, and identifying barriers (e.g., obtaining easements, placement of transformers, and attaching entities' issues).

Two design options are being utilized when FPL converts overhead laterals to underground, referred to as the North American and the European designs. The North American design currently is the predominant design, but both undergrounding designs eliminate all overhead lateral and service wire. The North American design generally

utilizes more primary conductor and a greater number of smaller-sized transformers, with less customers per transformer, and is better suited for front lot construction and service. The European design utilizes more secondary conductor, and a smaller number of larger-sized transformers, with more customers per transformer, and is better suited for rear lot construction and service. Where practical, FPL attempts to relocate existing facilities from the rear of to the front of customers' premises; however, there are instances where that option is not available (e.g., FPL is unable to obtain easements in front of customers' premises). FPL's standard design is the North American design (front lot construction), but FPL is gaining important experience and knowledge from its utilization of the European design (rear lot construction), which it can then better utilize for future projects as appropriate.

As part of the conversion process, FPL is also installing meter base adaptors that allow underground service to be provided to the customer by utilizing the existing meter and meter enclosure. The meter base adaptors minimize the impact on customer-owned equipment and facilities. For example, in certain situations, overhead to underground conversions of electric service can trigger a local electrical code requirement that necessitates a customer upgrade of the home's electric service panel. This can cost the customer thousands of dollars. However, by utilizing a meter base adaptor, overall costs are reduced and customers are able to avoid the need and expense to convert their electrical service panels.

b. Benefits of the Distribution Lateral Hardening Program

Laterals make up the majority of FPL's distribution system. For example, system-wide, there are over 180,000 laterals (including laterals with multi-stage fusing), in contrast to approximately 3,300 feeders, and there are 1.8 times as many miles of overhead laterals as there are overhead feeders (approximately 23,000 miles vs. 13,000 miles, respectively). Additionally, while feeders are predominately located in the front of customers' premises, many laterals are "rear of" or behind customers' premises. This is especially the case in older neighborhoods located throughout FPL's service territory. Generally, facilities in the rear of customers' premises take longer to restore than facilities in front of customers' premises because rear-located facilities are more difficult to access

and are more likely to be near vegetation. This results in a greater amount of CMH being devoted to laterals during storm restoration.

The basis for FPL's SSUP Pilot and the proposal to expand upon the Pilot under the SPP is the performance of the underground facilities as compared to overhead facilities and the extensive damage to the overhead facilities caused by vegetation during Hurricanes Matthew and Irma. This performance was demonstrated by the results of FPL's analysis referenced above in Section IV(A)(1)(b) and contained in the Commission's *Review of Florida's Electric Utility Hurricane Preparedness and Restoration Actions in 2018*,²⁰ which is summarized in the table below:

Storm and Facility	Laterals Out	Total Laterals	% Out
Matthew OH	3,473	82,729	4%
Matthew UG	238	101,892	0.2%
Irma OH	20,341	84,574	24%
Irma UG	3,767	103,384	4%

Finally, it is important to note that underground facilities also perform better than overhead facilities on a day-to-day basis. For example, based on the reliability performance metrics for overhead and underground facilities provided to the Commission in FPL's February 28, 2020 Annual Reliability Report filing, the System Average Interruption Duration Index ("SAIDI") for underground facilities is significantly better than hybrid facilities (combination of overhead and underground) or overhead facilities as shown in the table below:

Year	SAIDI²¹		
	UG	OH	Hybrid
2015	21.4	102.4	60.0
2016	17.2	80.4	57.6
2017	17.7	89.6	55.5
2018	21.2	89.0	54.2
2019	30.3	87.4	49.4

²⁰ See footnote 17.

²¹ See pages 93-97 of FPL's February 28, 2020 Annual Reliability Report filing for more details on day-to-day reliability performance - overhead vs. underground.

2. Actual/Estimated Start and Completion Dates

FPL's SSUP Pilot was initiated in 2018. By the end of 2020, the third and final year of the SSUP Pilot, FPL expects to have converted a total of 220-230 laterals from overhead to underground, which is consistent with the SSUP Pilot's plan most recently approved in Docket No. 20180144-EI. As part of its SPP, FPL will incorporate, continue, and expand the SSUP to provide the benefits of underground lateral hardening throughout its system. After completing the SSUP Pilot in 2020, FPL estimates it will convert 300-700 laterals annually. In 2024-2029 FPL estimates it will convert 800-900 laterals annually.

3. Cost Estimates

Estimated lateral undergrounding costs are determined utilizing the length of each lateral, the average historical lateral undergrounding cost per mile, and updated cost assumptions (e.g., labor and materials). The table below provides a comparison of the 2018-2019 total actual costs for the SSUP Pilot with the 2020-2022 (first three years of the SPP) total estimated distribution lateral hardening program costs and the 2020-2029 total estimated distribution lateral hardening program costs:

	Total Program Costs (millions)	Annual Average Program Costs (millions)
2018-2019 ²²	\$76	\$38
2020-2022	\$676	\$225
2020-2029	\$5,101	\$510

Further details regarding the SPP estimated distribution lateral hardening program costs, including estimated annual capital expenditures are provided in Appendix C.²³

4. Comparison of Costs and Benefits

As provided in Section IV(D)(3) above, during 2020-2029, total costs for FPL's Lateral Hardening (Undergrounding) – Distribution Program average approximately \$510 million per year. Benefits associated with the Lateral Hardening (Undergrounding) – Distribution

²² The Storm Secure Underground Program Pilot was initiated in 2018.

²³ See footnote 14.

Program discussed in Sections II AND IV(D)(1)(b) above, include improved storm resiliency as well as improved day-to-day reliability.

5. Criteria used to Select and Prioritize the Program

FPL will select/prioritize future laterals for conversion to undergrounding based on an overall feeder performance methodology. Rather than selecting individual “stand-alone” laterals, FPL will underground all the laterals on a feeder such that when a hardened feeder that has experienced an outage is restored, all associated underground laterals would also be restored (unless the underground lateral was damaged).

On average, there are currently 20-30 overhead laterals on a feeder. The selection and prioritization of the laterals to be converted will be based on a methodology that considers: (a) all of the overhead laterals on each feeder; (b) outage experience during the recent Hurricanes Matthew and Irma; (c) the number of vegetation-related outages experienced over the most recent 10 years; and (d) the total number of lateral and transformer outages experienced over the most recent 10 years. These overhead lateral factors are totaled for each feeder, and the feeders are ranked based on these totals. All laterals on the feeders will then be hardened according to the ranking of each feeder.

In order to optimize resources and provide lateral hardening throughout FPL’s system, lateral hardening projects will be performed annually in all sixteen (16) of FPL’s management areas. At this time, FPL has not identified any areas where the Lateral Hardening (Undergrounding) – Distribution Program would not be feasible, reasonable, or practical. However, in areas that are more prone to flooding or storm surge, FPL will consider alternative construction methods (e.g., elevating transformer pads).

E. Wood Structures Hardening (Replacing) – Transmission Program

1. Description of the Program and Benefits

The Wood Structure Hardening (Replacing) – Transmission Program included in the SPP is a continuation of FPL’s existing transmission hardening program through the end of 2022, when FPL expects that 100% of its transmission structures will be steel or concrete.

Below is an overview of FPL's existing transmission wood structure hardening program and the associated benefits.

a. Overview of the Transmission Hardening Program

While FPL's transmission facilities were affected by the 2004 and 2005 storms, the damage experienced was significantly less than the damage sustained by distribution facilities. A primary reason for this resulted from the fact that transmission structures were, at that time, already constructed to meet EWL consistent with Florida Statute 366.04 and the National Electrical Safety Code, Rule 250 C.

Based on the forensic data collected from the 2004 and 2005 storms, FPL implemented a Commission-approved transmission storm hardening initiative to replace all wood transmission structures, which accounted for nearly 70 percent of all transmission structures replaced during the 2004-2005 storm seasons, with steel or concrete structures. As explained below, this initiative is ongoing and expected to be completed by the end of 2022. As part of its SPP, FPL will continue its initiative to replace all wood transmission structures with steel or concrete structures.

b. Benefits of the Transmission Hardening Program

While an outage associated with distribution facilities (e.g., a transformer, lateral, or feeder) can impact up to several thousands of customers, a transmission-related outage can result in an outage affecting tens of thousands of customers. Additionally, an outage on a transmission facility could cause cascading (a loss of power at one transmission facility can trigger the loss of power on another interconnected transmission facility, which in turn can trigger the loss of power on another interconnected transmission facility, and so on) and result in the loss of service for hundreds of thousands of customers. As a result, the prevention of transmission-related outages is essential. As discussed earlier, while transmission facilities performed significantly better than distribution facilities during the 2004 and 2005 storms, there were several opportunities for improvement identified, including the replacement of wood transmission structures. As a result of its transmission inspection programs and its replacement of wood transmission structures, FPL's transmission facilities have demonstrated to be more storm resilient.

The table below compares the performance of FPL's transmission system for Hurricane Wilma, which occurred in 2005 before FPL implemented its current transmission hardening program, and Hurricane Irma, which occurred in 2017 after FPL implemented its current transmission hardening program:

	Hurricane Wilma	Hurricane Irma
% Line Section Outages	37%	17%
Transmission Structure Failures	100	5 (all non-hardened)
Transmission Substations De-energized	241	92
Days to Restore Substation Outages	5	1

As shown above, the impacts on FPL's transmission facilities associated with Hurricane Irma were significantly reduced from those experienced with Hurricane Wilma, even though Hurricane Irma's winds were stronger and its path impacted substantially more of FPL's facilities.

2. Actual/Estimated Start and Completion Dates

FPL implemented its transmission hardening program in 2007. As of year-end 2019, 96% of FPL's transmission structures, system-wide, were steel or concrete, with less than 2,900 (or 4%) wood structures remaining to be replaced. FPL expects to replace the 2,900 wood transmission structures remaining on its system by year-end 2022.

3. Cost Estimates

Estimated/actual annual transmission hardening costs are a function of the number of poles to be replaced, actual historical replacement costs, and updated cost assumptions (e.g., labor and materials). The vast majority of the transmission hardening program costs are capital costs resulting from replacement of the wood transmission structures.

The table below provides a comparison of the 2017-2019 total actual transmission hardening costs with the 2020-2022 (first three years of the SPP) total estimated transmission hardening costs:²⁴

	Total Program Costs (millions)	Annual Average Program Costs (millions)
2017-2019	\$162	\$54
2020-2022	\$118	\$39

Further details regarding the SPP estimated transmission hardening costs, including estimated annual capital expenditures and operating expenses, are provided in Appendix C.²⁵

4. Comparison of Costs and Benefits

As provided in Section IV(E)(3) above, during 2020-2022, total costs for FPL's Wood Structure Hardening (Replacing) – Transmission Program average approximately \$39 million per year. Benefits associated with the Wood Structure Hardening (Replacing) – Transmission Program discussed in Sections II and IV(E)(1)(b) above, include improved storm resiliency.

5. Criteria used to Select and Prioritize the Program

The annual prioritization/selection criteria for the remaining wood structures to be replaced includes proximity to high wind areas, system importance, customer counts, and coordination with other storm initiatives (e.g., distribution feeder hardening). Other economic efficiencies, such as opportunities to perform work on multiple transmission line sections within the same transmission corridor, are also considered.

At this time, FPL has not identified any areas where the replacement of the remaining wood transmission structures under the Wood Structure Hardening (Replacing) – Transmission Program would not be feasible, reasonable or practical.

²⁴ FPL expects that 100% of the remaining wood transmission structures in its system will be replaced by year-end 2022.

²⁵ See footnote 14.

F. Substation Storm Surge/Flood Mitigation Program

1. Description of the Program and Benefits

The Substation Storm Surge/Flood Mitigation Program is the only new program included in FPL's SPP. As explained below, Substation Storm Surge/Flood Mitigation Program is a new program to mitigate damage at several targeted distribution and transmission substations that are susceptible to storm surge and flooding during extreme weather events.

Historically, several FPL distribution and transmission substations have been impacted by storm surge and/or flooding as a result of extreme weather conditions. For example, as a result of flooding caused by Hurricanes Matthew and Irma, FPL's St. Augustine substation was required to be proactively de-energized (*i.e.*, shut down before water reached levels that would cause significant damage to powered substation equipment). Another example is FPL's South Daytona substation that was proactively de-energized during Hurricane Irma as a result of flooding. While proactively de-energizing those substations impacted by storm surge and/or flooding helps reduce damage to substation equipment, FPL is still required to implement both temporary flood mitigation efforts and repairs to substation facilities and equipment that become flooded as a result of extreme weather conditions.

An outage associated with distribution substations can impact up to several thousands of customers, and an outage associated with a transmission substation can result in an outage affecting tens of thousands of customers. Flooding and the need to proactively de-energize substations located in areas susceptible to storm surge and flooding can result in significant customer outages. For example, the flooding and de-energization of St. Augustine and South Daytona during Hurricane Irma resulted in more than 8,000 customer outages. Therefore, the prevention of outages at transmission and distribution substations due to storm surge or flooding is essential.

To prevent/mitigate future substation equipment damage and customer outages due to storm surge and flooding, FPL's new Substation Storm Surge/Flood Mitigation Program will target and harden certain substations located in areas throughout FPL's service

territory that are susceptible to storm surge or flooding during extreme weather events. Specifically, FPL plans to raise the equipment at certain substations above the flood level and construct flood protection walls around other substations to prevent/mitigate future damage due to storm surge and flooding.

2. Actual/Estimated Start and Completion Dates

At this time, FPL has identified between 8-10 substations where it initially plans to implement storm surge/flood mitigation measures over the next three years (2020-2022). FPL plans to initiate construction in late summer/early fall 2020 to raise the equipment at the St. Augustine substation, which is expected to be completed in 2021. In 2021 and early 2022, FPL also plans to begin construction on flood protection walls for the other 7-9 substations identified for mitigation, which is expected to be completed by 2022.

3. Cost Estimates

The storm surge/flood mitigation costs associated with St. Augustine substation (raising substation equipment) are estimated to be approximately \$10 million in total (2020 and 2021). Estimated storm surge/flood mitigation costs for the remaining 7-9 substations identified at this time (constructing surrounding flood walls) are estimated to be approximately \$13 million in total (2021 and 2022). See the table below the estimated annual program costs:

	Total Program Costs (millions)	Annual Average Program Costs (millions)
2020-2022	\$23	\$8

Further details regarding the SPP estimated storm surge/flood mitigation costs, including estimated annual capital expenditures and operating expenses, are provided in Appendix C.²⁶

4. Comparison of Costs and Benefits

As provided in Section IV(F)(3) above, during 2020-2022, total costs for FPL's Substation Storm Surge/Flood Mitigation Program average approximately \$8 million per year.

²⁶ See footnote 14.

Benefits associated with this program discussed in Section IV(F)(1) above, include improved storm resiliency (avoiding storm surge/flood damage), reduced customer outages and storm restoration costs.

5. Criteria used to Select and Prioritize Projects

The annual prioritization/selection criteria for the targeted substations is based on FPL's historical storm surge/flood experience, in particular, Hurricanes Matthew and Irma. At this time, for the targeted substations, FPL has not identified any areas where the upgrades would not be feasible, reasonable or practical.

