Re: *Duke Energy Florida, LLC's Petition for Limited Proceeding to Approve 2021 Settlement Agreement, Including General Base Rate Increases;* **Docket No. _____;**

Duke Energy Florida, LLC's Petition for Limited Proceeding for Recovery of Incremental Storm Restoration Costs Related to Hurricane Michael; **Docket No. 20190110**; and

Duke Energy Florida, LLC's Petition for Limited Proceeding for Recovery of Incremental Storm Restoration Costs Related to Hurricane Dorian and Tropical Storm Nestor; **Docket No. 20190222**

Dear Mr. Teitzman:

Enclosed for filing on behalf of Duke Energy Florida, LLC ("DEF") is DEF's Petition for Limited Proceeding to Approve 2021 Settlement Agreement, Including General Base Rate Increases, along with the following:

- 2021 Settlement Agreement
- Exhibit No. 2 - ECRC Costs Moving to Base Rates;
- Exhibit No. 3 - SPPCRC Sample Rate Calculation;
- Exhibit No. 5 - Rebate Levels and Caps for New EV Program;
- Exhibit No. 6 - Dismantlement Study;
- Exhibit No. 7 - Modified Storm Reserve Study;
- Exhibit No. 8 - Modified Depreciation Study; and
- Exhibit No. 9 - Stipulated Issues and Positions.

DEF's Exhibit No. 1, Minimum Filing Requirements, and Exhibit Nos. 4A and 4B, Clean and Legislative Tariffs, will be filed on or before January 28, 2021.

299 First Avenue North (33701) ▪ Post Office Box 14042 (33733) ▪ St. Petersburg, Florida
Phone: 727.820.4692 ▪ Fax: 727.820.5041 ▪ Email: dianne.triplett@duke-energy.com

Thank you for your assistance in this matter. Please feel free to call me at (727) 820-4692 should you have any questions concerning this filing.

Sincerely,

s/ Dianne M. Triplett

DUKE ENERGY FLORIDA, LLC'S PETITION FOR LIMITED PROCEEDING TO APPROVE 2021 SETTLEMENT AGREEMENT, INCLUDING GENERAL BASE RATE INCREASES

Duke Energy Florida, LLC ("DEF" or the "Company"), pursuant to Sections 366.076, 120.57(2), and 366.06(3), Florida Statutes ("F.S."), and Rules 28-106.301, 25-6.0143(l), 25-6.04364, and 25-6.0436, F.A.C., respectfully petitions the Florida Public Service Commission ("PSC" or the "Commission") for a limited proceeding to approve the 2021 Settlement Agreement attached as an exhibit and incorporated and made a part of this Petition.

BACKGROUND

DEF's last fully litigated base rate proceeding was in 2009, specifically Docket Number 20090079-EI. Since then, DEF and various consumer parties have entered into a series of settlement agreements that resolved various issues and provided for limited base rate increases.[1]

[1] See, e.g., Order No. PSC-2013-0598-FOF-EI, Docket No. 20130208-EI (approving the 2013 Settlement Agreement) and Order No. PSC- PSC-2017-0451-AS-EU, Docket No. 20170183-EI (approving the 2017 Revised and Restated Stipulation and Settlement Agreement).

The 2017 Revised and Restated Stipulation Settlement Agreement ("2017 Settlement Agreement"), the most recent settlement, provides that DEF's base rates shall be frozen until December 31, 2021. Thus, DEF is authorized to file for a base rate increase effective January 1, 2022, or upon the expiration of the 2017 Settlement Agreement. DEF is also obligated under the 2017 Settlement Agreement to file updated Dismantlement, Depreciation, and Storm Studies no later than ninety days before filing for a general base rate increase.[2] DEF filed those studies on December 31, 2020. Absent the 2021 Settlement Agreement, DEF was fully prepared to and had taken substantially all steps necessary to file, and would have filed a petition, testimony, and full Minimum Filing Requirements ("MFRs") for a general base rate increase on March 31, 2021. DEF's filed rate case would have included two test year periods – 2022 and 2023.

The 2021 Settlement Agreement is between DEF, the Office of Public Counsel ("OPC"), the Florida Industrial Power Users Group ("FIPUG"), White Springs Agriculture Chemicals, Inc. d/b/a PCS Phosphate ("White Springs"), and Nucor Steel Florida, Inc. ("Nucor") (hereinafter collectively the "Parties"). If the Parties had not reached settlement, OPC, FIPUG, White Springs, and Nucor would have intervened and challenged DEF's petition for a rate increase. The Parties engaged in negotiation before DEF filed its general base rate case, for administrative efficiency and to avoid expensive litigation. The 2021 Settlement Agreement is the result of more than five months of intensive and thorough informal discovery and negotiation and determines all issues that would have been raised in a general rate case. The 2021 Settlement Agreement also resulted in the development of MFRs which would have accompanied DEF's rate case filing, had the Parties not settled. The inclusion of the MFRs is an integral component of the 2021 Settlement Agreement, because these MFRs establish the baseline level of costs included in DEF's base rates.

[2] The 2017 Settlement Agreement also obligates DEF to file an updated Nuclear Decommissioning Cost Study, but DEF complied with that requirement with its filing in Docket No. 201900140-EI.

Since DEF has not had a rate case since 2009, the lack of MFRs has caused concern in instances where the question of whether a cost is included or not included in DEF's base rates is at issue (for example, in the new Storm Protection Plan Cost Recovery Clause proceeding and recent Storm Cost Recovery proceedings relating to Hurricanes Irma and Michael). The 2021 Settlement Agreement eliminates those concerns.

Approval of the 2021 Settlement Agreement in this limited proceeding under Section 366.076, F.S., is appropriate because it addresses numerous base rate, infrastructure and clean energy matters that all Parties support as timely, appropriate and reasonable. It also resolves all issues in two pending storm cost recovery dockets (related to Hurricanes Michael and Dorian).[3] Ultimately, this 2021 Settlement Agreement between DEF and the Parties who represent customers' interests before the Commission is a fair, reasonable, and comprehensive resolution of matters that is in the best interests of DEF and its customers, and that is therefore in the public interest.

The exhibits to this Petition include the 2021 Settlement Agreement and other supporting exhibits, all of which are integral parts of the 2021 Settlement Agreement. The Parties have agreed to the terms and conditions of the 2021 Settlement Agreement as a comprehensive and interdependent package, such that disapproval of any portion of the 2021 Settlement Agreement would negate the effectiveness of the 2021 Settlement Agreement in its entirety. Accordingly, for all the reasons in this Petition, DEF requests and moves the Commission to grant this Petition and approve the 2021 Settlement Agreement in its entirety. DEF also requests that the Commission approve the three studies attached to the 2021 Settlement Agreement. Finally, DEF requests that the Commission allow the discontinuation of the Electric Vehicle Pilot approved in the 2017

[3] Docket Nos. 20190110-EI and 20190222-EI, respectively.

Settlement Agreement ("2017 EV Pilot"), and approve the replacement EV program set forth in the 2021 Settlement Agreement.

I. Preliminary Information

1. The Petitioner's name and address are:

Duke Energy Florida, LLC
299 1st Avenue North
St. Petersburg, Florida 33701

2. Any pleading, motion, notice, order, or other document required to be served upon DEF or filed by any party to this proceeding should be served upon the following individuals:

Dianne M. Triplett
Duke Energy Florida, LLC
299 1st Avenue North
St. Petersburg, Florida 33701
T: (727) 820-4692
F: (727) 820-5519
E: Dianne.Triplett@duke-energy.com

Matthew R. Bernier
Duke Energy Florida, LLC
106 E. College Ave., Ste. 800
Tallahassee, Florida 32301
T: (850) 521-1428
F: (850) 521-1437
E: Matthew.Bernier@duke-energy.com
FLRegulatoryLegal@duke-energy.com

3. DEF, the Petitioner, is an investor-owned electric utility, regulated by the Commission pursuant to Chapter 366, F.S., and is a wholly owned subsidiary of Duke Energy Corporation. The Company's principal place of business is located at 299 1st Avenue North, St. Petersburg, Florida 33701.

4. DEF serves more than 1.8 million retail customers in Florida. Its service area comprises approximately 20,000 square miles, including the densely populated areas of Pinellas and western Pasco Counties and the greater Orlando area in Orange, Osceola, and Seminole

Counties. DEF supplies electricity at retail to approximately 350 communities and at wholesale to Florida municipalities, utilities, and power agencies in the State of Florida.

5. This Petition represents an original pleading and is not in response to any proposed action by the Commission. Accordingly, the Petitioner is not responding to any proposed agency action.

II. Approval of the 2021 Settlement Agreement Between the Parties

6. The 2021 Settlement Agreement presents a plan that establishes base rates, and related provisions, through the end of the year 2024. The detailed terms are set forth in the 2021 Settlement Agreement attached as an exhibit to and incorporated in the Petition. The 2021 Settlement Agreement further resolves all issues in two ongoing storm cost recovery dockets related to Hurricanes Michael and Dorian (Docket Numbers 20190110-EI and 20190222-EI, respectively). The Agreement also clarifies certain cost allocation and rate design matters pertaining to DEF's Storm Protection Plan Cost Recovery Clause. Additionally, inasmuch as the parties have engaged in extensive informal – but highly detailed – discovery and a general exchange of information over a period of more than five months, the revenue increases contained in the 2021 Settlement Agreement, coupled with the 2022-2024 base rate freeze and the EV Program, represent both a short-term and longer-term moderation of future rate impacts that would otherwise likely occur as a result of conventional base rate proceedings in and after 2021. More specifically, in the absence of the 2021 Settlement Agreement, DEF expected to request rate increases in its 2021 rate case for test periods 2022 and 2023, and it also expected and planned to file another rate case in 2023 for new rates to become effective in 2024. The 2021 Settlement Agreement moderates those rate increases and provides rate stability by freezing DEF's base rates

through the end of 2024. The 2021 Settlement Agreement therefore avoids the need for not just one, but two, fully litigated rate cases.

7. DEF believes, and represents the Parties believe, that the 2021 Settlement Agreement in its totality resolves all the issues between DEF and the representatives of all of its customers, is fair, just, and reasonable, and is in the public interest. The 2021 Settlement Agreement provides the Company, the Parties, and the Company's customers represented by the numerous Parties, a comprehensive resolution of the matters described in the 2021 Settlement Agreement. As a result, the 2021 Settlement Agreement fairly and reasonably balances the various positions of the Parties on the issues resolved by the 2021 Settlement Agreement and serves the best interests of the customers they represent and the public interest in general. Approval of the 2021 Settlement Agreement promotes administrative efficiency and avoids the time and expense associated with litigating the settled issues and is further consistent with the Commission's long-standing practice of encouraging parties to settle contested proceedings whenever possible.[4] DEF, therefore, requests and moves the Commission to grant this Petition and approve the 2021 Settlement Agreement in its entirety.

[4] See, e.g., In re: Request for approval of amendment to connection/transfer sheets, increase in returned check charge, amendment to miscellaneous service charges, increase in meter installation charges, and imposition of new tap-in fee in Marion County by East Marion Sanitary Systems Inc., Order No. PSC-11-0566-AS-WU, Docket No. 080562-WU, (P.S.C. Dec. 11, 2011); In re; Application for staff-assisted rate case in Lee County by Mobile Manor Water Company, Inc., Order No. PSC-10-0299-AS-WU, Docket No. 090170-WU (P.S.C. May 10, 2010); In re: Application for increase in water and wastewater rates in Pasco County by Labrador Utilities. Inc., Order No. PSC-09-0711-AS-WS, Docket No. 080249-WS (P.S.C. Oct. 26, 2009); In re: Petition of Tampa Electric Company to close Rate Schedules IS-3 and IST-3 and approve new Rate Schedules GSLM-2 and GSLM-3, Order No. PSC-00-0374-S-EI, Docket No. 990037-EI (P.S.C. Feb. 22, 2000); In re: Application for staff-assisted rate case in Pasco County by Orangeland Water Supply, Order No. PSC-08-0640-AS-WU, Docket No. 070601-WU, (P.S.C. Oct. 3, 2008); and In re: Application for increase in water and wastewater rates in Lake County by Utilities. Inc. of Pennbrooke, Order No. PSC-07-0534-AS-WS, Docket No. 060261-WS (P.S.C. June 26, 2007).

8. Section 366.076(1), F.S., provides that the Commission may conduct a limited proceeding to consider and act upon any issue within its jurisdiction, including any issue which, once resolved, requires a public utility to adjust its rates. Approval of the 2021 Settlement Agreement through a limited proceeding under Section 366.076, F.S., provides the Commission and the Parties a single proceeding in which all issues related to the two ongoing storm cost recovery dockets will be resolved. Implementation of the Company's proposed base rate adjustments set forth in the 2021 Settlement Agreement will become effective consistent with the terms of the 2021 Settlement Agreement, pursuant to the Commission's Order granting the Petition and approval of the 2021 Settlement Agreement in its entirety. Accordingly, DEF requests and moves the Commission to grant the Petition and approve the 2021 Settlement Agreement in its entirety.

III. Approval of DEF's As-Filed Depreciation, Dismantlement, and Storm Studies

9. Pursuant to Rule 25-6.0436, F.A.C., DEF must file an updated Depreciation Study with the Commission. The timing of this study is governed by the 2017 Settlement Agreement. Exhibit 8 to the 2021 Settlement Agreement includes the Depreciation Study, along with updated schedules to reflect the agreed-upon modifications set forth in the 2021 Settlement Agreement. DEF requests that the Commission approve its Depreciation Study, as modified by the schedules to reflect the settlement terms.

10. Pursuant to Rule 25-6.04364, F.A.C., DEF must file an updated dismantlement study with the Commission. The timing of this study is also governed by the 2017 Settlement Agreement. Exhibit 6 to the 2021 Settlement Agreement includes the Dismantlement Study. DEF requests approval of the Dismantlement Study, but as set forth in the 2021 Settlement Agreement, it has not included any adjustments to its base rates to account for this Dismantlement Study.

Rather, DEF will be permitted to defer the impact to a regulatory asset, for recovery in DEF's next base rate proceeding.

11. Pursuant to Rule 25-6.0143(l), F.A.C., and the 2017 Settlement Agreement, DEF must file an updated Storm Damage Self-Insurance Reserve Study ("Storm Study") with the Commission. DEF's updated Storm Study is attached to the 2021 Settlement Agreement as Exhibit 7. It reflects and supports no change to DEF's current reserve amount of $132 million. DEF requests approval of the updated Storm Study.

IV. DEF's 2017 EV Program

12. Pursuant to the 2017 Settlement, DEF implemented an Electric Vehicle (EV) Pilot. The 2017 Settlement also provides that "DEF shall either initiate a separate proceeding for approval of a permanent electric vehicle charging station offering within 4 years of the Effective Date or shall make a filing with the Commission to explain why a permanent offering is not warranted."[5] The 2021 Settlement Agreement, and the filing of this Petition, satisfies this requirement because DEF is requesting the approval of a permanent EV charging station offering. Specifically, as set forth in paragraph 18 of the 2021 Settlement Agreement, DEF is authorized to offer a new EV program that in part builds upon the EV Pilot but also adds new elements. Accordingly, DEF requests that the Commission approve its new EV offering, in compliance with the 2017 Settlement.

V. Statement of No Disputed Issue of Material Fact

13. DEF believes, and represents the other Parties believe, that there are no disputed issues of material fact that would remain unresolved if the Commission grants the Petition and

[5] See 2017 Settlement Agreement, ¶17.f.iii.

approves the 2021 Settlement Agreement, in resolution of the issues shown in Exhibit 9, to be attached to that Agreement as provided therein.

VI. Statement of Ultimate Facts Alleged and Providing the Basis for Relief

14. The ultimate facts that entitle DEF to the relief requested herein, i.e. the Commission granting the Petition and approving the 2021 Settlement Agreement in its entirety, are that the 2021 Settlement Agreement represents a fair and reasonable resolution of all remaining issues related to the storm cost recovery dockets and of the issues shown in Exhibit 9, that the rates resulting from approval of the Petition and the 2021 Settlement Agreement will be fair, just, and reasonable, and that the 2021 Settlement Agreement is in the public interest. DEF is entitled to the relief requested pursuant to Chapter 366, F.S., and Chapter 120, F.S.

VII. Effective Date, Notice, and Final Hearing

15. DEF requests that the Commission provide public notice of this Petition for the approval of the 2021 Settlement Agreement in this docket and set the Petition for approval of the 2021 Settlement Agreement for final hearing. DEF respectfully requests that the Commission's consideration of the proposed 2021 Settlement Agreement be decided by a bench vote at the conclusion of the requested final hearing. DEF has conferred with the other Parties to the 2021 Settlement Agreement and represents that those Parties support this approach.

16. The Parties to the 2021 Settlement Agreement include OPC, who represents all customers, and the organizations that represent the major customer groups served by the Company, and thus, the interests of all customers and customer classes are fairly represented by the signatories to the 2021 Settlement Agreement. DEF, therefore, requests that the Commission proceed expeditiously to issue the public notice of the hearing on this Petition for approval of the 2021 Settlement Agreement and to set the date for the requested final hearing at least fourteen

(14) days after issuance of the public notice of the hearing consistent with Rule 28-106.302(2), F.A.C. As reflected in the 2021 Settlement Agreement, it is the Parties' intent that the tariff sheets reflected in Exhibits 4A and 4B of the 2021 Settlement Agreement become effective and applicable to bills rendered for the first billing cycle of January 2022. Given the rate design changes included in the 2021 Settlement Agreement and implementing tariffs, DEF must spend time with its customers to help ensure that they are informed of the rate changes and have the opportunity to select the best rate for their usage going forward. Such discussions require significant time, in advance of the rate changes taking effect. Accordingly, the Parties respectfully request that the final hearing to consider this 2021 Settlement Agreement be set as soon as the Commission's schedule will permit.

VIII. Conclusion

17. For all the reasons provided in this Petition, and the supporting 2021 Settlement Agreement, complete with amended tariff sheets, MFRs, and other exhibits to the 2021 Settlement Agreement filed with this Petition, DEF respectfully requests that the Commission promptly schedule the consideration of the 2021 Settlement Agreement for final hearing, grant this Petition, and approve the 2021 Settlement Agreement (and the accompanying Depreciation, Dismantlement, and Storm Studies) pursuant to Section 366.076(1), F.S.

Respectfully submitted this 14th day of January 2021.

2021 SETTLEMENT AGREEMENT

CONTENT	STARTING PARAGRAPH

BEFORE THE FLORIDA PUBLIC SERVICE COMMISSION

In re: Petition by Duke Energy Florida, LLC for limited proceeding to approve 2021 Settlement Agreement, including general base rate increases	DOCKET NO. _____
In re: Petition by Duke Energy Florida, LLC for limited proceeding for recovery of incremental storm restoration costs related to Hurricane Michael	DOCKET NO. 20190110-EI
In re: Petition by Duke Energy Florida, LLC for limited proceeding for recovery of incremental storm restoration costs related to Hurricane Dorian and Tropical Storm Nestor.	DOCKET NO. 20190222-EI

2021 SETTLEMENT AGREEMENT

WHEREAS, Duke Energy Florida, LLC ("DEF" or "Company") has taken all necessary steps, including the preparation of Minimum Filing Requirements ("MFRs"), cost of service studies, depreciation and dismantlement studies, a storm reserve study, and tariffs, to prepare, and would have, with absolute certainty, filed, a general base rate proceeding with the Florida Public Service Commission ("FPSC" or "Commission") in March 2021 to request new rates to be set effective January 1, 2022 and January 1, 2023;

WHEREAS, certain parties, including but not limited to the Office of Public Counsel ("OPC"), PCS White Springs ("PCS"), Nucor Steel Florida, Inc. ("Nucor"), and the Florida Industrial Power Users Group ("FIPUG") (collectively, the "Intervenor Groups") would have intervened and challenged DEF's case, when it was filed;

WHEREAS, DEF and the Intervenor Groups (collectively, the "Parties" and any one of the Parties individually, a "Party") desired to avoid the expense and time associated

with litigating a base rate proceeding by settling the matters that would have been litigated in such a proceeding;

WHEREAS, the Parties desired to agree to the general terms of an agreement so that focus could be diverted from the preparation of a filed litigated case and to the preparation of a settlement package;

WHEREAS, because DEF has not had a fully litigated base rate proceeding, with complete MFRs since Docket No. 20090079-EI, the Parties desired, as part of the settlement package, to submit for full approval by the Commission MFRs that reflect and support the provisions of the 2021 Settlement Agreement. For further clarity, the Parties also submit, for approval by the Commission, an agreed-upon set of issues and stipulated resolutions that resolve these necessary ratemaking issues in the case that DEF would, with certainty, have filed and reflect the agreements made by entering into this 2021 Settlement Agreement;

WHEREAS, agreement on the matters and issues in this 2021 Settlement Agreement will promote administrative efficiency and will avoid the time, expense, and uncertainty associated with addressing the issues in the above-referenced Commission dockets and other matters;

WHEREAS, nothing in this 2021 Settlement Agreement is an admission of liability, imprudence, or fault;

WHEREAS, the Parties have entered into this 2021 Settlement Agreement in compromise of positions taken in accord with their rights and interests under Chapters 350, 366 and 120, Florida Statutes ("F.S."), as applicable, and as a part of the negotiated exchange of consideration among the Parties to this 2021 Settlement Agreement, each has agreed to concessions to the others with the expectation, intent,

and understanding that all provisions of this 2021 Settlement Agreement will be enforced by the Commission as to all matters addressed herein with respect to all Parties upon Commission approval of this 2021 Settlement Agreement; and

WHEREAS, the provisions of this 2021 Settlement Agreement will become effective upon Commission approval (the "Effective Date") and continue through the last billing cycle for December 2024 (the "Term"), unless otherwise specified or provided for in this 2021 Settlement Agreement.

NOW, THEREFORE, in consideration of the foregoing and the mutual covenants contained herein, and for other good and valuable consideration, the receipt and sufficiency of which is hereby acknowledged, the Parties hereby agree and stipulate as follows:

General Retail Revenue Requirements Terms

1. The test years for MFR purposes for DEF's rate case are 2022 and 2023, with a further rate increase in 2024 and with partial revenue requirement offsets utilizing Department of Energy ("DOE") award funds. The specific rate increases for each year are described further in Paragraph 3 and reflected and supported in the MFRs attached to the 2021 Settlement Agreement as Exhibit 1.

2. The Parties agree to the following terms relating to Return on Equity ("ROE") and equity ratio:

a. Subject to the adjustment trigger provision in Paragraph 2(b), DEF's authorized ROE shall be within a range of 8.85% to 10.85%, with a mid-point of 9.85%, upon which rates are established in this 2021 Settlement Agreement. Except as otherwise specified in this 2021 Settlement Agreement, DEF's authorized ROE range and mid-point, using a financial common equity ratio of 53 percent

(investor sources), shall be used for all purposes during the Term, including for cost recovery clauses, earnings surveillance reporting, Paragraph 37 of this 2021 Settlement Agreement, and the calculation of the Company's Allowance for Funds Used During Construction ("AFUDC") rate. The applicable annual AFUDC rate will be 6.09% for 2022 and 6.14% for 2023 and 2024.

b. If at any time during the Term, but no more than once during the Term, the average 30-year United States Treasury Bond yield rate for any period of six (6) consecutive months is at least 50 basis points greater than the yield rate on the date the Commission votes to approve this 2021 Settlement Agreement (the "Trigger"), DEF's authorized ROE shall, after an elective filing by DEF, be increased by 25 basis points to be within a range of 9.10% to 11.10% with a mid-point of 10.10% ("Revised Authorized ROE") from the Trigger Effective Date defined below for and through the remainder of the Term, and for any period in which the Company's rates continue in effect after December 31, 2024, and then, until the Commission issues a final order in a future proceeding changing the Company's rates and its authorized ROE. Base rates will be adjusted by the revenue requirements of 25 basis points on cost of equity for the impact of the Trigger based on the Company's filed test period MFRs, attached hereto as Exhibit 1, for the year of the Trigger, or the 2023 test period MFRs, attached hereto as Exhibit 1, if the Trigger occurs in 2024, by the application of a uniform percentage increase to the customer, demand, and energy charges reflected in the Company's base rate schedules existing at the time of the increase, but, the IS/CS/GSLM-2 credits shall not be adjusted. Based on DEF's MFRs for 2022 and 2023, attached hereto as Exhibit 1, if the

Trigger occurs, the revenue requirement increase cap would be $24.428 million in 2022 or $26.785 million in 2023 or 2024. This number shall be adjusted downward to the extent that it would cause adjusted earnings, as reflected on the Company's pro forma weather adjusted earnings surveillance report ("ESR"), to exceed the midpoint of the new range. The use of the pro forma weather adjusted ESR for the highly specific circumstances of the Trigger shall not be precedent for use of the pro forma weather adjustment information for any other purpose. The Commission shall approve the Company's verified request for a uniform percentage rate increase to recover the designated revenue requirement pursuant to this Paragraph within sixty (60) days following the filing of the petition, and such rate increase will be effective with the first billing cycle following Commission approval. The uniform percentage increase shall be calculated using the billing determinants included in the Company's most recent projection clause filing unless otherwise agreed to by the Parties, with the understanding that the Intervenor Groups do not waive the right to challenge the accuracy and validity of the billing determinants. The Trigger shall be calculated by summing the reported 30-year U.S. Treasury bond rates for each day over any continuous six-month period, e.g., January 1, 2022 through July 1, 2022, or March 17, 2022 through September 17, 2022, for which rates are reported, and dividing the resulting sum by the number of reporting days in such period. The effective date of the Revised Authorized ROE ("Trigger Effective Date") shall be the first day of the month following the day in which the Trigger is reached. If the Trigger is reached and the Revised Authorized ROE becomes effective, except as otherwise specifically provided in this

Agreement, DEF's Revised Authorized ROE range and mid-point shall prospectively be used for the remainder of the Term for cost recovery clauses, earnings surveillance reporting, Paragraph 37 of this 2021 Settlement Agreement regarding an ROE adjustment, and AFUDC. By seeking and receiving a rate increase under this Paragraph, DEF is affirming that it remains under this 2021 Settlement Agreement for the remainder of the Term, unless and until it subsequently invokes the provisions under Paragraph 37 to exit the 2021 Settlement Agreement. DEF cannot double count the impact of the Trigger and the ability to achieve a higher mid-point by virtue of Paragraph 37. For example, if application of the Trigger were to result in DEF earning below the new ROE floor, DEF must choose whether to utilize the Trigger mechanism or to avail itself of Paragraph 37 and exit the 2021 Settlement Agreement. The impact of any tax increase subject to deferral or increase under Paragraph 18 shall not be considered in the application of the Trigger.

c. The ROE in effect at the expiration of the Term of this 2021 Settlement Agreement, and including one that is adjusted pursuant to Paragraph 2(b) of this 2021 Settlement Agreement, shall continue in effect until the ROE is next reset by the Commission whether expiration occurs by operation of Paragraph 37 or otherwise.

3. DEF shall be authorized to increase its base rates by $67.246 million effective for the first billing cycle of 2022 and by another $48.933 million effective for the first billing cycle of 2023, and by another $79.199 million effective for the first billing cycle of 2024, for a cumulative rate increase of $195.378 million, subject to the impact of any income tax legislation described in Paragraph 18(d), and the impact of any Trigger described in

Paragraph 2(b). DEF shall be authorized to "monetize" the expected DOE award of $173 million (retail), including the Dry Cask Storage ("DCS") regulatory asset reimbursement portion of $71 million (retail), through the use of a regulatory liability or asset as necessary, and reflect it as a credit to income through the use of a regulatory liability or asset as necessary in an amount to be determined each year by the Company. This treatment shall afford both DEF and customers the right to be made whole in a subsequent Capacity Cost Recovery ("CCR") clause filing for any cost of money or over- or under- collection and timing thereof of the actual award relative to the assumed $173 million (retail) to be recognized herein. The Parties further agree that the Company shall be permitted to recover the full DCS regulatory asset ($96 million retail) and to continue recovery of the applicable carrying costs through the CCR clause over a twenty-year period beginning in 2025.

4. The Parties agree that DEF has properly removed all costs associated with the Storm Protection Plan ("SPP") from the costs included in DEF's MFRs, attached hereto as Exhibit 1, as all such costs spent on approved SPP programs are properly recoverable through the SPP Cost Recovery Clause ("SPPCRC").

5. DEF shall be permitted to remove the Regulatory Assessment Fee ("RAF") from base rates and include the RAF, on the same line as the Gross Receipts Tax, on customer bills. The line shall be renamed "Gross Receipts Tax and Regulatory Assessment Fee."

6. Except for the base rate increases provided for in Paragraphs 2, 3 and 37, or provided for in Paragraph 15 of the 2017 Second Revised and Restated Settlement Agreement, the Company shall freeze its base rates through the last billing cycle for December 2024. As a part of this base rate freeze, the Company will not seek Commission approval to defer for later recovery in rates, any costs incurred or reasonably

expected to be incurred from the Effective Date through and including December 31, 2024, which are of the type which traditionally or historically have been or would be recovered in base rates, unless such deferral and subsequent recovery is expressly authorized herein or otherwise agreed to by the Parties.

7. DEF shall be authorized to include residential credit card fees in its cost of service and terminate the separate charge that exists at the time of the filing of this 2021 Settlement Agreement, effective for the first billing cycle of 2022. These fees are reflected in the base rate increases described in Paragraph 3.

8. The base rate increases described in Paragraph 3 have incorporated and include the transfer of certain assets that have been placed in service and are currently being recovered through the Environmental Cost Recovery Clause. Details of those costs are included in Exhibit 2.

Rate Design and Revenue Allocation

9. DEF shall allocate the revenue adjustments provided for under this 2021 Settlement Agreement among its customer classes, other than street lighting, by applying no more than an equal percentage increase to each class.

10. The cost of service MFRs, attached hereto as Exhibit 1, provide production cost allocation results employing both the 12 CP and 25 AD method and the 12 CP and 1/13 AD method. Because the MFRs provide both methods, and revenue adjustments shall be allocated in accordance with Paragraph 9, the Parties clarify that, for the purpose of compliance with Commission Rule 25-6.043, F.A.C., in DEF's next general base rate case, DEF intends to file both the 12 CP and 1/13 AD and 12 CP and 25 AD methods but rely upon only the 12 CP and 25 AD method to meet its initial burden of proof. DEF acknowledges no Party waives any right to advocate a different production cost allocation

methodology. DEF further agrees to consult with Parties concerning other allocation methods that may be performed for informational purposes.

11. The following levels of clause-recoverable credits for Interruptible ("IS"), Curtailable ("CS"), and Standby Generation ("GSLM-2") customers shall be in effect beginning with the first billing cycle of 2022:

Customer Type	Credit Level
IS	$7.72/kw-month
CS	$7.72/kw-month
GSLM-2	$6.61 x C + $0.10 x kwh monthly

The levels of these credits will not change after the expiration of the Term absent a Commission order in a general base rate proceeding or a Demand Side Management goals and plan approval proceeding, occurring after the expiration of the Term.

12. For cost recovery clause purposes, for demand metered customer classes, the billed demand shall be the maximum 30 minute demand established during the current billing period. DEF shall bill demand customers for SPPCRC costs on a demand (i.e., per kw) basis. DEF shall also calculate SPPCRC rates consistent with Exhibit 3 attached.

13. DEF shall permanently close the grandfathered IS-1, IST-1, CS-1, and CST-1 rates and transfer those customers to an otherwise applicable rate, in consultation with customers.

14. The following delivery voltage credits shall be in effect beginning with the first billing cycle of 2022:

Delivery Level	2022 $/kW	2023 $/kW	2024 $/kW
Distribution Primary	$1.28	$1.29	$1.33

Transmission < 230 kV	$5.17	$5.32	$5.48
Transmission > 230 kV	$7.04	$7.36	$7.57

15. DEF's tariffs shall be modified to reflect that Super-Off-Peak Period hours and pricing will apply on weekends and holidays. DEF shall modify the Fuel Cost Recovery Factor to align with the new On-Peak and Off-Peak periods proposed for the base tariffs, including incorporating the Super-Off-Peak Period. These modifications are reflected in the tariffs attached as Exhibits 4A and 4B to this 2021 Settlement Agreement.

16. The Parties agree that all rate design changes reflected in the attached tariffs shall be approved. The Parties further agree that the rate designs reflected in the attached tariffs are non-precedential and that no Party waives any right to advocate for different rate designs in future cases.

Electric Vehicle ("EV") Program

17. As a result of approval of the 2017 Second Revised and Restated Settlement Agreement, approved by Commission Order PSC-2017-0451-AS-EU, dated Nov. 20, 2017 (the "2017 Settlement Agreement"), DEF was authorized to implement an EV Charging Station Pilot Program ("2017 EV Pilot"). The Parties agree that DEF's MFRs, attached hereto as Exhibit 1, reflect the appropriate level of investment permitted under the terms of the 2017 Settlement Agreement. The Parties further agree that DEF's 2017 EV Pilot should not be continued in its current form, but instead, DEF is authorized to implement three new EV programs ("EV Program"), as further described in Paragraphs 17(a) through (c) below. Notwithstanding, the Parties agree that DEF shall be authorized to continue operation and recovery of costs of the charging stations that were installed pursuant to the 2017 EV Pilot.

a. First, DEF is authorized to add a residential EV Non-Time of Use ("Non-TOU") credit program as reflected in the attached tariffs. Residential customers not on a whole home TOU rate who have EV charging stations located at their residence and who participate in the program will be eligible for a $10 per month credit as a proxy for being on a TOU rate. The credit will be paid monthly to participating residential customers who observe off-peak charging. Customers will be allowed to "opt out" and charge during on-peak hours no more than twice in one month; customers who charge on-peak more than twice in one month will not receive that month's credit. All associated costs of this EV Program are reflected in the cost of service included in the MFRs attached hereto in Exhibit 1.

b. Second, DEF is authorized to implement a rebate program for Commercial & Industrial ("C&I") customers. All C&I customers that install an eligible EV charging station are eligible for the rebate. In exchange for the rebate, the C&I customer must install all EV chargers behind a separate meter and take service on schedule GST-1, a non-demand TOU rate schedule. The rebate amount will vary depending on the type of segment where the EV charging station is being installed. Exhibit 5 to this 2021 Settlement Agreement sets forth the rebate levels for each type of segment. DEF shall be authorized to defer the recovery of its C&I rebate costs to a regulatory asset to be amortized over five (5) years.

c. DEF can continue installing Company-owned DC Fast Charge stations. DEF will be allowed to offer a new tariff for a Fast Charge Fee ("FCF-1") to be collected from EV drivers using Company-owned DC Fast Charging stations.

The Fast Charge Fee included in FCF-1 is based on the average cost for Fast Charging provided by other Fast Charging operators across Florida. DEF has included the Fast Charging station investments in rate base. All associated costs related to the DC Fast Charge EV program have been included in the cost of service included in the MFRs attached hereto in Exhibit 1.

d. The total cost of the Company's proposed EV Program is forecasted to be $62.9 million over the four-year period 2022-2025. The Parties agree that DEF's decision to pursue the EV Program is prudent, and they waive any right to challenge, other than the imprudence in dollars actually expended, in any proceeding addressing the recoverability of the EV program costs in future years beyond the test years.

Federal and/or State Corporate Income Tax Change

18. The Parties agree to the following terms relating to federal and state corporate income taxes:

a. Federal or state corporate income tax changes occurring after the Effective Date ("Tax Reform") can take many forms, including changes to tax rates, changes to deductibility of certain costs, and changes to the timing of deductibility of certain costs. Therefore, the impact of Tax Reform could impact the effective tax rate recognized by DEF in FPSC adjusted reported net operating income and the measurement of existing and prospective deferred federal income tax assets and liabilities reflected in the FPSC adjusted capital structure. Congress last reduced the maximum federal corporate income tax rate in the Tax Cuts and Jobs Act of 2017 ("TCJA"), which amended parts of the Internal Revenue Code and resulted in a

maximum federal corporate income tax rate reduction from 35% to 21%. Prior to the TCJA, Congress last reduced the maximum federal corporate income tax rate in the Tax Reform Act of 1986 ("TRA"). As parts of TCJA and TRA, Congress included a transition rule that, as an eligibility requirement for using accelerated depreciation with respect to public utility property, specified the method and period for returning to customers the portion of the resulting excess deferred income taxes attributable to the use of accelerated depreciation. This is referred to as tax normalization for public utilities and results in "protected" items. Specifically, for DEF, the Average Rate Assumption Method was used to comply with the transition rules. To the extent future Tax Reform includes a transition rule applicable to excess deferred federal income tax assets and liabilities ("Excess Deferred Taxes") or deficient deferred federal income tax assets and liabilities ("Deficient Deferred Taxes"), defined as those that arise from the re-measurement of those deferred federal income tax assets and liabilities at the new applicable corporate tax rate(s), those "protected" Excess and/or Deficient Deferred Taxes will be governed by the Tax Reform transition rule. Excess and/or Deficient Deferred Taxes not governed by the Tax Reform transition rule will be referred to as "unprotected."

b. If Tax Reform is enacted during the Term, DEF will quantify the impact of Tax Reform on its Florida Jurisdictional base revenue requirement as projected in DEF's forecasted earnings surveillance report for the calendar year that includes the period in which Tax Reform is effective. If Tax Reform is enacted effective for the tax years 2021, 2022, or 2023, the impacts of Tax Reform on

base revenue requirements, primarily driven by an income tax rate increase/decrease, will be adjusted for retail customers within the later of 120 days of when the Tax Reform becomes law or the effective date of the law, through a prospective adjustment to base rates upon a thorough review of the effects of the tax reform on base revenue requirements. This adjustment shall be accomplished through a uniform percentage decrease or increase to customer, demand and energy base rate charges, excluding delivery voltage credits, for all retail customer classes. Any effects of tax reform on retail revenue requirements from the effective date through the date of the base rate adjustment shall be flowed back or collected from customers through the CCR Clause on the same basis as used in any base rate adjustment. If Tax Reform is enacted effective for the tax year 2024, the impacts of Tax Reform shall be calculated as set forth above, but DEF will utilize deferral accounting as permitted by the Commission, thereby neutralizing the FPSC adjusted net operating income impact of the Tax Reform to a net zero, through the Term of this 2021 Settlement Agreement. In this situation, DEF shall defer the revenue requirement impacts to a regulatory asset or liability to be considered for prospective recovery in a change to base rates to be addressed in DEF's next base rate proceeding or in a limited scope proceeding before the Commission no sooner than the expiration of this 2021 Settlement Agreement.

c. Excess and/or Deficient Deferred Taxes shall be deferred to a regulatory asset or liability, which shall be included in the FPSC-adjusted capital structure and flowed back to customers over a term consistent with law. If the same Average Rate Assumption Method used in the TCJA and TRA is prescribed, then the

regulatory asset or liability will be flowed back or collected from customers over the remaining life of the assets associated with the Excess and/or Deficient Deferred Taxes subject to the provisions related to FPSC adjusted operating income impacts of Tax Reform noted above. If the Tax Reform law or act is silent on the flow-back or collection period for parts or all of the Excess and/or Deficient Deferred Taxes, and there are no other statutes or rules that govern the flow-back or collection period for these "unprotected" amounts, then there is a rebuttable presumption that the following flow-back or collection period(s) will apply: (1) if the cumulative "unprotected" regulatory asset/liability balance, including any remaining unamortized TCJA balances, is less than $200 million, the flow-back/collection period for the cumulative balance will be five years; or (2) if the cumulative "unprotected" regulatory asset/liability balance, including any remaining unamortized TCJA balances, is greater than $200 million, the flow-back/collection period for the cumulative balance will be ten years. These "protected", and "unprotected" Excess and/or Deficient Deferred Taxes will be flowed back/collected for retail customers within the later of 120 days of when the Tax Reform becomes law or the effective date of the law. As subsequent information becomes available, such as the federal tax return being filed, any true-ups or adjustments will be evaluated and implemented within 120 days of that information becoming available.

d. If the applicable federal or state income tax rate for DEF changes before the effective date of any of the rate increases provided for in Paragraph 3, DEF will adjust the amount of the base rate increase to reflect the new tax rate before the implementation of such increase. Any base rate adjustments or changes

that are implemented before the effective date of the applicable federal or state income tax rate change will be adjusted as part of the overall method outlined in Paragraph 9 and section b. of Paragraph 18.

