POTENTIAL CAPACITY – WASTE HEAT Florida Industrial Cogeneration Association

	-				
SOURCE		Company Name:		Florida Industrial Cogeneration Association	Florida Industrial Cogeneration Association
		Applicable Utility Service Area	(if any)	Florida Power & Light, Progress Energy, Tampa Electric	Florida Power & Light, Progress Energy, Tampa Electric
		Energy Resource:	(Individual Type)	Waste heat from sulfuric acid manufacturing process	Waste heat from sulfuric acid manufacturing process
		Energy Resource Type:	(Category)	Waste Heat	Waste Heat
		Resource Scale	(Unit or Aggregate)	UNITHeat recovery technology available in 8 MW increments (1)	AGGREGATE 140 MW
		Unit Status	(Existing or Planning)	Potential	Potential
COMMERCIAL AVAILABILITY		Typical Unit Annual Capacity Rating	(MW)	Increments of about 8 MW dependent on site specifics(2)	140 MW aggregate potential new generating capacity
		Earliest Commercial In-Service Date	(Year)	2010	2010
		Typical Construction & Permitting Time	(Years)	2 to 3 years	2 to 3 years
		Useful Life of Unit	(Years)	30 years	30 years
		Fuel Type		No fuel used except minimal natural gas or oil for startup	No fuel used except minimal natural gas or oil for startup
PERFORMANCE CHARACTERISTICS		Contribution to Summer Peak Demand	(MW)	Heat recovery technology available in 8 MW increments	140 MW aggregate potential new generating capacity
		Contribution to Winter Peak Demand	(MW)	Heat recovery technology available in 8 MW increments	140 MW aggregate potential new generating capacity
		Average Annual Heat Rate	(BTU/kWh)	Not applicable/available(3)	Not applicable/available(3)
		Equivalent Availability Factor	(%)	95%	95%
		Average Annual Generation	(MWH)	Estimated at 55,000 MWH	Estimated at 1,000,000 MWH
		Resulting Capacity Factor	(%)	Approximately 80%(2)	Approximately 80%(2)

POTENTIAL CAPACITY – WASTE HEAT Florida Industrial Cogeneration Association

Emission Rates	Carbon Dioxide (CO ₂)	(lb/kWh)	ZERO lb/kWh	ZERO lb/kWh
	Sulfur Dioxide (SO ₂)	(lb/kWh)	ZERO lb/kWh	ZERO lb/kWh

FOOTNOTES: See Next Sheet

FOOTNOTES / ADDITIONAL NOTES

- (1) The latest technology for additional waste heat recovery is typically available in increments of approximately 8 megawatt as a retrofit to existing sulfuric acid plants or as original equipment on new plants. Depending on site specifics incremental generating capacity could be as small as 8 megawatt or multiples of 8 megawatts
- (2) The data forms request information sufficient to calculate and compare "effective" capacity contributions each technology. FICA strongly encourages the Commission to do so. For Example:

An 800 mW coal plant, with an installed cost of \$4 Billion would equate to a nominal installed cost \$5,000 per kW. Assuming an 80% capacity factor, the effective capacity would be 640 mW and the effective cost would be \$6250 per kW. (<u>This cost does not include the cost of fuel or environmental costs which are substantial</u>)

An 80 mW solar facility with an installed cost of \$500 Million would equate to a nominal installed cost of \$\$6,250 per kW. Assuming a 22% capacity factor, the effective capacity would be 17.6 mW and the effective cost would be in excess of \$**28,000 per kW**. (<u>This cost does not include environmental costs associated with some solar technologies</u>.)

At \$4,000 per kW), the effective installed cost of waste heat capacity would be \$5,000 per kW - over 80% less than the effective cost of solar. Waste heat has all the positive attributes of solar photo-voltaic but at a much lower nominal and effective capacity cost per kW. Like solar photo-voltaic, waste heat has zero environmental costs or impacts.

- (3) Waste heat produces both process steam for manufacturing and byproduct electricity. As such, heat rate in the sense of a dedicated "fuel consuming" generating plant is not monitored or applicable in this instance.
- (4) This number is a representative estimate that can vary by specific application and various facility specific factors.