G. Vegetation Management – Distribution Program

1. Description of the Program and Benefits

The Vegetation Management – Distribution Program included in the SPP is a continuation of FPL's existing Commission-approved Vegetation Management – Distribution Program. Below is an overview of FPL's existing Vegetation Management – Distribution Program and the associated benefits.

a. Overview of the Vegetation Management – Distribution Program

Prior to 2006, FPL's Vegetation Management – Distribution Program consisted of inspecting and maintaining its feeders on a three-year average trim cycle and performing targeted trimming on certain feeders more frequently (e.g., targeting vegetation with faster growth rates and palm trees) through its "mid-cycle" program. Lateral trimming was prioritized based on reliability performance. Another important component of this program was FPL's "Right Tree Right Place" initiative, which provided information to educate customers on FPL's vegetation management program and practices, safety issues, and the importance of placing trees in the proper location.

After the 2004-2005 storm seasons, the Commission determined that the "vegetation management practices of the investor-owned electric utilities do not provide adequate assurance that tree clearances for overhead distribution facilities are being maintained in a manner that is likely to reduce vegetation related storm damage. We believe that

utilities should develop more stringent distribution vegetation management programs.”²⁷ As result, FPL proposed and the Commission approved the continuation of FPL’s system-wide three-year average trim cycle for feeders, mid-cycle targeted trimming for certain feeders, and its Right Tree Right Place initiative, as well as the implementation of a new six-year average trim cycle for laterals.²⁸ These same initiatives, which have provided storm and day-to-day reliability benefits, remain in place today.

Tree limbs and branches, especially palm fronds, are among the most common causes of power outages and momentary interruptions during both day-to-day operations and storm events. The primary objective of FPL’s Vegetation Management – Distribution Program is to clear vegetation in areas where FPL is permitted to trim from the vicinity of distribution facilities and equipment in order to provide safe, reliable, and cost-effective electric service to its customers. The program is comprised of multiple initiatives designed to reduce the average time customers are without electricity as a result of vegetation-related interruptions. These include preventive maintenance initiatives (planned cycle and mid-cycle maintenance), corrective maintenance (trouble work and service restoration efforts), customer trim requests, and support of system improvement and expansion projects, which focus on long-term reliability by addressing vegetation that will impact new or upgraded overhead distribution facilities.

FPL’s Vegetation Management Distribution Program’s practices follow the NESC, the American National Standards Institute (“ANSI”) A-300, and all other applicable standards, while considering tree species, growth rates, and the location of trees in proximity to FPL’s facilities. Danger or hazard trees (leaning, structurally damaged, or diseased/dead that have a high likelihood to fail and impact FPL’s facilities) located outside of right-of-way (“ROW”), which cannot be trimmed without approval from the property owner, are identified as candidates for customer-approved removal.

Finally, a very important component of FPL’s vegetation program is providing information to customers to educate them on the company’s trimming program and practices, safety issues, and the importance of placing trees in the proper location – FPL’s “Right Tree,

²⁷ See Order No. PSC-06-0351-PAA-EI.

²⁸ See Order No. PSC-07-0468-FOF-EI.

Right Place” initiative. Right Tree, Right Place is a public education program based on FPL’s core belief that providing reliable electric service and sustaining the natural environment can go hand-in-hand and is a win-win partnership between the utility and its customers.

The SPP will continue FPL’s currently-approved distribution vegetation program, which includes the following system-wide vegetation management activities: three-year cycle for feeders; mid-cycle targeted trimming for certain feeders; six-year cycle for laterals; and continued education of customers through its Right Tree, Right Place initiative.

b. Benefits of the Vegetation Management – Distribution Program

In Order No. PSC-07-0468-FOF-EI, the Commission confirmed that FPL should continue to implement three-year and six-year average cycles for its feeders and laterals because the cycles complied with the Commission’s storm preparedness objectives to increase the level of trimming over historical levels, promote system reliability and reduce storm restoration costs.²⁹ Additionally, Commission’s orders indicated that FPL’s proposed cycles: were cost-effective; would improve day-to-day “tree SAIFI” from 0.22 to 0.16 in ten years;³⁰ and would provide savings when comparing savings on a customers interrupted (“CI”) per storm basis. Further, day-to-day distribution tree SAIFI has significantly improved as a result of FPL implementing its approved distribution vegetation management program (from 0.20 prior to the 2004-2005 storm seasons to 0.08 at year-end 2019).

Finally, another indication that the current program is providing benefits is that, while forensic analysis indicated vegetation was the overwhelming primary cause for pole and wire failures and a significant cause of outages during Hurricanes Matthew and Irma, the vast majority of damage resulted from uprooted trees, broken trunks, and broken limbs

²⁹ FPL’s proposed three-year and six-year cycles were initially approved in Order No. PSC-06-0781-PAA-EI.

³⁰ The tree-related SAIFI has averaged less than 0.09 over the last few years.

that fell into distribution facilities from outside of right-of-way, *i.e.*, beyond where FPL is currently allowed trim without approval from the property owner.

2. Actual/Estimated Start and Completion Dates

FPL's ongoing vegetation management plan was originally approved in 2007, and remains in place today. Under the SPP, FPL plans to inspect and maintain, on average, approximately 15,200 miles annually, including approximately 11,400 miles for feeders (cycle and mid-cycle) and 3,800 miles for laterals. This is comparable to the approximately 15,200 miles inspected and maintained annually, on average, for 2017-2019.

3. Cost Estimates

The vast majority of vegetation management costs are associated with cycle and mid-cycle trimming, which is performed by several FPL-approved contractors throughout FPL's system. Other vegetation management costs include costs associated with day-to-day restoration activities (*e.g.*, summer afternoon thunderstorms), removals, debris cleanup, and support (*e.g.*, arborists, supervision, back office support). Costs associated with vegetation management are generally operating expenses.

The table below provides a comparison of the 2017-2019 total actual distribution vegetation management costs with the 2020-2022 (first three years of the SPP) total estimated distribution vegetation management costs and the 2020-2029 total estimated distribution vegetation management costs:³¹

	Total Program Costs (millions)	Annual Average Program Costs (millions)
2017-2019	\$189	\$63
2020-2022	\$183	\$61
2020-2029	\$596	\$60

Further details regarding the SPP estimated distribution vegetation management costs,

³¹ The vegetation management costs shown in the table below exclude storm-related vegetation management costs.

including estimated annual capital expenditures and operating expenses, are provided in Appendix C.³²

4. Comparison of Costs and Benefits

As provided in Section IV(G)(3) above, during 2020-2029, total costs for FPL's Vegetation Management – Distribution Program average approximately \$60 million per year. Benefits associated with the Vegetation Management – Distribution Program discussed in Sections II and IV(G)(1)(b) above, include increased storm resiliency.

5. Criteria Used to Select and Prioritize the Program

The primary reason for maintaining feeders on a three-year average cycle, as opposed to a six-year average cycle for laterals, is that a feeder outage can affect, on average, approximately 1,500 customers as compared to an outage on a lateral line that can affect, on average, approximately 35 customers. FPL enhances its approved feeder inspection and trimming plan through its mid-cycle trimming program, which encompasses patrolling and trimming feeders between planned maintenance cycles to address tree conditions that may cause an interruption prior to the next planned cycle trim. Mid-cycle work units typically have a trim age of 12 to 18 months and usually involve certain fast-growing trees (e.g., palm trees) that need to be addressed before the next scheduled cycle trim date.

Additionally, customers often contact FPL with requests to trim trees around distribution lines in their neighborhoods and near their homes. As a result of these discussions with customers and/or a follow-up investigation, FPL either performs the necessary trimming or determines that the requested trimming can be addressed more efficiently by completing it through the normal scheduled cycle trimming.

Cycle trimming is prioritized annually to ensure compliance with cycle schedules. At this time, FPL has not identified any areas where the Vegetation Management – Distribution Program would not be feasible, reasonable or practical.

³² See footnote 14.

H. **Vegetation Management – Transmission Program**

1. Description of the Program and Benefits

The Vegetation Management – Transmission Program included in the SPP is a continuation of FPL's existing transmission vegetation management program. Below is an overview of FPL's existing transmission vegetation management program and the associated benefits.

a. Overview of the Vegetation Management - Transmission Program

The North American Electric Reliability Corporation's (NERC) vegetation management standards/requirements serve as the basis for FPL's transmission vegetation management program. The reliability objective of these standards/requirements is to prevent vegetation-related outages that could lead to cascading by utilizing effective vegetation maintenance while recognizing that certain outages such as those due to vandalism, human errors, and acts of nature are not preventable. Transmission lines that must conform with these standards/requirements include lines operated at or above 200 kV or any line that is either an element of the Interconnection Reliability Operating Limit (IROL) or the Western Electricity Coordinating Council (WECC).

For FPL, just over 4,300 miles of its transmission system (or nearly two-thirds of all of FPL's total transmission system) are subject to NERC's vegetation management standards/requirements. NERC's vegetation management standards/requirements include annual inspection requirements, executing 100% of a utility's annual vegetation work plan, and to prevent any encroachment into established minimum vegetation clearance distances ("MVCD").

The key elements of FPL's transmission vegetation management program are to inspect the transmission right-of-ways, document vegetation inspection results and findings, prescribe a work plan, and execute the work plan.

FPL conducts ground inspections of all transmission corridors annually for work planning purposes. During these inspections, FPL identifies vegetation capable of approaching the defined Vegetation Action Threshold ("VAT"). VAT is a calculated distance from the

transmission line that factors in MVCD, conductor sag/sway potential, and a buffer. The identified vegetation is given a work prescription and then prioritized and organized into batches of work, which collectively become the annual work plan.

For transmission lines that are subject to NERC's vegetation management standards/requirements, FPL also uses a technology called "LiDAR," short for light detection and ranging. LiDAR is a remote sensing technology that uses light in the form of a pulsed laser to measure ranges (distances) to a target. For vegetation management purposes, LiDAR is used to measure distance between vegetation and transmission lines. LiDAR patrols are conducted annually for all NERC transmission corridors. Data collected by the LiDAR patrols is then used to develop annual preventative and reactive work plans.

In its SPP, FPL will continue its current transmission vegetation management plan, which includes visual and aerial inspections of all transmission line corridors, LiDAR inspections of NERC transmission line corridors, developing and executing annual work plans to address identified vegetation conditions, and identifying and addressing priority and hazard tree conditions prior to and during storm season.

b. *Benefits of the Vegetation Management – Transmission Program*

The benefits of a Vegetation Management – Transmission Program are self-evident and the consequences of not having a reasonable transmission vegetation management plan can be extreme. As discussed previously, the transmission system is the backbone of the electric grid. While outages associated with distribution facilities (e.g., a transformer, lateral, or feeder) can result in an outage affecting anywhere from a few customers up to several thousands of customers, a transmission related outage can affect tens of thousands of customers. Additionally, an outage on a transmission facility could cause cascading and result in the loss of service for hundreds of thousands of customers. As such, it is imperative that vegetation impacting transmission facilities be properly maintained using reasonable and appropriate cycles and standards to help ensure they are prepared for storms. For these reasons, it is no surprise that NERC has developed

prescriptive vegetation management requirements for transmission facilities to help prevent such damage from occurring.

FPL also notes that while vegetation-related damage and transmission line outages occurred during Hurricanes Matthew and Irma, the vast majority of such damages/outages were caused by vegetation located outside of the right-of-way, *i.e.*, beyond where FPL is currently allowed to trim without approval from the property owner, which further demonstrates that FPL's historical efforts in this area have been beneficial.

2. Actual/Estimated Start and Completion Dates

FPL's Vegetation Management – Transmission Program is an ongoing program, initiated decades ago. Under the SPP, FPL plans to inspect and maintain, on average, approximately 7,000 miles annually, including approximately 4,300 miles for NERC transmission line corridors and 2,700 miles for non-NERC transmission line corridors. This is comparable to the approximately 7,000 miles inspected and maintained annually, on average, for 2017-2019.

3. Cost Estimates

The vast majority of vegetation management costs are associated with annual inspections and the execution of planned work to address identified conditions, which is performed by several FPL approved contractors throughout FPL's system. Other vegetation management costs include costs associated with day-to-day restoration activities (*e.g.*, summer afternoon thunderstorms), removals, debris cleanup, and support (*e.g.*, arborists, supervision, back office support). Costs associated with vegetation management are generally operating expenses.

The table below provides a comparison of the 2017-2019 total actual transmission vegetation management costs with the 2020-2022 (first three years of the SPP) total estimated transmission vegetation management costs and the 2020-2029 total estimated transmission vegetation management costs:³³

³³ The vegetation management costs shown in the table below exclude storm-related vegetation management costs.

	Total Program Costs (millions)	Annual Average Program Costs (millions)
2017-2019	\$27	\$9
2020-2022	\$27	\$9
2020-2029	\$96	\$10

Further details regarding the SPP estimated transmission vegetation management costs, including estimated annual capital expenditures and operating expenses, are provided in Appendix C.³⁴

4. Comparison of Costs and Benefits

As provided in Section IV(H)(3) above, during 2020-2029, total costs for FPL’s Vegetation Management – Transmission Program average approximately \$10 million per year. Benefits associated with the Vegetation Management – Transmission Program discussed in Sections II and IV(H)(1)(b) above, include increased storm resiliency. The execution of FPL’s Vegetation Management – Transmission Program is a significant factor in mitigating damage to transmission facilities and avoiding transmission-related outages.

5. Criteria used to Select and Prioritize the Programs

Priority vegetation conditions and hazard tree conditions are completed annually prior to storm season. Additionally, prior to and during the storm season, FPL conducts aerial inspections of transmission corridors to identify hazard trees and any priority vegetation locations. Priority vegetation conditions and hazard tree conditions identified through aerial inspections are addressed as soon as possible.

At this time, FPL has not identified any areas where the Vegetation Management – Transmission Program would not be feasible, reasonable or practical.

³⁴ See footnote 14.

V. Detailed Information on the First Three Years of the SPP (2020-2022)

A. Detailed Description for the First Year of the SPP (2020)

The following additional information required by Rule 25-6.030(3)(e)(1), F.A.C., for the first year of the SPP (2020) is provided in Appendix E. (1) the actual or estimated construction start and completion dates; (2) a description of the affected existing facilities, including number and type(s) of customers served, historic service reliability performance during extreme weather conditions, and how this data was used to prioritize the storm protection projects; (3) a cost estimate including capital and operating expenses. A description of the criteria used to select and prioritize the storm protection programs is included in the description of each SPP program provided in Section IV.

B. Detailed Description of the Second and Third Years of the SPP (2021-2022)

Additional details required by Rule 25-6.030(3)(e)(2), F.A.C., for the second and third years of the SPP (2021-2022), including the estimated number and costs of projects under every program, is provided in in Appendix C.

C. Detailed Description of the Vegetation Management Activities for the First Three Years of the SPP (2020-2022)

The following additional information required by Rule 25-6.030(3)(f), F.A.C., for the first three years of the vegetation management activities under the SPP (2020-2022) is provided in n Sections IV(G) and IV(H) above and Appendix C: the projected frequency (trim cycle); the projected miles of affected transmission and distribution overhead facilities; the estimated annual labor and equipment costs for both utility and contractor personnel. A description of how the vegetation management activities will reduce outage times and restoration costs due to extreme weather conditions is provided in Sections IV(G) and IV(H) above.

VI. Estimate of Annual Jurisdictional Revenue Requirements for the 2020-2029 SPP

Pursuant to Rule 25-6.030(3)(f), F.A.C., the table below provides the estimated annual jurisdictional revenue requirements for each year of the SPP.

