

Dear Florida Public Service Commission,

I fully support the EPA's proposed limits on carbon emissions from Florida's existing, modified and reconstructed power plants. In order to help our state comply with the EPA's guidelines, I also strongly recommend that you hold the state's power companies to their previous energy-efficiency goals and do not allow them to drastically reduce their own efficiency targets.

Florida's coastal wildlife habitats and human properties are at severe risk from ocean transgressions due to global climate change, and, as a state, we will be senseless self-damaging hypocrites if we fail to reduce our own carbon emissions and then whine about the consequences of rising sea levels and average temperatures. In fact, we should be working as hard as we can to cut our power plants' emissions below even the EPA's new standards. In the short term, Floridians would enjoy direct health benefits from less airborne carbon pollution. In the long term, we'd be doing our part to protect our coastlines from rising sea levels by reducing our own contributions to global climate change. Every air-pollution reduction helps. Please act in the best interests of our entire state by supporting and enforcing the EPA's new guidelines for power-plant carbon emissions to the full extent of your legal abilities.

Thank you for your time.

Sincerely,

Kathryn Dorn