Depreciation, Dismantlement, and Storm Reserve Studies

19. The Parties agree that the Dismantlement Study, as filed by DEF on December 31, 2020 and attached hereto as Exhibit 6, should be approved without changes. DEF will be permitted to defer to a regulatory asset the impact of the cost increase during the term of the 2021 Settlement Agreement, and the Parties agree not to oppose approval of the recovery of the total regulatory asset in DEF's next base rate proceeding over a period not to exceed five years.

20. The Parties agree that the Storm Reserve Study filed by DEF on December 31, 2020, has been modified to reflect no increase to the current $132 million reserve that is currently in DEF's base rates. The modified Storm Reserve Study is attached to this 2021 Settlement Agreement as Exhibit 7 and should be approved as modified.

21. The Parties agree that the Depreciation Study filed by DEF on December 31, 2020 has been modified to reflect the changes detailed in Paragraphs 21(a) through (c) below and should be approved as modified. The modified Depreciation Study is attached to this 2021 Settlement Agreement as Exhibit 8.

a. Distribution (excluding account 373-Street Lighting and Signal Systems) and Transmission rates will remain at the same level as reflected in the 2009 Depreciation Study;

b. The useful lives of Combined Cycle units are 40 years; and

c. DEF will delay the start of amortization of the Cost of Removal ("COR") Regulatory Asset to January 1, 2025 and the recovery period of this regulatory

asset shall be no longer than the average remaining service life of the assets, approved in the Company's most recent depreciation study at that time.

Nuclear Decommissioning Trust

22. If DEF determines that additional funds are necessary in order to fund the Crystal River 3 ("CR3") Nuclear Decommissioning Trust in support of decommissioning CR3, DEF shall be allowed to petition to collect those additional funds through a surcharge in base rates. The Parties reserve all rights to challenge the amount of any additional CR3 decommissioning costs (funding accrual). The Parties expressly agree that any proceeding to recover costs associated with decommissioning CR3 under this Paragraph shall not be a vehicle for a "rate case" type inquiry concerning the expenses, investment, or financial results of operations of the Company and shall not apply any form of earnings test or measure or consider previous or current base rate earnings.

Hurricanes Michael and Dorian Storm Cost Recovery Dockets

23. To fully and completely resolve all issues in Docket Nos. 20190110-EI and 20190222-EI, the Parties agree to the following:

a. DEF shall reduce the current debit balance in the FERC 228 Hurricane Storm Reserve by $29 million (retail) and record a new regulatory asset for $29 million to be amortized over the average life of its fixed assets, currently 27 years.

b. Under Order No. PSC-2019-028-PCO, DEF would be required to flow back the tax savings surplus of $29 million (retail) to customers via the CCR Clause in 2022 upon the completion of hurricane cost recovery. However, to resolve these dockets and the overall base rate case, the Parties agree that, consistent with the adjustments required in subparagraph a, DEF shall debit the income statement in 2022 upon the completion of hurricane cost recovery and make a

corresponding credit to a new regulatory liability in the amount of $29 million (retail).

c. DEF shall use this regulatory liability created under subparagraph b to reduce the Dismantlement Regulatory Asset created in Paragraph 19. This offset benefits DEF customers by reducing the amortization and carrying costs of the Dismantlement Regulatory Asset that they would otherwise incur starting in 2025.

d. DEF agrees to work together, in good faith, with the Parties in an effort to explore and develop a policy to mitigate costs incurred by DEF during storm restoration, including but not limited to the allocation of costs of non-SEE contractor assistance retained for storm duty that are ultimately released to DEF affiliates for storm duty in those jurisdictions. DEF further agrees that these discussions will take place over the twelve-month period after the Effective Date, and that the time for the discussions can be extended if the parties agree that progress is made towards a mutually agreeable policy development. DEF would only be obligated to implement a policy that was agreed to and approved by the Commission after such good faith discussions.

Other General Terms

24. The Parties agree with the amount for Economic Development costs reflected in DEF's MFRs attached hereto as Exhibit 1. Additionally, Commission approval of the Economic Development Tariffs, included as part of Exhibits 4A and 4B, satisfies the requirements of Commission Rule 25-6.0426(3)-(6), F.A.C.; accordingly, the expense of the economic development benefits afforded in these tariffs, shall, for all ratemaking

purposes and Surveillance reporting, be included as a cost in the Company's cost of service.

25. The Parties recognize that several factors are making future electric and grid investment a more dynamic environment. DEF shall be allowed to implement a Vision Florida pilot program. This program may consist of capital and Operating & Maintenance ("O&M") investments associated with but not limited to: up to four Emergency Relief Microgrid projects; a floating solar pilot project at the Hines generating station; an investment in some form of hydrogen power; and solar plus storage projects that are intended to delay or avoid future transmission or distribution investments (for example - substation, breaker, or line upgrades and it will incorporate a partnership with the local community to assist in siting). O&M investments in this program will be deferred for recovery in conjunction with DEF's next general base rate case over a 5-year period. As Vision Florida eligible capital projects go in service, DEF shall be authorized to defer all financial impacts associated with the capital projects to a regulatory asset, which will be allowed to earn an AFUDC carrying cost and will be recovered in DEF's next base rate proceeding. Total costs under this pilot shall not exceed $100 million in capital and $12 million in O&M. These expenditures may be incurred at any time during 2021 – 2025.

26. DEF shall continue to exclude the following amounts related to CR3 from all earnings surveillance reports: (1) revenues associated with the recovery of the CR3 Regulatory Asset referenced in the 2017 Settlement Agreement; (2) rate base and O&M expense amounts (including, but not limited to, all amounts that have been deferred to or recorded in regulatory assets and liabilities); and (3) cost of capital accounts with specific adjustments for items including, but not limited to, deferred income taxes, with all other CR3-related items removed from capital structure on a *pro rata* basis. All costs

that are being recovered as part of the nuclear asset-recovery bonds shall be excluded from the earnings surveillance reports.

27. The tariff sheets reflecting the changes necessary to implement this 2021 Settlement Agreement are attached hereto as Exhibits 4A and 4B. The Parties agree that all the tariffs will have an effective date of January 1, 2022 (first billing cycle for January 2022). The Parties further agree and request that the Commission authorize its Staff to administratively approve future tariff sheets to reflect the rate changes provided for in this 2021 Settlement Agreement for 2023 and 2024 (on the same basis of the first billing cycle for January of the year in question).

28. The Parties agree that the MFRs submitted by DEF, and attached hereto as Exhibit 1, accurately reflect and support the terms of this 2021 Settlement Agreement. The Parties also agree that the separation factors for all applicable ratemaking purposes in 2022 will be consistent with the separation factors included in the 2022 MFRs, attached hereto as Exhibit 1, and the separation factors for all applicable ratemaking purposes in 2023 and 2024 will be consistent with the separation factors included in the 2023 MFRs, attached hereto as Exhibit 1. The residential base rate tier 1 and tier 2 spread included in MFR E-14B and applicable tariffs will be incorporated into the fuel clause but will be done so on a non-seasonal basis. The annualized spread to be used for the Fuel Clause in 2022 and beyond through at least the Term will be 1.07 cents.

29. The Parties agree that this 2021 Settlement Agreement and all Exhibits including the MFRs, attached hereto as Exhibit 1, resolve the differences of the Parties that exist and would have existed in a litigated case in all associated dockets covered herein as reflected in the stipulated issues and positions included in Exhibit 9. The Parties request

that the Commission approve these stipulated positions by approval of the 2021 Settlement Agreement.

30. The Parties agree that:

a. Nothing shall preclude the Company from requesting the Commission approve the recovery of costs that are of a type which traditionally and historically would be, have been, or are presently recovered through cost recovery clauses or surcharges;

b. It is the intent of the Parties that, in conjunction with the provisions of Paragraph 6, DEF shall not seek to recover, nor shall DEF be allowed to recover, through any cost recovery clause or charge, or through the functional equivalent of such cost recovery clauses and charges, costs of any type or category that have historically and traditionally been recovered in base rates, unless such costs are: (i) the direct and unavoidable result of new governmental impositions or requirements; (ii) new or atypical costs that were unforeseeable and could not have been contemplated by the Parties resulting from significantly changed industry-wide circumstances directly affecting DEF's operations; or (iii) costs that would otherwise be recoverable through base rates that the Florida Legislature has expressly authorized as clause recoverable by public utilities, as that term is defined in Section 366.02(2), F.S.; and

c. With respect to storm damage costs caused by a tropical system named by the National Hurricane Center or its successor, nothing in this 2021 Settlement Agreement shall preclude DEF from petitioning the Commission to seek recovery of costs associated with any storms without the application of any form of earnings test or measure and irrespective of previous or current base rate

earnings. The Parties agree that recovery from customers for storm damage costs will begin, subject to Commission approval on an interim basis, sixty (60) days following the filing of a cost recovery petition with the Commission, and subject to true-up pursuant to further proceedings before the Commission, and will be based on a 12-month recovery period. All storm-related costs shall be calculated and disposed of pursuant to Commission Rule 25-6.0143, F.A.C., and will be limited to costs resulting from a tropical system named by the National Hurricane Center or its successor, an estimate of incremental costs above the level of storm reserve prior to the storm event, and replenishment of the storm reserve to $132 million (retail). The Parties are not precluded from participating in any such proceedings and do not waive any rights they may otherwise have to challenge such costs. The Parties expressly agree that any proceeding to recover costs associated with any storm shall not be a vehicle for a "rate case" type inquiry concerning the expenses, investment, or financial results of operations of the Company and shall not apply any form of earnings test or measure or consider previous or current base rate earnings.

31. If the University of Florida (“UF”) expresses an intent to exercise or exercises its option to require DEF to retire the UF Cogeneration Plant (“UF Plant”), DEF will be allowed to continue the current level of depreciation expense on the UF Plant until it files its next general base rate case and will then be allowed to recover the remaining net book value (“NBV”) of the UF Plant over a five (5) year period as part of that case.

32. In the event that DEF is required to implement settlement accounting for Pension Benefits Expense, DEF will be permitted to defer, to a regulatory asset (or regulatory liability), the impact associated with the Generally Accepted Accounting Principles

("GAAP") required recognition of the unrealized losses (or gains) and amortize that regulatory asset (or liability) over a period to be determined in the next general base rate case.

33. DEF may not petition for an increase in base rates and charges that would take effect prior to the first billing cycle for January 2025, except for the increases in base rates and charges provided for or allowed by the terms of this 2021 Settlement Agreement, including, without limitation, the recovery of nuclear asset-recovery charges that are being recovered on behalf of Duke Energy Florida Project Finance, LLC, pursuant to Commission Docket No. 20150171-EI. In addition, the Parties agree that the base rate increases or charges that, pursuant to the terms of this 2021 Settlement Agreement extend beyond the last billing cycle for December 2024 and survive the expiration of the Term or termination of this 2021 Settlement Agreement, specifically include, without limitation: (A) the recovery of the nuclear asset-recovery charge until the nuclear asset-recovery bonds have been paid in full and the Commission-approved financing costs have been recovered in full, as provided for in Paragraph 5.c. of the 2017 Settlement Agreement; (B) the potential recovery of additional funds to fund the CR3 Nuclear Decommissioning Trust pursuant to Paragraph 22 of this 2021 Settlement Agreement; (C) the potential recovery of the NBV of the UF Plant pursuant to Paragraph 31 of this 2021 Settlement Agreement; (D) the recovery of the EV Program pursuant to Paragraph 17 of this 2021 Settlement Agreement; (E) the potential base rate increase associated with the Trigger provision pursuant to Paragraph 2(b); (F) the recovery of the Vision Florida program costs pursuant to Paragraph 25; and (G) the recovery or refund resulting from Tax Reform pursuant to Paragraph 18. Notwithstanding the rate relief mechanism described in Paragraph 37, DEF is prohibited from seeking or implementing an interim

rate increase pursuant to Section 366.071, F.S., until the expiration of this 2021 Settlement Agreement. The Parties likewise agree that they will neither seek nor support any reduction in DEF's base rates and charges, including limited, interim, or any other rate decreases, that would take effect prior to the first billing cycle for January 2025, except for any reduction requested by DEF or as otherwise provided for in this 2021 Settlement Agreement.

34. No Party to this 2021 Settlement Agreement shall request, support, or seek to impose a change to any provision in this 2021 Settlement Agreement. This 2021 Settlement Agreement, and the attached Exhibits, schedules, tariffs, and MFRs, represent the entire and complete agreement between the Parties. The Parties consider each provision to be integral to their respective support for this 2021 Settlement Agreement in its entirety, and no provision may be changed or altered without the consent of each signatory Party in a written document duly executed by all Parties to this 2021 Settlement Agreement. To the extent a dispute arises among the Parties about the provisions, interpretation, or application of this 2021 Settlement Agreement, the Parties agree to meet and confer in an effort to resolve the dispute. To the extent that the Parties cannot resolve any dispute, the matter may be submitted to the Commission for resolution. Florida law will govern all terms, conditions, and provisions of this 2021 Settlement Agreement, including, but not limited to, any disputes arising from this 2021 Settlement Agreement.

35. The provisions of this 2021 Settlement Agreement are contingent on approval of this 2021 Settlement Agreement in its entirety by the Commission. The Parties further agree that this 2021 Settlement Agreement is in the public interest, and that they will support this 2021 Settlement Agreement and will not request or support any order, relief,

outcome, or result in express conflict with the terms of this 2021 Settlement Agreement in any administrative or judicial proceeding relating to, reviewing, or challenging the establishment, approval, adoption, or implementation of this 2021 Settlement Agreement or the subject matter hereof. No Party will assert in any proceeding before the Commission that this 2021 Settlement Agreement or any of the terms in the 2021 Settlement Agreement shall have any precedential value. The Parties' agreement to the terms in the 2021 Settlement Agreement shall be without prejudice to any Party's ability to advocate a different position in future proceedings not involving the 2021 Settlement Agreement. The Parties further expressly agree that no individual provision, by itself, necessarily represents a position of any Party in a future proceeding nor shall any Party represent in any future forum that another Party endorses a specific provision of this 2021 Settlement Agreement because of that Party's signature herein. It is the intent of the Parties to this 2021 Settlement Agreement that the Commission's approval of all the terms and provisions of this 2021 Settlement Agreement is an express recognition that no individual term or provision, by itself, necessarily represents a position, in isolation, of any Party or that a Party to this 2021 Settlement Agreement endorses a specific provision, in isolation, of this 2021 Settlement Agreement because of that Party's signature herein.

36. DEF may seek Commission authorization to implement any new or revised tariff provision(s) or rate schedule(s) provided that such tariff request does not increase any existing base rate component of a tariff or rate schedule during the term of this 2021 Settlement Agreement unless the application of such new or revised tariff or rate schedule is optional to DEF's customers. Additionally, DEF may seek approval to implement new or revised tariff provisions or rate schedules if any such provision or rate schedule is (a) required in order to implement a legislative requirement for which compliance is

mandatory during the Term of this 2021 Settlement Agreement or (b) required to implement a Commission order of statewide applicability, and such order expressly provides (i) that compliance is necessary to protect the integrity of the bulk power supply grid or the safety of persons and property, and (ii) that compliance is mandatory during the Term of this 2021 Settlement Agreement.

37. The Parties agree further that:

a. Notwithstanding Paragraph 6 and subject to the Trigger in Paragraph 2(b) above, if DEF's earned return on common equity falls below 8.85% during the Term, or 9.10% if modified by the Trigger provision, on a DEF monthly earnings surveillance report stated on an actual Commission thirteen-month average adjusted basis, DEF may petition the Commission to amend its base rates during the Term of this 2021 Settlement Agreement. Such request by the Company shall be limited to an increase that would achieve a 9.85% ROE or as may have been modified by the Trigger provision to 10.10%. No Party waives its right to participate in such a proceeding, and such participation will only be limited by the terms of this 2021 Settlement Agreement. This floor shall be subject to adjustment in accordance with the Trigger provision in Paragraph 2(b).

b. Notwithstanding Paragraph 6 and subject to the Trigger in Paragraph 2(b) above, if DEF's earned ROE exceeds 10.85% during the Term on a DEF monthly earnings surveillance report stated on an actual Commission thirteen-month average adjusted basis, any Intervener Party shall be entitled to petition the Commission for a review of DEF's base rates. In any case initiated by DEF or any other Party pursuant to Paragraph 37, no Party waives any rights

conferred by law. The ceiling in this subsection shall be subject to adjustment in accordance with the Trigger provision in Paragraph 2(b) to 11.10%.

c. Notwithstanding Paragraph 6 and subject to the Trigger in Paragraph 2(b) above, the 2021 Settlement Agreement shall terminate upon the effective date of any final order issued in any such proceeding pursuant to Paragraph 37 that changes DEF's base rates prior to the last billing cycle of December 2024.

d. This Paragraph shall not (i) be construed to bar DEF from requesting any recovery of costs otherwise contemplated by this 2021 Settlement Agreement; (ii) apply to any request to change DEF's base rates that would become effective after the expiration of the Term of this 2021 Settlement Agreement; or (iii) limit any Party's rights in proceedings concerning changes to base rates that would become effective subsequent to the Term of this 2021 Settlement Agreement to argue that DEF's authorized ROE range should be different than as set forth in this 2021 Settlement Agreement.

e. This Paragraph shall not be construed to bar or limit DEF from any recovery of costs otherwise contemplated by this 2021 Settlement Agreement, and all other provisions of this 2021 Settlement Agreement shall remain in force and effect.

38. All dollar values, asset determinations, rate impact values, or revenue requirements in this 2021 Settlement Agreement are intended by the Parties to be retail jurisdictional in amount or formulation basis, unless otherwise specified. The Parties agree that, due to the volume of documents and the need to ensure accuracy, certain exhibits may be filed with the Commission subsequent to the filing of this 2021 Settlement Agreement within a reasonable period not to exceed 14 days. The Parties request that the Commission's consideration and approval of this 2021 Settlement Agreement shall

be based on the complete 2021 Settlement Agreement, including all Exhibits.

39. This 2021 Settlement Agreement dated as of January 14, 2021, may be executed in counterpart originals, and a facsimile or PDF email of an original signature shall be deemed an original.

In Witness Whereof, the Parties evidence their acceptance and agreement with the provisions of this 2021 Settlement Agreement by their signatures below.

DISMANTLEMENT STUDY

DUKE ENERGY FLORIDA, LLC
DISMANTLEMENT STUDY

Duke Energy Florida
2020 Fossil Plant Dismantlement Cost Study

TABLE OF CONTENTS

Section Number:

DUKE ENERGY FLORIDA, LLC
2020 FOSSIL PLANT DISMANTLEMENT COST STUDY

Section No. 1 - Dismantlement Study Summary

A site-specific fossil plant dismantlement cost study has been prepared by Burns & McDonnell Engineering Company, Inc. (B&M) and was finalized in 2020. This study included sites with total estimates of dismantlement to be $246,121,000 in 2018 dollars. In addition, using the normalized solar costs per the B&M study, there are solar sites with in-service dates subsequent to the B&M study with cost estimates of $124,673,000 in 2018 dollars (Section 7). Duke Energy Florida (DEF) calculated the total dismantlement cost of $414,483,689 in 2022 dollars. The costs can be categorized as follows:

	(in 000's) 2022 $	**% of Total**
Labor	$ 295,342,000	71%
Materials & Equipment	155,902,000	38%
Plant Inventory, net of salvage	59,470,000	14%
Disposal	19,372,000	5%
Salvage	(131,149,000)	-32%
Landfill	15,547,000	4%
	$ 414,484,000	100%

The cost estimate includes updated dismantlement assumptions from the cost study that was approved by the Florida Public Service Commission (FPSC) in Order No. PSC-1O-0398-S-EI (Docket 070079). The test year 2022 cost estimates are $253 million higher than the 2010 estimates. The most significant changes are related to the addition of several solar sites and the Citrus County Combined Cycle site, the addition of plant inventory (net of salvage) in the cost estimates, the acceleration of planned retirement dates for some plants and changes in inflation rates, partially offset by the dismantlement of several plants. Comparative analyses of significant cost changes by plant since the last study are contained in Section 6.

ESCALATION RATE

The future cost of dismantlement is forecasted by analyzing the individual cost categories from B&M's cost study and solar sites as described above. The costs are divided into components of labor, material and equipment, disposal, salvage, landfill and plant inventory. These components are escalated by the estimated inflationary rates for compensation per hour, Intermediate Materials, Gross Domestic Product (Implicit Price Deflator), Metals and Metal Products and Consumer Price Index. Section 5 contains a schedule of the applicable escalation rates for each category. DEF used the same data vendor (Economy.com) to obtain the inflation forecast as was used in the previous study. Moody's Economy.com, a division of Moody's Analytics, is a leading independent provider of economic, financial, country, and industry research designed to meet the diverse planning and information needs of businesses,

governments, and professional investors worldwide. The firm has over 500 clients worldwide, including the largest commercial and investment banks; insurance companies; financial services firms; mutual funds; governments at all levels; manufacturers; utilities; and industrial and technology clients.

The cost estimate obtained by applying these rates yields the future cost of dismantlement using currently available technology and procedures, as shown in Section 3.

The methodology used to determine the escalation rate for converting the current estimated dismantlement cost to future estimated dismantlement cost is consistent with the guidance set out in FPSC Rule 25-6.04364 and that used in the preparation of all past studies.

CONTINGENCY ALLOWANCE

The overall contingency allowance of 20% approved in Order No. PSC-1O-0398-S-EI (Docket 070079) was also used in the current 2018 study to determine the 2022 proposed annual accrual.

CONCLUSION

The annual accrual amount requested for DEF's retail share of total dismantlement costs is **$19,050,434** ($20,597,388 system). This is based on the assumptions of a total retail cost in 2022 dollars of **$383,315,434** ($414,483,689 system). DEF requests that the annual accrual be adjusted effective January 1, 2022. Section 2 of this report provides the related determination of the annual accrual.

DUKE ENERGY FLORIDA, LLC
2020 FOSSIL PLANT DISMANTLEMENT COST STUDY

Section No. 2 - Determination of Annual Accrual for Dismantlement

Progress Energy Florida
Calculation of Jurisdictional Impact

	Annual Accrual			2022 $ Dismantlement Estimate			Future $ Dismantlement Estimate

DUKE ENERGY FLORIDA, LLC
2020 FOSSIL PLANT DISMANTLEMENT COST STUDY

Section No. 4 – Proposed Reserve Adjustments

Progress Energy Florida
2018 Dismantlement Study
Proposed Reserve Adjustments - Residual Reserve Balances

Transfer of Residual Reserve from:

	Accumulated Reserve (12/31/21 projected)	Future to Dismantle	Surplus/(Deficit)	Function
Bartow Steam	21,864,962	-	21,864,962	STEAM
Bartow-Anclote Pipeline	6,425,683	-	6,425,683	OTHER PROD
Higgins Steam	(45,195)	-	(45,195)	STEAM
Rio Pinar	32,935	-	32,935	OTHER PROD
Suwannee Steam	1,023,071		1,023,071	STEAM
Turner Steam	(21,494)	-	(21,494)	OTHER PROD
Turner Gas Turbine 1 & 2	(2,342,178)	-	(2,342,178)	OTHER PROD
Turner Gas Turbine 3 & 4	(1,740,619)	-	(1,740,619)	OTHER PROD
Steam Function	22,842,839	-	22,842,839	
Other Production Function	2,354,327	-	2,354,327	
	25,197,166	-	25,197,166	

Transfer of Residual Reserve to:

	A	*B*	*C=A-B*	*D*	*E*	*F=A+D+E*
	Accumulated Reserve (before adjustments)	Future to Dismantle	Deficit	Allocation of Residual Reserves	Adjustments due to Theoretical Reserve analysis	Adjusted 12/31/21 Reserve Balances (for plants receiving portion of residual reserve balances)
Anclote	13,338,662	25,481,840	(12,143,178)	5,974,736	65,695	19,379,092
CR 1&2	(524,421)	16,343,682	(16,868,103)	16,868,103	-	16,343,682
Avon Park	(2,667,144)	-	(2,667,144)	2,354,327	4,363	(308,454)
	10,147,097	41,825,522	(31,678,425)	25,197,166	70,057	35,414,320

NOTES:
D (above): allocation based on similar production facitilites (i.e. steam), adjusted based on theoretical reserve analysis.

1.0 EXECUTIVE SUMMARY

1.1 Introduction

Burns & McDonnell Engineering Company, Inc. ("Burns & McDonnell") of Kansas City, Missouri, was retained by Duke Energy Florida, LLC ("DEF") to conduct a Dismantlement Cost Study ("Study") for power generation assets ("Plants") in Florida. The assets include natural gas, coal, and solar generating facilities. The purpose of the Study was to review the facilities and to make a recommendation to DEF regarding the total cost to demolish the facilities at the end of their useful lives. The dismantlement costs were developed by Burns & McDonnell using information provided by DEF and in-house data available to Burns & McDonnell.

1.2 Results

Burns & McDonnell has prepared estimates in 2018 dollars for the dismantlement of the Plants. These costs are summarized in Table 1-1. When DEF determines that the Plants should be retired, the above grade equipment and steel structures are assumed to have sufficient scrap value to a salvage contractor to offset a portion of the dismantlement costs. DEF will incur costs in the demolition and restoration of the sites less the salvage value of equipment and bulk steel.

Table 1-1: Dismantlement Cost Summary (2018$)

Plant	Dismantlement Costs	Credits	Net Project Cost
Anclote Station	$ 29,194,000	$ (11,374,000)	**$ 17,820,000**
Avon Park Station	$ 967,000	$ (501,000)	**$ 466,000**
Bartow Station	$ 30,783,000	$ (10,430,000)	**$ 20,353,000**
Bayboro Station	$ 2,972,000	$ (1,550,000)	**$ 1,422,000**
Citrus County Combined Cycle	$ 24,871,000	$ (15,020,000)	**$ 9,851,000**
Crystal River Common	$ 33,945,000	$ (781,000)	**$ 33,164,000**
Crystal River Helper	$ 5,900,000	$ (477,000)	**$ 5,423,000**
Crystal River Mariculture	$ 1,363,000	$ (-)	**$ 1,363,000**
Crystal River North	$ 73,052,000	$ (27,210,000)	**$ 45,842,000**
Crystal River South	$ 64,474,000	$ (13,838,000)	**$ 50,636,000**
DeBary Station	$ 16,209,000	$ (5,344,000)	**$ 10,865,000**
Higgins Station	$ 2,103,000	$ (901,000)	**$ 1,202,000**
Hines Station	$ 40,524,000	$ (15,903,000)	**$ 24,621,000**
Intercession City Station	$ 16,110,000	$ (6,170,000)	**$ 9,940,000**
Osceola Solar Center	$ 548,375	$ (104,000)	**$ 444,375**
Osprey Station	$ 10,085,000	$ (5,106,000)	**$ 4,979,000**
Perry Solar Center	$ 736,750	$ (192,200)	**$ 544,550**
Suwannee River Station	$ 2,725,000	$ (1,006,000)	**$ 1,719,000**
Tiger Bay Station	$ 5,428,000	$ (1,832,000)	**$ 3,596,000**
University of Florida Station	$ 2,474,000	$ (604,000)	**$ 1,870,000**

The total project costs presented above include the costs to return the sites to an industrial condition suitable for reuse for development of an industrial facility. Included are the costs to dismantle the power generating equipment owned by DEF as well as the costs to dismantle the DEF-owned balance of plant facilities ("BOP") and environmental site restoration activities.

As DEF continues to add solar PV facilities to their generation fleet, dismantlement costs can be approximated using normalized costs obtained from current solar Plants. Using the normalized net dismantlement costs at Osceola Solar Center and Perry Solar Center, DEF can estimate the expected dismantlement cost at any future solar facility added to the fleet. A full study should be conducted on any additional Facility to determine a more detailed dismantlement cost. Table 1-2 presents a summary of the normalized net dismantlement cost for each solar Plant.

Table 1-2: Normalized Net Dismantlement Cost (2018$/acres)

Plant	Dismantlement Costs
Osceola Solar Center	$ 21,047
Perry Solar Center	$ 25,648

1.3 Statement of Limitations

In preparation of this dismantlement study, Burns & McDonnell has relied upon information provided by DEF. Burns & McDonnell acknowledges that it has requested information from DEF that it deemed necessary to complete this study. While Burns & McDonnell has no reason to believe that the information provided, and upon which Burns & McDonnell has relied, is inaccurate or incomplete in any material respect, Burns & McDonnell has not independently verified such information and cannot guarantee its accuracy or completeness.

Burns & McDonnell's estimates and projections of dismantlement costs are based on Burns & McDonnell's experience, qualifications and judgment. Since Burns & McDonnell has no control over weather, cost and availability of labor, material and equipment, labor productivity, construction contractors' procedures and methods, and other factors, Burns & McDonnell does not guarantee the accuracy of its estimates and projections.

Burns & McDonnell's estimates do not include allowances for unforeseen environmental liabilities associated with unexpected environmental contamination due to events not considered part of normal operations, such as fuel tank ruptures, oil spills, etc. Estimates also do not include allowances for environmental remediation associated with changes in classification of hazardous materials.

2.0 INTRODUCTION

2.1 Background

Burns & McDonnell of Kansas City, Missouri, was retained by DEF to conduct a Dismantlement Cost Study for power generation assets in Florida. The assets include solar natural gas, and coal-fired generating facilities. Burns & McDonnell had previously prepared a similar study for Progress Energy Florida (PEF) in 2008 in support of PEF's 2009 rate case. This Study serves to update the costs presented in the 2008 study for changes to market conditions, physical changes that have occurred at the Plants, and incorporating new facilities that have been constructed or acquired since 2008. Individuals from Burns & McDonnell visited each Plant included in the Study, except Citrus County Combined Cycle, in August of 2017, when the Study commenced. The Study report was issued in 2018 with estimates presented in 2018 dollars. The Study report was reissued in 2020, to include some additional cost items, also in 2018 dollars. The purpose of the Study was to review the facilities and to make a recommendation to DEF regarding the total cost to demolish the facilities at the end of their useful lives.

Burns & McDonnell has prepared dismantlement studies for over 100 facilities on various types of fossil fuel and renewable power plants using a proven approach to develop these estimates. These dismantlement studies and associated cost estimates were produced for various reasons, many of which have held up to strict scrutiny as part of a regulatory review process. Burns & McDonnell has experience providing both written and verbal testimony before public utility commissions, which has been well received and confirmed. This assists in confirming the reasonableness of the Burns & McDonnell estimates. In addition to preparing demolition estimates, Burns & McDonnell has supported demolition projects as the owner's engineer, to evaluate demolition bids and oversee demolition activities. This has provided Burns & McDonnell with insight into the range of competitive demolition bids, which also assists in confirming the reasonableness of the dismantlement estimates developed by Burns & McDonnell.

2.2 Study Methodology

The site dismantlement costs were developed using information provided by DEF and in-house data Burns & McDonnell has collected from previous project experience. Burns & McDonnell estimated quantities for equipment based on a visual inspection of the facilities, review of engineering drawings, Burns & McDonnell's in-house database of plant equipment quantities, and Burns & McDonnell's professional judgment. This resulted in an estimate of quantities for the tasks required for each dismantlement effort. Current market pricing for labor rates, equipment, and unit pricing were then developed for each task. The unit pricing was developed for each site based on the labor rates, equipment

costs, and disposal costs specific to the area in which the work is to be performed. These rates were applied to the quantities for the Plants to determine the total cost to demolish each site.

The dismantlement costs include the cost to return the site to an industrial condition, suitable for reuse for development of an industrial facility, commonly referred to as a brownfield site. Included are the costs to demolish all of the assets owned by DEF at the site, including power generating equipment and BOP facilities.

2.3 Site Visits

Representatives from Burns & McDonnell visited the sites. The site visits consisted of a tour of each facility with plant personnel to review the equipment installed at each site. Tours were conducted by plant personnel.

A DEF representative was present throughout the site visits, along with plant personnel at each of the sites.

The following Burns & McDonnell representatives comprised the site visit team:

- Mr. Jeff Kopp, Burns & McDonnell, Project Manager
- Ms. Beth Wiese, Burns & McDonnell, Project Analyst
- Mr. Drew Burczyk, Burns & McDonnell, Project Analyst

Table 2-1 and Figure 2-1 show the dates and locations of the DEF site visits.

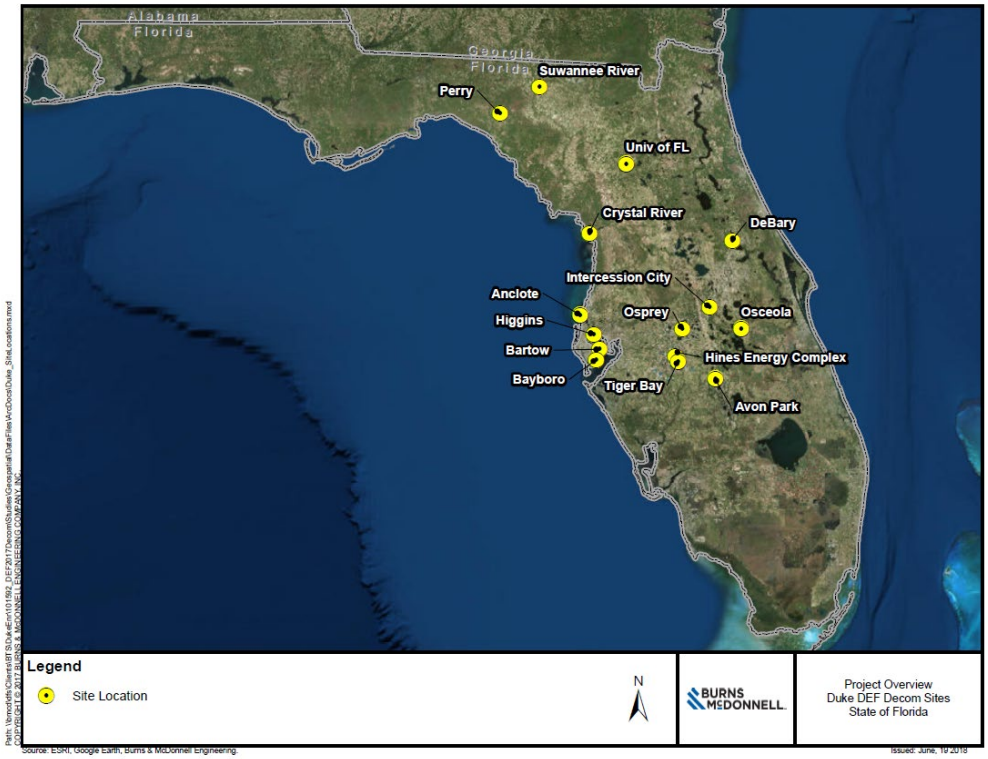
University of Florida Station	August 1, 2017

Figure 2-1: DEF Facilities Visited



3.0 PLANT DESCRIPTIONS

The following sections provide site descriptions for each of the power plants included in this Study.

3.1 Anclote Station

The Anclote plant is in Holiday, Florida (part of the greater Tampa area). The facility consists of two natural gas-fired boilers. Both boilers were converted to natural gas from fuel oil in 2013 to accommodate federal emissions standards. Unit 1 and Unit 2 each utilize one General Electric ("GE") G-2 steam turbine to generate power at the facility. The facility was built between 1974 and 1978 and includes a summer net capacity of 1,016 megawatts ("MW"). Table 3-1 displays all the units included in the Anclote estimate. Since the 2008 Study, Anclote has installed natural gas infrastructure to allow the plants to burn 100 percent natural gas, new Forced Draft fan variable frequency drives, and new auxiliary transformer. Additionally, all fuel oil storage and burning equipment has been removed.

Table 3-1: Anclote Summary

Unit	Generation Technology	Fuel Type	Summer Net Capacity (MW)	In Service Date
1	Steam Turbine	Natural Gas	508	1974
2	Steam Turbine	Natural Gas	508	1978

3.2 Avon Park Station

The Avon Park plant is in Avon Park, Florida. The facility consists of one natural gas-fired combustion turbine and one fuel oil-fired combustion turbine. Unit 1 and Unit 2 consist of one Pratt & Whitney GG combustion turbine. The facility was built in 1968 and includes a summer net capacity of 48 MW. Table 3-2 displays all the units included in the Avon Park estimate. No changes have been made to Avon Park since the 2008 Study.