Estimated Annual Revenue Requirements (millions)	
2020	\$257.3
2021	\$368.8
2022	\$494.0
2023	\$625.2
2024	\$760.6
2025	\$877.9
2026	\$963.4
2027	\$1,036.8
2028	\$1,110.7
2029	\$1,185.0

While FPL has provided estimated costs by program as of the time of this filing and associated total revenue requirements in its SPP, consistent with the requirements of Rule 25-6.030, F.A.C., subsequent projected and actual program costs submitted for cost recovery through the Storm Protection Plan Cost Recovery Clause (per Rule 25-6.031, F.A.C.,) could vary by as much as 10-15%, which would then also impact associated estimated revenue requirements and rate impacts. The projected costs, actual/ estimated costs, actuals costs, and true-up of actual costs to be included in FPL's Storm Protection

Plan Cost Recovery Clause will all be addressed in subsequent filings in separate storm protection plan cost recovery clause dockets pursuant to Rule 25-6.031, F.A.C.³⁵

VII. Estimated Rate Impacts for First Three Years of the SPP (2020-2022)

FPL anticipates the programs included in the SPP will have zero bill impacts on customer bills during the first year of the SPP and only minimal bill increases for years two and three of the SPP. An estimate of hypothetical overall rate impacts for the first three years of the SPP (2020-2022), without regard for the fact that FPL remains under a general base rate freeze pursuant to a Commission-approved settlement agreement through December 31, 2021, as stated in footnote 36 below are based on the total program costs reflected in this filing.³⁶ The projected costs, actual/estimated costs, actuals costs, and true-up of actual costs to be included in FPL's Storm Protection Plan Cost Recovery Clause will all be addressed in subsequent filings in Storm Protection Plan Cost Recovery Clause dockets pursuant to Rule 25-6.031, F.A.C.³⁷

Pursuant to Rule 25-6.031, F.A.C., FPL has not identified any reasonable implementation alternatives that could mitigate the resulting rate impact for each of the first three years of the SPP. As explained above, FPL's SPP is largely a continuation of existing Commission-approved storm hardening programs and initiatives, which have already demonstrated that they have and will continue to provide increased T&D infrastructure resiliency, reduced restoration time, and reduced restoration costs when FPL's system is impacted by severe weather events. Further, as explained above, the estimated costs

³⁵ The Commission has opened Docket No. 20200092-EI to address Storm Protection Plan Cost Recovery Clause petitions to be filed the third quarter of 2020.

³⁶ Pursuant to Rule 25-6.030(3)(h), F.A.C., the hypothetical rate impacts for FPL's typical residential, commercial, and industrial customers for the first three years of the SPP (2020-2022) without regard for the fact that FPL remains under a general base rate freeze pursuant to a Commission-approved settlement agreement through December 31, 2021, are as follows for 2020, 2021, and 2022, respectively: Residential (RS-1) \$0.00250/kWh, \$0.00357/kWh, and \$0.00478/kWh; Commercial (GSD-1) \$0.81/kW, \$1.15/kW, and \$1.54/kW; and Industrial (GSLDT-3) \$0.05/kW, \$0.08/kW and \$0.10/kW. These rate impacts are for all programs included in the SPP and are based on the total estimated costs as of the time of this filing, which could vary by as much as 10% to 15%, regardless of whether those costs will be recovered in FPL's Storm Protection Plan Cost Recovery Clause or through base rates.

³⁷ See footnote 34.

for the programs included in FPL's SPP are consistent with the historical costs incurred for the existing storm hardening and storm preparedness programs, which were most recently approved in FPL's 2019-2021 Storm Hardening Plan.

VIII. Conclusion

The Florida Legislature has determined that it is in the State's interest to "strengthen electric utility infrastructure to withstand extreme weather conditions by promoting the overhead hardening of distribution and transmission facilities, undergrounding of certain distribution lines, and vegetation management," and for each electric utility to "mitigate restoration costs and outage times to utility customers when developing transmission and distribution storm protection plans." Section 366.96(1), F.S. Based on these findings, the Florida Legislature concluded that it is in the State's interest for each electric utility to develop and file a SPP for the overhead hardening and increased resilience of electric T&D facilities, undergrounding of electric distribution facilities, and vegetation management. See Sections 366.96(1)-(3).

FPL's SPP is a systematic approach to achieve the legislative objectives of reducing restoration costs and outage times associated with extreme weather events and enhancing reliability. As explained above, FPL's SPP is largely a continuation and expansion of its existing and already successful storm hardening and storm preparedness programs previously approved by the Commission, as well as a new storm hardening program to harden certain targeted substations that are susceptible to storm surge or flooding during extreme weather events. Based on the recent experiences of Hurricanes Matthew and Irma, the existing storm hardening programs have a demonstrated and proven track record of mitigating and reducing restoration CMH, outage times, and storm restoration costs, as well as improving day-to-day reliability. FPL's SPP will continue and expand these important benefits to customers and the State.

APPENDIX A

Florida Power & Light Company
Docket No. 20170215-EU
Staff's First Data Request
Request No. 29 - Third Supplemental Amended
Page 1 of 9

QUESTION:

Please complete the table below summarizing hardened facilities that required repair or replacement as a result of Hurricanes Matthew, Hermine, Irma, Maria, and Nate.

RESPONSE:

FPL does not maintain its accounting records at the level of detail required to provide the requested information as they do not differentiate hardened facilities from non-hardened facilities, nor do they track which assets were repaired. However, FPL does track certain assets, at the total system level, that were requested and replaced during each hurricane as reflected in the tables below. Note, FPL did not track storm repairs/replacements for Hurricanes Maria and Nate as Hurricane Maria did not impact FPL's service territory and Nate had limited impact. Also, Hurricanes Matthew and Irma capital details associated with follow-up work are not yet available by plant account as these costs have not yet been unitized from account 106 to account 101 by plant account.

Notes:

For Hurricane Matthew, there is a difference of 248 poles between what is provided in this discovery response for total poles replaced (656 poles) and what is provided in FPL's post-storm forensic review report for Hurricane Matthew (provided in FPL's response to Staff's Second Data Request No. 2 in this same docket) for poles that failed and needed to be replaced to restore service (408 poles). The difference is associated with poles replaced during "follow-up" - i.e., poles that were damaged (e.g., a cracked pole) as a result of the storm and needed to be replaced to restore the pole to its pre-storm condition - but did not fail during the storm and, thus, did not need to be replaced to restore service. As mentioned above in FPL's response to this data request, FPL's accounting records do not differentiate hardened facilities from non-hardened facilities and FPL did not track or maintain forensic information on the 248 distribution poles replaced as a result of follow-up work. As a result, FPL does not have a hardened vs. non-hardened breakdown for the 248 distribution poles replaced during follow-up work.

Florida Power & Light Company
Docket No. 20170215-EU
Staff's First Data Request
Request No. 29 - Third Supplemental Amended
Page 4 of 9

The distribution pole and transmission structure counts provided above represent the amount of pole/structure replacements FPL has recorded on its books and records associated with Hurricane Irma as of December 31, 2017. These amounts should be considered preliminary at this time as they are subject to change (e.g., the counts do not reflect poles that will be replaced during follow-up work, which has yet to be completed).

N/A – Information is not available at this level of detail in FPL’s accounting records.

For substations and feeders, FPL has stated 0 since no entire substation or feeder was replaced. However, these facilities consist of many pieces of equipment (e.g., wire, cable, breakers, transformers, cross arms and arrestors) some of which may have been replaced.

2016/2017 Hurricanes - FPL Restoration/Infrastructure Performance

FPL’s infrastructure/restoration performance for Hurricanes Matthew (2016) and Irma (2017) demonstrates that the implementation and execution of its FPSC-approved (1) ten storm preparedness initiatives (which includes vegetation management): (2) pole inspection programs; (3) storm hardening plans; and (4) tariffs to incent municipal overhead to underground conversions have provided great benefits to FPL’s customers and to the State of Florida.

During 2016 and 2017, FPL’s service territory was threatened with massive Category 4 and 5 storms. The size and scale of these storms impacted FPL’s infrastructure throughout its entire service territory (which encompasses 35 counties in the State of Florida). For both Matthew and Irma, FPL’s infrastructure storm resiliency and smart grid investments resulted in improved infrastructure resiliency performance and reduced restoration times.

2016/2017 Hurricanes - Restoration Performance

FPL saw significant improvements in overall restoration results. As can be seen in the table below, restoration results for Hurricanes Matthew and Irma show significant improvement vs. Hurricane Wilma. FPL attributes these significant improvements in restoration to the investments made to make its system smarter and more storm-resilient as well as its well-tested restoration processes. This includes FPL’s distribution and transmission storm hardening and storm preparedness initiatives, pole inspection programs, smart grid initiatives, vegetation management programs and continuous efforts to improve its restoration processes.

	Wilma 2005	Matthew 2016	Irma 2017
Customer Outages	3.2M	1.2M	4.4M
% Restored / days	50% / 5	99% / 2	50% /1
All restored / days	18	4	10
Avg. to restore / days	5.4	<1	2.1

2016/2017 Hurricanes – Infrastructure Performance

To assess the effectiveness of FPL's infrastructure storm hardening investments, the Company utilizes information collected through post-storm forensic data collection and various systems (e.g., FPL's outage management system) to conduct post-storm infrastructure performance analysis. These efforts and analysis allow FPL to quantify and assess its distribution and transmission infrastructure performance including the performance of: hardened and non-hardened facilities; overhead and underground facilities; and smart grid performance. For distribution, this includes reviewing the storm performance of poles, feeders and laterals. For transmission, this includes reviewing the storm performance of poles/structures, line sections and substations. The data demonstrates that hardened infrastructure performed better than non-hardened infrastructure, underground facilities performed better than overhead facilities and smart grid devices prevented a significant number of outages from occurring.

Distribution/Transmission Poles/ Structures Performance

The performance of FPL's approximately 1.2 million distribution and transmission poles/structures during Hurricanes Matthew and Irma was excellent, as hardened poles and structures performed as expected by minimizing outages and reducing restoration times. The total number of distribution/transmission poles that failed (i.e., had to be repaired/replaced in order to restore service) during Hurricanes Matthew and Irma was a mere fraction of 1% of the 1.2 million pole/structure pole population.

Additionally, hardened distribution and transmission pole performance was significantly better than non-hardened pole performance, as hardened pole failures were either non-existent (e.g., Hurricane Matthew) or significantly less than non-hardened pole failures (e.g., during Hurricane Irma, hardened feeder poles had a 0.02% failure rate, while non-hardened feeder poles had a 0.20% failure rate). Also, total poles replaced (i.e., poles that failed + poles that were replaced during follow-up work) were also a mere fraction of 1% of the total pole population and significantly less than the number of poles replaced during Hurricane Wilma.

FPL notes that for Hurricanes Matthew and Irma, while it did track hardened vs. non-hardened pole performance during restoration, it did not track poles replaced (hardened vs. non-hardened) during follow-up work, since these poles had accomplished their intended purpose of not failing during the storms. Therefore, FPL cannot provide the number of hardened poles replaced during follow up work in Hurricanes Matthew and Irma. Based on the performance of hardened poles that failed during these storms (see table below), it is highly unlikely that there would be a significant number of hardened poles, if any, that needed to be replaced during follow-up work. However, going forward, should the Commission want FPL to track replacement of hardened vs. non-hardened poles during follow-up work, FPL will begin to track this information.

FPL attributes this excellent pole performance to its FPSC-approved distribution and transmission storm hardening plan initiatives (e.g., extreme wind load construction standards for distribution poles and replacing wood transmission poles/structures) and its pole inspection programs.

Page 6 of 9

Distribution Poles 12/31/17

Total Number 1,188,202
Total Hardened 124,518*

* This number is understated as it includes only poles hardened as a result of FPL’s approved hardening plan projects, as FPL does not track or maintain the number of hardened poles installed as a result of new construction (e.g., new feeders or laterals) and/or daily work activities (e.g., maintenance, pole line extensions, relocation projects). There are also other existing poles throughout FPL’s service territory that would currently meet the NESC’s extreme wind loading criteria and therefore qualify as a hardened pole, however, FPL does not currently track or maintain that information.

Distribution Pole Failures*	Hardened	Non-Hardened	Total
Matthew - 2016	0	408	408
Irma - 2017	26	2834	2860

*Broken/Fallen poles that must be repaired/replaced to restore service

Transmission Pole/Structures 12/31/17

Total 66,685
Concrete 60,694 (91%)
Wood 5,991 (9%)

Transmission Pole Failures*	Hardened	Non-Hardened	Total
Matthew - 2016	0	0	0
Irma - 2017	0	5	5

*Broken/Fallen poles that must be repaired/replaced to restore service

Distribution Feeders/Laterals Performance

As demonstrated below, FPL’s hardened feeders performed significantly better than non-hardened feeders and underground feeders/laterals performed significantly better than overhead feeders/laterals. Performance was compared considering feeder and lateral outages that occurred during Hurricanes Matthew and Irma. It is also important to note that during Hurricane Irma, the Construction Man Hours (“CMH”) to restore hardened feeders was 50% less than non-hardened feeders, primarily due to hardened feeders experiencing less damage than non-hardened feeders.

It is important to note that the majority of outages for overhead facilities resulted from trees that broke and/or fell into FPL’s facilities. Many of these trees were outside of easements or public rights of way where FPL is generally allowed to trim. As a result, no additional amount of

Florida Power & Light Company
Docket No. 20170215-EU
Staff's First Data Request
Request No. 29 - Third Supplemental Amended
Page 7 of 9

traditional tree trimming would help mitigate this issue. Tree damage was particularly impactful on FPL laterals.

The two tables below provide feeder and lateral outage performance statistics for Hurricanes Matthew and Irma.

Matthew	Overhead non-Hardened			Overhead Hardened			Underground			Total		
	Out	Pop	% Out	Out	Pop	% Out	Out	Pop	% Out	Out	Pop	% Out
Distribution Feeders	280	2,031	14%	68	721	9%	11	493	2%	359	3,245	13%
Distribution Laterals	3,473	82,729	4%	N.A.	N.A.	N.A.	238	101,892	0.2%	3,711	184,621	2%

Pop = Population; Lateral population includes laterals with multi-stage fusing

IRMA- 2017	Overhead Non-Hardened			Overhead Hardened			Underground			Total		
	Out	Pop	% Out	Out	Pop	% Out	Out	Pop	% Out	Out	Pop	% Out
Distribution Feeders	1,609	1,958	82%	592	859	69%	85	470	18%	2,286	3,287	70%
Distribution Laterals	20,341	84,574	24%	N.A.	N.A.	N.A.	3,767	103,384	4%	24,108	187,958	13%

Pop = Population; Lateral population includes laterals with multi-stage fusing

FPL notes that, overall, for Hurricane Irma, many more laterals experienced outages compared to feeders, thus laterals required significantly more time to restore (871,000 CMH) compared to feeders (170,000 CMH). FPL continues to promote its Right Tree Right Place initiative and recommends there be changes to state laws and/or local ordinances to restrict the type and location of trees and provide utilities additional trimming rights to address existing tree conditions.¹

Additionally, FPL notes that day-to-day, hardened feeders perform approximately 40% better than non-hardened feeders.

Transmission Line Sections/Substations Performance

The transmission system’s performance was excellent during Hurricanes Matthew and Irma. Equipment and conductor damage was minimal as a result of our investments in transmission hardening and the installation of flood monitoring equipment in those substations located in flood prone areas. Substations that experienced outages were restored in one day. During Hurricanes Matthew and Irma, flood monitoring equipment operated as expected, providing notification which allowed FPL to proactively de-energize three substations (one in Matthew and two in Irma) and prevent potential serious damage from occurring at these substations.

¹ Where municipalities are not actively engaged in ensuring appropriate limitations on planting trees in public rights of way, restoration efforts are impeded and made more costly. In fact, one particular municipality is actively planting “wrong trees in the wrong place,” in spite of FPL’s direct communications and efforts to encourage its Right Tree Right Place initiative.

