Re: 2022 Ten-Year Site Plan Data Request #1; Undocketed

Dear Mr. Teitzman:

Please find enclosed for filing, Duke Energy Florida, LLC's Response to Staff's Data Request #1, questions 3 through 95, issued on March 7, 2022 regarding the 2022 TYSP.

Thank you for your assistance in this matter and if you have any questions, please feel free to contact me at (850) 521-1425.

Sincerely,

s/ Stephanie A. Cuello

DEF's Response to Staff's Data Request Regarding the 2022 Ten Year Site Plan; Questions 3-95

Instructions: Accompanying this data request is a Microsoft Excel (Excel) document titled "Data Request #1.Excel Tables," (Excel Tables File). For each question below that references the Excel Tables File, please complete the table and provide, in Excel Format, all data requested for those sheet(s)/tab(s) identified in parenthesis.

General Items

1. Please provide an electronic copy of the Company's Ten-Year Site Plan (TYSP) for the period 2022-2031 (current planning period) in PDF format.

Response:

Please see PDF file DEF 2022 TYSP.PDF, submitted on April 1, 2022.

2. Please provide an electronic copy of all schedules and tables in the Company's current planning period TYSP in Excel format.

Response:

Please see Excel files titled *DEF 2022 TYSP Schedules 1-10.xlsx and DEF 2022 TYSP – Tables.xlsx*, submitted on April 1, 2022.

3. Please refer to the Excel Tables File (Financial Assumptions, Financial Escalation). Complete the tables by providing information on the financial assumptions and financial escalation assumptions used in developing the Company's TYSP. If any of the requested data is already included in the Company's current planning period TYSP, state so on the appropriate form.

Response:

Please see tables below and the following tabs of the attached Excel File *Data Request* #I - Excel Tables: Financial Assumptions Financial Escalation

	Financial Assumptions Base Case

Load & Demand Forecasting

- 4. **[Investor-Owned Utilities Only]** Please refer to the Excel Tables File (Hourly System Load). Complete the table by providing, on a system-wide basis, the hourly system load in megawatts (MW) for the period January 1 through December 31 of the year prior to the current planning period. For leap years, please include load values for February 29. Otherwise, leave that row blank.
 - a. Please also describe how loads are calculated for those hours just prior to and following Daylight Savings Time (March 14, 2021, and November 7, 2021).

Response:

Please see tab *Hourly System Load* of the attached Excel File *Data Request* #1 - Excel Tables:

- a. On March 14th, 2021 there will be a zero in hour 3. For hour 2 on November 7th, 2021, DEF computes the average for hours 2 and hour 3 and places it in hour 2 as hour 3 is shifted back to hour 2.
- 5. Please refer to the Excel Tables File (Historic Peak Demand). Complete the table by providing information on the monthly peak demand experienced during the three-year period prior to the current planning period, including the actual peak demand experienced, the amount of demand response activated during the peak, and the estimated total peak if demand response had not been activated. Please also provide the day, hour, and system-average temperature at the time of each monthly peak.

Response:

Please see table below and tab *Historic Peak Demand* of the attached Excel File *Data* Request #1 - Excel Tables:

Year	Month	Actual Peak Demand	Demand Response Activated	Estimated Peak Demand	Day	Hour	System- Average Temperature
		(MW)	(MW)	(MW)			(Degrees F)
	1	7,052	0	7,052	19	8	45.2
	2	8,308	0	8,308	4	8	43.05
	3	7,565	0	7,565	31	17	86.25
	4	7,871	0	7,871	29	18	86.9
	5	8,735	0	8,735	5	18	87.5
5	6	9,147	0	9,147	11	17	92.55

	12	5,895	0	5,895	19	8	46
l <mark>otes</mark> Temperatures are at ho	ur ended peak ho	ur. System we	ighted St Petr (4	5%), Orlando (4	5%), and Tallal	nassee (10%)	

6. Please identify the weather station(s) used for calculation of the system-wide temperature for the Company's service territory. If more than one weather station is utilized, please describe how a system-wide average is calculated.

DEF uses dry bulb temperature readings (from three weather stations - St Petersburg (45%), Orlando (45%) and Tallahassee (10%), weight included in parenthesis.

Weather station weightings are developed using "weather-sensitive" energy sales by customer building types reported by eighteen individual Operation Centers located around the service area. Energy sales by Operation Centers are grouped to its closest weather station to determine weather station weights.

- 7. Please explain, to the extent not addressed in the Company's current planning period TYSP, how the reported forecasts of the number of customers, demand, and total retail energy sales were developed. In your response, please include the following information:
 - Methodology.
 - Assumptions.
 - Data sources.
 - Third-party consultant(s) involved.
 - Anticipated forecast accuracy.
 - Any difference/improvement(s) made compared with those forecasts used in the Company's most recent prior TYSP.

Response:

- Methodology. Please refer to the DEF 2022 TYSP.
- Assumptions. Please refer to the DEF 2022 TYSP.
- Data sources. Please refer to the DEF 2022 TYSP.
- Third-party consultant(s) involved. No third-party consultants involved.
- Anticipated forecast accuracy. As in every published DEF Load Forecast, the use of "most recently available" economic projections from a most-reliable source has been employed. Also, every TYSP Base Case planning projection is designed to result in a 50/50 probability of outcome.
- Any difference/improvement(s) made compared with those forecasts used in the Company's most recent prior TYSP.

Differences from the previous TYSP projection include an updated 30-Year normal weather assumption. The company applied a 30-Year average using 1991-2020.

8. Please identify all closed and open Florida Public Service Commission (FPSC) dockets and all non-docketed FPSC matters which were/are based on the same load forecast used in the Company's current planning period TYSP.

Response:

- Fuel and purchased power cost recovery clause with generating performance incentive factor. Docket 20210001-EI (Mid-Course Update Filed 12/21/2022).
- Fuel and purchased power cost recovery clause with generating performance incentive factor. Docket 20220001-EI (Continuation of Mid-Course Update Filed 12/21/2022).
- Standard Offer Contract docket number: 20220065-EQ.
- 9. Please explain if your Company evaluates the accuracy of its forecasts of customer growth and annual retail energy sales presented in its past TYSPs by comparing the actual data for a given year to the data forecasted one, two, three, four, five, or six years prior.
 - a. If your response is affirmative, please explain the method used in your evaluation, and provide the corresponding results, including work papers, in Excel format for the analysis of each forecast presented in the TYSPs filed with the Commission during the 20-year period prior to the current planning period. If your Company limits its analysis to a period shorter than 20 years prior to the current planning period, please provide what analysis you have and a narrative explaining why your Company limits its analysis period.
 - b. If your response is negative, please explain why.

Response:

DEF maintains annual Forecast Evaluation Tables reflecting projection accuracy for all previous TYSP projections from 2002 to 2021 for Net Energy for Load (NEL), System Customers, System MW and Retail MW. Each previous projection's ten-year forecast horizon is compared to all existing comparable historical data-to date. For NEL and Customer data, reported actual company data is compared to projection. For System and Retail MW, both actual and forecast Summer and Winter MW peaks are evaluated on a comparable basis assuming no activated demand response. See attached file *TYSP Error Fan_2022.xlsx*.

- 10. Please explain if your Company evaluates the accuracy of its forecasts of Summer/Winter Peak Energy Demand presented in its past TYSPs by comparing the actual data for a given year to the data forecasted one, two, three, four, five, or six years prior.
 - a. If your response is affirmative, please explain the method used in your evaluation, and provide the corresponding results, including work papers, in Excel format for the analysis of each forecast presented in the TYSPs filed with the Commission during the 20-year period prior to the current planning period. If your Company limits its analysis to a period shorter than 20 years prior to the current planning period, please provide what analysis you have and a narrative explaining why your Company limits its analysis period.

b. If your response is negative, please explain why.

Response:

Please refer to response to Q9 and the corresponding excel file.

- a. DEF prepared a forecast comparison of the past Ten-Year Site Plan forecasts from 2002 to 2021 as compared to the history. Variance calculation of (History / Forecast) are calculated across history and the TYSPs. This is the "TYSP Error Fan "in excel spread sheet form. The calculations compare the forecasts of Net Energy for Load, System Customers, Retail Peak Load and System Peak Load. Annual forecasts are compared for Net Energy for Load and System Customers and season forecasts are compared for Retail Peak Load and System Load.
- 11. Please explain any historic and forecasted trends in each of the following:
 - a. Growth of customers, by customer type (residential, commercial, industrial) as well as Total Customers, and identify the major factors (historically, currently, and in the forecasted period) that contribute to the growth/decline of the trends.
 - b. Average KWh consumption per customer, by customer type (residential, commercial, industrial), and identify the major factors (historically, currently, and in the forecasted period) that contribute to the growth/decline of the trends.
 - c. Total Sales (GWh) to Ultimate Customers, identify the major factors (historically, currently, and in the forecasted period) that contribute to the growth/decline of the trends. Please include a detailed discussion of how the Company's demand management program(s) and conservation/energy-efficiency program(s) impact the growth/decline of the trends.

Response:

a. DEF customer growth has always been dominated by the Residential and Commercial customer classes. Customer growth trends are driven by broad economic and demographic trends. These generic trends are typically covered in each year's assumptions section of the DEF's TYSP. Items like population growth, population migration, retirement demographic trends determine customer growth. Housing market issues like affordability, mortgage rates and job growth have always applied a significant influence on customer growth dynamics as well. More recent site plans reflect a return to the long-term trend of population migration into Florida. Commercial customer growth typically tracks residential growth supplying needed services.

One anomalous period of importance now buried in the middle of the error fan time horizon was the U.S. financial crisis. The severe financial crisis in the 2008-2010 timeframe caused many homeowners to lose substantial equity and in some cases their homes. This severely limited both retirees and other movers from migrating to Florida for a period. Negative forecast variances can be seen in the "System Customers" tab of

the "error fan" all the way through projections made between 2003-2009 for the years 2009-2017.

There are no projections of future wars, pandemics, or abnormal weather events embedded in the customer growth forecast.

- b. Residential and commercial class per customer usage are driven, primarily, by fluctuations in electric price, end use appliance saturation, changing (improving) end use appliance efficiency, improved building codes, housing type/building size, and space conditioning equipment fuel type. More recently, the ability to self-generate has begun to make an impact. A small percentage of industrial/commercial customers have chosen to install their own natural gas generation, reducing KWh consumption from the power grid. Similarly, residential and some commercial accounts have reduced their utility requirements by installing solar panels behind their meter. Contrarily, the penetration of plug-in electric vehicles has grown, leading to an increase in residential use per customer, all else being equal. Each of these stated items are handled either implicitly in the economic scenario presented by Moody's Analytics or explicitly in the internal DEF projections of UEE, Solar PV and plug-in Electric Vehicles.
- c. This series is defined as the aggregation of all retail, wholesale, "company use" energy consumption. The resulting sum is grossed up to "generation level requirements" by applying a line-loss factor which estimates transmission line-losses. Non-weather trends and variation in this series include all items listed in parts "a." and "b." above. A very significant item included in NEL is "Sales for Resale" (SFR) MWh. SFR or Wholesale energy sales are bulk transactions to sell power through contractual obligations that typically include a maximum MW capacity. DEF was successful for winning many wholesale power contracts in past years but the non-renewal of many contracts of late has caused a significant drop in SFR sales and thus NEL.
- 12. Please explain any historic and forecasted trends in each of the following components of Summer/Winter Peak Demand:
 - a. Demand Reduction due to Conservation and Self Service, by customer type (residential, commercial, industrial) as well as Total Customers, and identify the major factors (historically, currently, and in the forecasted period) that contribute to the growth/decline in the trends.
 - b. Demand Reduction due to Demand Response, by customer type (residential, commercial, industrial), and identify the major factors (historically, currently, and in the forecasted period) that contribute to the growth/decline of the trends.
 - c. Total Demand, and identify the major factors (historically, currently, and in the forecasted period) that contribute to the growth/decline in the trends.

d. Net Firm Demand, by the sources of peak demand appearing in Schedule 3.1 and Schedule 3.2 of the current planning period TYSP, and identify the major factors (historically, currently, and in the forecasted period) that contribute to the growth/decline in the trends.