Table 3-2: Avon Park Summary

Unit	Generation Technology	Fuel Type	Summer Net Capacity (MW)	In Service Date
1	Combustion Turbine	Natural Gas	24	1968
2	Combustion Turbine	Fuel Oil	24	1968

3.3 Bartow Station

The Bartow plant is located along Old Tampa Bay in North of St. Petersburg, Florida. The facility includes four combustion turbine units operating in simple cycle, and a 4-on-1 combined cycle arrangement. Table 3-3 displays all the units included in the Bartow estimate.

Table 3-3: Bartow Summary

Unit	Generation Technology	Fuel Type	Summer Net Capacity (MW)	In Service Date
1	Combustion Turbine	Fuel Oil	43	1972
2	Combustion Turbine	Natural Gas	42	1972
3	Combustion Turbine	Fuel Oil	43	1972
4	Combustion Turbine	Natural Gas	47	1972
4CC	Combined Cycle	Natural Gas	1,120	2009

Built in 1972, Units 1 through 4 include both natural gas and fuel oil-fired combustion turbines with a total summer net capacity of 175 MW. Each combustion turbine is a GE MS7001B combustion turbine.

Built in 2009, the combined cycle power block includes four Siemens 501FD natural gas-fired combustion turbines, four Vogt HRSGs, and one Mitsubishi Heavy Industries ("Mitsubishi") steam turbine. Additionally, this unit includes a selective catalytic reduction ("SCR") for reducing nitrogen oxides ("NO_x") emissions. Water for the facility's condensing cooling system is provided via Old Tampa Bay with water discharge to a man-made canal back to Old Tampa Bay. The combined summer peak rating for the power block is 1,120 MW. No changes have taken place at Bartow since the 2008 Study.

3.4 Bayboro Station

The Bayboro plant is in St. Petersburg, Florida. Built in 1973, the facility consists of four Pratt & Whitney FT4C1 fuel oil-fired combustion turbines operating in simple cycle. These units have a total summer net capacity of 171 MW. Table 3-4 displays all the units included in the Bayboro estimate. No changes have taken place at Bayboro since the 2008 Study.

Table 3-4: Bayboro Summary

Unit	Generation Technology	Fuel Type	Summer Net Capacity (MW)	In Service Date
1	Combustion Turbine	Fuel Oil	44	1973
2	Combustion Turbine	Fuel Oil	41	1973
3	Combustion Turbine	Fuel Oil	43	1973
4	Combustion Turbine	Fuel Oil	43	1973

3.5 Citrus County Combined Cycle

The Citrus County plant is located approximately seven miles northwest of Crystal River, Florida. The facility includes two 2-on-1 combined cycle units with a total summer net capacity of 1,640 MW. Table 3-5 displays all the units included in the Citrus County estimate.

Table 3-5: Citrus County Summary

Unit	Generation Technology	Fuel Type	Summer Net Capacity (MW)	In Service Date
1CC	Combined Cycle	Natural Gas	820	2018
2CC	Combined Cycle	Natural Gas	820	2018

Burns & McDonnell did not visit Citrus County since the facility was under construction in August of 2017. Both combined cycle power blocks consist of two Mitsubishi 501 GAC combustion turbines and one Mitsubishi steam turbine. Cooling water for each unit is provided via a closed loop cooling system that rejects heat with mechanical cooling towers. Both power blocks were commissioned in 2018 and are currently in service. Inventory at Citrus County is based on the planned purchases as noted in the Generation Base Adjustment filing which is approximately $12.5 million.

3.6 Crystal River Station

The Crystal River plant is located approximately seven miles northwest of Crystal River, Florida and consists of four coal-fired boilers with a total summer net capacity of 2,188 MW. Coal for these units is transported by barge via the Gulf of Mexico as well as rail via a dedicated railway adjacent to the plant. Table 3-6 displays all the units included in the Crystal River estimate.

Table 3-6: Crystal River Summary

Unit	Generation Technology	Fuel Type	Summer Net Capacity (MW)	In Service Date
1	Steam Turbine	Coal	324	1966
2	Steam Turbine	Coal	442	1969
4	Steam Turbine	Coal	710	1982
5	Steam Turbine	Coal	712	1984

Built in 1966, Unit 1 consists of one GE G-2 steam turbine with a summer net capacity of 324 MW. Built in 1969, Unit 2 consists of one GE G-2 steam turbine with a summer net capacity of 442 MW. Each of these units utilizes cooling water from man-made canals in and out of the Gulf of Mexico. As of December 31, 2018 Crystal River 1 and 2 have been retired.

Built between 1982 and 1984, Units 4 and 5 consist of one GE G-3 steam turbine each with a summer net capacity of 710 and 712 MW, respectively. Cooling water for these units utilize both a man-made canal from the Gulf of Mexico and two hyperbolic cooling towers. Used water is rejected into a different man-made canal and returns to the Gulf of Mexico. Scrubbers that were being installed during the 2008 Study have been completed and are included within Study.

Crystal River is also home to the Crystal River nuclear power facility. However, dismantlement of this facility was beyond the scope of the Study. Any facilities shared with this unit that are subject to dismantlement per the Study will be called out specifically.

3.7 DeBary Station

The DeBary plant is located approximately four miles west of Deltona, Florida. The facility includes ten combustion turbine units operating in simple cycle with a total net summer capacity of 615 MW. Table 3-7 displays all the units included in the DeBary estimate.

Table 3-7: DeBary Summary

Unit	Generation Technology	Fuel Type	Summer Net Capacity (MW)	In Service Date
1	Combustion Turbine	Fuel Oil	54	1976
2	Combustion Turbine	Fuel Oil	48	1976
3	Combustion Turbine	Fuel Oil	50	1975
4	Combustion Turbine	Fuel Oil	50	1976
5	Combustion Turbine	Fuel Oil	50	1975
6	Combustion Turbine	Fuel Oil	51	1976
7	Combustion Turbine	Natural Gas	79	1992
8	Combustion Turbine	Natural Gas	78	1992
9	Combustion Turbine	Natural Gas	80	1992
10	Combustion Turbine	Natural Gas	75	1992

Built between 1975 and 1976, Units 1 through 6 are fuel oil-fired GE MS7001B combustion turbines with individual capacities of approximately 50 MW. Built in 1992, Units 7 through 10 are natural gas-fired GE MS7001EA combustion turbines, each with a summer net capacity of approximately 80 MW. DeBary Unit 1 has been retired since the 2008 Study was performed.

3.8 Higgins Station

The Higgins plant is located on a peninsula off of Mobbly Bay (part of Old Tampa Bay) approximately two miles south of Oldsmar, Florida (in the greater Tampa area). The facility includes four natural gas-fired Pratt & Whitney combustion turbines operating in simple cycle with a total summer net capacity of 107 MW. Built between 1969 and 1971, the four units include Pratt & Whitney GG combustion turbines and have net summer capacity of 20, 25, 31, and 31 MW, respectively. Table 3-8 displays all the units included in the Higgins estimate. Higgins has not changed since the 2008 Study was performed.

Table 3-8: Higgins Summary

Unit	Generation Technology	Fuel Type	Summer Net Capacity (MW)	In Service Date
1	Combustion Turbine	Natural Gas	20	1969
2	Combustion Turbine	Natural Gas	25	1969
3	Combustion Turbine	Natural Gas	31	1970
4	Combustion Turbine	Natural Gas	31	1971

3.9 Hines Station

The Hines plant is located approximately five miles northwest of Fort Meade, Florida. The facility includes four 2-on-1 combined cycle units with a total summer net capacity of 2,372 MW. Cooling water for these units is taken from and discharged to a man-made and isolated surface-cooling pond northeast of the plant. Table 3-9 displays all the units included in the Hines estimate.

Table 3-9: Hines Summary

Unit	Generation Technology	Fuel Type	Summer Net Capacity (MW)	In Service Date
1CC	Combined Cycle	Natural Gas	490	1999
2CC	Combined Cycle	Natural Gas	524	2003
3CC	Combined Cycle	Natural Gas	521	2005
4CC	Combined Cycle	Natural Gas	525	2007

Built in 1999, Power Block 1 includes two Siemens Westinghouse 501FC combustion turbines, two Foster Wheeler HRSGs, and one Westinghouse steam turbine, each with a summer peak rating of 163 MW, 169 MW, and 158 MW, respectively. Built in 2003, Power Block 2 includes two Siemens Westinghouse 501FD combustion turbines, two Nooter Erickson HRSGs, and one Siemens Westinghouse steam turbine, each with a summer peak rating of 172 MW, 175 MW, and 177 MW, respectively. Built in 2005, Power Block 3 includes two Siemens Westinghouse 501FD combustion turbines, two Nooter Erickson HRSGs, and one Siemens Westinghouse steam turbine, each with a summer peak rating of approximately 173 MW. Built in 2007, Power Block 4 includes two GE 7FA combustion turbines, two Nooter Erickson HRSGs, and one GE steam turbine, each with a summer peak rating of approximately 175 MW. Inlet air chilling systems have been installed on all units since the 2008 study was performed.

3.10 Intercession City Station

The Intercession City plant is located approximately two miles west of Intercession City, Florida. The facility includes 14 combustion turbines operating in simple cycle with a combined summer peak rating of approximately 951 MW. Table 3-10 displays all the units included in the Intercession City estimate.

Table 3-10: Intercession City Summary

Unit	Generation Technology	Fuel Type	Summer Net Capacity (MW)	In Service Date
1	Combustion Turbine	Fuel Oil	47	1974
2	Combustion Turbine	Fuel Oil	46	1974
3	Combustion Turbine	Fuel Oil	46	1974
4	Combustion Turbine	Fuel Oil	46	1974
5	Combustion Turbine	Fuel Oil	45	1974
6	Combustion Turbine	Fuel Oil	47	1974
7	Combustion Turbine	Natural Gas	78	1993
8	Combustion Turbine	Natural Gas	79	1993
9	Combustion Turbine	Natural Gas	79	1993
10	Combustion Turbine	Natural Gas	78	1993
11	Combustion Turbine	Fuel Oil	140	1997
12	Combustion Turbine	Natural Gas	73	2000
13	Combustion Turbine	Natural Gas	75	2000
14	Combustion Turbine	Natural Gas	72	2000

Built in 1974, Units 1 through 6 are fuel oil-fired Pratt & Whitney FT4C1D combustion turbines with individual capacities of approximately 48 MW at the summer peak rating. Built in 1993, Units 7 through 10 are natural gas-fired GE MS7001EA combustion turbines each with a summer peak rating of approximately 78 MW. Built in 1997, Unit 11 is a fuel oil-fired Siemens V84.3 combustion turbine with a summer peak rating of 143 MW. Built in 2000, Units 12 through 14 are natural gas-fired GE-7EA combustion turbines each with a summer peak rating of approximately 75 MW. No changes have been made to Intercession City since the 2008 study was performed.

3.11 Osceola Solar Center

The Osceola Solar Center ("Osceola Solar") is a photovoltaic solar power facility located approximately 13 miles south of St. Cloud, Florida. The facility was built in 2016 and currently includes approximately 14,000 solar panels with a total plant capacity of 4 MW. Osceola Solar is new to this Study.

3.12 Osprey Station

The Osprey Plant, also called the Osprey Energy Center, is a natural gas-fired, 2-on-1 combined cycle facility located in Auburndale, Polk County, Florida. The facility began commercial operation in 2004. The facility consists of two Siemens 501FD combustion turbines, two Nooter Eriksen HRSGs, one Siemens KN steam turbine. The facility has a summer net capacity of 590 MW. Table 3-11 displays all

the units included in the Osprey estimate. Osprey is new to this Study, since it was acquired by DEF in 2015.

Table 3-11: Osprey Summary

Unit	Generation Technology	Fuel Type	Summer Net Capacity (MW)	In Service Date
1CC	Combined Cycle	Natural Gas	590	2004

3.13 Perry Solar Center

The Perry Solar Center ("Perry Solar") is a photovoltaic solar power facility located just outside the town of Perry, Florida. The facility was built in 2016 and currently includes approximately 22,000 solar panels with a total plant capacity of 5 MW. Perry Solar is new to this Study.

3.14 Suwannee River Station

The Suwannee River plant is located approximately 13 miles northwest of Live Oak, Florida. The facility includes three simple cycle combustion turbines, with a total summer net capacity of 149 MW. Table 3-13 displays all the units included in the Suwannee River estimate.

Table 3-12: Suwannee River Summary

Unit	Generation Technology	Fuel Type	Summer Net Capacity (MW)	In Service Date
1	Combustion Turbine	Natural Gas	49	1980
2	Combustion Turbine	Fuel Oil	50	1980
3	Combustion Turbine	Natural Gas	50	1980

Built in 1980, Units 1 through 3 include two Pratt & Whitney FT4C3F natural gas and fuel oil-fired combustion turbines each with a summer peak rating of approximately 50 MW.

Suwannee River plant also includes three natural gas-fired boilers steam turbines. However, review of these units was excluded from the scope of this Study, because they were retired from service in 2016 prior to commencement of the Study. The dismantlement of any facilities shared with these units will be called out specifically.

3.15 Tiger Bay Station

The Tiger Bay plant is located approximately three miles west of Fort Meade, Florida. The facility includes a 1-on-1 combined cycle unit with a total summer net capacity of 200 MW. Built in 1995, and acquired by Duke Energy in 1997, the Unit includes a GE 7FA natural gas-fired combustion turbine, one Detac HRSG, and a GE steam turbine. Cooling water for the condenser is taken from the Hines facility.

The site uses a convection cooling tower for heat rejection. Table 3-13 displays all the units included in the Tiger Bay estimate. No changes have been made to Tiger Bay since the 2008 study was performed.

Table 3-13: Tiger Bay Summary

Unit	Generation Technology	Fuel Type	Summer Net Capacity (MW)	In Service Date
1CC	Combined Cycle	Natural Gas	200	1997

3.16 University of Florida Station

The University of Florida plant is located on the University of Florida Campus in Gainesville, Florida. The facility includes a GE-LM6000 combustion turbine operating in a cogeneration (combined heat and power, or "CHP") cycle. The waste heat from combustion is used to provide process heat to various functions throughout the campus. Table 3-14 displays all the units included in the University of Florida estimate. No changes have been made to the University of Florida plant since the 2008 study was performed.

Table 3-14: University of Florida Summary

Unit	Generation Technology	Fuel Type	Summer Net Capacity (MW)	In Service Date
1	Combined Cycle	Natural Gas	47	1993

4.0 DISMANTLEMENT COSTS

Burns & McDonnell has prepared dismantlement cost estimates for the Plants. When DEF determines that each site should be retired, the above grade equipment and steel structures are assumed to have sufficient scrap value to a salvage contractor to offset a portion of the site dismantlement costs. However, DEF will incur costs of dismantlement of the Plants and restoration of the site to the extent that those costs exceed the salvage value of equipment and bulk steel.

The dismantlement costs include the cost to return the site to an industrial condition, suitable for reuse for development of an industrial facility. Included are the costs to dismantle all the assets owned by DEF at the site, including power generating equipment and BOP facilities, as well as environmental site restoration activities.

For purposes of this study, Burns & McDonnell has assumed that each site will be demolished as a single project, allowing the most cost-effective demolition methods to be utilized. A summary of several of the means and methods that could be employed are summarized in the following paragraphs; however, means and methods will not be dictated to the contractor by Burns & McDonnell. It will be the contractor's responsibility to determine means and methods that result in safely dismantlement the Plants at the lowest possible cost.

Asbestos remediation, as required, would take place prior to commencement of any other demolition activities. Abatement would need to be performed in compliance with all state and federal regulations, including, but not limited to requirements for sealing off work areas and maintaining negative pressure throughout the removal process. Final clearances and approvals would need to be achieved prior to performing further demolition activities.

High grade assets would then be removed from the site, to the extent possible. This would include items such as transformers, transformer coils, circuit breakers, electrical wire, condenser plates and tubes, and heater tubes. High grade assets include precious alloys such as copper, aluminum-brass tubes, stainless steel tubes, and other high value metals occurring in plant systems. High grade asset removal would occur up-front in the schedule, to reduce the potential for vandalism, to increase cash flow, and for separation of recyclable materials to increase scrap recovery. Methods of removal vary with the location and nature of the asset. Small transformers, small equipment, and wires would likely be removed and shipped as-is for processing at a scrap yard. Large transformers, combustion turbines ("CT"), steam turbine generators ("STG"), and condensers would likely require some on-site disassembly prior to being shipped to a scrap yard.

Construction and Demolition ("C&D") waste includes items such as non-asbestos insulation, roofing, wood, drywall, plastics, and other non-metallic materials. C&D waste would typically be segregated from scrap and concrete to avoid cross-contamination of waste streams or recycle streams. C&D crews could remove these materials with equipment such as excavators equipped with material handling attachments, skid steers, etc. This material would be consolidated and loaded into bulk containers for disposal.

In general, boilers and heat recovery steam generators ("HRSG") could be felled and cut into manageable sized pieces on the ground. First the structures around the boilers would need to be removed using excavators equipped with shears and grapples. Stairs, grating, elevators, and other high structures would be removed using an "ultra-high reach" excavator, equipped with shears. Following removal of these structures, the boilers or HRSGs would be felled, using explosive blasts. The boilers would then be dismantled using equipment such as excavators equipped with shears and grapples, and the scrap metal loaded onto trailers for recycling.

After the surrounding structures and ductwork have been removed, the stacks would be imploded, using controlled blasts. Following implosion, the stack liners and concrete would be reduced in size to allow for handling and removal.

BOP structures and foundations would likely be demolished using excavators equipped with hydraulic shears, hydraulic grapples, and impact breakers, along with workers utilizing open flame cutting torches. Steel components would be separated, reduced in size, and loaded onto trailers for recycling. Concrete would be broken into manageable sized pieces and stockpiled for crushing on-site. Concrete pieces would ultimately be loaded into a hopper and fed through a crusher to be sized for on-site disposal.

4.1 General Assumptions for All Sites

The following assumptions were made as the basis of all the cost estimates.

1. All cost estimates are in 2018 dollars.
2. All estimates are budgetary in nature and do not reflect guaranteed costs. Budgetary refers to the nature of the itemized cost estimate for planning purposes only and are not a guarantee.
3. All estimates are based on labor rates from RS means values for a B-8 demolition crew with adjusted rates based on the local site cost index for the Plants.
4. All work will take place in a safe and cost-efficient method.
5. Labor costs are based on a regular 40-hour workweek without overtime.

6. The estimates are inclusive of all costs necessary to properly dismantle all sites to a marketable or usable condition. For purposes of this study and the included cost estimates, the sites will be restored to a condition suitable for industrial use.
7. Abatement of asbestos will precede any other work. After final air quality clearances have been reached, demolition can proceed.
8. It is assumed that all the power stations will be dismantled after all units at a single site are taken out of service, allowing dismantlement of entire sites at once. Existing utilities will remain in place for use by the contractor for the duration of the demolition activities.
9. Soil testing and other on-site testing has not been conducted for this study.
10. Transmission switchyards and substations within the boundaries of the plant are not part of the demolition scope. For purposes of this study, the division between generation assets and transmission assets is at the high voltage connection to the bulk electric system (typically the switchyard bus connection).
11. The costs for relocation of transmission lines, or other transmission assets, are specifically excluded from the dismantlement cost estimates. Any costs necessary to support on-going operation of adjacent or newly proposed units will be allocated to the operating costs of the units not being demolished.
12. All demolition and abatement activities, including removal of asbestos, will be done in accordance with all applicable federal, state and local laws, rules and regulations.
13. Any residual oil or sludge in tanks and pipes will be cleaned up by DEF prior to demolition.
14. The scrap value of the equipment is based on the equipment being at the end of its useful life at the time of demolition; therefore, the equipment will not have a value on the grey market for reinstallation. Equipment will have value as scrap only at the time of site demolition.
15. It is assumed that there will be sufficient area to receive, assemble and temporarily store equipment and materials during demolition.
16. Step-up transformers, auxiliary transformers, and spare transformers are included for demolition and scrap in all estimates.
17. Demolition will include the removal of all structures, equipment, tanks, conveyer systems, ancillary buildings, and any other associated equipment to two feet below grade.
18. To the extent possible, non-contaminated concrete will be crushed and disposed of on-site. During crushing of the concrete, a large magnet is utilized to remove all rebar. All other non-hazardous material with no salvage value will be disposed of off-site at the nearest landfill.

19. All above grade plant structures and materials that would be considered debris such as doors, windows, building finishes, plumbing, HVAC ductwork, lighting fixtures, cable trays, etc., will be disposed of off-site at the nearest landfill.
20. Foundations and ground floor slabs will be removed to two feet below grade. The surface will be graded for drainage using onsite soil and seeded.
21. All pipe supports, and pipe racks will be demolished and scrapped.
22. Three feet of soil beneath the fuel oil tanks will be removed and replaced with clean fill.
23. Hazardous material abatement is included for all sites as necessary, including asbestos, mercury, and polychlorinated biphenyls ("PCBs"). Lead paint coated materials will be handled by certified personnel compliant with Occupational Safety and Health Administration ("OSHA") Standards as necessary but will not be removed prior to demolition. Scrap steel can be taken to scrap brokers with lead paint still intact, and it will not impact the scrap value.
24. All portable tanks will be removed from the site and scrapped, including any propane tanks, oil storage tanks, and waste oil tanks.
25. All production wells will be closed as per state regulations. Production wells will be filled with grout to approximately five feet below surface grade. The top five feet will be over drilled and filled with soil backfill to grade on top of the grout. Monitoring wells will remain intact.
26. All chemicals will be consumed or disposed of by the Plant prior to shut down, including process chemicals in equipment, stored chemicals, and laboratory chemicals.
27. All trash, debris, and miscellaneous waste will be removed and disposed of properly.
28. All Circulating Water Piping will be filled with grout of other structural material and left in the ground.
29. Although properly recoverable through the dismantlement reserve, no environmental costs have been included to address cleanup of contaminated soils, hazardous materials, or other conditions present on-site having a negative environmental impact, other than those specifically listed in these assumptions. No allowances are included for unforeseen environmental remediation activities at this time, but will be captured and included in future studies when they are available.
30. Handling and disposal of hazardous material will be performed in compliance with the approved methods of DEF's Environmental Services Department.
31. Stormwater ponds will be drained, and the area graded out to allow for natural drainage.
32. Site areas will be graded to achieve suitable site drainage to natural drainage patterns, but grading will be minimized to the extent possible.
33. Existing basements will be used to bury non-hazardous debris. Concrete in trenches and basements will be perforated to create drainage. Non-hazardous debris, such as concrete will be

crushed and used as clean fill on-site once the capacity of all existing basements has been exceeded. All inert debris will be disposed of on-site. Costs for offsite disposal are included for materials not classified as inert debris.

34. Major equipment, structural steel, CTs, generators, inlet filters, exhaust stacks, transformers, electrical equipment, cabling, wiring, pump skids, above ground piping, and equipment enclosures for the above equipment will be sold for scrap and removed from the Plant site by the demolition contractor. All other demolished materials are considered debris.
35. Valuation and sale of land and all replacement generation costs are excluded from this scope.
36. A 20 percent contingency was included on the direct costs in the estimates prepared as part of this study to cover unknowns.
37. End-of-life inventory values have been provided by DEF and are included in the study as a plant cost. Burns & McDonnell assumes ten percent of the plant inventory value will be recovered as a scrap credit. The inventory cost is not included in the calculation for contingency and indirect costs.
38. Rolling stock, including rail cars, dozers, plant vehicles, etc. is assumed to be removed by DEF prior to dismantlement.
39. The scope of the costs included in the Study is limited to the dismantlement activities that will occur at the end of useful life of the facilities. Additional on-going costs may be required, including, but not limited to groundwater monitoring associated with ash pond closure and/or other environmental monitoring activities. These costs are excluded from the cost estimates provided in this study.
40. Indirect costs are included in the cost estimate to cover owner expenses such as management trailers, utilities, etc. which may impact the cost of dismantlement each site. An indirect cost of five (5) percent was included in the estimates to cover such costs.
41. Market conditions may result in cost variations at the time of contract execution.
42. In the absence of detailed information, such as plant layout or equipment drawings, Burns & McDonnell assumed information with the use of publicly available data and Burns & McDonnell's industry experience.
43. Scrap values were determined using the American Metal Market reports from September 2017 through August 2018. Prices were optimized by minimizing transportation cost and maximizing scrap value for the nearest hubs. The prices presented in Table 4-1 are the scrap values for the Atlanta hub less the cost of transportation. The prices for stainless steel are for the Houston hub less the cost of transportation.

Table 4-1: Scrap Value Summary (2018$)

Plant Name	Steel (Per Net Ton)	Copper (Per Pound)	Aluminum (Per Pound)	Stainless (Per Net Ton)	Brass (Per Pound)
Anclote	($198.25)	($2.28)	($0.43)	($759.13)	($1.44)
Avon Park	($201.75)	($2.28)	($0.43)	($762.63)	($1.45)
Bartow	($201.23)	($2.28)	($0.43)	($762.11)	($1.45)
Bayboro	($202.80)	($2.28)	($0.43)	($763.68)	($1.45)
Citrus County	($195.97)	($2.28)	($0.43)	($756.85)	($1.44)
Crystal River	($195.97)	($2.28)	($0.43)	($756.85)	($1.44)
Crystal River Helper	($195.97)	($2.28)	($0.43)	($756.85)	($1.44)
Crystal River	($195.97)	($2.28)	($0.43)	($756.85)	($1.44)
Crystal River North	($195.97)	($2.28)	($0.43)	($756.85)	($1.44)
Crystal River South	($195.97)	($2.28)	($0.43)	($756.85)	($1.44)
DeBary	($205.71)	($2.28)	($0.43)	($766.59)	($1.45)
Higgins	($202.10)	($2.28)	($0.43)	($762.98)	($1.45)
Hines	($200.00)	($2.28)	($0.43)	($760.88)	($1.44)
Intercession City	($206.06)	($2.28)	($0.43)	($766.94)	($1.45)
Osceola	($205.07)	($2.28)	($0.43)	($765.95)	($1.45)
Osprey	($200.00)	($2.28)	($0.43)	($760.88)	($1.44)
Perry	($208.22)	($2.29)	($0.43)	($769.10)	($1.45)
Suwannee River	($199.59)	($2.28)	($0.43)	($760.47)	($1.44)
Tiger Bay	($198.18)	($2.28)	($0.43)	($759.06)	($1.44)
University of Florida	($202.80)	($2.28)	($0.43)	($763.68)	($1.45)

4.2 Site Specific Dismantlement Assumptions

The following assumptions were made specific to each plant cost estimate.

4.2.1 Anclote Station

1. The intake and discharge canals will remain in place in their current state.
2. The existing grade will remain as-is even though it is 14 feet above the original grade.
3. The canal access roads will remain in place.

4.2.2 Avon Park Station

1. No site-specific assumptions.

4.2.3 Bartow Station

1. The existing discharge canal will be filled, closed, and capped.
2. The existing intake structure with seawalls will remain in place.

4.2.4 Bayboro Station

1. No site-specific assumptions.

4.2.5 Citrus County Combined Cycle

1. Titanium scrap pricing is derived from a national average since the American Metal Market reports do not display the scrap pricing at any of the individual hubs.
2. Burns & McDonnell assumes titanium scrap would be transported to the Atlanta hub.
3. Citrus County Combined Cycle is the only plant with titanium scrap. Titanium scrap pricing less transportation for Citrus County Combined Cycle is $8.06 per pound.

4.2.6 Crystal River Station

1. Asbestos abatement will be required, and the quantities for asbestos abatement are the same as those from the 2008 study.
2. The limestone back haul facility is owned by a third party and is not included in the estimate.
3. New scrubbers have been installed and are included in the estimate.
4. The area is non-hazardous.
5. Demolition will be performed using conventional and explosive methods. This estimate does not include alternate work methods or stoppages to accommodate possible concerns associated with performing demolition in close proximity to the nuclear facility on-site.
6. The Mariculture Center on-site is included in this study, but is not included in the Crystal River estimate. The Mariculture Center estimate is a stand-alone estimate.
7. Costs are included for closure of the ash landfill. Closure costs include costs required to remove associated piping and the access road to the landfill, as well as costs required to cover the area with a geosynthetic clay liner, a geocomposite layer for drainage, 18 inches of protective soil cover, and 6 inches of vegetative soil. The area will be graded and seeded.

4.2.7 DeBary Station

1. Two wells provide raw water to the facility and are included in the estimate.

4.2.8 Higgins Station

1. All steam plants have been demolished and covered with two feet of soil with seeding. No additional costs associated with these units are included in the estimate.
2. The combustion turbines and the supporting BOP equipment are all that remain for dismantlement.
3. The fuel oil tank on-site has been drained and cleaned ready for demolition.

4.2.9 Hines Station

1. New combustion turbine inlet chilling equipment has been added to the site and is included in the dismantlement estimate.

4.2.10 Intercession City Station

1. The fuel oil tank on-site is lined with HDPE. The HDPE removal is included in the estimate.

4.2.11 Osceola Solar Station

1. There are no site-specific assumptions.

4.2.12 Osprey Station

1. There are no site-specific assumptions.

4.2.13 Perry Solar Station

1. There are no site-specific assumptions.

4.2.14 Suwannee River Station

1. The existing intake and discharge canals will remain in their current state.

4.2.15 Tiger Bay Station

1. The extraction steam line and associated Auxiliary Boiler have been removed. This change has been accounted for in the estimate.

4.2.16 University of Florida Station

1. The existing above ground tanks are property of the University of Florida and are not included in the estimate.

4.3 Scrap Pricing Sensitivity

Burns & McDonnell typically uses a rolling 12-month average to determine the normalized value of scrap at facilities in order to account for the variability of scrap prices over time. Historical scrap prices were used to determine the maximum and minimum values that may be allocated as scrap credit. This provides a greater insight to the range of dismantlement costs that could be expected at the DEF facilities. Burns & McDonnell conducted a sensitivity analysis using 10 years of Federal Reserve indices to adjust current scrap pricing. Burns & McDonnell used the maximum and minimum indices to adjust the current scrap pricing for both sensitivity analyses. Burns & McDonnell obtained indices from varying months and years to maximize or minimize the scrap credit at the facilities. The scrap sensitivity analysis did not adjust the cost or credit received from plant end-of-life inventory as the plant inventory calculation is independent of fluctuation within the scrap market. Table 4-2 presents the high scrap values from the historical data used in Burns & McDonnell's sensitivity analysis.

Table 4-2: Summary of High Scrap Prices in the Sensitivity Analysis(2018$)

Plant Name	Steel (Per Net Ton)	Copper (Per Pound)	Aluminum (Per Pound)	Stainless (Per Net Ton)	Brass (Per Pound)
Anclote	($236.25)	($4.68)	($0.42)	($796.46)	($1.87)

Citrus County Combined Cycle was the only facility with titanium scrap. The titanium high scrap value at Citrus County Combined Cycle was determined to be $ 13.07 per pound. All scrap prices required adjusting since none of the scrap indexes are currently experiencing a maximum value. Table 4-3 presents

a summary of the dismantlement cost for each Plant using the scrap values from the high sensitivity analysis.

Table 4-3: Site Dismantlement Cost Using High Scrap Prices (2018$)

Plant	Dismantlement Costs	Credits	Net Project Cost
Anclote Station	$ 29,194,000	$ (16,646,000)	**$ 12,548,000**
Avon Park Station	$ 967,000	$ (810,000)	**$ 157,000**
Bartow Station	$ 30,783,000	$ (15,188,000)	**$ 15,595,000**
Bayboro Station	$ 2,972,000	$ (2,548,000)	**$ 424,000**
Citrus County	$ 24,871,000	$ (23,720,000)	**$ 1,151,000**
Crystal River Common	$ 33,945,000	$ (986,000)	**$ 32,959,000**
Crystal River Helper	$ 5,900,000	$ (728,000)	**$ 5,172,000**
Crystal River Mariculture	$ 1,363,000	$ (-)	**$ 1,363,000**
Crystal River North	$ 73,052,000	$ (33,411,000)	**$ 39,641,000**
Crystal River South	$ 64,474,000	$ (18,669,000)	**$ 45,805,000**
DeBary Station	$ 16,209,000	$ (9,010,000)	**$ 7,199,000**
Higgins Station	$ 2,103,000	$ (1,426,000)	**$ 677,000**
Hines Station	$ 40,524,000	$ (23,960,000)	**$ 16,564,000**
Intercession City Station	$ 16,110,000	$ (10,077,000)	**$ 6,033,000**
Osceola Solar Center	$ 548,375	$ (135,400)	**$ 412,975**
Osprey Station	$ 10,085,000	$ (7,552,000)	**$ 2,533,000**
Perry Solar Center	$ 736,750	$ (242,100)	**$ 494,650**
Suwannee River Station	$ 2,725,000	$ (1,649,000)	**$ 1,076,000**
Tiger Bay Station	$ 5,428,000	$ (2,723,000)	**$ 2,705,000**
University of Florida Station	$ 2,474,000	$ (848,000)	**$ 1,626,000**

There was no change in the Crystal River Mariculture estimate since there is no scrap at the facility. Scrap pricing has no effect on the dismantlement cost of each plant, which remained unchanged in the high scrap price sensitivity analysis. Table 4-4 presents the low scrap values used in Burns & McDonnell's low scrap price sensitivity analysis.

Table 4-4: Summary of Low Scrap Prices in the Sensitivity Analysis (2018$)

Plant Name	Steel (Per Net Ton)	Copper (Per Pound)	Aluminum (Per Pound)	Stainless (Per Net Ton)	Brass (Per Pound)

Citrus County Combined Cycle was the only facility with titanium scrap. The titanium low scrap value at Citrus County Combined Cycle was determined to be $ 7.52 per pound. All scrap prices required adjusting since none of the scrap indexes are currently experiencing a minimum value. Table 4-5 presents a summary of the dismantlement cost for each Plant using the scrap values from the low sensitivity analysis.

Table 4-5: Site Dismantlement Cost Using Low Scrap Prices (2018$)

Plant	Dismantlement Costs	Credits	Net Project Cost
Anclote Station	$ 29,194,000	$ (8,305,000)	**$ 20,889,000**
Avon Park Station	$ 967,000	$ (399,000)	**$ 568,000**
Bartow Station	$ 30,783,000	$ (8,410,000)	**$ 22,373,000**
Bayboro Station	$ 2,972,000	$ (1,273,000)	**$ 1,699,000**
Citrus County	$ 24,871,000	$ (12,646,000)	**$ 12,225,000**
Crystal River Common	$ 33,945,000	$ (708,000)	**$ 33,237,000**
Crystal River Helper	$ 5,900,000	$ (407,000)	**$ 5,493,000**
Crystal River Mariculture	$ 1,363,000	$ (-)	**$ 1,363,000**
Crystal River North	$ 75,052,000	$ (21,106,000)	**$ 51,946,000**
Crystal River South	$ 64,474,000	$ (10,113,000)	**$ 54,361,000**
DeBary Station	$ 16,209,000	$ (4,572,000)	**$ 11,637,000**
Higgins Station	$ 2,103,000	$ (736,000)	**$ 1,367,000**
Hines Station	$ 40,524,000	$ (12,204,000)	**$ 28,320,000**
Intercession City Station	$ 16,110,000	$ (5,178,000)	**$ 10,932,000**
Osceola Solar Center	$ 548,375	$ (65,500)	**$ 482,875**
Osprey Station	$ 10,085,000	$ (3,852,000)	**$ 6,233,000**
Perry Solar Center	$ 736,750	$ (115,800)	**$ 620,950**
Suwannee River Station	$ 2,725,000	$ (825,000)	**$ 1,900,000**
Tiger Bay Station	$ 5,428,000	$ (1,395,000)	**$ 4,033,000**
University of Florida Station	$ 2,474,000	$ (481,000)	**$ 1,993,000**

There was no change in the Crystal River Mariculture estimate since there is no scrap at the facility. Scrap pricing has no effect on the dismantlement cost of the plant and remained unchanged in the low scrap price sensitivity analysis.

Burns & McDonnell has provided the high-price and low-price sensitivity analyses to indicate the range of scrap credit each facility could be capable of recovering. Burns & McDonnell does not suggest using these values as the current scrap credits available at each facility. Burns & McDonnell suggests using the 12-month average of scrap values obtained from historical data. Using the current rolling 12-month average will provide an accurate representation of recoverable costs from scrap at each facility.

4.4 Site Specific Scrap Quantity

Burns & McDonnell's dismantlement cost model requires site quantities as an input. Burns & McDonnell developed quantities at each site by using DEF provided drawings and industry knowledge of equipment characteristics. Table 4-6 displays the quantities of steel, concrete and copper at each plant within the DEF fleet. Often condensers and other BOP equipment at plants are made of precious metals, which is accounted for in the models, but is not presented in Table 4-6.

Table 4-6: DEF Site Quantities

Plant Name	Steel (Net Tons)	Concrete (Cubic Yards)	Copper (Pounds)
Anclote	36,809	19,706	1,617,082
Avon Park	1,237	577	109,314
Bartow	24,563	30,285	1,570,094
Bayboro	3,453	2,522	360,653
Citrus County	24,591	14,623	1,814,846

University of Florida	1,480	1,053	78,299

4.5 Results

Table 4-7 presents a summary of the dismantlement cost for each Plant. This summary provides a breakout of the major dismantlement activities and the scrap value for the Plant.