Page 8 of 9

The tables below provide substation line section outage performance for Hurricanes Matthew and Irma.

MATTHEW - 2016	Overhead Non-Hardened			Overhead Hardened			Underground			Total		
	Out	Pop	% Out	Out	Pop	% Out	Out	Pop	% Out	Out	Pop	% Out
Trans. Line Sections	16	350	5%	23*	846	3%	0	49	0%	39	1,245	3%

IRMA - 2017	Overhead Non-Hardened			Overhead Hardened			Underground			Total		
	Out	Pop	% Out	Out	Pop	% Out	Out	Pop	% Out	Out	Pop	% Out
Trans. Line Sections	60	306	20%	142**	884	16%	13***	51	25%	215	1241	17%

* 2 sections were out because substation was proactively de-energized due to flooding

** 4 sections were out because substations were proactively de-energized due to flooding

*** No underground section was damaged or failed causing an outage; however, the sections were out due to line termination equipment in substations.

The table below compares substation outage and restoration performance – Irma vs, Wilma.

Substations	Wilma 2005	Irma 2017
De-energized	241	92
Restored (Days)	5	1

Smart Grid Performance

During Hurricane Matthew and Irma, smart grid devices prevented a significant amount of customer outages, assisted with restoration efforts and reduced restoration time and costs. Specifically, automated feeder switches avoided approximately 664,000 outages during Hurricanes Matthew and Irma. Additionally, FPL’s restoration crews are able to “ping” smart meters before leaving an area to ensure that power is, in fact, restored. This prevents restoration crews from leaving an area, thinking all power was restored, only to be called back when the customer informs FPL that they are still without service. FPL is also enhancing an application, first utilized during Hurricanes Matthew and Irma, whereby it will be able to “bulk meter ping” smart meters to confirm whether customers have service.

Automated Feeder Switches	Avoided Customer Outages
Matthew - 2016	118,000
Irma - 2017	546,000

Estimate of Storm Restoration Cost Savings Due to Hardening based on Storm Damage Model Simulation

The attached analysis provides an estimate of transmission and distribution storm restoration savings for Hurricanes Matthew and Irma that resulted from storm hardening completed by FPL prior to the storms' impacts. To calculate these savings, FPL utilized its Storm Damage Model (the same model FPL utilizes to estimate damage when a storm approaches FPL's service territory) to simulate damage that likely would have occurred without hardening and determine the associated required construction man hours (CMH) that would have been required to restore service in the absence of hardening, days to restore in the absence of hardening and associated incremental restoration costs. Additionally, FPL calculated the 40-year net present value of these savings for two scenarios – (1) a similar storm occurs every 3 years; and (2) a similar storm occurs every 5 years.

As indicated on the attached analysis, the 40-year net present values of the savings related to storm hardening are significant. In the absence of hardening the estimated percentage increase in CMHs for Hurricane Matthew and Hurricane Irma restoration would have been significantly higher (36% and 40%, respectively), days to restore would have been increased (50% and 40%, respectively) and restoration costs would have been greater (36% and 40%, respectively).

(1) Project level detail for 2020 in Appendix

(2) Costs include previous year(s) projects carried over to current year's project costs and future year's preliminary project costs (e.g., engineering)

(3) # of feeders or lateral to be initiated in the current year

APPENDIX D

(FPL's Hardening Design Guidelines)

Distribution Design Guidelines

The following **guidelines** will be used to standardize the design of FPL's overhead distribution facilities **when practical, feasible, and cost effective**.

General

1. FPL has made a change to adopt Extreme Wind loading (EWL) as the design criteria for: (1) new pole line construction, (2) pole line extensions, (3) pole line relocations, (4) feeder pole replacements on multi-circuit pole lines, and (5) feeder pole replacements on Top-CIF feeders. Reference the Pole Sizing section (pg. 7) for the guidelines to determine the necessary pole class and type for all work. Refer to the Distribution Engineering Reference Manual Addendum for calculating pole sizes for specific framing under extreme wind loading conditions.
2. For maintenance, existing non-top-CIF pole lines may be evaluated using NESC combined ice and wind loading with Grade B construction. This represents the loading prior to the adoption of extreme wind loading. If the pole must be replaced, refer to the Pole Sizing section for the minimum class pole to be installed. Refer to the Distribution Engineering Reference Manual (DERM) Section 4 for calculating pole sizes for specific framing under the NESC combined ice and wind loading conditions.
3. Every attempt should be made to place new or replacement poles in private easements or as close to the front edge of property (right of way line) as practical.
4. Overhead pole lines should be placed in front lot lines or accessible locations where feasible.
5. When replacing poles, the new pole should be set as close as possible to the existing pole to avoid the creation of a new pole location.
6. Poles are not to be placed in medians.
7. Concrete poles are not to be placed in inaccessible locations or locations that could potentially become inaccessible.
8. Please reference the minimum setting depth charts located in DCS D-3.0.0 which shows the increased setting depths for concrete poles.
9. Every effort should be made not to install poles in sidewalks. If a pole must be placed in a sidewalk, a minimum unobstructed sidewalk width of 32" must be maintained to comply with the American Disabilities Act (ADA) requirements.
10. If concrete poles are required by the governing agency as a requirement of the permit, and if the work is being done solely for FPL purposes (feeder tie, etc.), then the concrete

poles are installed with no differential charges. If the concrete poles are required as a condition of the permit, and the work is being done at the request of a customer (and fall outside the Pole Sizing Guidelines) to provide service to the customer or relocation by request of the customer, then the customer is charged a differential cost for the concrete poles.

11. When installing new OH secondary spans, multiplexed cable should be used instead of open wire secondary. When reconductoring or relocating existing pole lines containing open wire secondary, replace the open wire with multiplexed cable whenever possible. The system neutral should not be removed when replacing open wire secondary with multiplexed cable if primary wire is present. It is necessary to maintain a separate system neutral for operational continuity of the system.
12. When designing overhead facilities where secondary and service crossings exist across major roadways, the engineer should take into consideration placing these secondary street crossings underground. Operations Director Approval is required.
13. Whenever extending a feeder, reconductoring a feeder section, or attaching a device to a feeder, always reference the nearest existing disconnect switch number on the construction drawing and show the dimension to the switch. This will aid the Control Centers in updating their switching system and will aid AMG in updating AMS, as well as provide the Production Lead and Distribution Tech information needed for switching and RC Off requests.
14. When an overhead feeder crosses any obstacle to access (i.e. – water bodies such as rivers, canals, swamps; limited access R/W such as interstate highways, turnpikes, and expressways; etc.) disconnect switches should be placed on both sides of the obstacle in order to isolate the crossing in the event of a wiredown situation. See the example in the Crossing Multi-Lane Limited Access Highways section (pg. 5).
15. Projects that affect or extend feeder conductors should always be coordinated with Distribution Planning to ensure optimization of the distribution grid. Taking into account future feeder plans such as, feeder boundary changes, sectionalizing devices, integration of automation and remotely controlled protection.

As always, good engineering judgment, safety, reliability, and cost effectiveness should be considered. In addition to these guidelines, all distribution facilities shall be engineered to meet the minimum requirements set forth in all applicable standards and codes including but not limited to the National Electrical Safety Code (NESC), Utility Accommodation Guide, and FPL Distribution Construction Standards. Please contact a Distribution Construction Services (DCS) analyst with any questions.

New Construction

1. When installing a new feeder, lateral, or service pole, reference the Pole Sizing section for the guidelines to determine the necessary pole class and type to meet Extreme Wind Loading (EWL) for the wind zone region (105, 130, or 145 MPH).
2. Modified Vertical is the preferred framing for accessible locations. Post-top (single phase) or Cross Arm (multi-phase) is the preferred framing for inaccessible locations.
3. During the design of new pole lines in developed areas, field visits should be conducted to ensure the design would cause minimum impact to the existing property owners.
4. Overhead pole lines should not be built on both sides of a roadway unless agreed to by the customer nor should multi-circuit pole lines be created. When designing main feeder routes all viable options must be reviewed (including alternative routes) and consideration should be given to constructing the line underground. If undergrounding is chosen and it is not the least cost option, approval is required from the Engineering & Technical Services Director and the Operations Director. In addition, prior to proceeding with any pole lines on both sides of a street or any multi-circuit feeder design recommendations, Operations Director approval is required.
5. When there is an existing pole line in the rear easement, every effort should be made not to build a second pole line along the right of way.
6. When installing a pole line within a transmission line, accessible distribution poles should be concrete. Distribution concrete poles should not be installed in inaccessible locations.
7. If concrete distribution poles are installed in a concrete transmission line, there is no additional charge to the customer (the concrete poles are FPL's choice and not requested by the customer). Coordination between the transmission and distribution design is critical and consideration should be given to a design with all transmission poles versus distribution intermediate poles. This approach will reduce the overall number of poles.
8. When transmission is overbuilding (concrete structures), along an existing distribution corridor, if the distribution wood poles are in good condition, do not replace. If wood poles need to be changed out or relocated, replace with concrete poles to match the transmission pole type. Coordination between the transmission and distribution design is critical and consideration should be given to a design with all transmission poles versus distribution intermediate poles. This approach will reduce the overall number of poles.

Existing / Maintenance

1. When installing and/or replacing a feeder, lateral, or service pole on an existing pole line, reference the Pole Sizing section for the guidelines to determine the necessary pole class and type.
2. When installing or replacing a feeder pole on a feeder that serves a Top-CIF customer, ensure the new pole will meet extreme wind loading (versus just a minimum class 2 or IIIH pole) so that it will not have to be replaced when the feeder is hardened as a hardening project. Please reference the Storm Secure Hardening SharePoint Site: Distribution > Central Maintenance > Central Contractor Services > Hardening > Reports > Feeder Prioritization_xxxxxx Snapshot for the list of Top-CIF feeders within the Prioritization File.
3. When extending pole lines, the existing pole type should be used as a guide for the new pole type. If concrete poles are requested by the customer or are required as a condition of the permit and fall outside the Pole Sizing Guidelines, the customer will pay a differential charge for the concrete poles.
4. When replacing pole(s) and anchor(s) with larger self-supporting concrete poles, caution should be used, as the property owners in the vicinity of the pole will not necessarily perceive this concrete pole as a better choice.
5. When replacing poles on a multi-circuit feeder the replacement pole should be designed for Extreme Wind Loading using Pole Foreman to calculate the wind loading.

Relocations

1. When relocating a pole line, reference the Pole Sizing section for the guidelines to determine the necessary pole class and type to meet Extreme Wind Loading (EWL) for the wind zone region (105, 130, or 145 MPH).
2. When relocating either a concrete or wood pole line for a highway improvement project, the existing pole line 'type' should be used as a guide for the pole type replacements. There is no additional charge for concrete poles if the existing poles being relocated are concrete (like for like relocation). If the customer requests an "upgrade" to concrete poles, a differential is charged.
3. Reimbursable relocations will equal the cost to relocate the line built to Extreme Wind Loading (plus removal of old), including indirect cost.
4. Agency relocation projects should be coordinated with Distribution Planning to ensure optimization of the distribution grid and to take into account future feeder plans and potential feeder boundary changes.

Crossing Multi-Lane Limited Access Highways

The following guidelines are to be used when an overhead feeder crosses any obstacle to access (i.e. –limited access R/W such as interstate highways, turnpikes, and expressways, etc.). Similar consideration can be given to water bodies such as rivers, canals, swamps.

1. Underground installation is the preferred design for all new crossings (1, 2, 3 phase) of multi-lane limited access highways & hardening of existing crossings; reference Fig 1. Limited Access Highway Crossing Schematic (Preferred). If underground construction is not feasible, reference Fig 2. Limited Access Highway Crossing Schematic (Alternate).
2. Underground crossing for 1 & 2 phases should be designed for potential three phase feeder size cable. Ensure riser poles meet or exceed extreme wind design for the designated region. For further information, please contact the CMC Hardening Group.
3. For accessible overhead crossings, use concrete poles (III-H or greater square concrete pole) for the crossing poles and minimum Class 2 wood poles for the intermediate poles. For inaccessible overhead crossings, minimum Class 2 wood poles should be used for the crossing and intermediate poles. All poles installed should meet or exceed EWL for the designated region.
4. Every attempt should be made to install storm guys & back guys for the highway crossing poles. Storm guys are not required on the adjacent poles.
5. Frame the highway crossing pole double dead-end (See LOC 2 & 3 Fig 2 below).
6. Install disconnect switches on adjacent poles on both sides of the crossing (or as required by field conditions) to isolate the feeder section for restoration. Switches are to be installed in **accessible** locations that can be reached with readily available aerial equipment. Switches should be installed at ~42 Above Grade (AG), with a maximum pole size of 50' wood or 55' concrete. If there is no load between the nearest existing switch and the crossing, an additional switch is not required.
7. Check for uplift on all poles. Refer to DERM Section 4.2.3 Page 4 of 16 & DCS E-4.0.2 and E-4.0.3. Back guys should be installed at the adjacent pole if required for uplift.
8. Ensure to maintain proper clearance above or under all highways as dictated by the owner of the R/W & DCS B-3.0.1.
9. Any conductors crossing the highway that have splices should be replaced with a continuous conductor (NESC 261H2a). See Fig 2 below for additional notes on the use of splices on adjacent spans. One additional set of dead-end insulators at the highway crossing pole may be used if this eliminates the need for splices when installing a new pole.

10. Engineers must conduct a pre-design meeting with the Production Lead to ensure the feasibility of the proposed design.
11. As always, use good engineering judgment to produce a quality, cost-effective design.

Fig 1. Limited Access Highway Crossing Schematic (Preferred)

Fig 2. Limited Access Highway Crossing Schematic (Alternate)

Pole Sizing

1. FPL has made a change to adopt Extreme Wind loading (EWL) as the design criteria for: (1) new pole line construction, (2) pole line extensions, (3) pole line relocations, (4) feeder pole replacements on multi-circuit pole lines, and (4) feeder pole replacements on Top-CIF feeders. Reference the Pole Sizing Guidelines (at the end of this section) to determine the necessary pole class and type.
2. When installing or replacing a feeder pole on a feeder that serves a Top-CIF customer, ensure the new pole will meet the extreme wind design (versus just a minimum class 2 or IIIH pole) so that it will not have to be replaced when the feeder is hardened as a hardening project. Please reference the Storm Secure SharePoint Site: Distribution > Central Maintenance > Central Contractor Services > Hardening > Reports > Feeder Prioritization_XXXXXX Snapshot for the list of Top-CIF feeders within the Prioritization File.
3. For maintenance, existing non-top-CIF pole lines may be evaluated using NESC combined ice and wind loading with Grade B construction. This represents the loading prior to the adoption of extreme wind loading. If the pole must be replaced, refer to the Pole Sizing Guidelines for the minimum class pole to be installed.
4. When performing work on an existing pole, and the pole requires change out (e.g., clearance height, location, condition, or the ability to support the planned activity), use the Pole Selection Guidelines. If the planned work can be done without changing out the pole and the pole meets minimum NESC grade B wind loading guidelines, use the existing pole(s).
5. Foreign pole owners are required to discuss design requirements with FPL prior to construction. FPL will assist with identifying the targeted poles.
6. Efforts should be made to ensure that span distances do not exceed 250 ft. for wood poles and 350 ft. for concrete poles even if longer spans would meet the Extreme Wind Loading requirements.
7. Concrete poles are preferred in the cases where replacement costs would be extremely high (i.e. duct system riser pole, corner poles with multiple circuits, critical poles, etc.). No differential is charged for poles in this case.