Response:

- a. Conservation (utility-sponsored and "naturally occurring" appliance efficiency & building code improvements) and self-generation are primary contributors to the long-term trends in lower energy use per customer and resulting reductions in the growth of the peak demand. Stricter building codes and improved heating/cooling (as well as other) equipment efficiencies have been a steady and effective way to reduce the growth in Summer/Winter peak for all classes of customers. The forecast projects continuing improvement as newer homes and newer appliances replace older, less efficient homes and appliances. DEF's conservation programs incentivize customers to purchase heating/cooling equipment at a level just above the required Federal Standards. In addition to conservation measures, customers in several different customer classes have installed "behind-the-meter" solar generation and more are projected to in the forecast. DEF has experienced a slight increase in installations of small gas turbines on-site of a paper manufacturer and a large hospital. If natural gas remains cheap and plentiful, we can expect to see more.
- b. DEF residential customers continue to allow the company to control their designated home appliances. The number of billed accounts on residential DR tariffs went from 396,000 in 2010 to 439,000 in 2020. It can be expected to continue trending upward in the projection period.
- c. Please see response to Q11. Most factors that impact levels of "energy" have similar effects for energy at time of peak.
- d. Please see response to Q11. Most factors that impact levels of "energy" have similar effects for energy at time of peak.
- 13. Please explain any anomalies caused by non-weather events with regard to annual historical data points for the period 10 years prior to the current planning period that have contributed to the following, respectively:
 - a. Summer Peak Demand.
 - b. Winter Peak Demand.
 - c. Annual Retail Energy Sales.

Response:

In the 10-year period beginning in 2011 there have been significant non-weather changes or anomalies impacting DEF's Summer/Winter Peak MW demand. One such "anomaly" involves served wholesale customers. Prior to 2010, DEF's service to wholesale jurisdictional demand and energy was a greater share of total company Summer Peak, Winter Peak and NEL. By 2020 the level of wholesale peak demand and energy requirements reduced to lower levels.

Secondly, seasonal peak demand has been affected by more efficient end-use appliances and lighting. Surely, all end uses drawing power on-peak will reflect the improved level of efficiency improvement mandated by the Federal governments "Codes & Standards" via previous national energy policy acts. Finally, other technological events impacting seasonal peak must include the broader saturation of self-generation like natural gas generators by manufacturers and universities and rooftop solar PV.

- 14. Please provide responses to the following questions regarding the weather factors considered in the Company's retail energy sales and peak demand forecasts:
 - a. Please identify, with corresponding explanations, all the weather-related input variables that were used in the respective Retail Energy Sales, Winter Peak Demand, and Summer Peak Demand models.
 - b. Please specify the source(s) of the weather data used in the aforementioned forecasting models.
 - c. Please explain in detail the process/procedure/method, if any, the Company utilized to convert the raw weather data into the values of the model input variables.
 - d. Please specify with corresponding explanations:
 - e. How many years' historical weather data was used in developing each retail energy sales and peak demand model.
 - f. How many years' historical weather data was used in the process of these models' calibration and/or validation.
 - g. Please explain how the projected values of the input weather variables (that were used to forecast the future sales or demand outputs for each planning years 2022 2031) were derived/obtained for the respective retail sales and peak demand models.

Response:

Please refer to the DEF 2022 TYSP.

15. **[Investor-Owned Utilities Only]** If not included in the Company's current planning period TYSP, please provide load forecast sensitivities (high band, low band) to account for the

uncertainty inherent in the base case forecasts in the following TYSP schedules, as well as the methodology used to prepare each forecast:

- a. Schedule 2.1 History and Forecast of Energy Consumption and Number of Customers by Customer Class.
- b. Schedule 2.2 History and Forecast of Energy Consumption and Number of Customers by Customer Class.
- c. Schedule 2.3 History and Forecast of Energy Consumption and Number of Customers by Customer Class.
- d. Schedule 3.1 History and Forecast of Summer Peak Demand.
- e. Schedule 3.2 History and Forecast of Winter Peak Demand.
- f. Schedule 3.3 History and Forecast of Annual Net Energy for Load.
- g. Schedule 4 Previous Year and 2-Year Forecast of Peak Demand and Net Energy for Load by Month.

Response:

Please refer to the DEF 2022 TYSP.

- 16. Please provide responses to the following questions regarding the possible impacts of COVID-19 Pandemic (Pandemic) on the utility load forecast:
 - a. Please briefly summarize the impacts due to the Pandemic, if any, to the accuracy of the Company's respective forecast of annual retail energy sales and peak demands for 2020 and 2021.
 - b. Have any of your 2022 TYSP retail energy sales and peak demand forecasts incorporated the potential impacts of the Pandemic? Please explain your response.

Response:

a. The forecast of Net Energy for Load residual, measured as (actual - forecasted)/ forecasted, went from average value of -6.3%, 2015 to 2019, to-7.2% for 2020 to 2021, see the TYSP Error Fan 2021. System customers error declined and remained low going from average of -1.6%, 2015 to 2019, to average of -1.1%, 2020 to 2021. The fitting of system peak was impacted as the Mean Absolute Percentage Error, MAPE, score for system Peak regression equation went from 2.4% from 2018 to 2019 to 3.2% over the COVID-19 pandemic period from February 2020 to July 2022. Initial indication is that the pandemic impacted the load shape estimation accuracy the most followed by energy forecast accuracy. Residential, Commercial, and industrial building occupancy shifted over the time of the initial Covid 19 outbreak through the recovery. Customer growth model accuracy was not impacted by pandemic.

- b. The COVID-19 pandemic impacts were assessed using the economic drivers from Moody's analytics which incorporated the pandemic impacts on the economies of the world, US, Florida, and the specific counties served by DEF. The impacts are mixed as the COVID-19 pandemic impact negatively some of the commercial building types and some industrial sector activity while other commercial and industrial activity increased during COVID-19 pandemic. COVID-19 pandemic impacted positively the growth in residential customers. Florida continued to attract people to the area as retirees entering Florida were impacted by the Baby Boom generation population cohort wave in the 65 to 70 age category, which greatly increased population in-migration to Florida. COVID-19 pandemic increased the level of early retirees and therefore enhanced the in-migration of retirees to Florida. Florida residence with vacation homes resided in Florida during the COVID-19 pandemic as workers worked from home. The change in policies during COVID-19 pandemic in the West and East coast of the US attracted many people and companies to Florida. This was captured in the Moody's Analytics forecast in the DEF sales forecast models.
- 17. Please address the following questions regarding the impact of all customer-owned/leased renewable generation (solar and otherwise) on the Utility's forecasts.
 - a. Please explain in detail how the Utility's load forecast accounts for the impact of customer owned/leased renewable generation (solar and otherwise).
 - b. Please provide the annual impact, if any, of customer-owned/leased renewable generation (solar and otherwise) on the Utility's retail demand and energy forecasts, by class and in total, for 2022 through 2031.
 - c. If the Utility maintains a forecast for the planning horizon (2022-2031) of the number of customers with customer-owned/leased renewable generation (solar and otherwise), by customer class, please provide.

- a. Existing customer owned renewable generation is captured in the historical dataset used for load forecast modeling. The projected impact of future customer owned renewable generation is added to the base load forecast as a reduction to load.
- b. Annual impact, if any, of customer-owned/leased renewable generation (solar and otherwise) on the Utility's retail demand and energy forecasts, by class and in total, for 2022 through 2031. The "existing customer owned renewable generation is captured in the historical dataset used for load forecast modeling" as such, the energy and demand data as presented represents "net new" as of 1/1/2022 and is a cumulative view from that point.

Please see tables below and tab *Customer Own-Leased Renew Gen* of the attached Excel File *Data Request* $#1 - Excel Tables_Q17$.

			Cumula	tive Customer Owned/	Leased Renewable Ge	neration		
Year	Residential Summer Demand (MW)	Residential Winter Demand (MW)	Commercial Summer Demand (MW)	Commercial Winter Demand (MW)	Industrial Summer Demand (MW)	Industrial Winter Demand (MW)	Total Summer Demand (MW)	Total Winter Demand (MW)

		Notes		
The negative values indicate	te that customer owne	d PV is a reduction to	projected load	

c. Forecast for the planning horizon (2022-2031) of the number of customers with customer-owned/leased renewable generation (solar and otherwise), by customer class, please provide. The data represents a cumulative view of all customers, including those that added renewable generation prior to 1/1/2022.

Please see table below and tab *Customer Own-Leased Renew Cust* of the attached Excel File *Data Request* $#1 - Excel Tables_Q17$.

	Cumulative	Customer Owned/Le	ased Renewable Genera	tion Counts
Year	Residential Customers	Commercial Customers	Industrial Customers	Total Customers
2022	68,439	728	3	69,170
2023	87,714	872	5	88,591
2024	104,680	1,010	7	105,697
2025	112,115	1,077	9	113,201
2026	118,986	1,127	11	120,124
2027	127,223	1,187	13	128,423
2028	136,559	1,259	15	137,833
2029	147,111	1,339	17	148,467
2030	157,935	1,423	19	159,377
2031	169,291	1,507	21	170,819
Notes				
Historical non-residential	data not distinguished	between commercia	al and industrial - assum	ed all commercial

18. Please discuss whether the Company included plug-in electric vehicle (PEV) loads in its demand and energy forecasts for its current planning period TYSP. If so, how were these impacts accounted for in the modeling and forecasting process?

Response:

Yes, PEV loads were included in the Company's demand and energy forecasts for the 2022 TYSP. Load from existing PEVs were captured in the historical dataset used for load forecast modeling. Projected load from future PEVs was added to the base load forecast as a positive modifier.

19. Please discuss the methodology and the assumptions (or, if applicable, the source(s) of the data) used to estimate the number of PEVs operating in the Company's service territory and the methodology used to estimate the cumulative impact on system demand and energy consumption.

Response:

The Company used a tool developed by Guidehouse called Vehicle Analytics and Simulation Tool (VAST) to develop the forecast for the number of PEVs operating in its service territory and the potential loading impacts to system demand and energy. VAST has an EV Adoption Module which uses multiple variables (registration data, fuel costs, vehicle availability, vehicle miles traveled, etc.) to develop a conservative, base, and aggressive vehicle forecast. This Adoption Module feeds the EV Charging Needs Module and Load Impacts Module which uses additional variables (vehicle per charger ratio, daily traffic data, vehicle charging profiles, etc.) to develop the impact on system demand and energy consumption.

20. Please refer to the Excel Tables File (Electric Vehicle Charging). Complete the table by providing estimates of the requested information within the Company's service territory for the current planning period. Direct current fast charger (DCFC) PEV charging stations are those that require a service drop greater than 240 volts and/or use three-phase power.

Response:

Please see table below and tab *Electric Vehicle Charging* of the attached Excel File *Data Request* #1 - Excel Tables.

		Number of Public	Number of Public	Cumulative Impact of PEVs				
Year	Number of PEVs	PEV Charging Stations	DCFC PEV Charging Stations.	Summer	Winter	Annual		
		Stations	Stations.	Demand	De mand	Energy		
				(MW)	(MW)	(GWh)		
2022	33,325	*	573	1.45	0.5	24		
2023	42,404		926	3.6	1.3	54		
2024	52,918		1,438	6.6	1.9	92		
2025	65,134		2,128	10.5	2.7	139		
2026	79,267		3,035	15.3	3.8	199		
2027	95,455		4,170	21.2	5.3	275		
2028	114,021		5,459	28.1	7.2	367		
2029	135,439		6,867	71.0	9.5	470		
2030	160,059		8,382	44.6	12.1	586		
2031	188,139		10,018	54.0	14.8	712		
Notes								

1. Source: Fall 2021 EV Forecast.

Previous EV forecasts only included Light Duty. This version includes Light, Medium, and Heavy Duty forecasts. Light duty is considered passenger vehicles (Class 1 and 2). Medium duty is delivery vehicles (Class 3 - 6 vehicles). Heavy duty are transit, school, haul vehicles (Class 7 and 8).