Table 4-7: Site Dismantlement Cost (2018$)

Plant	Dismantlement Costs	Credits	Net Project Cost
Anclote Station	$ 29,194,000	$ (11,374,000)	**$ 17,820,000**
Avon Park Station	$ 967,000	$ (501,000)	**$ 466,000**
Bartow Station	$ 30,783,000	$ (10,430,000)	**$ 20,353,000**
Bayboro Station	$ 2,972,000	$ (1,550,000)	**$ 1,422,000**
Citrus County Combined Cycle	$ 24,871,000	$ (15,020,000)	**$ 9,851,000**
Crystal River Common	$ 33,945,000	$ (781,000)	**$ 33,164,000**
Crystal River Helper	$ 5,900,000	$ (477,000)	**$ 5,423,000**
Crystal River Mariculture	$ 1,363,000	$ (-)	**$ 1,363,000**
Crystal River North	$ 73,052,000	$ (27,210,000)	**$ 45,842,000**
Crystal River South	$ 64,474,000	$ (13,838,000)	**$ 50,636,000**
DeBary Station	$ 16,209,000	$ (5,344,000)	**$ 10,865,000**
Higgins Station	$ 2,103,000	$ (901,000)	**$ 1,202,000**
Hines Station	$ 40,524,000	$ (15,903,000)	**$ 24,621,000**
Intercession City Station	$ 16,110,000	$ (6,170,000)	**$ 9,940,000**
Osceola Solar Center	$ 548,375	$ (104,000)	**$ 444,375**
Osprey Station	$ 10,085,000	$ (5,106,000)	**$ 4,979,000**
Perry Solar Center	$ 736,750	$ (192,200)	**$ 544,550**
Suwannee River Station	$ 2,725,000	$ (1,006,000)	**$ 1,719,000**
Tiger Bay Station	$ 5,428,000	$ (1,832,000)	**$ 3,596,000**
University of Florida Station	$ 2,474,000	$ (604,000)	**$ 1,870,000**

Using the normalized net dismantlement costs at Osceola Solar Center and Perry Solar Center DEF can estimate the expected dismantlement cost at any future solar facility added to the generation fleet. Table 4-8 presents a summary of the normalized net dismantlement cost for both solar Plants.

Table 4-8: Normalized Net Dismantlement Cost (2018$/acres)

Plant	Dismantlement Costs
Osceola Solar Center	$ 21,047
Perry Solar Center	$ 25,648

Risk Profile

The following is a summary Description of analyses performed by ABS Consulting of Duke Energy Florida's ("Duke") hurricane loss exposure and reserve performance. This report is intended to be used solely by Duke and the Florida Public Service Commission for estimation of potential future Duke losses to the reserve and the estimation of the performance of the reserve.

OWNER	**Duke Energy Florida**	
ASSETS	Transmission and Distribution (T & D) System: Transmission towers, and conductors; Distribution poles, transformers, conductors, lighting and other miscellaneous assets; Non-recovered property insurance policy Deductibles.	
LOCATION	All aerial T & D assets located within the State of Florida,	
ASSET VALUE	Normal replacement value is approximately $10,700 million, of which approximately 30% is transmission and 70% is distribution	
LOSS PERILS	Hurricane Windstorm (SSI 1 to 5)	
	Hurricane Hazard (one year)	
EXPECTED ANNUAL LOSS	$81.8 million	
1% AGGREGATE DAMAGE EXCEEDANCE VALUE	$1,080 million	
Reserve Analysis Case	**Expected balance at 5 years**	**Probability of negative balance within 5 years**
$132 million Initial Balance 1 Year Recovery of Negative Balances	Negative ($56.2 million)	67.9%

Table of Contents

1. Hurricane Loss Analysis

Duke Energy Florida, Inc. (“Duke”) transmission and distribution (T & D) systems and general property are exposed to and in the past have sustained damage from hurricanes. The exposure of these assets to hurricane wind damage is described and potential losses are quantified. Loss analyses were performed using a computer model simulation program *Risk Quantification and Engineering* (RQE®). The proprietary computer software RQE is evaluated and determined acceptable by the Florida Commission on Hurricane Loss Projection Methodology (FCHLPM) for projecting hurricane loss costs (Reference 1).

Hurricane damage results which are presented here have been calculated using RQE, and the Duke provided T & D asset portfolio data. Factors considered in the analysis include the location of Duke’s aerial T & D assets, the probability of hurricanes of different intensities and/or landfall points impacting those assets, the vulnerability of those assets to hurricane damage, and the costs to repair assets and restore electrical service.

RQE Modeling Methodology

Natural Catastrophe (NatCAT) modling is the process of using computer-assisted calculations to estimate losses that could be sustained due to hurricanes, ice storms, earthquakes, floods and other similar events. NatCAT modeling has developed over the past few decades to be the standard methodology utilized in the insurance industry to analyze potential losses and is at the confluence of many disciplines including actuarial science, engineering, meteorology, and computer science. NatCAT models utilize a class of computer programs called geographic information systems (GIS). GIS allow the storage, manipulation, analysis, and management, of the very large quantities of geographical and other data required by NatCAT simulation models.

Natural catastrophic events have low probabilities of occurrence and high consequences, and there have not been the large numbers of actual loss events affecting the built infrastructure that would be required for actuarial analysis of these perils. Therefore, simulation modeling has been developed, using known science of meteorology, to allow modeling of the many more hurricane events that are possible, but have not yet been observed.

Model Components

Hurricane simulation models are developed using four model components: hazard, assets at risk, vulnerability, and damage which are described here.

Hurricane Hazard Model

First, the hazard component of the hurricane model describes three basic attributes of the hazard. These are the location of events, their frequency of occurrence, and their severity. Hazard models are developed using available historical hurricane information from inventories and catalogs of actual historical events. The historical record for hurricanes is only about a century long in the United States, with the most modern scientific observations and measurements having been made in the last half of the twentieth century.

Synthetic hurricanes are generated using scientific parameters observed in past historical events. For hurricanes, central pressure, wind speed, radius to maximum winds, hurricane track, are among the important modeled parameters. For each hurricane variable, the model uses probability distributions that describe the range of values each variable may have to construct synthetic events. These probability distributions are used to produce thousands of scientifically possible simulated events with varying severities and frequencies called a stochastic event set. These large stochastic event sets provide a more realistic representation of the full range of potential hurricanes that could happen, but have not yet been observed in our limited historical observation period.

Portfolio Model – Assets at Risk

Second, assets at risk are an essential component of catastrophe models. The risk model requires defining of the portfolio of properties at risk. It is basically putting together all the relevant information of the transmission and distribution asset portfolio including location, values at risk, structural types.

The inventory of assets at risk are managed in GIS data bases and describe the basic asset attributes of location, value, structure type to allow the estimation of potential damage to structures and associated assets. The estimation of damage from hurricane events requires estimation of hazard parameters at the location of each asset at risk. Model computations are performed in the hazard module to estimate how the local

hazard intensity (peak gust wind speed) varies over the areas where assets are at risk for each simulated event. Transmission and Distribution asset value data are provided in the Tables 1-1 and 1-2 below. Distribution and transmission asset values are shown in Figure 1-1 and Figure 1-2 respectively.

Vulnerability Model

Third, is the model vulnerability component. Damage to structures varies with the intensity of the forces from hurricane winds. Damage also varies with other asset characteristics such as type of structure. Vulnerability functions account for variability by assigning a probability distribution bounded by 0% and 100% with a prescribed mean value and standard deviation.

The Duke loss history from the 2004 Hurricanes Charley, Frances, and Jeanne, and the 2017 and 2018 Hurricanes Michael and Irma were considered in the modeling. These hurricanes provide data on recent storm recovery costs. The historical hurricane loss experience includes the effects of many factors including the post hurricane costs of labor and other factors associated with the hurricane restoration process utilized by Duke. This loss history is believed to be most reflective of the current Duke hurricane restoration practices and cost experience.

Damage Model

Lastly, the model damage component estimates the damage to the assets at risk that are sustained as a result of the local hazard intensity of each simulated event. Damage is estimated by the relationship between the local hazard intensity at each asset location and the vulnerability of the asset.

Damage to each asset for each of the stochastic events is estimated and aggregated along with the frequency of each event. The damages at the site are combined probabilistically to develop the damage distribution. In this way, a large database of damage is developed for all events that can cause damage to the asset portfolio.

These databases of damage and frequency are used to develop probability distributions of event driven losses. The individual damage estimates for each possible event are probabilistically aggregated to estimate overall expected (annual) damage and damage non-exceedance values. The expected annual damage represents the aggregate of the

annualized damages from all relevant probabilistic events. It is a common measure of the hazard severity in the region of interest.

Damage is defined as the cost associated with repair and/or replacement of T & D assets, and to promptly restore service in a post-storm environment. This cost is typically larger than the costs associated with scheduled repair and replacement programs. This study includes costs associated with hurricane damage, service restoration and insured property deductibles.

2. Hurricane Hazard

Hurricane Exposure

The hurricane wind exposure is analyzed from a probabilistic approach, which considers the full range of potential hurricane characteristics and corresponding losses. RQE is a probabilistic model designed to estimate damage and losses due to the occurrence of hurricanes. The proprietary computer software RQE is evaluated and determined acceptable by the Florida Commission on Hurricane Loss Projection Methodology for projecting hurricane loss costs.

The historical annual frequency of hurricanes has varied significantly over time. There are many causes for the temporal variability in hurricane formation. While stochastic variability is a significant factor, many scientists believe that the formation of hurricanes is also related to climate variability.

One of the primary climate cycles having a significant correlation with Hurricane activity is the Atlantic Multidecadal Oscillation (AMO). It has been suggested that the formation of hurricanes in the Atlantic Ocean off the coast of Africa is related to the amount of rainfall in the Western African Sahel region. Years in which rainfall is heavy have been associated with the formation of a greater number of hurricanes. The AMO cycle consists of a warm phase, during which the tropical and sub-tropical North Atlantic have warmer than average temperatures at the surface and in the upper portion relevant to hurricane activity, and a cool phase, during which these regions of the ocean have cooler than average temperatures. In the period 1900 through the present, the AMO has gone through the following phases:

1900 through 1925	Cool	(decreased Hurricane Activity)
1926 through 1969	Warm	(Increased Hurricane Activity)
1970 through 1994	Cool	(decreased Hurricane Activity)
1995 through present	Warm	(Increased Hurricane Activity)

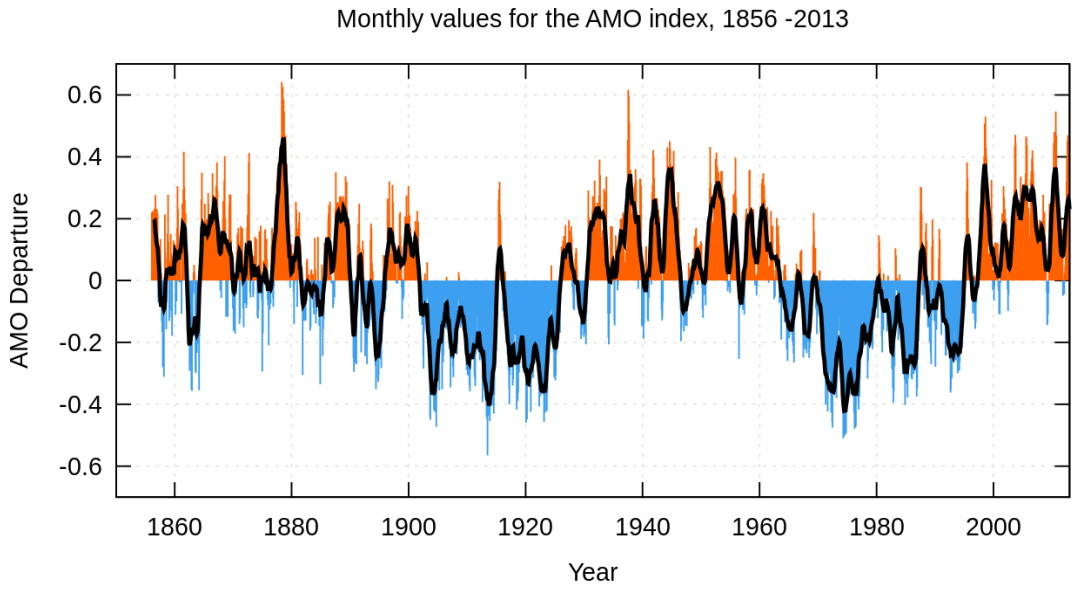

Figure 2-1: Atlantic Multidecadal Oscillation index computed as the linearly detrended North Atlantic sea surface temperature anomalies 1856-2013.

These AMO phases are illustrated by the plot of Sea Surface Temperature (SST) Anomalies (deviation from mean temperatures in °C) in the Atlantic Basin over the past 138 years in Figure 2-1.

The National Oceanic and Atmospheric Administration (NOAA) believes that we entered a warm phase of AMO in the mid-1990s. Historically, each phase of AMO has lasted approximately 20 to 40 years.

Probabilistic annual damage & restoration cost is computed using the results of thousands of random variable hurricanes considering the near-term hurricane hazard of the current warm phase. Annual damage estimates are developed for each individual asset site and aggregated to overall portfolio damage amounts. Damage is defined as the total cost including the operations and maintenance (O&M) and capital components associated with repair and/or replacement of T & D assets, and to promptly restore service in a post storm environment. This cost is typically larger than the costs associated with scheduled repair and replacement programs.

Factors considered in the analysis include the location of Duke's T & D assets, the probability of hurricanes of different intensities and/or landfall points impacting those assets, the vulnerability of those assets to hurricane damage, and the costs to repair assets and restore electrical service.

3. Hurricane Loss Analysis Results

Aggregate Loss Exceedance and Expected Annual Loss

A probabilistic database of T&D is developed using the hurricane hazard, assets at risk and their vulnerabilities. The analysis utilizes the current near-term hurricane hazard. For each hurricane, the center, shape, geographical orientation, track and wind speeds were defined. The wind field for each hurricane is integrated with the asset vulnerability and the asset locations to compute the damage. The annual frequency and the portfolio damage for each are simulated. By using this database of thousands of hurricane losses, various loss non-exceedance distributions are generated.

The frequencies and computed damage for all hurricanes are combined to calculate the expected annual loss and the annual aggregate exceedance relations.

Aggregate damage exceedance calculations are developed by keeping a running total of damage from ***all possible events*** in a year. At the end of each time period, the aggregate damage for all events is then determined by probabilistically summing the damage distribution from each event, taking into account the event frequency. The process considers the probability of having zero events, one event, two events, etc. during a year.

A series of probabilistic analyses were performed, using the vulnerability for Duke assets and the computer program RQE. A summary of the analysis is presented in Table 3-1, which shows the aggregate damage exceedance probability for damage layers between zero and over $1,000 million dollars.

The analysis calculates the probability of damage from all hurricanes and aggregates the total.

Table 3-1 provides the aggregate damage exceedance probabilities for the Duke T&D assets analyzed for a series of layers. Each layer has a layer amount of $50 million. For each damage layer shown, the probability of damage exceeding a specified value is shown. The value in the first column, labeled Damage Layer, is the attachment point for each layer. The second column of the table, labeled 1 year Exceedance Probability,

provides the annual modeled probability of penetrating each layer, i.e. the probability that the total damage from all events in a 1 year period will exceed the attachment point of the layer. For example, the probability of damage exceeding $200 million in one year is 6.96%.

The expected annual loss (EAL) and exposure to Duke's reserve from hurricane damage to T&D is $81.8 million. This value represents the average loss from all simulated hurricanes. The EAL is not expected to occur each and every year. Some years will have no damage from hurricanes, some years will have small amounts of damage and a few years will have large amounts of damage. The EAL represents the average of all hurricane years over a long period of time.

It should be noted that the National Oceanographic and Atmospheric Administration (NOAA) believes that in the mid-1990s we entered a period of heightened hurricane formation in the Atlantic Basin and near-term frequencies of hurricanes over the current warm phase are significantly higher than those over the long term.

Table 3-1

T & D ASSETS
AGGREGATE DAMAGE EXCEEDANCE PROBABILITIES

Damage Layer ($millions)	1 Year Exceedance Probability
(≥ 5)	40.7%
50,000	24.2%
100,000	16.0%
150,000	10.67%
200,000	6.96%
250,000	4.92%
300,000	3.73%
350,000	2.96%
400,000	2.53%
450,000	2.09%
500,000	1.88%
550,000	1.73%
600,000	1.58%
650,000	1.43%
700,000	1.27%
750,000	1.12%
800,000	0.98%
850,000	0.90%
900,000	0.84%
950,000	0.78%
1,000,000	0.72%

4. Reserve Performance Analysis

A probabilistic analysis of losses from hurricanes was performed for Duke Energy Florida to determine their potential impact on the reserve. The analysis included transmission and distribution (T&D) damage as well as estimates of insurance deductibles paid on insured property assets.

Analysis

The reserve performance analysis consisted of performing 10,000 iterations of hurricane loss simulations within the Duke Energy Florida service territory, each covering a 5-year prospective period, to determine the effect of the charges for damage on the Duke reserve. Monte Carlo simulations were used to generate damage samples for the analysis. The one year damage and frequency distribution is described in the hurricane hazard analysis above. The analysis provides an estimate of the reserve balance in each year of the simulation, accounting for hurricane damage using a dynamic financial model.

The performance analysis assumes an initial $132 million reserve balance. In years when the reserve has a negative balance due to hurricane losses, Duke's recovery of hurricane costs will be governed by a Storm Cost Recovery Mechanism as an appropriate way to assure solvency.

Assumptions

The analysis performed included the following assumptions:

- An initial reserve balance of $132 million.
- Hurricane losses are assumed to increase by 3% per year as replacement values of T&D increase due to system growth and inflation.
- In years when the reserve has a negative balance, the shortfall is assumed to be recovered over the following one year period.
- $70.8 million of the $81.8 million Expected Annual Loss, determined in the Loss Analysis, is assumed to be an obligation of the reserve. This includes

- estimates of the impact of the T&D Storm Hardening Program over the 5 year prospective period, and capital costs excluded from the reserve.
- Hurricane losses include estimates of property insurance policy deductibles up to the policy limit of $1 million per occurrence.

Figures 4-1 shows the results of the $132 million the initial reserve balance, and a one year recovery of negative reserve balances. The Figure illustrates the expected performance of the reserve. The reserve has a mean (expected) balance of negative ($56.2 million) at the end of the five year simulation. The 5th percentile and 95^{h} percentile 5 year ending reserve balances are negative ($343 million) and $132 million respectively. The reserve has a 67.9% chance of a negative balance in one or more years of the five-year simulation. The reserve has a 66.3% chance of a balance greater than $110 million in one or more years of the five-year simulation.

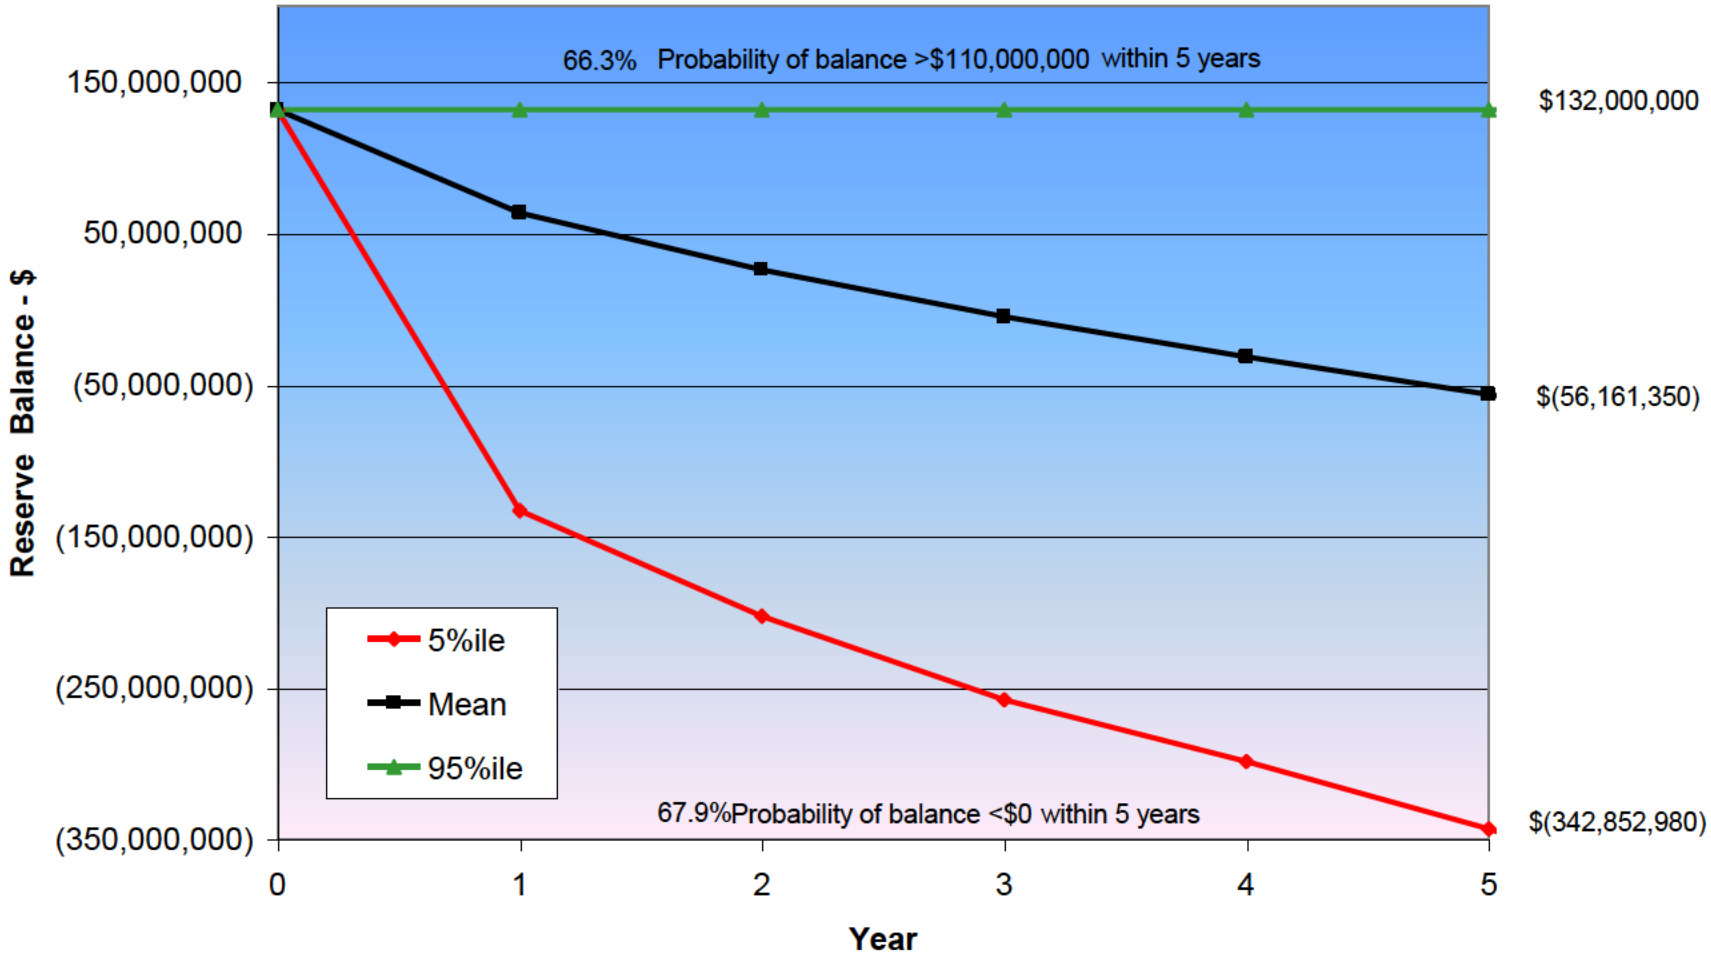

Figure 4-1: Reserve Performance Analyses: $132 million initial balance, and 1 Year recovery of negative balances

Attention: David Doss, Jr.
Director Asset Accounting

Ladies and Gentlemen:

Pursuant to your request, we have conducted a depreciation study related to the electric plant of Duke Energy Florida as of December 31, 2021. The attached report presents a description of the methods used in the estimation of depreciation, the summary of annual and accrued depreciation, the statistical support for the service life and net salvage estimates, and the detailed tabulations of annual and accrued depreciation.

Respectfully submitted,

GANNETT FLEMING VALUATION

DUKE ENERGY FLORIDA

DEPRECIATION STUDY

EXECUTIVE SUMMARY

Pursuant to Duke Energy Florida's ("DEF" or the "Company") request, Gannett Fleming Valuation and Rate Consultants, LLC ("Gannett Fleming") conducted a depreciation study related to electric plant as of December 31, 2021. The purpose of this study was to determine the annual depreciation accrual rates and amounts for book and ratemaking purposes.

The depreciation rates are based on the straight line method using the average service life ("ASL") procedure and were applied on a remaining life basis. The calculations were based on attained ages, estimated service lives and forecasted net salvage characteristics for each depreciable group of assets.

The depreciation study results in annual depreciation rates that result in an increase in annual depreciation expense of approximately $179.4 million as of December 31, 2021 when compared with the current approved depreciation rates. The increase in depreciation is primarily due to additions to the Company's production plant accounts, aligning the depreciation rates for combined cycle assets with the experience and operations of these facilities, and the impact of updating depreciation rates to incorporate plant and reserve activity since the last depreciation study. The recommended depreciation rates do not include the recovery of regulatory assets associated with depreciation. Consistent with the Company's 2017 Settlement Agreement, these costs will be recovered through a separate amortization over the estimated remaining life of the Company's plant in service. Additions to life span property, such as power plants,

generally result in increases to depreciation rates because the new additions are recovered over a shorter period of time than existing assets. The increase resulting from these additions is somewhat mitigated by decreases in depreciation expense due to other factors such as service life and net salvage estimates for certain accounts. Service lives for many transmission and distribution plant accounts have increased from the prior depreciation study, although this has been offset to a degree by a trend to more negative net salvage for some accounts.

Gannett Fleming recommends the calculated remaining life annual depreciation accrual rates set forth herein apply specifically to electric plant in service as of December 31, 2021 as summarized by Table 1 of the study. Supporting analysis and calculations are provided within the study.

The study results set forth an annual depreciation expense $816.8 million applied to depreciable plant balances as of December 31, 2021. The results are summarized at the functional level as follows (amounts are shown in millions of dollars):

SUMMARY OF ORIGINAL COST, ACCRUAL RATES AND AMOUNTS

		EXISTING		PROPOSED		
FUNCTION	ORIGINAL COST	ANNUAL DEPR. RATE	ANNUAL DEPR. ACCRUALS	ANNUAL DEPR. RATE	ANNUAL DEPR. ACCRUALS	INCREASE/ DECREASE

PART I. INTRODUCTION

DUKE ENERGY FLORIDA
DEPRECIATION STUDY

PART I. INTRODUCTION

SCOPE

This report sets forth the results of the depreciation study for Duke Energy Florida ("DEF" or "Company") to determine the annual depreciation accrual rates and amounts for book purposes applicable to the original cost of electric plant as of December 31, 2021. The rates and amounts are based on the straight line remaining life method of depreciation. This report also describes the concepts, methods and judgments which underlie the recommended annual depreciation accrual rates related to electric plant in service as of December 31, 2021.

The service life and net salvage estimates resulting from the study were based on informed judgment which incorporated analyses of historical plant retirement data as recorded through 2019, a review of Company practice and outlook as they relate to changes in technology, plant operation and retirement, and consideration of current practice in the electric industry including knowledge of service lives and net salvage estimates used for other electric companies.

PLAN OF REPORT

Part I, Introduction, contains statements with respect to the plan of the report, and the basis of the study. Part II, Estimation of Survivor Curves, presents descriptions of the considerations and the methods used in the service life study. Part III, Service Life Considerations, presents the factors and judgment utilized in the service life study. Part IV, Net Salvage Considerations, presents the factors and judgment utilized for the net salvage study. Part V, Calculation of Annual and Accrued Depreciation, describes the procedures used in the calculation of group depreciation. Part VI, Results of Study,

presents summaries by depreciable group of annual depreciation accrual rates and amounts, as well as composite remaining lives. Part VII, Service Life Statistics presents the statistical analysis of service life estimates. Part VIII, Net Salvage Statistics sets forth the statistical indications of net salvage percents. Part IX, Detailed Depreciation Calculations presents the detailed tabulations of annual depreciation. Part X, Detail of Production Plant provides narrative descriptions of the Company's production plants and considerations related to the estimation of service life and net salvage for each generating plant unit and account. Part XI, Detail of Transmission, Distribution and General plant provides narrative descriptions of the considerations related to the estimation of service life and net salvage for each transmission, distribution and general plant account.

BASIS OF THE STUDY

Depreciation

Depreciation, in public utility regulation, is the loss in service value not restored by current maintenance, incurred in connection with the consumption or prospective retirement of utility plant in the course of service from causes which are known to be in current operation and against which the utility is not protected by insurance. Among causes to be given consideration are wear and tear, deterioration, action of the elements, inadequacy, obsolescence, changes in the art, changes in demand, and the requirements of public authorities.

Depreciation, as used in accounting, is a method of distributing fixed capital costs, less net salvage, over a period of time by allocating annual amounts to expense. Each annual amount of such depreciation expense is part of that year's total cost of providing electric utility service. Normally, the period of time over which the fixed capital cost is allocated to the cost of service is equal to the period of time over which an item renders service, that is, the item's service life. The most prevalent method of allocation is to

distribute an equal amount of cost to each year of service life. This method is known as the straight line method of depreciation.

The annual depreciation for accounts included in the study was calculated by the straight line method using the average service life procedure and the remaining life basis.

The straight line method, average service life procedure is a commonly used depreciation calculation procedure that has been widely accepted in jurisdictions throughout North America.

Service Life and Net Salvage Estimates

The service life and net salvage estimates used in the depreciation calculations were based on informed judgment which incorporated the statistical analyses of the Company's historical data; a review of management's plans, policies and outlook; general knowledge of the property studied; and a general knowledge of the electric utility industry, including the service life and net salvage estimates from our studies of other electric utilities.

The use of survivor curves to reflect the expected dispersion of retirement provides a consistent method of estimating depreciation for electric plant. Iowa type survivor curves were used to depict the estimated survivor curves for the plant accounts not subject to amortization accounting. The procedure for estimating service lives consisted of compiling historical data for the plant accounts or depreciable groups, analyzing this history through the use of widely accepted techniques, and forecasting the survivor characteristics for each depreciable group on the basis of interpretations of the historical data analyses and the probable future. The combination of the historical experience and the estimated future yielded estimated survivor curves from which the average service lives were derived.

PART II. ESTIMATION OF SURVIVOR CURVES

PART II. ESTIMATION OF SURVIVOR CURVES

The calculation of annual depreciation based on the straight line method requires the estimation of survivor curves and the selection of group depreciation procedures. The estimation of survivor curves is discussed below and the development of net salvage is discussed in later sections of this report.

SURVIVOR CURVES

The use of an average service life for a property group implies that the various units in the group have different lives. Thus, the average life may be obtained by determining the separate lives of each of the units, or by constructing a survivor curve by plotting the number of units which survive at successive ages.

The survivor curve graphically depicts the amount of property existing at each age throughout the life of an original group. From the survivor curve, the average life of the group, the remaining life expectancy, the probable life, and the frequency curve can be calculated. In Figure 1, a typical smooth survivor curve and the derived curves are illustrated. The average life is obtained by calculating the area under the survivor curve, from age zero to the maximum age, and dividing this area by the ordinate at age zero. The remaining life expectancy at any age can be calculated by obtaining the area under the curve, from the observation age to the maximum age, and dividing this area by the percent surviving at the observation age. For example, in Figure 1, the remaining life at age 30 is equal to the crosshatched area under the survivor curve divided by 29.5 percent surviving at age 30. The probable life at any age is developed by adding the age and remaining life. If the probable life of the property is calculated for each year of age, the probable life curve shown in the chart can be developed. The frequency curve presents the number of units retired in each age interval. It is derived by obtaining the differences between the amount of property surviving at the beginning and at the end of each interval.

This study has incorporated the use of Iowa curves developed from a retirement rate analysis of historical retirement history. A discussion of the concepts of survivor curves and of the development of survivor curves using the retirement rate method is presented below.

Iowa Type Curves

The range of survivor characteristics usually experienced by utility and industrial properties is encompassed by a system of generalized survivor curves known as the Iowa type curves. There are four families in the Iowa system, labeled in accordance with the location of the modes of the retirements in relationship to the average life and the relative height of the modes. The left moded curves, presented in Figure 2, are those in which the greatest frequency of retirement occurs to the left of, or prior to, average service life. The symmetrical moded curves, presented in Figure 3, are those in which the greatest frequency of retirement occurs at average service life. The right moded curves, presented in Figure 4, are those in which the greatest frequency occurs to the right of, or after, average service life. The origin moded curves, presented in Figure 5, are those in which the greatest frequency of retirement occurs at the origin, or immediately after age zero. The letter designation of each family of curves (L, S, R or O) represents the location of the mode of the associated frequency curve with respect to the average service life. The numbers represent the relative heights of the modes of the frequency curves within each family.

The Iowa curves were developed at the Iowa State College Engineering Experiment Station through an extensive process of observation and classification of the ages at which industrial property had been retired. A report of the study which resulted in the classification of property survivor characteristics into 18 type curves, which constitute three of the four families, was published in 1935 in the form of the Experiment Station's Bulletin 125.