Lateral Pole Policy

1. All existing poles must meet NESC grade "B" as an absolute minimum.
2. If a pole is modified in any way, it must meet NESC grade "B" at a minimum when completed.
3. If you become aware of a pole which does not meet NESC "B" or DCS standards, the pole must be immediately upgraded or modified to meet the NESC & DCS standards.
4. All replacement lateral poles must meet NESC "EWL" and be compliant with FPL Pole Policies.
5. Restoration of lateral poles should comply with the class 2/3 table.

For practical purposes this means...

1. Engineer all poles to the NESC EWL standards and to meet FPL policies.
2. Run Pole Foreman on all designed WR's and poles suspected of being substandard.
3. If you are completing substantial work on a pole, such as installing additional cables, upgrading a TX, re-conductor or new framing: The pole must meet EWL and the revised class standards.
4. If you are completing minor like for like work such as replacing a fuse switch, insulator or other small equipment: The pole must meet NESC grade "B" and DCS standards at a minimum when the work is complete.
 - a. Note: Most FPL poles currently exceed NESC grade "B". This means there is some leeway for minor changes in wind loading and clearances while maintaining the NESC grade "B" minimum.
5. Temporary or time constrained poles may be installed to NESC grade "N" temporary construction. This is relatively complicated, requires sound engineering judgment and should be avoided. If grade NESC grade "N" is applied, a replacement pole engineered to NESC EWL must be designed and installed as soon as practical and not longer than 6 months after NESC grade "N" was installed.
6. Class 4 poles may only be installed for SVC, SEC, SL, OL's. Once the available stock of class 4 is used up no more will be ordered and FPL will install class 3 poles for these applications.
7. In no case should class 4 poles be installed in laterals.

Contact Engineering Standards for situations that still are in question after careful consideration

Critical Pole Definitions & Sizing:

The following list comprises what will be considered critical poles. When installing and/or when doing work that otherwise requires the replacement of an accessible critical pole, use concrete. If the pole is inaccessible, use a minimum Class 2 wood pole, or consider relocating the equipment to an accessible concrete pole.

Critical Pole Identifier For new or when replaced use minimum III-H Square Concrete Pole⁵ (minimum Class 2 if inaccessible)			
Critical Poles	DCS Reference	Critical Poles	DCS Reference
1 st switch out of substation or duct system riser pole	UH-15.0.0 Fig 2 UH-15.3.1	Automated Feeder Switches (AFS) ²	C-9.2.0
Interstate Crossings ^{1,3}	E-10.0.0 Fig 2	Aerial Auto Transformers ²	I-9.0.0
Poles with multiple primary risers	UH-15.2.0	3 phase transformer banks 3 – 100 kVA and larger ²	I-52.0.2
Multi-circuit poles ⁴	Frame as existing	Capacitor Banks ²	J-2.0.2 & J-2.0.3
Three-phase reclosers ² (or Three single-phase reclosers)	C-8.0.0	Regulators	I-10.1.1
Primary Meter	K-28.0.0	Interruptors	C-9.5.0

All references are to the Distribution Construction Standards (DCS).

For all critical poles run Pole Foreman to calculate the wind loading for the specified pole and attachments combination. Additional information can be found in DERM Section 4 - Addendum for Extreme Wind Loading tables 4.2.2-8, 4.2.2-9, or 4.2.2-10.

- ¹⁾ Every attempt should be made to install storm guys where feasible and practical.
- ²⁾ Frame in-line per standard to equally distribute weight.
- ³⁾ Refer to the Crossing Multi-Lane Limited Access Highways section for details.
- ⁴⁾ Contact CMC Hardening Group before designing new multi-circuit line.
- ⁵⁾ To eliminate field drilling, inventory Special Drill Pole & create Pole Boring Detail for all III-H Poles on Hardening Jobs.

Pole Sizing Guidelines:

The following tables should be used as guidelines to help determine pole class and type, when installing and/or replacing a feeder, lateral or service pole.

Feeder or Three Phase Lateral:

Pole Line Description	New Construction, Line Extension, & Pole Line Relocation	Existing Infrastructure ¹	Installing or Replacing a Critical Pole ²
Wood	Use minimum Class 2 Wood Pole to meet EWL	Use Class 2 Wood Poles	Use III-H (Accessible) or Class 2 Wood (Inaccessible)
Concrete	Use minimum III-H Concrete Pole to meet EWL	Use III-H Concrete Poles	Use III-H Concrete Poles

When designing for EWL run Pole Foreman to calculate the wind loading for the specified pole and attachments combination. Additional information can be found in DERM Section 4 - Addendum for Extreme Wind Loading tables 4.2.2-8, 4.2.2-9, or 4.2.2-10.

Single or Two Phase Lateral:

Pole Line Description	New Construction, Line Extension, Pole Line Relocation, Pole Replacement, & Intermediate Poles	Existing Infrastructure ¹	Installing or Replacing a Critical Pole ²
Wood	105/135 mph: Use minimum Class 3 <i>MUST</i> meet EWL	105/135 mph: Use minimum Class 3	Use III-H (Accessible) or Class 2 Wood (Inaccessible)
	145 mph: Use minimum Class 2 <i>MUST</i> meet EWL	145 mph: Use minimum Class 2	
Concrete	Use minimum III-G ³ or III-H poles	Use III-G ³ or III-H poles to match existing line	Use III-H Concrete Poles

- Notes: ¹⁾ To be used when replacing equipment or installing new equipment on an existing pole.
²⁾ Reference Critical Pole List on pg.8.
³⁾ Use of III-G poles should be limited to existing concrete lateral pole lines whose wire size is less than or equal to 1/0A.
⁴⁾ Use Pole Foreman to calculate wind loading on all poles.

Basic Span Lengths for selected poles for Extreme Wind Loading:

Facility	Phase(s)	Wire size	Pole size	Recommended Maximum Span Length ⁴ (FPL with 2 attachments – FPL ONLY)		
				105 MPH	130 MPH	145 MPH
Feeder		3#568 ACAR	Class 2	180' - 230'	125' - 200'	90' - 140'
		3#3/0 AAAC	Class 2	180' - 250'	170' - 250'	120' - 220'
Lateral	3 PH	3#1/0 AAAC	Class 2	180' - 250'	180' - 250'	155' - 250'
	2 PH	2#1/0 AAAC	Class 3	180' - 250'	180' - 250'	125' - 250'
	1 PH	1#1/0 AAAC	Class 3	180' - 250'	180' - 250'	150' - 250'

⁴The lower number equates to the maximum span for FPL primary and two 1" foreign attachments. The higher number equates to the recommended maximum span for FPL primary only. Reference the DERM Addendum for EWL tables 4.2.2-8, 4.2.2-9, 4.2.2-10 when adding additional attachment(s) or equipment. As always, good engineering judgment, safety, reliability, and cost effectiveness should be considered.

Service / Secondary / St. Light / Outdoor Light Poles:

When installing or replacing a service or street light poles, a minimum of Class 3 wood pole should be used. Specific calculations may require a higher class pole for large quadruplex wire.

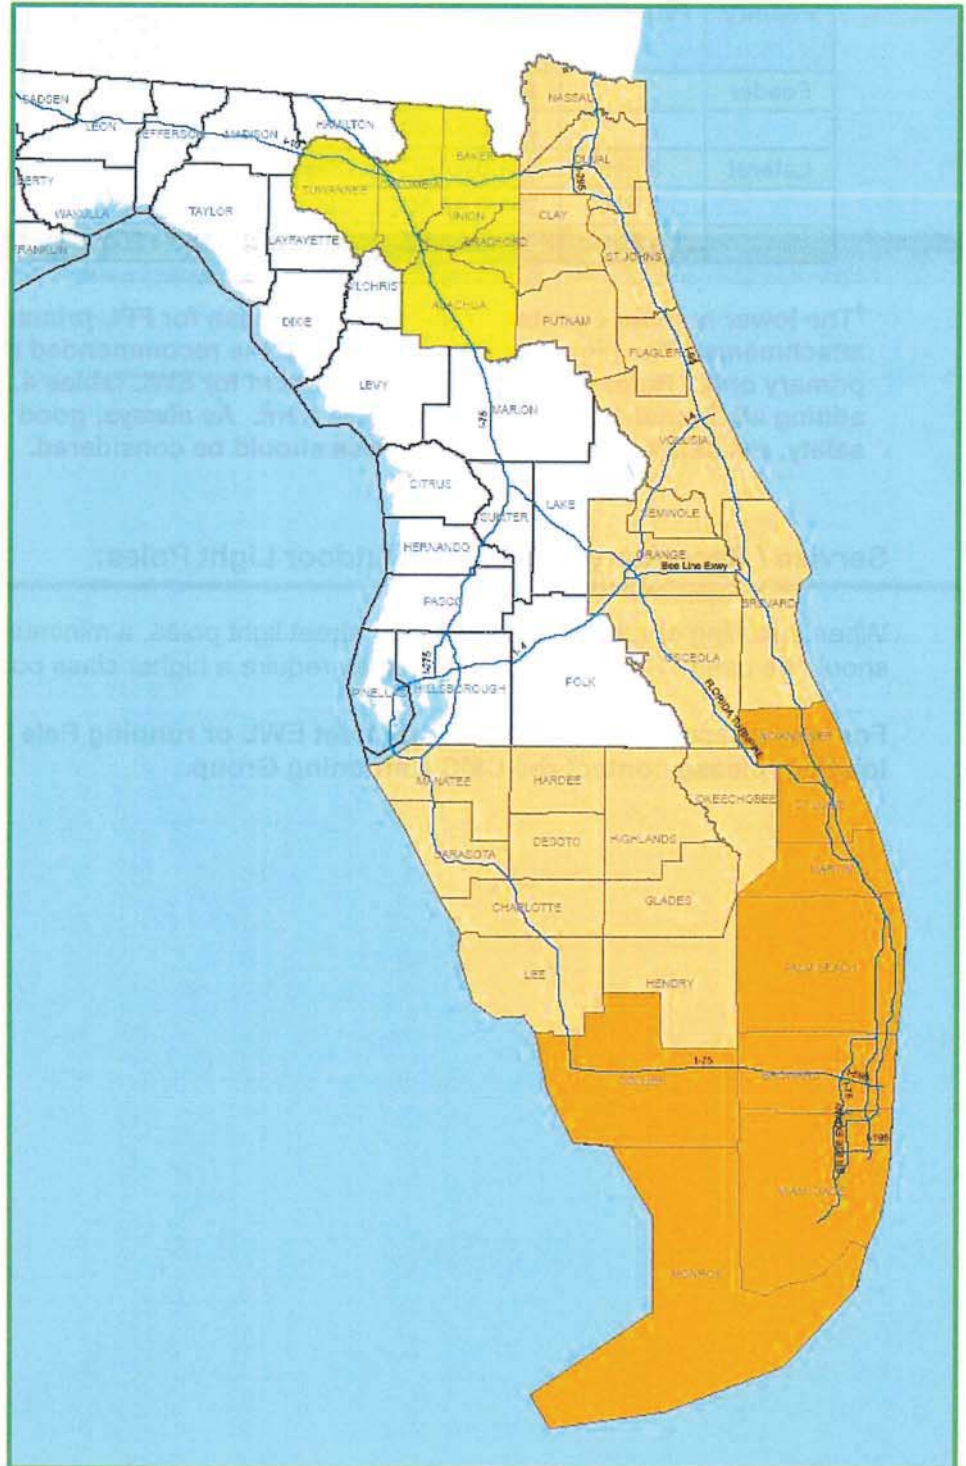

For any questions on pole sizing to meet EWL or running Pole Foreman to calculate wind loading, please contact the CMC Hardening Group.

Extreme Wind Loading (EWL) 3 Zone Map

Wind Zone	County
105	Alachua
105	Baker
105	Bradford
130	Brevard
145	Broward
130	Charlotte
130	Clay
145	Collier
105	Columbia
145	Miami-Dade
130	De Soto
130	Duval
130	Flagler
130	Glades

130	Volusia

Notification of FPL Facilities

Form 360, Notification of FPL Facilities, is to be used for all construction projects. Please include a copy of this form in negotiations with builders and developers. This form can be found on the DCS Website under "Letters and Agreements", or in WMS on the "Reports" menu item for the work request.

APPENDIX E

(FPL's 2020 Project Level Detail)

Notes:

(1) Start date reflects estimated/actual year when initial project costs will begin to accrue (e.g., preliminary engineering/design, site preparations, or customer outreach, if applicable).

(2) Completion year reflects the estimated/actual date when project will be completed.

(3) Amounts reflect SPP totals and breakdown between base and clause amounts can be seen in RBD-1 Form 6P.

(4) The SPP projects that will be completed as well as the associated costs in 2021 could vary based on a number of factors.

MJ-2 SPP Work Projected to be Completed in 2021

Notes:

- (1) Start date reflects estimated/actual year when initial project costs will begin to accrue (e.g., preliminary engineering/design, site preparations, or customer outreach, if applicable).
- (2) Completion year reflects the estimated/actual date when project will be completed.
- (3) Amounts reflect SPP totals and breakdown between base and clause amounts can be seen in RBD-1 Form 6P.
- (4) The SPP projects that will be completed as well as the associated costs in 2021 could vary based on a number of factors.

I. INTRODUCTION 3

II. DETERMINATION OF 2021 SPPCRC RECOVERABLE COSTS..... 6

III. 2021 WACC CALCULATION..... 12

1 **I. INTRODUCTION**

2

3 **Q. Please state your name and business address.**

4 A. My name is Liz Fuentes, and my business address is Florida Power & Light
5 Company (“FPL” or the “Company”), 9250 West Flagler Street, Miami,
6 Florida, 33174.

7 **Q. By whom are you employed and what is your position?**

8 A. I am employed by FPL as Senior Director, Regulatory Accounting.

9 **Q. Please describe your duties and responsibilities in that position.**

10 A. I am responsible for planning, guidance, and management of most regulatory
11 accounting activities for FPL and Gulf Power Company. In this role, I ensure
12 that financial books and records comply with multi-jurisdictional regulatory
13 accounting requirements and regulations.

14 **Q. Please describe your educational background and professional
15 experience.**

16 A. I graduated from the University of Florida in 1999 with a Bachelor of Science
17 Degree in Accounting. That same year, I was employed by FPL. During my
18 tenure at the Company, I have held various accounting and regulatory
19 positions of increasing responsibility with the majority of my career focused
20 in regulatory accounting and the calculation of revenue requirements.
21 Specifically, I have provided accounting support in multiple FPL retail base
22 rate filings and other regulatory dockets filed at the Florida Public Service
23 Commission (“FPSC” or the “Commission”) as well as the Federal Energy

1 Regulatory Commission (“FERC”). My responsibilities have included the
2 management of the accounting for FPL’s cost recovery clauses and the
3 preparation, review and filing of FPL’s monthly Earnings Surveillance
4 Reports (“ESR”) at the FPSC. I am a Certified Public Accountant (“CPA”)
5 licensed in the Commonwealth of Virginia and am a member of the American
6 Institute of CPAs. I have previously filed testimony before the Commission
7 for FPL’s Solar Base Rate Adjustments related to the solar photovoltaic
8 projects placed in service in 2018 and 2020 (Docket Nos. 20170001-EI and
9 20190001-EI) and request for approval of the Indiantown Transaction (Docket
10 No. 160154-EI).