2. "Number of PEVs" includes total cumulative PEV vehicles which includes Light, Medium, and Heavy duty

3. "Cumulative Impact of PEVs" includes only net-new vehicles beginning January 2022 as used in Load Forecast. Includes Light, Medium, and Heavy duty demand and energy impacts.

4. Summer Demand: August HE 18. Winter Demand: January HE 08

5. * Duke currently forecasts L2 private and public chargers together. Duke is developing a charger forecasting tool that will differentiate between the two in the future.

21. Please describe any Company programs or tariffs currently offered to customers relating to PEVs, and describe whether any new or additional programs or tariffs relating to PEVs will be offered to customers within the current planning period.

- a. Of these programs or tariffs, are any designed for or do they include educating customers on electricity as a transportation fuel?
- b. Does the Company have any programs where customers can express their interest or expectations for electric vehicle infrastructure as provided for by the Utility, and if so, please describe in detail.

In addition to an expansion of the pilot program public DC fast charging network, the company launched an EV charging installation rebates program for commercial & industrial customers that install EV charging solutions as well as a program that assists residential customers to avoid system on-peak charging and rewards that behavior with small monthly credits.

- a. While all programs include budget for education & outreach that inherently increases customer knowledge of electricity as a transportation fuel, the off-peak credit program, in particular, provides prospective and actual participants with education and experience not only in using electricity as a fuel but also in managing that use for the benefit of the system as a whole. The Company also regularly updates its website to enhance web pages for consumer information of electric vehicles and electric vehicle infrastructure.
- b. The Company consistently seeks to add programs and processes that ease the transition to electric transport for customers. These efforts include consideration of programs that would assist with or directly provide for privately controlled charging infrastructure. While the Company anticipates introducing such programs for consideration at a later date, it is too early at this time to share detailed descriptions.
- 22. Please describe how the Company monitors the installation of PEV public charging stations in its service area.

Response:

The Company monitors PEV public charging stations through the U.S. Department of Energy Alternative Fuels Data Center (<u>https://afdc.energy.gov</u>). VAST also uses AFDC data as an input to monitor the installation of PEV charging stations.

23. Please describe any instances since January 1 of the year prior to the current planning period in which upgrades to the distribution system were made where PEVs were a contributing factor.

Response:

The Company is not aware of any upgrades to the distribution system since 1/1/2021 that would be specifically attributable to PEV loads. Distribution system upgrades often result from a combination of factors and determining the existence and contribution of a single source such as PEV loads would be challenging.

24. Has the Company conducted or contracted any research to determine demographic and regional factors that influence the adoption of PEVs applicable to its service territory? If so, please describe in detail the methodology and findings.

Response:

The Company has not studied demographic characteristics. The Company launched its ChargeFL program in 2019 to better understand PEV charging behaviors and data collected from the program has helped provide insights into PEV use and charging behavior. This program has helped provide insight on load charging shapes and energy and peak demand information. The Company also launched the Electric Vehicle Supply Equipment (EVSE) Pilot Program to gather additional information about charging characteristics at public charging infrastructure and its grid impact.

25. What processes or technologies, if any, are in place that allow the Company to be notified when a customer has installed a PEV charging station in their home?

Response:

At this time the Company does not have processes or technologies in place to be notified when a customer installs a PEV charging station. The deployment of advanced metering infrastructure (AMI) will potentially enable the company to identify probable EV charging loads at Level 2 and higher power levels.

26. What are the major drivers of the Company's PEV growth?

Response:

The Company sees many influential drivers to PEV growth such as: lower costs associated with vehicles and/or batteries, additional models available for purchase, increased charging infrastructure, and increased consumer support. The impacts of these drivers cause PEV adoption and growth to vary greatly.

27. Please describe if and how Section 339.287, Florida Statutes, (Electric Vehicle Charging Stations; Infrastructure Plan Development) has impacted the Company's projection of PEV growth and related demand and energy growth.

Response:

The Florida Statute Section 287 resulted in the FDOT EV Infrastructure Master Plan which delivers a comprehensive course of action to efficiently and effectively provide for PEV charging infrastructure to support the goals of F.S. 339.287. The company is evaluating the Master Plan utility recommendations and believes the potential impacts from improving a key adoption driver (PEV charging infrastructure) will result in a more positive trajectory of PEV adoption which then correlates with higher demand and energy growth.

28. What has the Company learned about the impact of PEV ownership on the Company's actual and forecasted peak demand?

Response:

The Company is still evaluating the impacts of PEV ownership on the peak demand. Using the ChargeFL pilot program data and VAST the Company has developed load charging profiles for PEVs. These have shown PEV charging impacts summer peak demand more than winter peak demand. As additional PEV adoption occurs and more datasets are developed using additional pilot programs a more complete dataset will be able to be analyzed to determine further impacts on peak demand.

29. If applicable, please describe any key findings and metrics of the Company's EV pilot program(s) which reveal the PEV impact to the demand and energy requirements of the Company.

Response:

The Company's ChargeFL pilot program provided insight on charging behaviors and energy amounts. The Company also has an EVSE Pilot program to gather information about DEF customer charging behavior and grid impacts of increasing EV adoption. Both pilot programs have provided opportunities to learn how to serve the emerging electric transportation market and the increased PEV demand.

30. **[FEECA Utilities Only]** Please refer to the Excel Tables File (DR Participation). Complete the table by providing for each source of demand response annual customer participation information for 10 years prior to the current planning period. Please also provide a summary of all sources of demand response using the table.

Response:

Please see table below and tab *DR Participation* of the attached Excel File *Data Request* #1 - Excel Tables.

32. **[FEECA Utilities Only]** Please refer to the Excel Tables File (DR Peak Activation). Complete the table by providing for each source of demand response annual seasonal peak activation information for 10 years prior to the current planning period. Please also provide a summary of all demand response using the table.

Response:

Please see table below and tab *DR Peak Activation* of the attached Excel File *Data Request* #1 - Excel Tables.

Generation & Transmission

34. Please refer to the Excel Tables File (Unit Performance). Complete the table by providing information on each utility-owned generating resources' outage factors, availability factors, and average net operating heat rate (if applicable). For historical averages, use the past three years and for projected factors, use an average of the next ten-year period.

Response:

Please see table below and tab *Unit Performance* of the attached Excel File *Data Request #1* – *Excel Tables*.

35. Please refer to the Excel Tables File (Utility Existing Traditional). Complete the table by providing information on each utility-owned traditional generation resource in service as of December 31 of the year prior to the current planning period. For multiple small (<250 kW

per installation) distributed resources of the same type and fuel source, please include a single combined entry. For capacity factor, use the net capacity as a basis.

Response:

Please see table below and tab *Utility Existing Traditional* of the attached Excel File *Data* Request #1 - Excel Tables.

36. Please refer to the Excel Tables File (Utility Planned Traditional). Complete the table by providing information on each utility-owned traditional generation resource planned for in-

service within the current planning period. For multiple small (<250 kW per installation) distributed resources of the same type and fuel source, please include a single combined entry. For projected capacity factor, use the net capacity as a basis.

a. For each planned utility-owned traditional generation resource in the table, provide a narrative response discussing the current status of the project.

Response:

Please see table below and tab *Utility Planned Traditional* of the attached Excel File *Data* Request #1 - Excel Tables.

Bay Trail, Sandy Creek and Fort Green are under construction and are expected to be in service Q2-2022. Charlie Creek is also under construction and expected to be in service Q3-2022. Bay Ranch, Hildreth, Hardeetown and High Springs are expected to be in service Q1-2023. The rest of the units are still in the development or planning stages. *DEF modeling derives an equivalent summer noncoincident, but on-peak-hour capacity value equal to 25% of the facility's nameplate rating for planned PV installations from 2025 to 2028 and 12.5% for 2029 and beyond.

39. Please list and discuss any planned utility-owned renewable resources that have, within the past year, been cancelled, delayed, or reduced in scope. What was the primary reason for the changes? What, if any, were the secondary reasons?

The Charlie Creek solar project was delayed from its original Q4 2021 forecasted in service date to an expected Q3 2022 date due to state permitting delays. The Bay Trail and Fort Green solar projects were originally forecasted to be placed in service in Q1 2022 and have slipped into Q2 2022 due to permitting, workforce, and supply chain delays. All of the projects mentioned continued to experience some delays during onsite mobilization due to workforce logistics related to the pandemic during 2021.

40. Please refer to the Excel Tables File (Firm Purchases). Complete the table by providing information on the Utility's firm capacity and energy purchases.

Response:

Please see table below and tab *Firm Purchases* of the attached Excel File *Data Request* #1 - Excel Tables.

Nominal, Fir	m Purch	ases
	Firm	Purchases
Year	\$/MWh	Escalation %
HISTORY:		
2019	127.45	
2020	138.66	8.8%
2021	156.92	13.2%
FORECAST:

45. Please list and discuss any purchased power agreements with a renewable generator that have, within the past year, been cancelled, delayed, or reduced in scope. What was the primary reason for the change? What, if any, were the secondary reasons?

Response:

The US EcoGen Polk biomass QF Agreement was terminated on October 3, 2018 by DEF due to default by US EcoGen Polk. On March 28, 2019, US EcoGen Polk filed for formal arbitration, the process for dispute resolution under the FPSC approved QF Agreement. In March 2021 the arbitration panel ruled that DEF had rightfully terminated the agreement.

46. Please refer to the Excel Tables File (PSA Existing). Complete the table by providing information on each power sale agreement still in effect by December 31 of the year prior to the current planning period pursuant to which energy was delivered from the Company to a third-party during said year.

Response:

50. **[Investor-Owned Utilities Only]** Please refer to the Excel Tables File (Potential Solar Sites). Complete the table by providing information on all of the Company's plant sites that are potential candidates for utility-scale (>2 MW) solar installations.

Response:

Please see table below and tab *Potential Solar Sites* of the Excel File *Data Request* #1 - Excel Tables.xlsx.

Plant Name	Land Available (Acres)	Potential Installed Net Capacity (MW)	Potential Obstacles to Installation
Anclote	50	9	Wetlands, geotechnical problems, power grid interconnection costs, coastal area
Avon Park	60	10	Wetlands, geotechnical problems, species impacts
Crystal River	150	25	Wetlands, geotechnical problems, non-contiguous land, power grid interconnection not studied, impact to existing power plant, coastal area, species impacts
DeBary	400	67	Wetlands, native species habitat, existing solar footprint, geotechnical problems, non-contiguous land for solar
Hines	150	25	Wetlands, geotechnical problems, native species habitat, non-contiguous land for solar, power grid interconnection not studied, impact to existing power plant, species impacts
Suwannee	60	10	Wetlands, geotechnical problems, archeological finds, native species habitat
Turner	15	2	Small site, non-contiguous land for solar, native species habitat
Higgins	75	12.7	Wetlands, geotechnical problems, power grid interconnection not studied and not in our territory, coastal area
Bartow	50	9	Wetlands, geotechnical problems, archeological finds, non-contiguous land for solar power grid interconnection not studied, impact to existing power plant, coastal area
Levy	1300	75	Wetlands, flood zones, geotechnical problems, species impacts
Notes			
(Include Notes Here)			

51. Please describe any actions the Company engages in to encourage production of renewable energy within its service territory.

Response:

DEF encourages renewable energy advancement within its service territory as it continues to educate, engage, and discuss Florida renewable policy and regulation and the need for dependable and renewable energy that would contribute to reliable fuel diversity in Florida. DEF continues to address inquiries about developing renewable energy projects or initiatives in the state. DEF continues to explore renewable energy production through good faith purchased power discussions with qualified parties. In addition, DEF continues to educate interested parties at various industry conferences, local community events, and via our web site on renewable energy resources and innovative technologies. During 2021, using virtual mediums, DEF was able to engage stakeholders, customers, and potential companies interested in the production or use of renewable energy within the state.

52. **[Investor-Owned Utilities Only]** Please discuss whether the Company has been approached by renewable energy generators during the year prior to the current planning period regarding constructing new renewable energy resources. If so, please provide the number and a description of the type of renewable generation represented.