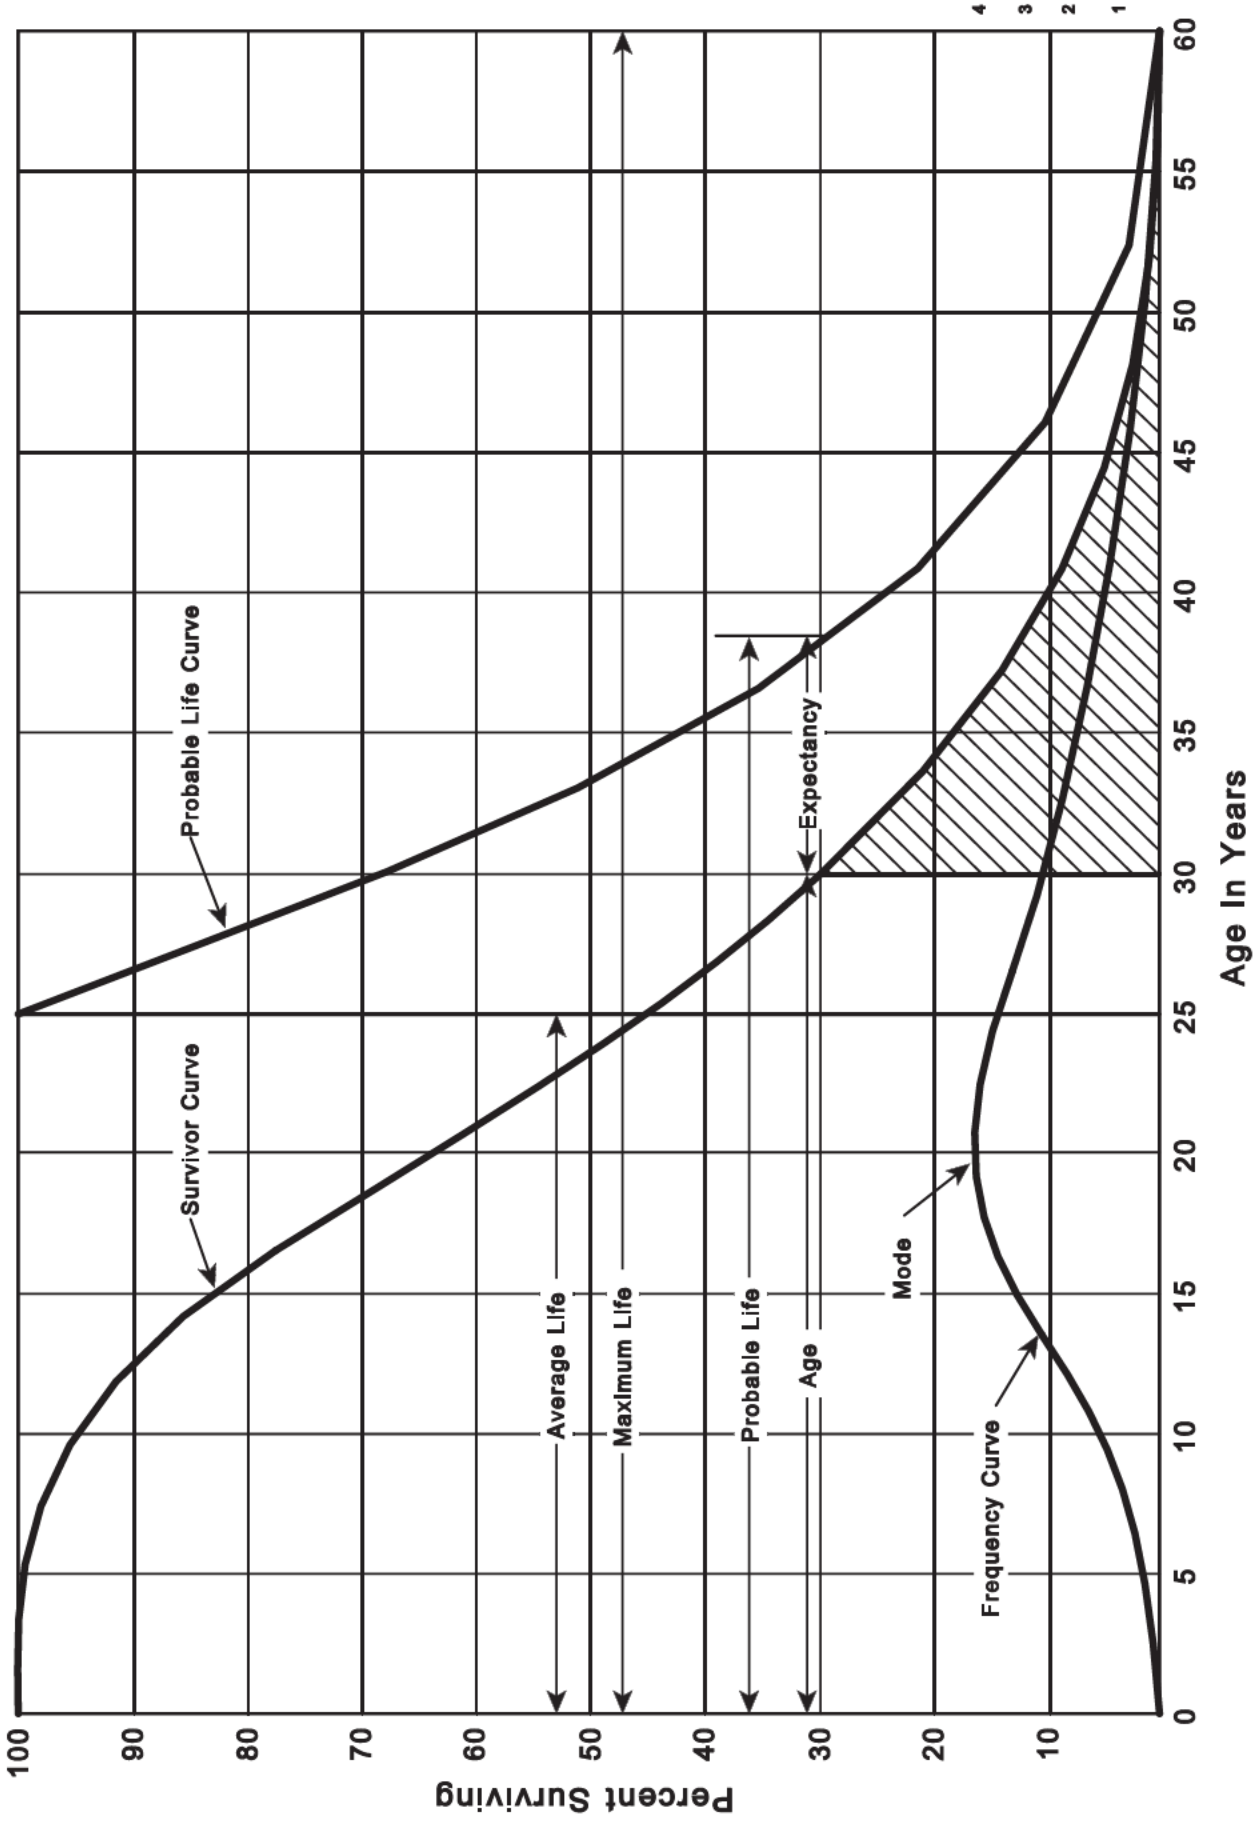

Figure 1. A Typical Survivor Curve and Derived Curves

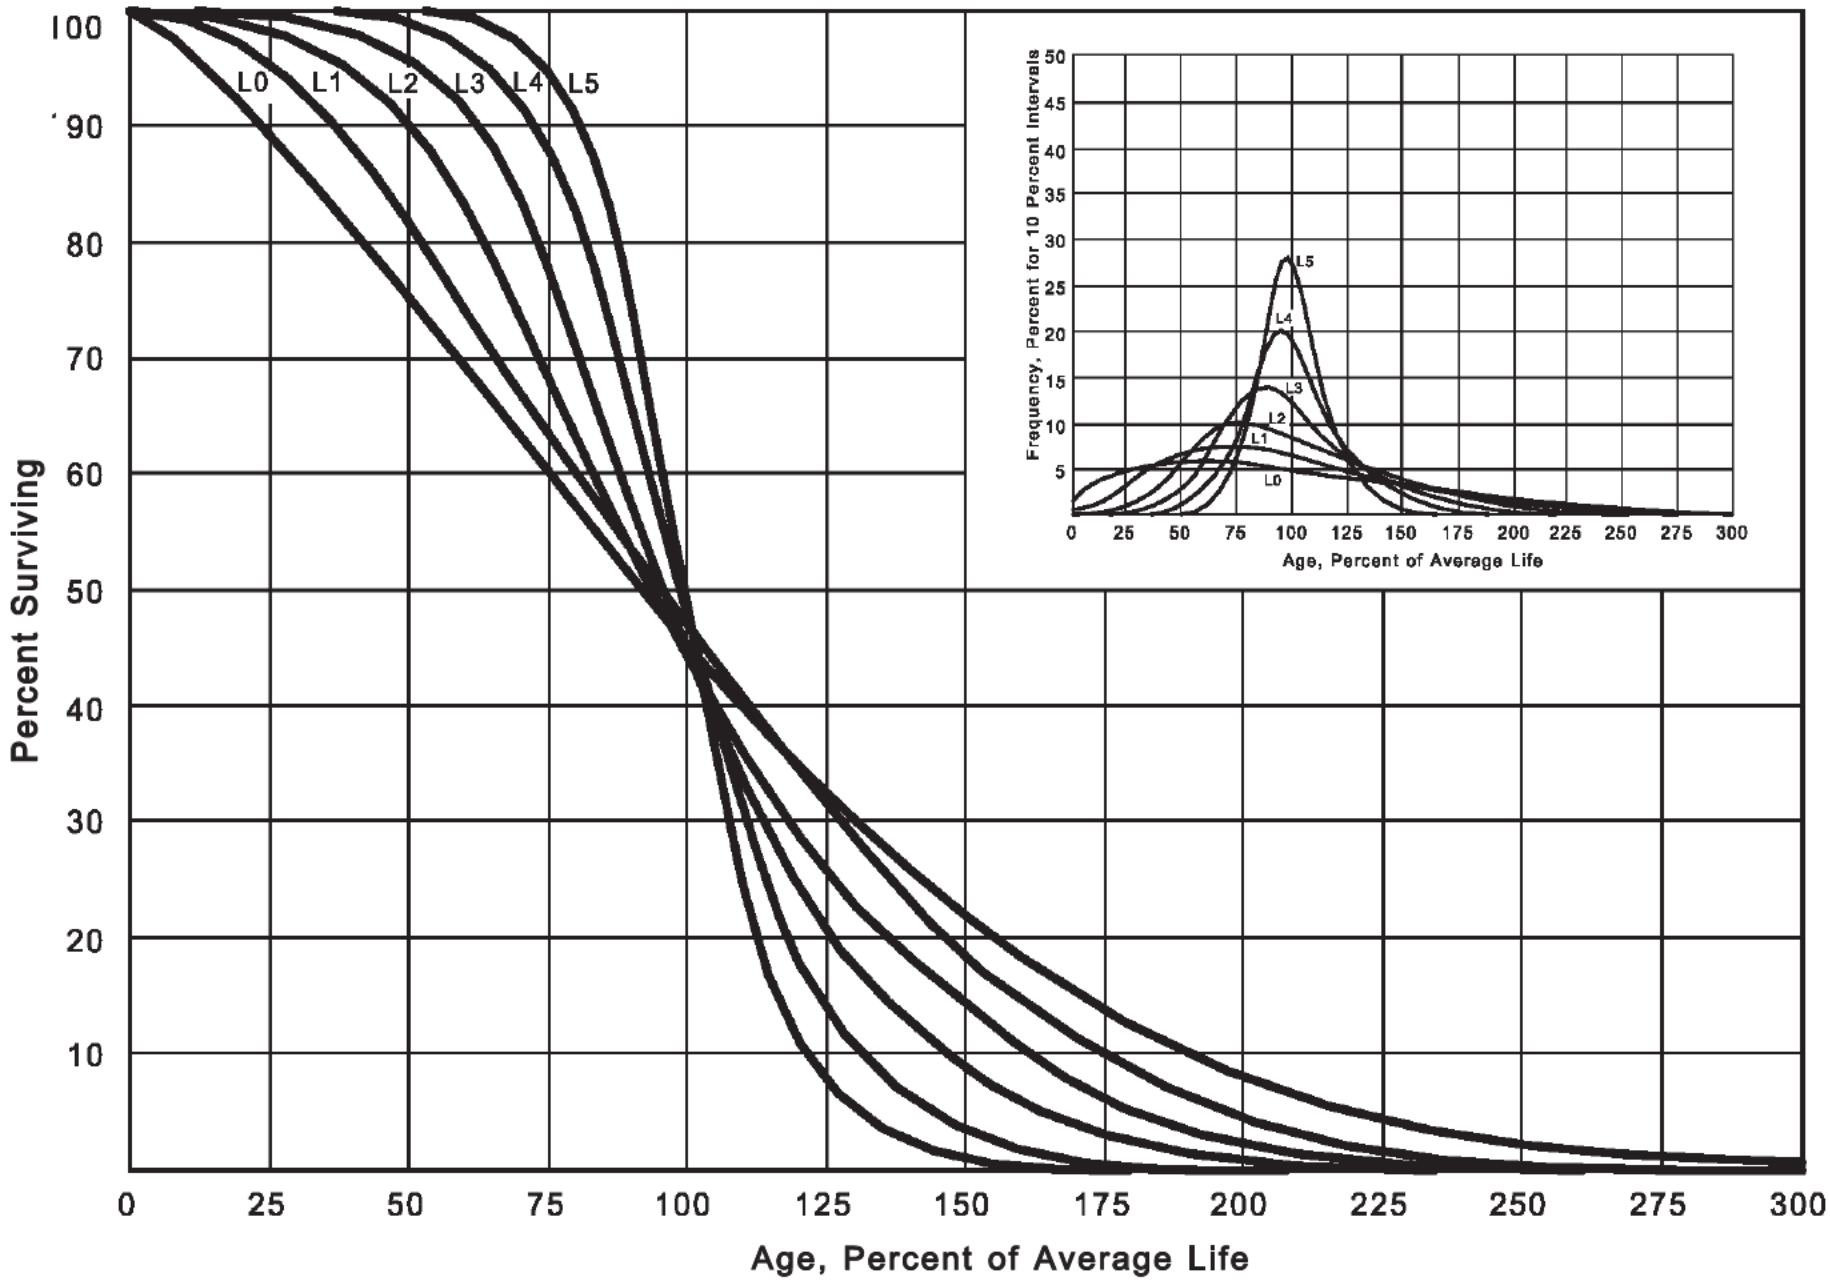

Figure 2. Left Modal or "L" Iowa Type Survivor Curves

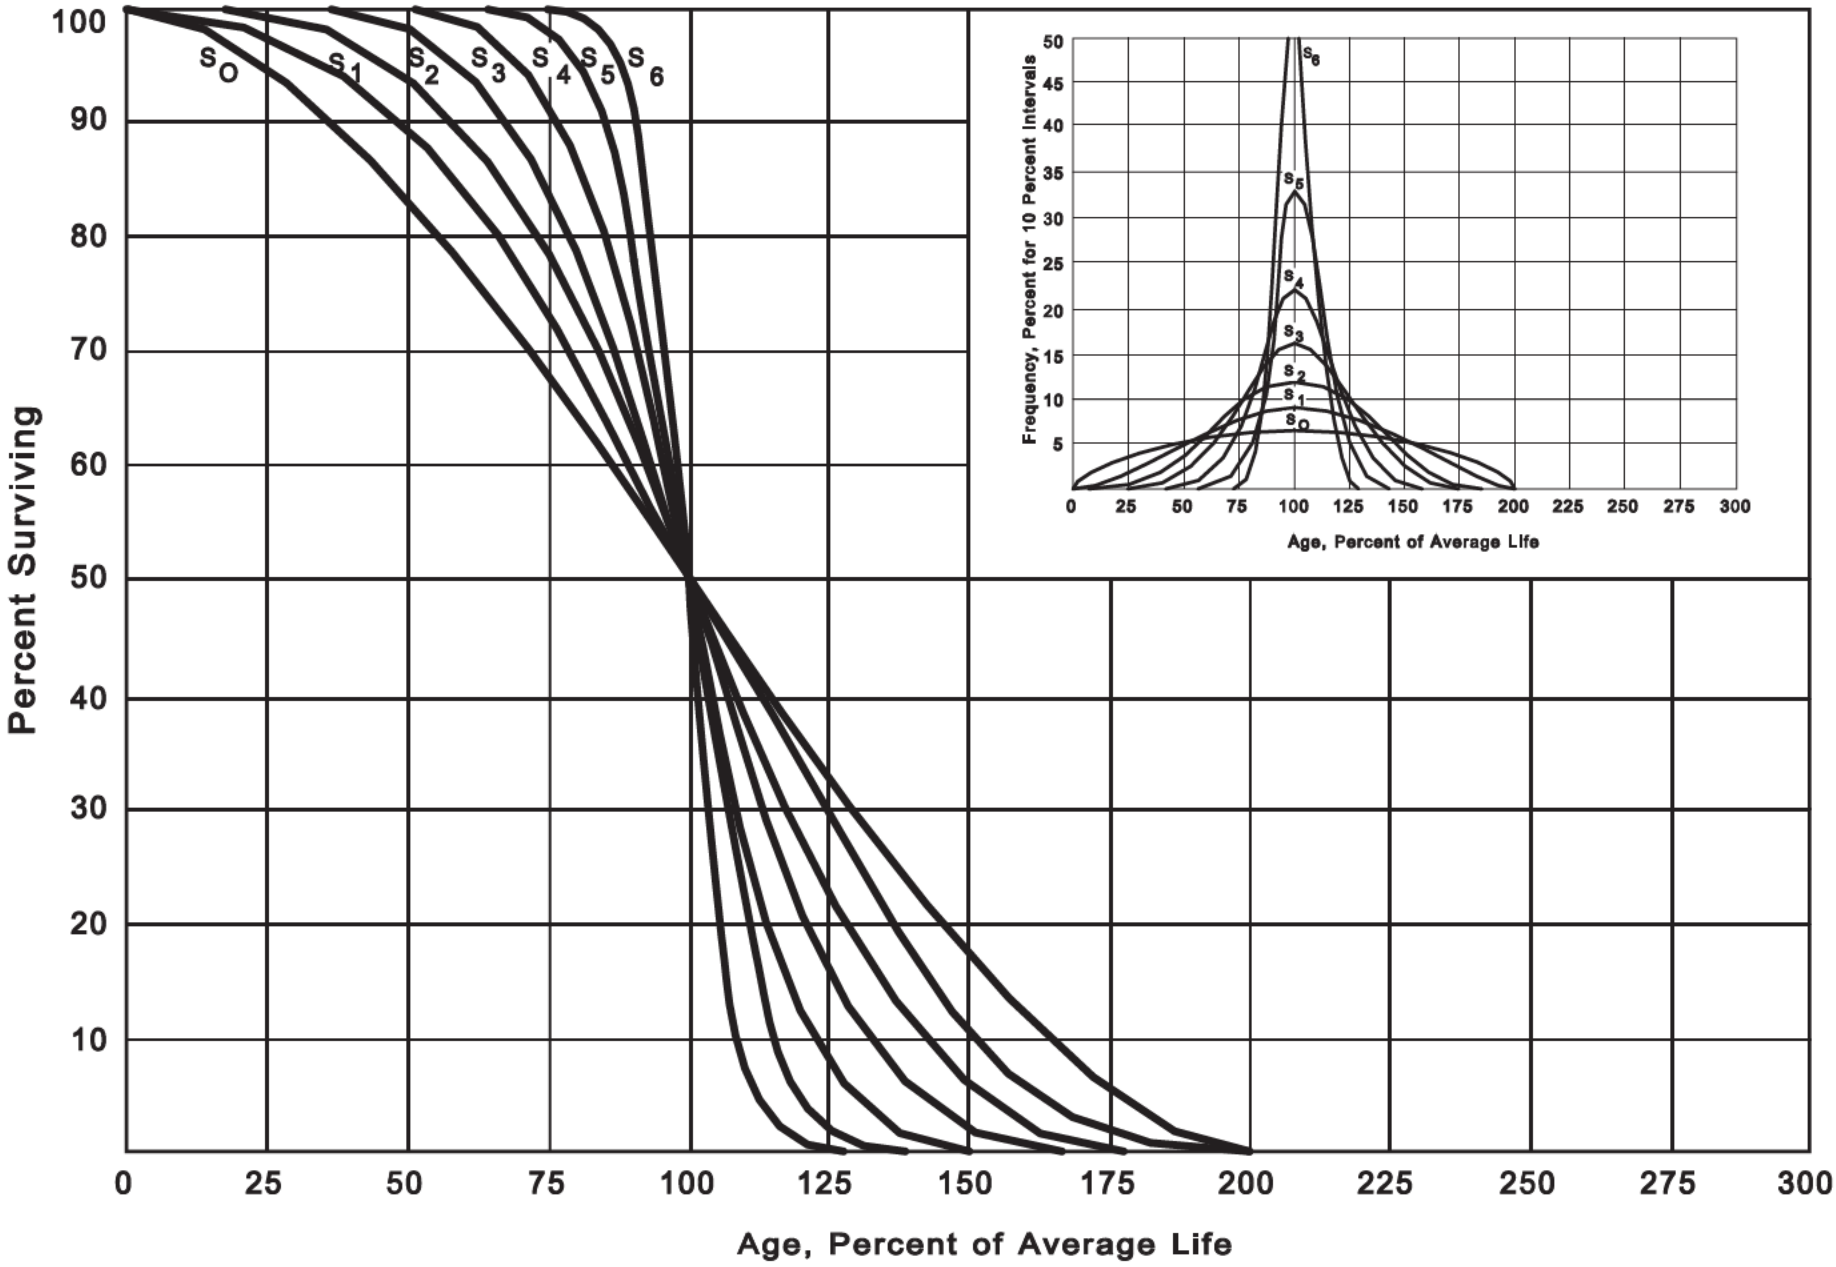

Figure 3. Symmetrical or "S" Iowa Type Survivor Curves

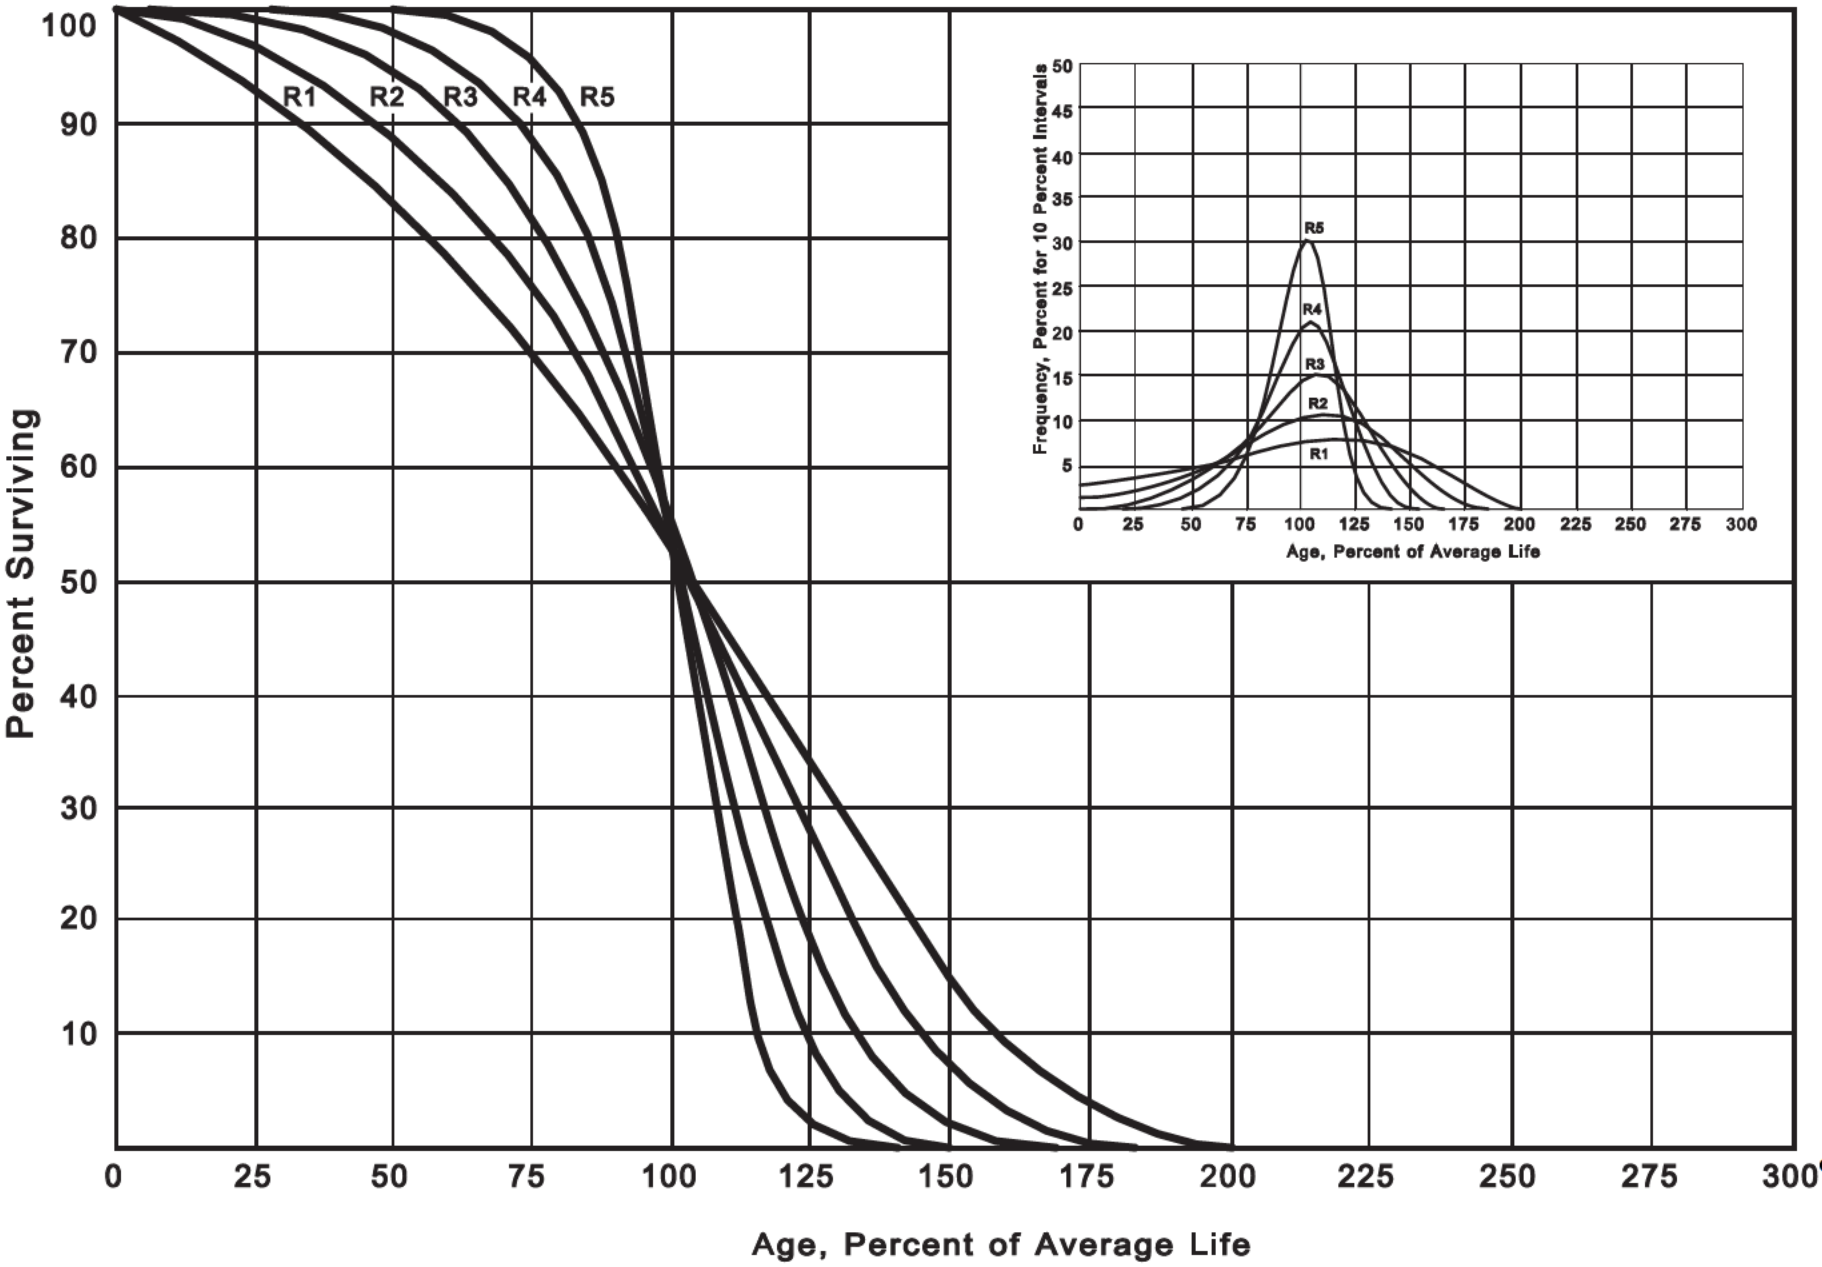

Figure 4. Right Modal or "R" Iowa Type Survivor Curves

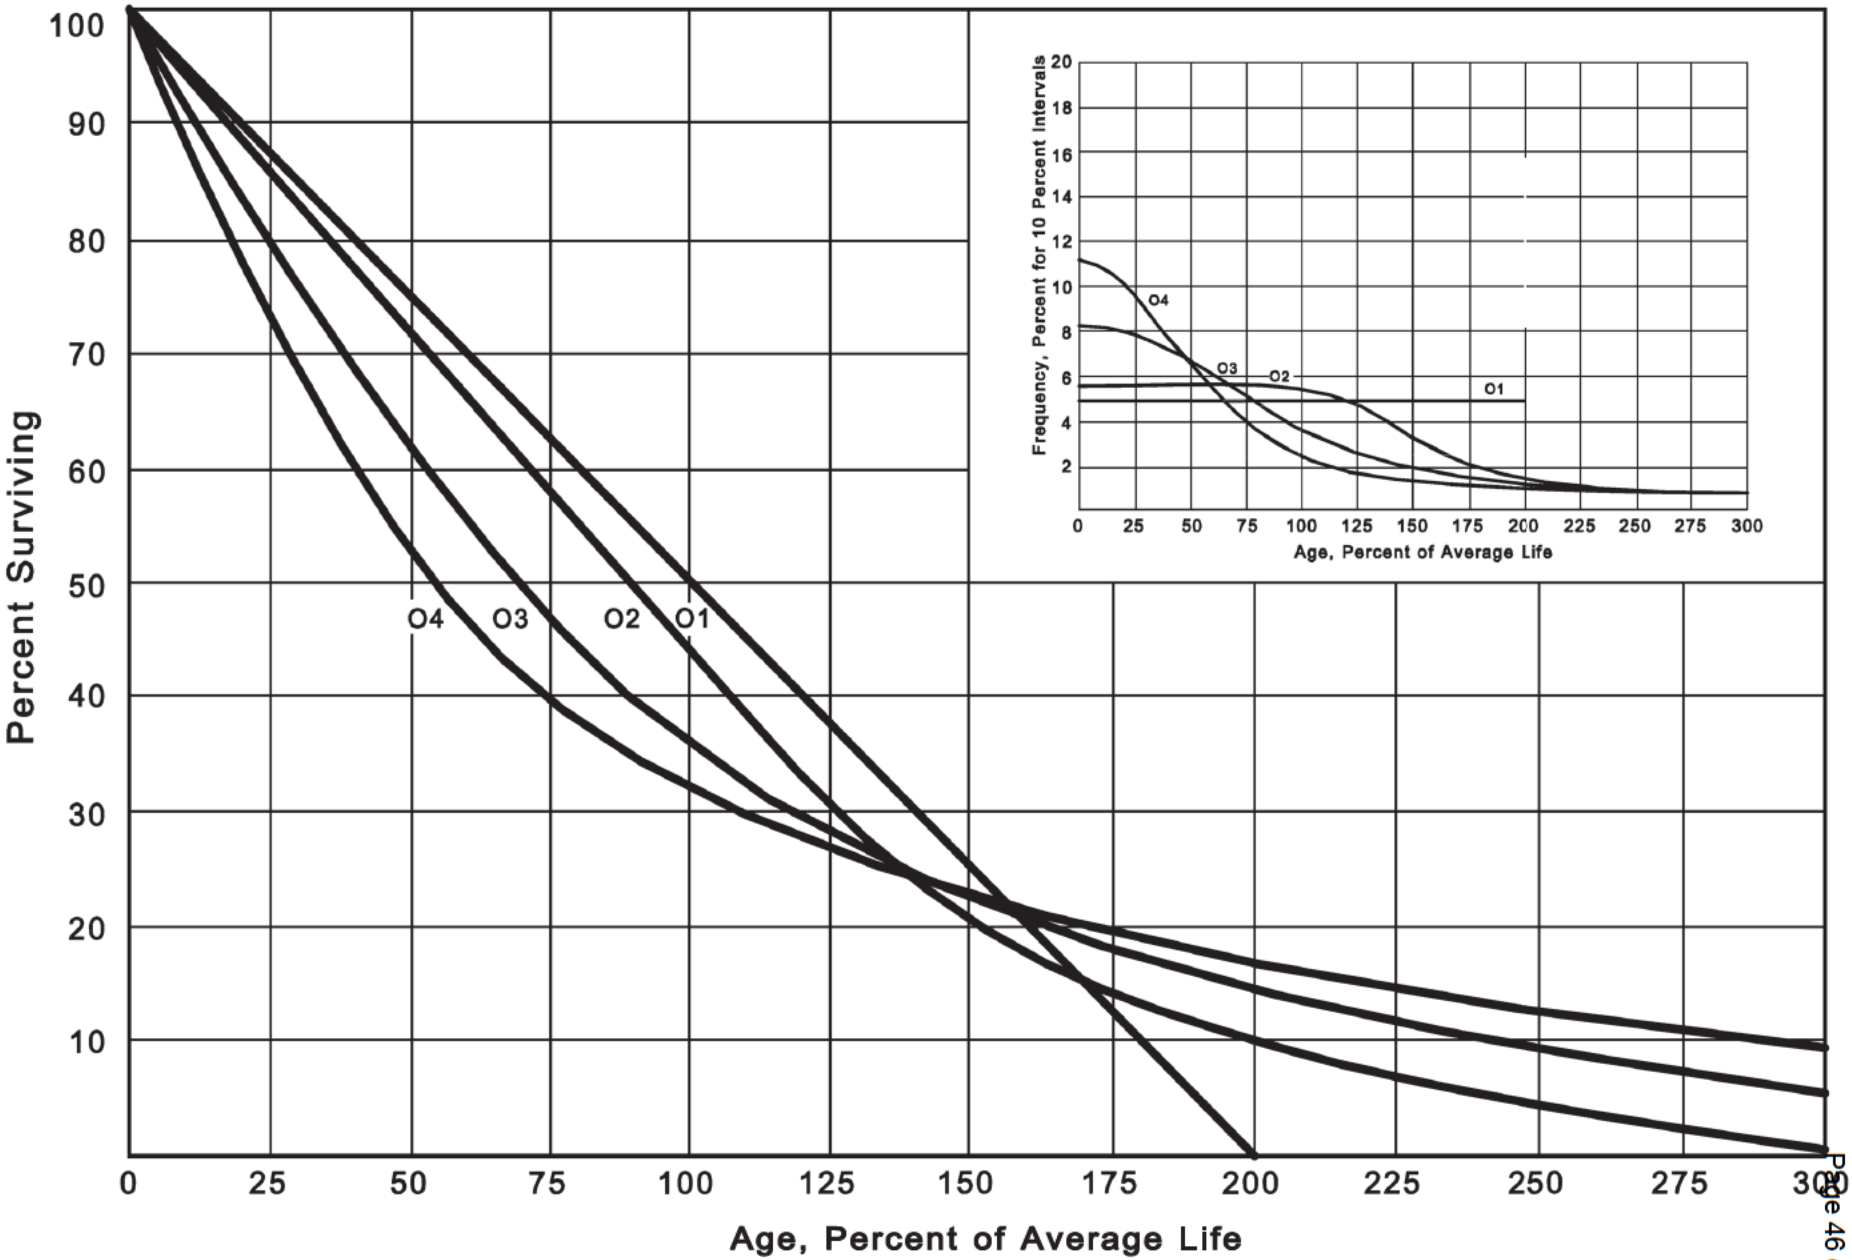

Figure 5. Origin Modal or "O" Iowa Type Survivor Curves

These curve types have also been presented in subsequent Experiment Station bulletins and in the text, "Engineering Valuation and Depreciation."[1] In 1957, Frank V. B. Couch, Jr., an Iowa State College graduate student submitted a thesis presenting his development of the fourth family consisting of the four O type survivor curves.

Retirement Rate Method of Analysis

The retirement rate method is an actuarial method of deriving survivor curves using the average rates at which property of each age group is retired. The method relates to property groups for which aged accounting experience is available and is the method used to develop the original stub survivor curves in this study. The method (also known as the annual rate method) is illustrated through the use of an example in the following text, and is also explained in several publications, including "Statistical Analyses of Industrial Property Retirements,"[2] "Engineering Valuation and Depreciation,"[3] and "Depreciation Systems."[4]

The average rate of retirement used in the calculation of the percent surviving for the survivor curve (life table) requires two sets of data: first, the property retired during a period of observation, identified by the property's age at retirement; and second, the property exposed to retirement at the beginning of the age intervals during the same period. The period of observation is referred to as the experience band, and the band of years which represent the installation dates of the property exposed to retirement during the experience band is referred to as the placement band. An example of the calculations used in the development of a life table follows. The example includes schedules of annual aged property transactions, a schedule of plant exposed to retirement, a life table and illustrations of smoothing the stub survivor curve.

Schedules of Annual Transactions in Plant Records

The property group used to illustrate the retirement rate method is observed for the experience band 2010-2019 during which there were placements during the years 2005-2019. In order to illustrate the summation of the aged data by age interval, the data were compiled in the manner presented in Schedules 1 and 2 on pages II-1 and II-1 . In Schedule 1, the year of installation (year placed or vintage) and the year of retirement are shown. The age interval during which a retirement occurred is determined from this information. In the example which follows, $10,000 of the dollars invested in 2001 were retired in 2006. The $10,000 retirement occurred during the age interval between 4½ and 5½ years on the basis that approximately one-half of the amount of property was installed prior to and subsequent to July 1 of each year. That is, on the average, property installed during a year is placed in service at the midpoint of the year for the purpose of the analysis. All retirements also are stated as occurring at the midpoint of a one-year age interval of time, except the first age interval which encompasses only one-half year.

The total retirements occurring in each age interval in a band are determined by summing the amounts for each transaction year-installation year combination for that age interval. For example, the total of $143,000 retired for age interval 4½-5½ is the sum of the retirements entered on Schedule 1 immediately above the stair step line drawn on the table beginning with the 2010 retirements of 2005 installations and ending with the 2019 retirements of the 2014 installations. Thus, the total amount of 143 for age interval 4½-5½ equals the sum of:

10 + 12 + 13 + 11 + 13 + 13 + 15 + 17 + 19 + 20.

In Schedule 2, other transactions which affect the group are recorded in a similar manner. The entries illustrated include transfers and sales. The entries which are credits to the plant account are shown in parentheses. The items recorded on this schedule are not totaled with the retirements but are used in developing the exposures at the beginning of each age interval.

Schedule of Plant Exposed to Retirement

The development of the amount of plant exposed to retirement at the beginning of each age interval is illustrated in Schedule 3 on page II-14. The surviving plant at the beginning of each year from 2010 through 2019 is recorded by year in the portion of the table headed "Annual Survivors at the Beginning of the Year." The last amount entered in each column is the amount of new plant added to the group during the year. The amounts entered in Schedule 3 for each successive year following the beginning balance or addition are obtained by adding or subtracting the net entries shown on Schedules 1 and 2. For the purpose of determining the plant exposed to retirement, transfers-in are considered as being exposed to retirement in this group at the beginning of the year in which they occurred, and the sales and transfers-out are considered to be removed from the plant exposed to retirement at the beginning of the following year. Thus, the amounts of plant shown at the beginning of each year are the amounts of plant from each placement year considered to be exposed to retirement at the beginning of each successive transaction year. For example, the exposures for the installation year 2010 are calculated in the following manner:

Exposures at age 0	= amount of addition	= $750,000
Exposures at age ½	= $750,000 - $ 8,000	= $742,000
Exposures at age 1½	= $742,000 - $18,000	= $724,000
Exposures at age 2½	= $724,000 - $20,000 - $19,000	= $685,000
Exposures at age 3½	= $685,000 - $22,000	= $663,000

2017								960[a]	949	926	5,719	1½-2½
2018									1,080[a]	1,069	6,579	½-1½
2019										1,220[a]	7,490	0-½
Total	1,975	2,382	2,824	3,318	3,872	4,494	5,247	6,017	6,852	7,799	44,780	

[a]Additions during the year

For the entire experience band 2010-2019, the total exposures at the beginning of an age interval are obtained by summing diagonally in a manner similar to the summing of the retirements during an age interval (Schedule 1). For example, the figure of 3,789, shown as the total exposures at the beginning of age interval 4½-5½, is obtained by summing:

255 + 268 + 284 + 311 + 334 + 374 + 405 + 448 + 501 + 609.

Original Life Table

The original life table, illustrated in Schedule 4 on page II-16**,** is developed from the totals shown on the schedules of retirements and exposures, Schedules 1 and 3, respectively. The exposures at the beginning of the age interval are obtained from the corresponding age interval of the exposure schedule, and the retirements during the age interval are obtained from the corresponding age interval of the retirement schedule. The retirement ratio is the result of dividing the retirements during the age interval by the exposures at the beginning of the age interval. The percent surviving at the beginning of each age interval is derived from survivor ratios, each of which equals one minus the retirement ratio. The percent surviving is developed by starting with 100% at age zero and successively multiplying the percent surviving at the beginning of each interval by the survivor ratio, i.e., one minus the retirement ratio for that age interval. The calculations necessary to determine the percent surviving at age 5½ are as follows:

Percent surviving at age 4½	=	88.15				
Exposures at age 4½	=	3,789,000				
Retirements from age 4½ to 5½	=	143,000				
Retirement Ratio	=	143,000	÷	3,789,000	=	0.0377
Survivor Ratio	=	1.000	-	0.0377	=	0.9623
Percent surviving at age 5½	=	(88.15)	x	(0.9623)	=	84.83

The totals of the exposures and retirements (columns 2 and 3) are shown for the purpose of checking with the respective totals in Schedules 1 and 3. The ratio of the total retirements to the total exposures, other than for each age interval, is meaningless.

SCHEDULE 4. ORIGINAL LIFE TABLE
CALCULATED BY THE RETIREMENT RATE METHOD

Experience Band 2010-2019 Placement Band 2005-2019

(Exposure and Retirement Amounts are in Thousands of Dollars)

Age at Beginning of Interval	Exposures at Beginning of Age Interval	Retirements During Age Interval	Retirement Ratio	Survivor Ratio	Percent Surviving at Beginning of Age Interval
(1)	(2)	(3)	(4)	(5)	(6)

12.5	323	44	0.1362	0.8638	48.90
13.5	167	26	0.1557	0.8443	42.24
14.5					35.66
Total	44,780	1,606			

Column 2 from Schedule 3, Column 12, Plant Exposed to Retirement.
Column 3 from Schedule 1, Column 12, Retirements for Each Year.
Column 4 = Column 3 Divided by Column 2.
Column 5 = 1.0000 Minus Column 4.
Column 6 = Column 5 Multiplied by Column 6 as of the Preceding Age Interval.