11 **Q. What is the purpose of your testimony?**

12 A. The purpose of my direct testimony is to explain how the Company
13 determined the amount of forecasted 2021 Storm Protection Plan (“SPP”)
14 costs incremental from its base rates for which it is seeking recovery through
15 the Storm Protection Plan Cost Recovery Clause (“SPPCRC”) in its 2021
16 Projection filing. I will also explain how the Company will uniquely identify
17 and record costs to be recovered through the SPPCRC beginning in 2021. In
18 addition, I will explain and provide support for the calculation of the projected
19 2021 Weighted Average Cost of Capital (“WACC”) to be used in order to
20 calculate the return on 2021 SPPCRC capital investments.

21 **Q. Please summarize your testimony.**

22 A. In order to determine the amount of 2021 SPP program costs eligible for
23 recovery through the SPPCRC, FPL has compared the forecasted 2021 SPP

1 capital expenditures presented in Exhibit MJ-1 – FPL’s Storm Protection Plan
2 2020-2029 attached to the testimony of FPL witness Michael Jarro, which was
3 filed with and is currently pending before the Commission in Docket No.
4 20200071-EI (the “SPP Filing”), to the amount of capital expenditures for
5 storm hardening projects included for recovery in FPL’s most recent base rate
6 filing and actual storm hardening capital expenditures incurred for the period
7 of 2018 through 2019 and forecasted 2020. Based on this analysis, FPL has
8 determined that all forecasted 2021 SPP capital expenditures are incremental
9 to the amount currently recovered in base rates and, therefore, recoverable
10 through the SPPCRC. Also, FPL is not seeking SPPCRC recovery of any
11 forecasted 2021 SPP program Operations & Maintenance (“O&M”) expenses
12 and will address the recovery of those expenses during its next base rate
13 proceeding. FPL has also identified incremental costs that are necessary to
14 implement the tracking and reporting of costs recoverable through SPPCRC
15 and has included them for recovery in its 2021 Projection Filing. In addition,
16 FPL has calculated and applied a projected WACC to calculate a return on the
17 2021 SPPCRC capital investments in accordance with Commission Order No.
18 PSC-2020-0165-PAA-EU, Docket No. 20200118-EU, issued on May 20,
19 2020 (the “WACC Order”).

20 **Q. Are you sponsoring or co-sponsoring any exhibits in this case?**

21 A. Yes. I am sponsoring or co-sponsoring the following exhibits:

- 22 • LF-1 – Determination of Cost Recovery through the SPPCRC;
- 23 • LF-2 – 2021 SPPCRC Capital Costs;

- 1 • LF-3 – Forecasted 2021 Weighted Average Cost of Capital; and
- 2 • Co-Sponsoring Form 6P - Program Description and Progress Report
- 3 included in FPL witness Renae Deaton’s Exhibit RBD-1.

4

5 **II. DETERMINATION OF 2021 SPPCRC RECOVERABLE COSTS**

6

7 **Q. Please explain why it is necessary to determine the amount of SPP costs**
8 **that are incremental to base rates.**

9 A. Rule 25-6.031(6)(b), F.A.C., provides that “Storm Protection Plan costs
10 recoverable through the clause shall not include costs recovered through the
11 utility’s base rates or any other cost recovery mechanism.” Therefore,
12 consistent with the requirements the Commission’s Rule, it is necessary to
13 demonstrate that any costs sought to be recovered through the SPPCRC are
14 not being recovered in FPL’s current base rates.

15 **Q. Has FPL determined the amount of SPP costs being recovered through**
16 **base rates?**

17 A. Yes.

18 **Q. Please explain the method FPL used to determine the amount of SPP**
19 **costs currently included in its base rates.**

20 A. FPL’s current base rates were established pursuant to a Stipulation and
21 Settlement Agreement approved by the Commission in Order No. PSC-16-
22 0560-AS-EI, Docket No. 160021-EI (the “2016 Settlement Agreement”). The
23 2016 Settlement Agreement resulted in base rates lower than those presented

1 by FPL in its Minimum Filing Requirements (“MFRs”) in that docket.
2 Nonetheless, for purposes of determining the level of SPP costs embedded in
3 FPL’s current base rates, FPL relied upon the amount of storm hardening
4 costs included in its 2018 Subsequent Year MFRs filed in Docket No.
5 160021-EI as a conservative proxy to determine the maximum amount of SPP
6 costs that could possibly be currently included in its base rates. To the extent
7 FPL has exceeded the level of storm hardening costs included in its MFRs,
8 any amount above those levels would be considered incremental SPP costs
9 eligible to be recovered through the SPPCRC.

10 **Q. Is FPL seeking recovery of any forecasted 2021 SPP program O&M**
11 **expenses in its request for SPPCRC recovery in this proceeding?**

12 A. No. FPL is not seeking recovery of any forecasted 2021 SPP program O&M
13 expenses through the SPPCRC. FPL will evaluate whether it intends to seek
14 recovery of future SPP program O&M expenses through the SPPCRC during
15 its next base rate proceeding.

16 **Q. Is FPL seeking recovery of any forecasted 2021 SPP capital costs in its**
17 **request for SPPCRC recovery in this proceeding?**

18 A. Yes.

19 **Q. How did FPL determine the amount of forecasted 2021 SPP capital costs**
20 **eligible for recovery through the SPPCRC?**

21 A. As reflected on Exhibit LF-1, FPL identified historical capital expenditures
22 for each of its SPP programs and split 2020 forecasted SPP capital costs
23 between capital expenditures and cost of removal. FPL then compared the

1 amount of forecasted capital expenditures for storm hardening projects in its
2 2018 Subsequent Year MFRs filed in Docket No. 160021-EI to the cumulative
3 amount of actual capital expenditures for the years ended 2018 through 2019
4 and forecasted 2020 in order to determine whether any of its forecasted 2021
5 SPP capital expenditures are incremental to base rates and eligible for
6 SPPCRC recovery. Based on this comparison, FPL is expected to incur a total
7 of \$2.0 billion in SPP capital expenditures for the period of 2018 through
8 2020, which is approximately \$1.1 billion more than the maximum amount
9 included in its MFRs. In addition, each of FPL's SPP programs individually
10 exceeded the maximum capital amount forecasted in the 2018 Subsequent
11 Year MFRs. Therefore, all of FPL's forecasted 2021 SPP capital
12 expenditures, in total and by SPP program, are eligible for SPPCRC recovery.

13 **Q. Did FPL include all of its forecasted 2021 SPP capital expenditures in its**
14 **request for recovery through the SPPCRC in this proceeding?**

15 A. Yes. As reflected on Exhibit LF-2, FPL included all forecasted 2021 SPP
16 capital expenditures for recovery through the SPPCRC.

17 **Q. Has FPL forecasted an amount for the cost of removal of existing assets**
18 **associated with its SPP programs?**

19 A. Yes. As reflected on Exhibit LF-2, FPL has forecasted a total of \$128.8
20 million of cost of removal for existing assets associated with its SPP programs
21 for 2021.

22 **Q. Did FPL include any of its forecasted 2021 cost of removal in its request**
23 **for recovery through the SPPCRC in this proceeding?**

1 A. No. Since the cost of removal associated with existing assets being removed
2 in 2021 as a result of FPL's SPP programs was recovered from customers
3 through base rates as a component of depreciation expense, FPL has excluded
4 cost of removal from SPPCRC recovery in this proceeding. Cost of removal
5 related to FPL's SPP programs incurred in 2021 will be reflected as base rate
6 recoverable costs.

7 **Q. Did FPL reflect an amount for the retirement of existing assets in its**
8 **request for recovery of 2021 SPPCRC costs in this proceeding?**

9 A. No. The retirement of existing assets as a result of FPL's SPP programs
10 occurring during 2021 are not included in FPL's forecasted 2021 SPP costs
11 requested for recovery through the SPPCRC. Retirements occurring in 2021
12 will remain as a base rate activity since those assets are currently being
13 recovered through base rates and will be incorporated into the calculation of
14 revenue requirements in FPL's next base rate proceeding.

15 **Q. Did FPL include a beginning balance for Construction Work In Progress**
16 **("CWIP") for any of its SPP programs in its 2021 SPPCRC Projection**
17 **filing?**

18 A. No. Since FPL committed to not seek recovery of any SPP project costs
19 incurred in 2020, FPL did not include forecasted beginning balances of CWIP
20 for any of its SPP programs in the 2021 SPPCRC Projection filing.

21 **Q. What is the total amount of forecasted 2021 SPP capital expenditures**
22 **FPL included in its calculation of SPPCRC revenue requirements?**

23 A. As reflected on Exhibit LF-2, the total amount of forecasted 2021 SPP capital

1 expenditures included for recovery in the 2021 Projection Filing is \$886.6
2 million. This amount is included in the calculation of the revenue
3 requirements on Exhibit RBD-1 of FPL witness Deaton.

4 **Q. How will FPL track SPP costs approved for recovery through the**
5 **SPPCRC starting January 1, 2021?**

6 A. As required by Rule 25-6.031(5), F.A.C., FPL has created new FERC
7 subaccounts to ease the recording and tracking of capital expenditures,
8 accumulated depreciation, depreciation expense, and O&M expenses for SPP
9 costs approved for recovery through the SPPCRC. In addition, FPL has
10 created a new Business Area within its SAP accounting system which
11 provides another way to identify and report all SPP costs approved for
12 recovery through the SPPCRC. The methodology described above is
13 consistent with how FPL records and tracks costs recoverable through other
14 clause recovery mechanisms such as the Environmental Cost Recovery Clause
15 and Energy Conservation Cost Recovery Clause, and will facilitate the annual
16 clause audits performed by the FPSC Staff and removal of SPPCRC costs
17 from FPL's monthly ESR.

18 **Q. How will FPL record SPP costs approved for recovery through SPPCRC**
19 **on its books and records?**

20 A. As described by FPL witness Jarro, FPL has created unique master data in its
21 systems (*i.e.*, work order type and work breakdown structure) to record SPP
22 capital costs and O&M expenses recoverable through SPPCRC starting
23 January 1, 2021. This new master data will distinguish costs recoverable

1 through SPPCRC separate and apart from base rate recoverable costs and will
2 translate costs to the newly created FERC subaccounts as explained above
3 depending on the type of activity. In addition, FPL will record all capital
4 expenditures to CWIP in accordance with its capitalization policy and transfer
5 CWIP to plant-in-service once the projects are completed. FPL will then
6 depreciate SPPCRC assets at the plant account level using the current
7 approved depreciation rates reflected in the 2016 Settlement Agreement.

8 **Q. Has FPL identified any incremental costs necessary to implement its**
9 **SPPCRC?**

10 A. Yes. FPL has identified the following incremental costs required to
11 implement its SPPCRC:

- 12 • Capital Projects – FPL has identified a total of \$2.1 million of
13 capital expenditures and \$18 thousand of O&M expenses for
14 software modifications to various systems that are necessary to
15 manage, track, and bill customers for amounts recovered through
16 the SPPCRC. Approximately \$1.1 million of the incremental
17 capital expenditures relate to the creation of forecasted and actual
18 revenue requirement calculations to be submitted in FPL’s annual
19 SPPCRC filings, while the remainder of the costs includes
20 modifications to FPL’s accounting and work management systems
21 in order to track actual SPPCRC recoverable costs at the project
22 and program level.
- 23 • O&M expenses – FPL has identified a total of \$0.5 million in

1 annual O&M expenses beginning in 2021 for additional resources
2 required to support FPL's annual SPPCRC filings and tracking of
3 SPP project costs.

4 Since both the implementation capital costs and O&M expenses were not
5 contemplated or included in FPL's MFRs, they are incremental and eligible
6 for recovery through the SPPCRC.

7 **Q. Did FPL include any incremental implementation costs in its request for**
8 **recovery through the SPPCRC in this proceeding?**

9 A. Yes. As reflected in FPL witness Deaton's testimony, FPL has included the
10 recovery of all incremental implementation costs in its 2021 Projection Filing.

11

12 III. 2021 WACC CALCULATION

13

14 **Q. Is FPL required to utilize a specific WACC when calculating a return on**
15 **the SPPCRC capital investments included for recovery in its 2021**
16 **Projection filing?**

17 A. Yes. Per the WACC Order, beginning with all 2021 clause projection filings,
18 FPL is required to project its WACC using its currently approved mid-point
19 return on equity ("ROE") for the clause projection year and apply the
20 proration formula prescribed by Treasury Regulation §1.167(l)-1(h)(6)(i) to
21 the plant only depreciation-related Accumulated Deferred Federal Income Tax
22 ("ADFIT") included in capital structure. As quoted in the WACC Order, the
23 proration formula as required under Treasury Regulation §1.167(l)-1(h)(6)(i)

1 is as follows:

2 “The pro rata portion of any increase to be credited or decrease to be
3 charged during a future period...shall be determined by multiplying
4 any such increase or decrease by a fraction, the numerator of which is
5 the number of days remaining in the period at the time such increase or
6 decrease is to be accrued, and the denominator of which is the total
7 number of days in the period.”

8 **Q. Has FPL calculated a projected 2021 WACC to be applied to the 2021**
9 **SPPCRC capital investments requested for recovery in this proceeding?**

10 A. Yes. As reflected on Exhibit LF-3, FPL projected the mid-point ROE, 13-
11 month average WACC for 2021 using the Company’s most recent financial
12 forecast and applied the proration formula to the plant only depreciation-
13 related ADFIT as prescribed by the Treasury Regulation §1.167(l)-1(h)(6)(i).
14 The resulting after-tax WACC to be applied to the 2021 SPPCRC capital
15 investments is 6.36%, which is reflected on Form 7P, Capital Structure and
16 Cost Rates, in FPL witness Deaton’s Exhibit RBD-1.

17 **Q. Will the projected 2021 WACC be revised through the 2021 SPPCRC**
18 **true-up process?**

19 A. Yes. Pursuant to the WACC Order, FPL must carry through the proration
20 adjustment to the 2021 Actual/Estimated True-Up and 2021 Final True-Up.

21
22 For the 2021 Actual/Estimated True-Up, FPL will utilize the mid-point ROE
23 13-month average WACC from the 2021 Forecasted ESR and carry forward

1 the same proration adjustment reflected in the 2021 Projection Filing.
2 However, if the depreciation-related ADFIT balance in the 2021 Projection
3 Filing was over-estimated, the Proration Formula adjustment will then need to
4 be reduced to reflect the difference between the originally projected and
5 prorated depreciation-related ADFIT balance and the re-projected
6 depreciation-related ADFIT balance. The resulting WACC calculation would
7 then be used to calculate a monthly return on all projected clause investments
8 in the 2021 Actual/Estimated Filing.

9
10 For the 2021 Final True-Up filing to be made in the Spring of 2022, FPL will
11 utilize the midpoint ROE 13-month average WACC from the 2021 December
12 ESR and carry forward the same proration adjustment reflected in the 2021
13 Projection Filing. However, if the depreciation-related ADFIT balance in the
14 Projection Filing was over-estimated, the Proration Formula would be
15 adjusted downward as described above. The resulting WACC calculation will
16 be used to calculate a monthly return on all projected clause investments in
17 the 2021 Final True-Up Filing.

18 **Q. Does this conclude your testimony?**

19 A. Yes.

Notes:

- 37 ^(A) Amounts reflected were included in FPL's MFRs in its last base rate case (Docket No. 160021-EI) and represent dollars forecasted to be invested in storm hardening projects in 2018.
- 38 ^(B) Totals by SPP program tie to the capital costs reflected on Appendix C of FPL's 2020 - 2029 SPP, which is provided as Exhibit MJ-1 to the testimony of FPL witness Jarro and is currently pending before the FPSC in Docket No. 20200071-EI.
- 39 ^(C) Cost of removal was estimated based on an average of historical spend.
- 40 ^(D) Amounts reflected are above the amount of capital expenditures forecasted for storm hardening projects in FPL's 2018 Subsequent Year.