Response:

DEF managed and connected over 12,500 requests in 2021 from customer-owned renewable energy generators and DEF responded to many more informal emails and phone conversations. As the cost of solar PV technology continues to decline and subsidies remain, there continues to be interest from various customer segments trying to utilize, develop, install, and learn how to interconnect solar PV technology to the Florida power grid. DEF recorded about 8 inquiries in 2021 from potential large utility scale renewable energy generators and DEF responded to many more informal emails and phone conversations. This large-scale interest can be seen in the continued solar PV generator interconnection requests that DEF receives from speculative parties. As of December 31, 2021, DEF had over 3,400 MW of potential third-party solar PV generation projects in its interconnection queue. DEF continues to educate potential renewable energy generators on the Qualifying Facility criteria, FERC Orders, and structure requirements. DEF also educates on pricing, and obligations under FPSC Rules for a negotiated renewable power purchase agreement and an agreement for purchase of as-available energy. All of the inquiries during 2021 were for potential renewable energy generators utilizing solar PV technology.

53. Does the Company consider solar PV to contribute to one or both seasonal peaks for reliability purposes? If so, please provide the percentage contribution and explain how the Company developed the value.

Response:

DEF has assigned DEF owned solar PV generation an equivalent summer capacity value equal to 57% of the nameplate capacity of the planned installations from 2021 to 2024. DEF modeling derives an equivalent summer non-coincident, but on-peak-hour capacity value equal to 25% of the facility's nameplate rating for planned PV installations from 2025 to 2029 and 12.5% for 2030 through 2031. These assignments assume that the projects developed over the period of this plan will be single-axis tracking technology.

Other technologies may result in other values such as DEF's DeBary Solar Plant in a fixed tilt configuration has been assigned a 45% equivalent summer capacity value. DEF assigns no winter peak capacity value to solar PV. DEF recognizes that actual performance will differ from year to year; and may differ from the model and that the correlation to peak load will change as the amount of solar is installed and there are changes in the load behavior. As a result, DEF expects that these values may be revised further as additional solar PV power plants are in service and there is longer-term demonstrated operating data.

54. Please identify whether a declining trend in costs of energy storage technologies has been observed by the Company.

Response:

Yes, Duke Energy has observed a continued declining trend in costs of energy storage. However, recent supply chain issues have lessened the trend observed previously.

55. Briefly discuss any progress in the development and commercialization of non-lithium battery storage technology the Company has observed in recent years.

Response:

Duke Energy continues to monitor the non-lithium battery solutions. This includes flow storage, zinc hybrid, gravity storage, adiabatic compressed air energy storage, and electrothermal energy storage. Duke Energy participates in development and testing of battery technologies through its partnerships with entities such as EPRI and the National Renewable Energy Laboratory (NREL) as well as research and pilot projects across the Duke Energy regulated and non-regulated companies.

56. Briefly discuss any considerations reviewed in determining the optimal positioning of energy storage technology in the Company's system (e.g., Closer to/further from sources of load, generation, or transmission/distribution capabilities).

Response:

Duke Energy considers energy storage to be another power grid operator tool or resource for distribution, transmission, and generation solutions. The optimal positioning is very project specific and is dependent upon the problem being solved. Ultimately, energy storage projects are compared to traditional tools or methods to determine if energy storage is in fact a low cost and optimal solution. For example, Duke Energy is evaluating solar power plants with adjacent battery storage as well as investigating solutions to distribution reliability closer to the customer loads.

57. Please explain whether ratepayers have expressed interest in energy storage technologies. If so, how have their interests been addressed?

Response:

DEF's retail customers are showing an interest in energy storage by installing battery storage at their premise along with their customer-owned renewable generators. Currently, DEF is experiencing about a doubling of the percentage of customers utilizing the state's net metering policy that have also installed energy storage equipment at their premise compared to last year. DEF continues to carefully monitor this increased activity and the customer's battery project configuration. DEF's commercial and industrial customers have inquired about using energy storage in various forms, usually for business continuity whether post-hurricane or temporary interruptions. Some customers have developed their own backup power strategy. However, few have found battery storage external to their business as the best, economical solution to date. The customer is often looking for days of backup power which presently prices Li-ion technology out of consideration. Lastly, at the end of 2021, DEF finalized its "Bring Your Own Battery" pilot that launched in January 2022 to allow a small group of customers who have batteries installed in their homes to participate. This pilot will study potential grid enhancements and resiliency contributions when DEF, as the grid operator is able to thoughtfully dispatch these distributed resources.

58. Please refer to the Excel Tables File (Existing Energy Storage). Complete the table by providing information on all energy storage technologies that are currently either part of the Company's system portfolio or are part of a pilot program sponsored by the Company.

Response:

Please see table below and tab *Existing Energy Storage* of the Excel File *Data Request* #I - Excel Tables.xlsx.

Project Name	Pilot Program (Y/N)	In-Service/ Pilot Start Date (MM/YY)	Max Capacity Output (MW)	Max Energy Stored (MHh)	Conversion Efficiency (%)
USF Microgrid Energy Storage Pilot	Y	7/8/2018	0.25	0.475	88.00%
Trenton	Y	12/21/2021	11	15.6	83.20%
Lake Placid BESS	Y	12/9/2021	17.275	50.6	83.50%
Notes					
(Include Notes Here)					

59. Please refer to the Excel Tables File (Planned Energy Storage). Complete the table by providing information on all energy storage technologies planned for in-service during the current planning period either as part of the Company's system portfolio or as part of a pilot program sponsored by the Company.

Response:

Please see table below and tab *Planned Energy Storage* of the Excel File *Data Request* #1 - Excel Tables.xlsx.

Project Name	Pilot Program (Y/N)	In-Service/ Pilot Start Date (MM/YY)	Projected Max Capacity Output (MW)	Projected Max Energy Stored (MHh)	Projected Conversion Efficiency (%)
Cape San Blas	Y	1Q 2022	5.5	20.5	83.5%
Jennings	Y	2Q 2022	5.5	8.5	84.0%
Micanopy	Y	2Q 2022	8.25	18.2	83.5%
Duke / UCF Long-Duration Energy Storage Project	Y	2Q 2022	0.01	0.04	75.0%
John Hopkins Microgrid	Y	3Q 2022	2.475	23.5	83.5%
Notes					
(Include Notes Here)					

- 60. Please identify and describe the objectives and methodologies of all energy storage pilot programs currently running or in development with an anticipated launch date within the current planning period. If the Company is not currently participating in or developing energy storage pilot programs, has it considered doing so? If not, please explain.
 - a. Please discuss any pilot program results, addressing all anticipated benefits, risks, and operational limitations when such energy storage technology is applied on a utility scale (> 2 MW) to provide for either firm or non-firm capacity and energy.

- b. Please provide a brief assessment of how these benefits, risks, and operational limitations may change over the current planning period.
- c. Please identify and describe any plans to periodically update the Commission on the status of your energy storage pilot programs.

Response:

- a. Duke Energy is currently developing energy storage projects as part of the 50 MW battery energy storage pilot program identified in the 2017 DEF Settlement Agreement. The pilot program is studying how energy storage is a cost-effective tool to improve customer reliability, defer or eliminate traditional distribution investment, and improve system operations at universal solar assets. As of this filing, three DEF pilot sites have been placed in service and five more are under construction. The total program costs, benefits, and results have not yet been realized.
- b. DEF expects the current pilot program as well as future energy storage projects will help to better optimize the best blend of multiple use battery locations which may system balancing, capacity, and energy arbitrage values. These will include projects to mitigate intermittency from solar power and improve the coincidence between renewable generation and load. DEF also expects to better understand the benefits of energy storage as a key component of localized resiliency for locations as well as future uses of batteries to harden the local grids for counties and municipalities. As costs continue to decline on Li-ion batteries and perhaps other technologies provide additional paths to energy storage, storage will become a part of the myriad of tools DEF deploys to optimize grid resiliency and reduce certain transmission or distribution congestion/redundancy needs.
- c. Duke Energy plans to update the Commission on the status of our energy storage pilot programs during future Ten Year Site Plan filings and during any ad hoc requests made by the Commission.
- 61. If the Company utilizes non-firm generation sources in its system portfolio, please detail whether it currently utilizes or has considered utilizing energy storage technologies to provide firm capacity from such generation sources. If not, please explain.
 - a. Based on the Company's operational experience, please discuss to what extent energy storage technologies can be used to provide firm capacity from non-firm generation sources. As part of your response, please discuss any operational challenges faced and potential solutions to these challenges.

Response:

DEF has an increasing amount of solar PV generation on its system and projects to have more through the forecast period. While a portion of that capacity is considered to be firm in the summer, i.e. coincident with the peak, some portion of that capacity is also considered to be non-firm. Only a minimal amount of the PV capacity is coincident with the winter peak. DEF continues to examine the opportunity to use energy storage in combination with solar generation and other sources to provide additional firm capacity. Under the terms of DEF's 2017 rate settlement DEF is currently constructing 50 MW of battery storage projects to pilot various uses of battery storage and evaluate the value to the DEF system, including the provision of firm capacity.

- a. DEF recently placed a Lithium storage facility in service at 45 MW Lake Placid Solar Facility. Duke Energy plans to update the commission on operational experience from this facility during future Ten Year Site Plan filings after an adequate time period has elapsed to gather operational experience.
- 62. Please identify and describe any programs the Company offers that allows its customers to contribute towards the funding of specific renewable projects, such as community solar programs.
 - a. Please describe any such programs in development with an anticipated launch date within the current planning period.

Response:

Duke Energy Florida is excited to offer a new shared solar program, offering customers subscriptions to local clean energy in Florida. DEF's Clean Energy Connection is an opportunity for our Florida customers who want access to renewable energy without the hassle, long term commitment, or up front installation cost of installing or maintaining solar equipment.

Program participants subscribe to kilowatt (kW) blocks of power associated with the program's solar plants for a fixed \$8.35/kW monthly subscription fee, where each block represents 1 kW. This subscription fee supports the operation of these solar plants and is added to the customer's regular monthly DEF bill. In return, the customer will receive monthly bill credits associated with their participation in the program.

The power generated by the solar plant feeds into the Duke Energy electric grid across Florida, and customers will have the ability to subscribe to enough solar generation to match their energy usage.

The Program has allocations for large commercial and industrial customers, local government customers, residential and small business customers, and low-income customers. Low-income participants will pay a fixed monthly-kW subscription fee for the life of the program and can expect to receive immediate and sustained savings, as the fixed credit rate will be higher than the subscription fee. DEF has worked with local governments and community organizations, before the program opens, to help drive awareness of the program benefits to low income customers.

DEF opened the approved Clean Energy Connection Program for enrollment for large business and industrial customers in 2021 and is fully subscribed for those customer types. Enrollment for residential customers opens in April 2022 with a planned program launch. Please see docket #20200176 and Order PSC-2021-0059-S-EI for additional details.

Further, DEF continues to offer another community type shared solar program through its Shared Solar Rider. This Rider is available to all Customers throughout the entire service area served by the Company on a first come first served basis subject. Customers can voluntarily subscribe to 50-kWh blocks of energy per month from solar photovoltaic (PV) facilities owned and operated by Duke Energy Florida. The subscription fee per 50 kWh-energy block is \$7.75 per month and the customer receives an as-available energy based bill credit. Multiple blocks may be subscribed qualifying customers up to a maximum of 25 blocks per month for residential, 150 blocks for commercial, and 2,000 blocks for industrial customers under this experimental pilot tariff. DEF reserves the right to close the program to new applicants at any time during the 5-year availability period.

63. Please identify and discuss the Company's role in the research and development of utility power technologies. As part of this response, please describe any plans to implement the results of research and development into the Company's system portfolio and discuss how any anticipated benefits will affect your customers.