The original survivor curve is plotted from the original life table (column 6, Schedule 4). When the curve terminates at a percent surviving greater than zero, it is called a stub survivor curve. Survivor curves developed from retirement rate studies generally are stub curves.

Smoothing the Original Survivor Curve

The smoothing of the original survivor curve eliminates any irregularities and serves as the basis for the preliminary extrapolation to zero percent surviving of the original stub curve. Even if the original survivor curve is complete from 100% to zero percent, it is desirable to eliminate any irregularities, as there is still an extrapolation for the vintages which have not yet lived to the age at which the curve reaches zero percent. In this study, the smoothing of the original curve with established type curves was used to eliminate irregularities in the original curve.

The Iowa type curves are used in this study to smooth those original stub curves which are expressed as percents surviving at ages in years. Each original survivor curve was compared to the Iowa curves using visual and mathematical matching in order to determine the better fitting smooth curves. In Figures 6, 7, and 8, the original curve developed in Table 4 is compared with the L, S, and R Iowa type curves which most nearly fit the original survivor curve. In Figure 6, the L1 curve with an average life between 12 and 13 years appears to be the best fit. In Figure 7, the S0 type curve with a 12-year average life appears to be the best fit and appears to be better than the L1 fitting. In Figure 8, the R1 type curve with a 12-year average life appears to be the best fit and appears to be better than either the L1 or the S0.

In Figure 9, the three fittings, 12-L1, 12-S0 and 12-R1 are drawn for comparison purposes. It is probable that the 12-R1 Iowa curve would be selected as the most representative of the plotted survivor characteristics of the group.

PART III. SERVICE LIFE CONSIDERATIONS

PART III. SERVICE LIFE CONSIDERATIONS

FIELD TRIPS

In order to be familiar with the operation of the Company and observe representative portions of the plant, a field trip was conducted for the study. A general understanding of the function of the plant and information with respect to the reasons for past retirements and the expected future causes of retirements are obtained during field trips. This knowledge and information were incorporated in the interpretation and extrapolation of the statistical analyses.

The following is a list of the locations visited during the most recent field trips.

July 18-19, 2017
Crystal River Generating Station North
Crystal River Generating Station South
Anclote Generating Station
Bartow Generating Station

During the field trips and throughout the conduct of this depreciation study, meetings were held with representative Company personnel from various DEF business units. Information attained through conversation and discussions were incorporated into the life and net salvage analyses of this report.

SERVICE LIFE ANALYSIS

The service life estimates were based on judgment which considered a number of factors. The primary factors were the statistical analyses of data; current Company policies and outlook as determined during conversations with management; and the survivor curve estimates from previous studies of this company and other electric utility companies. For transmission, distribution and general plant accounts survivor curves were estimated using the retirement rate method. Survivor curves were also estimated

for interim retirements for production plant accounts using the retirement rate method. A list of accounts for which the survivor curve provided an indication of service life are set forth in the table below.

ACCOUNT		SURVIVOR CURVE
STEAM PRODUCTION PLANT		
311	Structures and Improvements	90-R2 *

* For production plant accounts, the survivor curve shown applies only to interim retirements. The life span method is used for these accounts.

The statistical support for the service life estimates is presented in the section beginning on page VII-2. A narrative discussion of the considerations for each service life estimate for transmission, distribution and general plant accounts is provided in the section beginning on page XI-2. For production plant accounts, the life span method was used, as is described in the next section. A narrative discussion of the considerations for each interim survivor curve estimate for production plant is provided in the section beginning on page X-2.

Life Span Estimates

Inasmuch as electric production plant has specific retirement dates, the life span method was employed. In this method the account follows the survivor curve until the selected date of retirement at which time the curve is truncated. For each of the facilities for which the life span technique was used, a probable retirement date (also referred to as an economic recovery date) was established. The probable retirement dates are based on a number of factors, including the operating characteristics of the facilities, the type of technology used at each plant, environmental and other regulations, experience in the industry, current forecasted life spans, and the Company's outlook for each facility.

A description of each generating facility, as well as the bases for the estimated probable retirement dates and estimated interim survivor curves can be found in the section beginning on page X-2. The probable retirement dates used in this study for each of the production facilities are summarized below. The same retirement date was used for each unit at the facility unless otherwise noted.

PART IV. NET SALVAGE CONSIDERATIONS

PART IV. NET SALVAGE CONSIDERATIONS

NET SALVAGE ANALYSIS

The estimates of net salvage by account were based in part on the analyses of historical data compiled for the years 1975 through 2019. Cost of removal and gross salvage were expressed as percents of the original cost of plant retired, both on annual and three-year moving average bases. The most recent five-year average also was calculated for consideration. The net salvage estimates by account are expressed as a percent of the original cost of plant retired.

Net Salvage Considerations

The estimates of future net salvage are expressed as percentages of surviving plant in service, i.e., all future retirements. In cases in which removal costs are expected to exceed gross salvage receipts, a negative net salvage percentage is estimated. The net salvage estimates were based on judgment which incorporated analyses of historical cost of removal and gross salvage data, knowledge of the property studied, expectations with respect to future removal requirements and markets for retired equipment and materials.

For transmission, distribution and general plant accounts net salvage was estimated based on the considerations described above. For production plant accounts, net salvage for interim retirements was also estimated in the same manner. Consistent with the previous depreciation study, transactions related to reimbursements, sales and hurricanes not considered to be indicative of future experience were excluded from the retirements, cost of removal and gross salvage used for the statistical analysis. The statistical support for the net salvage estimates is presented in the section beginning on page VIII-2. A narrative discussion of the considerations for each net salvage estimate for transmission, distribution and general plant accounts is provided in the section

beginning on page XI-2. The estimation of net salvage for life span property, such as production plant accounts, is described in the next section. A narrative discussion of the considerations for each net salvage estimate for production plant is provided in the section beginning on page X-2.

* For production plant accounts, the net salvage estimate shown applies only to interim retirements. These estimates are adjusted to develop a composite net salvage percent that applies to the full account.

Net Salvage for Life Span Groups

Life span property experiences two types of net salvage. Terminal net salvage is cost of removal and gross salvage that occurs at or subsequent to the retirement of the entire facility (for example, the cost to dismantle a power plant). Interim net salvage is the cost of removal and gross salvage related to interim retirements that occur prior to the final retirement of the facility.

The terminal net salvage for DEF's power plants have been estimated based on dismantlement or decommissioning studies. These costs are recovered separately and are not part of the Depreciation Study. Therefore, the only net salvage for life span property that is included in the depreciation study is interim net salvage. The estimates of interim net salvage were made in the same manner as the net salvage estimates for transmission, distribution and general plant. A narrative discussion of the considerations for each interim net salvage estimate for production plant accounts is provided in the section beginning on page X-2.

The interim net salvage estimates for production plant accounts apply only to the portion of plant in service forecast to retire as interim retirements. The net salvage estimates are therefore adjusted to develop composite net salvage percents that can be applied to the balance of each plant account. Table 4 beginning on page VIII-2 provides the calculation of the composite net salvage estimate for each production plant account that can be applied to the plant balance as of December 31, 2021. The composite net salvage percents calculated in Table 4 are the net salvage percents used in the calculation of depreciation for production plant accounts.

PART V. CALCULATION OF ANNUAL AND ACCRUED DEPRECIATION

PART V. CALCULATION OF ANNUAL AND ACCRUED DEPRECIATION

GROUP DEPRECIATION PROCEDURES

A group procedure for depreciation is appropriate when considering more than a single item of property. Normally the items within a group do not have identical service lives but have lives that are dispersed over a range of time. There are two primary group procedures, namely, average service life and equal life group. In the average service life procedure, the rate of annual depreciation is based on the average life or average remaining life of the group, and this rate is applied to the surviving balances of the group's cost. A characteristic of this procedure is that the cost of plant retired prior to average life is not fully recouped at the time of retirement, whereas the cost of plant retired subsequent to average life is more than fully recouped. Over the entire life cycle, the portion of cost not recouped prior to average life is balanced by the cost recouped subsequent to average life.

Single Unit of Property

The calculation of straight line depreciation for a single unit of property is straightforward. For example, if a $1,000 unit of property attains an age of four years and has a life expectancy of six years, the annual accrual over the total life is:

$$\frac{\$1{,}000}{(4 + 6)} = \$100 \text{ per year.}$$

The accrued depreciation is:

$$\$1{,}000 \left(1 - \frac{6}{10}\right) = \$400.$$

Remaining Life Annual Accruals

For the purpose of calculating remaining life accruals as of December 31, 2021, the composite remaining life for each depreciable group is calculated based on the original cost and attained age of each vintage of plant in service. Explanations of remaining life accruals and calculated accrued depreciation follow. The annual depreciation rates and accruals for each depreciation group are set forth in Table 1 beginning on page VI-5. The detailed calculations of the composite remaining life for each depreciable group as of December 31, 2021 are set forth in Part IX of the study beginning on page IX-2.

Average Service Life Procedure

In the average service life procedure, the remaining life annual accrual for a property group is determined by dividing future book accruals (original cost less book reserve less net salvage) by the average (or composite) remaining life. The average remaining life for a property group is the weighted average of the average remaining lives for each vintage. The average remaining life for each vintage is a direct weighted average derived from the estimated future survivor curve in accordance with the average service life procedure.

The calculated accrued depreciation for each depreciable property group represents that portion of the depreciable cost of the group which would not be allocated to expense through future depreciation accruals if current forecasts of life characteristics are used as the basis for such accruals. The accrued depreciation calculation consists of applying an appropriate ratio to the surviving original cost of each vintage of each

account based upon the attained age and service life. The straight line accrued depreciation ratios are calculated as follows for the average service life procedure:

$$Ratio = 1 - \frac{Average\ Remaining\ Life}{Average\ Service\ Life}.$$

PART VI. RESULTS OF STUDY

PART VI. RESULTS OF STUDY

QUALIFICATION OF RESULTS

The calculated annual and accrued depreciation are the principal results of the study. Continued surveillance and periodic revisions are normally required to maintain continued use of appropriate annual depreciation accrual rates. An assumption that accrual rates can remain unchanged over a long period of time implies a disregard for the inherent variability in service lives and net salvage and for the change of the composition of property in service. The annual accrual rates were calculated in accordance with the straight line remaining life method of depreciation, using the average service life procedure based on estimates which reflect considerations of current historical evidence and expected future conditions.

The annual depreciation accrual rates are applicable specifically to the electric plant in service as of December 31, 2021. For most plant accounts, the application of such rates to future balances that reflect additions subsequent to December 31, 2021 is reasonable for a period of three to five years.

DESCRIPTION OF DETAILED TABULATIONS

Table 1 presents a summary of the results of the study as applied to the original cost of electric plant as of December 31, 2021, and can be found on pages VI-5 through VI-12 of this report. The depreciation rates presented in Table 1 are the remaining life depreciation rates recommended in the study. Table 2, on pages VI-13 through VI-17, presents a comparison as of December 31, 2021 of the recommended remaining life depreciation rates to the current approved depreciation rates. Table 3, on pages VI-18 through VI-27, presents a comparison of the book reserve and theoretical reserve based on the recommended service life and net salvage estimates for electric plant in service

as of December 31, 2021. The book reserve amounts shown on Table 3 incorporate the regulatory assets associated with depreciation that originated in prior rate cases. These amounts are included in Table 3 because the regulatory assets represent capital costs that need to be recovered through future expense and excluding these amounts would understate the theoretical reserve imbalance.

The service life estimates were based on judgment that incorporated statistical analyses of retirement data, discussions with management and consideration of the property studied. The results of the statistical analysis of service life are presented in the section beginning on page VII-2. For each depreciable group analyzed by the retirement rate method, a chart depicting the original and estimated survivor curves followed by a tabular presentation of the original life table(s) plotted on the chart. The survivor curves estimated for the depreciable groups are shown as dark smooth curves on the charts. Each smooth survivor curve is denoted by a numeral followed by the curve type designation. The numeral used is the average life derived from the entire curve from 100 percent to zero percent surviving. The titles of the chart indicate the group, the symbol used to plot the points of the original life table, and the experience and placement bands of the life tables which where plotted. The experience band indicates the range of years for which retirements were used to develop the stub survivor curve. The placements indicate, for the related experience band, the range of years of installations which appear in the experience.

The analyses of net salvage data are presented in Part VII of the report. The tabulations present annual cost of removal and gross salvage data, three-year moving averages and the most recent five-year average. Data are shown in dollars and as percentages of original costs retired. In addition, the calculation of the composite net salvage percents for production plant are presented in Table 4 on page VIII-2.

Tables detailing the calculations of the composite (or average) remaining life for each property group as of December 31, 2021 are presented in account sequence starting on page IX-2 of the supporting documents. The tables indicate the estimated survivor curve and net salvage percent for the account and set forth, for each installation year, the original cost, the average service life, the whole life annual rate and accrual, the remaining life, and the calculated future accrual factor and amount. The composite remaining life for each property group is equal to the total calculated future accrual amount divided by the total whole life annual accrual amount. The composite remaining lives are used in Table 1 for the calculation of remaining life depreciation accruals for each property group.

In addition to the statistical support presented in Parts VII and VIII for the service life and net salvage estimates, a narrative description of the development of the service life and net salvage estimates for each depreciable group has been provided in Parts X and XI. Part X provides narrative descriptions of the Company's generation plants and considerations related to the estimation of service life and net salvage for each generating plant unit and account. Part XI provides narrative descriptions of the related to the estimation of service life and net salvage for each transmission, distribution and general plant account.

PART X. DETAIL OF PRODUCTION PLANT

STEAM PRODUCTION PLANT

DEF's steam production fleet consists of two production facilities. Crystal River Units 4 and 5 are coal-fired generating units. Anclote was converted to burn natural gas since the last depreciation study. DEF has retired multiple steam production generating units in the time since the last study. A summary of the Company's current steam plants is provided in the table below.

Plant	Fuel	Status
Crystal River Units 4 and 5	Coal	Owner
Anclote	Natural Gas	Owner

The service lives for each plant are based on estimated probable retirement dates for each unit, combined with interim survivor curves estimated for each plant account. Net salvage for interim retirements has been incorporated into the depreciation rates. The capital recovery of terminal net salvage is estimated in a separate dismantlement study.

Interim survivor curves and interim net salvage were estimated for each account based on judgment incorporating a number of factors, including the historical analysis of interim retirements, cost of removal and gross salvage. The probable retirement dates estimated for each unit are consistent with the Company's current expectations for these facilities and result in life spans of 50 to 55 years.

DEF has retired a number of steam generating plants in recent years. The table below summarizes the retirement date and life span of each of these generating units. The average life span for these retired facilities was approximately 54 years.

Generating Unit	Retirement Date	Life Span
Crystal River Unit 1	2018	52
Crystal River Unit 2	2018	49
Bartow Unit 1	2009	51
Bartow Unit 2	2009	48
Bartow Unit 3	2009	46
Suwannee River Unit 1	2016	63
Suwannee River Unit 2	2016	62
Suwannee River Unit 3	2016	60

A description of each generating site, as well the estimated probable retirement dates for each generating unit, is included in the pages that follow. An account by account discussion of the development of the service life and net salvage parameters for interim retirements follows the discussion of each site.

Anclote Steam Generating Plant

The Anclote Plant is a two-unit natural gas-fired facility located at the mouth of the Anclote River, one mile west of Tarpon Springs, Florida. The site consists of two steam generating units (Units 1 and 2). Both units were constructed as oil-fired units. Unit 1 was placed in service in 1974 and Unit 2 was placed in service in 1978. In 2013, both units were converted to burn 100 percent natural gas. Unit 1 has a net summer capacity of 498 MW and Unit 2 has a net summer capacity of 505 MW.

The current depreciation rates for the Anclote plant are based on a probable retirement date of 2024. The recommendation is to increase the life span of the facility by five years and use a 2029 probable retirement date. This retirement date results in a 55-year life span for Unit 1 and a 51-year life span for Unit 2. These life spans are consistent with the experienced life spans of DEF steam generating facilities that have been retired and with the life spans of other steam production facilities in the industry.

Crystal River Units 4 and 5

The Crystal River Energy Complex is located near the mouth of the Crystal River in Citrus County Florida. Crystal River Units 1 and 2 were coal-fired generating units that were retired in 2018. Crystal River Unit 3 was a nuclear generating plant that was retired in 2013. Crystal River Units 4 and 5 are coal-fired units placed into service in 1982 and 1984. The Citrus Combined Cycle Station is also located on the site and was placed in service in 2018.

Crystal River Unit 4 has a net summer capacity of 712 MW and Unit 5 has a net summer capacity of 710 MW. Major work at the plant has included boiler work, generator rewinds and turbine work. A flue-gas desulfurization (FGD) system and other pollution-control equipment were installed in 2010. The current depreciation rates for Crystal River Units 4 and 5 are based on a probable retirement date of 2042. However, the outlook for coal-fired generation has changed since the last depreciation study, due to factors such as environmental regulations and the economics of operating coal-fired generation when compared to newer technologies such as gas combined cycle facilities and solar generation. The recommendation in this study is for a retirement date of 2034, which corresponds to life spans of 52 and 54 years for Units 4 and 5, respectively.

Account 311: Structures and Improvements

This account includes the cost of structures and improvements for steam power generation.

GENERAL INFORMATION:

The structures in this account include all structures located at the Company's steam power plants. Interim retirements for this account have averaged over $1.2 million per year over the past 10 years.

SERVICE LIFE ANALYSIS:

Discussion: The 80-L2 survivor curve was proposed for interim retirements in the 2009 depreciation study. The Commission approved an 0.0009 interim retirement rate, which corresponds to an average service life for interim retirements of approximately 556 years.

Bands analyzed for this account include the overall band, as well as the most recent ten, twenty and thirty year experience bands. Most of the Company's older steam plants have been or are planned to be retired. For this reason, the data points through age 45 are considered to be most relevant to the Company's current steam production plants, as these are the only ages that represent the experience of the plants still in service.

Recommendation: The 90-R2 survivor curve represents a good fit of the data through the significant data points. The recommendation is to change currently authorized interim retirement rate to the 90-R2 survivor curve.

NET SALVAGE ANALYSIS:

Discussion: The current net salvage estimate is (3) percent, which is a composite estimate that applies to the full account. The net salvage analysis for the current study based on forty-four years of historical data from 1976 to 2019 indicates a more negative estimate is more appropriate than the estimate from the last study. Cost of removal has been recorded every year but gross salvage has not been. The overall average cost of removal is (101) percent, the average gross salvage is 16 percent, and the average net salvage is (85) percent. However, there have been a number of major projects in the last 10 to 15 years, such as work related to the natural gas conversion at Anclote and pollution control equipment for Crystal River Units 4 and 5 that impact the overall average net

salvage. The most recent five-year average net salvage is (52) percent.

Recommendation: The data supports a negative net salvage estimate. The recommendation is for a (25) percent net salvage estimate, which is conservative relative to the overall average net salvage. This estimate is adjusted for interim retirements to a (1) percent composite net salvage percent.

Account 312: Boiler Plant Equipment

This account includes the cost installed of furnaces, boilers, coal and ash handling and coal preparing equipment, steam and feed water piping, boiler apparatus and accessories used in the production of steam, mercury, or other vapor, to be used primarily for generating electricity.

GENERAL INFORMATION:

Some of the assets in this account, such as stacks, are likely to be in service for the full life of the plant. Other equipment, such as pumps, motors and piping, will be retired as interim retirements. Interim retirements for this account have averaged about $16 million per year over the past ten years.

SERVICE LIFE ANALYSIS:

Discussion: The 48-S0 survivor curve was proposed for interim retirements in the 2009 depreciation study. The Commission approved a 0.0021 interim retirement rate, which corresponds to an average service life of approximately 238 years.

Bands analyzed for this account include the overall band, as well as the most recent ten, twenty and thirty year experience bands. The life indications for each band were similar. Most of the Company's older steam plants have been or are planned to be retired. For this reason, the data points through age 45 are considered to be most relevant to the Company's current steam production plants, as these are the only ages that represent the experience of the plants still in service. The 55-R1 survivor curve represents a good fit of the data.

Recommendation: Change currently authorized interim retirement rate to the 55-R1 survivor curve.

NET SALVAGE ANALYSIS:

Discussion: The current net salvage estimate is (4) percent, which is a composite estimate that applies to the full account. Forty-five years of data, from 1975 through 2019 were available for the historical net salvage analysis. Most years have experienced cost of removal and gross salvage, with removal costs normally exceeding gross salvage. The overall average cost of removal is 37 percent, the average gross salvage is 6 percent, and the average net salvage is (31) percent. The most recent five year average is slightly more negative at (37) percent.

Recommendation: The recommendation is to use the negative net salvage

estimate of (20) percent, which is conservative compared to the data but gives less consideration to some of the larger cost of removal amounts recorded in recent years. This estimate is adjusted for interim retirements to a (2) percent composite net salvage percent.

Account 314: Turbogenerator Units

This account includes the cost installed of main turbine-driven units and accessory equipment used in generating electricity by steam.

GENERAL INFORMATION:

Interim retirements have averaged over $5 million per year for the past ten years.

SERVICE LIFE ANALYSIS:

Discussion: The 55-L0.5 survivor curve was proposed for interim retirements in the 2009 depreciation study. The Commission ordered a 0.0053 interim retirement rate, which corresponds to an average service life of approximately 94 years.

In this study, bands analyzed for this account include the overall band, as well as the most recent ten, twenty and thirty year experience bands. For this reason, the data points through age 45 are considered to be most relevant to the Company's current steam production plants, as these are the only ages that represent the experience of the plants still in service. The 50-R1 survivor curve represents a good fit of the data.

Recommendation: Change currently-authorized interim retirement rate to the 50-R1 survivor curve.

NET SALVAGE ANALYSIS:

Discussion: The current net salvage estimate is (4) percent, which is a composite estimate that applies to the full account. Data available for the net salvage analysis encompassed forty-four years of historical data, from 1976 through 2019. Most years have cost of removal and gross salvage. There are large gross salvage amounts in many years. Most of these transactions are the gross salvage for components that were refurbished and reused. Going forward, the Company will continue to refurbish components when possible, but as assets age the opportunity for refurbishment may be less frequent than in the historical data.

The overall average cost of removal is (30) percent, the average gross salvage is 8 percent, and the average net salvage is (22) percent. The most recent five-year average

and the most recent ten-year average have trended more negative at (50) and (40) percent.

Recommendation: Use a negative net salvage estimate of (15) percent, which is conservative when compared to the data. This estimate is adjusted for interim retirements to a (2) percent composite net salvage percent for Anclote and Crystal River.

Account 315: Accessory Electric Equipment

This account includes the cost installed of auxiliary generating apparatus, conversion equipment, and equipment used primarily in connection with the control and switching of electric energy produced by steam power, and the protection of electric circuits and equipment, except electric motors used to drive equipment included in other accounts. Such motors shall be included in the account in which the equipment with which they are associated is included.

GENERAL INFORMATION:

This account includes accessory electric equipment at the Company's steam power plants. Step-up transformers are not contained in the account, and are instead in Account 353.01, Step-Up Transformers. Interim retirements for this account have averaged about $500,000 per year over the past ten years.

SERVICE LIFE ANALYSIS:

Discussion: The 65-L0.5 survivor curve was proposed for interim retirements in the 2009 depreciation study. The Commission ordered a 0.0009 interim retirement rate, which corresponds to an average service life of approximately 556 years.

In this study bands analyzed for this account include the overall band, as well as the most recent ten, twenty and thirty year experience bands. For this reason, the data points through age 45 are considered to be most relevant to the Company's current steam production plants, as these are the only ages that represent the experience of the plants still in service. The 70-R1.5 survivor curve represents a good fit of the historical data.

Recommendation: The recommendation is to change current interim retirement rate to the 70-R1.5 survivor curve.

NET SALVAGE ANALYSIS:

Discussion: The current net salvage estimate is (1) percent, which is a composite estimate that applies to the full account. Historical data available for the net salvage analysis encompassed a forty-five year period, from 1975 through 2019. Cost of removal has exceeded gross salvage in most years, with little gross salvage recorded since 2002. The overall average cost of removal is 16 percent, the average gross salvage is 5 percent, and the average net salvage is (12) percent. More recent years have experienced more negative net salvage, with the most recent the ten-year average of (40) percent and the most recent five-year average of (52) percent.

Recommendation: The recommendation is to use the net salvage estimate of (15) percent, which is supported by the historical data. This estimate is adjusted for interim retirements to a (1) percent composite net salvage percent.

Account 316: Miscellaneous Power Plant Equipment

This account includes the cost installed of miscellaneous equipment in and about the steam generating plant devoted to general station use, and which is not properly includable in any of the foregoing steam-power production accounts.

GENERAL INFORMATION

Interim retirements for this account have averaged a little less than $400,000 per year over the past ten years.

SERVICE LIFE ANALYSIS:

Discussion: The 36-S0.5 interim survivor curve was proposed for interim retirements in the 2009 depreciation study. The Commission ordered a 0.0103 interim retirement rate, which corresponds to an average service life of approximately 49 years.

In this study, bands analyzed for this account include the overall band, as well as the most recent ten, twenty and thirty year experience bands. For this reason, the data points through age 45 are considered to be most relevant to the Company's current steam production plants, as these are the only ages that represent the experience of the plants still in service. The 45-R1 survivor curve represents a good fit of the data, with less consideration given to the larger retirement at age 38.

Recommendation: The recommendation is to change current interim retirement rate to the 45-R1 survivor curve.

NET SALVAGE ANALYSIS:

Discussion: The current net salvage estimate is (3) percent, which is a composite estimate that applies to the full account. Forty-four years of historical data, ranging from 1976 through 2019, was available for the net salvage analysis. There has been cost of removal and gross salvage in most years, and cost of removal has normally exceeded gross salvage. The overall average cost of removal is 15 percent, the average gross salvage is 6 percent, and the average net salvage is (9) percent.

Recommendation: Use an estimate of (5) percent. This estimate is adjusted for interim retirements to a (1) percent composite net salvage percent.

OTHER PRODUCTION PLANT

DEF's Other Production generating stations include four combined cycle plants, six simple cycle power plants, and multiple solar generating facilities. The Company has plans to construct additional solar generating plants. Some of the simple cycle facilities have different generations of generating technologies. The individual units at each facility were grouped together based on the estimated retirement date. For example, Debary Units 2 through 6 are older technologies than Units 7 through 10 and are expected to retire sooner than Units 7 through 10. Debary Units 2 through 6 were studied together and Units 7 through 10 were studied together for the depreciation study.

The table below shows DEF's fossil Other Production fleet by type of plant. The table is organized consistent with how the units are grouped in the depreciation study. The solar facilities are listed later in this report.

Plant	Type
Bartow Unit 4	Combined Cycle
Citrus Combined Cycle Plant	Combined Cycle
Osprey Combined Cycle Plant	Combined Cycle
Hines Energy Complex Unit 1	Combined Cycle
Hines Energy Complex Unit 2	Combined Cycle
Hines Energy Complex Unit 3	Combined Cycle
Hines Energy Complex Unit 4	Combined Cycle
Tiger Bay	Combined Cycle
Bartow Units 1 and 3	Simple Cycle Frame Units
Bartow Units 2 and 4	Simple Cycle Frame Units
Bayboro Units 1 through 4	Simple Cycle Aeroderivative Units
Debary Units 2 through 6	Simple Cycle Frame Units
Debary Units 7 through 10	Simple Cycle Frame Units
Intercession City Units 1 through 6	Simple Cycle Aeroderivative Units
Intercession City Units 7 through 10	Simple Cycle Frame Units
Intercession City Unit 11	Simple Cycle Frame Units
Intercession City Units 12 through 14	Simple Cycle Frame Units
Suwannee River Units 1 through 3	Simple Cycle Aeroderivative Units
University of Florida Cogeneration	Cogeneration

GENERAL INFORMATION:

Combined Cycle

The plants in DEF's combined cycle fleet range in age and efficiency. As an example, the Tiger Bay facility was placed in service in the 1990s whereas Citrus was placed in service in 2018. Citrus is a more efficient plant and also operates for more hours during the year. In general, many of the combined cycle plants are cycled to follow the load on the system. Even for baseload plants there may be some variation in output or cycling depending on the needs on the system. The additions of more solar facilities may impact the need to cycle plants in order to meet the load on the system. Cycling of facilities can have an impact on the service lives of components of the facilities and can potentially impact the overall life spans of facilities as well.

Combined cycle plants typically have life span estimates of 30 to 40 years. The current life spans for DEF's combined cycle plants are 35 years. This estimate is within the industry range and consistent with the expected timing of major capital expenditures on assets such as rotors, generators and the heat recovery steam generators. DEF has made investments in recent years to replace upgrade components at some of its combined cycle facilities. For example, there have been rotor replacements and advanced gas path upgrades for units at Hines. However, not all plants have had similar investments and upgraded parts may have more of an impact on interim retirements than the overall life span of the facilities.

DEF's combined cycles are still relatively young in terms of their overall life cycle and there is not historical experience for DEF that supports an overall expectation for the life span of these facilities. However, two combined cycle plants in the state of Florida have been retired in recent years (Florida Power and Light's Putnam and Ft. Lauderdale

facilities). These plants experienced life spans of around 35 years or less.

Modern combined cycle plants are highly efficient machines that require capital investments at scheduled intervals in order to ensure optimal operating conditions. Each unit is on a schedule that requires inspection, refurbishment and/or replacement of major gas turbine components. As a result, many assets in each combined cycle plant have significantly shorter lives than the plants themselves. These assets have been categorized as rotable parts for this study. The recommendation in the study is that a subaccount be created for rotable parts, which will be studied as a separate depreciable group. Rotable parts are expected to have shorter service lives and more positive net salvage than most of the other assets at each plant.

The table below provides a summary of the configuration, in-service date, proposed retirement date and life span of each of the Company's combined cycle plants.

PLANT	PLANT TYPE	MAJOR YEAR IN SERVICE	PROBABLE RETIREMENT YEAR	LIFE SPAN
Combined Cycle				
Bartow	4 x 1	2009	2044	35
Citrus	2 x 1 (2 units)	2018	2053	35
Osprey	2 x 1	2004	2039	35
Hines Unit 1	2 x 1	1999	2034	35
Hines Unit 2	2 x 1	2003	2038	35
Hines Unit 3	2 x 1	2005	2040	35
Hines Unit 4	2 x 1	2007	2042	35
Tiger Bay	1 x 1	1995	2030	35

Simple Cycle

DEF's simple cycle fleet includes both aeroderivative units and frame units. While some units are older, the frame units are relatively similar to the combustion turbines found at the Company's combined cycle plants, but with no steam cycle. The life spans of the simple cycle plants vary based on the specifics of each facility. DEF has retired simple cycle plants at Turner, Higgins, Rio Pinar and Debary in the past few years and plans to retire the units at Avon Park. Additional units are planned to retire in the coming years, including Debary Units 2-6, two units at Bartow and the University of Florida cogeneration plant. The life spans for the remaining plants are 45 years or longer.

With the exception of the life analysis for rotable parts, the simple cycle plants have been combined with the combined cycle plants for the analyses of interim survivor curves and interim net salvage. For most assets, the expected lives and net salvage costs are considered similar enough that the benefit of a larger sample size for the combined analysis results in the most appropriate results for each account. A separate estimate for rotable parts was not used for simple cycle plants because the frame units have fewer run hours than the combined cycle plants and, therefore, do not have components replaced as frequently as is the case for the combined cycles.

The table below provides a summary of the plant type, in-service date, proposed retirement date and life span of each of the Company's simple cycle plants.

DEPRECIABLE GROUP	PLANT TYPE	MAJOR YEAR IN SERVICE	PROBABLE RETIREMENT YEAR	LIFE SPAN
Simple Cycle Plants				
Bartow Units 1 and 3	Frame Units	1972	2034	62
Bartow Units 2 and 4	Frame Units	1972	2027	55
Suwannee River	Aeroderivative Units	1980	2034	54
Bayboro	Aeroderivative Units	1973	2024	51
Debary Units 2-6	Frame Units	1975	2027	52
Debary Units 7-10	Frame Units	1992	2037	45
Intercession City Units 1-6	Aeroderivative Units	1974	2034	60
Intercession City Units 7-10	Frame Units	1993	2038	45
Intercession City Units 11	Frame Units	1997	2042	45
Intercession City Units 12-14	Frame Units	2000	2045	45
University of Florida	Cogeneration	1993	2027	34

Solar

The Company's current plants are photovoltaic solar plants. Newer plants have tracking systems. The Company also plans to add new solar plants in the coming years. The service lives for each plant are based on estimated probable retirement dates for each unit. A 30-year life span is currently used for each solar facility and the recommendation is to continue to use the 30-year life span. There have been minimal interim retirements for the Company's solar plants, and so there are currently no estimated interim retirements and no interim net salvage estimates incorporated with the proposed depreciation rates for solar production. However, it is possible that some assets such as inverters, will require capital replacements in the future.

The table below provides a summary of the in-service date, proposed retirement date and life span of each of the Company's solar plants.

DEPRECIABLE GROUP	MAJOR YEAR IN SERVICE	PROBABLE RETIREMENT YEAR	LIFE SPAN
Solar			
Osceola	2016	2046	30

Energy Storage

The Company plans to add energy storage assets to its system. A typical service life for these types of assets is a 15-year average service life. The 15-S3 survivor curve is recommended with 0 net salvage.

LIFE AND NET SALVAGE ESTIMATES

The probable retirement dates for each type of facility are provided in the preceding sections. Interim survivor curves and interim net salvage were also estimated for each account based on judgment incorporating a number of factors, including the historical analysis of interim retirements, cost of removal and gross salvage. An account by account discussion of the development of the life and net salvage parameters for interim retirements is included in the pages that follow.

Account 341: Structures and Improvements

This account includes the cost of structures and improvements for other power generation.

GENERAL INFORMATION:

The structures in this account include all structures located at the Company's other production plants Interim retirements for this account have averaged about $660,000 per year over the past ten years.

SERVICE LIFE ANALYSIS:

Discussion: The 55-L2 survivor curve was proposed for interim retirements in the 2009 depreciation study. The Commission ordered a 0.006 interim retirement rate, which corresponds to an average service life of approximately 833 years.

For this study, bands analyzed included the overall experience, as well as the most recent ten, twenty and thirty year experience bands. The 85-R1.5 survivor curve represents a good fit of the historical data

Recommendation: The recommendation is to change current interim retirement rate to the 85-R1.5 survivor curve.

NET SALVAGE ANALYSIS:

Discussion: The current net salvage estimate is 0 percent, which is a composite estimate that applies to the full account. Forty-five years of data were available for the net salvage analysis, ranging from 1975 to 2019. The overall average cost of removal is 33 percent, the average gross salvage is 11 percent, and the average net salvage is (22) percent. More recent years show more negative net salvage. The most recent ten year average is (41) percent and the most recent five year average is (46). More recent years are also more representative of the current fleet of combined cycle plants.

The data supports a negative net salvage estimate. A more gradual change to (20), which is consistent with typical estimates for structures and improvements, is recommended at this time. This estimate is somewhat less negative than the net salvage percentage proposed for structures and improvements for steam production plant.

Recommendation: The recommendation is an interim net salvage estimate of (20) percent. This estimate is adjusted for interim retirements to a (1) percent composite net salvage percent for simple cycle plants and a (2) for combined cycle plants.

Account 342: Fuel Holders, Producers and Accessories

This account includes the cost installed of fuel handling and storage equipment used between the point of fuel delivery to the station and the intake pipe through which fuel is directly drawn to the engine, also the cost of gas producers and accessories devoted to the production of gas for use in prime movers driving main electric generators.

GENERAL INFORMATION

Interim retirements have averaged around $900,000 per year for this account.

SERVICE LIFE ANALYSIS:

Discussion: The 30-R0.5 survivor curve was proposed for interim retirements in the 2009 depreciation study. The Commission ordered a 0.0046 interim retirement rate, which corresponds to an average service life of approximately 109 years.

For this study, bands analyzed included the overall experience, as well as the most recent ten, twenty and thirty year experience bands. The 50-R1 survivor curve represents a good fit of the historical data.

Recommendation: Change current interim retirement rate to the 50-R1 survivor curve.

NET SALVAGE ANALYSIS:

Discussion: The current net salvage estimate is (1) percent, which is a composite estimate that applies to the full account. In the historical net salvage analysis, which consists of data from 1979 through 2019, most years have experienced cost of removal, while fewer have experienced gross salvage. The overall average cost of removal was 24 percent, the average gross salvage was 11 percent, and the average net salvage is (14) percent. More recent years have shown higher removal costs. The most recent ten year average for net salvage is (22) percent and the most recent five year average is (28) percent. More recent years are also more representative of the current fleet of combined cycle plants.

The data indicates that there is typically negative net salvage for this account. While more recent years show more negative net salvage, an estimate of (10) percent is a reasonable, although conservative, indication of future expectations for

this account.

Recommendation: The recommendation is to use an interim negative net salvage estimate of (10) percent. This estimate is adjusted for interim retirements to a (2) percent composite net salvage percent for both combined cycle plants and simple cycle plants.

Account 343: Prime Movers - General

This account includes the cost installed of Diesel or other prime movers devoted to the generation of electric energy, together with their auxiliaries.

GENERAL INFORMATION:

For this depreciation study, the recommendation for combined cycle plants is that this account be subdivided into two subaccounts – one for Rotable Parts and the other for the remaining assets in Account 343, referred to as Prime Movers – General. A similar subdivision of this account is used by affiliate Duke companies and by Florida Power and Light. Rotable parts include components of the gas cycle of the Company's combined cycle plants such as hot gas path and combustor components that are inspected and refurbished at regular intervals. The Prime Movers – General depreciable group includes the other components included in Account 343. The assets in Prime Movers – General are expected to have longer service lives than rotable parts and also to experience lower levels of gross salvage.