BEFORE THE FLORIDA PUBLIC SERVICE COMMISSION

FLORIDA POWER & LIGHT COMPANY

TESTIMONY OF RENAE B. DEATON

DOCKET NO. 20200092-EI

JULY 24, 2020

1 **Q. Please state your name and address.**

2 A. My name is Renae B. Deaton. My business address is Florida Power & Light
3 Company, 700 Universe Boulevard, Juno Beach, Florida 33408.

4 **Q. By whom are you employed and in what capacity?**

5 A. I am employed by Florida Power & Light Company (“FPL” or the “Company”) as
6 Director of Clause Recovery and Wholesale Rates, in the Regulatory & State
7 Governmental Affairs Department.

8 **Q. Please describe your educational background and professional experience.**

9 A. I hold a Bachelor of Science in Business Administration and a Master of Business
10 Administration from Charleston Southern University. Since joining FPL in 1998,
11 I have held various positions in the rates and regulatory areas. Prior to my current
12 position, I held the positions of Senior Manager of Cost of Service and Load
13 Research and Senior Manager of Rate Design in the Rates and Tariffs Department.
14 I am a member of the Edison Electric Institute (“EEI”) Rates and Regulatory Affairs
15 Committee, and I have completed the EEI Advanced Rate Design Course. I have
16 been a guest speaker at Public Utility Research Center/World Bank International
17 Training Programs on Utility Regulation and Strategy. In 2016, I assumed my
18 current position, where my duties include providing direction as to the
19 appropriateness of inclusion of costs through a cost recovery clause and the overall
20 preparation and filing of all cost recovery clause documents including testimony
21 and discovery. As part of the various roles I have held with the Company, I have
22 testified before this Commission in base rate and clause recovery dockets.

1 **Q. What is the purpose of your testimony?**

2 A. The purpose of my testimony is to present for Commission review and approval the
3 Storm Protection Plan Cost Recovery Clause (“SPPCRC”) projections for the
4 period January 2021 through December 2021.

5 **Q. Have you prepared or caused to be prepared under your direction,
6 supervision, or control an exhibit in this proceeding?**

7 A. Yes, I am sponsoring the following forms provided as Appendix I to Exhibit RBD-
8 1:

- 9 • Form 1P - Summary of Projected Period Recovery Amount
- 10 • Form 2P - Calculation of Annual Revenue Requirements for O&M Programs
- 11 • Form 2P Projects - Project Listing by Each O&M Program
- 12 • Form 3P - Calculation of the Total Annual Revenue Requirements for Capital
13 Investment Programs
- 14 • Form 3P Projects - Project Listing by Each Capital Program
- 15 • Form 3P Capital - Calculation of Annual Revenue Requirements for Capital
16 Investment by Program
- 17 • Form 4P - Calculation of the Energy & Demand Allocation % By Rate Class
- 18 • Form 5P - Calculation of the Cost Recovery Factors by Rate Class
- 19 • Form 7P - Approved Capital Structure and Cost Rates

20 Also included in Appendix I to Exhibit RBD-1 is Form 6P - Program Description
21 and Progress Report, which is co-sponsored by FPL witnesses Jarro and Fuentes.
22 These Commission Forms were used to calculate FPL’s proposed SPPCRC factors

1 for the period of January 1, 2021 through December 31, 2021. Appendix II to RBD-
2 1 contains the retail separation factors and Appendix III provides the allocation of
3 implementation costs between transmission and distribution.

4 **Q. Is FPL seeking to recover through the SPPCRC any actual SPP costs incurred**
5 **for the prior year or any actual/estimated SPP project costs for the current**
6 **year?**

7 A. No. As explained by FPL witness Jarro, there is no “prior year” (2019) applicable
8 to the SPPCRC in this proceeding and FPL has committed and previously advised
9 parties that it will not seek recovery of the 2020 SPP project costs through the
10 SPPCRC. Therefore, FPL is not submitting the Commission forms applicable to
11 support the actual and actual/estimated SPP costs.

12 **Q. What is the source of the data presented in your testimony and/or exhibits to**
13 **support the 2021 SPPCRC projection?**

14 A. The projections are taken from the Company’s financial forecasting system, and
15 are consistent with the projections provided in Exhibit MJ-1 – FPL’s Storm
16 Protection Plan 2020-2029 attached to the testimony of FPL witness Jarro, which
17 was filed with and is currently pending before the Commission in Docket No.
18 20200071-EI (“SPP”).

19 **Q. Please explain the calculation of the Revenue Requirements for the projected**
20 **period.**

21 A. Form 2P titled “Calculation of Annual Revenue Requirements for O&M Programs”
22 shows the calculation of the monthly O&M revenue requirements for the period

1 January 2021 through December 2021. As explained by FPL witness Fuentes, FPL
2 is not seeking recovery of O&M expenses associated with the SPP programs in
3 2021. Form 3P titled “Calculation of Annual Revenue Requirements for Capital
4 Investment Programs” shows the calculation of the monthly revenue requirements
5 for the capital expenditures projected to be incurred during the period January 2021
6 through December 2021. The monthly capital revenue requirements include the
7 debt and equity return grossed up for income taxes on the average monthly net
8 investment, including Construction Work In Progress, and depreciation and
9 amortization expense. The identified recoverable cost is then allocated to retail
10 customers using the appropriate separation factors provided in Appendix II to
11 Exhibit RBD-1.

12 **Q. How are implementation costs treated?**

13 A. As described by FPL witness Fuentes, FPL identified incremental capital and O&M
14 costs that are necessary to implement the tracking and reporting of costs
15 recoverable through SPPCRC and has included them for recovery in its request
16 2021 Projection Filing. These costs are allocated to the retail rate classes using the
17 appropriate separation factors. For retail class allocation, the implementation costs
18 are as allocated to transmission or distribution based on the transmission and
19 distribution programs’ average plant in service balances.

20 **Q. Have you provided a schedule showing the allocation of costs by retail rate**
21 **class?**

22 A. Yes. Form 4P provides the allocation of costs to the retail rate classes. The

1 allocation to the retail rate classes is consistent with the allocations used in FPL's
2 Cost of Service Study in the most recent retail rate case (Docket No. 20160021-EI).
3 Transmission costs are allocated to all rate classes based on the 12 monthly
4 Coincident Peaks (12CP). The distribution costs are allocated only to the
5 distribution-level rate classes based on the Group Coincident Peak (GCP). The
6 transmission level rate classes are not allocated any distribution costs.

7 **Q. Does this conclude your testimony?**

8 A. Yes.

Exhibit RBD-1 Appendix 1

Florida Power & Light Company
Storm Protection Plan Cost Recovery Clause

9. Total System Recoverable Expenses (Lines 7 + 8)		\$10,214	\$31,240	\$53,293	\$76,073	\$99,365	\$123,014	\$146,908	\$170,968	\$195,136	\$219,370	\$243,640	\$267,926	\$1,637,147

Notes:

- (a) Excludes Cost of Removal on the retirement of existing plant.
- (b) The Gross-up factor for taxes is 1/.754782, which reflects the Federal Income Tax Rate of 21%. The equity component for the period Jan. – Dec. 2021 is 5.1242% based on FPL's most recent financial forecast.
- (c) The debt component is 1.2406% based on FPL's most recent financial forecast.
- (d) Calculated using the composite depreciation rates for distribution/transmission function as reflected in FPL's 2016 retail base rate settlement agreement (Order No. PSC-16-0560-AS-EI).

Notes:

- (a) Excludes Cost of Removal on the retirement of existing plant.
- (b) The Gross-up factor for taxes is 1/.754782, which reflects the Federal Income Tax Rate of 21%. The equity component for the period Jan. - Dec. 2021 is 5.1242% based on FPL's most recent financial forecast.
- (c) The debt component is 1.2406% based on FPL's most recent financial forecast.
- (d) Calculated using the composite depreciation rates for distribution/transmission function as reflected in FPL's 2016 retail base rate settlement agreement (Order No. PSC-16-0560-AS-EI).

**FLORIDA POWER & LIGHT COMPANY
PROJECT DESCRIPTION AND PROGRESS REPORT**

Program Title: Pole Inspections – Distribution Program

Description:

The Pole Inspections - Distribution Program included in the Storm Protection Plan (“SPP”) is a continuation of Florida Power & Light Company’s (“FPL”) existing Florida Public Service Commission (“Commission”) approved distribution pole inspection program. FPL’s existing, Commission-approved distribution pole inspection program is an eight-year pole inspection cycle for all distribution poles that targets approximately 1/8 of the system annually (the actual number of poles inspected can vary somewhat from year to year). To ensure inspection coverage throughout its service territory, FPL established nine inspection zones (based on FPL’s management areas and pole population) and annually performs pole inspections of approximately 1/8 of the distribution poles in each of these zones, as well as any necessary remediation as a result of such inspections. With approximately 1.2 million distribution poles as of year-end 2019, FPL expects to inspect approximately 150,000 poles annually (spread throughout its nine inspection zones) during the 2020-2029 SPP period.

The total estimated costs for the Pole Inspection – Distribution Program for the ten-year period of 2020-2029 is \$605 million with an annual average cost of approximately \$61 million, which is consistent with historical costs for the existing distribution pole inspection program.¹ A detailed description of the Pole Inspection – Distribution Program is provided in Section IV(A) of FPL’s SPP filed in Docket No. 20200071.

¹ Note, the 2020-2029 program costs shown above are the projected costs estimated as of the April 10, 2020 filing date of FPL's 2020-20209 SPP, and subsequent projected and actual costs could vary. The projected, actual/estimated, and actual costs for the SPP programs will be addressed annually in FPL’s Storm Protection Plan Cost Recovery Clause filings.

**FLORIDA POWER & LIGHT COMPANY
PROJECT DESCRIPTION AND PROGRESS REPORT**

Accomplishments:

Fiscal Expenditures:

SPP Year 2020 – For 2020, FPL’s SPP estimated approximately \$54.5 million for the Pole Inspections - Distribution Program, which included approximately \$50.7 million in capital costs and approximately \$3.8 million in Operations & Maintenance (“O&M”) expenses. As of the end of May 2020, the total spend for this program is \$16.5 million, which includes \$15.1 million in capital costs and \$1.4 million in O&M expenses. FPL is not seeking to recover any 2020 costs associated with the Pole Inspections - Distribution Program through the Storm Protection Plan Cost Recovery Clause.

Progress Summary:

SPP Year 2020 – In its SPP, FPL projected the inspection of 150,000 distribution poles spread throughout its nine inspection zones. As of the end of May 2020, FPL completed approximately 57,418 pole inspections and is on track to complete the remaining 92,582 inspections for a total of 150,000 pole inspections by the end of 2020.

Projections:

SPP Year 2021 – For 2021, FPL projects it will inspect 150,000 distribution poles spread throughout its nine inspection zones. FPL estimates that it will incur approximately \$57.9 million in 2021 for the Pole Inspections – Distribution Program, which includes approximately \$33.6 million in capital expenditures, \$20.5 million in cost of removal, and \$3.8 million in O&M expenses. FPL is seeking to recover \$33.6 million of capital expenditures for the Pole Inspections – Distribution Program through the Storm Protection Plan Cost Recovery Clause; the 2021 O&M expenditures and cost of removal for this program will be recovered through base rates.

**FLORIDA POWER & LIGHT COMPANY
PROJECT DESCRIPTION AND PROGRESS REPORT**

Program Title: Structures/Other Equipment Inspections – Transmission Program

Description:

The Structures/Other Equipment Inspections – Transmission Program included in the SPP is a continuation of FPL’s existing Commission-approved transmission inspection program. The SPP will continue FPL’s current, Commission-approved transmission inspection program which requires: (a) transmission circuits and substations and all associated hardware to be inspected on a six-year cycle; (b) wood structures to be inspected visually from the ground on an annual basis and conduct climbing or bucket truck inspections to be conducted on a six-year cycle; and (c) steel and concrete structures to be inspected visually on an annual basis and climbing or bucket truck inspections to be conducted on a ten-year cycle. FPL expects to inspect approximately 68,000 structures annually during the 2020-2029 SPP period.

The total estimated costs for the Structures/Other Equipment Inspections – Transmission Program for the ten-year period of 2020-2029 is \$500 million with an annual average cost of approximately \$50 million, which is consistent with historical costs for the existing transmission inspection program.² A detailed description of the Structures/Other Equipment Inspections – Transmission Program is provided in Section IV(B) of FPL’s SPP filed in Docket No. 20200071.

Accomplishments:

Fiscal Expenditures:

SPP Year 2020 – For 2020, FPL’s SPP estimated approximately \$35.8 million for the Structures/Other Equipment Inspections – Transmission Program, which included approximately \$34.5 million in capital costs and approximately \$1.3 million in O&M expenses. As of the end of May 2020, the total spend for this program is \$16.5 million, which includes \$16 million in capital costs and \$0.5 million in O&M expenses. FPL is not

² See footnote 1.

**FLORIDA POWER & LIGHT COMPANY
PROJECT DESCRIPTION AND PROGRESS REPORT**

seeking to recover any 2020 costs associated with the Structures/Other Equipment Inspections – Transmission Program through the Storm Protection Plan Cost Recovery Clause.

Progress Summary:

SPP Year 2020 – In its SPP, FPL projected the inspection of 68,000 structures. As of the end of May 2020, FPL completed approximately 28,500 inspections and is on track to complete a total of 68,000 inspections by the end of 2020.

Projections:

SPP Year 2021 – For 2021, FPL projects it will inspect 68,000 structures. FPL estimates that it will incur approximately \$32.2 million in 2021 for the Structures/Other Equipment Inspections – Transmission Program, which includes approximately \$25.5 million in capital expenditures, \$5.7 million in cost of removal, and \$1.0 million in O&M expenses. FPL is seeking to recover \$25.5 million of capital expenditures for the Structures/Other Equipment Inspections – Transmission Program through the Storm Protection Plan Cost Recovery Clause; the 2021 O&M expenditures and cost of removal for this program will be recovered through base rates.

**FLORIDA POWER & LIGHT COMPANY
PROJECT DESCRIPTION AND PROGRESS REPORT**

Program Title: Feeder Hardening (EWL) – Distribution Program

Description:

The Feeder Hardening (EWL) – Distribution Program included in the SPP is a continuation of FPL’s existing Commission-approved approach to harden existing feeders and certain critical distribution poles, as well as FPL’s initiative to design and construct new pole lines and major planned work to meet the National Electrical Safety Code’s (“NESC”) extreme wind loading criteria (“EWL”). During the period 2006-2019, FPL hardened over 1,300 existing feeders, the vast majority being Critical Infrastructure Function (“CIF”) feeders (i.e., feeders that serve hospitals, 911 centers, police and fire stations, water treatment facilities, county emergency operation centers) and Community Project feeders (i.e., feeders that serve other key community needs like gas stations, grocery stores and pharmacies) throughout FPL’s service territory. Additional feeders were hardened as a result of FPL’s Priority Feeder Initiative, a reliability program that targeted feeders experiencing the highest number of interruptions and/or customers interrupted. FPL also applied EWL to the design and construction of new pole lines and major planned work, including pole line extensions and relocations and certain pole replacements.

FPL expects to harden approximately 250-350 feeders annually, with 100% of FPL’s feeders expected to be hardened or underground by year-end 2024 and with the final costs of the program to be incurred in 2025. The total estimated costs for the Feeder Hardening (EWL) – Distribution Program for the period of 2020-2025 is \$3,206 million with an annual average cost of approximately \$534 million, which is consistent with historical costs for the existing distribution feeder hardening program.³ A detailed description of the Feeder Hardening (EWL) – Distribution Program is provided in Section IV(C) of FPL’s SPP filed in Docket No. 20200071.