Response:

Through our research and development efforts, Duke Energy's Emerging Technology Office continuously reviews technology trends that may provide benefit for our customers. We are active in industry groups such as the Electric Power Research Institute (EPRI), national labs (NREL, ORNL, PNNL, etc.) and the U.S. Department of Energy (DOE), where we collaborate with government, other utility, and industry experts on emerging technologies, including renewables and emission-free resources. The goal of our work is to monitor and assess technology readiness to solve current and future power system issues whether they be behind the meter or universally grid tied. New technologies like microgrids, energy storage, battery energy storage coupled with solar PV, hydrogen, and grid-connected/controlled devices are being tested to enable the Company to meet evolving customers' needs.

64. **[Investor-Owned Utilities Only]** Please refer to the Excel Tables File (As-Available Energy Rate). Complete the table by providing, on a system-wide basis, the historical annual average as-available energy rate in the Company's service territory for the 10-year period prior to the current planning period. Also, provide the projected annual average as-available energy rate in the Company's service territory for the current planning period. If the Company uses multiple areas for as-available energy rates, please provide a system-average rate as well.

Response:

Please see table below and tab *As-available Energy Rate* of the attached Excel File *Data Request* #I - Excel Tables.

Year		As-Available Energy	On-Peak Average	Off-Peak Average
		(\$/MWh)	(\$/MWh)	(\$/MWh)
	2012	30.10	34.41	26.44
	2013	34.35	38.29	31.02
	2014	37.68	42.97	33.21
	2015	26.03	28.74	23.74
Actual	2016	25.97	29.79	22.73
Act	2017	28.97	32.44	26.03
	2018	30.84	34.80	27.49
	2019	23.71	27.22	20.73
	2020	18.57	21.22	16.33
	2021	34.45	40.53	29.30
	2022	38.63	42.85	35.05
	2023	31.16	34.54	28.31
	2024	27.80	30.64	25.39
-	2025	25.04	27.97	22.57
Projected	2026	24.89	28.21	22.08
roje	2027	24.63	27.41	22.28
2	2028	26.80	30.69	23.51
	2029	26.61	29.14	24.47
	2030	27.42	29.81	25.39
	2031	28.32	30.94	26.09
lotes				

This year, both the Actuals and the Projected As-Available payment rates shown reflect all components but for the delivery voltage adjustment (because the generator's interconnection level is unknown) defined under rule 25-17.0825(2)(a). These components include: identifiable variable operating and maintenance expenses, start up costs, and a reasonable as-available block size of solar QF generation for appropriate customer protections. The Projected values are only valid and effective as of December 31, 2021 due to the volume of potential solar QF activity. DEF also anticipates that at some point, the system will have increasing amounts of time when the required DEF system resources along with potential solar QF generation may exceed DEF load levels and that excess generation is not fully captured in the Projected values herein.

65. Please refer to the Excel Tables File (Planned PPSA Units). Complete the table by providing information on all planned traditional units with an in-service date within the current planning period. For each planned unit, provide the date of the Commission's Determination of Need and Power Plant Siting Act certification, if applicable.

Response:

Please see table below and tab *Planned PPSA Units* of the Excel File *Data Request* #1 - Excel Tables.xlsx.

	Summer Capacity	Certification Dates (In-Service Date	
Generating Unit Name	(MW)	Need Approved (Commission)	PPSA Certified	(MM/YY)
	Co	mbustion Turbine Unit Addit	ions	
Undesignated CT	214	Not Required	Not Required	6/1/2029
	(Combined Cycle Unit Addition	ns	
		Steam Turbine Unit Addition	S	
Notes				
(Include Notes Here)				

66. For each of the planned generating units, both traditional and renewable, contained in the Company's current planning period TYSP, please discuss the "drop dead" date for a decision on whether or not to construct each unit. Provide a timeline for the construction of each unit, including regulatory approval, and final decision point.

Response:

In the DEF 2022 Ten-Year Site Plan, the in-service date for a future simple cycle unit was projected for 6/1/2029. A "drop dead" decision date to proceed with the 6/1/2029 simple cycle units would typically occur just shy of 30 months prior to the in-service date. Therefore, the "drop dead" date will be year-end of 2026 for the future simple cycle unit. The major components of the "drop dead" date for the simple cycles' schedule is shown below:

6/2029 Simple Cycle Unit	2026			2027			2028				2029					
6/2029 Simple Cycle Onit	Q1	Q2	Q3	Q4	Q1	Q2	Q3	Q4	Q1	Q2	Q3	Q4	Q1	Q2	Q3	Q4
Evaluations																
Regulatory/Licensing/Permiting																
Engineer/Procure/Construct																

A "drop dead" decision date to proceed with the solar units would typically occur 18 months prior to the in-service date. However, some sites may require longer permitting times and the "drop dead" may be extended.

67. Please refer to the Excel Tables File (Capacity Factors). Complete the table by providing the actual and projected capacity factors for each existing and planned unit on the Company's system for the 11-year period beginning one year prior to the current planning period.

Response:

	Unit	Unit	Fuel		Capacity Factor (%)										
Plant	No.	Туре	Туре	Actual	Projected										
				2021	2022	2023	2024	2025	2026	2027	2028	2029	2030	2031

(Include Notes Here)															

Please see table below and tab *Capacity Factors* of the attached Excel File *Data Request* #1 - Excel Tables.

68. **[Investor-Owned Utilities Only]** For each existing unit on the Company's system, please provide the planned retirement date. If the Company does not have a planned retirement date for a unit, please provide an estimated lifespan for units of that type and a non-binding estimate of the retirement date for the unit.

Response:

DEF does not strictly maintain a retirement schedule for each unit on the DEF system, but periodically evaluates each unit on a case by case basis, taking into account changes in many factors including unit dispatch (history and projections of starts and capacity factor), changes in upcoming maintenance, the anticipated impact of final or proposed environmental regulations, potential transmission impacts, and availability of parts and vendor maintenance support. DEF uses the most recently approved depreciation schedules as a guideline. The table below presents the current depreciation schedules.

	Major	Probable	
DEPRECIABLE GROUP	Year in	Retirement	Life

69. Please refer to the Excel Tables File (Steam Unit CC Conversion). Complete the table by providing information on all of the Company's steam units that are potential candidates for repowering to operation as Combined Cycle units.

Response:

Please see table below and tab *Steam Unit CC Conversion* of the attached Excel File *Data Request* #1 - Excel Tables.

Plant Name	Fuel Type	Summer Capacity (MW)	In-Service Date (MM/YYY)	Potential Conversion	Potential Issues
Anclote	NG	508	10/74	CC	Project Development
Anclote	NG	505	10/78	CC	Project Development
Crystal River	BIT	712	12/82	CC/IGCC	Project Development
Crystal River	BIT	698	10/84	CC/IGCC	Project Development
Notes					
(Include Notes Here)					

70. Please refer to the Excel Tables File (Steam Unit Fuel Switching). Complete the table by providing information on all of the Company's steam units that are potential candidates for fuel-switching.

Response:

Please see table below and tab *Steam Unit Fuel Switching* of the attached Excel File *Data Request* #1 - Excel Tables.

Plant Name	Fuel Type	Summer Capacity (MW)	In-Service Date (MM/YYY)	Potential Conversion	Potential Issues
Crystal River	BIT	712	12/82	CC/IGCC	Project Development
Crystal River	BIT	698	10/84	CC/IGCC	Project Development
Notes					
(Include Notes Here)					

71. Please refer to the Excel Tables File (Transmission Lines). Complete the table by providing a list of all proposed transmission lines for the current planning period that require certification under the Transmission Line Siting Act. Please also include in the table transmission lines that have already been approved, but are not yet in-service.

Please see table below and tab *Transmission Lines* of the attached Excel File *Data Request* #1 - Excel Tables.

	Line	Nominal	Date	Date	In-Service
Transmission Line	Length Voltage		Need	TLSA	Date
	(Miles)	(kV)	Approved	Certified	
N/A	N/A	N/A	N/A	N/A	N/A
Notes					
DEF has no proposed t	ransmission	lines for the current plan	ning period that requ	ire certification	under the
Transmission Line Siti	ng Act, nor	are there any that have alre	eady been approved, I	but are not yet in-	service.

Environmental

- 72. Please explain if the Company assumes carbon dioxide (CO₂) compliance costs in the resource planning process used to generate the resource plan presented in the Company's current planning period TYSP. If the response is affirmative, answer the following questions:
 - a. Please identify the year during the current planning period in which CO₂ compliance costs are first assumed to have a non-zero value.
 - b. **[Investor-Owned Utilities Only]** Please explain if the exclusion of CO₂ compliance costs would result in a different resource plan than that presented in the Company's current planning period TYSP.
 - c. **[Investor-Owned Utilities Only]** Please provide a revised resource plan assuming no CO₂ compliance costs.

Response:

DEF assumes CO2 compliance costs in the resource planning process used to generate the resource plan presented in the current TYSP.

- a. The year during the current planning period in which CO₂ compliance costs are first assumed to have a non-zero value is 2025.
- b. While DEF has not done an in-depth planning study to determine the resource plan without a CO2 compliance cost, any impacts would be to the quantity of solar PV selected. Project based evaluations, however, indicate that DEF solar provides cost-effective emission-free resources producing customer savings over the useful life of the solar power plants. These cost-effective emission-free resources are thoughtfully phased in over time so that DEF can continue to learn and further optimize its total resource mix while also being able to address future climate policies with consideration given to all emissions in general, (e.g. SO2, NOx, CO2, CH4, etc.) if needed. DEF does not expect a significant change to the TYSP resource plan.
- c. DEF has not performed an in-depth planning exercise to determine the resource plan assuming no CO2 compliance costs.

73. Provide a narrative explaining the impact of any existing environmental regulations relating to air emissions and water quality or waste issues on the Company's system during the previous year. As part of your narrative, please discuss the potential for existing environmental regulations to impact unit dispatch, curtailments, or retirements during the current planning period.

Response:

There were no impacts to unit dispatch, curtailments, or retirements during 2021 due to environmental regulations. DEF is not planning to retire any units in the current planning period as a response to existing environmental regulations. In the past DEF has experienced curtailments of some units related to water temperature restrictions. Because these events are weather related, there is no anticipated curtailment in the plan.

- 74. For the U.S. EPA's Standards of Performance for Greenhouse Gas Emissions for New Stationary Sources: Electric Utility Generating Units Rule:
 - a. Will your Company be materially affected by the rule?
 - b. What compliance strategy does the Company anticipate employing for the rule?
 - c. If the strategy has not been completed, what is the Company's timeline for completing the compliance strategy?
 - d. Will there be any regulatory approvals needed for implementing this compliance strategy? How will this affect the timeline?
 - e. Does the Company anticipate asking for cost recovery for any expenses related to this rule? Refer to the Excel Tables File (Emissions Cost). Complete the table by providing information on the costs for the current planning period.
 - f. If the answer to any of the above questions is not available, please explain why.

Response:

a. The EPA combined several standards and issued the final rule as the "Standards of Performance for Greenhouse Gas Emissions from New, Modified and Reconstructed Stationary Sources: Electric Utility Generating Units" (CO2 NSPS). The new Citrus Combined Cycle units affected by these standards meet the compliance requirements outlined in the rule and DEF has not identified any units potentially affected as "Modified" or "Reconstructed" stationary sources. As such, DEF does not anticipate any reliability impacts of this rule. On March 27, 2017 President Trump signed an Executive Order (EO) entitled "Promoting Energy Independence and Economic Growth." The EO directed federal agencies to "immediately review existing regulations that potentially burden the development or use of domestically produced energy resources and appropriately suspend, revise, or rescind those that unduly burden the development of domestic energy resources."

The EO specifically directed the EPA to review the Standards of Performance for Greenhouse Gas Emissions from New, Modified, and Reconstructed Stationary Sources: Electric Utility Generating Units Rule (among other rules) and determine whether to suspend, revise, or rescind the rule.

In response to the EO, the Department of Justice filed motions with the D.C. Circuit Court to stay the litigation of the CO2 NSPS rules, along with the Clean Power Plan for existing sources, while each was reviewed by EPA. The CO2 NSPS rules remained in effect through the conclusion of EPA's review. The framework of the regulation of greenhouse gas emissions is now being evaluated by the new Biden administration and the CO2 NSPS rules remain in effect pending outcome of the review. DEF will continue to monitor the status of the rule and any proposed changes to ascertain any further compliance steps that may be required.