For Prime Movers – General, interim retirements have averaged approximately $22 million per year for the past 10 years.

SERVICE LIFE ANALYSIS:

Discussion:

For Prime Movers – General, the 25-O1 survivor curve was proposed for interim retirements in the 2009 depreciation study. The Commission ordered a 0.0072 interim retirement rate, which corresponds to an average service life of approximately 69 years.

For this study, bands analyzed included the overall experience, as well as the most recent ten, twenty and thirty year experience bands The service life indications for the various bands were relatively similar, and the life analysis of the historical data provides a decent indication of the interim survivor characteristics for this account. More consideration was given to the 12-year experience band from 2008-2019, which excludes the period prior to 2008 when data for rotable parts was not available.

The 40-R0.5 survivor curve has a longer life than indicated by the statistical analysis. Because this is the first study with rotable parts split out separately, a more gradual change in the service life estimate is proposed. As more data is available in future studies, the service life can be reviewed with additional data.

Recommendation:

Change current interim retirement rate to the 40-R0.5 interim survivor curve. This represents a gradual change when

compared to the statistical analysis.

NET SALVAGE ANALYSIS:

Discussion: The current net salvage estimate is (0) percent, which is a composite estimate that applies to the full account. Analyses were performed for all of Account 343 and, for the period for which data was available, separate analyses were performed for rotable parts and the other assets in the accounts. For the separate analyses, data was available from 2008 through 2019 although, because the account has not historically had subaccounts the data has not been tracked separately on the Company's books. The combined analysis for Account 343 was given more consideration because a longer period of history was available and because the types of assets have not been accounted for in separate accounts previously. In future studies, the expectation is that more data will be available to perform separate net salvage analyses.

For the combined analysis, the overall average cost of removal is 9 percent and the overall average gross salvage is 60 percent. However, most of the gross salvage is related to rotable parts. Further, while there may be negative net salvage, on average, for this account, the data is not as definitive.

For other companies that have separate accounts for rotable parts, this account typically has a net salvage estimate that is zero or somewhat negative.

Recommendation: The recommendation is to continue to use zero percent net salvage for this account. The estimate can be reviewed in future studies when more data specific to the non-rotable parts is available.

Account 343.1: Prime Movers – Rotable Parts

FERC Account 343 includes the cost installed of Diesel or other prime movers devoted to the generation of electric energy, together with their auxiliaries.

GENERAL INFORMATION:

For the Depreciation Study, this account has been segregated between rotable parts and the remaining assets in Account 343, referred to as Prime Movers – General. Rotable parts at DEF's combined cycle plants includes components such as blades, buckets and transition components.

Rotable parts include components of the gas cycle of the Company's combined cycle that have shorter service lives than the plants themselves. During these inspections, many assets are removed and refurbished. DEF retires each asset when refurbished and records a salvage value for the retired component. This amount, plus the refurbishment cost is then recapitalized when returned to service. Typically, after three replacement cycles, the assets can no longer be refurbished and are retired. DEF has upgraded components at some combined cycle plants, which could lead to longer intervals between inspections.

For Prime Movers – General, interim retirements have averaged approximately $74.1 million per year for the past 10 years.

SERVICE LIFE ANALYSIS:

Discussion: In the 2009 study, the Commission ordered a 0.0072 interim retirement rate for all of Account 343, which corresponds to an average service life of approximately 69 years.

The overall experience band was studied for combined cycle rotable parts. This band incorporates data from 2008 through 2019, which is the period for which data on rotable parts was available for DEF.

The service life indications from the statistical analysis were for lower mode L curves with average service lives of around 6 years representing the best fits of the historical data. If more data points were emphasized, a curve with a somewhat longer life, such as the 7-L0.5 survivor curve is a good fit for the data.

Recommendation: Change current interim retirement rate to the 7-L0.5 This estimate is somewhat longer than the better fitting curves but is a more gradual change that incorporates the potential for component upgrades resulting in longer inspection intervals for some units.

NET SALVAGE ANALYSIS:

Discussion:

In the 2009 depreciation study, an estimate of 0 percent was approved for all of FERC Account 343.

As discussed for Account 343, Prime Movers – General, both separate and combined net salvage analyses were performed. The combined data was given more consideration in this study. For the combined analysis, the overall net salvage was positive 51 percent. Most of the net salvage is likely related to rotable parts. However, given the age of the Company's combined cycle plants, most of this gross salvage is likely for refurbishments and there will be a higher percentage of retirements for which scrap is the only gross salvage in the future (since the assets will eventually reach the number of replacements for which parts cannot be refurbished and are instead scrapped). As a result, there is the potential for gross salvage to be, on average, lower overall than indicated by the historical data.

Recommendation:

Change the currently authorized net salvage estimate of 0 percent to positive 40 percent. Based on the 7-L0.5 survivor curve estimate for combined cycle, the majority of the retirements of plant in service will be interim retirements, and so the 40 percent net salvage estimate applies to all combined cycle rotable parts.

Account 344: Generators

This account includes the cost installed of diesel or other power driven main generators.

GENERAL INFORMATION

Interim retirements for this account have averaged about $2.1 million per year for the past ten years.

SERVICE LIFE ANALYSIS:

Discussion: The 55-R1.5 survivor curve was proposed for interim retirements in the 2009 depreciation study. The Commission ordered a 0.0004 interim retirement rate, which corresponds to an average service life of approximately 1250 years.

In the analysis for this study, bands studied include the overall band, as well as the most recent twenty, thirty and forty year experience bands. The statistical indications are similar across all of the bands.

The 65-R1 survivor curve represents a good fit of the historical data.

Recommendation: Change current interim retirement rate to the 65-R1 survivor curve.

NET SALVAGE ANALYSIS:

Discussion: The current net salvage estimate is (0) percent, which is a composite estimate that applies to the full account. Thirty-two years of data were available for the net salvage analysis, ranging from 1988 through 2019. In aggregate, the gross salvage has been similar to the historic cost of removal recorded to this account. The overall average cost of removal was 13 percent, the average gross salvage was 14 percent, and the average net salvage was 1 percent. However, the gross salvage is influenced by two large gross salvage entries in 2003 and 2012. In recent years, the trend has been towards higher cost of removal and the five-year average of the net salvage percentage is (13).

The more recent data supports a more negative net salvage estimate than the approved 0 percent estimate.

Recommendation: The recommendation is for an interim net salvage estimate of (5) percent. This estimate is adjusted for interim retirements

to a (1) percent composite net salvage percent for both combined cycle and simple cycle plants.

Account 345: Accessory Electric Equipment

This account includes cost installed of auxiliary generating apparatus, conversion equipment, and equipment used primarily in connection with the control and switching of electric energy produced in other power generating stations, and the protection of electric circuits and equipment, except electric motors used to drive equipment included in other accounts. Such motors shall be included in the account in which the equipment with which it is associated is included.

GENERAL INFORMATION:

The Company's step-up transformers are not contained in the account, and are instead in Account 353.01, Step-Up Transformers. Interim retirements have averaged $1.4 million per year for the past ten years.

SERVICE LIFE ANALYSIS:

Discussion: The 50-S0.5 survivor curve was proposed for interim retirements in the 2009 depreciation study. The Commission ordered a 0.0041 interim retirement rate, which corresponds to an average service life of approximately 122 years.

Bands studied in the life analysis for this study include the overall experience, as well as the most recent twenty, thirty and forty year bands. The historical data provide good indications of the service life for interim retirements.

The 60-S0 survivor curve represents a good fit of the historical data.

Recommendation: Change current interim survivor curve to the 60-S0 survivor curve.

NET SALVAGE ANALYSIS:

Discussion: The current net salvage estimate is 0 percent, which is a composite estimate that applies to the full account. The historical data available for the net salvage analysis ranged from 1978 through 2019. The overall average cost of removal was 17 percent, the average gross salvage was 3 percent, and the average net salvage was (13) percent. The most recent ten-year net salvage average was (14) percent and the most recent five year average was (16) percent.

Recommendation: The recommendation is for a net salvage estimate of (10) percent. This estimate is adjusted for interim retirements to a (2) percent composite net salvage percent for combined cycle

a (1) percent composite net salvage percent for simple cycle plants.

Account 346: Miscellaneous Power Plant Equipment

This account includes the cost installed of miscellaneous equipment in and about the other power generating plant, devoted to general station use, and which is not properly includable in any of the foregoing other power production accounts.

GENERAL INFORMATION

Interim retirements for this account have averaged around $200,000 per year for the past ten years.

SERVICE LIFE ANALYSIS:

Discussion: The 45-R1.5 survivor curve was proposed for interim retirements in the 2009 depreciation study. The Commission ordered a 0.0017 interim retirement rate, which corresponds to an average service life of approximately 294 years. Bands studied in the life analysis for this study include the overall band, as well as the most recent twenty, thirty and forty year experience bands.

The statistical analysis indicates a relatively short service life for this account. The recommendation is for a more gradual change from both the approved and proposed estimates from the last depreciation study.

Recommendation: Change current interim survivor curve to the 35-R1.5 survivor curve.

NET SALVAGE ANALYSIS:

Discussion: The current net salvage estimate is (1) percent, which is a composite estimate that applies to the full account. Forty-four years of data were available for the net salvage analysis, ranging from 1976 through 2019. Most recent years with retirements show some cost of removal and limited gross salvage. The overall average cost of removal is 32 percent, the average gross salvage is 11 percent, and the average net salvage is (21) percent. The most recent ten-year (21) and five year (22) net salvage averages have been consistent with the overall average.

Recommendation: The recommendation is for a (10) percent estimate, which considers the historic net salvage data and the estimate used for steam's miscellaneous equipment (5). This estimate is adjusted for interim retirements to a (4) percent estimate for combined cycle and a (2) percent estimate for simple cycle plants.

PART XI. DETAIL OF TRANSMISSION, DISTRIBUTION AND GENERAL PLANT

Account 350.01: Rights of Way

This account includes the cost of land and land rights for electric transmission.

GENERAL INFORMATION

This account includes easements used for transmission plant, both for substations and for transmission lines.

SERVICE LIFE ANALYSIS:

Discussion: For land rights accounts it is not uncommon to have a limited level of retirements in the historical data, and therefore the results of the life analyses do not provide definite results for this account. Typical average lives in the industry for this account are in the 60 to 80-year range. In the 2009 Study, a 75-R3 was recommended and approved by the Commission. The historical data does not provide support for modifying the current 75-R3 estimate.

Recommendation: Continue to use the approved 75-R3 survivor curve.

NET SALVAGE ANALYSIS:

Discussion: There has been limited historical activity in this account. Typically estimates of 0 percent are used for land rights, as there is generally neither cost of removal nor gross salvage when land rights are retired.

Recommendation: Retain currently authorized net salvage rate of 0 percent.

Account 352: Structures and Improvements

This account includes the cost of structures and improvements for electric transmission. This includes the cost of all buildings and fixtures permanently attached to the structures and improvements.

GENERAL INFORMATION

Structures in this account are transmission buildings that usually house controls for substations and offices. There are also other types of property associated with transmission included fencing, walkways, lighting, etc. The buildings are a mix of masonry and prefab construction. Retirements are generally the result of deterioration or inadequacy. Structures are also retired when an entire substation is removed from service.

SERVICE LIFE ANALYSIS:

Discussion: In the 2009 depreciation study a 75-R2.5 survivor curve was recommended for this account and this estimate was adopted by the Commission. Bands analyzed in the statistical analysis include the overall experience band with activity since 1943, as well as more recent 20, 30 and 40 year experience bands. The current estimate continues to be a reasonable fit for the historical data.

Recommendation: Continue to use the approved 75-R2.5.

NET SALVAGE ANALYSIS:

Discussion: The net salvage recommended and approved in the 2009 depreciation study was (15) percent. Forty-five years of data were available for the net salvage analysis, ranging from 1975 to 2019. Through 2014, the cost of removal was consistent relative to the retirements. The most recent five year average with an average of 72 percent has experienced higher cost of removal than in earlier years. Little gross salvage has been recorded for this account.

The overall average for the net salvage is (22) percent. This, in conjunction with the more recent activity, support that an estimate at least as negative as the current estimate should be used.

Recommendation: Recommendation is to continue to use (15) percent net salvage for this account based in part on the overall and more recent averages.

Account 353: Station Equipment

This account includes the cost of station equipment for electric transmission, specifically transforming, conversion and switching equipment.

GENERAL INFORMATION

This account is made up of all transmission substation equipment and is the largest transmission account. Two types of assets that make up the largest portion of the investment in this account are transformers and circuit breakers. Transformers and circuit breakers are typically retired due to failure, proactive replacement and due to capacity needs or upgrades. Predictive replacements (i.e. the replacement of assets predicted to fail due to the results of analyses such as dissolved gas analysis) have become more common, and DEF has installed dissolved gas analysis monitoring on larger transformers. DEF has a program to replace older oil-filled breakers. Additionally, the expectation is that newer transformers and breakers may not last as long as those installed thirty or forty years ago due to the fact that newer transformers have tighter design tolerances. There is also a program to replace relays. Solid state relays are being replaced with microprocessor-based relays, which typically have shorter lives than the older style relays.

Retirement, cost of removal and gross salvage transactions related to events not expected to reoccur, such as the early failure of a transformer, were excluded from the life and net salvage analyses.

SERVICE LIFE ANALYSIS:

Discussion:

A 53-R0.5 survivor curve was recommended in the 2009 depreciation study and adopted by the Commission. Bands analyzed in the statistical analysis include the overall experience band with activity since 1943, a band with data since 1959, as well as more recent 20, 30 and 40 year bands. Each of the bands produced fairly similar results, with the best fitting curves having average service lives around 50 years and low to mid mode R and S type curves.

The statistical analysis is considered to be indicative of the future experience for this account. While some factors, such as tighter design tolerances, could lead to shorter service lives in the future these may be offset by predictive maintenance and other programs. Even though the historical data indicates a slight trend towards shorter lives (and specifically in the more recent bands) the currently approved 53-R0.5 survivor curve estimate is still a reasonable fit for the data. This life and curve is consistent with estimates for other utilities for this type of property.

.

Recommendation: Continue to use the 53-R0.5 survivor curve for this account. This estimate also takes into consideration the statistical analysis as well as information provided by DEF personnel and experience of the industry.

NET SALVAGE ANALYSIS:

Discussion: In the 2009 depreciation study, the recommendation was for (0) percent net salvage, which the Commission approved. Forty-five years of data were available for the net salvage analysis, ranging from 1975 to 2019. In part because of the shorter history for which there is separate data for each subaccount, net salvage analysis was performed in which this subaccount was combined with 353.01 and 353.04, which contain assets related to the step-up transformers and equipment. The overall average cost of removal is 25 percent, the overall average gross salvage is 21 percent and the overall average net salvage is (4) percent. Cost of removal has trended upwards in the last ten years. The most recent ten-year average cost of removal is 35 percent.

Gross salvage has trended lower overall, although there have been some larger gross salvage amounts in recent years. Gross salvage was consistently recorded through 2002, but since that time has been more moderate. The most recent 20-year gross salvage is 15 percent and the most recent 10-year average gross salvage is 17 percent. Both are somewhat lower than the overall average gross salvage.

As a result of the decrease in gross salvage since 2002, net salvage has trended somewhat more negative. The most recent 20 year net salvage is (12) percent and the most recent ten-year average is (18) percent. The most recent five-year average is (17).

Recommendation: The overall net salvage data supports the recommended estimate of (5) percent, which is conservative when compared to the more recent data. If trends in cost of removal continue a more negative net salvage estimate may be appropriate in the future.

Account 353.01: Station Equipment – Step-Up Transformers

This account includes the cost of station equipment located at the Company's generating facilities, specifically step-up transformers.

GENERAL INFORMATION

Step-up transformers were part of Account 353, Station Equipment, until 2014 when the Company moved these assets to a separate subaccount. Historical data for the account is available from 2014 through 2019. The service life for assets in this account are impacted both by the physical life of the equipment as well as the potential retirement of generating facilities. Many of DEF's facilities, such as combined cycle plants and solar plants, have life spans of 35 years or less.

SERVICE LIFE ANALYSIS:

Discussion: Since this subaccount was included with Account 353 in the previous study, the current estimates are the same as that account. Data was available for actuarial analysis from 2014 through 2019. This account was studied in combination with Account 353.04, Step-Up Equipment. The statistical analysis indicated shorter service lives than the 53-R0.5 estimate used for Account 353, with best fitting curves having average service lives in the mid-20s. However, these service lives are somewhat shorter than is typically expected for this type of equipment and may be the result of the shorter period of data available for the study.

Recommendation: The 30-R1.5 survivor curve is recommended for this account. This estimate is somewhat longer than the better fitting curves (for example the 21-R1 or 21-S0.5) in the statistical analysis.

NET SALVAGE ANALYSIS:

Discussion: Since this subaccount was included with Account 353 in the previous study, the current estimates are the same as that account. Net salvage analysis was performed for this account in combination with Accounts 353 and 353.04 and the estimate for this account is the same as for those subaccounts.

Recommendation: Recommend a (5) percent net salvage, consistent with Account 353.

Account 353.04: Station Equipment – Step-Up Equipment

This account includes the cost of station equipment located at the Company's generating facilities, specifically equipment related to the step-up transformers.

GENERAL INFORMATION

Step-up equipment was part of Account 353, Station Equipment, until 2016 when the Company moved these assets to a separate subaccount. Historical data for the account is available from 2015 through 2019. The service life for assets in this account are impacted both by the physical life of the equipment as well as the potential retirement of generating facilities. Many of DEF's facilities, such as combined cycle plants and solar plants, have life spans of 35 years or less.

SERVICE LIFE ANALYSIS:

Discussion: Since this subaccount was included with Account 353 in the previous study, the current estimates are the same as that account. Data was available for actuarial analysis from 2015 through 2019. This account was studied in combination with account 353.01 Step-Up Transformers. The recommended service life is the same as for that account.

Recommendation: The recommendation is to use the same 30-R1.5 survivor curve as is recommended for Account 353.01.

NET SALVAGE ANALYSIS:

Discussion: Since this subaccount was included with Account 353 in the previous study, the current estimates are the same as that account. Net salvage analysis was performed for this account in combination with Accounts 353 and 353.04 and the estimate for this account is the same as for those subaccounts.

Recommendation: Recommend a (5) percent net salvage, consistent with Account 353.

Account 353.91: Station Equipment – Energy Control

This account include costs related to the Company's control centers. The largest investment in the account is for the energy control center placed in service in 1991.

GENERAL INFORMATION

DEF's St. Petersburg control center was placed in service in 1991 and is currently being renovated.

SERVICE LIFE ANALYSIS:

Discussion: In the 2009 depreciation study the recommended life and curve was 17-R3. The Commission approved the 17-L2 survivor curve. Data was available for actuarial analysis from 1980 through 2019. The statistical analysis indicated longer service lives than the existing estimate. The longer service lives are the result of fewer retirements since 2000. However, the St. Petersburg location is currently being renovated so a number of retirements are expected around 30 years of age. Additionally, some assets in the account have newer technologies that will likely have shorter lives than older types of assets.

Recommendation: The 30-S0.5 survivor curve is recommended for this account. This estimate is longer than the currently approved estimate, which reflects that retirements may occur at the same rate as in recent years. This estimate is a reasonable fit of the available data while also considering the age and outlook for the control center as well as newer equipment

NET SALVAGE ANALYSIS:

Discussion: In the 2009 depreciation study, the recommendation was for 0 percent net salvage, which was approved by the Commission. Twelve years of data were available for the net salvage analysis, ranging from 2008 to 2019. This account has had no gross salvage in that period. The overall cost of removal and overall net salvage has been 93 percent. However, given the somewhat limited data, there is no basis to move from the currently approved net salvage percent.

Recommendation: Continue to use the approved 0 percent net salvage.

Account 354: Towers and Fixtures

This account includes the cost of towers and fixtures used in electric transmission.

GENERAL INFORMATION

Most of the assets in this account were placed in service between 1966 and 1986, corresponding with the construction of the Company's nuclear plants and coal plants. Most lattice towers built in the 1950s and 1960s are on 230 kV circuits. Many towers built in the 1970s and 1980s are on 500 kV circuits.

SERVICE LIFE ANALYSIS:

Discussion: In the 2009 depreciation study the 65-R3 survivor curve was recommended and approved. Bands analyzed in the statistical analysis include the overall experience band with activity since 1943, a band with activity since 1959, as well as more recent 20, 30 and 40 year bands. The statistical results are not definitive, they do show an increase in retirement rates in the late 20 to 30 year age ranges. Estimates for other utilities typically range from 50 to 75 years. Higher mode R curves are also the most common for survivor curve estimates for this account.

A higher mode curve is indicative of the causes of retirement for these types of assets. Towers are generally retired when the transmission line is rerouted or replaced with conductors upgraded for heavier duty. Towers also are replaced due to foundation decay. It is possible that the environmental and climate conditions in Florida could impact the service lives of towers, as is the case with other types of assets.

Because there have been relatively few retirements through age 40, an increase in the average service life is appropriate for this account. The 70-R3 fits the available data well and represents a five-year increase in average service life. The R3 survivor curve is consistent with the current estimate.

Recommendation: The recommendation is for a change in the estimated survivor curve to the 70-R3.

NET SALVAGE ANALYSIS:

Discussion In the 2009 depreciation study, an estimate of (30) percent was recommended. The Commission approved a net salvage percent of (25). The overall net salvage percentage for this account is (77). After not experiencing any cost of removal from the period 1996 through 2002, DEF has experienced

more regular net salvage in the last 20 years. The 20-year average net salvage percentage is (108).

The data therefore supports a negative net salvage estimate. It is reasonable to expect negative net salvage for towers, as large transmission towers require manpower and equipment to remove

Recommendation: A more negative estimate is supported by the historical data. However, there has not been as much activity for this account as for other overhead transmission line accounts. For this reason, consideration was also given to Accounts 355 and 356. An estimate of (50) percent net salvage is recommended. This estimate is consistent with the recommended net salvage percentage for Accounts 355 and 356. This is a conservative estimate compared to the overall average net salvage of (77) percent.

Account 355: Poles and Fixtures

This account includes cost of poles (all types) and fixtures used in electric transmission.

GENERAL INFORMATION

Most transmission poles currently in service are wood. However, as a part of DEF's storm protection plan, the Company plans to replace wood poles on 69 kV or higher circuits with concrete or steel poles over the next fifteen years. Retirements for transmission poles typically occur due to damage, deterioration, loading, capacity and relocations. Retirements also occur as a result of storm hardening.

SERVICE LIFE ANALYSIS:

Discussion: In the 2009 depreciation study the 38-R2 survivor curve was approved. For the current study, bands analyzed in the statistical analysis include the overall experience band with activity since 1943, a band with data since 1959, and more recent 20, 30 and 40 year bands. The most recent 20 year placement band was also analyzed. The actuarial analysis indicated best fitting curves with average service lives of around 40 years with the better fitting curves having average service lives that are somewhat shorter than 40 years. The R2 type curve continues to be a good fit of the historical data.

Due to the replacement of wood poles with concrete poles, the overall composition of this account has changed and will continue to change. Of approximately 50,000 transmission poles on the system, approximately 18,000 are wood and the remainder are steel or concrete. Steel and concrete poles are expected to have a longer average service life than wood poles. As a result, the service life for the account going forward may be for a longer life than experienced in the historical data. However, this is offset by the fact that the approximately 18,000 wood poles will be replaced over the next 15 years.

Recommendation: Increase the average service life and retain the same curve type. The 40-R2 survivor curve is recommended, which is a longer service life than the best fitting survivor curves from the statistical analysis. As wood poles are replaced over the next fifteen years, a longer service life may be appropriate in the future.

NET SALVAGE ANALYSIS:

Discussion: In the 2009 depreciation study, the recommendation was for (50) percent net salvage. The Commission adopted a (25)

percent net salvage. Forty-five years of data were available for the net salvage analysis, ranging from 1975 to 2019. The overall average cost of removal is 89 percent, the average gross salvage is 11 percent, and the overall average net salvage was (78) percent. The most recent five year average net salvage was (81) percent. Thus, the data supports a more negative estimate than the current estimate of (25) percent.

A portion of the increase in cost of removal in recent years has been due to the volume of work performed (both for DEF and across the state), in particular for storm hardening work. The volume of work has impacted the cost for pole replacements, in part due to contractor costs. In the future, it is possible that these costs will moderate.

Given these considerations, the overall and more recent averages are considered to provide a reasonable basis for the net salvage estimates for this account. However, a more gradual change in net salvage is appropriate at this time because over the long-term costs may moderate.

Recommendation: The overall and five-year average of net salvage is more negative than the approved estimate. The recommendation is to use the previously proposed net salvage estimate of (50) percent, which is conservative and a gradual change when compared to the historical data.

Account 356: Overhead Conductors and Devices

This account includes the cost of overhead conductors and devices on tower lines used for electric transmission.

GENERAL INFORMATION

Transmission conductor is primarily for capacity and relocations. Damage and failure can also result in the replacement of conductor, as conductors exposed to greater wind loading suffer more metal fatigue.

SERVICE LIFE ANALYSIS:

Discussion:

In the 2009 depreciation study the 55-R1.5 survivor curve was recommended, which was approved by the Commission. For the current study, bands analyzed in the statistical analysis include the overall experience band with activity since 1958, as well as more recent 20, 30 and 40 year bands. Most bands indicate similar service life indications.

The actuarial analysis indicates average service lives of around 60 years, with low to mid mode curves resulting in the best fits. The statistical analysis therefore indicates that an increase in average service life is appropriate for this account. The analysis also indicates a slightly lower mode curve type. The R1 curves and S0 curves fit the historical data better than the existing R1.5 curve.

The impact of the storm hardening program on conductor is uncertain at this time. The design of the program is to increase the strength of the structural assets on transmission and distribution lines (i.e. the poles). With stronger structures, more force from storms and wind could be transferred to the conductor, resulting in more retirements due to deterioration and damage. However, as many of the retirements for conductor occur due to capacity and relocations, the impact could be limited. For these reasons, the statistical analysis is considered to be indicative of future experience for this account.

The 60-R1 is a good for the for the representative data points. The data also indicates that historically all assets have retired before age 100, which provides an indication of the maximum life of the curve.

Recommendation: Modify currently authorized 55-R1.5 service life and curve to the 60-R1 life and curve, which is a good fit of the historical data in the statistical life analysis.

NET SALVAGE ANALYSIS:

Discussion: In the 2009 depreciation study, the recommendation was for (30) percent net salvage. The Commission adopted a (20) percent net salvage. Forty-five years of data were available for the net salvage analysis, ranging from 1975 to 2019. The overall average cost of removal was 113 percent, the average gross salvage was 27 percent and the overall average net salvage was (85) percent. More recent averages have experienced slightly more negative net salvage; the most recent five year average is (116) percent and the most recent ten year average at (126) percent. The historical data therefore supports a more negative estimate than the approved (20) percent.

Recommendation: Increase the currently authorized net salvage rate from (20) percent to (50) percent. This estimate is conservative, but it is consistent with the other transmission overhead line accounts.

Account 357: Underground Conduit

This account includes the cost of underground conduit and tunnels for housing of cables and wires for transmission conductors.

GENERAL INFORMATION

The Company has different types of construction for underground transmission lines. In St. Petersburg, some older underground transmission is gas or oil-filed pipe conduit. Newer construction is solid dielectric in conduit. The most significant investment in the account, $25 million (or about 75% of the entire account), was added in 2009. These assets are solid dielectric cable in conduit primarily at the Bartow generating plant and the life may be tied to the life of the Bartow plant.

SERVICE LIFE ANALYSIS:

Discussion: In the 2009 depreciation study the 55-R3 survivor curve was recommended, which was approved by the Commission. For the current study, bands analyzed in the statistical analysis include the overall experience band with activity since 1958, as well as more recent 20, 30 and 40 year bands. Because most of the assets are 60 years old or less, there have been relatively few retirements for the account. The statistical analysis is therefore inconclusive. The historical data does indicate some retirements, but in general does not support any change in service life for the account from the approved 55-R3. If anything, the lives of the newer assets may be shorter than 55 years. Most estimates for others in the industry are in the 50 to 65 year range.

Recommendation: The recommendation is to continue to use the 55-R3 survivor curve.

NET SALVAGE ANALYSIS:

Discussion: In the 2009 depreciation study, the recommendation was for 0 percent net salvage, which was adopted by the Commission. Similar to the life analysis, the historical data is not conclusive for the net salvage analysis, with removal costs and gross salvage not recorded for each year. The overall average cost of removal is 40 percent. The expectation is that in the future, when more conduit is retired, that cost of removal will moderate.

To the extent conduit is retired in place, there should be limited cost of removal and gross salvage, which supports the approved 0 percent net salvage. However, oil-filled conduit in

St. Petersburg may have removal requirements, which could result in cost of removal for oil-filled pipe.

Recommendation: The recommendation at this time is to retain the currently authorized 0 percent net salvage rate. In future studies a negative net salvage estimate may be appropriate.

Account 358: Underground Conductors and Devices

This account includes the cost of underground conductors and devices for electric transmission.

GENERAL INFORMATION

Similar to Account 357, a large portion of the account was added in 2009 ($63 million which is about 80% of the account) related to the construction of the Bartow combined cycle plant.

SERVICE LIFE ANALYSIS:

Discussion: In the 2009 depreciation study the 50-R3 survivor curve was recommended, which was approved by the Commission. For the current study, bands analyzed in the statistical analysis include the overall experience band with activity since 1957, as well as more recent 20, 30 and 40 year bands. The statistical analysis indicated a longer service life than the approved estimate, with the better fitting curves having longer average service lives.

The R3 curve continues to be a good fit of the historical data. An average service life of 55 is a better fit than the currently approved 50 years and is consistent with the average service life approved for Account 357.

Recommendation: The recommendation is to use the 55-R3 survivor curve. This is a good fit of the available historical data.

NET SALVAGE ANALYSIS:

Discussion: In the 2009 depreciation study, the recommendation was for (3) percent net salvage. The Commission adopted 0 percent net salvage. Forty-three years of data were available for the net salvage analysis, ranging from 1977 to 2019. The overall average cost of removal was 2 percent, the overall gross salvage was 1 percent and the overall average net salvage was (1) percent. There has not been any gross salvage since 1977.

Recommendation: The recommendation is to continue to use 0 percent net salvage.

Account 359: Roads and Trails

This account includes the cost of roads and trails for access to electric transmission facilities.

GENERAL INFORMATION

Most of the assets in this account have been installed since the 1970s, with 99.7 percent of the surviving assets as of 2019 are from vintages 1974 and subsequent. As a result, the retirement experience is somewhat limited.

SERVICE LIFE ANALYSIS:

Discussion: In the 2009 depreciation study the 75-R3 survivor curve was recommended. The Commission approved a 90-R3 survivor curve. For the current study, bands analyzed in the statistical analysis include the overall experience band with activity since 1943, a band since 1959, and more recent 20, 30 and 40 year bands. Because most of the assets are 50 years old or less, there have been relatively few retirements for the account. The statistical analysis is therefore inconclusive.

Most estimates for others in the industry are in the 55 to 75 year range. A 90-year average service life is long for roads and trails and outside of the typical industry range.

Recommendation: The 75-R3 survivor curve is recommended. This curve was proposed in the previous study and has the same average service life as the estimate for easements in Account 350.01.

NET SALVAGE ANALYSIS:

Discussion: In the 2009 depreciation study the recommended net salvage estimate was 0 percent, which was approved by the Commission. The net salvage analysis is somewhat limited, with cost of removal and gross salvage not recorded each year. The overall net salvage is (8) percent.

Recommendation: The recommendation is to continue to use the approved 0 percent net salvage.

Account 360.01: Rights of Way

This account includes the cost of land and land rights for electric distribution.

GENERAL INFORMATION:

This account includes easements used for distribution lines and structures.

SERVICE LIFE ANALYSIS:

Discussion: For land rights accounts it is not uncommon to have a limited level of retirements in the historical data, and therefore the results of the life analyses do not provide definite results for this account. Typical average lives in the industry for this account are in the 60 to 80 year range. In the 2009 Study, a 75-R3 was proposed and approved by the Commission. There is no new information based on the life analysis that would support a change in service life estimate.

Recommendation: Continue to use the approved 75-R3 survivor curve.

NET SALVAGE ANALYSIS:

Discussion: There has been limited historical activity in this account. Typically estimates of 0 percent are used for land rights, as there is generally neither cost of removal nor gross salvage when land rights are retired.

Recommendation: Retain currently authorized net salvage rate of 0 percent.

Account 361: Structures and Improvements

This account includes the cost of structures and improvements used in connection with electric distribution substations. This includes the cost of all buildings and fixtures permanently attached to the structures.

GENERAL INFORMATION:

The structures in this account are typically small control buildings with the majority being constructed of concrete or metal. Improvements such as fencing are also included in the account.

SERVICE LIFE ANALYSIS:

Discussion: The 75-R2 survivor curve was recommended in the 2009 depreciation study, which was adopted by the Commission. Bands analyzed using the retirement rate method for this account include the overall experience band with activity since 1943, a band with data since 1959, and the most recent 20, 30 and 40 year experience bands..

The statistical analysis indicates a shorter life than the approved curve type. The 65-R2.5 life and curve is a good fit of the most representative data points and is within the range of other estimates for this account in the industry.

Recommendation: The 65-R2.5 curve is recommended. This estimate is a better fit to the historic data and the curve type is consistent with what was recommended for transmission structures and improvements.

NET SALVAGE ANALYSIS:

Discussion: In the 2009 depreciation study a net salvage estimate of (10) percent was recommended and was approved by the Commission. Forty-five years of data were available for the net salvage analysis, ranging from 1975 to 2019. The overall cost of removal was 15 percent and the overall gross salvage is 2 percent. The overall net salvage was (13) percent. Little gross salvage has been recorded in more recent years, but the overall net salvage has been relatively consistent over time. The most recent 10 and 5 year averages of net salvage have been (11) percent and (9) percent respectively. The approved (10) percent continues to be a reasonable estimate for this account.

Recommendation: The recommendation is to continue to use the approved (10) percent net salvage.

Account 362: Station Equipment

This account includes the cost of station equipment used for the purpose of changing the characteristics of electricity in connection with its distribution.

GENERAL INFORMATION:

This account includes distribution substation equipment. The two types of property that make up the largest portion of the investment in this account are circuit breakers and transformers. Transformers and circuit breakers are typically retired due to failure, proactive replacement and due to capacity needs or upgrades. Additionally, due to tighter design tolerances, the expectation is that newer transformers and breakers may not last as long as those installed thirty or forty years ago. There is also a program to replace relays. Solid state relays are being replaced with microprocessor based relays, which typically have shorter lives than the older style relays.

SERVICE LIFE ANALYSIS:

Discussion: The service life estimate for this account in the 2009 depreciation study was 60-R0.5, which was adopted by the Commission. Bands analyzed using the retirement rate method for this account include the overall experience band with activity since 1943 and the most recent 20, 30 and 40 year experience bands. The actuarial analysis indicates a trend to a somewhat shorter service life than the approved 60-R0.5, with the best fitting curves having average service lives around 50 years. More recent bands also support a trend towards a somewhat shorter average service life.

Newer transformers may not last as long as the older ones due to tighter design tolerances. Environmental and climate conditions in DEF's service territory, such as heat, rain, wind, lightening, and salt spray all have an impact on the life of substation equipment.

The 50-R1 is a good fit of the historical data for the most representative data points.

Recommendation: Use the 50-R1 survivor curve. This estimate is a good fit to the historic data and consistent with expectations for this account.

NET SALVAGE ANALYSIS:

Discussion: In the 2009 depreciation study the net salvage estimate was (15) percent. The Commission approved a net salvage percent of (10). Forty-five years of data were available for the net salvage analysis, ranging from 1975 to 2019. The overall

average cost of removal for this period was 27 percent, the average gross salvage was 13percent and the overall average net salvage was (13) percent. The more recent five year average indicates slightly more negative net salvage of (29) percent. Thus, the historical data supports continuing to use the approved estimate for this account.

Recommendation: Retain the current approved (10) percent net salvage for this account, which is consistent with the historical data.

Account 364: Poles, Towers and Fixtures

This account includes the cost of poles, towers, and appurtenant fixtures for supporting electric overhead distribution conductors and service wires.

GENERAL INFORMATION

The majority of DEF's distribution poles are wood poles. The Company's storm hardening program has led to the replacement of many wood poles with newer poles that are stronger, often spaced closer together and consistent with current standard. Most of these new poles are wood.

SERVICE LIFE ANALYSIS:

Discussion: The causes of pole retirements are from the pole replacement program due to deterioration, as well as loading, storms, road widening, inadequacy, reconductoring and car accidents. In the 2009 depreciation study the 29-R4 survivor curve was recommended. The 32-R4 survivor curve was approved by the Commission.

Bands analyzed using the retirement rate method for this account include the overall experience band with activity since 1943, data since 1959, and the most recent 20, 30 and 40 year experience bands.

The results of the statistical analysis showed that the best fitting curves had average service lives in the 40 year range. The statistical indications for poles were for slightly lower modes than the current estimate.

The 40-R3 survivor curve is a good fit of the historical data for poles. It is somewhat longer than the best fitting curves for the overall band but consistent with more recent bands. This is an increase in service life from the approved estimate and represents a lower mode curve type as approved estimate.

Recommendation: The 40-R3 survivor curve is recommended. This estimate is slightly longer than the overall indications in the historical data but is supported by the analysis of more recent bands and by information provided by management.

NET SALVAGE ANALYSIS:

Discussion: In general, distribution poles have become more costly to replace over the past 10 to 15 years. Reasons for increased costs include increases in labor and contractor costs, increases in permitting costs and traffic control costs. In the

2009 Study, a (50) percent net salvage estimate was recommended. A net salvage estimate of (35) percent was approved by the Commission.

The historical data supports that a more negative estimate than the approved (35) percent is appropriate for this account. Forty-five years of data were available for the net salvage analysis, ranging from 1975 to 2019. The overall average cost of removal was 112 percent, the overall average gross salvage was 30 percent, and the overall average net salvage was (82) percent. While removal costs have trended higher for the reasons described above, gross salvage has trended lower. Gross salvage for wood poles is lower due to disposal retirements, as wood poles typically can no longer be sold to third parties to use as mulch due to environmental rules.