³ See footnote 1.

**FLORIDA POWER & LIGHT COMPANY
PROJECT DESCRIPTION AND PROGRESS REPORT**

Accomplishments:

Fiscal Expenditures:

SPP Year 2020 – For 2020, FPL’s SPP estimated approximately \$628.1 million for the Feeder Hardening (EWL) – Distribution Program, which included approximately \$628.1 million in capital costs and \$0 in O&M expenses. As of the end of May 2020, the total spend for this program is \$279.5 million, which includes \$279.5 million in capital costs and \$0 in O&M expenses. FPL is not seeking to recover any 2020 costs associated with the Feeder Hardening (EWL) – Distribution Program through the Storm Protection Plan Cost Recovery Clause.

Progress Summary:

SPP Year 2020 – In its SPP, FPL projected the hardening of 300-350 feeders. As of the end of May 2020, FPL completed the hardening of approximately 62 feeders and is on track to complete a total of 300-350 hardened feeders by the end of 2020.

Projections:

SPP Year 2021 – For 2021, FPL projects it will harden 300-350 feeders. FPL estimates that it will incur approximately \$664.9 million in 2021 for the Feeder Hardening (EWL) – Distribution Program, which includes approximately \$573.7 million in capital expenditures, \$91.3 million in cost of removal, and \$0 in O&M expenses. FPL is seeking to recover \$573.7 million of capital expenditures for the Feeder Hardening (EWL) – Distribution Program through the Storm Protection Plan Cost Recovery Clause; the 2021 O&M expenditures and cost of removal for this program will be recovered through base rates.

**FLORIDA POWER & LIGHT COMPANY
PROJECT DESCRIPTION AND PROGRESS REPORT**

Program Title: Lateral Hardening (Undergrounding) – Distribution Program

Description:

The Lateral Hardening (Undergrounding) - Distribution Program included in the SPP is a continuation and expansion of FPL's existing three-year Storm Secure Underground Program Pilot ("SSUP Pilot") implemented in 2018. The SSUP Pilot is a program that targets certain overhead laterals that were impacted by recent storms and have a history of vegetation-related outages and other reliability issues for conversion from overhead to underground. As part of its proposed SPP, FPL will complete its existing three-year SSUP Pilot in 2020 and expand the application of the SSUP during 2021-2029 to the implementation of the system-wide Lateral Hardening (Undergrounding) – Distribution Program to provide the benefits of underground lateral hardening throughout its system.

By the end of 2020, the third and final year of the SSUP Pilot, FPL expects to have converted a total of 220-230 laterals from overhead to underground, which is consistent with the SSUP Pilot plan most recently approved in July 2019 in FPL's most recent storm hardening plan docket, Docket No. 20180144-EI. After completing the SSUP Pilot in 2020, FPL estimates that it will convert approximately 300-700 laterals annually in 2021-2023 and approximately 800-900 laterals annually in 2024-2029.

The total estimated costs for the Lateral Hardening (Undergrounding) - Distribution Program for the ten-year period of 2020-2029 is \$5,101 million with an annual average cost of approximately \$510 million.⁴ A detailed description of the Lateral Hardening (Undergrounding) - Distribution Program is provided in Section IV(D) of FPL's SPP filed in Docket No. 20200071.

⁴ See footnote 1.

**FLORIDA POWER & LIGHT COMPANY
PROJECT DESCRIPTION AND PROGRESS REPORT**

Accomplishments:

Fiscal Expenditures:

SPP Year 2020 – For 2020, FPL’s SPP estimated approximately \$120.4 million for the Lateral Hardening (Undergrounding) - Distribution Program, which included approximately \$120.4 million in capital costs and \$0 in O&M expenses. As of the end of May 2020, the total spend for this program is \$56.8 million, which includes \$56.5 million in capital costs and \$0.3 million in O&M expenses. FPL is not seeking to recover any 2020 costs associated with Lateral Hardening (Undergrounding) - Distribution Program through the Storm Protection Plan Cost Recovery Clause.

Progress Summary:

SPP Year 2020 – In its SPP, FPL projected the hardening of a total of 220-230 laterals in the third and final year of the SSUP Pilot. As of end the of May 2020, FPL completed the hardening of approximately 78 laterals and is on track to complete a total of 220-230 hardened/underground laterals by the end of 2020, the third and final year of the SSUP Pilot.

Projections:

SPP Year 2021 – For 2021, FPL projects it will harden 300-350 laterals. FPL estimates that it will incur approximately \$212.5 million in 2021 for the Lateral Hardening (Undergrounding) - Distribution Program, which includes approximately \$206.9 million in capital expenditures, \$5.6 million in cost of removal, and \$0 in O&M expenses. FPL is seeking to recover \$206.9 million of capital expenditures for the Lateral Hardening (Undergrounding) - Distribution Program through the Storm Protection Plan Cost Recovery Clause; the 2021 O&M expenditures and cost of removal for this program will be recovered through base rates.

**FLORIDA POWER & LIGHT COMPANY
PROJECT DESCRIPTION AND PROGRESS REPORT**

Program Title: Wood Structures Hardening (Replacing) – Transmission Program

Description:

The Wood Structures Hardening (Replacing) – Transmission Program included in the SPP is a continuation of FPL’s existing transmission hardening program to replace all wood transmission structures with steel or concrete structures. As of year-end 2019, 96% of FPL’s transmission structures, system-wide, were steel or concrete, with less than 2,900 (or 4%) wood structures remaining to be replaced. FPL expects to replace the remaining wood transmission structures on its system by year-end 2022.

The total estimated costs for the Wood Structures Hardening (Replacing) – Transmission Program for the period of 2020-2022 is \$118 million with an annual average cost of approximately \$39 million, which is a decrease from the historical costs for the existing transmission hardening program.⁵ A detailed description of the Wood Structures Hardening (Replacing) – Transmission Program is provided in Section IV(E) of FPL’s SPP.

Accomplishments:

Fiscal Expenditures:

SPP Year 2020 – For 2020, FPL’s SPP estimated approximately \$52.9 million for the Wood Structures Hardening (Replacing) – Transmission Program, which included approximately \$52.7 million in capital costs and approximately \$0.2 million in O&M expenses. As of the end of May 2020, the total spend for this program is \$47.6 million, which includes \$47.6 million in capital costs and \$0 in O&M expenses. FPL is not seeking to recover any 2020 costs associated with the Wood Structures Hardening (Replacing) – Transmission Program through the Storm Protection Plan Cost Recovery Clause.

⁵ See footnote 1.

**FLORIDA POWER & LIGHT COMPANY
PROJECT DESCRIPTION AND PROGRESS REPORT**

Progress Summary:

SPP Year 2020 – In its SPP, FPL projected the replacement of 900-1,100 wood structures. As of the end of May 2020, FPL completed the replacement of approximately 314 wood structures and is on track to complete a total of 900-1,100 wood structure replacements by the end of 2020.

Projections:

SPP Year 2021 – For 2021, FPL projects it will replace 500-700 wood structures. FPL estimates that it will incur approximately \$42.9 million in 2021 for the Wood Structures Hardening (Replacing) – Transmission Program, which includes approximately \$38.6 million in capital expenditures, \$4.1 million in cost of removal, and \$0.2 million in O&M expenses. FPL is seeking to recover \$38.6 million of capital expenditures for the Wood Structures Hardening (Replacing) – Transmission Program through the Storm Protection Plan Cost Recovery Clause; the 2021 O&M expenditures and cost of removal for this program will be recovered through base rates.

**FLORIDA POWER & LIGHT COMPANY
PROJECT DESCRIPTION AND PROGRESS REPORT**

Program Title: Vegetation Management – Distribution Program

Description:

The Vegetation Management – Distribution Program included in the SPP is a continuation of FPL’s existing, Commission-approved distribution vegetation management program. FPL’s currently-approved distribution vegetation program, includes the following system-wide vegetation management activities: three-year cycle for feeders; mid-year cycle targeted trimming for certain feeders; six-year cycle for laterals; and continued education of customers through its Right Tree, Right Place initiative. Under the SPP, FPL plans to trim, on average, approximately 15,200 miles annually, including approximately 11,400 miles for feeders (cycle and mid-cycle) and 3,800 miles for laterals, which is consistent with the historic miles trimmed annually for 2017-2019.

The total estimated costs for the Vegetation Management – Distribution Program for the ten-year period of 2020-2029 is \$596 million with an annual average cost of approximately \$60 million, which is consistent with historical costs for the existing distribution vegetation management program.⁶ A detailed description of the Vegetation Management – Distribution Program is provided in Section IV(G) of FPL’s SPP filed in Docket No. 20200071.

Accomplishments:

Fiscal Expenditures:

SPP Year 2020 – For 2020, FPL’s SPP estimated approximately \$61.1 million for the Vegetation Management – Distribution Program, which included \$0 in capital costs and approximately \$61.1 million in O&M expenses. As of the end of May 2020, the total spend for this program is \$30.6 million, which includes \$0 in capital costs and \$30.6 million in O&M expenses. FPL is not seeking to recover any 2020 costs associated with

⁶ See footnote 1.

**FLORIDA POWER & LIGHT COMPANY
PROJECT DESCRIPTION AND PROGRESS REPORT**

the Vegetation Management – Distribution Program through the Storm Protection Plan Cost Recovery Clause.

Progress Summary:

SPP Year 2020 – In its SPP, FPL projected 15,200 miles of vegetation maintenance. As of the end of May 2020, FPL completed approximately 7,018 miles of vegetation maintenance and is on track to complete a total of 15,000 miles by the end of 2020.

Projections:

SPP Year 2021 – For 2021, FPL projects it will complete 15,200 miles of vegetation maintenance. FPL estimates that it will incur approximately \$61.3 million in O&M expense and \$0 in capital expenditures in 2021 for the Vegetation Management – Distribution Program. FPL is not seeking recovery of the 2021 costs for the Vegetation Management – Distribution Program through the Storm Protection Plan Cost Recovery Clause; the 2021 O&M expenditures for this program will be recovered through base rates.

**FLORIDA POWER & LIGHT COMPANY
PROJECT DESCRIPTION AND PROGRESS REPORT**

Program Title: Vegetation Management – Transmission Program

Description:

The Vegetation Management – Transmission Program included in the SPP is a continuation of FPL’s existing transmission vegetation management program. The key elements of FPL’s transmission vegetation management program are to inspect the transmission right-of-ways, document vegetation inspection results and findings, prescribe a work plan, and execute the work plan. In its SPP, FPL will continue its current transmission vegetation management plan, which includes visual and aerial inspections of all transmission line corridors, Light Detection and Ranging (“LiDAR”) inspections of North American Electric Reliability Corporation’s (“NERC”) transmission line corridors, developing and executing annual work plans to address identified vegetation conditions, and identifying and addressing priority and hazard tree conditions prior to and during storm season. Under the SPP, FPL plans to inspect and maintain, on average, approximately 7,000 miles of transmission lines annually, including approximately 4,300 miles for NERC transmission line corridors and 2,700 miles for non-NERC transmission line corridors. This is comparable to the approximately 7,000 miles inspected and maintained annually, on average for 2017-2019.

The total estimated costs for the Vegetation Management – Transmission Program for the ten-year period of 2020-2029 is \$96 million with an annual average cost of approximately \$10 million, which is consistent with historical costs for the existing transmission vegetation management program.⁷ A detailed description of the Vegetation Management – Transmission Program is provided in Section IV(H) of FPL’s SPP filed in Docket No. 20200071.

⁷ See footnote 1.

**FLORIDA POWER & LIGHT COMPANY
PROJECT DESCRIPTION AND PROGRESS REPORT**

Accomplishments:

Fiscal Expenditures:

SPP Year 2020 – For 2020, FPL’s SPP estimated approximately \$9.0 million for the Vegetation Management – Transmission Program, which included \$0 in capital costs and approximately \$9.0 million in O&M expenses. As of the end of May 2020, the total spend for this program is \$3.8 million, which includes \$0 in capital costs and \$3.8 million in O&M expenses. FPL is not seeking to recover any 2020 costs associated with the Vegetation Management – Transmission Program through the Storm Protection Plan Cost Recovery Clause.

Progress Summary:

SPP Year 2020 – In its SPP, FPL projected 7,000 miles of vegetation maintenance. As of the end of May 2020, FPL completed approximately 2,660 miles of vegetation maintenance and is on track to complete a total of 7,000 miles by the end of 2020.

Projections:

SPP Year 2021 – For 2021, FPL projects it will complete 7,000 miles of vegetation maintenance. FPL estimates that it will incur approximately \$8.9 million in O&M expense and \$0 in capital expenditures in 2021 for the Vegetation Management – Transmission Program. FPL is not seeking recovery of the 2021 costs for the Vegetation Management – Transmission Program through the Storm Protection Plan Cost Recovery Clause; the 2021 O&M expenditures for this program will be recovered through base rates.

**FLORIDA POWER & LIGHT COMPANY
PROJECT DESCRIPTION AND PROGRESS REPORT**

Program Title: Substation Storm Surge/Flood Mitigation Program

Description:

The Substation Storm Surge/Flood Mitigation Program is a new program to mitigate damage at several targeted substations that are susceptible to storm surge and flooding during extreme weather events. To prevent/mitigate future substation equipment damage and customer outages due to storm surge and flooding, the Storm Surge/Flood Mitigation Program will raise the equipment at certain substations above the flood level and construct flood protection walls around other substations to prevent/mitigate future damage due to storm surge and flooding. At this time, FPL has identified between 8-10 substations where it initially plans to implement storm surge/flood mitigation measures over the next three years (2020-2022).

The total estimated costs for the new Substation Storm Surge/Flood Mitigation over this three-year period is approximately \$23 million with an annual average cost of approximately \$8 million per year.⁸ A detailed description of the Substation Storm Surge/Flood Mitigation Program is provided in Section IV(F) of FPL's SPP filed in Docket No. 20200071.

Accomplishments:

Fiscal Expenditures:

SPP Year 2020 – For 2020, FPL's SPP estimated approximately \$3.0 million for the Substation Storm Surge/Flood Mitigation Program, which included approximately \$3.0 million in capital costs and \$0 in O&M expenses. As of the end of May 2020, the total spend for this program is \$0. FPL is not seeking to recover any 2020 costs associated with the Substation Storm Surge/Flood Mitigation Program through the Storm Protection Plan Cost Recovery Clause.

⁸ See footnote 1.

**FLORIDA POWER & LIGHT COMPANY
PROJECT DESCRIPTION AND PROGRESS REPORT**

Progress Summary:

SPP Year 2020 – In its SPP, FPL projected to begin the flood mitigation construction of 1 substation in 2020, which is projected to be completed in 2021. As of the end of May 2020, FPL is on track to complete the flood mitigation at this substation plan by end of 2021.

Projections:

SPP Year 2021 – For 2021, FPL projects it will initiate flood mitigation construction of 2 substations. FPL estimates that it will incur approximately \$10.0 million in 2021 for the Substation Storm Surge/Flood Mitigation Program, which includes approximately \$8.3 million in capital expenditures, \$1.7 million in cost of removal, and \$0 in O&M expenses. FPL is seeking to recover \$8.3 million of capital expenditures for the Substation Storm Surge/Flood Mitigation Program through the Storm Protection Plan Cost Recovery Clause; the 2021 O&M expenditures and cost of removal for this program will be recovered through base rates.