- b. DEF will ensure that all future new generating facilities comply with new standards and will monitor maintenance and compliance activities related to existing facilities that could potentially result in the facilities being identified as "Modified" or "Reconstructed" stationary sources under the rule.
- c. N/A
- d. Will there be any regulatory approvals needed for implementing this compliance strategy? How will this affect the timeline?

There are no specific regulatory approvals identified as associated with compliance with this rule.

- 75. Explain any expected reliability impacts resulting from each of the EPA rules listed below. As part of your explanation, please discuss the impacts of transmission constraints and changes to units not modified by the rule that may be required to maintain reliability.
 - a. Mercury and Air Toxics Standards (MATS) Rule.
 - b. Cross-State Air Pollution Rule (CSAPR).
 - c. Cooling Water Intake Structures (CWIS) Rule.
 - d. Coal Combustion Residuals (CCR) Rule.
 - e. Standards of Performance for Greenhouse Gas Emissions for New Stationary Sources: Electric Utility Generating Units.
 - f. Affordable Clean Energy Rule or its replacement.
 - g. Effluent Limitations Guidelines and Standards (ELGS) from the Steam Electric Power Generating Point Source Category.

Response:

a. Mercury and Air Toxics Standards (MATS) Rule.

DEF has provided its compliance strategy for MATS in the Integrated Clean Air Compliance Plan submitted to the Commission on March 29, 2019 in Docket 20190007-EI and updated in Docket 20210007-EI. This compliance strategy has been implemented and there are no reliability impacts from this regulation.

b. Cross-State Air Pollution Rule (CSAPR).

DEF sources are not subject to CSAPR and therefore there are no reliability impacts from this regulation.

c. Cooling Water Intake Structures (CWIS) Rule.

DEF has provided updates on the compliance strategy for CWIS at the Crystal River station in the testimony provided to the Commission on April 1, 2021, Docket No 20210007-EI. There are no reliability impacts from this regulation.

As explained in the prior testimonies of DEF witnesses Patricia West and Kim McDaniel in Dockets 20170007-EI, 20180007-EI, and 20190007-EI, DEF has been conducting 316(b) studies at the Anclote and Bartow stations and study results, along with proposed compliance strategies, were filed with the Florida Department of Environmental Protection ("FDEP") in July and August 2020, respectively, as part of the NPDES renewal process. Proposed compliance strategies for both are currently being evaluated by FDEP as part of the NPDES permit renewal. The full extent of compliance activities cannot be determined until FDEP's review of the proposed options has been completed and the NPDES permit renewal issued. There are no reliability impacts anticipated with the proposed compliance strategies.

d. Coal Combustion Residuals (CCR) Rule.

In 2021 DEF completed the installation of a liner system in the existing sedimentation basin and west ditch. The liner system was installed as a corrective measure to address groundwater quality impacts. Actions to address groundwater exceedances and comply with groundwater assessment mandates resulting from the CCR landfill are described in Docket No. 20190007-EI, approved by PSC-2019-0500-FOF-EI, and updated in Docket Nos. 20200007-EI, and 20210007-EI. This compliance strategy is not expected to have any impacts on reliability.

e. Standards of Performance for Greenhouse Gas Emissions for New Stationary Sources: Electric Utility Generating Units.

The new units (Citrus Combined Cycle Units) affected by these standards meet the compliance requirements outlined in the rule. This compliance strategy is not expected to have any impacts on reliability.

f. Affordable Clean Energy Rule or its replacement.

On January 19, 2021, the court vacated the ACE rule and remanded it back to EPA. Currently, neither the ACE rule nor Clean Power Plan rule are in effect. On October 29, 2021, the Supreme Court agreed to hear the appeal of ACE vacatur. The case was heard at the Supreme Court on February 28, 2022, and we are awaiting the ruling from the court. In the meantime, the EPA is working on a replacement rule, therefore any potential reliability impacts are yet to be determined.

g. Effluent Limitations Guidelines and Standards (ELGS) from the Steam Electric Power Generating Point Source Category.

On November 22, 2019, EPA published a revised ELG rule with proposed changes to the FGD effluent and bottom ash transport water limits. EPA published the final ELG Reconsideration Rule on October 13, 2020, with an effective date of December 14, 2020. The rule has been challenged by environmental organizations and is also under review by the EPA under President Biden's administration. DEF has evaluated the changes in the ELG Reconsideration Rule and has determined that modifications completed at the Crystal River North station in 2020 under the original rule satisfy the requirements of the ELG Reconsideration Rule. DEF is working with FDEP to reflect this in the pending

Crystal River Units 4 and 5 NPDES permit renewal. The NPDES permit renewal has not been issued by FDEP. There are no reliability impacts from this rule.

76. Please refer to the Excel Tables File (EPA Operational Effects). Complete the table by identifying, for each unit affected by one or more of EPA's rules, what the impact is for each rule, including; unit retirement, curtailment, installation of additional emissions controls, fuel switching, or other impacts identified by the Company.

Response:

Please see table below and tab *EPA Operational Effects* of the Excel File *Data Request* #1 - Excel Tables.xlsx.

79. If applicable, identify any currently approved costs for environmental compliance investments made by your Company, including but not limited to renewable energy or energy efficiency measures, which would mitigate the need for future investments to comply with recently finalized or proposed EPA regulations. Briefly describe the nature of these investments and identify which rule(s) they are intended to address.

Response:

DEF's currently approved costs for environmental compliance investments which may be considered in the EPA's future CO2 regulations include plant conversions to natural gas, coal resource retirements, and utilizing advanced natural gas technologies as discussed in detail in question # 75. These plans were undertaken to address the requirements of various new or forthcoming rules. The retirement of Crystal River units 1 and 2 in response to MATS and the Regional Haze rule also reduced the impacts of the CCR rule, the CWIS rule and updates to the State Implementation Plan to achieve attainment with SO2 and Ozone National Ambient Air Quality Standards (NAAQS). This retirement reduced DEF's CO2 footprint. The conversion of the two units at Anclote to natural gas firing in response to MATS similarly reduced priority pollutant emissions and the resultant risk around future updates to the NAAQS as well as CO2 emissions.

Until the EPA's CO2 emission reduction regulations are clearly defined, DEF can only estimate which investments would contribute to compliance and to what degree. DEF does,

however, have some approved renewable energy and energy efficiency investments, recovered or administered under the energy conservation cost recovery clause that may mitigate the need for some limited future investments that may be contemplated in the EPA's future CO2 regulations; and, finally, DEF continues to evaluate clean energy technologies and prudently prepare now for a CO2 constrained future.

Fuel Supply & Transportation

80. Please refer to the Excel Tables File (Fuel Usage & Price). Complete the table by providing, on a system-wide basis, the actual annual fuel usage (in GWh) and average fuel price (in nominal \$/MMBTU) for each fuel type utilized by the Company in the 10-year period prior to the current planning period. Also, provide the forecasted annual fuel usage (in GWh) and forecasted annual average fuel price (in nominal \$/MMBTU) for each fuel type forecasted to be used by the Company in the current planning period.

Response:

Please see table below and tab *Fuel Usage & Price* of the attached Excel File *Data Request* #1 - Excel Tables.

N		Ura	nium	C	al	Natur	al Gas	Resid	ual Oil	Distill	ate Oil

Notes											
(Include Notes Here)											

81. Please discuss how the Company compares its fuel price forecasts to recognized, authoritative independent forecasts.

Response:

DEF's fuel price forecasts are developed based on the forward market price for the first five years, followed by the long-term fundamental forecast beyond year five. The fundamental forecast is a long-term proprietary forecast prepared by a nationally recognized third-party consulting company.

As part of its forecast comparison process, Duke Energy compares its own fundamental commodity price outlooks to both public forecasts like EIA, and proprietary outlooks from other leading energy consultants. Duke Energy also compares supply and demand fundamentals where they are available to review the underlying drivers. Natural gas and distillate fuel oil are widely traded commodities with multiple forecasts although these forecasts are influenced by views of not only domestic supply and demand effects, but also international market trends. Coal price forecast comparisons are more tenuous given the limited number of qualified outlooks, the significance of transportation cost and the nonhomogeneous nature of the commodity itself. Duke Energy utilizes direct comparisons for select coal product qualities widely available in the market. Since the objective of Duke Energy fundamental forecasting process is to produce a comprehensive internally consistent forecast, Duke Energy also performs checks that the final price forecast is intuitively aligned with the supply/demand balances across the various commodities

- 82. Please identify and discuss expected industry trends and factors for each fuel type listed below that may affect the Company during the current planning period.
 - a. Coal
 - b. Natural Gas
 - c. Nuclear
 - d. Fuel Oil
 - e. Other (please specify each, if any)

Response:

a. Coal

On average with respect to coal, in the first half of the period the high-sulfur Illinois basin coal prices generally are in the high \$30's per ton escalating to high-\$40's in the back half of the period; while Illinois basin low chlorine coal prices are generally in the high-\$40's to low-\$50's per ton across the period. Central Appalachia coal prices are in the low \$60's per ton in the first half of the period escalating to the low \$70's in the back half of the period; Northern Appalachia coal prices are in the high \$40's per ton in the first half of the period escalating to mid-\$50's in the back half of the period; Powder River Basin coal prices are in the low teens escalating to mid-teens; and Colorado coal prices are in the mid \$30's per ton escalating to low \$40's in the back half of the curve. Since the fall of 2021, near term coal pricing for CAPP, NAPP and ILB regions has climbed over \$100 per ton as international coal prices hit record highs at ~ \$400/ton. Coal demand is primarily driven by changes in electric power consumption and is expected to continue to fluctuate based on changes in natural gas pricing, weather driven demand, purchase power costs, increasing availability of renewable generation, and export demand. Looking forward, coal markets continue to be distressed and there has been increased market volatility due to a number of factors, including: (1) deteriorated financial health of coal suppliers following the past several years of steep

declines in coal generation demand, which has impacted the ability of producers to respond to changes in demand; (2) natural gas price volatility; (3) renewed uncertainty from the new administration regarding proposed and imposed U.S. Environmental Protection Agency ("EPA") regulations for power plants and mining operations; (4) increased demand in global markets for both steam and metallurgical coal; (5) tightening access to investor financing coupled with deteriorating credit quality is increasing the overall costs of financing for coal producers; (6) continued shifts in production from thermal to metallurgical coal as producers move away from supplying declining electric generation to take advantage of increasing demand from industry; and, (7) increasing labor and resource constraints due to structural changes in the coal industry further limiting suppliers' operational flexibility. International coal pricing assumptions are not currently accounted for in long-term fundamental price modeling. In the future if domestic coal supply becomes increasingly constrained, importing international supply may become necessary to ensure adequate supply.

b. Natural Gas

Over the planning horizon there are several of trends that could have an impact on natural gas prices, and the overall supply and demand for domestic natural gas. First is the level of production of domestic natural gas, particularly from unconventional resources. Second is the forecasted growth in the use of natural gas from electric power generation, and the industrial sector. Third is the level of natural gas exports via pipelines to Mexico, and LNG to the global natural gas market from U.S. export facilities.

Each year, the U.S. Energy Information Agency ("EIA") publishes a long-term forecast of energy market fundamentals, and for their 2022 outlook published March 3, 2022, in most scenarios, they forecast dry natural gas production continuing to grow. In their reference case, the EIA projects total U.S. dry natural gas production to grow from 94 Bcf/day in 2021 to approximately 103 Bcf/day on average for 2031. More than half of this growth will be from associated gas in the Permian region in Texas and New Mexico. Additional production growth from the Marcellus and Utica plays in the Appalachia region will be somewhat limited by the lack of new pipeline infrastructure projects. In 2031, the EIA reference case forecasts domestic natural gas consumption will be approximately 82 Bcf/day, with a total volume of exports at approximately 24 Bcf/day. Power generation is expected to be approximately 28 Bcf/day of the domestic natural gas demand in 2031. U.S. LNG exports reached 10.5 Bcf/d in 2021 and are expected to grow to an average of 21.2 Bcf/d in 2031. Current US LNG exports are limited to approximately 13.7 Bcf/day until additional infrastructure is completed at end of 2024.