The combination of higher removal costs and lower gross salvage results in the more recent data indicating even more negative net salvage. While the overall net salvage is (82) percent, the most recent five year average (211) percent. The three year moving averages have exceeded (90) percent each year since the 2004-2006 period

As noted above, discussions with Company management support that removal costs have been increasing for a number of reasons. However, there is also the potential that the storm hardening work in recent years has resulted in higher costs of removal and that costs may moderate somewhat going forward. Also, because storm hardening work typically occurs on critical lines, it is more likely to be located near main roads. Due to permitting and other work requirements, costs can be higher for this type of work than is the case for work on lateral lines. Thus, while it should be expected that much of the increase in removal costs should continue for the future, costs may moderate somewhat once the storm hardening program is completed and be lower than the (211) percent or more that has been experienced in the last five years.

Recommendation:

The overall average supports an estimate of at least (60) percent. The recommendation at this time is for an estimate of (60) percent, which is conservative compared to the historical data. If trends for more negative net salvage continue, a more negative estimate will be appropriate in future studies.

Account 365: Overhead Conductors and Devices

This account includes the cost of electric overhead conductors and devices used for distribution purposes.

GENERAL INFORMATION:

AAC is the most common type of conductor used on the system with 1.0 being the most common size. Overhead conductor is retired as the result of deterioration or too many splices, inadequate capacity or clearance, road widening, and storms. Older copper and open wire may also be proactively replaced. DEF is undergrounding many of its conductors as a part of its storm hardening program.

SERVICE LIFE ANALYSIS:

Discussion: In the 2009 depreciation study the recommendation was for the 36-R0.5 survivor curve, which the Commission approved. Bands analyzed using the retirement rate method for this account include the overall experience band with activity since 1943, a band with activity since 1959 and the most recent 20, 30 and 40 year experience bands. The statistical analysis indicated an increase in average service life for this account. The statistical indications were for average service lives in the 40-45 year range. The R0.5 is still a reasonable fit for the historic data; however, in recent years, many assets have been retired at earlier ages than is expected going forward. Given this, the R1 is more consistent with future retirement expectations, while also being a good fit to the historic data.

The impact of the storm hardening program on conductor is uncertain at this time. The design of the program is to increase the strength of the structural assets on transmission and distribution lines (i.e. the poles). With stronger structures, more force from storms and wind could be transferred to the conductor, resulting in more retirements for conductor due to deterioration. However, as many of the retirements for conductor occur due to capacity and relocations, the impact could be limited. The 45-R1 survivor curve is a good fit of the representative data points for this account. This estimate represents an increase over the approved estimate.

Recommendation: Change currently authorized service life and curve from the 36-R0.5 to the 45-R1.

NET SALVAGE ANALYSIS:

Discussion: In the 2009 depreciation study the net salvage estimate was (45) percent. The Commission approved an estimate of (20)

percent. Forty-five years of historical net salvage data were available for the net salvage analysis, ranging from 1975 to 2019. The overall average cost of removal for this period was 59 percent, the overall average gross salvage was 25 percent, and the overall average net salvage was (35) percent. However, cost of removal has trended higher and gross salvage lower in recent years. The most recent five year average cost of removal of 66 percent is more negative than the overall average, while the most five year average gross salvage is lower than the overall average. The most recent five years only experienced 6 percent gross salvage and the five year net salvage has been (61). The more recent data therefore indicates more negative net salvage than the overall average.

The reasons for increasing costs for overhead conductor are similar to those for poles, and include permitting requirements, safety requirements and traffic control requirements. However, similar to poles there is the possibility that storm hardening work, which is more likely to be adjacent to major roads, could experience higher removal costs. It is therefore possible that costs cold moderate somewhat in the future.

Recommendation: The historical data supports a more negative net salvage estimate than the approved estimate. The recommendation is for a (30) percent net salvage estimate. This estimate is slightly more negative than the overall average but is conservative when compared to more recent averages.

Account 366: Underground Conduit

This account includes the cost of electric underground conduit and tunnels used for housing distribution cables.

GENERAL INFORMATION:

Underground distribution conduit can be thin-wall conduit or PVC. DEF also has network systems in downtown Clearwater, Downtown St. Petersburg and Treasure Island. Underground conduit is generally retired only when accidentally dug up or abandoned due to relocations or upgrades. Over 97 percent of DEF's surviving investment in this account is vintage 1980 or newer. Starting in 2019, new installations will be in PVC conduit.

SERVICE LIFE ANALYSIS:

Discussion: In the 2009 depreciation study the recommendation was for the 67-R2.5 survivor curve, which was approved by the commission. Bands analyzed using the retirement rate method for this account include the overall experience band with activity since 1943, a band with data since 1959, and the most recent 20, 30 and 40 year experience bands. The statistical analysis indicated a higher mode curve than the approved R2.5. The 70-R3 is a better fit of the historical data than the approved estimate for the representative data points.

Recommendation: Use the 70-R3 survivor curve.

NET SALVAGE ANALYSIS:

Discussion: In the 2009 depreciation study the net salvage estimate was (10) percent. The Commission approved an estimate of (5) percent. Forty-five years of historical net salvage data were available for the net salvage analysis, ranging from 1975 through 2019. The overall cost of removal has been 109 percent, the overall gross salvage 27 percent and the overall net salvage has been (82) percent. Both cost of removal and gross salvage have trended more negative in recent years. The most recent ten-year net salvage percent is (143) percent.

Recommendation: The recommendation is (10) percent net salvage for this account. This estimate is conservative relative to the historic trends but incorporates that many assets will be retired in place in the future.

Account 367: Underground Conductors and Devices

This account includes the cost of electric underground conductors and devices used for electric distribution.

GENERAL INFORMATION:

Approximately 80% of underground cable is direct buried. Cable that is not direct buried varies and can be thin-wall conduit or PVC conduit. DEF also has network systems in downtown Clearwater, Downtown St Petersburg and Treasure Island. DEF has a replacement program in place to remove older cable with concentric neutral. The Company is also doing cable injection in some instances. Typical causes of retirement in this account include failure, dig-ins and relocations. Underground cable that is in PVC conduit or ducts is more likely to be removed when replaced than direct buried cable.

SERVICE LIFE ANALYSIS:

Discussion: In the 2009 depreciation study the recommendation was for the 35-R2 survivor curve, which was approved by the Commission. Bands analyzed using the retirement rate method for this account include the overall experience band with activity since 1943 and the most recent 20, 30 and 40 year experience bands. Each band indicated similar service life characteristics.

The best fitting survivor curves typically had somewhat longer service lives than the approved estimate, with the best fitting curves having average service lives around 45 years. The R1 curve type is a better fit than the current R2 curve. An increase in service life is consistent with the expectation that the quality of underground cable has improved, as newer cable has improved dielectric properties. The 45-R1 is a good fit of the data and consistent with future expectations for this account.

Recommendation: The recommendation for this account is the 45-R1 survivor curve.

NET SALVAGE ANALYSIS:

Discussion: In the 2009 depreciation study the recommendation was for a (10) percent net salvage estimate. The Commission approved an estimate of (5) percent. Forty-five years of data was available for the net salvage analysis, ranging from 1975 through 2019. The overall average cost of removal for this period was 37 percent and the overall gross salvage was 17 percent. The overall average net salvage was (20) percent. The most recent ten and five year averages have been more

negative than the overall average at (27) percent and (31) percent respectively.

Conductor in the network system is often removed when replaced, as the conductor is pulled from the duct to make room for new conductor. Costs can also be higher due to traffic control and other requirements. When conductor is abandoned in place the Company has to cut the cable at each joint and intersection below grade. There is no gross salvage when cable is abandoned in place.

The data, as well as the Company's practices, support that a negative net salvage estimate is appropriate for this account.

Recommendation: The recommendation is for an estimate of (10) percent net salvage, which is conservative.

Account 368: Line Transformers

This account includes the cost installed of overhead and underground distribution line transformers and poletype and underground voltage regulators owned by the utility, for use in transforming electricity to the voltage at which it is to be used by the customer, whether actually in service or held in reserve.

GENERAL INFORMATION:

DEF has overhead, underground and pad mount transformers. Overhead transformers are more subject to lighting but pad mount transformers are more exposed to irrigation and other factors that can cause corrosion. Since 2000, DEF has installed stainless steel within 1,000 feet of coastline, which could mitigate corrosion.

SERVICE LIFE ANALYSIS:

Discussion: In the 2009 depreciation study the recommendation was for the 27-R2 survivor curve. The Commission approved the 31-R2 survivor curve. Bands analyzed using the retirement rate method for this account include the overall experience band with activity since 1943, a band with data since 1959 and the most recent 20, 30 and 40 year experience bands.

The statistical analysis indicated slightly longer average service lives than the approved estimate. Retirements in the past 10 years have been on average younger than those recorded in previous years. The result has been for a lower mode curve to be indicated in the data. A change of curve type to the R0.5 curve, which represents a very good fit of the historical data for the representative data points, is recommended. The 35-R0.5 survivor curve represents a slight increase in average service over the approved estimate and is a good fit of the historical data.

Recommendation: The recommendation is to change the approved 31-R2 survivor curve to the 35-R0.5 survivor curve.

NET SALVAGE ANALYSIS:

Discussion: In the 2009 depreciation study the recommendation was for (15) percent net salvage. The Commission adopted a (10) percent net salvage. Forty-five years of data was available for the net salvage analysis, ranging from 1975 through 2019. The overall average cost of removal for this period was 28 percent, the overall gross salvage was 13 percent and the overall average net salvage was (15) percent. The most recent ten-year average is (19).

The current estimate of (10) percent, while on the conservative end, is consistent with more recent averages.

Recommendation: The recommendation is to keep the approved net salvage estimate of (10).

Account 369.01: Services - Underground

This account includes the cost of electric distribution underground services.

GENERAL INFORMATION

Retirements of underground services typically occur due to third party damage, failure (i.e., if there are three or more outages), capacity, and customer requirements. The assets in the account have been installed since 1966, with almost 90 percent installed since 1985.

SERVICE LIFE ANALYSIS:

Discussion: In the 2009 depreciation study the recommendation was for the 43-R0.5 survivor curve, which the Commission approved. Bands analyzed using the retirement rate method for this account include the overall experience band with activity since 1943, a band with data since 1959, and the most recent 20, 30 and 40 year experience bands. An analysis was also performed for the combined data of Accounts 369.01 and 369.02.

The statistical analysis for Account 369.01 data was not conclusive but the combined analysis indicated a slightly shorter service life than the approved estimate for this account. Earlier-aged retirements have occurred in recent years that impact the original life table but are not expected to be reflective of future experience. Because the analysis for Account 369.01 is not conclusive, more consideration was given to the combined analysis. The 40-R2.5 curve is a better fit to the combined data than the existing curve.

Recommendation: The recommendation is to change the approved 43-R0.5 survivor curve to the 40-R2.5 survivor curve.

NET SALVAGE ANALYSIS:

Discussion: In the 2009 depreciation study an estimate of (15) percent net salvage was recommended. The Commission approved an estimate of (5) percent. Forty-five years of data was available for the net salvage analysis, ranging from 1975 through 2019. The overall average cost of removal was 21 percent, the overall gross salvage was 8 percent and the overall average net salvage was (14) percent. There has been very little gross salvage recorded since 2002. Cost of removal has trended lower. The most recent ten-year average cost of removal is 13 percent.

The historical data supports that a more negative net salvage estimate is appropriate.

Recommendation: The recommendation is for a (15) percent net salvage estimate, which is similar to the overall average net salvage.

Account 369.02: Services - Overhead

This account includes the cost of electric distribution overhead services.

GENERAL INFORMATION:

Overhead services are retired as the result of deterioration, weather or capacity. Services may also be replaced due to customer requirements.

SERVICE LIFE ANALYSIS:

Discussion: In the 2009 depreciation study the recommendation was for the 34-R3 survivor curve, which the Commission approved. Bands analyzed using the retirement rate method for this account include the overall experience band with activity since 1943, a band with data since 1959, and the most recent 20, 30 and 40 year experience bands. An analysis was also performed for the combined data of Accounts 369.01 and 369.02. The statistical analysis indicates a longer service life than the current estimate. The combined analysis indicates a longer service life than the analysis based only on Account 369.02 data. The 40-R2.5 curve is a good fit of the combined analysis and has a somewhat longer life than the analysis for data for only Account 369.02.

Recommendation: The recommendation is to use the 40-R2.5 survivor curve, which is the same recommendation as for Account 369.01 Services - Underground. This is a somewhat longer estimate than had only the data for Account 369.02 been considered.

NET SALVAGE ANALYSIS:

Discussion: In the 2009 depreciation study the recommendation was for (50) percent net salvage. The Commission approved an estimate of (40) percent. Forty-five years of data were available for the net salvage analysis, with years ranging from 1975 through 2019. The overall average cost of removal for this period was 30 percent, the average gross salvage was 7 percent and the average net salvage was (23) percent. Cost of removal has trended higher over the past decade while gross salvage has not experienced much activity since 2001. The most recent five-year average cost of removal is 53 percent and the most recent five-year average gross salvage is zero percent.

Overall, the historical data supports a less negative net salvage estimate than the approved (40) percent.

Recommendation: The recommendation is for a net salvage estimate of (20) percent. This estimate is consistent with the overall average net salvage.

Account 370: Meters

This account includes the cost of meters or devices for use in measuring the electricity delivered to customers.

GENERAL INFORMATION:

DEF is currently replacing its existing meters with AMI meters. Most of the assets that remain in the account are related assets such as meter boxes and instrument transformers. AMI meters are in Account 370.02. Retirements related to the AMI program have been excluded from the life and net salvage analyses.

SERVICE LIFE ANALYSIS:

Discussion: The current estimate for this account is the 18-R0.5 survivor curve. Bands analyzed using the retirement rate method for this account include the overall experience band with activity since 1943, a band with activity since 1959 and the most recent 20, 30 and 40 year experience bands. The statistical analysis indicated a somewhat longer service life than the approved estimate. Since most assets that remain in this account are not meters, but other related equipment, a longer life is reasonable. The 25-R1 survivor curve is longer than the best fitting curves but incorporates that an expectation that the assets currently in this account may have longer lives than meters had historically experienced.

Recommendation: Increase the current approved 18-R0.5 survivor curve to the 25-R1 survivor curve.

NET SALVAGE ANALYSIS:

Discussion: In the 2009 depreciation study the recommendation was for (10) percent net salvage. The Commission approved an estimate of (8) percent. Forty-five years of data were available for the net salvage analysis, ranging from 1975-2019. The overall average for this period was (11) percent. The historic data supports the (10) percent net salvage that was proposed in the previous study.

Recommendation: Use the (10) percent net salvage estimate. This estimate is consistent with the overall average net salvage.

Account 370.02: Meters - AMI

This account includes the cost of meters or devices for use in measuring the electricity delivered to customers. This account includes all new AMI meters.

GENERAL INFORMATION:

DEF has replaced the vast majority of its analog meters with AMI meters. This account contains the AMI meters.

SERVICE ANALYSIS:

Discussion: DEF did not have AMI meters at the time of the 2009 depreciation study. A 15-year service life is currently used for this account and was approved in Docket No. PSC-2017-0451-AS-EU. Because all of the assets in this account have been installed since 2015, there is limited historical data for the life analysis. The approved 15-year average service life is consistent AMI meters used for other utilities continues to be reasonable for this account. The R2.5 curve type is recommended for this account.

Recommendation: The recommendation is to use the 15-R2.5 survivor curve for this account.

NET SALVAGE ANALYSIS:

Discussion: There is currently not a negative net salvage estimate for this account and because the AMI meters are new, there is limited net salvage data available specific to AMI meters. However, he historical experience for Account 370 should be representative of the net salvage experience for AMI meters. It is reasonable to use the same net salvage estimate for both accounts.

Recommendation: The recommendation is to use (10) percent net salvage, which is the same estimate as is recommended for Account 370.

Account 371: Installation on Customers' Premises

This account includes the cost of equipment on the customer's side of the meter when the utility retains responsibility for same.

GENERAL INFORMATION:

Assets in this account primarily include lighting on customer premises, as well as assets associated with customer lighting, such as poles and conductor.

SERVICE LIFE ANALYSIS:

Discussion: In the 2009 depreciation study the recommendation was for the 25-R2 survivor curve, which was approved by the Commission. Bands analyzed using the retirement rate method for this account include the overall experience band with activity since 1943, a band with data since 1959vand the most recent 20, 30 and 40 year experience bands. Almost all of the assets in this account have been added since the 1980s, and most have been added within the past 30 years. The approved 25-R2 survivor curve is a still a good fit to the historical data.

Recommendation: The recommendation is to retain the approved 25-R2 survivor curve.

NET SALVAGE ANALYSIS:

Discussion: In the 2009 depreciation study the recommendation was for a 0 net salvage estimate, which the Commission approved. Forty-five years of data was available for the net salvage analysis, ranging from 1975 through 2019. The overall average cost of removal for this period was 41 percent, the overall average gross salvage was 5 percent and the overall average net salvage was (36) percent. Retirements, cost of removal and gross salvage have been relatively limited since 2000. Negative cost of removal has usually accompanied retirements when they have occurred. The most recent 5 and 10 year average net salvage percentages are (93) percent and (128) percent. The data in recent years is not definitive, but it does support a negative net salvage estimate.

Most of the assets in this account are related to customer lighting, for which the net salvage expectations should be similar to Account 373. It is reasonable to use the same estimate for this account as for Account 373.

Recommendation: The recommendation is for (10) percent net salvage, which is the same estimate as is recommended for Account 373.

Account 373: Street Lighting and Signal Systems

This account includes the cost installed of equipment used wholly for public street and highway lighting; or traffic, fire alarm, police, and other signal systems.

GENERAL INFORMATION:

Assets in this account include street lighting, as well as assets associated with street lighting, such as poles and conductor. New lighting is LED and the Company replaces a number of street lights each year due to customer requests for LED lighting. When LED lights are replaced, the entire fixture is replaced.

SERVICE LIFE ANALYSIS:

Discussion: The recommendation in the 2009 depreciation study was for the 20-L1.5 survivor curve, which was approved by the Commission. Bands analyzed using the retirement rate method for this account include the overall experience band with activity since 1943, a band with data since 1959 and the most recent 20, 30 and 40 year experience bands. The statistical analysis indicated a longer service life than the approved estimate, and the more recent bands were even longer. The statistical analysis indicates a longer service life than the current estimate and the 25-S0 survivor curve is a good fit of the most representative data points.

About 10% of DEF's current lighting population is LED; however, all future street light installations will be LED, which are expected to have around a 20 year life.

Recommendation: The recommendation is for an increase in average service life and a change in curve type to the 25-S0 survivor curve. This curve is a good fit to the historical data, and also incorporates expectations for DEF's future LED investment.

NET SALVAGE ANALYSIS:

Discussion: The recommendation in the 2009 depreciation study was for a net salvage estimate of (20) percent. The Commission approved a net salvage estimate of (5) percent. Forty-five years of data were available for the net salvage analysis, ranging from 1975 through 2019. The overall average cost of removal for this period was 26 percent, the overall average gross salvage was 14 percent and the overall average net salvage was (11) percent. There has been little gross salvage since 2002, which has made the average net salvage more negative in recent years.

The overall average and more recent averages are supportive of a somewhat more negative net salvage estimate.

Recommendation: The recommendation is for a net salvage estimate of (10) percent.

Account 390: Structures and Improvements

This account includes the cost of structures and improvements for general plant. This includes the cost of all buildings and fixtures permanently attached to the structures and improvements.

GENERAL DISCUSSION:

This account includes the Company's office buildings as well as service centers and other buildings. DEF has a mix of leased and owned facilities; the St. Petersburg office is leased while most other operation centers are owned. Sales for buildings that occurred prior to the end of their useful lives have been excluded from both the life and net salvage analysis, as these transactions are not indicative of the future experience for buildings that will remain in service to the end of their useful lives.

SERVICE LIFE ANALYSIS:

Discussion: In the 2009 depreciation study the recommendation was for the 24-L0.5 survivor curve, which was approved by the Commission. Bands analyzed using the retirement rate method for this account include the overall experience band with activity since 1943 and the most recent 20, 30 and 40 year experience bands.

The statistical analysis indicated a longer service life than the approved estimate. The 35-R0.5 survivor curve represents a better fit than the approved estimate.

Recommendation: The recommendation is to use the 35-R0.5 survivor curve.

NET SALVAGE ANALYSIS:

Discussion: In the 2009 depreciation study, a net salvage estimate of (5) percent was recommended. The Commission approved an estimate of 10 percent. Forty-five years of data were available for the net salvage analysis, ranging from 1975 to 2019.

The historical data suggests that a negative net salvage estimate is appropriate. The overall cost of removal was 10 percent. The overall gross salvage was 3 percent. The more recent data indicates more negative net salvage. The most recent ten and five year net salvage averages were both (13) and (10).

The more recent net salvage data indicates that an estimate of (10) percent could be appropriate. However, a (5) percent estimate reflects that there could be some value of the Company's buildings once they reach the end of their useful

lives. This is the same estimate as proposed in the 2009 depreciation study.

Recommendation: A more negative net salvage estimate is appropriate. The recommendation is for (5) percent net salvage.

Account 392.1: Transportation Equipment – Passenger Cars

This account includes the cost of automobiles used in utility operations.

GENERAL INFORMATION:

This account includes automobiles such as cars.

SERVICE LIFE ANALYSIS:

Discussion: This account has a current depreciation rate of 8.7%. Bands analyzed using the retirement rate method for this account include the overall experience band with activity since 1944 and the most recent 15, 20, 30 and 40 year experience bands. The more recent placement bands were given the most consideration, as these bands are more representative of the current fleet of automobiles.

The statistical analysis indicated that the 9-R3 survivor curve is good fit of the historical data.

Recommendation: Use the 9-R3 survivor curve.

NET SALVAGE ANALYSIS:

Discussion: Net salvage analysis was performed for this subaccount and in combination with transportation Accounts 392.2, 392.3 and 392.4. The combined net salvage analysis was given the most consideration. Thirty years of data were available for the net salvage analysis, ranging from 1990 to 2019. The overall cost of removal was 0 percent and the overall average gross salvage is 14 percent. The overall net salvage was 14 percent. The five year average for the net salvage was 20 percent.

Recommendation: The recommendation is to use the estimate of 20 percent.

Account 392.2: Transportation Equipment - Light Trucks

This account includes the cost of light trucks such as pick-up trucks used in utility operations.

GENERAL INFORMATION:

This account primarily includes trucks that weigh less than 13,000 lbs.

SERVICE LIFE ANALYSIS:

Discussion: This account has a current depreciation rate of 8.7%. Bands analyzed using the retirement rate method for this account include the overall experience band with activity since 1945 and the most recent 15, 20, 30 and 40 year experience bands. The more recent bands were given the most consideration, as these bands are more representative of the current fleet of light trucks.

The statistical analysis indicated that the 9-S3 survivor curve is good fit of the historical data.

Recommendation: Use the 9-S3 survivor curve.

NET SALVAGE ANALYSIS:

Discussion: Net salvage analysis was performed for this subaccount and in combination with transportation Accounts 392.1, 392.3 and 392.4. The combined net salvage analysis was given the most consideration and the recommendation is to use the same estimate as for the other transportation equipment accounts.

Recommendation: The recommendation is to use the estimate of 20 percent.

Account 392.3: Transportation Equipment – Heavy Trucks

This account includes the cost of larger trucks used in the operations of the utility.

GENERAL INFORMATION:

This account primarily includes trucks that weigh more than 13,000 lbs.

SERVICE LIFE ANALYSIS:

Discussion: This account has a current depreciation rate of 4.8%. Bands analyzed using the retirement rate method for this account include the overall experience band with activity since 1943 and the most recent 15, 20, 30 and 40 year experience bands. The more recent placement bands were given the most consideration, as these bands are more representative of the current fleet of heavy trucks.

The statistical analysis indicated that the 12-S2 survivor curve is good fit of the historical data.

Recommendation: Use the 12-S2 survivor curve.

NET SALVAGE ANALYSIS:

Discussion: Net salvage analysis was performed for this subaccount and in combination with transportation Accounts 392.1, 392.2 and 392.4. The combined net salvage analysis was given the most consideration and the recommendation is to use the same estimate as for the other transportation equipment accounts.

Recommendation: The recommendation is to use the estimate of 20 percent.

Account 392.4: Transportation Equipment – Special Trucks

This account includes the cost of specialized trucks used in utility operations.

GENERAL INFORMATION:

This account includes special trucks.

SERVICE LIFE ANALYSIS:

Discussion: The current depreciation rate for this account is 5.0%. Bands analyzed using the retirement rate method for this account include the overall experience band with activity since 1990 and the most recent 15 and 20, year experience bands. The more recent placement bands were given the most consideration, as these bands are more representative of the current fleet of special trucks.

The statistical analysis indicated that the 15-L2.5 survivor curve is good fit of the overall band.

Recommendation: Use the 15-L2.5 survivor curve.

NET SALVAGE ANALYSIS:

Discussion: Net salvage analysis was performed for this subaccount and in combination with transportation Accounts 392.1, 392.2 and 392.3. The combined net salvage analysis was given the most consideration and the recommendation is to use the same estimate as for the other transportation equipment accounts.

Recommendation: The recommendation is to use the estimate of 20 percent.

Account 392.5: Transportation Equipment – Trailers

This account includes the cost of trailers used in utility operations.

GENERAL INFORMATION:

Trailers are included in this account.

SERVICE LIFE ANALYSIS:

Discussion: The current depreciation rate for this account is 1.7%. Bands analyzed using the retirement rate method for this account include the overall experience band with activity since 1944 and the most recent 15, 20, 30 and 40 year experience bands. The more recent placement bands were given the most consideration, as these bands are more representative of the current fleet of trailers.

The statistical analysis indicated that the 22-S0 survivor curve is good fit of the overall band.

Recommendation: Use the 22-S0 survivor curve.

NET SALVAGE ANALYSIS:

Discussion: Thirty years of data were available for the net salvage analysis, ranging from 1990 to 2019. The overall cost of removal was 0 percent and the overall average gross salvage is 5 percent. The overall net salvage was 4 percent. The five-year average was 1 percent.

Recommendation: The recommendation is to use the estimate of 0 percent.

Account 396: Power Operated Equipment

This account includes the cost of power operated equipment used in utility operations.

GENERAL INFORMATION:

This account includes power operated equipment such as backhoes, bulldozers, front-end loaders and cranes.

SERVICE LIFE ANALYSIS:

Discussion: The current depreciation rate for this account is 5.8%. Bands analyzed using the retirement rate method for this account include the overall experience band with activity since 1963 and the most recent 20, 30 and 40 year experience bands. The 18-L1.5 survivor curve is a good fit of the historical data.

Recommendation: Use the 18-L1.5 survivor curve.

NET SALVAGE ANALYSIS:

Discussion: Forty-five years of data were available for the net salvage analysis, ranging from 1975 to 2019. The overall cost of removal was 0 percent and the overall gross salvage is 4 percent. The overall net salvage was 4 percent.

Recommendation: The recommendation is to use a 5 percent net salvage estimate.

EXHIBIT 9

STIPULATED ISSUES AND POSITIONS

EXHIBIT 9 – 2021 SETTLEMENT AGREEMENT
Stipulated Positions on Key Base Rate Issues:

Issue No.	**Issue:**	**Stipulated Position:**
1	Should the 2021 Settlement Agreement be approved in its entirety as in the public interest?	Yes.
2	Are DEF's projected test periods of the twelve months ending 2022 and 2023, appropriate?	Yes. The test years for MFR purposes for DEF's rate case will be 2022 and 2023, plus an additional increase agreed to for 2024.
3	What are the appropriate inflation, customer growth, and other trend factors for use in forecasting?	Those included in the MFRs, as filed.
4	Are DEF's forecasts of customer growth, KWH by revenue class, and system KW for the projected test year appropriate?	Yes.
5	Are DEF's forecasts of billing determinants by rate class for the projected test year appropriate?	Yes.
6	Is the quality and reliability of the electric service provided by DEF adequate?	Yes.
7	Does DEF's depreciation study comply with the requirements of Rule 25-6.0436, F.A.C.?	Yes.
8	Should the current-approved depreciation rates, capital recovery schedules, and amortization schedules be revised?	Yes, as reflected in pages 2-19 and 21-26 of Exhibit 8 to the 2021 Settlement Agreement.
9	Are the depreciation parameters [remaining life, net salvage percent, allocated reserve percent, amortizations,	Yes, as presented in Exhibit 8.

Issue No.	Issue:	Stipulated Position:
	and resulting rates) in DEF's depreciation study appropriate?	
10	Is there a need for DEF to adjust its current annual dismantlement accrual?	Yes, but the financial impact of the increase in the accrual will be deferred to a regulatory asset, as set forth in Paragraph 20 of the 2021 Settlement Agreement.
11	Do DEF's site restoration assumptions in the dismantlement study comport with Commission Rule 25-6.04364, F.A.C.?	Yes.
12	Is the level of plant in service for the projected test years appropriate?	Yes, as included in MFR B-7 and as adjusted in MFR B-1.
13	Are any adjustments to DEF's retirement levels necessary to reflect the terms of the 2021 Settlement Agreement?	Yes, as included in MFR B-1.
14	Is the level of accumulated depreciation for the projected test years appropriate?	Yes, as included in MFR B-9 and as adjusted in MFR B-1.
15	Is the requested level of CWIP-No AFUDC for the projected test years appropriate?	Yes, as included in MFR B-1.
16	Is the level of plant held for future use for the projected test years appropriate?	Yes, as included in MFR B-15 and as adjusted in MFR B-1.
17	Should the non-transmission portion of the Levy Land be included in rate base?	No, as reflected in the adjustment made in MFR B-1.

Issue No.	Issue:	Stipulated Position:
18	Is the current storm damage reserve sufficient at this time?	Yes, given that the parties have agreed to the Storm Cost Recovery Mechanism in paragraph 31 of the 2021 Settlement Agreement and the modified Storm Study attached as Exhibit 7.
19	Is DEF's proposed 13-month average for working capital for the projected test years appropriate?	Yes, as included in MFR B-17.
20	What is the appropriate level of rate base for the projected test years?	The appropriate amounts are included in MFR B-1 for each test period. These amounts reflect reductions in the rate base that the Company originally intended to request in its filed base rate proceeding.
21	Is DEF's capital structure appropriately calculated?	Yes.
22	What is DEF's appropriate equity ratio for ratemaking purposes for the projected test years?	53% equity as a percentage of investor-supplied sources.
23	What is the appropriate capital structure for rate making purposes for the projected test years?	The appropriate capital structure for rate making purposes is shown in MFR D-1.
24	Have rate base and capital structure been appropriately reconciled?	Yes.
25	Is DEF's requested ROE and range appropriate?	Yes, ± 100 basis points on either side of the authorized ROE of 9.85%, which is subject to change pursuant to the Trigger provision provided for in paragraph 2 of the 2021 Settlement Agreement.
26	What is the appropriate weighted average cost of capital for DEF for purposes of setting rates in this proceeding?	The appropriate rate is presented in MFR D-1 for each test period.

Issue No.	Issue:	Stipulated Position:
27	Has DEF made the appropriate test year adjustments to remove revenues and expenses recoverable through all clauses, including but not limited to the Storm Protection Plan Cost Recovery Clause?	Yes.
28	Should DEF be permitted to recover 100% of its incentive compensation expense for ratemaking purposes in this proceeding?	No. As reflected in MFR C-2, the Company has adjusted its expense to remove 100% of the costs associated with its long-term incentive compensation and supplemental executive retirement plans.
29	Should DEF's employee benefit expense for the projected test years be adjusted?	No further adjustment beyond that made in issue 28 is required.
30	Should DEF's accrual for property damage for the projected test years be adjusted?	No.
31	Should DEF's generation, transmission, and customer delivery O&M expense for the projected test years be adjusted?	No.
32	Should an adjustment be made to depreciation expense for the 2022 and 2023 projected test year?	Yes, as reflected in MFR C-2 and the updated Depreciation Study attached as Exhibit 8 to the 2021 Settlement Agreement.
33	Should an adjustment be made to the System Annual Accrual Amount for dismantlement?	No.
34	What is the appropriate net operating income for the projected test years?	The appropriate net operating income is reflected in MFR C-1.

Issue No.	Issue:	Stipulated Position:
35	Has DEF appropriately accounted for affiliate transactions and following the correct methodology for allocation of its non-regulated costs?	Yes.
36	What is the appropriate projected test year revenue expansion factor and the appropriate net operating income multiplier, including the appropriate elements and rates for DEF?	The appropriate factor and multiplier are reflected in MFR C-44.
37	Has DEF properly reflected the impact of the current federal and state income tax rates in its rate filing?	Yes.
38	Should a parent debt adjustment be made and if so, in what amount for 2022, 2023 and 2024?	Yes, as reflected in MFR C-2.
39	Has DEF made the appropriate adjustments to remove non-regulated and other miscellaneous items?	Yes, as reflected on MFR C-3, the Company has made the appropriate adjustments for 2022 and 2023, and the adjustments to remove these types of costs will continue until DEF's next rate case or settlement proceeding.
40	Has DEF made the appropriate adjustments to remove the cost of corporate aircraft from the test year requests?	Yes, as reflected on MFR C-3, the Company has made the appropriate adjustments for 2022 and 2023, and the adjustments to remove this type of cost will continue until DEF's next rate case or settlement proceeding.
41	Has DEF made the appropriate adjustments to remove all promotional advertising from the test year requests?	Yes, as reflected on MFR C-3, the Company has made the appropriate adjustments for 2022 and 2023, and the adjustments to remove this type of cost will continue until DEF's next rate case or settlement proceeding.

Issue No.	Issue:	Stipulated Position:
42	Has DEF made the appropriate adjustments to include miscellaneous interest expense that is related to regulated business but is recorded below the line?	Yes, as reflected on MFR C-3, the Company has made the appropriate adjustments for 2022 and 2023, and the adjustments to include this type of cost will continue until DEF's next rate case or settlement proceeding.
43	Has DEF made the appropriate adjustments to remove industry association dues related to lobbing activities from the test year requests?	Yes, as reflected on MFR C-3, the Company has made the appropriate adjustments for 2022 and 2023, and the adjustments to remove this type of cost will continue until DEF's next rate case or settlement proceeding.
44	Has DEF made the appropriate adjustments to remove 50% of directors and officers liability insurance from the test year requests?	Yes, as reflected on MFR C-3, the Company has made the appropriate adjustments for 2022 and 2023, and the adjustments to remove 50% of this type of cost will continue until DEF's next rate case or settlement proceeding.
45	Has DEF made the appropriate interest synchronization adjustments to the test year requests?	Yes, as reflected on MFR C-3, the Company has made the appropriate adjustments for 2022 and 2023, and these interest synchronization adjustments will continue until DEF's next rate case or settlement proceeding.
46	Is the amount of rate case expense requested by DEF appropriate?	Yes, as reflected on MFR B-2 and C-3, the Company has made the appropriate adjustments.
47	Is the rate case amortization period of four years appropriate?	Yes, as reflected on MFR B-2 and C-3.
48	How should DEF treat any proceeds it receives from the DOE litigation on spent fuel?	As set forth in Paragraph 3 of the 2021 Settlement Agreement.
49	In the event federal legislation is passed and signed into law during the Term of the 2021 Settlement Agreement, that results in a change in the corporate income tax rate to	Changes in the tax rate should be addressed as set forth in Paragraph 19 of the 2021 Settlement Agreement.

Issue No.	Issue:	Stipulated Position:
	which DEF is subject, what adjustments or provisions, if any, should the Commission make to address such changes?	
40	Is DEF's proposed separation of costs and revenues between the wholesale and retail jurisdictions appropriate?	Yes.
51	Is DEF's proposed cost of service methodology appropriate?	Yes.
52	How should DEF's allocation of the approved revenue increase be allocated?	As set forth in the 2021 Settlement Agreement and as presented in MFR E-8.
53	Should the Commission approve the tariffs attached to the 2021 Settlement Agreement as Exhibit 4?	Yes.
54	Should DEF's proposal to permanently close the grandfathered IS-1, IST-1, CS-1, and CST-1 rates and transfer customers to an otherwise-applicable rate be approved?	Yes.
55	Are DEF's proposed credits for Interruptible Service (IS), Curtailable Services (CS), and Standby Generation (GSLM-2) customers appropriate?	Yes, the credits in the amounts shown in Paragraph 11 of the Settlement Agreement are appropriate and should be approved.
56	Are DEF's proposed delivery voltage credits appropriate?	Yes.
57	Are DEF's power factor charges and credits appropriate?	Yes.
58	Is DEF's proposal to offer fee-free payment options (card payment and electronic check fees) for residential	Yes.

Issue No.	Issue:	Stipulated Position:
	customers and recover these costs as part of its cost of service appropriate?	
59	What effective date should be implemented for the revised rates and charges?	First billing cycle for January 2022, and the Commission Staff should have administrative authority to approve the other rate increases contemplated by the 2021 Settlement Agreement for years effective first billing cycle for January 2023 and first billing cycle for January 2024.
60	Should DEF's 2017 Electric Vehicle ("EV") Pilot Program be continued in its current form?	No.
61	Should DEF be authorized to implement new EV programs?	Yes, as described in paragraph 18 of the 2021 Settlement Agreement.
62	Should the costs DEF proposes to remove from the ECRC be moved to base rates?	Yes, as reflected in DEF's MFRs and Exhibit 2 to the 2021 Settlement Agreement
63	Is the proposed amount for Economic Development costs reflected in DEF's MFRs resulting from recent changes to Commission Rule 25-6.0426, F.A.C. appropriate?	Yes.
64	Should DEF be authorized to implement its proposed Vision Florida Pilot Program and if so should DEF be authorized to establish a regulatory asset to defer eligible capital project costs as they go in service, as well as O&M costs as they are incurred?	Yes, per paragraph 26 of the 2021 Settlement Agreement.
65	Should DEF's costs associated with the Regulatory Assessment Fee be removed and recovered outside of base rates like the Gross Receipts tax?	Yes.

Issue No.	**Issue:**	**Stipulated Position:**
66	Does the 2021 Settlement Agreement fully resolve the issues in Docket Numbers 20190110 and 20190222?	Yes.