Demand growth for natural gas from electric generation, industrial, and exports could result in additional upward pressure on prices over the planning horizon from 2022 through 2031. According to the EIA long-term forecast, spot prices at the Henry Hub averaged \$3.91 per MMBtu in 2021 and are expected to stay at or below \$4.00/MMBtu through 2031 (in real terms). DEF has retired the Crystal River 3 Nuclear plant and does not plan to add a new nuclear unit in the ten-year horizon. Therefore, it does not expect to be significantly impacted by trends and factors of nuclear fuel.

d. Fuel Oil

With respect to industry trends, per the EIA's Annual Energy Outlook ("AEO") 2022 Reference Case published in February 2022, domestic oil production levels are expected to rise throughout 2022 and return to pre-COVID 2019 levels by 2023. Starting in 2024 through the balance of the planning period, domestic production levels are expected to remain relatively flat as new drilling continues to rely more on cash flows from existing sources than new equity or debt as the market continues to look for higher returns in order to invest. Per EIA's AEO 2022 Reference case projects that prices are high enough to maintain investment at steady crude oil production levels but not high enough to elicit increasing volumes from those levels of investment. However, given the Russian invasion of Ukraine and subsequent oil sanctions, prices have risen to \$112 BBl through 2022 and should encourage additional drilling to lessen reliance on Russian Crude oil. EIA's Short-Term Energy Outlook, published March 2022, expect the average price to fall to \$89/b in 2023. However, this price forecast is highly uncertain. Actual price outcomes will be dependent on the degree to which existing sanctions imposed on Russia, any potential future sanctions, and independent corporate actions affect Russia's oil production or the sale of Russia's oil in the global market. In addition, the degree to which other oil producers respond to current oil prices, as well as the effects macroeconomic developments might have on global oil demand, will be important for oil price formation in the coming months. EIA forecast that global consumption of petroleum and liquid fuels will average 100.6 million b/d for all of 2022, up 3.1 million b/d from 2021 and forecast that consumption will increase by 1.9 million b/d in 2023 to average 102.6 million b/d. Economic forecasts in the EIA Short -Term Energy Outlook were completed before Russia's invasion of Ukraine. The outlook for economic growth and oil consumption in Russia and surrounding countries is highly uncertain.

DEF will continue to monitor oil prices, trends and its fuel forecast over time and will procure needed fuel oil supply and transportation services to meet its generation fleet needs over the planning horizon. As new information becomes available, DEF will monitor this information for potential developments.

- e. Other (please specify each, if any)
 - N/A
- 83. Please provide a comparison of the Utility's 2021 fuel price forecast and the actual 2021 delivered fuel prices.

Response:

Please see table below and tab 2021 Fuel Prices-FCastvsActual of the attached Excel File Data Request $\#1 - Excel Tables_Q83$.

Year		Co	oal	Natur	al Gas	Distillate Oil				
rear		GWh	\$/MMBTU	GWh	\$/MMBTU	GWh	\$/MMBTU			
Projected	2021	10,268 1.79		27,521	3.10	16	9.26			
Actual	2021	5,042	3.03	34,517	5.28	61	20.27			
Notes										
(Include Notes Here)										

Projected values include commodity price and variable transportation cost.

Actual values include commodity price, variable and fixed transportation cost, surcharge deliver costs, and cost of existing inventory (coal sitting on the pile, oil in the tanks).

84. Please explain any notable changes in the Utility's forecast of fuel prices used to prepare the Utility's 2022 TYSP compared to the fuel prices used to prepare the Utility's 2021 TYSP.

Response:

DEF's 2022 TYSP is based on fuel forecasts developed in the Fall of 2021. Markets continue to change based on both near term and projected long-term factors. In the near term, markets are impacted by the supply and demand disruptions caused by the COVID pandemic and the economic recovery from that event. Longer term projections are impacted by changes in the forecast generation mix and by global energy use trends.

2021 saw Gulf Coast natural gas storage inventories depleted by extreme weather and unexpected demand conditions related to the rapid economic recovery. This resulted in market prices higher than the previous forecast. While this increase is expected to mitigate going forward, higher prices than those from the previous forecast are projected to persist for three to four years. In the longer term, gas prices are projected to moderate and drop below the previous forecast by 2030 as the impacts of increasing amounts of renewables, particularly solar PV generation, are seen. Nationwide, the Fall 2021 forecast incorporates over 460 additional GW of renewable capacity compared to the Fall 2020 forecast.

The higher natural gas prices in 2021 supported gas-to-coal switching, increasing coal's share of power generation throughout the summer, although this switch was moderated at DEF due to transportation disruptions related to damage caused by Hurricane Ida. The higher coal demand, paired with production levels that had yet to recover from COVID-19 induced lows and transportation issues, drew coal inventory down and pushed prices up for the fall forecast. These near-term factors are expected to impact the market for the next three to four years. Longer term, the expectation is for steep declines in coal use for electric generation. While this might be expected to lead to lower coal prices, the forecast is that the resulting shrinkage in the number of available suppliers and in the availability of transportation will keep prices moderately elevated above the previous forecast throughout the forecast period.

85. Please identify and discuss steps that the Company has taken to ensure natural gas supply availability and transportation over the current planning period.

Response:

DEF has broad contacts and relationships with natural gas suppliers and pipeline transportation providers. DEF performs short-term and long-term fuel forecasts to project estimated fuel usage for future periods. The short-term forecasts typically cover a period of five years, and the long-term forecasts cover years six through year twenty. Fuel forecasts includes items such as, but not limited to, load forecasts, fuel and emission prices, operational specifics of owned generation and contracted generation resources, wholesale power sales agreements, and unit maintenance schedules. The short-term forecast is performed approximately four times per year for a five-year period and currently covers years 2022 through 2027. The long-term forecast is performed two times per year and currently covers years 2028 through 2048.

To ensure that DEF has the needed natural gas supply to meets its generation needs over the planning horizon, DEF performs periodic competitive natural gas supply Request for Proposals ("RFP's") and market solicitations to procure the needed competitively priced natural gas supply consistent with its procurement approach. In addition, DEF also monitors potential pipeline expansion projects that can access competitively priced and secure natural gas for delivery to DEF's facilities. DEF monitors potential pipeline expansions through ongoing discussions and periodic meetings with gas suppliers and pipeline providers, open seasons issued by pipelines, industry events, and publications.

86. Please identify and discuss any existing or planned natural gas pipeline expansion project(s), including new pipelines and those occurring or planned to occur outside of Florida that would affect the Company during the current planning period.

Response:

The project descriptions outlined below are not intended to be an all-inclusive or exhaustive list of all the upstream pipeline projects that are in-service or proposed in the Gulf Coast and Southeast region, but those that DEF believes could have an impact on the natural gas supply available for DEF and the State of Florida.

Callahan Pipeline

Status: In-service as of November 2020

Peoples Gas expanded its natural gas service in Jacksonville, Fla., with the construction the Callahan Pipeline project. The pipeline starts at the Southern Natural Gas Cypress Interstate Pipeline in Callahan and travels east to Highway 17 in Yulee. The initiative was done through a partnership with Florida Public Utilities Co (FPU). TECO's affiliate, SeaCoast Gas Transmission, and FPU's affiliate, Peninsula Pipeline Co. Inc., are jointly developing the Callahan Pipeline. This will help the Company meet current and future natural gas demand in the Jacksonville area, including the planned Eagle LNG export terminal. The Eagle LNG project is not yet under construction. Upon completion, Eagle is expected to be capable of exporting up to 49.8 Bcf of LNG per year.

Florida Gas Transmission – Putnam Expansion Project

Status: Under Construction with projected in-service targeted for April 2022

FGT has proposed a 21-mile, 169,000 MMBtu/d, pipeline project to increase Seminole Electric Cooperative volumes at the SeaCoast Gas Transmission delivery point in Putnam County, Florida. The project would allow previously unsubscribed firm capacity available on FGT's West Leg system to be moved to FGT's East Leg mainline, according to an application filed with FERC (CP19-474). This would be accomplished through loop extensions on the East Leg mainline to meet SECI's contractual firm volumes at the SeaCoast Gas Transmission delivery point in Putnam County. Downstream of the delivery point, SeaCoast plans to build a roughly 21.3-mile pipeline to ship gas to an existing SECI power plant, which will be replaced by a gas-fired, combined-cycle unit. The project entails about 13.7 miles of 30-inch-diameter loop extension in Clay and Putnam counties, along with seven miles of 30-inch-diameter loop extension in Clay and Putnam counties and other modifications in Orange County to FGT's existing Compressor Station 18 to allow for bidirectional flows. According to the application at FERC, CS-18 will be able to discharge and flow from south to north to accommodate the total deliveries at the FGT/SeaCoast interconnection.

Gulfstream Natural Gas – Phase VI Expansion

Status: Under Construction with projected in-service targeted for December 2022

GNGS proposed the Phase VI Expansion project, designed to add about 78,000 Dt/d of mainline capacity from receipt points in Mississippi and Alabama, to a delivery point in Manatee County, Florida. Tampa Electric, which is transforming one unit at a coal-fired station in Hillsborough County, Florida, into a combined-cycle gas generating unit, has a 25-year Precedent Agreement for the full capacity. The project facilities entail one 16,000 hp compressor unit at an existing station in Mobile County, Alabama; four miles of 36-inch-diameter pipeline onshore in Mobile County; abandonment of a four-mile segment; uprating the MAOP of the 55-mile segment in offshore in Mobile County; metering equipment; and other facilities.

Sabal Trail Transmission

Status: Phases I & II In-Service, Phase III Extension Request filed at FERC as of 4/14/2021

Sabal Trail Transmission, LLC is a joint venture of Spectra Energy Corp (an Enbridge subsidiary), NextEra Energy, and Duke Energy. Sabal Trail is an approximately 515-mile interstate pipeline extending from Transco Station 85 in Choctaw County, Alabama to the Central Florida Hub. It interconnects with FGT, Gulfstream, and the Florida Southeast Connection in Osceola County, Florida. Sabal Trail's Phase I facilities were placed into full commercial service on July 3, 2017. The full Phase I capacity of the Sabal Trail pipeline is 830,000 Dth/day with the ability to scale-up its design capacity of 1.1 Bcf/day with the implementation of the third and final phase. Adding this additional pipeline into the State will increase overall direct onshore supply access to the State of Florida. Sabal Trail has two foundation shippers, Florida Power & Light and DEF.

Transco - Hillabee Expansion Project

Status: Phases I & II In-Service, Phase III not yet under construction

The Transco Hillabee Expansion Project will provide 1,131,730 MMBtu/day of incremental firm capacity in three phases. It originates at Transco Station 85 in Choctaw County, Alabama to a proposed interconnection between Transco and Sabal Trail in Tallapoosa County, Alabama. Sabal Trail acquired 100% of the project capacity via a long-term lease to

provide Sabal Trail shippers gas supply access at Transco Station 85. Construction for Phase 1 began in 2016 and was placed in-service in July 2017. Phase II began construction in May of 2019 and was placed in-service on April 13, 2020. Phase III has yet to begin construction.

Transco – Southeastern Trails Project

Status: In-service as of January 1, 2021

The Southeastern Trail Expansion (SET) is a 296,375 MMBtu/day expansion of the Transco pipeline system designed to provide additional pipeline capacity to serve markets in the Mid-Atlantic and Southeastern states. It is an expansion from the existing Zone 5 Pleasant Valley Interconnect between Transco and Dominion Cove Point in Virginia to Transco's existing Zone 3 Pooling Point at Station 65 in Louisiana. The project is designed to provide additional reliable service to utility and local distribution companies located in Virginia, North Carolina, South Carolina, and Georgia. The Southeastern Trails Project moves gas from north-to-south to various markets on the Transco mainline. DEF is not a shipper in this project but may benefit from incremental gas supply that could be available at Transco Station 85 where DEF could access this supply to transport into Florida on downstream capacity on Sabal Trail and/or Transco's Mobile Bay South Lateral.

87. Please identify and discuss expected liquefied natural gas (LNG) industry factors and trends that will impact the Company, including the potential impact on the price and availability of natural gas, during the current planning period.

Response:

LNG exports are projected to remain at or near full export capabilities which is currently approximately 13.7 Bcf/day. This is due to the robust spread between United States natural gas prices and global LNG prices which is expected to continue through 2022. EIA projects LNG exports to average 11.3 Bcf/d in 2022, a 16% increase from 2021. According to the Federal Energy Regulatory Commission (FERC) there are currently 2 LNG export terminals that are approved by FERC and under construction and 13 more terminals that are approved but not yet under construction. Added U.S. export capacity over the next 5 years is estimated to be approximately 9 Bcf/day or a total of 22.7 Bcf/day.

The future trends of U.S. LNG exports are difficult to predict as it can be impacted by both domestic and global developments over the long-term period. These factors include, but are not limited to, global natural gas prices, fundamentals of supply and demand, storage levels, economic cycles, and government regulations. DEF will continue to monitor LNG infrastructure projects and exports from these facilities.

88. Please identify and discuss the Company's plans for the use of firm natural gas storage during the current planning period.

Response:

DEF utilizes firm natural gas storage as part of its overall gas fuel contract portfolio. DEF has agreements with Bay Gas Storage Company LTD ("Bay Gas") and SG Resources Mississippi LLC ("Southern Pines") for firm storage capacity. Both gas storage facilities are

directly connected to interstate pipelines (FGT, Gulfstream, SESH and Transco) on which DEF currently holds firm transportation. Bay Gas and Southern Pines both provide DEF with greater supply reliability, operational flexibility, and price protection during severe weather events and pipeline operational flow orders. DEF expects high deliverability storage to continue to be a critical component of its overall natural gas contract portfolio throughout the planning period. DEF will continue to evaluate any additional needs or changes in firm gas storage capacity throughout the planning period

89. Please identify and discuss expected coal transportation industry trends and factors, for transportation by both rail and water that will impact the Company during the current planning period. Please include a discussion of actions taken by the Company to promote competition among coal transportation modes, as well as expected changes to terminals and port facilities that could affect coal transportation.

Response:

With respect to transportation by rail, several years of steep declines in coal generation demand combined with increased mining costs, along with increasing labor and resource constraints, continues to apply pressure for coal transported by rail to be cost competitive. Additionally, increased demand for coal in foreign countries could put pressure on the railroads infrastructure to transport coal to the ports for export shipments. Declining demand for coal in the utility sector has also driven rail transportation providers to modify their business models to be less dependent on coal related transportation revenues. Although rail transportation providers have limited resources to adapt to significant changes in scheduling demand resulting from the Company's burn volatility, specifically in higher than forecasted coal burn scenarios. DEF maintains communications with the rail transportation to its coal generating station. DEF expects the coal market will remain volatile during the planning period and that access to rail transportation will continue to provide flexibility to respond to rapidly changing generation needs.

With respect to water transportation, because of the addition of scrubbers to many coal generation plants in the Midwest and Southeast, use of higher sulfur coal originating from the Illinois Basin remains the primary fuel source with the main mode of transportation from this region being via water. Here again, several years of steep declines in coal generation demand combined with increased mining costs, along with increasing labor and resource constraints continues to apply pressure for waterborne coal deliveries to be cost competitive. Declining demand for coal in the utility sector has also driven waterborne transportation for limited resources has increased. DEF expects waterborne transportation to remain a key component of its transportation portfolio during the planning period and maintains communications with the river and gulf barge transportation providers as well as its coal suppliers in order to actively explore opportunities to maintain cost competitive waterborne transportation to its coal generating station. Over the planning period, the Company expects terminal services in the Gulf to continue to play a role in waterborne purchases.

Having the ability to transport coal via waterborne barge and rail transportation creates opportunities for competition between transportation modes while also allowing DEF to mitigate unfavorable weather conditions and continue reliable deliveries. Additionally, the ability to take coal from various coal basins promotes competition between the different modes of transportation as well as the competition of coal pricing between coal basins. DEF expects the coal market will remain volatile during the planning period and having varying modes of transportation will continue to provide valuable flexibility. DEF continues to monitor and explore opportunities to maintain competition between water and rail delivery of coal

90. Please identify and discuss any expected changes in coal handling, blending, unloading, and storage at coal generating units during the current planning period. Please discuss any planned construction projects that may be related to these changes.

Response:

Coal handling, blending, unloading, and storage requirements for coals from different basins are a consideration when determining coals to purchase. Expected decreases in demand over the planning period are in turn expected to reduce coal handling, blending, and unloading activities at the Company's coal generating units. The Company expects to continue to require on-site resources to manage its contractional obligations. The Company also expects that terminal services in the Gulf, while continuing to facilitate coal blending, may play a decreasing role over the planning period as demand declines. Continuous communications with the station, terminal facilities, river and gulf barge companies, railroads, and suppliers are critical for DEF's coal transportation strategy in the future.

91. Please identify and discuss the Company's plans for the storage and disposal of spent nuclear fuel during the current planning period. As part of this discussion, please include the Company's expectation regarding short-term and long-term storage, dry cask storage, litigation involving spent nuclear fuel, and any relevant legislation.

Response:

The United States Federal Government is legally obligated to take title and possession of all spent nuclear fuel. DEF will utilize on-site dry storage until the government fulfills its contractual obligations. All fuel at Crystal River #3 has been moved into dry cask storage. Reimbursement for costs incurred to store fuel on site is expected if the storage is as a result of the DOE's breach of the standard contract for disposal of spent nuclear fuel. DEF cannot predict what future actions the government will take to fulfill its contractual obligations. The Nuclear Waste Policy Act of 1982, as amended cannot be changed except by an act of Congress.

92. Please identify and discuss expected uranium production industry trends and factors that will affect the Company during the current planning period.

Response:

DEF has retired the Crystal River 3 Nuclear plant and does not plan to add a new nuclear unit in the ten-year horizon. Therefore, it will not be affected by uranium production industry trends

Extreme Weather

93. Please identify and discuss steps, if any, that the Company has taken to ensure continued energy generation in case of a severe cold weather event.

Response:

Regulated & Renewable Energy (RRE) has weathered 2 recent polar vortexes (2014 & 2015) and a severe cold weather event in Jan 2018 and implemented weather hardening procedures and projects to ensure enhanced reliability through future cold weather events. For example, heat tracing and insulation of key equipment has provided dividends. Through each winter event, we gather lessons learned and disseminate throughout the fleet to mitigate future weather risks. Since Florida is winter peaking, focusing on winter hardening provides the most benefit to our customers although we prepare our fleet for summer weather as well. During the recent Texas blackouts (Feb 2021), we understand that the deregulated energy providers had issues getting operators to plants. In times of system critical needs, we ensure adequate staffing of operating shifts and if needed, even have operators remain close to plants (and in some cases, sleep at plants) to minimize travel risk.

Each station has an extreme weather procedure and RRE has developed a fleet guidance document outlining general expectations and harnessing lessons learned from around the fleet.

For example, while not the same extreme temperature, Florida stations can benefit from freezing events at our Indiana or North Carolina stations.

- Cold weather guidance document fleet wide Stations have hot weather preparedness procedure/checklists (Spring)
- Stations have cold weather preparedness procedure/checklist (Fall)
- Stations have standard Preventive Maintenance (PMs) associated with cold weather preparation entered into the Work Management System.
- Extreme weather Operations Protocol (Sterile control room, hands off, etc.)
- Preference to Spring / Fall outages to ensure reliability for peak Summer / Winter runs.
- Asset Inspection & Maintenance Programs (i.e., Reliability)
- 94. Please identify any future winterization plans, if any, the Company intends to implement over the current planning period.

Response:

At this time, Regulated & Renewable Energy (RRE) has no specific winterization plans for the current planning period beyond what has been described in response to Q93. RRE has taken lessons learned from previous cold weather events and added protective systems to generation stations (e.g., heat tracing and insulation). During the coldest winter in recent Florida history (January 2010), Duke Energy Florida's Generation Fleet recorded its peak generation to our customers without issue. Since then, we have continued to review equipment performance and modify our systems as necessary to continue to reliably supply power when needed.

95. Please explain the Company's planning process for flood mitigation for current and proposed power plant sites and transmission/distribution substations.

Response:

Power Plants - Each of Duke Energy Florida's (DEF) existing generating facilities have a Natural Disaster Emergency Response Plan that details the actions the facility will execute in the event of a forecasted or impending natural disaster. This includes attempts to mitigate the impacts of coastal floods, flash floods and high water events.

DEF's fossil engineering new power plant design criteria require all sites to have a grade level above the 100-year flood level. In some cases, this is addressed by raising the site elevation. DEF solar and storage sites are typically located above the 100-year flood level.

Transmission/Distribution Substations - DEF's Substation Flood Mitigation program builds in protection for substations most vulnerable to flood damage using flood plain and storm surge data. It includes a systematic review and prioritization of substations at risk of flooding to determine the proper mitigation solution, which may include elevating or modifying equipment, or relocating substations altogether.

Flood mitigation is a targeted application of mitigation measures for the 69kV to 12kV substations. New assets could include control houses, relays, or total station rebuilds to increase elevation, etc.

Notes						

1. Source: Fall 2021 EV Forecast.

Previous EV forecasts only included Light Duty. This version includes Light, Medium, and Heavy Duty forecasts. Light duty is considered passenger vehicles (Class 1 and 2). Medium duty is delivery vehicles (Class 3 - 6 vehicles). Heavy duty are transit, school, haul vehicles (Class 7 and 8).

2. "Number of PEVs" includes total cumulative PEV vehicles which includes Light, Medium, and Heavy duty

3. "Cumulative Impact of PEVs" includes only net-new vehicles beginning January 2022 as used in Load Forecast. Includes Light, Medium, and Heavy duty demand and energy impacts.

4. Summer Demand: August HE 18. Winter Demand: January HE 08

5. * Duke currently forecasts L2 private and public chargers together. Duke is developing a charger forecasting tool that will differentiate between the two in the future.

Notes	Notes										
See note below	ee note below										

Table Footnotes:

(1) Total available capacity may change as a result of multiple factors including changes in participation,

changes in contribution from existing participants, and periodic evaluation of system response.

Thus, changes in total available capacity do not directly correlate to changes in participation.

- (2) Added capacity corresponds to the addition of new participants and those converted from suspended accounts.
- (3) Data is Not Available (DNA) on lost capacity for certain source programs and therefore is listed as DNA in their specific table and for the aggregated ALL Source Table.
- (4) During 2016 the Emergency Stand-by Tariff was closed and the customers were removed from the program. Customers whose generators met new EPS requirements were added to the non-emergency program.
- (5) Increase in capacity due to customers added in 2020 that did not add load until 2021 and new customers added in 2021
- (6) Due to accounting differences Curtailable Rate Standby Supplemental 3 had not been recorded previously. It has been added in 2021.

Hardeetown and High Springs are expected to be in service Q1-2023. The rest of the units are still in the development or planning stages. *DEF modeling derives an equivalent summer non-coincident, but on-peak-hour capacity value equal to 25% of the facility's nameplate rating for planned PV installations from 2025 to 2028 and 12.5% for 2029 and beyond.

<u>e</u> ,	2028	26.80	30.69	23.51
	2029	26.61	29.14	24.47
	2030	27.42	29.81	25.39
	2031	28.32	30.94	26.09
Notes				

This year, both the Actuals and the Projected As-Available payment rates shown reflect all components but for the delivery voltage adjustment (because the generator's interconnection level is unknown) defined under rule 25-17.0825(2)(a). These components include: identifiable variable operating and maintenance expenses, start up costs, and a reasonable as-available block size of solar QF generation for appropriate customer protections. The Projected values are only valid and effective as of December 31, 2021 due to the volume of potential solar QF activity. DEF also anticipates that at some point, the system will have increasing amounts of time when the required DEF system resources along with potential solar QF generation may exceed DEF load levels and that excess generation is not fully captured in the Projected values herein.
